

THE ANTARCTICAN SOCIETY

Notice

The next meeting of the Antarctic Society will be held on Thursday, October 8, from 5:30 to 7:30 p.m. at the Cosmos Club, 2121 Massachusetts Avenue, N.W., Washington, D. C.

This notice is being sent to all members, as well as to other persons believed to be interested in Antarctica. It is hoped that all will be able to attend.

Each member or other person attending will be expected to pay for whatever refreshments he may order. There will be no other costs, since the Cosmos Club has graciously made available the second-floor lounge free of charge for this meeting of the Antarctic Society.

For the information of those who are not already members of the Antarctic Society, there is enclosed a copy of the By-Laws of the Society, which are of course subject to further amendment by the membership.

Wayne W. Fisher  
Secretary

Washington  
September 24, 1959

Note; Communications to the Secretary should be addressed as follows: Mr. Wayne W. Fisher,  
Secretary, The Antarctic Society,  
Room 214, 515 22nd St., N.W.  
Washington 25, D. C.

THE ANTARCTICAN SOCIETY

Notice

The Secretariat is now engaged in preparing an up-to-date list of all members of the Antarctic Society. The deadline for including names in this revised list is October 31, 1959. Each person desiring to become a member should accordingly communicate his name and address to the Secretary of the Society prior to that date, in accordance with the procedure established in Article 2 of the By-Laws.

At the monthly meeting in November it is planned to distribute copies of the revised membership list, for the information of the members and to facilitate contact among them.

Washington  
September 24, 1959

THE ANTARCTICAN SOCIETY

The annual business meeting of the Antarctic Society was held Friday evening, January 8, 1960 at the home of Dr. Carl Eklund, President and Chairman of the Board of Directors of the Society. The meeting was attended by 23 members of the Society.

A copy of the By-Laws, as amended at the meeting, is enclosed. In the discussion of the By-Laws, the wording of Article 2 (a) was agreed upon with the provision that the Board of Directors could decide whether any application for membership should be rejected on the grounds that the applicant does not have a bona fide interest in Antarctica. Following a discussion of the frequency of meetings, the wording of Article 9 (c) was agreed upon, subject to review at the next annual meeting.

Members will note that the date of the annual meeting has been changed from January to May. Thus, the next annual meeting will be held in May, 1961, and the terms of officers and four members of the Board of Directors will expire in May 1961 rather than January.

The following officers of the Society were elected, their terms to expire in May, 1961:

President	Dr. Carl R. Eklund
Vice-President	Dr. Harry Wexler
Secretary	Mr. Wayne W. Fisher
Treasurer	Captain John Cadwalader

Mr. Robert K. Coote and Drs. Thomas O. Jones, Paul A. Siple and Harry Wexler were elected to three-year terms on the Board of Directors. The entire Board membership, together with terms of office, is listed below:

<u>3-Year Term Expires</u> <u>May 1961</u>	<u>3-Year Term Expires</u> <u>May 1962</u>	<u>3-Year Term Expires</u> <u>May 1963</u>
Dr. Gordon D. Cartwright	Ambassador Paul C. Daniels	Mr. Robert K. Coote
Dr. A. P. Crary	Dr. Henry M. Dater	Dr. Thomas O. Jones
Dr. Larkin H. Farinholt	Dr. Carl R. Eklund	Dr. Paul A. Siple
Captain Franklin C. Snow	Mr. Ross C. Peavey	Dr. Harry Wexler

The Chairman of the Program Committee, Dr. Gordon D. Cartwright, outlined the nature of possible future programs, and was given a vote of confidence by the membership.

Washington  
January 12, 1960

Note: Communications to the Secretary should be addressed as follows:  
Mr. Wayne W. Fisher  
Secretary, The Antarctic Society,  
Room 5320, Dept. of State  
Washington 25, D. C.  
Phone: DU 3-5621

THE ANTARCTICAN SOCIETY

NOTICE

The next meeting of The Antarctic Society will be held at 8:00 p.m. on Tuesday, April 11, 1961, at the Westmoreland Hills Recreation Center. The meeting--and this one for members only -- will be our second annual business meeting, at which time we will elect new officers, consider any changes in bylaws, and take up whatever else you may wish.

In addition to the business meeting, our hard-working Program Committee has arranged for brief reports "by American observers who have recently returned from trips with foreign nations in their Antarctic resupply operations. These will include Dr. Henry Dater, observer with the Argentines; Admiral Richard Black, who was with the Belgian resupply ship; Erv Volbrecht, who visited the Australian Mawson and Davis Stations, and Walter L. Boxell, our observer with the Japanese.

For those who cannot come, don't forget to send in your annual dues of one buck. The others can be sandbagged at the meeting. Our treasury is in good shape, and I know we all want to keep it that way for the new administration. A few have not paid for the current year, which is no doubt an oversight. Since the bylaws call for dropping those who have not paid on or before the date of the annual business meeting, please get the dues in. In your case you (have) or (have not) paid the dues.

If you are coming from the District, to get to the Westmoreland Hills Recreation Center, go out Massachusetts Avenue, Northwest, to Westmoreland Circle. Continue on Massachusetts to the first (Duvall Drive) or second (Jamestown Road) streets on the left. Go left to Elliot Road (the first street after turning on Duvall or Jamestown). Turn right at Elliot Road and continue a short distance to the end of the street and the parking lot at the Recreation Center.

Wayne W. Fisher  
Secretary

March 31, 1961

THE ANTARCTICAN SOCIETY

The annual business meeting of The Antarctic Society was held on Tuesday evening, April 11, 1961, at the Westmoreland Hills Recreation Center.

The Secretary reported the membership of the Society at 95.

The following changes were made in the By-Laws at the meeting:

The offices of Secretary and Treasurer were combined;

Paragraph 3(b) was amended to permit both present and former members of the Board of Directors to be eligible for election to the offices of President and Vice-president;

Paragraph 9(a) was amended to provide that the annual business meeting be held in "April or May" rather than in May;

Former Paragraph 9(e) requiring that the Board of Directors meet monthly was deleted. Time and place of meetings of the Society and the Board shall be determined by the Board, as provided in new 9(e) (formerly 9(f)).

The following officers were elected, their terms to expire at the time of the annual meeting in 1962:

President	Dr. Paul A. Siple
Vice-President	Dr. Gordon A. Cartwright
Secretary-Treasurer	Dr. Henry M. Dater

Elected to three-year terms on the Board of Directors were Dr. George A. Llano, Mr. George H. Owen, Mr. George R. Toney, and Admiral David M. Tyree. The entire Board membership and their terms of office are listed below:

<u>3-Year Term Expires 1968</u>	<u>3-Year Term Expires 1965</u>	<u>3-Year Term Expires 1964</u>
Ambassador Paul C. Daniels	Mr. Robert K. Coote	Dr. George A. Llano
Dr. Henry M. Dater	Dr. Thomas O. Jones	Mr. George H. Owen
Dr. Carl R. Eklund	Dr. Paul A. Siple	Mr. George R. Toney
Mr. Ross C. Peavey	Dr. Harry Wexler	Admiral David M. Tyree

It was proposed that the next meeting of the Society be held at the home of Dr. Carl R. Eklund, former President of the Society. Wives will be welcome to attend this meeting which will be held outdoors at Carl's home, weather permitting. A quantity of crab-eater seal meat has been imported from Antarctica especially for the occasion.

Washington  
May 15, 1961

Note: Communications to the Secretary should be addressed as follows:  
Dr. Henry M. Dater  
Secretary, The Antarctic Society  
U.S. Antarctic Projects Office  
718 Jackson Place, N.W.  
Washington 25, D.C.

THE ANTARCTICAN SOCIETY

Notice

The annual garden party of The Antarctican Society will be held at 8:00 p.m. on Saturday, June 10, 1961, at the home of Dr. Carl R. Eklund, member of the Board of Directors. The evening will include a brief account, with selected pictures, of the recent United States traverse which successfully made the overland journey from McMurdo Sound to the South Pole, by Dr. Albert P. Crary, leader of the expedition.

Suitable libations will be available for relaxation and, after the talk, Lobodon caroinophagus stroganoff and assorted goodies will be served. Wives and guests of members are invited to participate.

It would be appreciated if those attending are prepared to contribute \$1.50 per person in order to help foot the bill for refreshments. (Don't overlook the elephant's foot!)

To assist in having some idea of the number of persons that may be expected at the meeting, those planning to attend are kindly requested to inform one of the following as far in advance of the meeting as possible:

Paul Siple	JA 5-5800 (or code 189)	ext. 2156
Gordon Cartwright	AD 2-3200 (or code 191)	ext. 461
Carl Eklund	JA 5-5800 (or code 189)	ext. 2561
Henry Dater	ST 3-0860 (or code 113)	ext. 3795

Carl's address in Maryland is 6612 Tulip Hill Terrace. Go out Massachusetts Avenue approximately 2.5 miles beyond the District line at Westmoreland Circle to Bent Branch Road. Turn left and go to third street on right, turn right and go to fourth house on left side. His telephone is OL 4-8217.

In case of rain, the meeting will be postponed to 17 June.

HENRY M. DATER  
Secretary-Treasurer

Washington,

May 25, 1961.

## THE ANTARCTICAN SOCIETY

### Notice

The Antarctic Society takes great pleasure in announcing a lecture by Sir Charles S. Wright to be held in the lecture hall of the National Academy of Sciences, 2101 Constitution Avenue, on 18 September 1961, at 8:00 p.m.

Sir Charles will discuss his Antarctic experiences, past and present. He was a member of the Second Scott Expedition (1910-1913) and returned to the Antarctic on DEEP FREEZE 61. It seems particularly appropriate for Sir Charles to address the Society during the fiftieth anniversary year of Scott's journey to the South Pole.

There will be opportunity for discussion and to meet the speaker. The lecture will be open to the public and members are invited to bring guests.

Henry M. Dater  
Secretary-Treasurer

Washington,

September 14, 1961

THE ANTARCTICAN SOCIETY

Notice

The Antarctic Society takes great pleasure in announcing the second meeting of the 1961-1962 season to be held in the auditorium of the National Academy of Sciences, 2101 Constitution Avenue, on 27 November 1961, at 8:00 p.m.

The subject will be "New Structural and Operational Concepts in Antarctic Stations." The speakers will be Mr. Harold Lewis of the Bureau of Yards and Docks, who will talk about the new Byrd Station, and Mr. Joe O'Brien of The Martin Company, who will explain the nuclear reactor being installed at McMurdo Sound. Captain Herbert Whitney, USNR, Operations Development Consultant to the United States Antarctic Projects Officer, will preside.

The meeting will be open to the public. Members are urged to bring guests and to inform anyone who, they believe, may be interested.

Henry M. Dater  
Secretary-Treasurer

Washington,

THE ANTARCTICAN SOCIETY

Notice

The Antarctic Society is happy to announce the third meeting of the 1961-62 season to be held in the John Wesley Powell auditorium of the Cosmos Club, Massachusetts and Florida Avenues, on the evening of January 26, 1962, at 8:00 p.m.

The feature of the evening will be the showing of the film Ninety Degrees South, which is the sound version of H.G. Footing's cinematic record of Captain Scott's second expedition. Dr. Paul A. Siple, President of the Society, will preside and introduce the film with appropriate remarks on the South Pole today.

The Society takes great pleasure in inviting the members of the Washington Group of the Explorers Club to attend the meeting. The showing of the Scott film will complement the interesting program on Roald Amundsen at the December meeting of the Explorers Club and will thus complete the local commemoration of the discovery of the South Pole.

The meeting is open to all of both sexes interested in the Antarctic. It is hoped, therefore, that members will bring guests. Refreshments will be available at moderate prices, and the well-known elephant's foot will be prominently displayed to receive contributions needed to help in paying the rent for the auditorium. The treasurer suggests about fifty cents per person.

It is requested that all persons who intend to be present so signify by calling STerling 3-0860 (government code 113), extension 3604, and leaving your name and number of guests with the operator.

Henry M. Dater  
Secretary-Treasurer

Washington,  
January 10, 1962

THE ANTARCTICAN SOCIETY  
Annual Business Meeting  
30 April 1962

The annual business meeting of the Antarctic Society was convened at 8:30 p.m. on 30 April 1962 in the auditorium of the National Science Foundation with Dr. Paul A. Siple, president of the Society in the chair.

After a few words of welcome, the chairman called for a report from the Secretary-Treasurer, Dr. Henry M. Dater. The report indicated that as of 5:00 p.m., 30 April 1962, the Society had 141 members on its roll, of whom 94 were in good standing, 44 owed annual dues, and 3 might be considered delinquent, i.e. owed two years dues. The treasury at the same hour had \$75.65. The report was accepted by the members present.

The chairman then had presented to the membership changes in the By-Laws proposed by the Board of Directors. The reasons for proposed changes were explained by the President and the Secretary-Treasurer. It was then moved and seconded that the By-Laws be amended as proposed. The motion was carried unanimously. A copy of the By-Laws as amended is attached to this notice. The amendments maybe found in Sections 2c, 3, 7, 10, and 11.

The amendments to the By-Laws being approved, the chairman then called upon the chairman of the Nominating Committee, Dr. Carl Eklund, who had presented the nominees for office approved by the Board of Directors. It was moved the nominations be closed, which motion was seconded and unanimously approved. There follows a complete list of the officers and directors of the Society.

OFFICERS

President	Dr. Gordon A. Cartwright
Vice President	Rear Admiral David M. Tyree, USN
Secretary-Historian	Dr. Henry M. Dater
Treasurer-Membership Secretary	Mr. Fred G. Alberts

DIRECTORS

<u>Term Expires 1963</u>	<u>Term Expires 1964</u>	<u>Term Expires 1965</u>
Mr. Robert N. Coote	Dr. George A. Llano	RADM Richard Black
Dr. Thomas O. Jones	Mr. George H. Owen	Mr. John M. Jones
Dr. Paul A. Siple	Mr. George R. Toney	Mr. Morton J. Rubin
Dr. Harry Wexler	RADM David M, Tyree	Mr. Walter R. Seelig

Pursuant to the change in Section 3 of the By-Laws, the Honorable Paul C. Daniels was nominated to be Honorary President of the Antarctic Society. The nomination was seconded, and the election of Ambassador Daniels approved by the unanimous vote of those present.

Washington - May 1962

NOTES: Communications relating to the Society, except for financing and membership matters should be addressed as follows:

Dr. Henry M. Dater  
Secretary of the Antarctic Society  
U.S. Antarctic Projects Officer  
718 Jackson Place, N.W.  
Washington .25, D.C.

Communications relating to financial and membership matters should be addressed as follows:

Mr. Fred G. Alberts  
Treasurer of the Antarctic Society  
Office of Geography  
Department of the Interior  
Washington 25, D.C.

## THE ANTARCTICAN SOCIETY Washington, D. C.

The Antarctic Society was organized in the autumn of 1959 at the suggestion of the Honorable Paul C. Daniels by a group of persons interested in Antarctica. In the words of its by-laws, the Society "is non-profit making and non-political." It is expressly enjoined by the same by-laws from any attempt to influence legislation or policy. The Society exists to facilitate the exchange of friendly and informal views about the Antarctic,

To attain this objective the Society holds four or five meetings a year. Usually, there will be a program consisting of a speaker or speakers, or perhaps a film will be shown. The latter have varied from those depicting the most recent events to historical items such as the films of the second Scott expedition (1911-1914). Programs usually are short, and the members are given ample opportunity to meet and discuss matters of common interest. One meeting a year, with suitable refreshments, has been devoted almost entirely to this pleasurable activity. The key note of the Society has been informality.

The Antarctic Society is headed by a president elected by the members. Past presidents have been Dr. Carl EkLund, Dr. Paul A. Siple, and Mr. Gordon D. Cartwright, all of whom are distinguished scientists and explorers. The routine activities of the Society are administered by a Board of Directors, composed of 12 persons, four of whom are elected each year. More important matters are referred to the members at business meetings.

The membership is presently made up of more than 200 persons representative of the diverse groups interested in Antarctica: scientists, diplomats, support personnel, administrators, and the public. There are women as well as men, for the only requirement to become a member is an interest in the area.

To apply for entrance into the society it is sufficient to write a letter expressing this interest to the Treasurer-Membership Secretary, presently Mr. Fred G. Alberts, enclosing \$1.00 initiation fee plus \$2.00 annual dues. (A sample letter, which may be signed and forwarded to Mr. Alberts, is attached,)

The funds of the Society are used for mailing out notices and other material to members, renting a meeting place, and for other necessary expenses.

Since the Society has adhered strictly to its objective of informality and has not sought to publicize itself, it is felt that many persons interested in Antarctica may not be aware of its existence. Those who would like to avail themselves of the opportunity to meet and talk with other persons possessing a common interest in the area are invited to do so.

Mr. Fred G. Alberts  
Office of Geography  
Department of the Interior  
Washington 25, D. C.

Dear Mr. Alberts:

My attention has been directed to the Antarctic Society as an organization dedicated to the friendly and informal exchange of views about Antarctica. Since I am interested in developments in this important area, I would like to join the Society. For that purpose, I am enclosing a check for \$3.00, payable to you, to cover the initiation fee of \$1.00 plus annual dues of \$2.00.

Notices should be sent to me at the following address:

Name  
Street  
City, State

Sincerely,

THE ANTARCTICAN SOCIETY  
Washington, D. C.

The Antarctic Society will begin the 1962-63 season with a meeting at the auditorium of the District of Columbia Chapter of the American Red Cross, 2025 E Street, N.W., to be held on the evening of November 1, 1962, at 8 o'clock.

Dr. Laurence M. Gould, a member of the first Byrd Antarctic Expedition, former President of Carleton College, and Chairman of the Polar Research Committee of the National Academy of Sciences, will deliver a brief talk entitled "Reflections on the Antarctic". Dr. Gould's talk will be followed by a movie, "The Way to the Yamato Mountains", prepared by Dr. Tetsuya Torii, leader of the Japanese Antarctic Research Expedition, 1961-62. This film, loaned to the Society through the courtesy of the Japanese Embassy, has a sound track in English.

The meeting is open to all interested in Antarctica, and members are urged to bring their friends and to call the meeting to the attention of associates.

-----

Members are reminded that for the majority dues were payable on October 1, 1962. For those who have overlooked this detail, remittances should be made to the treasurer:

Mr. Fred G. Alberts  
Office of Geography  
Department of the Interior  
Washington 25, D. C.

THE ANTARCTICAN SOCIETY  
Washington, D. C.

NOTICE TO MEMBERS

Enclosed please find an account of the annual business meeting of the Society and a copy of the By-Laws as amended at that meeting.

The Board of Directors regrets to call your attention to the death on August 11, 1962, of Dr. Harry Wexler, one of its most distinguished members. Dr. Wexler was one of the charter members of the Society and was serving the third year as a director. The Society will greatly miss his good counsel and enthusiastic participation in its activities. It is unnecessary to recall to members of the Antarctic Society Dr. Wexler's many contributions to science in general and to the Antarctic program in particular.

The Board is happy to announce that Mr. William H. Chapman of the U. S. Geological Survey has agreed to serve the remainder of Dr. Wexler's term.

Experience of three years indicated that the provision of the By-Laws for the payment of dues was obscure and open to various interpretations. To clarify this provision and to simplify the work of the Treasurer, the annual business meeting adopted a change to the By-Laws by which section 7 was amended to read

"Dues of \$1.00 are payable in advance on or before the first day of October."

At a meeting of the Board of Directors held on 11 September 1962, the method of change-over to the new date was discussed. The following rules were adopted:

1. Members who joined the Society on or subsequent to 30 April 1962, the date of the annual business meeting, will be considered as having paid their 1962-63 dues.
2. Members who were notified that they were eligible to attend the annual business meeting and those who paid their dues to maintain their eligibility pursuant to the notice announcing that meeting, will be expected to pay their dues for the 1962-63 year on or before 1 October 1962.

The records indicate that a few members have paid dues in advance. They will not be required to pay at this time and will be considered members in good standing until 1 October 1963. A check mark in the box at the end of this notice indicates that you do not have to pay dues at this time.

All other members owe annual dues of \$1.00 payable before 1 October 1962.

Dues should be remitted and checks made payable to

Fred G. Alberts  
Treasurer of the Antarctic Society  
Office of Geography  
Department of the Interior  
Washington 25, D. C.

The Board recognizes that this procedure may appear arbitrary in some instances. Any questions should be addressed to Mr. Alberts.

HENRY M. DATER  
Secretary-Historian

FRED G. ALBERTS  
Treasurer-Membership Secretary

[ ] Check mark in box indicates dues already paid.

THE ANTARCTICAN SOCIETY

Dr. Carl R. Eklund

The Officers and Board of Directors regret the sad duty of bringing to the attention of the members the death of Dr. Carl R. Eklund on November 4, 1962. In his passing, the Society lost one of its founders and most faithful supporters. The meeting at which the Society was organized and its first by-laws adopted was held at his house on January 8, 1960, and Dr. Eklund served as first president of the Society. Each spring he and Mrs. Eklund generously opened their house and garden to the members at what became an annual event, always a high spot of the year. The elephant's foot, that symbol of the Society's precarious finances, was also one of his possessions. It is difficult to see how the Society could have succeeded in its formative years without Dr. Eklund, and his impress will long remain upon it.

THE ANTARCTICAN SOCIETY

Notice

The Antarctic Society is happy to announce the second meeting of the 1962-63 season to be held in the lecture room of the National Academy of Sciences, 2101 Constitution Avenue, on Thursday evening February 14 at 8:00 p.m.

The program for the evening will feature an illustrated discussion of atmospheric physics with the general title The Atmosphere and Beyond, covering such important aspects of the subject as sun-earth relationships, solar particles, cosmic rays, configuration of the magnetic field, and the causes for conjugate points, auroras, ionospheric phenomena, and whistlers. The speakers will be Dr. Martin A. Pomerantz, Director of The Bartol Research Foundation and Chairman of the U.S. Committee for the International Year of the Quiet Sun, and Dr. T. Neil Davis, Resident Research Associate at the Goddard Space Flight Center.

The meeting will be open to the public. Members are urged to pass the word among interested persons and to bring guests.

Many requests have been received for a current roster of members. It is hoped to prepare such a document during March of this year. Members who are in arrears at that time will not be included. If you are one who through some oversight has neglected to pay his dues that fact will be noted below. Please make out checks to Fred G. Alberts and mail them to him at the Office of Geography, Department of the Interior, Washington 25, D. C.

Henry M. Dater  
Secretary

THE ANTARCTICAN SOCIETY

ANNUAL BUSINESS MEETING

7 May 1963

The Annual business meeting of the Antarctic Society was held at the National Academy of Sciences on the evening of 7 May 1963. The president of the Society, Mr. Gordon D. Cartwright presided. He opened the meeting by pointing out some of the high- lights of the year's activities. He was followed by the Secretary-Historian, Dr. Henry M. Dater, and the Treasurer-Membership Secretary, Mr. Fred G. Alberts, who delivered brief reports of the items under their cognizance. Mr. Alberts revealed that the Society had 162 members and that there was \$156.92 in the treasury.

After hearing these reports, the members took up proposed changes in the By-Laws. The Board of Directors presented five changes for consideration. With minor emendations from the floor all five were approved. Briefly, they provide: (1) that the Board may name life members of the Society; (2) that the Secretary-Historian and Treasurer-Membership Secretary may serve any number of successive terms; (3) that the annual dues will henceforth be \$2.00; (4) that Treasurers shall drop from the rolls of the Society members delinquent in the payment of dues; (5) five directors shall constitute a quorum of the Board.

The final act of the annual business meeting was the election of officers and directors for the coming year. The following is a complete list of officers and directors:

Honorary President	The Honorable Paul C. Daniels
President	Rear Admiral David M. Tyree, USN
Vice President	Mr. George R. Toney
Secretary-Historian	Dr. Henry M. Dater
Treasurer-Membership Secretary	Mr. Fred G. Alberts

Board of Directors

Term expires 1964	Term expires 1965	Term expires 1966
Dr. George A. Llano	Rear Admiral Richard	Dr. Meredith E.
Mr. George H. Owen	B. Black, USNR (Ret.)	Burril
Mr. George R. Toney	Mr. John M. Jones	Mr. Louis Deroche
Rear Admiral David M. Tyree, USN	Mr. Morton J. Rubin	Mr. Leonard Dykes
	Mr. Walter R. Seelig	Mr. William H. Chapman

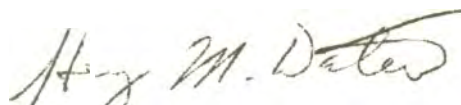

ANTARCTICAN SOCIETY

NOTICE

The Antartican Society will meet at the National Academy of Sciences, 2101 Constitution Ave., N.W., on Tuesday evening, 7 May 1963, at 8 o'clock.

This is the annual business meeting and the first part of the evening will be devoted to the presentation of reports, consideration of changes in the by-laws, election of officers, and such other business as the officers, the Board of Directors, or individual members may desire to place before the Society.

Following the business meeting, Rear Admiral James R. Reedy, USN, Commander U.S. Naval Support Force Antarctica, will discuss some of the highlights of Operation DEEP FREEZE 63; Mr. Robert Mason will talk about the U.S. Antarctic Research Program for the past season; and Dr. George Llano will explain the scientific work aboard USNS ELTANIN.

A handwritten signature in cursive script that reads "Henry M. Dater". The signature is written in dark ink and is positioned above the printed name and title.

HENRY M. DATER  
Secretary-Historian

THE ANTARCTICAN SOCIETY

The annual garden party of the Antarctic Society will be held at Rippon Lodge, Woodbridge, Va., the home of Rear Admiral and Mrs. Richard B. Black, on 8 June 1963 at 5 o'clock in the evening.

Refreshments and food of a nature to sustain Antarciticans will be served, and there will be a short program of general interest. Picnic clothes will be suitable attire.

Members are cordially invited to bring wives or husbands and other guests, especially those who may be interested in the purposes of the Society. In order to assist in defraying the expense involved, a contribution of \$3.00 for each person present will be deeply appreciated. The elephant's foot will be prominently displayed.

So that those responsible for the arrangements may know how many Antarciticans to plan for, it is requested that those expecting to attend call Sterling 3-0860 (gov't code 113), extension 3604 and leave your name and that of any guests with the operator by the close of business Thursday, 6 June 1963. By mail to Henry M. Dater, c/o U.S. Antarctic Projects Officer, 718 Jackson Pl., N.W., Washington 25, D.C.

A sketch map is enclosed showing how to reach Rippon. The attention of members approaching from Washington or Alexandria is directed to the desirability of proceeding beyond Rippon Lodge to Valley Camp in order to turn around and approach with the gate on the right.

In case of rain the party will postponed to 15 June 1963. If in doubt, call one of the following before noon on 8 June.

Mr. William H. Chapman	481-7185
Mr. Gordon A. Cartwright	FE7-8578
Mr. Gerald Pagano	JA7-3187

THE ANTARCTICAN SOCIETY

Notice to Members

18 October 1963

The second meeting of the Antarctic Society for the current season will be held on Wednesday evening, November 6, at 8:00 P.M., in the auditorium of the School of Nursing at The Catholic University of America. Dr. Raymond Spaulding, Staff Psychiatrist, Bethesda Naval Hospital, will speak on the U.S. Navy's experience with psychiatric and psychological evaluation of DEEP FREEZE personnel. The location of the School of Nursing and adjacent parking areas are indicated on the attached map.

For the past few years, Dr. Spaulding has been concerned with the testing of DEEP FREEZE participants and the evaluation of the testing program. He will review the history of the Navy's program, what has been learned from the screening methods and follow-up studies, and he will present some ideas of the future plans in view of the neuropsychiatric findings. A 12-minute sound-and-color film on "Antarctic Living" will be presented. The evening promises to be a stimulating and interesting one, and Dr. Spaulding's presentation will undoubtedly provoke discussion among old Antarctic hands and others with ideas on the subject.

The year's third meeting will be held at the Cosmos Club on January 30, 1964. At that time the New Zealand Embassy will review New Zealand activities in the Antarctic.

Members who have not paid their dues are reminded to forward them to Mr. Fred G. Alberts, Office of Geography, Department of the Interior, Washington, D.C. 20240.

HENRY M. DATER  
Secretary-Historian

## THE ANTARCTICAN SOCIETY

### Notice to Members

The Antarctic Society is pleased to present a New Zealand Night, with the cooperation of the Embassy of New Zealand. Materials not before seen in this country are being imported to illustrate New Zealand activities in Antarctica. The Ambassador of New Zealand, the Honorable George Laking, will be represented by the Counsellor of Embassy, Mr. J. H. Weir.

To meet our New Zealand friends and to facilitate social exchanges, refreshments will be served both before and after the program. The Society will furnish snacks and coffee, and alcoholic beverages will be available at moderate prices.

It is hoped that the success of the evening will establish a precedent so that we may feel free in the future to invite other embassies to explain their nations' Antarctic activities. Because of the social nature of the occasion, the meeting will be limited to members, their families, and guests of whom we would like to see a great number.

For the occasion, the Society has reserved the John Wesley Powell Auditorium of the Cosmos Club, beginning at 7:30 on the evening of 30 January 1964. The Cosmos Club is situated at the corner of Florida and Massachusetts Avenues, N. W. Entrance to the Auditorium is off Florida Avenue.

Let us show our New Zealand friends that we appreciate the assistance they have rendered our Antarctic operations.

Henry M. Dater  
Secretary Historian

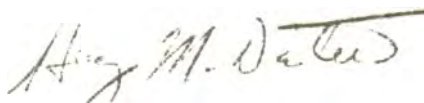

THE ANTARCTICAN SOCIETY

Notice to Members

The Officers and Board of Directors have the pleasure to announce the first Antarctic Society Memorial Lecture, It is the desire of the Society to honor the memory of those of its members who are deceased and, by so doing, to honor as well all those distinguished dead who have contributed to our knowledge of Antarctica.

The Antarctic Society Memorial Lecture will be delivered at the National Academy of Sciences, 2101 Constitution Avenue, on the evening of March 31, 1964 at 8 p.m. The distinguished biologist and Antarctic veteran Dr. William J. L. Sladen of the Johns Hopkins University, will give an illustrated lecture entitled "Penguins and Skuas." After the talk, there will be a social hour, during which the Society will serve light refreshments. The meeting will be open to the public, and members are urged to bring guests and to invite the attention of those who may be interested.

On April 30, 1964 the Society will conduct its annual business meeting, also at the National Academy of Sciences. In addition to the election of officers, consideration of changes in the By-laws, and such other business as the Officers, Board of Directors, or individual members may desire to bring before the Society, there will be a short program. Representatives of the U.S. Naval Support Force, Antarctica, and the National Science Foundation will present the highlights of the 1963-64 operations.

HENRY M. DATER  
Secretary Historian

## THE ANTARCTICAN SOCIETY

### Notice to Members

The Annual Business Meeting of the Antarctican Society will be held in the lecture hall of the National Academy of Sciences, 2101 Constitution Avenue, N.W. at 8:00 p.m. on 30 April 1964. The Business Meeting will hear reports from the officers of the Society, elect officers and four members of the Board of Directors, and discuss such other matters as may be appropriate. Discussion from the floor is invited.

Following the business session, a program presenting the highlights of the 1963-64 season in Antarctica will be presented. Rear Admiral James R. Reedy, USN, will discuss operations, and Dr. Albert P. Crary will cover scientific developments. As was so successfully done at the last meeting, the evening will close with a social hour and refreshments.

The final meeting of the year will be the annual garden party for which Rear Admiral and Mrs. Black have again generously offered the use of their home, Rippon Lodge, Woodbridge, Va. The garden party will be held on 23 May 1964, or in case of rain, on 6 June. Members will be requested, as in the past, to contribute to the cost of food and libations. Families and guests will be most welcome. Complete information will be forwarded when available. In the meantime save the date.

The success of the Antarctican Society depends upon bringing together individuals interested in Antarctica. The Officers of the Society urge members to bring the existence of the Society to the attention of friends and colleagues who would like to share in our programs and who may contribute to our activities.

HENRY M. DATER  
Secretary-Historian

THE ANTARCTICAN SOCIETY

Notice to Members

The annual garden party of the Antarctic Society will be held at Rippon Lodge, Woodbridge Virginia, on 23 May 1964 at 5 o'clock in the evening.

Refreshments will be available, and there will be a short entertainment featuring a penguin film by Dr. Sladen and a Russian film, showing the establishment of an Arctic draft station by the Atomic ice breaker, Lenin. Picnic clothes will be suitable attire.

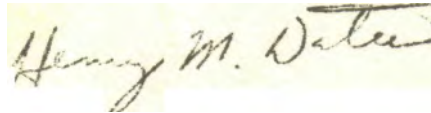

Members are cordially invited to bring wives and guests. To assist in defraying the expense involved, a contribution of \$3.00 for each person present will be deeply appreciated. The elephant's foot will be prominently displayed.

So that those responsible for the arrangements may know how many Antarcticans to expect, it is requested that anyone planning to attend call DU2-1604 (gov't code 128-21604) and leave his name and that of any guests with the operator by the close of business Thursday 21 May. Replies by mail should be sent to Henry M. Dater, U.S. Antarctic Projects Office, 801-19th St., N.W. Washington, D.C. 20305.

A sketch map is enclosed showing how to reach Rippon Lodge. The attention of members coming from Washington or Alexandria is directed to the desirability of proceeding beyond Rippon Lodge to Valley Camp in order to turn around and approach with the gate on the right.

In case of rain the party will be postponed to 6 June 1964. If in doubt call one of the following before noon on 23 May:

Mr George Toney OL2-7948  
Mr. Gerald Pagano JA7-3187  
Mr. Walter Selig PO2-6878

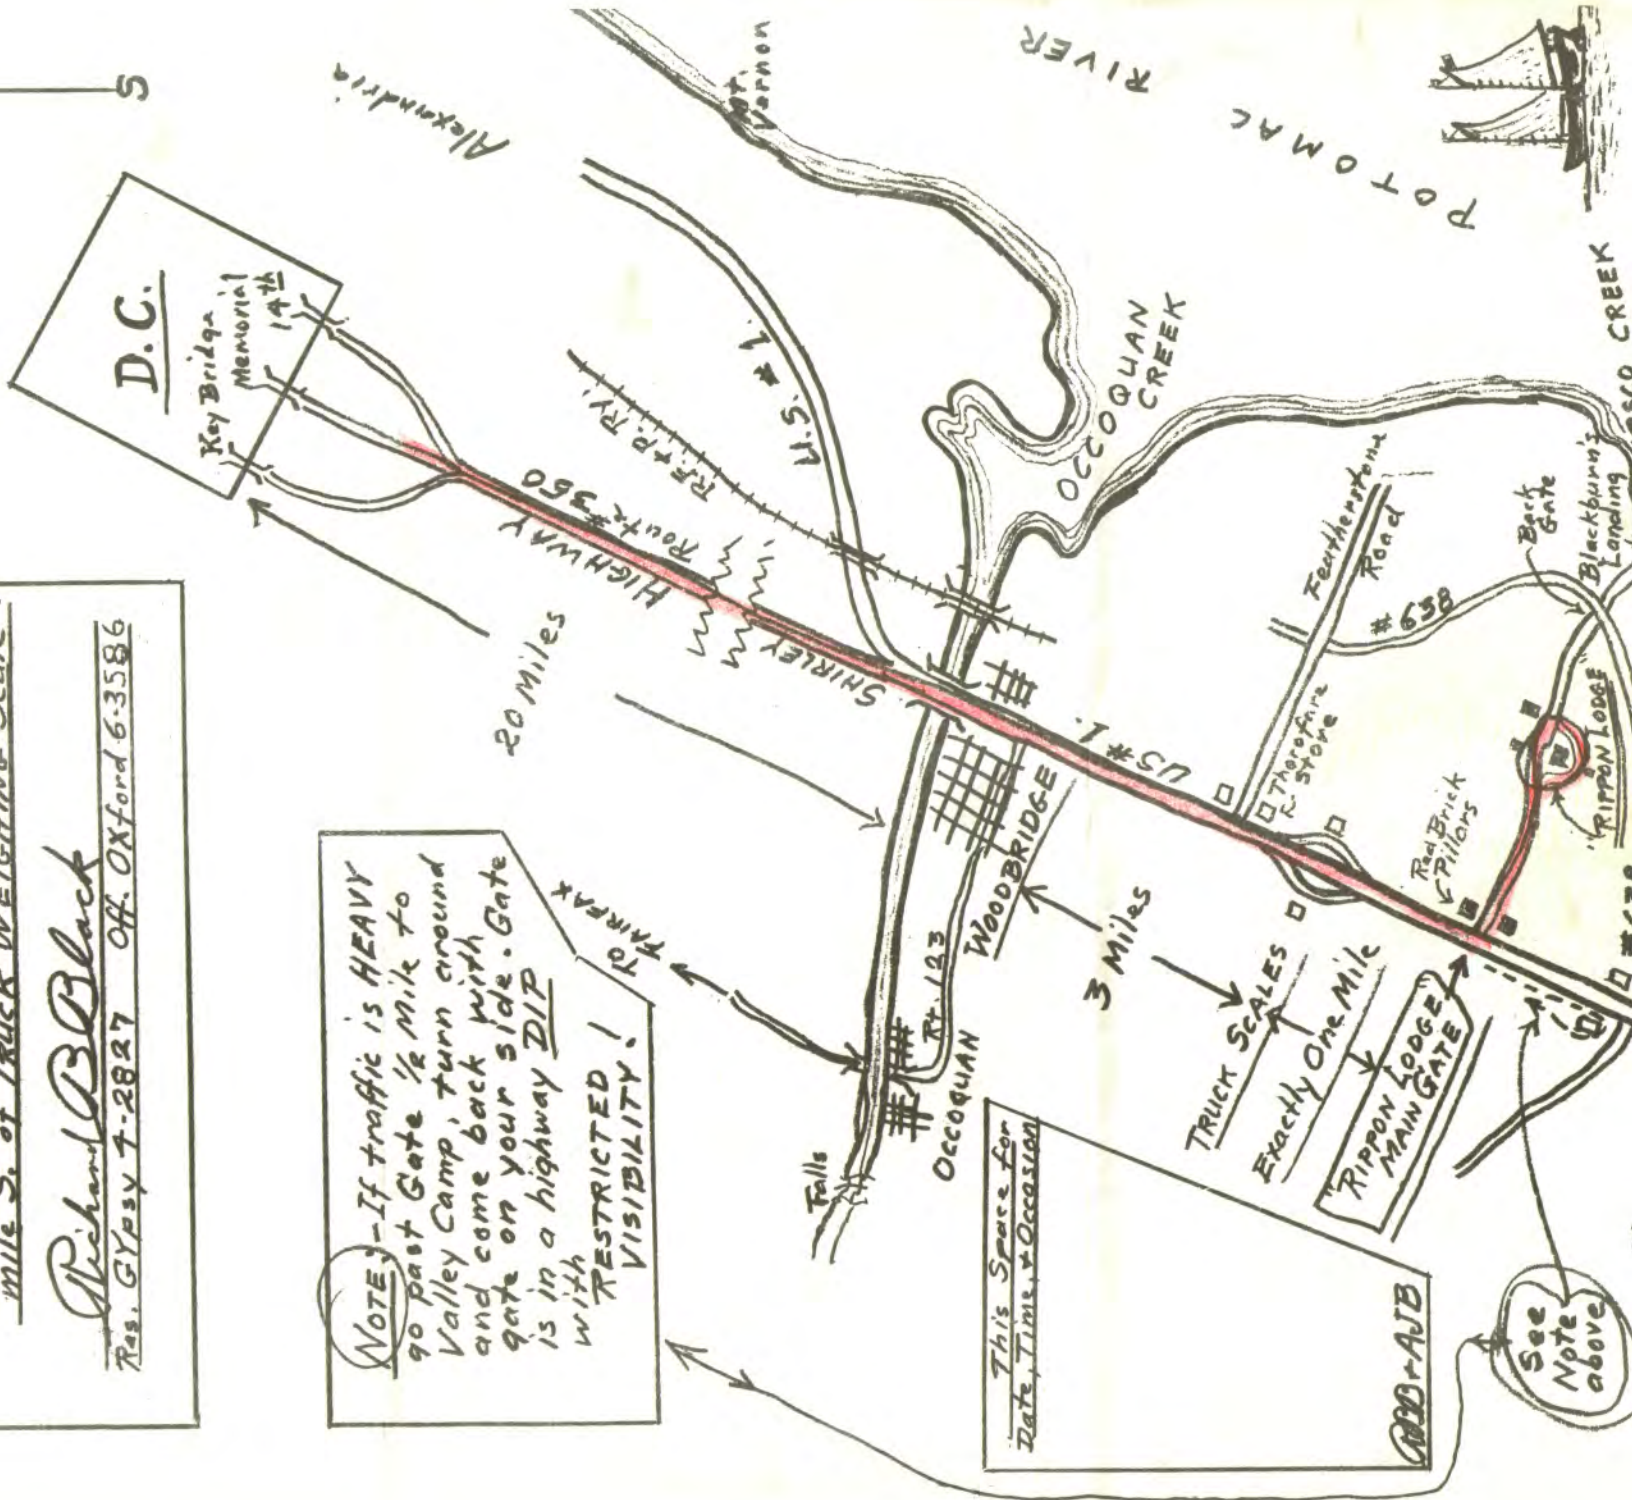

A handwritten signature in cursive script, reading "Henry M. Dater", written in dark ink on a light-colored rectangular piece of paper.

## THE ANTARCTICAN SOCIETY

### Notice to Members

The Antarctic Society is pleased to announce that the first meeting of the current year will be held at the National Academy of Sciences, 2101 Constitution Avenue, N. W., at 8 p.m. on the evening of 30 September 1964. Dr. Kenneth J. Bertrand, Head of the Department of Geography at the Catholic University of America, will address the Society on the early history of Antarctica. Following the custom inaugurated last year, refreshments will be served in the Guest Hall following the address.

The second meeting will be held on 12 November 1964 also at the National Academy. At that time Dr. Meredith F. Burrill will talk on "Antarctic Geographic Names." Other meetings will include a foreign night, where representatives of an embassy will explain to the Society what their compatriots are doing in Antarctica, a discussion of the exchange of representatives with other countries, the annual business meeting and review of the year's activities and, of course, the annual garden party.

Members are urged to bring friends and associates as this and most other meetings are open to the public.

HENRY M. DATER  
Secretary - Historian

THE ANTARCTICAN SOCIETY HEARS  
DR. BERTRAND AT SEPTEMBER MEETING

The Antarctic Society held the first meeting of the 1964-1965 season on 30 September at the National Academy of Sciences. In the absence of the President, Mr. George R. Toney, who was in the Antarctic area aboard USNS ELTANIN, Mr. Morton J. Rubin, the Vice President, presided. Mr. Rubin announced that the Society had determined to award its Certificate of Recognition to Mr. William F. Bakewell of Skandia, Michigan.

As a young man, Bakewell had gone to sea, been shipwrecked off Montevideo, Uruguay, and made his way to Buenos Aires, Argentina. There he saw Shackleton's Endurance and, hearing that a hand was needed, applied for the post. In order to join the Imperial Trans-Antarctic Expedition, he represented himself as a Canadian. He was accepted by Shackleton, thus becoming the sole citizen of the United States to take part in the great adventure that followed. After Endurance had been crushed in the ice and the party had made its way to Elephant Island, Bakewell was among those who remained with Frank Wild, while Shackleton went off to South Georgia to obtain help.

In recent years, Bakewell has been sheep-farming in Michigan. Last July, he went to London where the Antarctic Club had arranged a celebration for the fiftieth anniversary of the Expedition. He was one of five who appeared on that occasion.

Senator Patrick V. McNamara of Michigan kindly agreed to present the certificate to Bakewell and an appropriate ceremony was arranged for 21 October 1964 at the Marquette County Historical Society. In making the presentation, Senator McNamara said in part:

"The Shackleton Expedition is an epic story of exploration, courage, and endurance. William Bakewell, as an active participant in these exploits, deserves this recognition and our tribute."

The feature of the Antarctic Society meeting was a talk entitled "American Activity in the Early History of Antarctica," by Dr. Kenneth J. Bertrand, Department of Geography, The Catholic University of America. Dr. Bertrand has spent many years in research of this early period of Antarctic voyaging and in so doing has discovered much hitherto-unknown material.

Probably, no item is of greater importance than Dr. Bertrand's deciphering of the log of the New Haven Sealer, Hersilia, which visited the South Shetlands in 1819-1820. Hersilia's voyage had long been known, but exactly where she went was something of a mystery. Dr. Bertrand's reconstruction of the ship's track was a masterpiece of scholarly detection. Dr. Bertrand has provided the abstract of his talk which is printed below.

American Activity in the Early History of Antarctica

Early American activity in the Antarctic was based on the fur seal. The account of Captain James Cook's third voyage, 1776-1780, indicated the presence

of a profitable market for furs in China. Acting on this information, American merchants initiated the China trade by dispatching the ship *Empress of China* in 1784 with a mixed cargo, including some furs. Boston merchants began the fur trade between the Pacific Northwest Coast and China, in 1787. Meanwhile, however, Francis Rotch of Nantucket and New Bedford, who had been leader of an American whaling fleet in exile at the Falkland Islands during the Revolution, decided that the southern fur seal was the best source of furs for the China trade. In 1784 he dispatched the ship *United States* to the Falkland Islands. It returned to New York in 1786 with 13,000 seal skins, which were transhipped aboard the brig Eleanor to Canton where they sold for \$65,000.

From this beginning, the sealing business expanded rapidly along the coasts and off-lying islands of South America and Africa. However, as early as 1792, Elijah Austin of New Haven dispatched the brig *Nancy*, commanded by Captain Daniel Green, and the brig *Polly*, commanded by Captain Roswell Woodward, to South Georgia. So far as is now known, these were the first American vessels to cross the Antarctic Convergence. While the *Polly* returned to New Haven, the *Nancy* sailed with the skins to Canton and returned home in 1795 with Chinese goods, on which a duty of \$10,324 was paid. Another early voyage of note was made by the whalers *Asia* and *Alliance*, commanded by Captains Elijah and Bartlett Coffin, respectively, which remained at Kerguelen Island from December 17, 1792, to March 11, 1793, hunting elephant seals, for oil.

An example of the wealth that fur sealers brought to the United States at a time when trade was stifled by lack of gold for foreign exchange is the voyage of Captain Daniel Green in the ship *Neptune*, 1796-1799. Skins which he obtained in sub-Antarctic sealing grounds were exchanged at Canton for goods valued at \$280,000 on which a duty of \$74,000 was paid.

For 2 decades the sealing industry flourished, but indiscriminate slaughter of seals of all ages and both sexes brought the business to a low ebb by 1810. Clark estimated that 3,500,000 skins were taken between 1793 and 1807 from the island of Mas Afuera, about 500 miles west of Valparaiso; and Weddell estimated that not less than 1,200,000 had been taken at South Georgia. The business revived slightly after 1816, following the War of 1812.

The discovery of the South Shetland Islands by Captain William Smith, in the British brig *Williams*, in 1819, resulted in a great but short-lived revival of sealing. Meanwhile the brig *Hersilia*, commanded by Captain James P. Sheffield, had sailed from Stonington, Connecticut, July 22, 1819, on a combined sealing and exploring voyage. At the Falkland Islands, Nathaniel Palmer (the Second Mate) learned of Smith's discovery from the crew of a vessel bound for the South Shetlands from Buenos Aires.

Later, the Hersilia also set out to find the South Shetlands. The Hersilia's voyage was reported by the old sealing captain, Edmund Fanning, in his Voyage Round the World, published in 1835. When the Hersilia returned to Stonington, May 21, 1820, the news of thousands of seals at the South Shetlands was electrifying, and 3 separate fleets and a number of single vessels prepared

for voyages to the newly-found Islands. Until recently, only fragmentary evidence was available concerning the voyage of the *Hersilia*, and some of that was contradictory. Because of the importance of the voyage, there was a considerable amount of speculation as to just what was seen on the voyage. It was suggested, for instance, that the brig may have been the first vessel to cruise along the south shore of Livingston Island and possibly the first to see the Antarctic mainland.

In 1956 the existence of the *Hersilia's* logbook was made, known, but owing to the difficulty of interpreting the log, details of the voyage have only now been worked out. No physical features are referred to by name. The longitude, as reported, is at least 8 degrees too far east, and Elof Benson (the Swedish First Mate) wrote in a phonetic English that is not always easily deciphered. Smith Island was sighted on January 18, 1820, and after cruising, off-and-on, for several days, the brig came to anchor at *Hersilia* Cove on Rugged Island, on January 23, where they found a "black brig from Buenos Aires." The track of the *Hersilia* has been drawn on a large-scale map of the western South Shetlands.

In 1820-21 there were 30 American vessels at the South Shetlands. Much has been written about Palmer of the schooner *Hero* and his cruise to the Orleans Channel in November 1820, as well as his exploration of Deception Island and McFarlane Strait. Perhaps more important was the landing made February 7, 1820, in the vicinity of Hughes Bay, by men from the schooner *Cecilia*, commanded by Captain John Davis of New Haven. This is the first landing on the mainland for which there is documentary proof. Another notable achievement was the voyage south to a reported position of 66° South, 70° West by Captain Robert Johnson of New York in the sloop *Sarah*, tender to the *Jane Maria*. At least 3 maps were drawn by sealers in 1820-1821, and several returned with collections of mineral specimens.

With 30 American and 23 British vessels hunting seals at the South Shetlands in 1820-1821, the seals suffered wholesale slaughter. Some sealers left with less than full cargo and others wintered in South America or at the Falkland Islands, to return in 1821-1822. That year there were 18 American and 28 British vessels at the South Shetlands. So great was the slaughter of the remaining seals that, in a few years, the business had dwindled to 1 or 2 vessels a season and some years there were none. In December 1821, the South Orkneys were discovered, on a joint cruise made by Captain Nathaniel Palmer and the British sealer, George Powell.

In January and February 1830, 3 American vessels, the *Seraph*, *Anawan* and *Penguin*, sailed in the South Shetlands and then cruised westward to 103° West, in an unsuccessful search for the Islands reported by Captains Swain, Gardiner and Macy. Aboard the *Anawan* was James Eights, the first American scientist and one of the first scientists of any nation to visit the Antarctic. His work, published in now-obscure American journals of the day, is still valid. He discovered an unknown species of sea spider and the first fossils found in the Antarctic. From glacial erratics at the South Shetlands and in Icebergs, he inferred the existence of a large continent to the south.

THE ANTARCTICAN SOCIETY

Notice to Members

The Antarctic Society is pleased to announce that the second meeting of the 1964-65 season will take place on the evening of 12 November at 8 p.m. in the lecture hall of the National Academy of Sciences, 2101 Constitution Avenue, N.W. Dr. Meredith F. Burrill, Executive Secretary of the Board on Geographic Names, will speak on "Antarctic Geographic Names." The meeting is open to the public without charge. Members are invited to bring guests and to inform persons who may be interested in the Antarctic and in the topic of the evening. Following the talk, refreshments will be served in the Great Hall of the National Academy.

The following meeting will be International Night, which will be presented by the United Kingdom. The speaker will be Captain Robert H. Graham, RN, MVO, who will talk on his two years as commanding officer of HMS Protector in Antarctic waters. The meeting will be held about mid-January, at an exact date to be determined later.

This notice calls to the attention of members that annual dues of \$2.00 are now in order. To facilitate the work of the Treasurer-Membership Secretary, it will be greatly appreciated if checks are made payable and are promptly sent to:

Mr. Fred G. Alberts  
Office of Geography  
Department of the Interior  
Washington, D. C. 20240

The mailing of your check provides an excellent opportunity to include a notice of a change-of-address, if such has taken place in the past year.

HENRY M. DATER  
Secretary-Historian

## THE ANTARCTICAN SOCIETY

### Notice to Members

The Embassy of the United Kingdom has graciously offered to present the program for this season's International Night of the Antarctic Society to be held at the National Academy of Sciences, 2101 Constitution Avenue, N.W., on the evening of 14 January at 8:00 p.m. The featured speaker will be Captain Robert H. Graham, RN, MVO.

Captain Graham, who is Assistant Naval Attache, was formerly commanding officer of HMS PROTECTOR, a naval guard ship assigned to the Antarctic. He will give an illustrated talk entitled, "Two Years in HMS PROTECTOR in Antarctic Waters." Captain Graham will also explain to the Society the background of British Antarctic operations and discuss briefly current programs.

After the presentation, a social hour will be held in the Great Hall of the Academy. There will be time to meet the speaker and to discuss informally matters of interest to Antarcticans.

This is the second International Night to be held by the Antarctic Society and it is hoped that it will fix permanently the precedent so successfully inaugurated last year by the New Zealand Embassy. It is fitting that the Society show its recognition of the long and distinguished part played by the British in the opening and exploration of Antarctica. All members are urged to attend and to bring colleagues and guests who are interested in Antarctic affairs.

*Betty - a reminder that annual dues of \$2. are now payable the Treasurer;*

*Fred G. Alberta*

U. S. Dept. of the Interior  
Office of Geography

Washington 25, D.C.

THE ANTARCTICAN SOCIETY

Notice to Members

The Second Memorial Lecture of the Antarctica^ Society will be held at the National Academy of Sciences, 2101 Constitution Avenue, N, W., on 10 March 1965 at 8 p. m. The speaker of the evening will be Rear Admiral David M. Tyree, USN (Ret.), who will address the Society on the topic of "Technological Advances in Antarctica."

On 1 February 1955, the Navy Department activated the United States Naval Support Force, Antarctica. For a decade, that Force has supported our Antarctic scientific program and learned many lessons from hard experience, lessons which have greatly expanded man's ability to live and work in a harsh environment. No individual is better qualified to discuss these developments and to predict their future than Admiral Tyree, who commanded the Naval Support Force during the crucial years of transition from 1959 to 1962.

It is fitting that the Antarctic Society should honor this remarkable logistics organization and pay tribute to those of its members who have given their lives that science may flourish in Antarctica.

\* \* \* \* \*

Enclosed is an abstract of the talk delivered by Dr. Kenneth J. Bertrand at the 30 September 1964 meeting of the Society. The officers of the Society hope to be able from time to time to forward similar accounts of the organization's activities especially for the information of members unable to attend the meetings.

HENRY M. DATER  
Secretary-Historian

The Treasurer reminds those members who have not paid their dues that, according to the By-laws, they may be dropped from the rolls of the Society.

April 1, 1965

THE ANTARCTICAN SOCIETY  
NEWSLETTER NO. 2

In the "Notice to Members" announcing the meeting of March 10, 1965, it was indicated that the Officers and Board of Directors hoped from time to time to inform the membership of matters of interest. For the sake of recordkeeping, the opinion has been expressed that these occasional publications should be numbered. The abstract of Dr. Bertrand's talk is therefore designated as Newsletter No. 1, and this issue as Newsletter No. 2. The principal feature of the Newsletter will be texts or abstracts of talks given at the meetings of the Society, when they are susceptible to this type of treatment.

The second meeting of the season was held on November 12, 1964. At that time Dr. Meredith F. Burrill, Executive Secretary of the Board on Geographic Names, spoke on "Antarctic Geographic Names." A copy of Dr. Burrill's talk is attached as part of this Newsletter. The Society's second International Night took place on January 14, 1965. Captain Robert Graham, RN, gave an informal talk on his two years as commanding officer of HMS PROTECTOR. Unfortunately, Captain Graham's informative and witty remarks are not reproducible without the slides that accompanied them.

The Secretary also receives correspondence of interest to the members. Miss Joan Beckman, formerly of Washington, D. C., and now Science Editor of the University of Washington Press, writes that the Press is interested in manuscripts "on any scientific subject," providing that the manuscript presents a scholarly contribution to the subject concerned.

Mr. Tracey E. Simpson, Chairman of the Byrd Fellowship in New Zealand, forwarded to the Secretary an invitation to an anniversary service to be held at the Richard E. Byrd Memorial in Wellington on March 14, 1965. In an accompanying letter, Mr. Simpson requested the Secretary to inform members of the Antarctic Society that he and Mrs. Simpson will be delighted to entertain any of them who may visit Wellington.

## STANDARDIZING ANTARCTIC GEOGRAPHIC NAMES\*

Meredith F. Burrill  
Director, Office of Geography  
United States Department of the Interior

There seems to be something about Antarctica that brings out the man in men. Granted that sissies don't go there in the first place, and that in many who have gone there has been a lot of man to be brought out, the place does something to one.

Perhaps the continuous intimate contact over long periods, shared hardships and dangers, the mutual dependence for survival may lay bare a man's soul not only to his companions but also to himself. Perhaps in a situation reduced to elemental simplicity the choices that lead to maturity and greatness are part of daily living, or maybe Mother Nature's naked beauty, fearful power and seeming perversity do things to a man's spirit.

At the Geographic Congress in London last summer, Fuchs gave an evening lecture on man and machines in antarctic exploration, in which he said that the most indispensable ingredient of the total equipment still is absolute and transparent integrity.

This needed saying not only because sophisticated equipment and relative comfort invite us to discount mechanical failure and its results, but also because integrity is so significant in the making and working up of observations for new additions to our collective knowledge.

Speaking before the Special Libraries Association Geography and Map Division a few years ago I said that "The story of the geographic names of Antarctica is a story of people, men of imagination and courage. It is a story of faith that a task conceived in a knowledge of its elements and carefully planned could be carried through to a successful conclusion, a story of hard work over long periods." This applies not only to the intrepid explorers with whose heroics the public is familiar but also to the members of the committees and staffs who have done a monumental job on the names of Antarctica.

\*Paper read at a meeting of the Antarctic Society, November 12, 1964

The naming of antarctic features has been done by many people. The resolution of names and naming into some kind of order was for years the work of relatively few. In the more than two decades that BGN has had advisory committees on antarctic names only 8 men have served on them - Joerg, Saunders, Martin, Bertrand, Friis, Siple, Crary, and Dater, and only 9 professional staff people - Fielden, Lyle, Bertrand, Alberts, Blodgett, Lindegren, Taylor, Wilson, and Ashley. Further, of these two groups, Joerg, Saunders, Bertrand, and Alberts carried the brunt of the load in the first 13 years, with help from Martin at the beginning of that period and from Blodgett at the end.

It was principally through their efforts and their integrity that by the start of the IGY there was a reasonably orderly and unambiguous body of geographic names in Antarctica.

Out of the many interesting stories from that period I've picked a few that I think you'll find interesting and in point.

For the setting in which they occurred we need to review a little history.

In 1912 the then U.S. Geographic Board made decisions on eight antarctic names: Palmer Land, Palmer Archipelago, Wilkes Land, Termination Land, Knox Land, Cape Carr, Cape Hudson, Antarctic Continent. Subsequently it reaffirmed some of these, defended some, modified some, but for a generation paid little attention to the new names being given there. No other body was paying much attention either and by the late 1930's the names were in a fine mess. The chaotic state of the nomenclature came to light when the Hydrographic Office undertook to do a nautical chart and sailing directions for the Antarctic in connection with the U.S. Antarctic Service Expedition of 1939-41.

Bob English had charge of the chart and sailing directions, which are monuments to his ability and energy. On many of the name problems he consulted Col. Lawrence Martin at the Library of Congress and W.L.G. Joerg of the National Archives, and referred a draft of the chart to Joerg who was then also Chairman of the U.S. BGN which at that time was advisory to the Secretary of the Interior Ickes who had full and sole authority. Joerg had a bear by the tail. Many names on the chart were those of living persons who had put up the money or donated supplies for expeditions in the period when that was the way antarctic exploration was financed.

The BGN had, and still has, a long standing policy that natural features are not named for living persons. Ickes had had occasion to invoke the policy and was always one to apply policy without exception.

Joerg saw that many of the living persons' names in Antarctica were either bestowed by foreigners or were too much entrenched in usage to

change, but saw little likelihood of getting Ickes to except Antarctica from the policy.

Then came World War II and in 1943 "the reorganization and staffing of the BGN. After the most immediate projects were under way, attention was turned to the antarctic chart which was about to be released.

Joerg agreed that Ickes would have to be advised to make the needed exception, however repugnant this might be to him, and that antarctic name decisions would have to be based on systematically applied principles and on the fullest possible knowledge of the facts about the naming, however formidable a research task that might be. The Hydrographic Office didn't agree and in a few days brought out the chart with Ickes' name on some mountains and the President's on a sea. Ickes hit the ceiling and required that his name be deleted before the chart was released. The Hydrographic Office protested that the BGN had had a year to act on the proof, but did delete his name. BGN on its part undertook to process names as needed.

While this served to make Ickes aware of the broad problem, the policy exception was now judged to require really compelling arguments and a positive concrete policy that Ickes could see in toto.

A Special Committee on Antarctic Names was therefore named to work up a policy and test it against actual names. The members were Joerg, Martin and Capt. H. E. Saunders, a distinguished naval architect and classmate of Admiral Byrd's who had helped to work out positions and plane tracks from uncontrolled photos of the Byrd expeditions.

Almost immediately it developed that the President's name on the sea posed a problem - the Norwegians had earlier named the sea for Amundsen, and had published it on a map in a Norwegian language journal. Discussions with the Navy didn't bring agreement and the Navy took the matter to the President, who replied that Amundsen's name had priority and should be used, adding that for himself a smoking volcano would be more appropriate anyway.

While all this was in process, and before the President's reply was received, the Special Committee held its first meeting and took its first actions. Five names were recommended; Amundsen Sea headed the list, followed by four associated names including Mt, Walker, for the mountain Siple had named for his wife (Walker commanded the Flying Fish on the Wilkes Expedition) and Eights Peninsula for the feature Byrd had named Thurston Peninsula after a patron (Eights was the first American scientist in the Antarctic).

These names served to illustrate some general principles that the Committee considered important, and since some people would surely be unhappy the list would serve to show the Committee where it stood. The

names were promptly approved "by the Secretary and promulgated, and stuck until the Committee itself much later revised three of them. The Committee was in business. In due course a comprehensive policy was laid out matching categories of people with kinds of features, stating criteria of appropriateness, and indicating what would be done about language and form. This was discussed with several antarctic explorers and finally approved by Secretary Krug.

A letter from Saunders to me in January 1944 while we were investigating the Amundsen Sea matter contains this passage, "As I take it, our role in this matter is to clear away the cobwebs, get down to facts and fundamentals, and make a decision that is sound and can be respected as long as maps are made. I take it further that we are not necessarily bound by previous interpretation of whatever facts we may bring to light, but we are bound to be fair, just and considerate, as in all human dealings."

This was the Committee's approach as, over the next eight years, it went over in detail the records of antarctic exploration in various forms and languages, seeking the answers to "who named what, when, for whom, why, what was named and where is it?" The Committee needed that information itself to make decisions in accordance with policy and had faith that if the information were made available to all, the names would be accepted.

Assembling a working collection of literature and maps was one of the first staff jobs, worked on by Betty Fielden Rothrock in 1944, then Florence Lyle, then Ken Bertrand after he took over the staff work prior to going to Catholic University in September 1946. It is not easy now to picture how scanty, how fragmentary, the information was. The continent still had great blank parts and great stretches of pecked coastline, and the reliability of map positions was not always high. The Committee wanted to do something about American names in areas of their activity, and did, but repeatedly had difficulty because American expeditions had generally not made maps on their return.

An extraordinary amount of work had to go into the identification and approximate positioning of features named. In the case of the Wilkes Land coast and the Pensacola Mountains the Committee and staff actually did the first delineation of features and relative positions.

The Wilkes job was done with ONR support, by Gardner Blodgett under Captain Saunders' tutelage and eye. Some 800 miles of coastline and coastal features were drawn in from aerial photos by simple methods developed by Captain Saunders in treating the Byrd pictures some years before. Since control points had been established only at the ends and in the middle the pictures were not suited to precise trimetrogon treatment, but the nature, relationship and location of features could be established well enough to put on them names that had been given originally by Wilkes, or names derived from his expedition and operations Windmill and Highjump. The delineation also proved to be of great

value in IGY planning, for it showed up the few places where access to the land was possible. The ONE used this in later appropriations hearings as a shining example of payoff from basic research. Foreign countries asked for and got it. The map makers used it until later work superseded it.

The Pensacola job was done from the photos made on the Hawkes flight from McMurdo to the Weddell Sea and back. It was pushed to completion to give to Fuchs before his walkover that we thought would cross them. The features were shown in essentially correct relation to one another, but the whole assemblage had to be moved westward about 40 miles when ground fixes later showed the dead reckoning calculations to be off by that much.

Over the years some real puzzles have come up. Some may never be solved. Among those that we did work out was Stefansson Strait, a name given by Wilkins in 1928. On his December 20 flight along the east side of the Antarctic Peninsula he saw some straits that cut through the peninsula. The most southerly one he named Stefansson Strait and the land to the south of it Hearst Land. The news of his discovery created quite a stir, for it bore on whether early sightings of the peninsula were sightings of the continent. The Geographical Review published the story, with some of his photographs and a map made from the photographs and his notes. The concept of transverse straits was generally held for a decade thereafter. However, Ellsworth failed to find it from the air in November 1935 and the British Graham Land Expedition of 1934-37 confirmed by mid 1935 that there was not even one transverse strait! Several had tried to unravel this one. Joerg, while at the American Geographical Society, had identified some features on both the Wilkins and Ellsworth photographs but was still baffled. The British Graham Land Expedition surveyor Alfred Stephenson had a go at the puzzle in 1939; with assistance from A. R. Hinks, Secretary of the Royal Geographical Society, managing to match some features in the most northerly of that expedition's photographs with some in Wilkins' most southerly. Still no strait.

Among the large number of aerial photographs brought back by the U.S. Antarctic Service Expedition of 1939-41 was one that showed a low dome-shaped island to which no particular importance was attached then but which later proved to be the key to the mystery. Not immediately, however, because the war intervened and those pictures went into the files.

The Special Committee had been at its task for about two years when it went systematically at the names on the east side of the Antarctic Peninsula, which we then called Palmer Peninsula, reviewing all the previous investigations in this area with the Antarctic Service pictures in hand. Things didn't match up properly.

In one of several conferences with Wilkins he mentioned that in the Geo-

graphical Review article about his trip the pictures had been cropped, and that the negatives of some showed the airplane wing. These could be identified as taken on the outgoing or return leg of the flight, but the negatives had been cut apart, and so neatly that the order in which they were taken could not be established.

However, Wilkins cleared up several points with the Committee and the overlapping 1939-41 photographs made it possible to proceed slowly from one known point to another. Finally, a low ice-covered point in a panorama in the Sailing Directions was correlated with a sketch made from Wilkins' pictures by Briesemeister to accompany Joerg's 1937 Geographical Review article on Ellsworth's flight. The panorama showed a long strait to the left (east) of this point, between it and the low-domed island. Wilkins' description tallied item by item. Stefansson Strait is practically where Wilkins said it was, but it runs north-south instead of east-west and what appeared from Wilkins' low altitude to be a large piece of land loses apparent height and size in subsequent pictures from higher altitudes.

The activity of the Special Committee, and the Advisory Committee on Antarctic Names (ACAN) that succeeded it after the Board was given statutory authority in 1947, helped stir up things in other countries. If we couldn't find satisfactory answers in the records, we commonly wrote to people abroad who were involved in the naming in question or might know of information we had missed, so many were aware of the activity even before the appearance of BGN Special Publication 86, The Geographical Names of Antarctica, in 1947.

The Antarctic Place-names Committee had been organized in Britain in 1939 and reactivated in 1943 but had not attempted systematic coverage of its area of concern--the sector they called the Falkland Islands Dependencies. That Committee began in 1948 to produce mimeographed "APC Papers" setting forth for names that were to be proposed the same sort of information that ACAN assembled. It was agreed between the two bodies that informal exchange of such information prior to formal action in either country would usually lead both groups to the same conclusion, and would reduce changes in decisions once made. It worked out that way. Over the years agreement has been reached on literally thousands of names.

In a few cases the process took some years. Emotional involvement delayed for several years agreement on Ross Ice Shelf in place of Ross Barrier or Ross Shelf Ice, but it finally came quietly. The Palmer Peninsula/Graham Land difference was considered for nearly a decade to be beyond settling. Then a proposal was put forward based on the fact that the northern and southern halves of the peninsula are quite different. Neither the original proposal nor various counterproposals were accepted but the question was kept open and talked about from time to time. Just lately it was settled on the basis of Antarctic Peninsula, the northern half of which is Graham Land, the southern Palmer Land.

There have been numerous contacts with explorers and official bodies in other countries too, rather more with New Zealand, Australia and France than some others, but some at least with almost every country involved. We like to think that agreement on the Antarctic Treaty was the easier because of the high degree of agreement and cooperation that had already been worked out in antarctic geographic names.

The IGY marked a change in many things - kinds of exploration, kinds of name problems, the function of ACAN and its composition. The literature on antarctic exploration in the heroic period was mostly about getting down there, discovering gross features of the landscape, battling nature and getting back. Scientific observation played an increasing part over the years, but the subordination of survival to systematic detailed scientific investigation really came with the IGY. Massive, efficient logistic support by the Navy and technically advanced equipment have increasingly freed the scientist for his mission. The literature now deals primarily with these matters. A large number of scientific and technical men have now been to Antarctica and have conducted investigations there. Many of them after their return, and others who never went there, have worked up observations and prepared reports. Exploration has taken on new dimensions.

So have naming and name standardizing. The accumulated confusion of two centuries has been essentially set straight. The problem now is more one of assimilating new names and applying new tests of appropriateness. More naming is being done, as detailed investigations require names for more features, and as greater mobility and better logistic support permit examination of larger or more areas in a given time. At the same time, ever since Operation Highjump, those who have visited Antarctica are so numerous that just having been there is not enough to get one's name on something. Selections must be made. New problems of categorizing people arise not only from differences in activities, but also from continuing or repeated participation in successive years with changing roles. Authors of reports are commonly content to leave the choice of names to ACAN, being concerned only with having handles for the features that they discuss, and having the handles in good time.

At this stage ACAN does more assigning of names to features and more evaluation of personal performance in varied lines.

The present members of ACAN, Bertrand, Friis, Crary and Dater, are eminently equipped to deal with problems of these kinds. They and the staff also supply in generous measure that essential ingredient referred to by Fuchs - absolute and transparent integrity. It is no less essential now than in what we might think of as the heroic period of name standardizing from which I drew my stories, for the trust that can be reposed in the product is still directly related to the integrity of the standardizers.

THE ANTARCTICAN SOCIETY

Notice to Members

The annual Business Meeting of the Antarctic Society will be held in the lecture hall of the National Academy of Sciences at 8:00 p.m. on April 22, 1965. The Business Meeting will hear reports from the officers of the Society, elect officers and four members of the Board of Directors, and discuss such other matters as may be appropriate.

The Board of Directors has approved incorporation of the Society. A committee of the Board, with legal assistance, is currently engaged in drawing up the articles of incorporation and new bylaws. They will be referred to the membership for discussion and approval as soon as completed.

Following the Business Meeting, there will be a program presenting the highlights of the 1964-65 season in Antarctica. Rear Admiral James R. Reedy, USN, will discuss operations, and Dr. Thomas O. Jones will cover scientific developments. After the program, refreshments will be served in the Reading Room.

HENRY M. DATER  
Secretary-Historian

THE ANTARCTICAN SOCIETY

Notice to Members

The Board of Directors has called a special meeting of the membership to consider the incorporation of the Society and the resulting changes in the By-laws. The meeting will be held at 8 p.m. on 25 May 1965 at the National Academy of Sciences, 2101 Constitution Ave., N.W. Copies of the proposed Articles of Incorporation and By-laws are enclosed.

Following the special meeting there will be a program of unusual interest. Major Francois Bastin of the Royal Belgian Air Force and formerly leader at Roi Baudouin Base will show and narrate a film on Belgian activities in the Antarctic during 1959-60. There will also be a display of paintings and photographs by the United States Navy on Operation Deep Freeze. The customary social hour will be held after the talk, and members will have an opportunity to meet Major and Mrs. Bastin.

The Board of Directors is also happy to announce that the Smithsonian Institution has made available the Belmont Estate at Elkridge, Maryland, for the Annual Garden Party to be held on 5 June 1965. Recently acquired by the Smithsonian, Belmont was formerly the residence of the Honorable David K. E. Bruce, currently Ambassador to the Court of Saint James. The original manor house was built in 1738 by Caleb Dorsey, an ironmaster, and has been in the family of Mrs. Bruce since its foundation. Members are urged to bring families and guests to see this historic estate. For the party, which will begin at 5 p.m., picnic clothes are proper attire. As usual, suitable food and refreshments will be served. The Elephants Foot will be on hand to receive contributions of \$3.00 per person.

A map showing how to reach Belmont is enclosed. The following instructions are suggested for use with the map. At the intersection of Route 1 and Montgomery Road, the landmark is the new brick building of the Elkridge National Bank (on the left going north). Turn left (west) at the bank building, following Montgomery Road 0.8 mile to a single-lane concrete road which will be marked by a "Belmont" sign. Turn right and follow Belmont signs 1.0 mile to Belmont. Follow parking signs to parking field.

So that the Committee on Arrangements may plan accurately, it is requested that those planning to attend call or write before 5 p.m. on 3 June indicating the number in their party.

Phone: DU2-1795 (Gov't code 128 ext. 21795)

Write: Dr. H. M. Dater  
c/o U.S. Antarctic Projects Office  
801 19th Street, N.W.  
Washington, D.C. 20305

Historian

# THE ANTARCTICAN SOCIETY

## ANNUAL GARDEN PARTY

Through the generosity of the Secretary of the Smithsonian Institution, the historic Belmont Estate at Elkridge, Maryland, has been made available for the Annual Garden Party on June 4. Belmont was formerly the residence of the Honorable David K. E. Bruce, currently Ambassador to the Court of Saint James. The Original manor house was built in 1738 by Caleb Dorsey, an ironmaster, and remained in his family until it was acquired a few years ago by the Smithsonian. Members are urged to bring families and guests to see this historic estate and to join in the festivities.

For the party, which will begin at 5 p. m., picnic clothes are suitable attire. To cover the cost of refreshments, the Elephant's Foot will be on hand to receive contributions of \$4.00 for each adult and \$2.00 for each child.

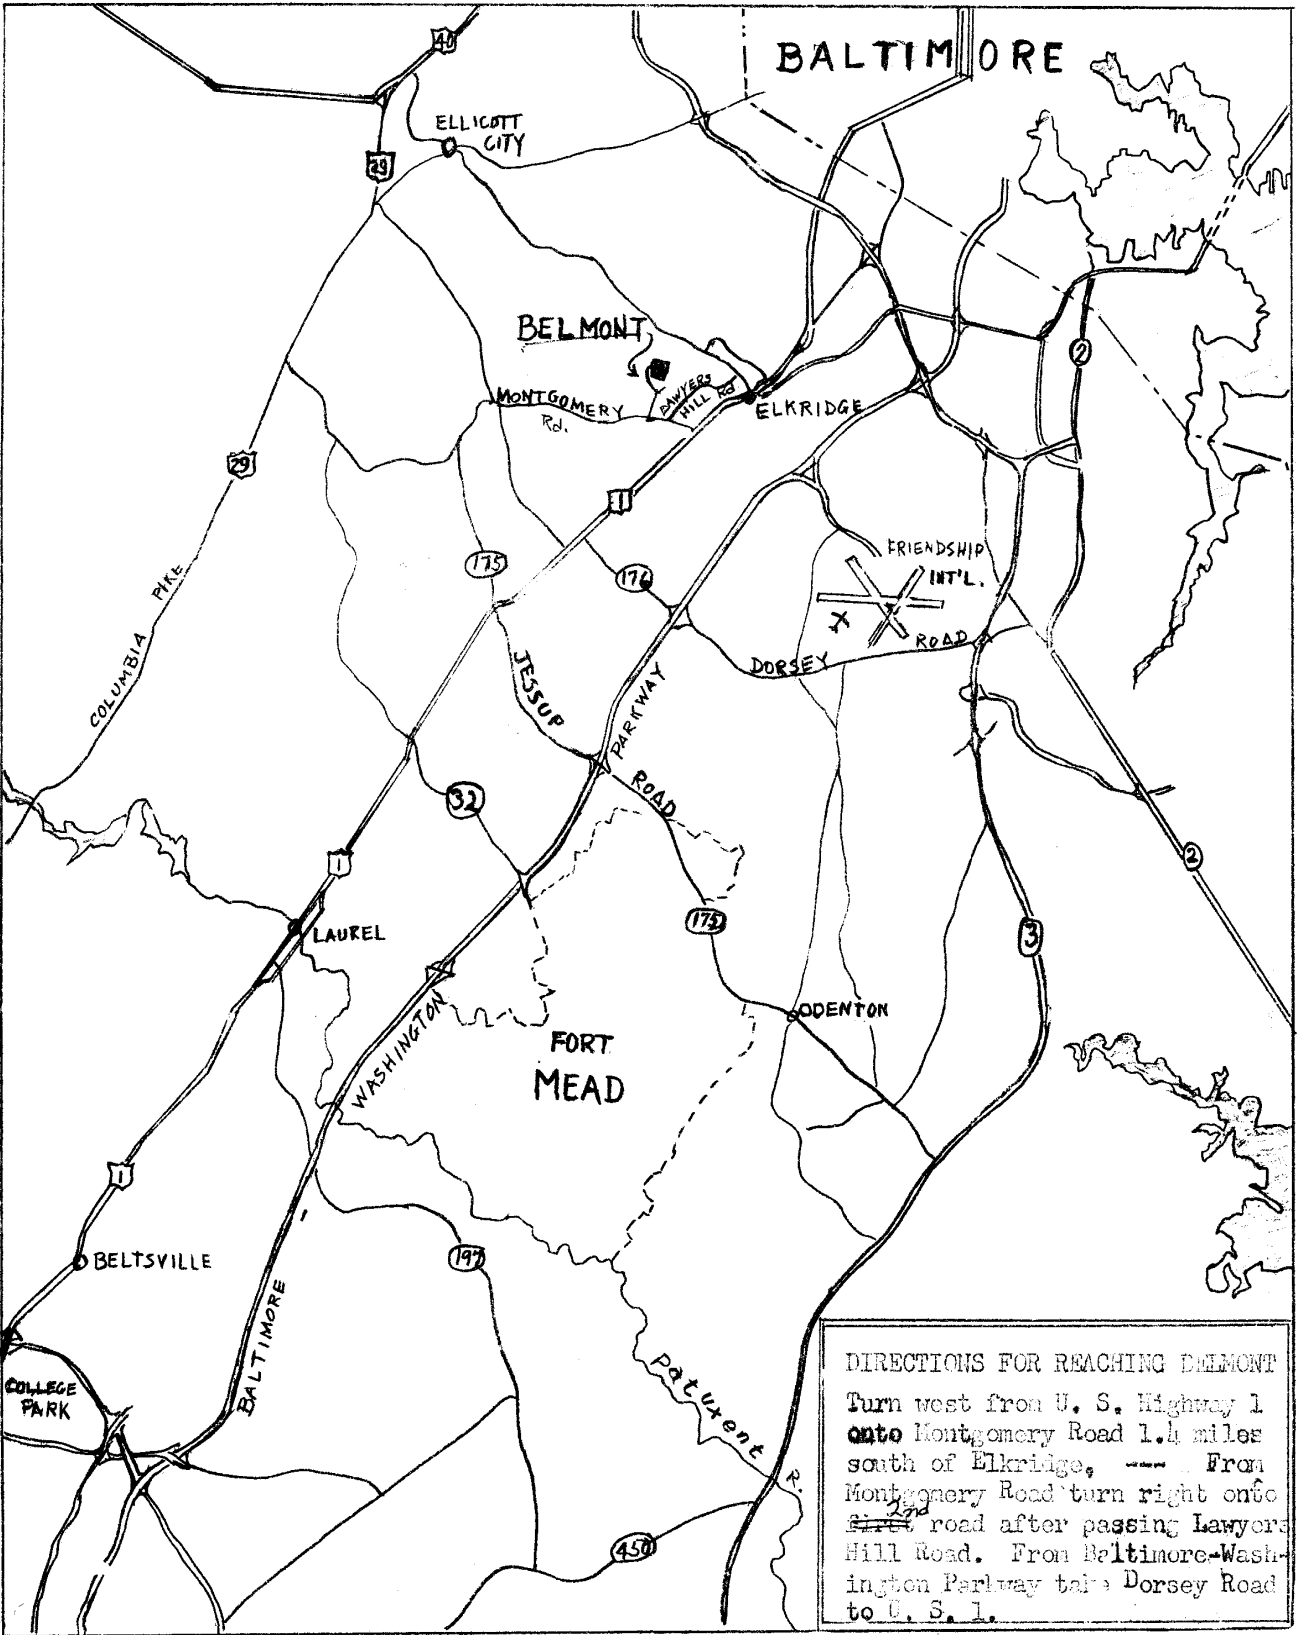

A map showing how to reach Belmont is enclosed. The following instructions are suggested for use with the map. At the intersection of Route 1 and Montgomery Road, the landmark is the new brick building of the Elkridge National Bank (on the left going north). Turn left (west) at the bank building, following Montgomery Road 0.8 mile to a single-lane concrete road which will be marked by a "Belmont" sign. Turn right and follow Belmont signs 1.0 mile to Belmont. Follow parking signs to parking field.

So that the Committee on Arrangements may plan accurately, it is requested that those planning to attend call or write before 5 p. m. on 2 June indicating the number in their party,

Phone: 967-8043 (Gov't Code 173 ext. 8043)

Write: Mr. George A. Doumani  
Science and Technology Division  
The Library of Congress  
Washington, D. C. 20540

George A. Doumani  
Secretary-Historian

**DIRECTIONS FOR REACHING BELMONT**  
 Turn west from U. S. Highway 1 onto Montgomery Road 1.4 miles south of Elkrige, --- From Montgomery Road turn right onto ~~first~~ <sup>2nd</sup> road after passing Lawyers Hill Road. From Baltimore-Washington Parkway take Dorsey Road to U. S. 1.

## THE ANTARCTICAN SOCIETY

### Notice to Members

The Antarctic Society is pleased to announce the first meeting of the 1965-1966 season to be held at 8 p.m. on the evening of September 28 in the lecture hall of the National Academy of Sciences, 2101 Constitution Ave., N.W. The occasion will constitute the Society's annual International Night at which one of the nations active in the Antarctic is honored and its activities explained.

This year the Society is honored to have as speaker the distinguished director of the Argentine Antarctic Institute, Rear Admiral Rodolfo N. Panzarini. In addition to an outstanding naval career, Admiral Panzarini, an oceanographer, is one of his country's leading scientists. His accomplishments have been recognized by the Scientific Committee of Antarctic Research of which he is currently Vice President.

His Excellency Norberto M. Barrenechea, Ambassador from Argentina, and members of his staff hope to attend. It is hoped that all members will wish to be present with their families and guests to honor our Argentine friends. The meeting will be open to the public, and members are urged to bring it to the attention of colleagues and other persons who may be interested. At the conclusion of the program, the usual social hour will be held in the Academy's Great Hall with light refreshments available.

This notice also calls to the attention of members that annual dues of \$2.00 are payable by October 1. Checks should be made payable to The Antarctic Society and mailed to:

Mr. Fred G. Alberts  
Office of Geography  
Department of the Interior  
Washington, D.C. 20240

The mailing of your check provides an excellent opportunity to include a notice of a change-of-address, if such has taken place in the past few months.

HENRY M. DATER  
Secretary-Historian

## THE ANTARCTICAN SOCIETY

### Notice to Members

The second regular meeting of the Antarctic Society for the current season will be held at the National Academy of Sciences, 2101 Constitution Ave., N. W., on the evening of 23 November 1965 at 8 p.m. The speaker will be Captain Prank H. Radspinner, USA, who will talk on "Army Helicopter Operations in Antarctica." Captain Radspinner was the Officer in Charge of the Army Helicopter Unit which operated in Antarctica during DEEP FREEZE 63.

The turbo-propellered helicopters with which this unit has been equipped have proved to be extremely versatile. They can operate on the high polar plateau and have landed at elevations up to 13,000 feet. Originally introduced into Antarctica to assist in topographic surveys, they have subsequently supported other\*scientific field investigations. The best measure of their significance is the remark of a geologist that, with the aid of these helicopters, his party accomplished in three months what would have taken as many years with any other form of support. On 4 February 1963, Captain Radspinner led his group to the South Pole, the first helicopters ever to land there,

After the meeting there will be a social hour in the Great Hall of the National Academy of Sciences. The meeting is open to the public without charge, and members are urged to bring guests, especially prospective members.

It is a pleasure to bring to the attention of members of the Society that an Antarctic Society Scarf will soon be available. The design by the noted Italian fashion designer Emilio Pucci has been seen and approved by a Committee of the Board of Directors, or what is more, significant by their wives. Through the generosity of Mr. Pucci, who has donated his services and also foregone his customary profit, the cost to members will be modest for such a distinguished product of high Italian fashion. It is hoped to have a sample at the meeting and that the Scarf will be ready in time for Christmas.

8 November 1965

HENRY M. DATER  
Secretary-Historian

# THE ANTARCTICAN SOCIETY

WASHINGTON, D. C.

The third meeting of The Antarctic Society for the current season will take place on 18 January at the National Academy of Sciences, 2101 Constitution Ave., N. W., at 8 p. m. Dr. Richard L. Penney, of Johns Hopkins University will present a talk on "Penguin Navigation. "

Dr. Penney began his studies of penguin behavior at Wilkes Station in 1959. He discovered at that time the remarkable ability of the penguin to navigate by use of the sun. He interested Dr. John T. Emlen, then his major professor, in the subject, and the two men returned to Antarctica for the 1962-63 and 1964-65 seasons. They carried out thorough studies on this aspect of penguin behavior. Dr. Penney will illustrate his talk with both colored slides and motion pictures.

After the talk, there will be a social hour with light refreshments. This will afford members and guests an opportunity to meet Dr. Penney and to discuss matters of common interest.

It is to be expected that a large number of the ladies present will wear their Antarctic Society scarves. Members who have not availed themselves of the opportunity to obtain one of these beautiful and distinctive pieces of apparel may still do so. Orders accompanied by \$10.00 for each scarf should be sent to Mr. Fred G. Alberts, Office of Geography, Department of the Interior, Washington, D. C. 20240.

HENRY M. DATER  
Secretary - Historian

# THE ANTARCTICAN SOCIETY

WASHINGTON, D. C.

## NOTICE TO MEMBERS

### ANNUAL MEETING

The Annual Meeting of The Antarctic Society will be held on 12 May 1966 at 8 p.m. in the Lecture Hall of the National Academy of Sciences, 2101 Constitution Avenue N.W., Washington, D.C. The principal business will be the election of officers for the coming year and the choice of four persons to serve three-year terms as Directors. Nominations will be invited from the floor, and members are urged to bring other matters of general concern to the attention of the meeting! Reports on activities of the past year will also be presented.

At the conclusion of the business meeting Rear Admiral Fred E. Bakutis, USN, Commander U.S. Naval Support Force, Antarctica, will give a brief talk on the operational highlights of Operation DEEP FREEZE 66, and Dr. Thomas O. Jones, Director, Environmental Sciences Division, National Science Foundation, will review the scientific accomplishments of the year. Following the talks, refreshments will be served in the Great Hall of the Academy.

Members are urged to reserve 4 June 1966 for the Annual Garden Party which, through the courtesy of the Secretary of the Smithsonian Institution, will again be held at the historic Belmont Estate in Elkridge, Maryland. Further details will be forwarded as soon as available.

The response of members in purchasing the scarves especially designed for The Antarctic Society by Emilio Pucci has been gratifying. A number, however, remain, and members are urged to make their purchases while there is still a choice of several color combinations. The scarves will be on display at the meeting\*

HENRY M. DATER  
Secretary-Historian

## THE ANTARCTICAN SOCIETY

WASHINGTON, D.C.

### INTERNATIONAL ANTARCTIC DAY

October 11, 1966

Antarctica is unique among continents. There, twelve nations have learned to cooperate and devote their energies to peaceful purposes. In a troubled world, it is an example of how men of differing races, religions, and philosophies can work together for the common good.

Science, which has often contributed to the instruments of destruction, has in Antarctica lighted the road to understanding and peace. The Scientific Committee on Antarctic Research (SCAR) has requested its constituent national academies to set aside a day during October to celebrate ten years of international scientific cooperation. The Committee on Polar Research of the National Academy of Sciences has selected October 11 as International Antarctic Day for the United States. The Committee further requested the Antarctic Society to arrange appropriate ceremonies.

The fruitful cooperation among scientists during the International Geophysical Year (1957-58) was a potent factor behind the Antarctic Treaty of 1959. The Antarctic Society is happy to announce that on October 11, 1966, The Honorable Paul C. Daniels, will address the members, guests, and friends of the Society on the topic - DOES SCIENCE CONTRIBUTE TO WORLD PEACE?

Ambassador Daniels has had a distinguished career in the Foreign Service. He is the founder and Honorary President of The Antarctic Society and the principal negotiator of the Antarctic Treaty.

The meeting of the Society to commemorate International Antarctic Day will be held on Tuesday, October 11, 1966, at 8 p.m. in the auditorium of the Museum of Natural History, Constitution Avenue at 10th Street, N. W. It is desired that other organizations interested in exploration, science, and international affairs participate in the celebration. Members are urged to bring International Antarctic Day to the attention of organizations to which they belong. The meeting is open to the public.

GEORGE A. DOUMANI  
Secretary - Historian

THE ANTARCTICAN SOCIETY

will hold a meeting on

NOVEMBER 15, 1966 AT 8 P.M.

at the

NATIONAL ACADEMY OF SCIENCES  
2101 Constitution Avenue, NW

REAR ADMIRAL RICHARD B. BLACK, USNR (Ret.)

will speak and show a film

ANTARCTICA REVISITED

The U.S. Antarctic Service Expedition, headed by Rear Admiral Richard E. Byrd, was one of the most significant scientific expeditions ever launched to Antarctica. Two bases were established: East Base on Stonington Island off the Antarctic Peninsula with Mr. Richard B. Black (now Admiral) as leader, and West Base near previous Little America sites under the leadership of Dr. Paul A. Siple. Plans called for the stations to be manned permanently with relief and resupply annually. The threat of war forced withdrawal after the first year with subsequent scattering of the participants around the globe in WW II.

Admiral Black, one of the expedition's organizers, will show his unusual film to which he has added material on his Antarctic activities from Byrd Expedition II, 1933-35 through DEEP FREEZE II, 1957-58.

Refreshments will be served in the Great Hall after the meeting.

GEORGE A. DOUMANI  
Secretary-Historian

THE ANTARCTICAN SOCIETY

November 14, 1966

Dear Member:

The Board of Directors of the Antarctic Society has decided to establish a list of members who would be willing to give lectures to various groups on particular topics pertaining to the Antarctic. Probably more than one list will be compiled, each being tailored to a particular area in the United States and to a particular kind of organization or group.

The lists will be available on request, and it is likely that they will be sent to persons whom the Board of Directors feels should be informed of the availability of lecturers from the society. The lists will include instructions for interested groups to contact prospective speakers directly. It is the intention of the Board of Directors that all arrangements for a particular lecture, including payment of stipends and expenses, should be made by the interested group with the speaker.

If you are interested in lecturing on the Antarctic, please complete the enclosed form and return it to the chairman of the Education Committee of the Society.

Sincerely,

Kenneth J. Bertrand, Chairman,  
Education Committee.

Kenneth J. Bertrand  
Department of Geography  
The Catholic University of America  
Washington, D.C. 20017

List days of the week when you are not available: \_\_\_\_\_

List, the number of times a year you are willing to give a talk: \_\_\_\_\_

The first meeting of the 1966-1967 season was held in the auditorium of the Museum of Natural History, Smithsonian Institution, Washington, B.C., on the evening of October 11, 1966. The occasion was International Antarctic Day, proclaimed by the Scientific Committee on Antarctic Research, a Committee of the International Council of Scientific Unions, The Committee on Polar Research of the National Academy of Sciences requested the Antarctic Society to organize appropriate activities in Washington to celebrate 10 years of international scientific cooperation in the Antarctic. For the occasion The Society's Program Committee asked the Honorable Paul C. Daniels, Honorary President of the Antarctic Society and principal negotiator of the Antarctic Treaty of 1959, to address the Society. The committee arranged for a week-long exhibit also at the Museum of Natural History.

Ambassador Daniels was introduced by Dr. Thomas O. Jones, Division Director, Environmental Sciences, and Head, Office of Antarctic Programs, National Science Foundation. The Ambassador spoke on the topic "Does Science Contribute to World Peace?" He pointed out that, while science has contributed to the technology of warfare, science itself has not been responsible for conflict among countries. Subjects of scientific investigation, such as weather, ocean currents, cosmic forces, and bacteria, are not confined within national boundaries. Their studies can best be carried on when scientists in all parts of the world participate in related investigations and exchange data freely. The pursuit of science creates an atmosphere conducive to international cooperation and hence world peace. The Antarctic Treaty has created scientific cooperation and exchange in one part of the earth, and combined it with man's great hope for world peace.

The exhibit was most successful and drew many interested spectators. The Society owes its thanks to Mr. Walter R. Seelig of the National Science Foundation and to Major Sidney J. Verlautz, USA, of the U.S. Naval Support Force, Antarctica, who set up the exhibit, and to Dr. William J.L. Sladen of The Johns Hopkins University and to the U.S. Geological Survey for most interesting contributions. Use of the auditorium and exhibit space was arranged by Mr. Robert W. Mason of the Smithsonian Institution.

The Society received a number of messages on the occasion of International Antarctic Day. Dr. Laurence M. Gould, President of the Scientific Committee on Antarctic Research and Chairman of the Committee on Polar Research, regretted being unable to attend and expressed his appreciation to the Society for arranging suitable activities. From New Zealand came a combined cable signed by Sir Walter Nash, Prime Minister when the Antarctic Treaty was negotiated; Dr. C.E. Fleming, President of the New Zealand Royal Society; Mr. Eric Gibbs, President of the New Zealand Antarctic Society; and Mr. R.W. Billet on behalf of the Richard E. Byrd Fellowship. Mr. Joseph J. Sisco, Assistant Secretary of State and Chairman of the Antarctic Policy Group, sent a message which said in part:

I know that the role of the Antarctic Society over the years has been an important and useful one. That remote continent, which is the scene of fruitful international cooperation, has become better known and understood through the efforts of the Society.

A second member of the Antarctic Policy Group, Dr. Leland J. Haworth, Director of the National Science Foundation, also expressed his appreciation of the work being done by the Antarctic Society. The Explorers Club, a fellow organization with strong Antarctic interests, congratulated us on the 10 years of fruitful scientific cooperation. Much appreciated was a message from Rear Admiral Fred E. Bakutis, USN, Commander, U.S. Naval Support Force, Antarctica:

My absence today is necessitated only by my required presence in Antarctica. The more I see of this great continent, the more strongly I am convinced that the future of Antarctica is as bright as her winter is dark. The participating nations here have charted a course toward international cooperation that proudly stands for the rest of the world to follow. I join with all Operation DEEP FREEZE personnel in sending sincere best wishes on International Antarctic Day.

Dr. Jones read a telegram to Ambassador Daniels from former President Dwight D. Eisenhower, during whose administration the Antarctic Treaty was negotiated. President Eisenhower stressed the importance of Ambassador Daniels' part in conceiving and carrying the Treaty through to ratification, and pointed out the Treaty's significance in the whole context of international relations.

At a meeting of the Board of Directors on September 8, 1966, it was proposed that a newsletter be established for circulation to members of the Society. On October 20, 1966, a committee was appointed to consider the form and content of the newsletter. The members of the committee are Dr. Henry M. Dater, Chairman; and Mr. Fred Alberts and Mrs. Virginia Taylor. In the meantime these notes are being published as matters of interest to the Society.

In addition to a newsletter, the Board of Directors has under active consideration other projects of interest to members who find it difficult to attend meetings. One is the establishment of affiliates wherever several members reside in reasonable proximity and can arrange to meet together. The legal aspects are now under investigation, including possible amendments to the by-laws. Another is the compilation of a list of speakers from among Society members who will be available to address clubs, schools, and other groups.

The Officers and Board of Directors invite all members of The Society to make suggestions on the contents of the proposed newsletter and other matters of common interest. Correspondence should be addressed to the Secretary-Historian:

Mr. George A. Doumani

THE ANTARCTICAN SOCIETY SCARF

Slightly over 100 of our specially designed, limited run, Emilio Pucci scarves are still available as Christmas gifts in the following color combinations:

\$10.00 Each	<u>MF NO</u>	<u>COLORS</u>
	5	Tan, Grey, Coral
	6	Blue, Purple, Mauve
	9	Shades of Fuchsia with Yellow
	11	Ocean Green, Blue, Turquoise

Mail your orders to Gerald Pagano, the Treasurer. Please indicate second and third choices since some of the color combinations remaining are limited. Make your checks payable to The Antarctic Society.

\* \* \* \* \*

The Antarctic Society is now incorporated in the District of Columbia as a Nonprofit Corporation. Full details will be sent to all members in the near future. In the interim, members are hereby informed that DUES for 1966-67 are deductible from Federal Income Taxes.

DUES (Two Dollars) ARE NOW PAYABLE FOR 1966-67 and may be given to the Treasurer after the meeting. If you cannot attend, make your check payable to The Antarctic Society and mail it to:

Gerald Pagano  
42 North Fenwick Street  
Arlington, Virginia 22201

THE ANTARCTICAN SOCIETY

Invites Members and Friends of Antarctica

to a Meeting on

TUESDAY

FEBRUARY 21, 1967 AT 8 P.M.

NATIONAL ACADEMY OF SCIENCES

2101 Constitution Avenue, NW

DR. SAMUEL C. SILVERSTEIN AND MR. CHARLES  
HOLLISTER will give an illustrated  
account of

THE AMERICAN ANTARCTIC MOUNTAINEERING EXPEDITION 1966-67

Sponsored by the American Alpine Club and the National Geographic Society, the expedition was coordinated by the National Science Foundation, fielded and supported by the U.S. Navy. Scientists will spend years analyzing the specimens and reducing the data returned from the first ascents of:

16,860-foot	VINSON MASSIF possibly the highest point in Antarctica
16,290-foot	MOUNT TYREE possibly the second highest point in Antarctica
15,000-foot plus	MOUNT SHINN MOUNT GARDNER
13,000-foot plus	MOUNT OSTENSO LONG GABIES

Dr. Samuel C. Silverstein, Rockefeller Institute: A.B., Dartmouth 1958; M.D., Albert Einstein College of Medicine 1963; Intern, University of Colorado Medical Center 1963-64. Fourteen years experience climbing mountains in U.S. and Canada, One of six Americans who in 1962 scaled North America's highest mountain, Mount McKinley, for the first time by way of the southeast spur.

Mr. Charles Hollister, Lamont Geological Observatory, Columbia University: B.S., Oregon State; Doctoral candidate in Marine Biology at Lamont. Nine years of mountain climbing experience in North America, Swiss and French Alps.

Refreshments will be served in the Great Hall after the meeting.

THE ANTARCTICAN SOCIETY

November 14, 1966

Dear Member:

The Board of Directors of the Antarctic Society has decided to establish a list of members who would be willing to give lectures to various groups on particular topics pertaining to the Antarctic. Probably more than one list will be compiled, each being tailored to a particular area in the United States and to a particular kind of organization or group.

The lists will be available on request, and it is likely that they will be sent to persons whom the Board of Directors feels should be informed of the availability of lecturers from the society. The lists will include instructions for interested groups to contact prospective speakers directly. It is the intention of the Board of Directors that all arrangements for a particular lecture, including payment of stipends and expenses, should be made by the interested group with the speaker.

If you are interested in lecturing on the Antarctic, please complete the enclosed form and return it to the chairman of the Education Committee of the Society.

Sincerely,

Kenneth J. Bertrand, Chairman,  
Education Committee.

Kenneth J. Bertrand  
Department of Geography  
The Catholic University of America  
Washington, D.C. 20017

ANTARCTICAN SOCIETY QUESTIONNAIRE REGARDING YOUR AVAILABILITY AS A PUBLIC LECTURER

ON SUBJECTS PERTAINING TO THE ANTARCTIC

Name: \_\_\_\_\_ Affiliation: \_\_\_\_\_

Street: \_\_\_\_\_

City: \_\_\_\_\_, State: \_\_\_\_\_ Zip Code: \_\_\_\_\_

Titles of lectures you are prepared to give;

1. \_\_\_\_\_ time: \_\_\_\_\_

2. \_\_\_\_\_ time: \_\_\_\_\_

Illustrations Check appropriate boxes.

35 mm Kodachrome slides ( ) 3 1/4" x 4" black and white slide ( ) time: \_\_\_\_\_

Moving picture film: 35 mm ( ) 16 mm ( ) sound ( ) silent ( )

color ( ) black and white ( ) time: \_\_\_\_\_

Remarks: \_\_\_\_\_

Maximum mileage you are willing to travel from above addresss

By automobile: \_\_\_\_\_ By airline: \_\_\_\_\_ By rail: \_\_\_\_\_ By bus \_\_\_\_\_

What stipend, if any, do you expect? \_\_\_\_\_ Does this apply in all circumstances?

Do you expect to be reimbursed for travel expenses? \_\_\_\_ . Is this in addition to the stipend? \_\_\_\_\_ Will you accept lodging in a private home? \_\_\_\_\_

Check whether or not you are willing to speak before the following;

	Yes	No		Yes	No
High school assemblies	( )	( )	Boy Scouts	( )	( )
High school classes	( )	( )	Church groups	( )	( )
College and university groups	( )	( )	Women's clubs	( )	( )
Men's clubs, e.g. Rotary	( )	( )			

Other: \_\_\_\_\_

Check whether or not you are willing to speak at the following hours:

	Yes	No		Yes	No
morning	( )	( )	dinner	( )	( )
luncheon	( )	( )	evening	( )	( )
afternoon	( )	( )	Remarks: _____		

List in order of preference the months during which you are available.

1. \_\_\_\_\_, 2. \_\_\_\_\_, 3. \_\_\_\_\_, 4. \_\_\_\_\_

List months when you are not available: \_\_\_\_\_

List days of the week which you prefer: 1. \_\_\_\_\_, 2. \_\_\_\_\_, 3. \_\_\_\_\_

List days of the week when you are not available: \_\_\_\_\_

List, the number of times a year you are willing to give a talk: \_\_\_\_\_

## DETAILS ON OUR NONPROFIT STATUS FROM THE SOCIETY'S LEGAL ADVISOR

On June 27, 1965, The Antarctican Society received a "determination letter" from the Internal Revenue Service concluding that the Society is exempt from Federal income tax as an organization described in Section 501 (c) (3) of the Internal Revenue Code. The exemption was granted on the basis of the Society's stated purposes as well as the understanding that the Society would continue to conform to the operations as described in the Internal Revenue Code. Any changes in operations, character or purposes must be reported to the Internal Revenue Service for consideration of their effect upon the exemption status.

Contributions made to the Society are deductible by donors as permitted in the Internal Revenue Code. In addition, bequests, legacies, devises, transfers or gifts to or for the Society's use are deductible for Federal Estate and Gift Tax purposes under the Code.

THE 15 NOVEMBER 1966 MEETING: Admiral Black presented his excellent film and speaking with intimate knowledge of both periods, took us from the era of geographic and scientific discovery supported by wooden ships and dog teams to the present post IGY period of detailed scientific followup made possible by sophisticated transport airlifting personnel and supplies to the continent and fielding scientific parties.

LECTURER QUESTIONNAIRE: The Board of Directors have expressed their appreciation to the Education Committee for preparing the enclosed questionnaire. Your return of a completed questionnaire will reassure the Board and the committee that members find this a worthwhile project.

## PUBLICATIONS OF INTEREST TO SOCIETY MEMBERS

THE ANTARCTIC JOURNAL OF THE UNITED STATES. Bimonthly prepared jointly by the Office of Antarctic Programs of the National Science Foundation and U.S. Naval Support Force, Antarctica, Department of Defense. Supersedes the Bulletin of The U.S. Antarctic Projects Officer (which contained articles pertinent to the logistic support community) and the Antarctic Report of the National Science Foundation (which was designed to keep interested organizations abreast of scientific developments). The Antarctic Journal retains major features of the predecessor publications, including scientific and logistic reports on the U.S. Program, accounts of collaborative activities, authoritative discussions of Antarctic matters, a chronology of program events, and other matters of current or historical interest. Submit requests to: Information Officer, Office of Antarctic Programs, National Science Foundation, Washington, D.C. 20550.

THE POLAR RECORD. Published in January, May, and September. Scholarly Journal of the Scott Polar Research Institute, Lensfield Road, Cambridge, England. International in scope and includes all SCAR Bulletins. Five Dollars a year from the Institute.

POLAR TIMES, Twice a year. One Dollar a year from August Howard, Secretary, American Polar Society, 98-20 62nd Drive (Apt ?H), Rego Park 74, New York

ANTARCTIC. Quarterly. News Bulletin of the New Zealand Antarctic Society. Edited by L.B. Quartermain, M.A. Newsy, authentic, and international in coverage. Subscriptions at one pound, five shillings per year from the Secretary, New Zealand Antarctic Society, P.O. Box 2110, Wellington, N.Z.

Principal U.S. Negotiator of the Antarctic Treaty, and founder of the Ant-  
arctican Society, Ambassador Paul DANIELS had a firsthand look at the Antarctic in  
November as a guest of the National Science Foundation. We have not heard yet  
whether one of the namesake fertilized Penguin eggs turned out to be a Miss or  
a Mr.

Tom KELLY spends most of his spare time in the shack of W3AEC handling phone  
patches from U.S. Antarctic Stations.

Major Frank RADSPINNER, US Army, who commanded the Army unit that made the first  
flight by helicopter to South Pole Station, is now on duty with Headquarters, U.S. Army  
Materiel Command,

The Department of State awarded Paul A. SIPLE a Superior Honor Award. "In  
recognition of superior service and exceptional dedication to duty as Scientific  
Attache in Canberra, Australia, from July 1963 to September 1966. Through energetic  
drive and imagination, the areas of association and relationships between U.S. and  
Australian scientists have been strengthened gaining new friends for the United States  
and contributing to the advancement of U.S. foreign policy objectives." Recovering from  
a long painful illness, Paul has rejoined the Army's Chief of Research & Development  
and has been able to be at his office several hours a day.

USARP scientists and DEEP FREEZE friends will note with interest that William E.  
LONG, geologist from Alaska Methodist University, had the unusual privilege as a member  
of the American Antarctic Mountaineering Expedition climbing LONG GABLES which were  
named for Bill and his brother Jack.

Dr. Victor SHEFFER, State Department Treaty Inspector during DEEP FREEZE 64, is  
now with the Biological Lab - Mammal, Department of the Interior at the Naval Air  
Station, Seattle, Washington,

Veteran VX-6 pilot CDR Donald L. ANGIER, USN, is now on duty with the Bureau of  
Naval Personnel,

FORMER STAFF MEMBERS, U.S. NAVAL SUPPORT FORCE, ANTARCTICA - CDR S.V. WRIGHT, USN  
relieved CDR J.S. HAHN, USN as Staff Public Affairs Officer, Carrier Division FIVE, CTF  
77 in Vietnam, Jim Hahn is now on duty at the Naval Air Station, Alameda, California.  
CAPTAINS M.W. NICHOLSON and M. HERMANSON, USN (Ret) are with the Boeing Company in the  
Seattle, Washington area. CDR J.R. MORGAN, USN did a paper The Effect of  
Oceanographic Knowledge on Naval Operations, for the March 1966 issue of DATA magazine,

CDR R.K. MCGREGOR, USN, former Officer-in-Charge, U.S. Antarctic Support  
Activities completed his tour of duty with the Office of the Chief of Naval Operat-  
ions and is now with the Office of Naval Research,

LT F. MYERS is taking graduate work in Geography at Catholic University,

George DOUMANI, formerly head of the Cold Regions Section at the Library of  
Congress, has joined the staff of the Library's Science Policy Research Division,  
Although this appointment relieves him from direct Antarctic work, George will continue  
his professional interest in the area,

DUES

DUES

DUES

Dues for 1966-67 (Oct. 1, 1966 - Aug. 31, 1967) - TWO DOLLARS, If you have paid  
them, do not neglect to list them as a deduction on your Federal Income Tax  
Return. The Society's Treasurer will appreciate receiving checks from members  
who have overlooked payment of their 66-67 dues.

LOCAL AFFILIATES - Ways and means are still being explored to have affiliates without in any way jeopardizing the Society's Tax Exempt status.

MEMBERSHIP IN THE ANTARCTICAN SOCIETY - Open to all persons interested in Antarctica.

HOW TO JOIN - Send a short note to the Membership Secretary, 42 North Fenwick St., Arlington, Virginia, 22201. State that you would like to become a member of the Society which has as one of its purposes, the friendly and informal exchange of information and views on Antarctica. A check for three dollars takes care of the one dollar initiation fee and two dollar annual dues (Federal Income Tax deductible).

A CALL FOR CORRESPONDENTS (Unpaid) - All members are encouraged to forward news items to the Membership Secretary.

To unite in a common organization persons interested in Antarctica

T H E   A N T A R C T I C A N   S O C I E T Y

WASHINGTON, D.C.

Will hold an open meeting at 8 P.M

TUESDAY, MARCH 21, 1967

at the

NATIONAL ACADEMY OF SCIENCES  
2101 Constitution Avenue, NW

Members, their families, and all persons  
interested in Antarctica are invited.

HARRY S. FRANCIS, JR.

will give an illustrated account of

THE JAPANESE ANTARCTIC RESEARCH EXPEDITION VII, 1965-1966

Mr, Francis, U.S. Antarctic Research Program Representative to JARE VII, accompanied the expedition aboard the newly constructed Japanese Icebreaker FUJI. The Japanese station SHOWA (69°00'28"S. 39° 35'24"E.) which had been closed since February 8, 1962, was reopened, new facilities were constructed, and the eighteen man wintering over party adequately supported to carry on the Japanese Antarctic Research Program\*

Mr. Francis is the Program Director for International Cooperation and Information, Office of Antarctic Programs, National Science Foundation. He wintered over as a member of the scientific party at LITTIE AMERICA station 1957-58.

The 1966-67 Memorial Lecture GEOLOGY IN ANTARCTICA will be given by Dr. J. Campbell Craddock at 8 P.M. on Tuesday, 11 April 1967 at the National Academy of Sciences.

Refreshments will be served after the meeting.

GEORGE A. DOUMANI  
Secretary

Science Policy Research Division  
Library of Congress  
Phone: 783-0400 Ext: 8460

THE FEBRUARY 21, 1967 MEETING

The meeting notices were late. The Smithsonian held a George Washington birthday party for the chiefs of the one hundred and seventeen Washington diplomatic missions. Commander Scott Carpenter delivered the annual Edwin A. Link lecture. In spite of the competition and late notice, Dr. Silverstein and Mr. Hollister made it a memorable evening for over one hundred members and friends of the Society with their illustrated account of The American Antarctic Mountaineering Expedition 1966-67.

Members in the Washington area that missed this meeting should make an effort to obtain tickets for the National Geographic lecture on the expedition to be given on 31 March 1967.

All members are alerted to watch for the June issue of The National Geographic Magazine for the complete story.

VICE PRESIDENT PATER'S IMPRESSIONS ON REVISITING ANTARCTICA

To return to the Antarctic after several years absence is a rewarding experience. The land has not changed, but the manner of doing things has improved greatly. The ski-equipped Hercules has revolutionized logistics. Eight years ago, when I was last at McMurdo Station, no one went to the South Pole or Byrd Stations except on urgent business. Now there is a constant flow of persons back and forth. These same aircraft, of course, fly periodic cargo runs to all inland stations and are available to place scientists in the field just about anywhere they want to go. Actually, when I was in Antarctica between January 10 and 21, most of the season's cargo operations had been completed, and scientific parties were being returned from the field.

It is possible to visit either South Pole or Byrd for lunch. During my stay I managed both. With the possible exception of Hallett, which I did not visit, South Pole is the only station where one can still discern, even though there have been many modifications, the type of construction of the original IGY stations. The snow and ice, however, are moving in, and it appears only a matter of time before the station will have to be replaced. One solution to the snow and ice problem is the use of tunnels and undersnow structures, as in the Byrd reconstruction of 1962. Byrd is certainly a remarkable engineering feat, but to the nontechnical observer like myself, the task of keeping it up seems to require relatively large expenditures of effort.

Another novel experience "to me was a day spent in the dry valleys on the western side of McMurdo Sound. For sheer, stark beauty they are unsurpassed anywhere in the world. A visitor is tempted to play scientist "and collect geological specimens even if he is not very sure what he is picking up. Nowhere else does the desert quality of Antarctica seem quite so real. Other deserts I have seen all contain some vegetations cacti, mesquite, prickly pears. There is no visible life in the dry valleys, even though local investigators assured me there were micro-organisms in the soil.

The changes at McMurdo itself are impressive. No longer do ships moor out in the sound arid discharge their cargo on the fast ice to be hauled several miles to the station. This was a slow, time-consuming process. Today, the ships tie up to the Elliot Quay in Winter Quarters Bay, just below where Scott in 1902 erected his first hut. From there trucks haul the cargo over a graded road to the station. One of the great changes has been the substitution of wheeled for tracked vehicles. The variety of these vehicles is amazing. At Scott Base, the New Zealanders have a Volkswagen, and I had a ride in a Rambler station wagon. There are Dodge Power

Wagons, tractor-trailers, and buses. To make efficient use of these vehicles has necessitated considerable road building.

Physically, McMurdo Station has expanded greatly since my previous visit. Much of the construction has been of warehousing so that most supplies can now be stored under cover. This permits better inventory control and greater efficiency and economy. With a new personnel building to house 250 individuals under construction, there is hope that many of the Jamesways and other temporary structures may soon be taken down.

Such a building would probably be impossible without the water and sewage systems. The distillation plant went into operation in late December using its own steam as a source of energy. While I was at McMurdo, steam from the nuclear power plant was first used to produce fresh water. Not all buildings receive "city water", but many do. While even now water is not abundant, it is certainly much more plentiful than in the past.

The nuclear reactor has also become a reliable source of power for the station. The initial difficulties in its operation have been overcome. As elsewhere in the world, adequate power is a necessity for orderly community life. It may be said of McMurdo that, while accommodations are not luxurious, they certainly are comfortable,

#### CHANGE OF COMMAND, U.S. NAVAL SUPPORT FORCE ANTARCTICA

In a ceremony held at McMurdo Station, on 25 February 1967, Rear Admiral James Lloyd Abbot, Jr., USN, relieved Rear Admiral Fred E. Bakutis, USN, as Commander, U.S. Naval Support Force Antarctica, and Commander Task Force FORTY THREE.

Rear Admiral Bakutis has reported for duty in his new billet as Commander Fleet Air Alameda, with headquarters at the U.S. Naval Station, Alameda, California.

#### BIOGRAPHICAL DATA ON RADM ABBOT

Born in Mobile, Alabama, on June 26, 1918, son of Captain J. Lloyd Abbot, USN, Retired and Mrs. (Helen Buck Taylor) Abbot. He attended Murphy High School, Mobile, Alabama and Spring Hill College, also in Mobile, for one year, prior to entering the U.S. Naval Academy, Annapolis, Maryland, on appointment from his native state in 1935. Graduated and commissioned Ensign on June 1, 1939; he subsequently advanced in rank to that of Rear Admiral.

Following graduation from the Naval Academy in 1939, he reported on board the USS ENTERPRISE (CV-6) and in September of that year transferred to the USS GUMER (DD-233). Detached from that destroyer in March 1941, he had flight training at the Naval Air Station, Pensacola, and Miami, Florida, and on August 18, 1941 was designated Naval Aviator. He next served as Officer in Charge of Students with the Advance Carrier Training Group, Pacific and in November 1942 joined Scouting Squadron 1-D14. In March 1943 he assumed command of Scouting Squadron SIXTY-SIX and for outstanding service while commanding that Squadron was awarded the Air Medal.

In March 1944 he joined the Staff of the Chief of Naval Air Training, with headquarters at the Naval Air Station, Pensacola, Florida, and while there had eighteen months as Engineering Training Officer and eleven months as Personnel Officer. He received a letter of commendation, with authorization to wear the Commendation Ribbon, from the Secretary of the Navy,

During the period August to November 1946 he had fighter refresher training

at the Naval Air Station, Miami, Florida, after which he commanded Fighter Squadron FORTY-WO. He reported in January 1949 as Head of Program Requirements in the Office of the Chief of Naval Operations, Navy Department, Washington, D.C., where he remained until January 1951, then assumed command of Utility Squadron FOUR. From August 1952 until February 1953 he was a student at the Armed Forces Staff College, Norfolk, Virginia, after which he served as Plans and Operations Officer on the Staff of the Chief of Naval Air Basic Training, with headquarters at the Naval Air Station, Pensacola.

In July 1955 he reported as Executive Officer of the USS LAKE CHAMPLAIN (CVAV39), which won the Air Force, Atlantic Fleet Battle Efficiency pennant for the fiscal year 1956, and in August 1956 joined the Staff of Commander Carrier Division TWO as Operations Officer. During the period August 1957 to August 1960 he was Executive Officer, Bancroft Hall at the U.S. Naval Academy, and in September assumed command of the USS VALCOUR (AVP-55). In May 1961 he became Commanding Officer of the USS INTREPID (CVA-11), which, under his command, won the Air Force, Atlantic Fleet Battle Efficiency Pennant for the fiscal year 1962. INTREPID was the recovery ship for Astronaut Scott Carpenter after his 3-orbit flight in May 1962.

In July 1963 he reported for instruction at the National War College, Washington, D.C., and in August 1964 became Director for Mid-Range Studies, Office of the Chief of Naval Operations, Navy Department. He was Director of Naval Warfare Analyses in that office from August 1960 until ordered detached in December 1966 for his present duty.

In addition to the Air Medal and the Commendation Ribbon, Admiral Abbot has the American Defense Service Medal; American Campaign Medal; Asiatic-Pacific Campaign Medal; World War II Victory Medal; and the National Defense Service Medal.

His "home town" address is 910 Government Street, Mobile, Alabama. He is married to the former Marjorie Grubbs of Norfolk, Virginia, and they have three children, Ensign James L. Abbot, III, USN (Naval Academy, Class of 1965), Ensign Charles S. Abbot, USN, (Naval Academy, Class of 1966) and Mary Neville Abbot.

Articles by Admiral Abbot have appeared in the Saturday Evening Post, Naval Institute Proceedings, and Shipmate Magazine.

Esquimalt, B.C.

10 November 1966

Dear----- :

I was very pleased to get the enquiry tagged on the end of your Antarctic Society Notes. I wish I had been able to come in to Washington on International Antarctic Day, but things were very difficult then. I had even to call off a hoped-for attendance at the NSF Skyline activities last fall. And I was certainly sorry to miss Admiral Black's talk.

One difficulty is that I have decided it is time to retire,

but Professor Jacobs, Director of the Institute of Earth Sciences (note how modest a title compared with the titles introducing planetary and space science) is not having an easy time finding my relief. I want to turn over to him a 'going concern' which seems to take up a great deal of time.

I realize I am not pulling my weight (which keeps increasing) in the Antarctic Society, but I will surely let you know in advance if the opportunity comes to visit ONR or NSF in Washington.

Sincerely yours,

C.S. Wright

1 March 1967

Dear----- :

No replacement yet except on the nearly invisible horizon one associates with "white out". I have, of course, no objection to anything you would like to put in the "Antarctic Society Notes". A pretty blameless life, and such that no one will ever want to "debunk" me.

This time I will have to hang on a bit after 31 March to keep the pot simmering until some one comes to stoke up the fire. This will complete for me 56 years engaged in Defense activities of the UK, US and Canada, Only 3 of our shore party are now above ground.

The lecture business you mention is I think a good line, especially for the High School and College lads, but I could not help in this, at least until I am properly retired.

Sincerely yours,

C.S. Wright

A BRIEF BIOGRAPHICAL NOTE ON SIR CHARLES FOR OUR YOUNGER MEMBERS

Honors: K.C.B., C.B., 6.B.E., M.C., Chevalier of the Legion of Honor.

Born in Toronto, Canada 1887.

of Totonto; Gonville and Calus Student, 1851 Exhibition Scholar).

Education: Upper Canada College & University College, Cambridge University (Wollaston

Research at Cavendish Laboratory 1908-1910. Physicist British Antarctic (Terra Nova) Expedition 1910-1913; served with distinction in World War I, as Officer Commanding Wireless, II Army; 1919-1929 Admiralty Department of Scientific Research and Experiment, Superintendent, Admiralty Research Laboratory 1929-34; Director of Scientific Research Admiralty, 1934-46; Chief of Royal Naval Scientific Service 1946-47. Immediately after retirement, called on to act as Scientific Advisor to the United Kingdom's Defense representatives in Washington. Retired in 1955 as Director of the Marine Physical Laboratory, Scripps Institution of Oceanography, San Diego, California. Since 1956 Director of Pacific Naval Laboratory.

Publications: Scores of scientific reports.

ON THE LIGHT SIDE

During several discussions, there was general agreement that the "NOTES" could also serve to record Antarctic happenings that for various reasons would not be acceptable for use in Official documents or Journals. We hope that you will enjoy the slightly edited version of this item.

DEEP FREEZE 62 MEMORANDUM

From: Commander D.

To: Commander B.

Subj: Airforce Weasels, pilfering of

1. Subject weasels amount to three in number. Each is a recently over-hauled piece of junk fresh from the tender care and mercy of Davisville Construction Equipment Department. Each arrived in Port Lyttleton in USNS ROBINSON and was intended for trans-shipment in USNS MIZAR to McMurdo. Each is much the same as it was when it left McMurdo for Davisville one year ago.
2. The USAF at the time it descended upon McMurdo had pressing need for convenience type transportation. The group was therefore, issued one snow-cat and one weasel. Air Force Representatives in Christchurch, in the course of the Sea-Drome Inspection at Pt. Lyttleton discovered the presumably rejuvenated weasels awaiting transport to McMurdo. Mis-led by the new and still shining coats of bright orange paint applied in Davisville, the representatives reported to their superiors the presence of this hidden cache of gold.
3. Meanwhile, back at McMurdo, the assigned SnoCat and weasel were experiencing the usual McMurdo epidemics of down-time and mismatched parts. It was therefore proposed, and duly disposed, that "the Air Force carry four of the Lyttleton weasels to McMurdo at no cost to the Navy. In return for this munificence the Air Force would turn in its beat up SnoCat and over-tired weasel and keep three of the newer machines. As a bonus, the Navy was to receive the fourth weasel free for its own purposes. After some considerable confusion over this complicated program of exchange, the Air Force brought in and were given possession of the three weasels contracted for; after even more confusion, since no contractual documents bearing valid signatures could be found, the Navy retrieved the SnoCat. The original weasel has not yet been turned in,
4. Also, meanwhile, back in McMurdo, the Navy was having its own equipment difficulties. A weasel assigned to Commander Task Force 43, one Rear Admiral D.M. Tyree, U.S. Navy, was discovered to have a peculiar ability to become balky whenever the Admiral was not present. It began to seem that the Machine was aware of its intended and prestigious purpose and refused to run whenever the closest members of the Admiral's staff were aboard it. In fact on four separate occasions the engine was induced to freeze up through an absence of oil. No blame should, of course, be attached to the operators for this unruly behavior on the part of the weasel.  

was
5. Finally, this command/faced with the most momentous decision yet encountered in the Antarctic. The weasel assigned to the Task Force Commander, the reporting senior of CASA (Commander, Antarctic Support Activities), was enjoying its fifth sojourn in the repair shop; there were simply no parts available to make it operable, much less, congenial towards its usual operators; coincidentally, one of the Air Force machines happened to be parked alongside, also waiting upon repairs. Quick reflection disclosed that the Air Force was in possession of an exchange vehicle. Hasty reference to the book of signal numbers disclosed that no Air Force personage possessing rank or title exceeding the TFC's was within 6000 miles

of McMurdo. Temptation became too much; in the still of the night, when observers were thought to be sleeping the sleep of the just, the two engines were exchanged. It remains a mystery how the members of the Air Force unit enjoying tenant status at this command learned of the engine swap between two Navy vehicles. Particularly since the Air Force machine has not yet been returned to its usual assignee.

6. Retrospection indicates that the decision was a poor one and that temptation should have been resisted, for subsequent events have proved that balky Admiral's weasel (the weasel, not the Admiral) to be as recalcitrant as ever. It has succeeded two more times in mishandling itself to the point where in-shop repairs were required.

7. Since the Air Force is in possession of these weasels, per agreement, and all three are running, albeit one of the three is that original machine which was not relinquished at the same time the SnoCat was wrenched from the Unit's possession, it would seem there is no pause for inter service strife. The Air Force asked for three and has three. It would seem, however, that some cause for inter-service strife exists since this command is commissioned to render support to its tenants. To date it has been singularly unsuccessful in keeping the Senior Officer Present equipped with reliable transportation.

8. Your indulgence is petitioned.

Respectfully,

D.

Rep You Know Where Via 0002

1st Endorsement, Cdr. D's undated memo

Fm. Cdr "I'm on the ice" B.

To: Cdr Big "R" Chi Chi

Subj: Pilfering, one one-lunger from nation's only strategic air lift weasel!

1. Here's how it happened.

2. Its night now and I can hear the rain on the window panes - no, wait, I meant its night and the 9th T.C.S. is restless. The whole thing is a misunderstanding that has proved most embarrassing and I have barely averted an unscheduled airdrop. It all stems from too many sasparillas one night in Christchurch. Henry the Janitor there at Advance Hqtrs, Major U and I were sipping away when the subject of banana sleds came up.

3. I thought we had drifted to the subject of reprovisioning the Pole with the mere mention of bananas and dozed off, but not Henry and U. They made a deal, Big "R", honest Injun, I just found out this morning that the real Henry the Janitor is in McMurdo, in the guise of a Studebaker Rep poaching engines. The way it works, the Air Force flies these 4-F weasels down here, and makes a superficial display about their untarnished safety record between the camp and the strip (you know the one I mean - the strip you arrived on and departed from two days later).

4. Dame Fortune pulled a fast one when the Admiral's weasel developed congenital bustitis. CASA tried to pawn it off on the lead-footed aide. U saw his chance, alerted Henry who was up to his pits in 40 weight oil, and THEY LIFTED ANOTHER ENGINE - THIS TIME, THE ADMIRAL'S 4-Fer. The laugh's on them, Big R; they completed the lift, back-loaded the good engine on 0002 for quick cash profits in Invercargill, and delivered the clunker one-lunger to the aide, and the weasel

with no one-lunger to 1st Lt. B, the 9th TCS rec officer on the strip. B is no dummy and he spotted the lack of engine immediately and complained to Major S, the 9th TCS complaint officer. Major S used the bare minimum of noodle work, filed an official complaint with GIF 43 and that's where we stand.

5. I propose that we back load Henry on the MIZAR and drop the business, Major U is pretty embarrassed - mumbled something about his chances for next year's DEW LINE.

Respectfully

B.

#### COMMITTEE APPOINTMENTS FOR 1966-67

PROGRAM: P. Smith, H.M. Dater, R.A. Lenton, R.W. Mason

FINANCE: G. Pagano, F.G. Alberts, J.G. Dyer

MEMBERSHIP: L. Deroche, M.J. Rubin, A.P. Crary, A. Moldvay, E. Phillips

PUBLICITY: R.K. McGregor, H. Eklund, J. Renirie, L. Deroche

EDUCATION: W. Sladen, K.J. Bertrand, A.P. Crary, H.M. Dater

LOCAL AFFILIATES: G. Toney, R.B. Black, M.J. Rubin

#### OUR PRESIDENT ASSUMES NEW DUTIES

Albert P. Crary moved from his position as Chief Scientist, Antarctic Research Programs to that of Deputy Director of Environmental Sciences Division, National Science Foundation. The appointment dates from November 1966. At time of writing, Bert was wearing both hats pending the selection of a Chief Scientist for Antarctic Research Programs.

#### MOUNTAINEERING

The several mountaineering accomplishments of New Zealand scientists operating from SCOTT Base with AirDevron Six support are worth recalling. At the time the ascents were made support was dependent on the limited capability of aircraft then available and in addition Base Camps had to be established in very rugged terrain.

MOUNT HARMSWORTH 78° 41' S - 160° 56' E. The first (see Note) major peak climbed in Antarctica, Bernie Gunn, Arnold Heine, Guy Warren. Feb., 10, 1957

MOUNT HUGGINS 78° 17' S - 162° 28' E. Richard Brooke & Bernie Gunn. 26 January 1958. Claimed to be the best piece of mountaineering accomplished to that date.

MOUNT FRIDJOF NANSEN 85° 21' S - 167° 33' W. W.W. Herbert, P.M. Ottway, V.R. McGregor, K.P. Pain. Between 16 and 22 January 1962.

NOTE: MOUNT EREBUS which has been climbed a number of times is considered to hold little technical challenge to mountaineers.

#### A NOTE FOR YOUR CALENDAR

The Annual Memorial Lecture will be given at 8 P.M., Tuesday, 11 April 1967 at the National Academy of Sciences. Dr. J. Cambell Craddock, 1966-67 Memorial Lecturer. Subject - GEOLOGY IN ANTARCTICA.

MEMBERSHIP IN THE ANTARCTICAN SOCIETY IS OPEN TO ALL PERSONS INTERESTED IN ANTARCTICA

How to Join: Forward a letter to the Membership Secretary, 42 North Fenwick St., Arlington, Virginia, 22201. State that you would like to become a member of the Society which has as one of its purposes, the friendly and informal exchange of information and views on Antarctica. An additional statement about any Antarctic duty or experiences you may have had would also be appreciated. A check for three dollars takes care of the one dollar initiation fee and two dollar annual dues- (Federal Income Tax deductible).

FINAL - George Doumani's address and telephone number appear on the announcement to provide a contact for the newspapers, radio or TV stations that might want additional information about the program.

To unite in a common organization persons interested in Antarctica

Members, their families, and all persons  
interested in Antarctica are invited  
to the 1966-67 Memorial Lecture.

DR. J. CAMPBELL CRADDOCK

GEOLOGY IN ANTARCTICA

Dr. Craddock, Associate Professor of Geology, University of Minnesota:

B.A., DePauw University, 1951. Major: Geology. Minor: Mathematics.  
Phi Beta Kappa. Teaching assistant in Geology, 1950-51.  
M.A., Ph.D., Columbia University, Geology, 1953, 1954. Higgins  
Fellow, 1951-52; National Science Foundation Fellow, 1952-53;  
teaching assistant in Geology, 1953-54; field geologist, N.Y.  
State Museum, summers, 1952, 1953.

A wealth of professional and field experience which included:  
geologist, airborne traverse, Antarctica, 1959-60; geologist, U.S.  
Bellingshausen Sea Expedition, 1960; leader, Jones Mountains Expedition,  
Antarctica, 1960-61; director, Minnesota-Wisconsin gravity field program,  
1961-65; director and leader, Ellsworth Mountains Expedition, Antarctica,  
1962-63; director, Ellsworth Mountains Expedition, Antarctica, 1963-64;  
director, Whitmore Mountains Expedition, Antarctica, 1964-65; editorial  
advisor, Geology folio, Antarctic Atlas, American Geographical Society,  
1964 - ; delegate to various International Geological Congresses.

Refreshments will be served after the meeting.

GEORGE A. DOUMANI  
Secretary

Science Policy Research Division  
Library of Congress  
Phone: 783-0400 Ext: 8460

SIR CHARLES WRIGHT

First an apology for having caused Sir Charles unnecessary embarrassment.

Since 1956, Sir Charles has been a Consultant under Contract to the Defense Research Board of Canada. The statement in the March 1967 Antarctic Society Notes - "Director of Pacific Naval Laboratory since 1956" - is incorrect.

From a letter dated 17 March 1967 -

- - " I am now officially transferred (with the contract) to the University of British Columbia to work for Professor Jacobs, also in the Institute of Earth Sciences, with support from our National Research Council. " ---

For his current series of projects, our best wishes.

For our inexcusable careless research we wish that there was some better way of atonement than sincere regret for the 'goof.'

THE 21 MARCH 1967 MEETING

Harry Francis should have retitled his illustrated account - HOW AN AMERICAN SCIENTIFIC OBSERVER EARNED HIS BOARD AND KEEP WITH THE JAPANESE ANTARCTIC RESEARCH EXPEDITION VII, 1965-1966.

About ninety members and friends joined Harry vicariously on the voyage of the icebreaker FUJI and in the monumental task of reopening, rebuilding, and expanding SHOWA station. The spirit of the Antarctic Treaty was truly exemplified by Mr. Francis in both his observations and the work he contributed to this successful Japanese expedition. Future American scientific observers with Japanese Antarctic expeditions have much to live up to.

LECTURER QUESTIONABLE

One of the purposes of the Society set forth in the Articles of Incorporation is "to encourage interest in and to interpret effectively the increasing importance of Antarctica", It was felt by the Board of Directors and the Education Committee that the compilation of a list of members willing to give lectures to various groups on particular topics pertaining to Antarctica would aid in meeting this worthwhile objective and at the same time render a service to the membership.

The response has been most disappointing.

Another copy of the questionnaire is enclosed. Your cooperation is earnestly solicited,

ELECTION OF OFFICERS FOR 67-68 AND FOUR DIRECTORS TO SERVE 67-70

The Nominating Committee, chaired by George Toney, will offer the following slate of officers and directors for election at the annual meeting on 16 May 1967. Nominations will also be invited from the floor.

For renomination to present posts: President	:A. P. Crary
Vice-President	:Harry M. Dater
Secretary-Historian	:George A. Doumani
Treasurer-Membership Secretary	:Gerald Pagano

For Board of Directors to serve three year terms: Max E. Britton  
Andrew H, Brown  
Harriet Eklund  
William Hines

CRARY TO VISIT ENGLAND AND NORWAY

President Crary, Deputy Director, Environmental Sciences Division, National Science Foundation, will be visiting professional colleagues in England and Norway. His tentative itinerary will be:

15 & 16 May	British Antarctic Survey, London, England
17 May	Scott Polar Research Institute, Cambridge, England
19 & 20 May	Norsk Polarinstitut, Oslo, Norway
22 May	Universitetet i Bergen, Bergen, Norway

WILLIAM M. HINES SR.

William M. Hines Sr., 78, father of Society member William M. Hines, Jr., died at St. Joseph's Infirmary, Atlanta, Georgia, 19 April 1967, after a long illness.

Mr. Hines was born in San Jose, California, in 1888 and began his 42 year newspaper and public relations career with the old SAN JOSE MERCURY when he was 20. He was an editor on western newspapers of the Hearst chain and also publisher of the SAN FRANCISCO BULLETIN and the BOSTON TRANSCRIPT, as well as city editor of the ATLANTA CONSTITUTION. From 1941 until he retired in 1950 he was chief of public information for the Quartermaster General of the Army in Washington, D.C. He then edited the MANASSAS (VA.) JOURNAL for several years until his health forced him to retire. In 1957 he moved from Woodstock, Virginia to Atlanta, Georgia.

THE 1966-67 MEMORIAL LECTURE

The Program Chairman has promised that either a resume or a transcript of Dr. J. Campbell Craddock's GEOLOGY IN ANTARCTICA will be available for mailing to members of the Society in the near future.

HOME AGAIN FOR GRIFFITHS AND A NEW STATION FOR FISHER

Derek L. Griffiths, UK Scientific Mission, British Embassy, Washington, D.C., returned to the United Kingdom on 19 April 1967.

Wayne Fisher, our Society's first secretary, has completed a tour of duty with the American Embassy in Paris and is now with our Embassy in London.

WASHINGTON, D.C.

Will hold an open meeting at 8 P.M.

TUESDAY, FEBRUARY 20, 1968

at the

NATIONAL ACADEMY OF SCIENCES  
2101 Constitution Avenue, NW

Members, their families, and all persons  
interested in Antarctica are invited.

PART I

CAPTAIN LEWIS O. SMITH, USN

will give an illustrated account of

OPERATION WINDMILL 1947-1948

In order to obtain supplementary ground control data for the aerial photography taken on OPERATION HIGH JUMP 1946-1947, the US Navy ice-breakers EDISTO and BURTON ISLAND used helicopters to field survey parties. As a Lieutenant Junior Grade in charge of the underwater demolition team, Smith assembled a rare collection of slides to document the highlights of OPERATION WINDMILL.

PART II

ON THE ICE

The first public presentation of the National Science Foundation's newest thirty minute color film on the work of US scientists in Antarctica. Reports of preview audiences indicate that this is certain to be an award winning film.

Refreshments will be served in the Great Hall after the meeting.

THE ANTARCTICAN SOCIETY ANNUAL REPORT, 16 MAY 1967

Mr. President, Ladies and Gentlemen:

During the past year, members of the Society met on seven occasions, including the garden party and the annual meeting presently in progress. The garden party was held at the Belmont Estate in Elkridge, Maryland, where Society members and their families enjoyed a delightful picnic, and watched another version of Scott's Last Expedition on film. Thanks to the commendable effort of Mr. Robert Mason, and the generosity of the Smithsonian Institution, we are privileged to enjoy the Belmont surroundings once again this year.

The highlight of these meetings was the International Antarctic Day, which marked ten years of international scientific cooperation. The day was observed in several countries, and here in Washington the Society heard the Honorable Paul C. Daniels speak on the question "Does Science Contribute to World Peace?". The meeting was held on October 11 (1966), in the auditorium of the Natural History Museum, and an attractive exhibit was displayed in the halls leading to the auditorium.

On November 15 (1966), we met and heard Rear Admiral Richard B. Black reminisce over the U.S. Antarctic Service Expedition and show some slides and rare films and film strips of Antarctic exploration.

After a period of quiescence during the height of the Antarctic season, we resumed our activities on February 21 (1967) when we had a preview of the American Antarctic Mountaineering Expedition of 1966-67. The expedition was sponsored by the American Alpine Club and the National Geographic Society, coordinated by the National Science Foundation, and logistically supported by the U.S. Navy. Expedition members Dr. Samuel C. Silverstein and Mr. Charles Hollister presented an illustrated account of their climbs.

A month later, Mr. Harry S. Francis, Jr., of the Office of Antarctic Programs at NSF, gave an account of the Japanese Antarctic Research Expedition, 1965-66, which he accompanied aboard the icebreaker Fuji.

The Memorial lecture was delivered by Dr. J. Campbell Craddock on April 11. Dr. Craddock had led several University of Minnesota groups into West Antarctica for geological exploration, and his lecture outlined the general geology of the continent.

Concurrent with these public meetings, the Society's Board of Directors was actively attending to the Society's affairs and legal matters. The Board of Directors held six meetings and discussed and directed the activities of the

committees on Programs, Finance, Publicity, Education, and Local Affiliates.

Most of the time was occupied with the legal procedure governing the establishment of groups affiliated with the Antarctic Society. The brunt of this task was the work of Mr. Marshall Meyers, our legal counsel, whose voluntary services to the Society have been most appreciated. The Education committee drew up a form which was mailed twice to all members. The form requests data on the member's competence in an Antarctic subject, and his desire to lecture on that subject to academic and civic organizations. The response from the members so far has not been very satisfactory.

A more widely-felt activity of the Board was the publication of the newsy little "NOTES" about informal happenings in the Society. The Notes have been received with great enthusiasm, and the correspondence and comments from members were most encouraging.

This constitutes a resume of the Society's activities for the 1966-67 year. Mr. President, I request that the annual meeting approve this report for insertion in the files.

GEORGE A. DOUMANI  
Secretary  
The Antarctic Society

PROFESSOR CAMPBELL CRADDOCK'S RESUME' OF HIS MEMORIAL LECTURE 11 APRIL 1967

Geologic Studies in Antarctica

Since 1959 seven geologic research expeditions from the University of Minnesota have studied the geology of selected areas in West Antarctica. The central purpose of this work has been to establish the geologic structure of West Antarctica and its relationship to the older shield of East Antarctica. These studies, along with those of other geologists of several nations, may ultimately provide answers to some important questions of southern hemisphere geology. Is West Antarctica really continental, or is it merely an ice-covered archipelago of mainly volcanic composition? Does the circum-Pacific mobile belt—defined by folded strata, earthquakes, and active volcanoes—continue from South America across West Antarctica? Can the andesite line, a compositional boundary between the Pacific Ocean basin and the surrounding continents, be traced across West Antarctica? What have been the paleogeography and paleoclimate of Antarctica in the various geologic periods of the past? Does the geologic history of Antarctica strengthen or weaken the case for continental drift?

Most of the Minnesota studies have centered about the 90th meridian west in a band from Peter I Island south to the Thiel Mountains. Peter I Island is a Cenozoic basaltic volcano mantled by an extensive icecap. Thurston Island along the main coastline exposes Paleozoic gneiss intruded by Mesozoic plutonic rocks. The Jones Mountains consist of a basement complex of Mesozoic igneous rocks overlain unconformably by late Cenozoic basaltic volcanics; striations and other markings on the unconformity surface suggest glaciation may have occurred here as early as the Miocene.

The Ellsworth Mountains are composed of a strongly folded sedimentary sequence of mainly Paleozoic age at least 12,000 meters thick; a rich Upper Cambrian fauna occurs near the middle of this section, and the Glossopteris flora has been found in the uppermost formation. The Pirrit Hills, the Nash Hills, and the Whitmore Mountains consist of deformed and metamorphosed sedimentary rocks intruded by Mesozoic granitic rocks. The Martin Hills are composed of slightly deformed and

metamorphosed sedimentary rocks and several badly altered intrusive bodies. Pagano Nunatak exposes a Mesozoic granitic pluton, but the nearby Hart Hills consist of tilted metasedimentary rocks and a strongly altered mafic intrusive mass.

The Stewart Hills are comprised of tightly folded metasedimentary rocks that were probably deformed during the early Paleozoic Ross Orogeny. Sedimentary rocks bearing stromatolites in the Thiel Mountains are cut by igneous plutons of late Precambrian and early Paleozoic age.

Along the Ruppert Coast in Marie Byrd Land Granitic rocks of probable Mesozoic age intrude both a sequence of deformed metasedimentary and metavolcanic rocks and a seemingly much older gneissic complex.

Much work remains to be completed on these extensive rock collections, but some preliminary conclusions may be drawn. A general contrast exists between ancient East Antarctica, consisting of a pre-Devonian basement complex overlain by sub-horizontal Phanerozoic strata, and younger West Antarctica, consisting of mainly Phanerozoic rocks which have undergone extensive tectonism and metamorphism. From both geological and geophysical evidence West Antarctica must be regarded as a continental area although the bedrock surface under a large part of it lies below sea level. The circum-Pacific belt of folded strata, plutonic intrusives, and young volcanoes extends along the seaward margin of West Antarctica, but the apparent absence of earthquakes is puzzling. Between this circum-Pacific belt and the Trans-antarctic Mountains on the edge of East Antarctica lies a new tectonic province, the Ellsworth Mountains fold belt, consisting of thick mainly Paleozoic strata that were deformed, metamorphosed, and intruded by granitic rocks during the early Mesozoic.

Many questions remain about Antarctic paleoclimates, but strong evidence has been found in several regions for extensive glaciation of the continent in late Paleozoic time. The striated surface in the Jones Mountains suggests the present icecap may have had its inception as long ago as 20m.y. in the past.

Geologic work in many parts of the continent during the past decade has established striking similarities between the geologic history of Antarctica and the other southern continents. Antarctica occupies a central position in most reconstructions of Gondwanaland, and these parallel geologic histories for the southern continents strengthen the case for continental drift.

(NOTE - Dr. Campbell Craddock is now Professor of Geology, The University of Wisconsin)

KUDOS

KUDOS

KUDOS

RALPH LENTON: This past summer Ralph led a scientific traverse, Operation BLUE TREK. Equipped with a ten year old Model 443 Tucker Sno-Cat and several motor toboggans the party travelled over the Greenland icecap from Camp Century, 77° 01' 03" North, 61° 08' 33" West to Inge Lehmann Station at 77° 56' 43" North, 39° 11' West. The 17th Troop Carrier Squadron with their ski-equipped C-130A aircraft used both airlanded and airdrop techniques to resupply BLUE TREK.

WILLIAM H. LITTLEWOOD: Bill is now the Deputy Scientific Attache in Japan. His many friends can reach him at this address:

William H.  
Littlewood  
Deputy Scientific Attache  
American Embassy  
APO San Francisco 96503

WAYNE FISHER: The Antarctic Society's first secretary and treasurer is now the Consul General of the United States in London, Drop him a note at this address:

Wayne W. Fisher  
American Embassy  
Box 40, FPO New York 09510

CAPTAIN PAUL BAUER, USN (Ret): Paul, advisor to the ONR Oceanic Biology Program, received the Order of the Falcon from the Icelandic Ambassador on January 30, 1967 for his contributions to the research effort on the newly formed volcanic island of Surtsey off the coast of Iceland.

ANTARCTIC PHILATELY - POST IGY THE 5 DECEMBER 67 SOCIETY MEETING

Ralph Lenton and Tom Kelly illustrated their lectures with 35mm color slides of sample covers, stamps, and cancellations. Members and friends enjoyed viewing the extensive exhibits in the Great Hall of the National Academy of Sciences during the refreshment period after the lecture. We all appreciate the time and effort that Tom and Ralph put forth in making the slides and setting up the exhibits.

NEW EDITION OF INTRODUCTION TO ANTARCTICA

A completely revised edition of Introduction to Antarctica was issued in October 1967 by the U.S. Naval Support Force, Antarctica. The publication replaces one of the same title last reprinted in 1965 by the now disestablished U.S. Antarctic Projects Officer. In 52 pages and 109 illustrations, Introduction to Antarctica presents a general review of antarctic geography, climate, biology, and history.

Most of the publication is devoted to the history of Antarctica's discovery and exploration, with emphasis on United States activities. One chapter reviews the great voyages, treks, and flights of discovery; another summarizes the antarctic programs of the International Geophysical Year; and two chapters discuss antarctic activities from the end of the IGY to the present. In the last of the seven chapters, a view into Antarctica's future is ventured.

Although Introduction to Antarctica is intended for general use, the scholastic popularity of past editions has been considered in the preparation of the current edition. A list of suggested readings is appended, and sources of additional information and maps are cited.

The publication is available upon request to the Public Affairs Officer, U.S. Naval Support Force, Antarctica, Building 210, Washington Navy Yard, Washington, D.C. 20390. (From the November-December 1967 issue of THE ANTARCTIC JOURNAL OF THE UNITED STATES)

A THANK YOU NOTE

The treasurer wishes to express his appreciation to all members that have forwarded their dues for 1967-68.

ELECTION OF OFFICERS FOR 1968-69 TERM AND FOUR DIRECTORS TO SERVE TO 1971-72

The Nominating Committee has selected the following slate for presentation to the membership by the Directors at the annual meeting, 28 May 1968:

- For the 1968-69 Term: President . . . . . Henry M. Dater
- Vice-President . . . . . George A. Doumani
- Secretary . . . . . R.K. McGregor
- Treasurer . . . . . Ralph A. Lenton

For three-year terms as Directors:

- Louis DeGoes
- N. Marshall Meyers
- Waldo L. Schmidt
- Roy G. Shults, Capt. USN (Ret.)

As specified in the By Laws, nominations from the floor will be solicited.

DO YOU HAVE A WHALE TAPE MEASURE HANDY?

From the CONGRESSIONAL RECORD - HOUSE .. April 29, 1968.

BENEVOLENT BUREAUCRATS OF THE INTERIOR DEPARTMENT PROHIBIT "YOU AND ME" FROM MOLESTING WHALES

(Mr. GROSS asked and was given permission to address the House for 1 minute and to revise and extend his remarks.)

Mr. GROSS.. Mr. Speaker, I was leafing through the Federal Register the other day and came upon a ukase put out by the benevolent bureaucrats of the Interior Department.

I wish to pay proper respect to Mr. Udall's minions who have acted with courage, with farsightedness, with compassion, and with their ever-present sense of priorities. They have prohibited you and me from molesting whales. Never having been a whale molestor I was unaware of the apparently pressing need for section 230.50 of this regulation, but I think those who may have toyed with the idea should be aware of the new rules. They state, in part--and I quote:

"The chasing, molesting, exciting, or interfering with, through the use of firearms or by any other manner or means, of any whale-- is prohibited."

The regulation goes on to forbid fooling around with baleen whales, blue whales, grey whales, humpback whales, right whales, and toothed whales.

But like many another bureaucratic regulation, this one has loopholes, and it turns out you can do almost anything to a whale if you are "hunting, killing, taking, towing, holding-on to--that is what it says--or scouting for whales"

If you somehow manage to obtain a whale without molesting it, the Interior Department says you must measure the whale, and in case you do not know how to measure a whale, the bureaucrats spell it out for you inch by inch, and I quote:

"Whales must be measured when at rest on deck or platform, as accurately as possible by means of a steel tape measure fitted at the zero end with a

WHALES (Cont'd)

spiked handle which can be stuck into the deck planking abreast one end of the whale.

The tape measure shall be stretched in a straight line (that's what it says) parallel with the whale's body and read abreast of the other end of the whale."

End of lesson. Mr. Speaker, I wait with baited breath the Interior Department's regulations concerning the capture of dichromatic herbivorous ungulates, which, I understand, is a real dilly.

PRO AND CON ON SCIENCE POLICY FOR ANTARCTICA.

George Doumani, staff member of the Science Policy Research Division of the Library of Congress' Legislative Reference Service, has written a lively piece for the April 1968 issue, Bulletin of the Atomic Scientists, SCIENCE POLICY FOR ANTARCTICA, p. 39-45.

The preface ..... "The year 1967 marked a decade of struggle between the legislative and executive branches of government over the power to formulate national policy for Antarctica. The period was marked by a multitude of bills and public resolutions, occassional hearings before several committees and subcommittees, and a final deterioration to mere briefings on what went on the year before. For 10 years Congress proposed and the administration opposed, and no significant legislation was ever enacted. Executive conduct of scientific research and Antarctic affairs on the international scene has been so overwhelmingly beyond reproach that Congress was virtually disarmed."

The topical headings listed below give an indication of the perceptive treatment Doumani has given to a facet of our National Science Policy that has long been an item of concern to those actively or vicariously involved in Antarctic matters.

THE SCIENTIFIC PROGRAM . . . PROGRAM ADMINISTRATION . . . LEGISLATIVE RECORD  
COORDINATION . . . BUDGETARY PRIORITIES . . . POLITICAL PRIORITY. . . .  
JURISDICTION

TURNING OUR THOUGHTS TOWARD THE ARCTIC

Federal Arctic Research, A Report Prepared Pursuant To The Request Of The COMMITTEE ON APPROPRIATIONS UNITED STATES SENATE by George A. Doumani, Science Policy Research Division . . . 313 pages.

From the Introduction: "This report presents an inventory of most aspects of scientific research in the Arctic region, performed by, or for, agencies of the Federal Government.

The compilation was gleaned, for the most part, from material supplied by the different agencies which responded to our request. The information requested included descriptions of individual projects, funding, organizational structure of the operating agency, administration of the projects, research facilities and logistic support, manpower, interagency coordination and cooperation, and formal or informal agreements for bilateral or multilateral international cooperation. Not every agency supplied all the requested information, some items being inapplicable to the activities of these agencies; those which did not respond were assumed to be inactive in Arctic work.

Specifying the desired definition of the Arctic for this purpose was accomplished by including Greenland, Iceland, and most of the State of Alaska. Although the State of Alaska is not totally in the Arctic the greater part of it lies north of latitude 60° N,, and is considered' here as Arctic and sub-Arctic.

## ARCTIC (Cont'd)

Iceland lies immediately south of the Arctic Circle, but for all practical purposes it is also considered in the same category. Projects that deal with Arctic or "cold regions" environmental conditions, but were not considered Arctic by definition (Some of the projects may not readily appear related to Arctic Research, but partial fulfillment of the projects' objectives is effected in Arctic or sub-Arctic environments.)## The Department of Agriculture Forest Service responded that its activities in Alaska extended only to the tree line, which stops south of the Arctic Circle; thus no information on Forest Service activities was supplied." ....

##are also included.

From the Summary ... " Federal Government activities in the Arctic Region are distributed among more than 20 agencies. The degree of involvement of these agencies varies from one or two projects in one agency to over 100 projects in another. The agencies participate in the form of logistic support activities, the actual conduct of scientific research, contract work performed by private organizations, financial support by grants and awards, the Federal aid program, and cooperative activities on reimbursable or transfer-of-funds basis.

The scientific programs represent a broad spectrum of disciplines, noticeably oriented toward the biological, atmospheric, and earth sciences. The activities of the three main services of the Department of Defense are supposed to be oriented toward military goals and the ultimate application of basic research results in the benefit of national defense. However, military interest in the Arctic is waning and, except for Army testing of military equipment in the laboratory and the Alaska ranges, most of the unclassified projects discussed in this report appear to be somewhat indirectly relevant to military applications and objectives." . . . .

A BOOK REVIEW REPRODUCED FROM THE TIMES (LONDON) LITERARY SUPPLEMENT BY PERMISSION

EDWARD WILSON: Birds of the Antarctic. Edited by Brian Roberts. 191pp. 300 drawings and paintings. Blanford Press. Five Pounds five shillings.

Of the many books on ornithology issued in 1967, none can hold so great an historical appeal as Birds of the Antarctic by Edward Wilson, skillfully edited by Dr. Brian Roberts of the Scott Polar Research Institute, Cambridge. Edward Wilson is a legendary figure whose name will go down to posterity as one of the five brave explorers who died on Scott's second Antarctic expedition after reaching the South Pole.

More than fifty years have passed since that epic adventure which ended in such tragedy, but their names have been engraved in our memories and none with greater respect and affection than that of, Edward Wilson. If it is possible that anything can add to the admiration already held for him, it will be found in this book. In his very short introduction the editor writes: "Edward Wilson was primarily a naturalist with leanings towards zoology and especially ornithology. He was also a doctor, an artist, and a man of exceptional character." It is as the artist and the naturalist that we see him depicted here, for within Birds of/Antarctic Wilson's drawings and water-colours have for the first time been brought together, thus enabling us to revalue his great artistic gifts and...to quote Dr. Roberts..."to form some idea of the way in which Wilson himself might have wished to publish a selection of his Antarctic bird pictures".

Most of those selected for reproduction were made during the Discovery expedition of 1901-04, at the beginning of which Wilson was barely twenty-nine years of age. On that occasion he was able to devote a great deal of his time to ornithology and to painting, but on Scott's second expedition in the Terra Nova, when he was appointed chief scientist, he had much less opportunity to devote to his favorite subjects; consequently his water-colour drawings and pencil sketches were far fewer in number. "Despite intensive search efforts to trace more Terra Nova bird pictures. . . have been unsuccessful."

## BIRDS OF THE ANTARCTIC (Cont'd)

An assessment of Wilson as an artist occupies four pages of text where we read that there is universal agreement among those who have visited the Antarctic that the delicacy of his pencil drawings suited the mountain scenery, the snow and ice features, the weathering of bergs and the details of pack ice. His water-colours were the first to convey an accurate idea of the beauty and subtlety of Antarctic colours. Students of Antarctic ornithology can have nothing but admiration for Wilson's unique contribution to their subject.

With all this we must assuredly agree when we come to study closely the reproductions of his work. Those which Dr. Roberts has selected show how talented Wilson was as a bird-artist and also as a painter of Antarctic scenes and landscape. He has painted in colour the head, feet and often the extended wing of every member of the petrels, shearwaters and albatrosses which the expedition was able to secure. The innumerable drawings of these birds made from life show how accurately he was able to depict birds in flight, his subjects never still for a moment to provide the opportunity for detail he must so often have desired; yet his pictures are full of life.

There are in this volume sixty pages in colour and forty-two pages of monochrome illustrations, every one of which is pleasing in varying degree. Edward Wilson was, indeed, a born artist. At the age of four his mother wrote of him: "He is never so happy as when lying full length on the floor and drawing little figures in every conceivable attitude which are full of action and all his own."

Some of the drawings now reproduced, done at the South Pole, are still in the rough and have been taken from his sketch books, but where detail is required Wilson could be meticulously accurate, as witness the scales on the foot of the Adelie penguin (68) and the foot of an Adelie chick (69 and 70). Some of his most striking studies are of the snow petrel in flight (236) and a quite delightful sketch (294) shows MacCormick's skua at her nest on Ross island with the Discovery in winter quarters in the background. His studies of the Emperor penguin (49-53) show an absolute mastery of pencil-line technique.

Editing a book such as this requires intimate knowledge of polar conditions and of natural history and few could hope to accomplish such a task. Brian Roberts is the ideal choice and has done a splendid job. Himself an Antarctic explorer and a foremost authority on Antarctic birds, he has for many years been a leading figure in the Scott Polar Research Institute at Cambridge, where he is a fellow of Churchill College. Dr. Roberts is also head of the Polar Regions Section at the Foreign Office. His principal object in publishing this book...to make Wilson's pictures better known to the world...has already been mentioned, but Dr. Roberts has done much more than that. He has drawn freely on the large collection of manuscripts in the archives of the Polar Institute and all the quotations in the text are...unless otherwise stated ...taken from Wilson's own journals and letters. The book is, in fact, a splendid memorial to a very great man and an outstanding ornithologist, and for that alone Dr. Roberts's achievements should be widely acclaimed.

The main text opens with a brief biographical memoir and proceeds at once to an account of the Discovery expedition of 1901-04; a section deals with Wilson's important work on the Grouse disease inquiry on his return home and then the fatal Terra Nova expedition, 1910-12. Separate sections deal with accounts culled from Wilson's journals describing South Trinidad, Macquarie Island, the Auckland Islands and the winter journey to Cape Crozier in 1911. There is much else in this book as well, including a bibliography and a list of selected publications relating to Edward Wilson and his work. Dr. Brian Roberts has shown great scholarship in his editorial work and has brought his own considerable knowledge to bear on every aspect of the book.

This review can fittingly close with an extract from Scott's tribute to Wilson: Words must always fail me when I talk of Bill Wilson. I believe he really is the finest character I ever met...the closer one gets to him, the more there is to admire .... I hold him mainly responsible for the extraordinary amicable relations which have existed among us.

Dr. Brian Roberts has probably put his finger on the reason for Edward Wilson's

## BIRDS OF THE ANTARCTIC (Cont'd)

great influence for good when he wrote: "Although it was not known to his companions at the time, we now know from his private journals and letters that he was motivated by a deep religious faith which certainly contributed to his strength of character."

The Antarctic Society is very grateful for having been given permission to reproduce this review from the Thursday, January 18, 1968 issue of THE TIMES LITERARY SUPPLEMENT.

If you do not have an account with a Bookseller in Great Britain, the book has been published in the United States by the Humanities Press Inc., 303 Park Avenue South, New York, New York 10010. The price is \$17.50.

WHAT NEXT???????

From the New York Times, Wednesday, 31 January 1968 .... Emilio Pucci, the  
Italian designer, will design a stocking collection each season for the  
McCallum Boutique division of the Indian Head Hosiery Company.

The first collection, expected to feature both sheer and opaque printed body stock-  
ings and panty-hose, will be for fall and will be available in late summer.

It is expected that the price range will be \$1.50 to \$15, similar to that of the  
Rudi Gernreich designs made by the same company.

WASHINGTON, D. C.

October 2, 1968

Miss Betty Didcoct  
5204 Westwood Drive  
Westmoreland Hills  
Washington, D.C. 20016

Dear Betty:

I am greatly pleased that you are willing to serve on the Education Committee of The Antarctic Society. As I have indicated in the enclosed letter to Ken Bertrand, I regard this as a most important committee for the future of the Society. This letter is not intended to limit the activities of the committee in any way but rather to set forth some of the possibilities confronting the Society. You will, I am sure, have many original ideas to contribute to the deliberations of the committee.

Sincerely,

A handwritten signature in cursive script, appearing to read "Henry M. Dater".

HENRY M. DATER  
President

# THE ANTARCTICAN SOCIETY

WASHINGTON. D. C.

October 2, 1968

Dr. Kenneth J. Bertrand  
6808 40th Avenue  
University Park  
Hyattsville, Maryland  
20782

Dear Ken:

It is a great pleasure for me to know that you will accept the Chairmanship of the Committee on Education of The Antarctic Society. I regard this as a most important committee of the Society. Paul Daniels, Honorary President and the founder of the Society, has stated that, in the beginning, he felt that the organization should have two objectives: (1) to bring together in an informal way people from the many Government agencies and private institutions particularly in the Washington area; and (2) to serve as an educational and cultural center for all persons interested in the Antarctic. As you are aware these objectives are written into our Act of Incorporation and By-Laws.

In a recent conversation, Paul indicated that he believed the first objective had been largely accomplished. He thought it was time that the Society embarked upon the second. This aspect of our activities was the subject of lively discussion at a meeting of the Board of Directors on September 10, 1968. Since you were present, you are aware of the nature of the Board's interest.

In the Articles of Incorporation, of which I am enclosing a copy of the relevant portions, I find that the Society is empowered to prepare and disseminate data of all kinds; to print, distribute, and sell books and periodicals; to organize and sponsor lectures and public discussions; to establish and conduct a non-profit library; and to maintain museums and information centers. It is into these things that your Committee should inquire in a broad way.

I recognize that, to investigate these matters, may appear to be a futile exercise for an organization virtually without funds. I feel strongly, however, that we shall never be able to approach either our own members or Individuals and organizations outside the Society with request for money unless we can show a set of worthwhile objectives. Second, I believe that we should be able to show that we are taking steps, however small, toward our goals. Machiavelli once stated that it was not money which produces success, but that it was success which guarantees a supply of money. If we can start now, we should be able to obtain the funds we need.

You may wish to consult with the Chairman of the Finance Committee, Ralph Lenton, and the Chairman of the Committee on Public Relations, Commander Sid Wright. The latter committee has been requested to develop a periodic newsletter. You may find this a useful vehicle to disseminate information to our members.

Attached are the names and addresses of the members of the Committee on Education. It is a strong and capable group from which, I believe, will arise many original ideas and projects of which neither the members of the Board nor I have thought. If you feel that I, as President, can be useful in the work of your committee, I shall be most happy to help at any time.

Sincerely,

HENRY M. DATER  
President

1968 - 1969  
Season

First Meeting  
of  
Antarctican Society

October 18, 1968

8:00 p.m.

Lecture Room

NATIONAL ACADEMY OF SCIENCES  
2101 Constitution Avenue, N. W.  
Washington, D. C.

This meeting is devoted to the 40th Anniversary  
of the 1928-30 Byrd Antarctic Expedition.

DR. LAURENCE M. GOULD, CHIEF SCIENTIST OF THE EXPEDITION WILL SPEAK

It is hoped that members of the expedition  
will take this opportunity to renew and  
retell associations and tales of the  
Antarctic.

NOTES: The Antarctican Society has a new address.  
Correspondence should be addressed as  
follows:

Antarctican Society  
1619 New Hampshire Avenue, N. W.  
Washington. D. C. 20009

- O Annual dues are payable 1 October 1968 to  
Ralph A. Lenton, Treasurer, at our new  
address.
- O Antarctic scarves will be available for  
purchase at the meeting on October 18, 1968.

# *The Bulletin of* **THE ANTARCTICAN SOCIETY**

No. 1

April, 1969

## A NEW ERA

As President, I feel confident that The Antarctic Society, is entering upon a new era of usefulness to the members and to our general objective of stimulating interest in the Antarctic. This *Bulletin* is tangible evidence of that advance. Its purpose is to provide the members with news of what the Society is doing and, perhaps, most importantly of the activities of the members themselves.

Such a medium for the exchange of information is all the more necessary because of recent expansion of the membership to well-over 400. It is necessary if the Society, is LM become something more than a Washington club. If the international character of the organization is to be sustained and, hopefully, enhanced we must have a way of maintaining contact. Presently, we are trying to organize chapters in areas where groups of members live in reasonable proximity to one another. These chapters must be kept informed of what the Society is planning and what other chapters are doing. Many individual members are issuing publications, performing research, going on journeys, or carrying on other activities that are of general interest.

All these things, we hope to record and more beside. The beginning is, of necessity, modest, but the future is unlimited. The success of the *Bulletin* will in large measure depend upon your cooperation. It is your publication, and unless you tell us what you are doing, we can't inform others. We solicit your help.

HENRY M. DATER  
President

## CANTERBURY MUSEUM

The Canterbury Museum at Christchurch, New Zealand, has plans to build an Antarctic wing. Among exhibits, it hopes to have a series on the development of field clothing. An appeal has been received for samples of United States field gear beginning with the first Byrd expedition. The Navy and National Science Foundation have arranged to transfer sets of clothing currently in use, but are unable to furnish items from the past. Members having gear from expeditions prior to 1954 may wish to consider a donation to the Canterbury Museum. It would be a nice gesture of appreciation for the hospitality consistently shown to Americans by New Zealanders on their way to Antarctica. Anyone interested in making such a donation is urged to communicate with the president of the Society.

## WASHINGTON MEETINGS

Up to the time of writing three meetings have been held this season, all at the National Academy of Sciences, and three more are planned. The talks at the last two meetings were taped by the United States Information Agency and relevant excerpts used on its foreign broadcasts. It expects to continue this practice.

The first meeting, held on October 18, 1968, commemorated the fortieth anniversary of the first Byrd Antarctic Expedition. Dr. Laurence M. Gould, the expedition's chief scientist and second in command, reminisced about the events of those early days. Six other veterans of the expedition honored The Society with their presence. A brief summary of this talk was distributed to members at an earlier date, and in slightly different form appeared in the *Antarctic Journal of the United States*, Vol. IV, No. 1, (Jan-Feb 1969). Dr. Gould is an honorary member of the Society.

If the first meeting aroused memories of the past, the second looked toward the future. Dr. Ernest Stuhlinger of NASA's George C. Marshall Space Flight Center gave an illustrated talk entitled "Antarctic Research, A Prelude to Space Research." Dr. Stuhlinger visited Antarctica in January 1967, accompanied by three other prominent members of the Space Agency: Drs. Robert R. Gilruth, Maxine A. Faget, and Werner Von Braun. During the trip, Dr. Stuhlinger said, "When the four of us from NASA looked at the many fascinating activities through the eyes of space-projects developers, we registered in our minds a number of impressions which will certainly find their way into our space program planning." One of these impressions was the size of the logistic effort required to support scientists in a remote location coupled with the division of labor that, by placing logistics responsibility on the Navy, permits the scientists to concentrate upon their research projects. He recognized that in lunar exploration a number of different types of vehicles would be necessary just as they were in the Antarctic. The four were also impressed by the elaborate safety precautions, especially against the danger of fire, and by the great desirability of providing the individual with a private space, no matter how small, in which, at times, he could be alone. They also became convinced that, in the descriptive, sciences, such as biology and geology, there was no substitute for the experienced investigator in the field. On the other hand, Dr. Stuhlinger believed that, in certain disciplines, the techniques and equipment of automated observation being developed for space exploration could be adapted to the Antarctic. The complete text of this talk has been published in the *Antarctic Journal of the United States*, Vol. IV, No. 1 (Jan-Feb 1969).

## BOOK NOTES

Mr. Amory H. Waite, Jr., spoke to the third meeting on February 6, 1969 on "The History and Development of Radio Ice Depth Measurement," a striking example of the use of electronic techniques in the field of scientific exploration. With a minimum of technical jargon and detail, Mr. Waite explained how, beginning with the Second Byrd Antarctic Expedition (1933-1935), his experiments with radio communications first led to an appreciation of the ease with which radio waves penetrated ice and then to the realization that this phenomenon could be used to measure the thickness of ice shelves and caps. Most interesting was the account of how Mr. Waite, with the support of the Army Signal Corps, worked out the techniques and equipment to make ice depth measurement a reality. When he discovered that investigators in other countries were working on similar devices, he arranged sponsorship for them to get together in Greenland for the purpose of comparing their different systems. This was done in 1963 and again in 1964 with scientists from England, Denmark, Canada and the United States participating. The 1964 summer experiments involved 4 tractors, 7 smaller vehicles, about 12 sleds, and 34 people. From 1964 on, the problems faced were those of improving established equipment and techniques to obtain greater accuracy and reliability. Radio depth measurement has, in recent years, been done successfully both from vehicles and aircraft in the Antarctic. It has the advantages over seismic sounding that the equipment is light, simple, to operate, records automatically, and gives a continuous profile rather than simply a sounding at the point of contact. The improvement is comparable to that, which occurred when echo soundings as a means of gauging ocean depths replaced the use of lead and line. "Bud" Waite is one of the great antarctic pioneers both in geographical exploration and technical development. The Society is proud to have him as a member.

## MEMBERSHIP

Individual membership has increased to over 400. A large increment came, when Lindblad Travel enrolled the participants on its cruise to the Antarctic Peninsula. We welcome these and other new members to The Society collectively and wish that we could do so individually. Unfortunately statistics have not been kept on the number of members who journey to the Antarctic each year, but there exists no doubt that the largest single bloc ever to visit the area were those who took this year's cruise to the Antarctic Peninsula.

All new members have been sent membership certificates. The Membership Secretary, Mr. Ralph Lenton, is busy preparing a directory of Members that, we hope, will be distributed soon. This and the *Bulletin* are a start, but the officers and Board of Directors are keenly aware that other steps are needed to maintain the interest of members of the Society. If any of you would be interested in forming local chapters or even contacting on a more informal basis Antarcticans who live in your vicinity, Mr. Lenton will be happy to forward an appropriate list of names and addresses. Other suggestions for improving the services of the Society are invited from all members, old and new.

With each issue of the Bulletin, we hope to bring to the attention of readers books of general interest on the Antarctic with brief notes indicating contents and level of readership.

Captain R. F. Scott, *The Diaries of Captain Robert F. Scott*, 6 vols., University Microfilms Ltd., 1968, \$70.

The originals of the Scott diaries that are now available in a Xerox reproduction will enable scholars to compare them with the various edited versions. Two of the volumes contain Scott's sledging orders and the typescript of the *South Polar Times*. Indispensable for those who wish the complete text.

E. P. Hoyt, *The Last Explorer: The Adventures of Admiral Byrd*, the John Day Company, 1968, \$7.95.

The author makes it very clear that no definitive life of Admiral Byrd can be written until the family papers are made available. In spite of having access to only the public record and relatively few of the individuals who were associated with Admiral Byrd, Hoyt has turned out an unusually well balanced and perceptive account. This fascinating and readable book will be enjoyed by young and old alike.

L. Sebastian, *The South Pole*, Hoyt, Rinehart and Winston, 1968, \$2.95, illustrated.

A volume in a series called "Books to Begin On". Suitable for primary school children. Some errors occur that more careful preparation could have avoided. It can be recommended as a starting place for very young Antarcticans.

John Grierson, *Heroes of the Polar Skies*, Meredith Press, 1967, \$4.95.

Several years ago, Mr. Grierson published *Challenge to the Poles*, a history of aviation in both polar regions up to the opening of scheduled air services over the Arctic in 1954. From the wealth of material he collected at that time, he has written, primarily for teenage boys, short biographies of Andree, Byrd, Wilkins, Ellsworth, Amundsen, and Mobile. Himself a pioneer of polar flying, Grierson succeeds in transmitting to the young reader the romance and excitement of these early ventures. It is recommended.

E. A. Bacon, *Some Songs of The South Pole*, privately printed, 1960.

This book of songs was written after two visits to Antarctica by Mr. Bacon, a charter member of the Society. They capture the mystery, excitement, and even loneliness of the early *Deep Freeze* operations. It is a pleasure to report that copies are available from the Francis Scott Key Book Shop, 28th and O Streets, N.W., Washington, D.C., 2.0007 at \$3.50 per copy.

## A NOTE FOR YOUR CALENDAR

The Annual Business Meeting will be at 8 p.m., Monday, 12th May 1969 at the National Academy of Sciences. Items on the agenda will be the election of Officers for 1970 and the Presidential Report by Dr. Henry M. Dater.

## IN MEMORIAM

It is our sad duty to record the recent passing of three charter members of the Society. The Honorable Edward A. Bacon died on October 5, 1968. As Deputy Assistant Secretary of the Army, Ted Bacon visited Antarctica in 1958 and again in 1959. Struck, as are many, by the strange beauty of the area and caught up by the skill, enthusiasm, and gaiety of the young Navy men and scientists who were carrying out the program, he had the talent, which most of us lack, to turn his impressions into verse. Other members will remember his book, *Some Songs of the South Pole*, privately printed in 1960, which remains one of the few examples of authentic poetry to emerge from the Antarctic. (See book notes.)

An historical summary in Ted Bacon's book was contributed by Dr. James E. Mooney, who died on October 27, 1968. A friend and associate of Admiral Byrd for over 20 years proceeding the Admiral's death, Jim Mooney served during the IGY as a consultant to Admiral Byrd when the latter was Officer in Charge, U.S. Antarctic Programs, and to Admiral George J. Dufek, who in 1951, succeeded the Admiral Byrd's position with the alternate title of U.S. Antarctic Projects Officer. In 1959, he was named Deputy United States Antarctic Projects Officer, a post he held until the abolition of the Projects Office on April 24, 1965. He then assumed the position of Assistant to the Assistant Secretary of Defense for Antarctic Matters until he retired from Government service at the end of that same year.

In 1956, when the thought of wintering over on the high plateau terrified many, the spirits of those who were to take part in the risky venture were heartened by the designation of Dr. Paul A. Siple, as South Pole Station Scientific Leader. America's most experienced Antarctic explorer, he bought with him the knowledge and wisdom gained on four previous expeditions, beginning in 1920 when, as a Boy Scout, he accompanied Admiral Byrd to Little America I. Somehow, between participation in the Second Byrd Antarctic Expedition (1933-1935) and the United States Antarctic Service Expedition (1939-1941), he managed to complete his education culminating with a doctor's degree in geography from Clark University in 1939. During World War II, Paul Siple served in the Army and after the conflict was associated with Army research and development programs.

His association with Admiral Byrd ripened into a deep friendship as they worked together over the years, and he accompanied the Admiral on his two postwar visits to Antarctica, Operation Highjump (1946-1947) and Deep Freeze I (1955-1956). The success of the year at the South Pole on Deep Freeze II, is set forth in the last of his four books, *90° South*.

The esteem, in which he was held by his fellows both in science and exploration, are indicated by the many honors he received. Notably, he was the first president of The American Polar Society and was later President of The Association of American Geographers as well as The Antarctican Society. The last he served well and remained, until his death on November 25, 1968, a devoted member. At its meeting of December 20, 1968, the Board of Directors adopted the following resolution:

The Antarctican Society notes with profound regret the death of its distinguished former President, Paul Allman Siple, Scientist, Explorer, Public Servant. Participant in six Antarctic Expeditions, he remained, throughout a lifetime of service to his country and his world, an inspiration to younger men, an example to contemporaries, and a strong staff upon which his elders leaned. His passing takes from us a wise counsellor and valued friend.

## PUBLICATIONS OF INTEREST

It is the belief of the editors that many periodicals, such as newsletters, bulletins, and journals, containing material of interest to members, are being issued by various organizations. Two are noted below. The editors will appreciate similar publications being brought to their attention.

### Antarctic Journal of the United States

Many members of The Society are already acquainted with the Antarctic Journal of the United States. Prepared jointly by the National Science Foundation and the Department of Defense, it deals with a wide range of subjects including scientific activities and accomplishments, logistic support operations, history of exploration, international cooperative programs, and other matters of current interest. Published six times a year, it may now be obtained from the Government Printing Office for \$2.50 a year; \$0.75 additional for foreign mailing. Orders should be sent to the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402.

### Newsletter, Institute of Polar Studies

The Institute of Polar Studies of The Ohio State University initiated a newsletter in January. To be issued twice a year, the newsletter is intended to inform organizations engaged in polar and alpine research, and other interested parties, of the Institute's activities and of research possibilities at the Institute. Since the newsletter is also expected to reach individuals not conducting polar research, it will occasionally include general information on polar research and news of significant discoveries in that field. Requests for the newsletter should be addressed to the Institute at 125 South Oval Drive, Columbus, Ohio 43210.

## CORPORATE MEMBERS

The Antarctica!! Society is pleased to announce that the following corporations have indicated their desire to support the work and objectives by accepting corporate memberships:

POLAR EXPEDITIONS, INC.  
ATCO INDUSTRIES, LTD.

It is to be hoped that other companies will, likewise, find it advantageous to assist the Society in carrying on its objectives.

## 1969 TOURIST CRUISE TO THE ANTARCTIC PENINSULA

by

Captain Edwin A. MacDonald USN (ret.), Director Ship & Polar  
Operations, Lindblad Travel, Inc.

This year's January cruise was as usual exciting and especially rewarding for the 112 passengers embarked on board the Chilean Naval ship *Aquiles*. However, this time the number of men exactly equaled the number of women whereas before, the fair sex always outnumbered the men. This upsurge of interest on the part of men appears to be slowly gaining from cruise to cruise.

Probably one of the high points of the 1969 cruise was the warm hospitality shown by the Russians at their new Bellingshausen Station on Fildes Peninsula, King George Island, South Shetlands. Another was the overnight stay aboard the icebreaker USCG EDISTO in Arthur Harbor and at the American Palmer Station on Anvers Island. Sudden rising winds of approximately 60 knots prevented normal boating back to the cruise ship until the following morning. Although facilities were somewhat strained on the icebreaker and even more so at the station (with the research trawler *Hero* alongside), the hospitality and courtesies shown by the men were thoroughly appreciated by the unexpected guests.

At Deception, tourists saw a new island which had mushroomed up from the bottom of the bay, near the former Chilean Station, by the recent eruption of December 1968. Every inch of land was covered with several feet of brownish-black volcanic ash. Jets of steam rise along the shorelines and the smell of sulphur permeates the cold air. At that time the Argentinians and British had returned to their stations at Deception, but the Chileans had not because of extensive damage to their buildings.

A newer, more recent eruption that occurred after the visit, has caused even greater damage. Reports indicate that Mount

Pond erupted, and sent down vast lahars (mud flows containing volcanic debris). One wiped out most of the British Base, the Norwegian cemetery and part of the former whaling station. The other apparently obliterated the Chilean Station. There is a gully through the runway at the British Station about 25 feet wide and 10 feet deep; Kroner Lake has vanished into the harbor.

As usual, the passage, through the LeMaire Channel was an awe-inspiring one. Here, 'towering cliffs rise vertically, their peaks crowned with ice cream-like glaciers. When it's calm, one is hard put to tell the real from the image in the cobalt blue waters.

Next year, three such cruises, with visits to the Soviet Bellingshausen Station, Chilean Bernardo O'Higgins Station, Chilean Gonzales Videla Station, Argentine Almirante Brown Station, United States Palmer Station, British Stations at the Argentine Islands and Adelaide Island, Deception Island, and selected nature sites are planned. Two cruises will include visits to the Falkland Islands; all cruises will attempt crossing the Antarctic Circle and entry into Marguerite Bay. These cruises will be aboard the new ice-working, 250 foot long, 3800 H.P., 16-knot, fully air-conditioned, stabilized ship *Lindblad Explorer* which is now building in Finland, with delivery scheduled for December 10, 1969. A fourth cruise will include; Falkland Islands, South Georgia, Cough and Tristan de Cunha Islands.

Membership in the Antarctic Society is open to  
all persons interested in Antarctica.

### HOW TO JOIN:

Forward a letter to the Membership Secretary, 1619 New Hampshire Ave., N.W., Washington, D.C. 20009. State that you would like to become a member of the Society which has as one of its purposes, the friendly and informed exchange of information and views on Antarctica. An additional statement about any Antarctic duty or experiences you may have had would also be appreciated.

---

## THE ANTARCTICAN SOCIETY

Will hold an open meeting at 8 P.M.

THURSDAY, SEPTEMBER 11, 1969

at the

NATIONAL ACADEMY OF SCIENCES, LECTURE HALL  
2101 Constitution Avenue, NW

Members, their families and all persons  
interested in Antarctica are invited to attend

MR. ROBERT B. THOMSON

will lecture on the

"NEW ZEALAND ANTARCTIC RESEARCH PROGRAM"

Mr. Thomson is the Superintendent, Antarctic Division, Department of Scientific and Industrial Research of New Zealand. He has been associated with antarctic research for several years and his experience includes wintering with the New Zealand and Australian National Antarctic Research Expeditions. For the past several years he has administered the New Zealand antarctic program and in this capacity has been closely associated with the United States Antarctic Research Program.

We are indeed fortunate to have a fellow Antarctic from New Zealand speak to the Society, and I sincerely hope that we can provide a good turnout on this occasion.

Refreshments will be served after the meeting.

# The Bulletin of

## THE ANTARCTICAN SOCIETY

No. 2

October 1969

### A FEW WORDS FROM THE PRESIDENT

Like other parts of the world, changes occur in Antarctica. Some of them can be detected in *this Bulletin*. For example, one of our corporate members, Lindblad Travel, has felt it worthwhile to arrange for the construction of a special ship, *Lindblad Explorer*, designed to take tourists to the polar regions. The operations of the ship will be directed by one of our earliest members, Captain E. A. MacDonald, USN (Ret.). Tourism is not new but it is expanding, and all recognize that it is here to stay. Responsible authorities welcome this development and will continue to do so as long as tour ships and the tourists themselves do not interfere with scientific programs and obey the regulations for the conservation of natural resources and the preservation of historic sites. In practice, close cooperation between tour directors and station leaders seems the best way to handle local problems.

In a very different realm, the Navy expects to introduce the largest ship ever to operate in Antarctic waters, the tanker *Maumee*. In one trip, she will deliver an entire year's supply of bulk fuels to McMurdo Station, about 7 million gallons, and will replace two smaller tankers making six trips. This innovation would be impossible if sufficient storage capacity had not been built up at the station over several years. Another benefit accruing from the employment of *Maumee* is the reduction in the number of icebreakers needed in McMurdo Sound from three to two. It is such intelligent planning and the use of new equipment and techniques that has enabled the Naval Support Force, Antarctica, to maintain and, in some instances, to increase its level of operations and its science support capability despite rising costs. Increased efficiency and their resultant economics have thus far offset inflationary trends.

To me as a non-scientist, one of the interesting features, besides the introduction of women, which everyone understands, is the inclusion in the science program of two projects in the field of paleontology. An attempt will be made to follow up the discovery, two years ago, of the jawbone of a labyrinthodont (a freshwater amphibian), called by many the greatest fossil find of the twentieth century. Success in this endeavour will provide further substantiation for the theory of continental drift. Fifteen years ago, this hypothesis was held only by a few hardy and imaginative souls who were generally looked down upon by their colleagues. Today, it has gained great respectability and wide spread acceptance, largely owing to investigations carried out in Antarctica.

Perhaps, this development could be pointed out to those who question the value of antarctic research, unless, of course,

they are of the type who would only be impressed by the discovery of an oil field like that recently found on the northern slope of Alaska. After all, one of man's few redeeming features is his desire to learn and to know, his eternal curiosity about the universe which he is condemned to inhabit and how it got that way. If work done in the Antarctic expands significantly the area of human understanding, and it has, a sufficient return has been received for the expenditures incurred.

HENRY M. DATER

### BYRD'S FLIGHT OVER THE SOUTH POLE

November 29, 1969 will mark the fortieth anniversary of Admiral Byrd's epoch making flight. With a crew consisting of Bernt Balchen, chief pilot; Harold June, co-pilot and radioman; Ashley McKinley, aerial photographer, and himself as navigator, Byrd took off from Little America at 1538 on the afternoon of November 28 in a Ford Tri-motor, named the Floyd Bennett, and arrived over the South Pole at 0014 the following morning. On the return trip, a stop was made at a pre-positioned cache to refuel the aircraft. The plane returned to Little America at 1008 on November 29. Except for some difficulty in nudging the Floyd Bennett over the pass at the head of Liv Glacier, the flight went smoothly; a tribute to the piloting of Balchen and June and, most of all, to Byrd's careful planning and navigating.

Scientifically, the flight was important largely because of the 250 aerial photographs taken by McKinley, but Byrd himself declared that other flights, particularly those over Marie Byrd Land, were more productive for science and exploration. No other flight, however, so caught the fancy of the American people. Success in this venture made it possible for Byrd to organize a second expedition and, in 1939, to interest the Government in supporting antarctic exploration and research. From the last, it was a natural step to the post-war expeditions (*Highjump* and "Windmill") and finally to United States participation in the International Geophysical Year out of which grew today's permanent antarctic research program, managed by the National Science Foundation and supported by the Navy.

The Officers and Directors of The Antarctic Society are aware of the importance of this anniversary. They have arranged for the chief pilot to speak to the Society on January 13, 1970. The reason for the delay is simply that Colonel Balchen, along with Dr. Laurence M. Gould, who

was second in command of the expedition, expect to be in Antarctica on November 29 and, circumstances permitting, to fly to the South Pole on that date. Colonel Balchen felt, and the program committee agreed, that the interest and value of his talk would be enhanced if he were able to contrast the old with the new.

## THE ANNUAL MEETING

The annual meeting of May 12, 1969 included reports of the officers, amendments to the by-laws, and election of officers and directors for the new term.

Although during the past few month\* the membership of the Society has increased substantially, there are now four Corporate members, there is still the need for continued recruitment in order to enhance the aims of the Society.

The costs of the Society per member per year have been reviewed in the light of increased membership and the future omiay of funds for the cost of the Bulletin. It was found that average costs of \$1.90 leave very little for the general operating expenses of the Society. Therefore, the Finance Committee recommended that the initiation fees and the annual dues be increased, and the by-laws of the Society, Article VII, Sections 1 and 11, be amended to read:

### ARTICLE VII

Section 1. Initiation Fees. An initiation fee of two dollars (\$2) shall be charged, to be paid at the time an applicant submits his application. This fee is not refundable under any conditions after the applicant has been accepted as a member.

Section 11. Dues. The amount of the annual dues of all members, except Honorary and Corporate members, shall be three dollars (\$3), payable annually in advance on or before the first of October. Dues are not refundable under any conditions.

The Society members voted unanimously to accept these amendments, having been duly notified 30 days prior to the meeting, as required by the by-laws.

Activities dunnq the past year were also reviewed during the annual meeting. Members of the Society met on six occasions at the National Academy of Sciences. The annual garden party was combined with reunion of the Deep Freeze personnel held at the Washington Navy Yard.

The Society was pleased to have the French Embassy present the program for the March 20 lecture. Dr. Maurice Levy, Science Attache, gave a short review of the activities of France in the Antarctic. This was followed by a film narrative of the firing of high altitude sounding rockets from the French Antarctic station at Dumont d'Urville.

On April 24, we heard presentations from Rear Admiral J. Lloyd Abbot, Jr., and Albert P. Crary, Deputy Director of the Environmental Sciences Division of the National Science Foundation. A review of the science program accomplishments and summary of the logistic support activities that make the wide ranging Antarctic Research Program possible were presented.

Upon completion of the business meeting, George A. Doumani, Vice President of the Society, gave a lecture on the

work and way of life on the Antarctic trail. The lecture was illustrated with color transparencies showing living, transportation, and study and study programs on IGY traverses and geological expeditions.

Concurrent with these public meetings, the Board of Directors of the Antarctic Society was actively attending to the Society's affairs and legal matters. The Board held five meetings and discussed and directed the activities of the various committees. The major efforts concerned the soliciting of corporate memberships, the establishment of local groups throughout the country affiliated with the Society in Washington, the preparation and publication of the first Bulletin, and the important issue of dues. These activities resulted in a number of Corporate members and the adoption of the amendments to Article VII, mentioned above.

## WOMEN IN THE ANTARCTIC

With the decline of whaling, tourism may soon become the only economic activity in the Antarctic, and it is well known that women have made up a large proportion of those who have gone to the area on cruise ships. In fact the first woman known to have set foot on the continent may be called a tourist of sorts. She was Caroline Mikkelsen, wife of Clarius Mikkelsen, master of the Norwegian whaler, *Thorshaven*, who had accompanied her husband on a voyage to the Antarctic. The date was February 20, 1935. At that, Mrs. Mikkelsen won this honor somewhat by default. Two years previously, the wife of her husband's boss, the Norwegian whaling magnate, Lars Christensen, accompanied by a Mrs. Racklaw, had attempted to reach shore but had been frustrated by four miles of ice. Mrs. Christensen did not, however, fail to establish a record for females. In 1937, she became, as a passenger, the first woman to fly over the continent; Mrs. Racklaw was the second. There is no record of a woman piloting a plane over the area, although at least one, has applied for permission to try.

No other women are known to have landed on the continent after Mrs. Mikkelsen until the 1947-48 season, when the Ronne Antarctic Research Expedition reoccupied the American base on Stonnington Island. The British, who had set up a station nearby, were more than a little astounded when two women came ashore. They were Jackie Ronne, wife of the expedition leader, and Jeannie Darlington, wife of one of the pilots, and they stayed over the winter, thus far, the only women to have done so.

Beginning in 1955, with the first efforts in support of the International Geophysical Year, no exact count is possible of the number of women who have set foot in Antarctica. Soviet ships, for example, have women crew members and scientists aboard, and how many of them may have visited Mirnyy and other Russian coastal stations is unknown, although it is customary for them to do so. The author is aware of no women among Soviet shore parties. During the 1957-58 and 1958-59 seasons, the Argentine Navy sent three tourist cruises to Antarctica. Among the women passengers on one trip was a biologist who used every opportunity ashore to investigate the local flora and actually identified one of three flowering plants known to grow in Antarctica.

The Argentine Navy experience had shown antarctic travel to be practicable. In 1965, Lindblad Travel, Inc., one of The Antarctic Society's corporate members, revived tourism. For the most part, this form of activity has been concentrated in the relatively accessible Antarctic Peninsula area. In January and February 1968, however, the same travel agency sponsored two trips to the Ross Sea and put parties ashore at McMurdo and Hallett Stations, as well as on subantarctic islands. One of the women passengers was an ornithologist, but it is unknown whether others had scientific interests.

The sending this year of five women scientists to do field work in the McMurdo Sound area raises the interesting question of whether women have previously contributed to expedition programs. In other words, what about working women in the Antarctic? Mrs. Ronne kept records, wrote reports and press releases. On October 15, 1957, a chartered Pan-American Airways "Stratocruiser" landed at McMurdo with two stewardesses aboard. After about four hours ashore, the girls were rushed off the continent.

More important were the contributions of Mrs. Philip Law and Mile. Christianne Gilet. Mrs. Law, an Australian, and wife of that country's Director of the Antarctic Division, Ministry of External Affairs, accompanied her husband to Antarctica in 1960-61. A commercial artist, Mrs. Law was assigned to make a pictorial record of Australian antarctic activities. Although wife of the Director, she took her duties seriously and returned with a series of informative paintings. She was the first Australian woman to set foot on the continent, but Australian women scientists had previously worked at Heard and Macquarie Islands in the sub-antarctic.

Mile. Gilet, a Civil engineer, has been head of the technical bureau of the Expeditions Polaires Fran<sup>^</sup>aises. It was in that capacity that she accompanied the French expedition of 1962-63 to supervise the reconstruction of Dumont d'Urville Station, and for this purpose, she lived ashore during the summer season. She has twice since then revisited the Antarctic, and a French woman inospheric physicist, Mme. Genevieve Pillet, has also worked at the station on three occasions. In the autumn of 1968, the Argentine Naval Hydrographic Service sent four women biologists to the Antarctic Peninsula. They were Irene Bernasconi, Maria Adela Caria, Elena Martinez, and Carmen Pujals.

As for the United States, women scientists began working aboard the National Science Foundation's research ship *Eltanin* in 1962. It has, however, taken them until this year to make it ashore for a season. The first of the five to reach McMurdo Station, Dr. Christine Muller-Schwarze, is accompanying her husband and two assistants to carry out a study of penguin behavior. The other four, from Ohio State's Institute of Polar Studies under the direction of Dr. Lois Jones, form a team that will live in tents and conduct studies in geochemistry, glacial geology, and paleolimnology in the ice-free valleys west of McMurdo Sound. Dr. Jones points out quite reasonably that for some years she has been working with specimens brought back by male investigators and that she will obtain a more representative smaple if she can observe them *in situ* and select her own. She is being assisted by Kay L. Lindsay, Eileen McSaveney, and Terry Lee Tickle. A man and wife team from New Zealand will be in the same area. The girls insist that they are going to Antarctica as scientists rather

than women, yet there are few more pleasing novelties than a mini-skirted explorer, no matter how erudite.

## ANTARCTIC RESPONSE TO THE LUNAR LANDING

Antarctica was the only continent wholly without television coverage of the Apollo 11 voyage to the Sea of Tranquility. The event, however, was followed with keen interest by those on the White Continent, the isolation of whose inhabitants and the rugged environment in which they live make it the closest thing to the moon that Earth has to offer. This was evident in the remarks made by two McMurdo residents—Comdr. William G. Hunter, commanding officer of Antarctic Support Activities' winter-over contingent, and Mr. Aleksandr Vasilev, Soviet exchange scientist—who were interviewed over a special radio-telephone circuit as part of CBS-TV's coverage of the historic lunar flight.

On the July 21 (local time) interview, Comdr. Hunter described the reaction of McMurdo's personnel like this: "Well, the general reactions were, somewhat, awe, elation and wonderment [sic]. Some of the comments were, 'amazing', 'fantastic', 'I can't believe it', 'It just doesn't seem real'. Everyone was very excited and certainly had a feeling of pride and just a good spirit of accomplishment over what was taking place there."

Mr. Vasilev, a meteorologist, said: "My reaction was indeed like the reaction of all people who are living on this station in Antarctica and not only this station but all stations in ANtarctica and all people all over the world." Mr. Vasilev described that reaction as "excitement" over this "historical occasion". He added, "All people can be proud that mankind has reached" the Moon.

The comments were broadcast in the United States at 3:30 a.m. (EDT) July 21, approximately 4% hours after the astronauts exited their lunar module and set foot on the Moon.

The special communications circuit was arranged by the Navy at the request of the Columbia Broadcasting System, which wanted to recognize those in Antarctica as fellow explorers of the astronauts as well as to get the reactions from people all over the world. A planned effort to contact South Pole Station was forestalled by the expiration of the limited daily period during which quality voice communications can be maintained with that station, but later in the week the station's complement sent the following message to the Apollo 11 crew:

"The voyages of discovery. . . have not only re-dounded to. . . glory but to the improvement of human knowledge. . . ." — John Quincy Adams.  
Congratulations on the greatest voyage of discovery ever accomplished by man.

Crew  
Amundsen-Scott  
South Pole Station

## SYMPATHY FROM RUSSIA

A message of condolence was received from the USSR by the Office of Antarctic Programs, the National Science Foundation, on the Death of Dr. Paul Siple.

"There is no way that I can express my feelings at this moment," said Mr. N. I. Makarov who signed the message. "The words of our poet H. A. Nekrasov, spoken at another time and under different circumstances, may truly be applied to Dr. Siple: 'What a brilliant light has burned out! What a great heart has ceased beating!' Sadness of similar magnitude among polar scientists was occasioned only by the death of Admiral Byrd. The forty years that Dr. Siple devoted to polar research will be remembered for generations and centuries."

N. I. Makarov is a member of the All-union Geographic Association of the USSR Academy of Sciences, and a participant in Arctic and Antarctic Expeditions. He learned about Dr. Siple's death from the Antarctic Journal of the United States.

## BOOK NOTES

E. A. MacDonald, *Polar Operations*, U.S. Naval Institute, 1969, \$11

Captain MacDonald is a veteran of Navy expeditions in both polar regions, former Deputy Commander and Chief of Staff, U.S. Naval Support Force, Antarctica, and a member of The Antartican Society. He has written numerous articles on his polar activities and has now summed up his experience in polar ship operations in an important book. Some sections may be a bit technical for the general reader, but they are necessary to an understanding of icebreakers and other polar ships and their handling and navigation. The book is extensively illustrated with photographs, charts, and diagrams. Useful appendices include the plans for Wind-class icebreakers, cargo and traffic on sea ice, lists of icebreakers by nationality and of institutions coordinating polar research. There are a glossary,

bibliography, and index. *Polar Operations* is highly recommended for all those interested in the subject matter.

Seon Manley and Gogo Lewis, *Polar Secrets, a Treasury of the Arctic and Antarctic*, Doubleday and Company, 1968, \$4.95.

This book is a collection of excerpts from polar literature that have struck the compilers' fancy. It mainly stresses the Arctic but contains some material in the Antarctic. The selections are capricious and the editing careless. The book is not recommended.

U.S. Naval Support Force, Antarctica, *Introduction to Antarctica*, Government Printing Office, 1969. \$0.60.

Originally published in 1957, this useful publication has been revised to bring its basic information up-to-date. For the first time it is available for public sale by the Superintendent of Documents, Washington, D.C., 20402.

## Reprints

The Greenwood Press, Inc., 211 East 43rd Street, New York, N. Y. 10017, announces that the following reprints are available:

Sir Vivian Fuchs and Sir Edmund Hillary, *The Crossing of Antarctica; The Commonwealth Trans-Antarctic Expedition*, 1959, \$18.00.

John Giaver, *The White Desert; The Official Account of the Norwegian-British-Swedish Antarctic Expedition*, 1954, \$11.00.

U.S. Naval Photographic Center, *Antarctic Bibliography*, 1951, \$14.75.

It seems probable that anyone desiring to obtain the first two volumes listed above could find them at a lesser price by a diligent search of second hand book stores. The third, however, was printed only in a small edition and received limited distribution. While not without omissions and other flaws, it is the most complete bibliography on the period preceding the International Geophysical Year and is a invaluable research tool.

## THE ANTARCTIC SOCIETY

Will hold an open meeting at 8 P. M.

TUESDAY, March 10, 1970

at the

NATIONAL ACADEMY OF SCIENCES, LECTURE HALL  
2101 Constitution Avenue, N. W.

The program will consist of two 16mm color films:

1. "Oceanographer in the Polar Regions" an award winning film, produced for the Oceanographer of the Navy, depicts the role of the oceanographer in the Antarctic and Arctic regions. This outstanding film has won awards at the San Francisco, Chicago International and Columbus, Ohio Film Festivals, as well as the International Film and Television Festival of New York.
2. "Passage to Prudhoe" is the film story of the epic voyage of the Icebreaker Tanker Manhattan through the Northwest Passage to the oil fields of Alaska in August and September of 1969.

Both of these films have been widely acclaimed for their exceptional photography and their showing should provide an enjoyable evening of entertainment.

Members, their families and all persons  
interested in Antarctica are invited to attend.

Refreshments will be served in the Great Hall after  
the meeting.

THE ANTARCTIC SOCIETY

Will hold an open meeting at 8 P. M.

TUESDAY, February 2, 1971

at the

UNITED STATES GEOLOGICAL SURVEY, BRANCH OF SPECIAL MAPS,

Blair Building, 8300 Colesville Road  
(at intersection with East-West Highway)  
Silver Spring, Maryland

Mr. R. B. Southard

Associate Chief Topographic Engineer of the USGS, and  
U.S. Member of the SCAR Working Group on Geodesy and  
Cartography, will give a talk at the U.S. Antarctic  
Mapping Center on

THE INTERNATIONAL EFFORT TO MAP ANTARCTICA

This is a unique chance to see firsthand how maps are made, as well as to learn of the cooperative efforts in mapping by the Antarctic nations. Antarctic Society member "Rupe" Southard has represented the U.S. at SCAR meetings in Paris and Oslo, and is well qualified to discuss the mapping of Antarctica--both technically and historically. Following his talk, there will be a tour of the U.S. Antarctic Mapping Center, run by the USGS for the U.S. Antarctic Research Program. USGS personnel will demonstrate the equipment and techniques they use to map Antarctica. There will be a display of field equipment used to establish geodetic control in Antarctica, and examples of Antarctic maps by all the other Antarctic nations. This should prove to be one of the most interesting and unusual meetings the Society has ever had--don't miss it!

Members, their families and all persons interested in Antarctica are invited to attend. Refreshments will be served after the meeting and the tour. Ample parking is available in the lot on the Colesville Road side of the Blair Building. Signs at the door will direct you to the proper floor.

Note: The next meeting is tentatively set to be the Memorial Lecture, by Peter Scott, son of Captain Robert Falcon Scott, on March 3 at 8 P. M. in the Rotunda of the British Embassy. Mark this date on your calendar.

Dues: In response to the many inquiries to Treasurer Bill MacDonald, we have been requested to inform you that Membership Renewals are \$3, New Memberships are \$5, and Corporate Memberships are \$100.

# *The Bulletin of*

## THE ANTARCTICAN SOCIETY

NO. 3

FEBRUARY 1971

### THE PRESIDENT'S MESSAGE

Each member of the Society has been sent a copy of the By-Laws, and each should have read them carefully. It is almost a sure bet, however, that some have never even glanced at them, and that those who did pursue them have probably forgotten the contents. For this reason, I would like to refresh your memory and then summarize succinctly how the Society's affairs are managed.

Officers and members of the Board of Directors are elected at the Annual Meeting in the Spring. Two major activities of the Society are meetings held by the Board of Directors to manage the affairs of the Society and lectures and informal meetings attended by the membership at large. The issues and affairs confronting the Board of Directors necessitate the appointment of committees in addition to the Program Committee and the Finance Committee required by the By-Laws.

Technically, as the change of administration is effected, the newly elected officers should start immediately to attend to the Society's affairs. It has been our practice to conduct some special meetings during the summer; but our experience has shown that the summer months are not conducive to satisfactory attendance by Board members, yours truly being no exception.

Immediately after the elections this year, I was requested by the Jordanian Government to assist in formulating policy guidelines for their newly established Royal Scientific Society. By the time the State Department approved the request, fighting broke out in Amman in June, and the official trip was postponed. Meanwhile, I proceeded on my annual leave which, ironically, took me to Amman during the month of August. Fortunately, I made it out of the country and back to the States before the situation deteriorated.

Back in Washington, a pile of paper was waiting on my desk, and in it was a letter of resignation from our newly reelected Secretary-Historian, Mr. Ronald McGregor. Ron's work load had become unbearable, and he felt that he could no longer serve the Society satisfactorily. Regrettable as this resignation may be, it is also understandable. Recently, it has become more and more difficult to obtain adequate service for the Society, as the membership grows and the pioneer members rise steadily in their respective professions and face the augmented duties commensurate with their higher positions. This phenomenon is at once wonderful and sad. Advancement and increased responsibility are a source of pride to us, and the resulting inconvenience to the Society is sad but tolerable.

This development brings me to the subject of member participation. The membership of the Society is such that, like similar organization, unless the individual members participate actively in the affairs of the organization, it will ultimately collapse. Carrying a membership card and just belonging to the Society in name does not entitle you to call yourself a participant. A member, individual or corporate, is expected to take part in the Society's activities in order to benefit both himself and others and to contribute to the health and growth of the Society. There have been occasions, during the years of my past service with the Society, when attendance at lectures was disappointingly low. Sometimes it was down right embarrassing, particularly when we had gone through the trouble of inviting an out-of-town speaker.

Your interest in the Society's welfare should be made manifest by your active participation. You do not have to be an officer or a member of the Board of Directors in order to render service and contribute to the Society. You were invited, in the first issue of this *Bulletin*, to write, make your views known, or contribute an item or two which is newsworthy, to your fellow members. That invitation stands, but it goes beyond the *Bulletin*. If you know of a person coming to Washington, a good prospect for a lecture, for example, let us know about him. If you have some constructive ideas that you think can improve the management or the posture of the Society, let us hear them. In short, we would like you to be thinking of your Society, critically and constructively, and to participate actively in furthering its-goals.

I shall not belabor the point. I simply wish to stress the fact that you, as individuals and as a group, make the Society what it is. The fact that you elected us as your officers does not absolve you from your responsibilities, and in no way should it be interpreted as a license for relinquishing responsibility and just "letting George do it." This George is going to do his darnedest, but he certainly will need your help.

George A. Doumani

### NEWS and VIEWS

Any members having items of interest concerning Antarctica, other members etc., are requested to address them to the Editor of The Bulletin Dr. Henry M. Dater

The Antarctic Society  
1619 New Hampshire Avenue NW  
Washington, DC 20009

## HIGHLIGHTS OF LAST YEAR'S WASHINGTON ACTIVITIES

### LECTURE SERIES

During the past season, members in the Washington area enjoyed several lectures at the National Academy of Sciences and a very successful annual Garden Party.

The first speaker was Mr. Robert B. Thompson, Superintendent of the Antarctic Division, Department of Scientific and Industrial Research of New Zealand. Mr. Thompson was followed in October by Mr. Richard Schirmacher, presently with Lufthansa in New York, and Dr. R. Regula, Chief Forecaster of Lufthansa in Frankfurt, Germany, and Chief Pilot and Forecaster of the "Third German Antarctic Expedition of 1938-39." The expedition was little known and equally little publicized, and the lecture provided the members with a new insight and very interesting details of this expedition.

In November 1969, Dr. Carleton Ray, Associate Professor at The Johns Hopkins University gave an illustrated lecture on polar marine mammals in their natural habitat, with very unusual under-ice photography.

To commemorate the fortieth anniversary of Rear Admiral Richard E. Byrd's first flight over the South Pole, the first lecture in 1970 was given by Colonel Bernt Balchen. Invitations were sent to other members of the Byrd expedition, and the lecture became a reunion as well.

In an era when oceanography has come to occupy a position of national and international concern, the Society enjoyed two appropriate films on the subject. The first film was the award winning "Oceanographer in Polar Regions," depicting the role of the oceanographer in Arctic and Antarctic regions. The second film was the timely record of the transit of the Northwest Passage by the ice strengthened tanker *Manhattan*, from Philadelphia, Pennsylvania, to the oil fields of Arctic Alaska in August and September of 1969.

As has become customary, a high point of the year were summaries of the scientific and the support activities in Antarctica during the season. Dr. Louis O. Quam, of the National Science Foundation, presented the summary of the research activities, and Rear Admiral David F. Welch, USN, summarized the activities of *Operation Deep Freeze*.

### ANNUAL GARDEN PARTY

Most of you in the immediate vicinity of the District of Columbia have in the past enjoyed the annual outdoor get-together of the Society. This event started out as an annual party that was held at the home of Dr. and Mrs. Carl Eklund and later at the residence of Rear Admiral and Mrs. Richard B. Black. Later, the gathering developed into a family-style picnic held in nearby places like the Smithsonian's Belmont Estate at Elkridge, Maryland, and Great Falls, Virginia.

This year the Society members and their families enjoyed a wonderful time in the pleasant surroundings of the Stronghold Estate on Sugar Loaf Mountain near Dickerson, Maryland. Sugar Loaf is a lonesome peak that juts uniquely out of the plains and commands a beautiful view of the Maryland countryside, plus trail hikes through its wooded slopes and some steep rock climbing near the top.

### BUSINESS MEETING

The annual business meeting was held on May 13, 1970, for presentation of the Officers' reports and the election of new officers and directors. The Officers duly elected were George A. Doumani, President; William Sladen, Vice President; William MacDonald, Treasurer-Membership Secretary; and Ronald McGregor, Secretary-Historian. Commander McGregor later resigned because of his heavy workload.

### PRESIDENTIAL ADDRESS

At the conclusion of the annual meeting, Dr. Henry M. Dater, the outgoing President, presented a paper entitled "Antarctica—A Study in Technological Impact," which was subsequently published in the *Antarctic Journal of the United States*, July-August 1970, p. 145-149. Dr. Dater made an historical excursion back to the days of Captain Cook, whom he called "the real founder of antarctic history." Then he traced the technological innovations from the dog days through the days of mechanized and airborne exploration to the present era of the Hercules (C-130), the Starlifter (C-141), and turbine-powered helicopters. A radical change has been brought about in the Antarctic continent comparable to the change from the nomadic life of early man to the days or urban settlements. This change is manifest in the departure from temporary hutments to permanent stations, a change which brought with it familiar problems of hygiene and contamination. "Today," concluded Dr. Dater, "man finds himself struggling not only with how to live in harsh environments, but also against the products of his own presence."

### BOARD OF DIRECTORS ACTIVITIES

The Board of Directors met periodically to conduct the business of the Society and attend to its administrative affairs. Emphasis during the past year was placed on increasing both corporate and individual membership and on the establishment of out-of-town affiliates. One important concern has been the Society's attempt at insuring preservation of the private papers of the late Rear Admiral Richard E. Byrd. A committee was established under the chairmanship of Rear Admiral David M. Tyree, and a dialogue commenced with the Byrd family in an effort to find ways and means to place the Byrd papers and memorabilia in an appropriate repository.

Another topic was the proposal by some members that the Antarctic Society should change its purely "southern" character and become bipolar to include the Arctic as well. A committee was established to study this proposal and to make recommendations commensurate with its findings. The committee, chaired by Captain John G. Stubenbord, III, USN, MC, (Ret.), reported that, following interviews with eminent members of the Antarctic Society and others interested in polar regions and with its various disciplines, it was recommended that the Society should continue as a separate entity, and that provisions should be considered for broadening its membership and strengthening its present foundation.

### POLAR CENTER PROPOSED

The Arctic Institute of North America has proposed the establishment of a National Polar Memorial Center in Washington, D.C., in memory of the great Americans who have worked to explore and study the polar regions.

The proposed center would house the administrative offices of the Institute, and would include a polar science information center, a modern scientific library, an auditorium, conference facilities, limited museum areas, and office space for visiting scholars. The center would complement the resources of many government agencies which are involved in polar programs, operate in collaboration with educational institutions of the Washington area, and serve all the universities and academic centers in North America.

The Antarctic Society discussed this proposal upon a request from the Arctic Institute, and the Board of Directors adopted a resolution expressing the sense of the Society that such a facility is viewed favorably, with the proviso that by participating in the Center, the Society would not compromise its autonomy. Aside from this reservation, the Board of Directors considered the proposed center to be a most worthy concept.

### **ADMIRAL RICHARD E. BYRD POLAR CENTER**

The Admiral Richard E. Byrd Polar Center was incorporated under Massachusetts law in July 1968 as a non-profit organization by a group of Bostonians interested in carrying on Admiral Byrd's life work of advancing knowledge of polar regions and in the creation of a memorial to the Admiral and his men. The Center is located at Central Waif, New England Aquarium, Boston, Massachusetts 02110.

### **OFFICE OF POLAR PROGRAMS**

Most of you are by now aware of the increasing importance of the Arctic since the recent discovery of oil on the Alaskan North Slope. A dramatic increase in research activities has resulted, particularly in ecological studies and disciplines directly related to the Arctic environment.

In keeping with the needs of the Federal Government, the National Science Foundation was charged with coordinating Federal Arctic Research, and the Office of Antarctic Programs was changed to the Office of Polar Programs. Dr. Louis O. Quam was designated Acting Head of the office, with Philip M. Smith as Deputy Head.

### **LAUNCHING OF THE RRS BRANSFIELD**

The Royal Research Ship *Bransfield* was launched by Lady Fuchs, wife of Sir Vivian Fuchs, Director of the British Antarctic Survey, on Friday, September 4, 1970 at Leith, Scotland.

The Natural Environment Research Council ordered the ship for the use of the British Antarctic Survey to relieve and re-supply the seven Antarctic stations present maintained by the United Kingdom. Six of these are strung along the Antarctic Peninsula and its off-shore islands, the seventh, Halley Bay, lies 1,000 miles away across the ice-filled Weddell Sea. The ship will make her maiden voyage in time to reach the stations during the 1970-71 Antarctic season.

*Bransfield*, designed by Graham and Woolnough, is strongly build to withstand the stresses of navigation through heavy ice. She is 327 feet overall with a beam of 60 feet and draft of 21 feet. The hull is of all-welded construction, the scantlings are to Lloyds' "Ice Class 1" requirements, and the shell plating is 1 1/8 inches thick, increasing to 1 1/4 inches in vulnerable areas. The frames are 14 to 16 inches apart and side tanks up to weather deck level extend from the fore to the after peak. The rounded hull form will help her to rise above pressure ice which would squeeze a slab-sided vessel. To enable her to forge a way through pack ice the stem is heavily raked, in icebreaker manner, from above the loaded water line to a short vertical step at the keel.

The main propulsion system is diesel-electric. Two engines provide power for a single electric motor delivering 5,000-shaft horsepower. The variable pitch propeller enables this power to be used more effectively when operating at low speeds in ice. In open water her operating speed is expected to be 14 knots, with an endurance of 50 days at this speed. Bilge keels, which would be damaged by ice, have been omitted but a passive stabilization system has been installed, and the main mast immediately above the bridge provides access to a high crow's nest from which the ship can be controlled. There are three other conning positions, the wheel house and either bridge wing. Two radar systems can be interswitched and either will work a "slave" on the chart table.

Two marine biological laboratories lie under the helicopter deck aft. Fire precaution systems conform to the latest Inter-governmental Maritime Consultative Organization (IMCO) regulations and on each side she carries sufficient life boats to accommodate all on board.

The cargo capacity is some 120,000 cubic feet in three separate holds, and the 50-ft. after hatch will facilitate the carriage of large, bulky items. A 5-ton crane is fitted forward and a 15-ton Speed Crane derrick aft.

The *Bransfield* will carry a crew of 36 officers and men, all in single cabins, and 62 expedition members in 15 four-berth and 2 two-berth cabins. All living accommodations are above the weather deck.

The name *Bransfield* was chosen to honor Edward Bransfield who, on his pioneering voyage of 1820, may have been the first man to sight and chart a portion of the Antarctic mainland. [There is no need to revive the Bransfield-Palmer controversy in this Bulletin. Ed.] Otherwise, relatively little is known about him. Born between 1782 and 1784, either in Cork or County Cork, he was probably impressed into the Navy in 1803 and served in numerous ships during the war against Napoleon. By 1813 he was a Midshipman, and in 1814 was awarded his Master's certificate by Trinity House. At this time he was described as "an assiduous officer, an excellent navigator and a good pilot."

In 1817 he wrote to the Admiralty describing his methods of calculating longitude and sought an appointment as Master of any vessel sailing on a voyage of discovery in order to try it out. It was this which finally led to him visiting the Antarctic in the 1819-20 season.

### **ANNUAL DUES**

A reminder to all members that dues are payable annually on October 1st. The annual dues are currently: Member \$3.00; Corporate Member \$100.00.

## Antarctic Air-Operations, 1970-1971; Deployment

Over the years, the U.S. Naval Support Force, Antarctica, has developed a discernible pattern of air operations. The initial phase calls for the deployment of the summer support personnel, high priority cargo, including mail and fresh vegetables, and new crews to relieve those who have passed the winter at various stations. The first order of business is to reactivate the full facilities at McMurdo Station and its airport, Williams Field, followed by regaining physical contact with the inland stations. Except for administrative personnel and a few investigators whose projects require early field work, scientists come in a second wave beginning in late October, as do naval construction workers and others with summer projects. Distribution of parties inland begins during late October and early November, while at the same time ski-equipped Hercules of the Navy Air Development Squadron Six (VXE-6) commence the resupply of the inland stations.

This last activity continues throughout the season. Likewise, once begun, the support of scientific parties is a continuing activity for which Hercules supply and move those at remote field locations, while helicopters perform the same services for small groups in the McMurdo Sound area. A unit of 3 UH-1D turbo-powered helicopters annually provides field support for a scientific survey, this year, a geological and paleontological study in the Central Transantarctic Mountains.

Deployment is completed by late November and is the subject of the following paragraphs. During December and January, the concentration is upon resupply of stations and the support of the scientific effort. Finally, beginning in late January and continuing through February, the original flow is reversed and both navy men and scientists, except those destined to winter-over, pour out of the Antarctic on their homeward journeys. This last phase will be in full swing when the readers receive this issue of the *Bulletin*.

On October 8, the first aircraft arrived at McMurdo Station. Five Hercules and one Super-Constellation landed without incident. The seventh plane, a second Super-Constellation, was not so fortunate. When about two hours from McMurdo, well-beyond the point of safe return, a sudden storm blew-up. By the time, the plane arrived over Williams Field, visibility had declined to zero-zero and a heavy cross-wind was blowing. After making five passes over the field, the pilot decided to come in for a landing. He touched down; the Super-Constellation veered off the runway, tore loose a wing, and ripped over on its side. Fortunately, the 68 passengers and 12 crewman aboard tumbled out without injuries beyond a few sprains and bruises not worthy of hospitalization. The aircraft, however, was a total loss, and its unavailability affected operations throughout the season.

When the personnel evacuated the Super-Constellation, their ordeal was not over. So bad was the visibility that it took a considerable time for rescue vehicles to find the party, and then, progress toward the station was painfully slow, a man having to walk ahead of the vehicles to point out the road. The affair clearly emphasizes the unpredictability of antarctic weather and the dangers of antarctic air operations, even in this day of greatly improved equipment and techniques, and explains the emphasis continually placed on safety precautions by the Commander, U.S. Naval Support Force, Antarctica.

The storm continued for 48 hours before flying could resume. During the next two weeks, southbound flights

frequently encountered strong headwinds, and several had to turn back to New Zealand, delaying the movement of cargo and personnel into the Antarctic and further aggravating the situation caused by the loss of the Super-Constellation. Scientists and navy men with equipment and needed supplies began to pile up in Christchurch. Conditions brought to mind the remark made some years ago by Rear Admiral David M. Tyree. "In the Antarctic," he said, "we don't have schedules so much as objectives."

The I; k log began to be reduced late in October when two Hercules of the Royal New Zealand Air Force joined briefly in the operation lifting some 30 tons of high-priority cargo into McMurdo. Very soon thereafter, heavy transports of the U.S. Air Force began their annual peak-season operations. Included among them was a Cargo Master (C-133) bearing two helicopters, as the largest plane ever to land in the Antarctic. Air Force Starlifters made 12 round trips between the continent and New Zealand carrying another 220 tons of cargo and 168 passengers. Simultaneously, Navy Hercules continued their flights so that by the end of November 1,200 persons had arrived at McMurdo. Deployment for the season was complete.

Concurrent with this effort, Hercules beg in flights to inland stations, first to reestablish the two summer stations—Hallett, north of McMurdo at the cape of the same name and Brockton on the Ross Ice Shelf. These installations exist primarily to furnish weather information for flights between New Zealand and McMurdo or from the latter place to Byrd and Amundsen-Scott South Pole Station. Emergency landings are possible at both places, and Hallett Station because of its interesting flora and fauna, is visited by United States and New Zealand biologists.

On October 14, a Hercules landed at Byrd Station, the first flight to that isolated spot since the previous February 18, a period just a few days less than eight months. Needless to say, the grizzled veterans were delighted to greet the 18 persons come to relieve them and to receive 2.6 tons of cargo, which included their mail, fresh vegetables, and other delicacies. The authorities were especially anxious to reach the South Pole because of the presence of a navy man stricken seriously ill the previous July and urgently in need of hospital treatment. The young doctor, with only radio consultations to assist him, had carried the patient through, improvising where needed drugs that were in short supply or non-existent. No better illustration could be provided of the necessity for having a competent physician at each Antarctic station. The first effort to reach the South Pole, on October 20, was turned back by bad weather. Eleven days later, a Hercules made the flight successfully, 15 years to the day after the first landing at the South Pole, by Rear Admiral George J. Dufek. The patient accompanied the aircraft on its return to McMurdo, the initial leg of the long journey to health and home.

The first flights of the season are primarily to bring naval summer support personnel into the area. As soon as they can reopen the stations, set up the equipment, and make things ready, scientists start to arrive in the area, and it is possible to place them in the field, usually in late October or early November. Bad weather caused some ill-days in the original schedule, but by early December the principal field parties had been established. While completion of this phase hardly means the diminution of air activity, its successful accomplishment is necessary if the season's planned objectives are to be obtained.

## OUR CORPORATE MEMBERS

It is the hope of the editor to present brief sketches of the corporate members of the Society, emphasizing the connection of each with cold weather activities. The generosity of these organizations has been of great assistance in sustaining the activities of the Society.

### POLAR EXPEDITIONS, INC.

Polar Expeditions, Inc. (POLEXI), a commercial company organized in 1968 is affiliated with the Arctic Institute of North America. It was formed to serve government, industry, and the scientific community by providing professional services in connection with mounting field expeditions into the Arctic, Antarctic, and Alpine regions.

POLEXI's most recent task is a study of offshore ice and bottom sediments along the coast of Alaska in the North Slope oil field area. The purpose of the study is to provide information to a group of fifteen oil companies that will be useful in the resolution of offshore drilling and construction-engineering problems. Concurrently with this project, the Mackenzie Valley Pipeline Consortium contracted with POLEXI to obtain certain data pertaining to permafrost in an adjacent offshore area. Mr. Richard E. Ragle, on loan from the Arctic Institute, was appointed as Director of both projects. The field teams have been supported by two Super-Courier Aircraft under the direction of the Chief Pilot, Mr. Philip Upton, and occasionally a helicopter, all on lease to POLEXI. An aerial photo and sensor capability is included.

In addition to field work, POLEXI has exclusive franchises for certain specialized premium quality field equipment. Staff personnel are available for consulting services in planning support for cold weather field work.

## BOOK NOTES

P. Briggs, *Laboratory at the Bottom of the World*, David McKay Company, Inc., New York, \$5.95.

Mr. Briggs is a journalist who made a brief visit to Antarctica during *Deep Freeze 70* and was tempted to write a book. He should have resisted the temptation, at least until he had assembled and digested more information. The presentation is uneven, and there are far more errors than are acceptable. It is a source of puzzlement why reputable publishers do not submit manuscripts for expert review before rushing into print. It is not recommended.

H. G. R. King, *The Antarctic*, Arco Publishing Company, New York, \$9.95.

Mr. King, the distinguished Librarian of the Scott Polar Research Institute, has prepared an introductory volume on the Antarctic. Covered in easily-understood, non-technical language are a description of the area, an outline of its history, brief accounts of the various scientific disciplines and their accomplishments, and a review of economic activities, whaling and sealing. Unfortunately, there are a number of small, un-

important, but annoying errors and occasionally a British bias is obvious. The book, however, is recommended for anyone who desires a quick over-view and serves as an excellent introduction to the study of Antarctica. It is the best overall presentation available, and therefore, deserves a place in any Antarctic library.

CDR A. R. Ellis, ed., *Under Scott's Command: Lashly's Antarctic Diaries*, 160 pp., illus., Taplinger Publishing Company, New York, 1969, \$4.75.

William Lashly was a leading stoker in the Royal Navy when he volunteered for Scott's first expedition. On his return, Scott urged that he be promoted, and Lashly became a Chief Petty Officer. In that capacity, he joined Scott's second expedition. The title of Stoker is misleading, because his principal function in the engine room was that of a mechanic rather than a coal shoveler. A country boy by origin, he was a jack of all trades and apparently could turn his hand to almost anything. At various times during the two expeditions, he worked as electrician, motor mechanic, carpenter, geologist, and mule tender. He became an expert sledge and trailman. In action, he was calm and resourceful. Scott on the first expedition and LT. Edgar Evans on the second, both credited Lashly with saving their lives.

Intermittently, he kept a diary noting down what seemed to him important. Most of the entries are short and laconic simply recounting the facts in a semi-literate English. The editor has fleshed out these bare entries with quotations from Scott, Wilson, Cherry-Garrard and others, as well as interpolating background material of his own to make the brief entries more intelligible. Lashly does not alter significantly the story as told by Scott, but he does add some interesting details. For example, when on the trail, he wore two shirts and each month changed them around, putting the one that had been inside on the outside. Lashly was greatly admired by both officers and men. It is to be regretted that he was not given to reflection because it would be interesting to know how the expeditions looked to those on the mess deck.

Robert Silverberg, *The Adventures of Nat Palmer, Antarctic Explorer—Clipper Ship Pioneer*, McGraw-Hill Book Company, New York, 1967, \$3.95. Children, Junior High School.

For the young reader, *Nat Palmer* recounts simply and clearly the story of an exciting life. The author handles the Palmer-Bransfield controversy sensibly by pointing out that, although the evidence is none too clear, whoever of them may have seen Antarctica first, both were skillful sailors and brave men. The vexing question of what Palmer and Bellingshausen said to one another is equally well discussed, but fails to note the possibility that Bellingshausen may have seen the Continent before either Bransfield or Palmer. According to the dust jacket, Silverberg is "one of the most prolific writers of children's books" and has "several dozen" in print. Such an author does relatively little research, and some slips in this volume attest to the haste with which he works. Even some adult Antarcticans, who know of Palmer's contribution to the Antarctic, will be interested in learning of his distinguished later careers in the China trade and as a pioneer designer of clipper ships. The book is recommended.

## Books from New Zealand

The New Zealand firm of A. H. & A. W. Reed Company, one of the Dominion's principal publishers, has been pleased to make available to the members of The Antarctic Society, the three following books:

Thompson, *The Coldest Place on Earth*, \$5.25

Buiing and Mannering, *South*, \$7.45

Braxton, *The Abominable Snow-Women*, \$5.25

Prices are quoted in U.S. dollars. The books may be ordered from:

The Promotion Department

A. H. & A. W. Reed Company

Box 600 2, Te Aro

Wellington, New Zealand

They will be shipped by surface mail.

R. B. Thompson, *The Coldest Place on Earth*, A. H. & A. W. Reed Company, Wellington, New Zealand, 1969, \$5.25,

Bob Thompson, a New Zealander with two winters passed in the Antarctic, was chosen to head the joint Australian-U.S. party at Wilkes Station for the 1962-1963 season. Part of the plans for the campaign was an overland traverse south of Wilkes. When assured of U.S. aid by air-dropping fuel, Thompson decided to extend the inland journey to the temporarily abandoned Soviet Vostok Station. This book recounts the story of that heroic journey — 1,800 mile round trip. The narrative gives an accurate and enthralling picture of what antarctic surface travel is like in the era of cracked vehicles and radio communications. *The Coldest Place on Earth* is highly recommended.

Graham Billing and Guy Mannering, *South: Man and Nature in Antarctica*, Rev. ed., A. H. & A. W. Reed, Wellington, N.Z., 1969, \$7.45.

The first edition of this work was published in 1964. Revision was held to a minimum for the second edition being mostly in the form of updating information to make it as current as possible. The volume contains 89 pages of impressionistic text, followed by 207 illustrations, a great number in color. The author and illustrator approach their task from a New Zealand viewpoint, but not overly so. Publication was

done in Japan, a fact which may account for an unnecessary number of typographical errors. With Emile Schulthess, *Antarctica*, published in 1960, no longer in print, *South*, is probably the best picture book available in English, and the price is modest. It is recommended.

Dorothy Braxton, *The Abominable Snow-Women*, A. H. & A. W. Reed Company, Wellington, New Zealand, 1969, \$5.25.

Mrs. Braxton is a veteran New Zealand journalist who participated in a 1968 Lindblad tour to McMurdo Sound aboard the chartered Danish ship *Magga Dan*. She tells the story of the trip in clear journalistic prose with an eye for detail and an ear for the appropriate anecdote. The book is interesting and is recommended to anyone who wishes to know about Antarctic's newest and only expanding industry.

## Reprints

Literature House/The Gregg Press, 121 Pleasant Avenue, Saddle River, New Jersey 07458, as announced that the following reprints are available:

Benjamin Morrell, *A Narrative of Four Voyages to the South Sea*, \$35.00

Charles Wilkes, *Narrative of the United States Exploring Expedition*, 5 vols., \$125.00

Morrell was in the Antarctic during the 1821-1822 and 1822-1823 seasons. On the second voyage he made the first known landing - a Bouvet Island, visited South Georgia and the Kerguelen islands, and reported a penetration of the Weddell Sea to latitude 70°14'S. Morrell's sightings of land between 62° and 69° South have since been disproved, and his account seems to be a strange compound of fact and fiction.

Wilkes' narrative of his great voyage was printed only in limited numbers during his lifetime. Its reprinting at this time is most welcome. Obviously, its importance transcends the Antarctic because, during the four years that the expedition lasted, only about four months were passed in antarctic waters. While the price is high for individuals, its acquisition by libraries specializing in geography, exploration, history of science, and kindred subjects is recommended.

WASHINGTON, D. C. 20009

"M E M O R I A L    L E C T U R E"

\* \* \* \* \*

THE ANTARCTICAN SOCIETY

Will hold an open meeting at 8 P.M.

WEDNESDAY March 3, 1971

at the

AUDITORIUM OF THE NATURAL HISTORY MUSEUM

(a facility of the Smithsonian Institution  
located at 10th 4 Constitution Ave., N.W.)

DR.    PETER SCOTT

Son of CAPTAIN ROBERT FALCON SCOTT, and  
a naturalist of international reputation,  
will give a talk on

"ANTARCTICA--PAST, PRESENT AND FUTURE"

Peter Scott will be returning from the Antarctic when he stops in Washington to speak to the Antarctic Society, and his views on Antarctica will be illustrated by slides. Dr. Scott is a well known naturalist and conservationist, being Director of the Wildfowl Trust in England, Vice President and Chairman of the Trustees of the World Wildlife Fund, Chairman of the Survival Service Commission of the International Union of the Conservation of Nature and Natural Resources, and the Fauna Preservation Society, and a member of the International Ornithological Committee. The May 1970 issue of "Smithsonian" has an article on him, in which he is described as "...Commander of the Order of The British Empire, twice winner of the Distinguished Service Cross for naval derring-do, thrice holder of the premier British trophy for small boats, Olympic medalist, sometime National Gliding Champion, explorer, familiar guru of British television, painter, author of a dozen books, ornithologist extraordinary, twice Doctor of Laws honoris causa, counselor to the Establishment and friend of kings ..." Peter Scott is an excellent speaker, and should not be missed on this rare visit to Washington.

PLEASE NOTE THE CHANGE OF LOCATION FROM THE PREVIOUS NOTICE, MADE NECESSARY BY THE SIZE OF THE EXPECTED AUDIENCE. FOR THE SAME REASON, REFRESHMENTS WILL NOT BE SERVED FOLLOWING THE MEETING, A DEPARTURE FROM OUR USUAL PROCEDURE. AS USUAL, THE PUBLIC IS INVITED TO THIS LECTURE.

Treasurer Bill MacDonald will be prepared to accept renewals and new memberships at the meeting.

# THE ANTARCTICAN SOCIETY

1619 NEW HAMPSHIRE AVENUE, N.W.  
WASHINGTON, D.C. 20009

THE ANTARCTICAN SOCIETY

in conjunction with its annual business meeting Will hold an open meeting at 8 P.M.

TUESDAY MAY 11, 1971

at the

NATIONAL ACADEMY OF SCIENCES  
2101 Constitution Avenue N.W.

All members are encouraged to attend and participate in the election of officers and new board members for 1971-72. Nominations will be accepted from the floor, however-, the Board, through the recommendation of the Nominating Committee, Chaired by Mr. Kenneth Moulton, presents for your consideration the following slate of officers and board members;

Officers	Board Members
Dr. William J.L. Sladen—President	Mr. Thomas F. Kelley
Dr. Max E. Britton—Vice President	Mrs. Josephine N. Seelig
Mr..Gerald Pagano--Secretary	Mr. Ralph A. Lenton
Mr. William R. MacDonald—Treasurer	Mr. Fredric L. Darling

Following the business meeting (about 8:30 P.M.)

PROFESSOR MILES O. HAYES  
of the  
Department of Geology  
University of Massachusetts

will present an audio-visual concert entitled

SUZANNE'S LAMENT

A 45-MTNUTE TONE POEM ABOUT THE GLACIAL OUTWASH  
PLAIN SHORELINE OF SOUTHEASTERN ALASKA

Combining photography and music to describe the scenery, geology, and environmental setting of the southeastern coast of Alaska, this unusual program includes some of a geological field party's reactions

- to a remote and beautiful place
- to the people who live there
- to the imminent destruction and alteration of the natural surroundings

Members, their families and all persons interested in Polar regions are invited.

Refreshments will be served in the Great Hall after the meeting.

Program Chairman: Peter Bermel - (202) 343-8995

# THE ANTARCTICAN SOCIETY

1619 NEW HAMPSHIRE AVENUE, N.W.  
WASHINGTON, D.C. 20009

Dear fellow Antarcticans:

The annual spring garden party of our Society will be held at the Stronghold Estate on Sugar Loaf Mountain near Dickerson, Maryland (map attached) on Friday, June 18, 1971, from 3:30 p.m. until 10:30 p.m. This is the site of last year's very successful party. The party will consist of a social hour with cocktails (cash bar) from 3:30 until 7:00, at which time a dinner buffet (menu attached) will be catered by the near-by Comus Inn.

As some of you already know, the United States will issue on June 23 a stamp commemorating the 10th anniversary of the entry into force of the Antarctic Treaty. The Antarctic Society is a co-sponsor of this stamp, and is having special envelopes printed to mark the occasion. First day of issue cancellations will be available at two locations in the Washington, D.C. area (only). In the though that many members who normally are not interested in stamps may want to acquire first day of issue covers for themselves or for their friends, our program following the buffet will be on polar stamps and covers. Society Director Tom Kelley, a long-time member of the American Society of Polar Philatelists and a stamp expert of international repute, will explain how the stamp was designed, our Society's involvement in the ceremonies attendant to its issuance, and give some suggestions on unique "covers" that members may acquire with a little imagination and trouble. Don't miss out on this once-in-a-lifetime U.S. Antarctic Treaty Commemorative Stamp.

The Georgian-Colonial mansion, Stronghold, is being made available exclusively for the Antarctic Society party. Weather permitting the party will be held in the extensive gardens adjoining the residence. If it rains, come anyway, for we will move inside the large mansion. You may want to bring informal or casual clothing, especially if you decide to arrive mid-afternoon, as it is only a short distance to the top of Sugar Loaf Mountain.

The cost for the garden party will be \$6 per person. Children 10 and under will be the guests of the Society and will receive a special buffet and soft drinks at no cost. We hope you can join us for what promises to be a repeat of last year's most enjoyable occasion in a very delightful atmosphere. Friends of members are, of course, welcome.

Please complete the attached reservation form and return it with your check as soon as possible, but not later than June 11, Reservations may be made by telephone to Fred Brownworth or me at the Geological Survey, (202) 343-8995, or to me at home (703) 560-4372. WE KNOW THAT FRIDAY MAY BE INCONVENIENT FOR MEMBERS, BUT PRIOR COMMITMENTS, ETC., MADE THIS SCHEDULING NECESSARY. WE HOPE YOU FIND IT POSSIBLE TO COME ANYWAY. (AN HOUR'S LEAVE, MAYBE?)

Pete Bermel, Chairman  
Program Committee

## STRONGHOLD-IS

April 1, 1969

First, a small mountain, geologically unique; second, a man, Gordon Strong, who "discovered" it and recognized its possibilities and then, in 1946, organized Stronghold, Inc., a non-profit corporation to develop the potential of the little mountain. He had some idea that people who have an appreciation of natural beauty are better people, people who treat each other better and that the mountain offered a means of bringing about that appreciation. Lastly, it is a dedicated staff, headed by a Board of Trustees of eleven men who serve without pay.

After "discovering" the mountain in 1902 (it was previously discovered in 1707 by Swiss, Louis Michel) Gordon Strong, a Chicagoan of Scotch ancestry spent over 50 years acquiring the mountain, until, at his death in 1954 he held 2350 acres. In 1926 he made arrangements that permitted the public to share with him and his wife the more spectacular parts of the mountain.

Gradually, the property was improved with roadways, landscaping and buildings, including his own residence. The natural-looking lake at the foot of the mountain is not natural at all; it was once a flat field where killdeers nested among the stones. The Georgian-Colonial residence was built in 1912 and enlarged in 1928. It is only one wing of an intended imposing structure that will be used to further the aims of Stronghold, Inc. that now owns the mountain property. The principal aim of the corporation is to do the thing that Gordon Strong conceived, "the teaching of an appreciation of natural beauty."

Since all his relatives were well-provided for in the will of his father, Henry Strong, and by the trust fund set up by it, Mr. Strong, in writing his own will could devote most of his assets to the mountain. Accordingly, a trust fund was arranged with The Riggs National Bank of Washington and the modest income thereby arising was directed to be paid to Stronghold, Inc. This income is now used by that corporation to maintain and develop the mountain.

In its administration of the now nearly 3000 acres in its care, the Board of Trustees proceeds on the principle of maintaining the area in as near a natural state as possible. Sugar Loaf Mountain as well as being possessed of considerable scenic attraction is geologically important. Geologists have said that the determination of its formation and subsequent history may well provide the key to the structure of the western Piedmont area.

A motor road permits driving to near the foot of the sugarloaf-shaped top of the mountain and at its terminus is ample parking hidden among the trees. From this point a trail leads to the top, 1283 feet above sea-level, and at its beginning Mr. Strong had erected a sign which reads:

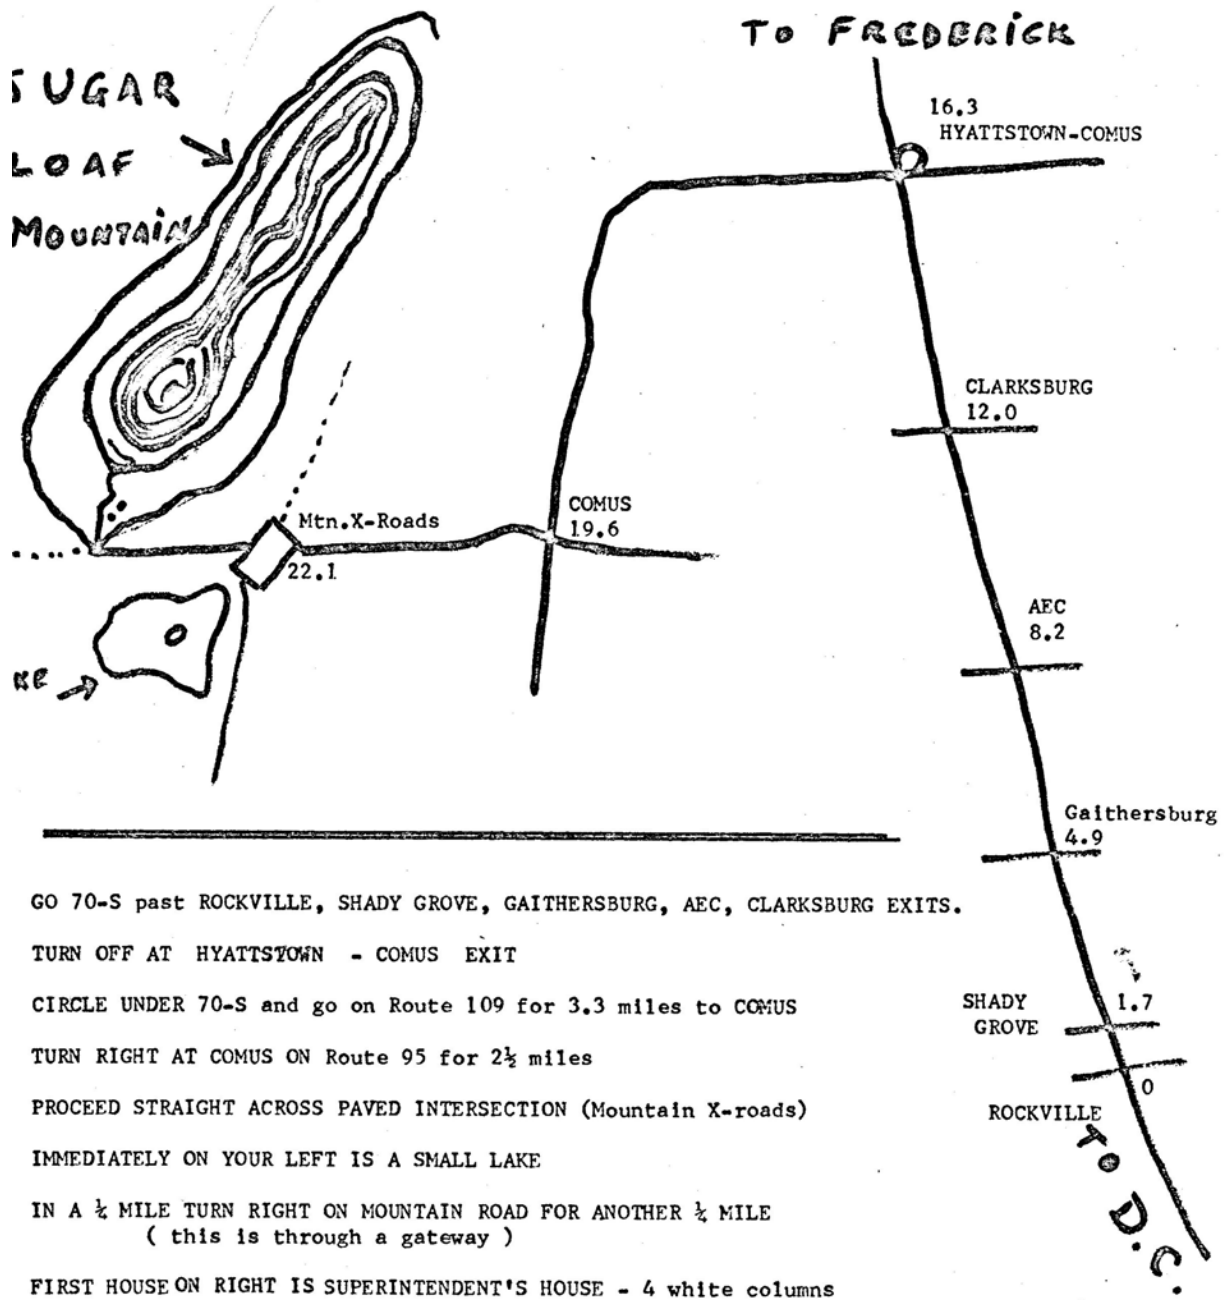

"One quarter mile horizontally (but it's not horizontal)

325 feet vertically (but it's not vertical either)

Tetanda est via (a trail well-worth trying)"

We feel sure that those who visit and walk about this little mountain will enjoy it and will benefit both physically and mentally.

When he "found" it, Sugar Loaf Mountain was far off the beaten track, a wilderness surrounded by lovely farming country and accessible only by rough dirt roads, always dusty when not impassable with mud. Now it is an easy 50 minutes from the Nation's Capital, northwest on Interstate 70-S toward Frederick. Its wooded and rocky peak overlooks farm country, still lovely, but daily becoming more crowded with dwellings, government offices, laboratories and the many service facilities that population requires. We shall preserve this "gem."

GO 70-S past ROCKVILLE, SHADY GROVE, GAITHERSBURG, AEC, CLARKSBURG EXITS.

TURN OFF AT HYATTSTOWN - COMUS EXIT

CIRCLE UNDER 70-S and go on Route 109 for 3.3 miles to COMUS

TURN RIGHT AT COMUS ON Route 95 for 2½ miles

PROCEED STRAIGHT ACROSS PAVED INTERSECTION (Mountain X-roads)

IMMEDIATELY ON YOUR LEFT IS A SMALL LAKE

IN A ½ MILE TURN RIGHT ON MOUNTAIN ROAD FOR ANOTHER ½ MILE  
( this is through a gateway )

FIRST HOUSE ON RIGHT IS SUPERINTENDENT'S HOUSE - 4 white columns

AROUND THE BEND IS THE STRONG RESIDENCE - PARKING LOT THIS SIDE OF IT

NOW IF YOU PREFER TO STEER BY SPEEDOMETER: Start at Rockville 0 and  
find mileages indicated on this map.

DINNER BUFFET

## THE ANTARCTICAN SOCIETY

January 1972

No. 4

### MESSAGE FROM THE PRESIDENT

I am honored to have the responsibility as President of our Society, though I feel inadequately adjusted to this after only one year as Vice-President. It is a loss for us all that pressure of work prevents George Doumani from continuing the now traditional full term of 2 years as President. Last year under his guidance we accomplished many good things. I would like especially to mention the International Night at the Branch of Special Maps of the U. S. Geological Survey, the role played by the Society in sponsoring the Antarctic Treaty Stamp, for which Tom Kelly was largely responsible, and the inspiring memorial lecture presented by Peter Scott, the son of the illustrious Captain Robert Falcon Scott.

During the coming year our attention will concentrate on two major objectives in addition to our routine and important accomplishments through the Program Committee. One will be a series of broadcasts in the name of the Society to fulfill one of our functions: that of interesting and informing the public on Antarctica. The other will be to review, and come to a decision, on a question that has been on the minds of many members: should the Antarctic Society continue as now is, or should it change to a bipolar society?

The broadcast program has already started in a modest way. A series of six 10 minute programs was taped by our Johns Hopkins group at the Baltimore Station of WFBR (1300 kc.) on Antarctic ornithology. WFBR's announcer Joe Knight was chairman, and participants were Robert Wood, Roberto Schlatter and myself.

We concentrated on studies of skuas and penguins. This seemed appropriate following closely on the showing of my film "Penguin City" on the CBS network. This was a trial run, but it is likely to be rebroadcast in other parts of the country.

A more comprehensive and sophisticated series, arranged through the good work of Harriet Eklund and Joanna Turner, is in the planning stage through the Washington Station of WAMU FM. Through this we hope to present a series of 15 programs, each of 15 minutes, under the title "Antarctica — The Peaceful Continent." It will alert the public to an ongoing United States program in Antarctica and to the international cooperation that exists there. Special emphasis will be paid to scientific endeavor and to the Antarctic Treaty. Our Society can muster a fine assemblage of talent in the Washington-Baltimore area, so we hope for some good accomplishments on the education front. We will inform you before the series is broadcast and would appreciate any comments, good or bad.

The possibility of the Antarctic Society becoming a bipolar society is not new. It was discussed by the Board 2

years ago and a committee appointed to study the subject brought in a negative report. There were, however, strong opinions on both sides, and the general opinion was that the time was not ripe for a change. I believe we should review it again and seek for more feedback from Society members.

Ned Ostenso will chair the important committee that looks into this. His qualifications are ideal: a researcher of great repute and a truly bipolar scientist. We are encouraging thoughts from members. I would like to give mine now while they are uninfluenced by the committee's deliberations. I believe the time is ripe for a change into a bipolar society. Antarctic research has rarely been done in complete isolation and now more than ever (with the change of National Science Foundations' Office of Antarctic Programs into the Office of Polar Programs) there is a renewed emphasis on bipolar research.

Much of the great accomplishments that have come out of Antarctic endeavor, sparked most recently by the International Geophysical Year (IGY) and for our part in the U.S.A. by the U. S. Antarctic Research Program (USARP) and then leading inevitably to the Antarctic Treaty, have come from the Continent where there have been minimal national vested interests. Who would have thought that at the height of the cold war, USSR and USA were continuing uninterrupted a program of exchange of scientists in Antarctica? It was nothing epoch making and involved only 2 men at a time, but it was done, and it set a pattern that people like Ambassador Daniels in the State Department could point to as at least a worthwhile and positive start toward better international understanding. The Antarctic Treaty has set a pattern, by very positive action, that has reduced mistrust and encouraged international cooperation.

Similarly with the conservation measures of the Antarctic Treaty. These have set a pattern for international conversation of terrestrial and marine life that is used by many conservation organizations as models.

The Antarctic experience and accomplishments thus could make a significant contribution to better understanding in the arctic, for, more than anywhere else in the world, antarctic scientists, or logistics supporters, or tourists, right up to governmental agencies have learned to work together under the Antarctic Treaty.

This is why I personally believe we should be considering both poles and that the purpose of our Society could change to "facilitate friendly and informal exchange of information and views on the polar regions."

The chief concern among members seems to be the loss of identity of the Antarctic Society and the possible swamping

of it by the greater number of members interested in the arctic. This is a very valid thought that must remain dominant in our minds. One suggestion, already made, for preserving the integrity of the Antarctic group within a bipolar society is the forming of an exclusive Antarctic membership with an annual dinner meeting, similar to the highly sophisticated "Antarctic Club" of United Kingdom. Incidentally, this Club wears Captain Scott's emblem of an Emperor Penguin on the South Pole as its membership tie and in true British tradition any non-member found wearing the tie is severely frowned upon.

These are thoughts which we should be tossing around among ourselves within the next few months and at coffee breaks after the meetings. Dr. Ostenson's committee will formulate a plan which the Board and members will have ample time to consider.

Finally, a word about the program. Dr. Vagn Flyger has kindly offered to be chairman and for continuity to work with Harriet Eklund, Pete Bermel and others. They hope to circulate a postcard to members with dates of meetings. When you receive this please mark the dates on your calendar. We need your support at the meetings and your ideas for the future of the Society.

WILLIAM J. L. SLADEN

### PROGRAM FOR 1972

Many members of the Society will remember the extremely interesting talk given by Dr. Elliot of Ohio State on the evening of November 3, 1971, in the Explorers Hall of the National Geographic Society. Unfortunately, it is probable that this copy of the *Bulletin* will reach you after the second meeting of the 1971-72 season. Through the kindness of the British Embassy arrangements were made to hold the Society's Annual International Night in the Rotunda of the Embassy on Massachusetts Avenue. The feature of the evening was a film on Shackleton's last expedition.

One of the factors that has contributed to the success of the Antarctic Treaty over the last decade has been the right, frequently exercised, of free and open inspection of installations and of ships and aircraft at points of embarkation and debarkation. On February 9, 1972, Mr. Frank Mahnke, a member of the United States team that inspected Australian, French, and Soviet Stations last year, will explain to the Society what such an inspection trip is like. The meeting will be held in the Lecture Hall of the National Academy of Sciences, 2101 Constitution Avenue, at 8 p.m.

One day less than a month later, on March 8, we will have the honor of hearing Mr. Frank Davies of Toronto, Canada, deliver the Antarctic Society Memorial lecture. Mr. Davies was a member of the Byrd Antarctic Research Expedition, 1928-1930. After his return from Antarctica, he had a distinguished career in his native country as a specialist in electronic communications.

-Each year the Society must convene for the election of officers and of one-third of the Board of Directors and to transact such other business as requires the approval of the membership. The Annual Business Meeting will be held on April 13. It is expected that the Meeting will be followed by a program to be announced later.

Many of us recall the informative and pleasant evening at the U. S. Geological Survey, Branch of Special Maps, when the processes of modern Antarctic map making were explained by experts. Through the kindness of Mr. Mort Rubin, former President of the Society, a similar evening has been arranged at the National Oceanic and Atmospheric Administration in Rockville. On May 11, we will be pleased to have the methods and accomplishments of recent Antarctic weather research presented to us.

Finally no year would be complete without a Garden Party. This year, at last, it will be held at Stronghold on Sugar Loaf Mountain on June 10. This gathering is intended to be a family affair when the children may romp and the adults talk. The more vigorous may wish to come early and whet their appetites by a hike to the top of the mountain. Older members may be content with the view from halfway up.

More details as to time and place will be forwarded as the date approaches. There is no excuse, however, for not marking these dates on your calendar, right now.

### ANTARCTICA-PAST, PRESENT, AND FUTURE THE ANTARCTICAN SOCIETY MEMORIAL LECTURE - 1971

By

Peter Scott

Ed. Note: On March 3, 1971, Mr. Peter Scott, Honorable Director of the Wildfowl Trust, England, and Vice President of the World Wildlife Fund, addressed the Society in the auditorium of the U. S. Museum of Natural History, Smithsonian Institution. President George A. Doumani presided and opened with words of welcome and then requested Dr. William J. L. Sladen, Vice President, who had known Mr. Scott for over a quarter of a century, to introduce the speaker. Dr. Sladen first welcomed Mrs. Scott, who had accompanied her husband, and their daughter Dafila. He next pointed to Mr. Scott's distinguished accomplishments as artist, Olympic yachtsman, gliding champion, and, above all, conservationist, and concluded by saying, "He is an all-around man and I think that it's wonderful to have somebody with these sorts of qualifications fight hard for conservation. We need people like Peter Scott." We are most grateful to Peter Scott for graciously allowing us to print excerpts from his lecture in the Society *Bulletin*.

Mr. President, Mr. Vice-President, ladies and gentlemen, it is a very great honor to be invited to give this Memorial Lecture tonight.

I believe the title (it was suggested by Bill Sladen) is the Antarctic, Past, Present, and Future. As he said, that will give me a bit of scope. Another possible sub-title for it could be "A Tourist in Antarctica" because that's all I have been. I am no expert and no historian. Indeed, I probably know less about my father's exploration than most of you who are here and, certainly, much less than your President, who had, he said, a whole Antarctic winter to read about it. I was brought up with it but I don't reread the story very often and one forgets these things, those details, very quickly and very easily. But I have had the opportunity of going out twice to McMurdo Sound and once to the Antarctic Peninsula.

The first time I went down in 1966 by air as a guest of the Admiral commanding *Operation Deep Freeze* and had a chance, amongst other things, to go and see Dr. Sladen's work at Cape Crozier. It was very exciting — his work on penguins based not far from Dr. Edward Wilson's old hut (the stone igloo) which he used when he made "the worst journey in the world" across Ross Island.

We went next, about four years later, to the Antarctic Peninsula on a tourist cruise in a Chilean ship, and I was able to take my wife with me. We sailed to the South Shetlands and then to the Peninsula.

The last tour, the one we have just been on, lasted the whole month of February. We were asked to go on the *Lindblad Explorer*, a cruise ship, that holds about 100 people, which Lars Lindblad has had built and which he uses for these off-beat tours to strange parts of the world. I think Mr. Lindblad deserves tremendous credit for having devised it, so to speak, for it gives enormous pleasure to a very large number of people who have always been interested in Antarctica and never have been able to get there. Suddenly, in late life, it is possible for them to go. Many of these people are over sixty, like me, and some of them are over seventy, and one or two over eighty. To provide this opportunity seems to me to be a very good thing for humanity.

We flew to New Zealand, boarded *Lindblad Explorer* and then sailed this little ship through the sub-Antarctic Islands, the Auckland Islands, Campbell Island, and south to McMurdo Sound. We were able to visit and land at all four of the historic huts on the shore of the Ross Sea. We possibly went as far south in the Ross Sea as any ship has been because it was a very open ice year. We reached almost to the edge of the shelf ice south of Scott Base.

I was happy to have my wife and daughter with me and they were able to see and enjoy the Antarctic. This is something I have always felt should be possible for women to do. The girls ought to be allowed down there. I think it is an absurd nonsense that until about a year or so ago they were not. Although there are a good many scientists in Antarctica, it is still very difficult for anyone who does not have a scientific affiliation to get there unless he happens to go on *Lindblad Explorer*, or another tourist ship.

My subject is Antarctica, Past, Present, and Future, and I have a film with me. We made it in 1966, five years ago, for the British Broadcasting Corporation and it was on the occasion of my first visit to McMurdo, in fact, my first visit to Antarctica. Before I show you the film I will talk briefly about the past and possibly a little about the present. After the film I will talk about the future because I think it will be more meaningful to do it that way.

First, the extreme past in sub-antarctic waters, and finally in antarctic waters was mainly connected with sealing. Everybody sailed south to attempt to catch more seals than the other chap. It did, in fact, wipe out the southern fur seals from a number of the sub-antarctic islands. It hit the elephant seals quite hard, too. In fact, what with whaling and sealing, that period from a conservation point of view was pretty bleak. Then came the short era of exploration from the very end of the last century until about 1920. During those 20 to 25 years there were a number of expeditions. This early period, sometimes called the "Heroic Period," is what gives Antarctica its very special kind of history. It is enshrined, if

one may put it that way, in the huts which still stand because things decay very slowly in the Antarctic. These huts still remain as monuments. In the Ross Sea area, they notably stand in four main places. There was Borchgrevink's hut on Cape Adare, built in 1899; the hut on Hut Point which was built by my father in his exploration in 1902-1904 with the *Discovery*; then there was the hut at Cape Royds built in 1908 by Ernest Shackleton; and finally, the hut at Cape Evans built in 1911 for my father's second expedition. That was the occasion for the race for the South Pole between my father's expedition and Amundsen's expedition, which, as you know, was won by a short head by Amundsen. After the "Heroic Period," there was a gap, followed by Admiral Byrd and the new era of exploration and scientific endeavour; the advent of the enormous developments in Antarctica since then.

Well now, there are three, perhaps four things to say about the Antarctic in the present. The main one, and to my mind the most important is the existence of the Antarctic Treaty. This is a most wonderful thing which is a blue print not only for the Antarctic, but for other parts of the World, possibly for the oceans, and for space.

Very many people get carried away with the logistics of supporting people in the Antarctic. It is exciting to have a nuclear power station there, a desalinization plant, street lighting and all kinds of things. No one denies these are great achievements, but that is not what it is all about. It is, in fact, to maintain a vast scientific program which started with the International Geophysical Year, and which has gone on strongly ever since and which, in my view, remains tremendously important. Some incredible work is being done and some great discoveries have been made. Several of them, if I may say, by our President [George Doumani], who worked for, I think, five expeditions down there. Discoveries which have led to confirmation of the theory of continental drift and so on. The research programs in Antarctica are of high importance.

When we think about the future, (I shall be talking about this again), it is important that the scientists should not be curtailed even though there will be some difficulty in maintaining them at their present level owing to the financial stringencies which the Western World is undergoing at this moment.

Finally, the only other thing which takes people to Antarctica except the scientific programs, is tourism. I think, on the whole, that antarctic tourism is going to be a good thing and it will increase. I see no great harm in this. It will also allow more women to see Antarctica, but there ought to be more women scientists too. Keeping them away seems to me, as I have said before, to be a nonsense. In the film you will hear me repeat this. You will also see pictures of some of the girls in the Antarctic, but they are mostly pinned up on the walls.

[At this point, the film was shown. It covered Mr. Scott's visit to Antarctica in 1966, giving a well-rounded picture of present-day antarctic activities with flashbacks of his father's experience where appropriate. At the conclusion of the showing, Peter Scott continued.]

Now, I want to say just a little about the future, because I am not sure that "Bunny" Fuchs [Sir Vivian Fuchs], had it quite right in the piece he so kindly narrated for the film. He may have accented too much the significance and importance

of economic issues and economic values of Antarctica. So, if we are going to talk about the future, let us for one moment use our crystal ball. The danger of crystal balls is that very often they incorporate a bit of wishful thinking. You are inclined to say what you would like to happen rather than what you believe will happen. On the other hand, if enough people talk about what they think really ought to happen, it does make it ever so slightly more likely that it will happen. So certainly the first thing that ought to happen is that the Antarctic Treaty should be continued. You heard Carleton Ray [in the film] describing it very eloquently. His description of it as one of the great hopes for mankind was a very significant and important one.

We need to reconsider the question of the economic side, especially in connection with the exploitation of Antarctic resources. This will depend very much on the philosophy that mankind follows in the next two or three generations. Here again, I may be indulging in wishful thinking, but I believe that the human race must come to terms with two or three major factors. The most important one, of course, is to stabilize the population of our own species. Just as the human population cannot go on expanding forever, even if we do have cities in the Antarctic, so the economy cannot go on expanding forever. I think this is a point at which we have to tell the economists to go and put wet towels around their heads and think out some sort of a basic economy for the world which will maintain a high quality of living for people, but not on the basis of continual growth. Aggressive expansion, with all its side effects, must come to an end because we just cannot go on expanding on a planet that does not expand. This is where wishful thinking may come in, but I also believe that the younger generation, which some of their elders view with alarm and despondency, are in fact turning toward a very much sounder basic philosophy of life than has obtained for the last two generations or more. This, I believe, is going to lead to new thoughts about Antarctica so that you do not think about it first as a place where money can be made or where resources can be made available to civilizations in other parts of the world, but where you are looking at it as a place of immense interest and beauty, of great cultural and spiritual potential for humanity.

Of course, there will be a change-over period. We cannot have all this straight away. We will need a period when there will still be great demands for resources and it may well be that some of them will have to come for a time from Antarctica. But I believe, in the end, we can use it as a great research laboratory and a great reservoir of aesthetic inspiration in the never ending pursuit of truth and beauty. I think that people will go there. There will be small towns, even cities. It is not much of a place to live in all year round, you know. I expect those of you who have been there might agree with that, although the young Swede in the film, whom I was talking to at the South Pole said he liked the life and would winter over. His main interest was in amateur radio and he liked the opportunity to talk to the outside world during "the long winter evenings." But in the summertime it is a marvelous and beautiful place and this is the time when tourists should be able to go, as we went. More of them will go in the future, and some sort of code of conduct must be developed, particularly for example, when visiting penguin rookeries or seals.

Earlier, I spoke about money and economics because this is the thing people think about primarily today. Maybe a time will come when we think that it is less important. But, in the meantime, I think that money should be spent on antarctic research programs by all the nations of the Antarctic Treaty. I think all kinds of exploration should have money spent on them. I think space exploration should, in particular, have money spent on it. Where you might possibly save money is by not spending so much on wars and on preparing to fight other people.

Thank you very much, ladies and gentlemen. It was a great privilege to address you tonight. Good night.

*President:*

Thank you very much, Mr. Scott. It was very inspiring and very enjoyable.

I want to thank all of you for coming and sharing with us this very nice and very rare lecture. It was our privilege and our luck to be able to have Mr. Scott here on his way back home.

Thank you, Mr. Scott, and Goodnight.

## **ANTARCTIC TREATY (1961-1971)**

On June 23, the United States Post Office issued a special Antarctic Treaty commemorative stamp. The reader may ask why that date rather than December 1, 1969 which was the tenth anniversary of the signing of the document. It was not until June 23, 1961, that the last of the ratifications by the twelve signatories was received, and the Treaty went into effect. It was ten years of the Antarctic Treaty in action that were being commemorated in the issuance of the stamp.

The Treaty was widely hailed as a step forward in the relations between the Soviet Union and the non-communist nations. Looking backward, it was the first break in the cold war, the first easing of tensions which was followed by agreements on the use of outer space, nuclear testing, and the sea bed. Provisions in these documents are clearly patterned on some of those in the 1959 Treaty. Great as its significance as a precedent, we should not lose sight that the primary reason for the Antarctic Treaty was to set aside for peaceful purposes an area comprising one seventh of the world's land surface. It is from this point of view that its success or failure must be judged.

With some reservations, it may be said that the Treaty has been a success. Its provisions placed in abeyance actions to increase or decrease territorial claims or rights, whether or not put forward, for an indefinite period. (Not 30 years as a great many people erroneously believe.) It prohibits the establishment of military bases, the conduct of military exercises, the testing of military equipment, the explosion of nuclear devices, and the disposal of radioactive waste, although military forces and equipment may be used for peaceful purposes. It provides for full exchange of scientific and operational information and permits inspection of stations and ships and aircraft at points of embarkation and debarkation in the Antarctic. One article made it possible for governments

other than the twelve signatories to accede to the Treaty, and five have done so: Poland, Czechoslovakia, the Netherlands, Denmark, and Romania.

The negotiators recognized that certain important matters were not covered in the Treaty. These included jurisdiction over personnel except observers designated to carry out inspections, and regulation of economic exploitation. The Treaty applies to all islands and the Continent, including ice shelves, south of 60 South Latitude, but reserves the rights of all participants on the high seas under international law. This last clause was a flaw in the agreement because it left in jeopardy the birds and mammals that feed from the ocean as well as the inhabitants of those deeps. Those responsible for the Treaty, however, hoped that they had provided a means for settling problems as they arose. They provided that the participants should meet together periodically and discuss and adopt recommendations for the implementation of the Treaty and the furtherance of measures to achieve its basic purpose.

The first Consultative Meeting was held in July 1961 and the second in July, 1962. Since the latter date, they have been held every two years, the last convening in Tokyo in 1970. From them has developed a growing body of regulations expressed in the form of recommendations that become effective when all participants have signified their approval.

One of the first concerns of the Consultative Meetings was the full exchange of information. They found that the scientists through their own associations and academies had created a Scientific (originally Special) Committee on Antarctic Research (SCAR) which had established programs in the various scientific disciplines and arranged for exchanges of information. These arrangements were approved and encouraged by the Consultative Meetings. The Treaty Governments also established a reporting system by which they would inform one another in advance of their operational and logistic, as well as scientific, plans and programs.

The objective of the Treaty to reserve Antarctica for peaceful purposes, especially scientific investigation, implied the conservation of flora and fauna. Indeed, the topic had been mentioned in the Treaty as one suitable for discussion at the periodic meetings. In this field, it was also found that SCAR had already been active and had prepared guide lines which the First Consultative Meeting recommended to the Treaty Governments as interim measures until more detailed regulations could be worked out. In drawing these up, the Treaty Governments turned to the scientists represented in SCAR for advice. At successive Consultative meetings it was agreed that the entire Treaty area should be declared a conservation area, two varieties of seals were set aside as specially protected species, and localities of particular scientific interest were declared specially protected areas.

By 1970, the concern with conservation of flora and fauna had grown into a desire to protect the entire environment. Some sources of pollution originate outside Antarctica and hence are not controllable under the Treaty. DDT and other pesticides have been found in the tissues of Adelie penguins and in the snow high on the Antarctic plateau. Lead from the exhausts of internal combustion engines and radioactive particles from nuclear explosions are also present. More amenable to effective control are the by-products of man's life processes. Both liquid and solid wastes are a potential menace to a delicately balanced environment. At the Consultative

Meeting of 1970, a recommendation requested SCAR to study the broad question of the threat to the environment and advise ways for its prevention or diminution. In the meantime, governments were urged to move against the more obvious and recognizable forms of contamination. Steps are being taken, such as those by the United States at McMurdo Station where a sewage disposal plant and an incinerator are under construction. Fortunately, realization of the danger arose before the ecology anywhere in Antarctica, even locally, had been irreparably harmed.

The experience of the Arctic demonstrates that the great threat to the environment comes from economic exploitation. It is unlikely that in the Antarctic resources worth development will be found in the near future on land. It is not impossible, of course, but, at the present time, exploitation of the seabed appears more feasible technologically. The only growing industry that touches on land is tourism. Indiscriminate swarming ashore by visitors could disrupt normal activities at antarctic stations, damage bird and seal rookeries, and even destroy lichens and other scarce and delicate vegetation. The Consultative Meetings had adopted recommendation not to restrict tourism but to regulate it for the benefit of the tourists and the protection of the environment.

Antarctic seas are as rich in life as its land areas are poor. Unfortunately, the Treaty does not apply to activities on the high seas. The participating governments, however, are not altogether helpless. Norway and other maritime nations have expressed an interest in pelagic sealing. With the assistance of SCAR, the Consultative Meetings developed a draft convention to regulate this potential industry. At the 1970 meeting in Tokyo, the topic was withdrawn from the agenda because it dealt with an activity carried out on the high seas and because some of the nations interested in sealing were not signatories of the Treaty. Informally, it was agreed that the delegates would bring the problem and the draft convention to the attention of their governments with the recommendation that a separate meeting be held for discussion and appropriate action. In this way, initial steps taken under the Antarctic Treaty will have served as catalysts in the solving of a problem affecting the entire ecology of the area. If this occurs, it may be a happy precedent for regulating the harvesting of plankton and krill both of which are currently being investigated and are almost certain to be tried in the near future.

The Consultative Meetings have also dealt with other topics. Under their auspices, a symposium on logistics, which provided a useful exchange of information, was held in 1968. It has also been provided that meetings of specialists be convened to investigate special problems and recommend measures toward their solution to the Consultative Meetings. Thus far two meetings of experts in telecommunications have been held, in 1963 and 1969 respectively. The first surveyed the problem and made suggestions, few of which were carried out. In fact the second meeting was called to examine the results of the first. It, too, drew up a set of recommendations which were approved at the Consultative Meeting of 1970 and are now before Governments for approval and application.

The difficulties encountered in telecommunications indicate a weakness not in the Treaty but in its implementation. In this case no organization existed to monitor whether the suggestions of the 1963 meeting of the experts were being carried out or to determine whether they were practicable.

Only when the situation had deteriorated badly was action taken and then it took the form of a second meeting with no more assurance than in 1963 that its recommendations will be effective because no machinery exists to oversee their application. The reporting system, as developed at the various Consultative Meetings, provides for a full exchange of information on existing bases and facilities and of future programs. The national reports are transmitted through diplomatic channels which are notoriously slow. No body exists to see that they are submitted on time or disseminated to those in the field or even that they are complete and meaningful. Finally, the Treaty runs into a subtle difficulty. After the First Consultative Meeting, a United States participant remarked that all present were animated by a desire to make the Treaty work. Such a spirit is, of course, vital to success, but it may also have a tendency to encourage the avoidance of controversial issues such as jurisdiction over personnel or the general regulation of economic activity.

Whatever imperfections may be discerned in the Antarctic Treaty and its application, the fact remains that for 10 years it has achieved its principal objective. In a troubled world, the Antarctic remains a peaceful oasis where men of different nationality, ideology, religion, and race cooperate in the pursuit of knowledge. The achievements in conservation, for example, are a hopeful sign that still more steps can be taken toward solving outstanding problems. As a delegate to the 1970 Consultative Meeting remarked, an atmosphere of mutual trust and confidence has developed over the past decade that augers well for the years ahead. All of us active in antarctic affairs may feel content in the example we have set and in the precedent we are establishing, even in a small way, for a better future everywhere.

HENRY M. DATER

## ANNIVERSARIES

In Antarctica, the calendar year can be a source of confusion. The season begins in October and extends into March. To break it at the turn of the year is both unrealistic and deceptive. The United States Navy, for example, is by its method of accounting engaged on *Operation Deep Freeze 72*. This approach seems reasonable and more concise than the alternative of the 1971-1972 season.

In any event, during the period of *Deep Freeze 72*, several noteworthy anniversaries will occur. Sixty years ago, first Roald Amundsen and then Robert Scott reached the South Pole, the first men to do so. The first in December 1911 and the second in January 1912. The stories of this remarkable achievement are too well known to all Antarcticans to be repeated here. To those of us like the editor, who, on the way to the South Pole, have flown over the great glaciers that fall from the plateau of the Ross Ice Shelf, it will always be a source of wonder how men could have ascended them on the surface, especially in the case of Scott and party who man-hauled their sleds. The fact that they succeeded is a tribute almost beyond expression to their physical stamina and moral courage.

Forty-five years later, on October 31, 1956, Rear Admiral George J. Dufek stood on the same spot, the third party to do

so. He arrived by aircraft, a Douglas DC-3 or Dakota. This method of voyaging required much less physical exertion than surface travel, but the moral courage was equally as great. When the plane left McMurdo Sound, no one knew for sure what the landing conditions would be. Even if the Dakota alighted successfully, taking-off might prove extremely difficult, or even impossible. Those who have read Admiral Dufek's account know what a nip-and-tuck affair it was.

Ten years before, Dufek had been a member of another expedition, *Operation Highjump*. To this day, it remains the largest expedition dispatched to Antarctica. More important was the application of technology development during World War II to antarctic exploration. It is sufficient to cite icebreakers, helicopters, and radar among others. More of Antarctica was flown over and photographed than on all previous expeditions combined.

## TENTH ANNIVERSARY OF ANTARCTIC TREATY AND COMMEMORATIVE STAMP

The tenth anniversary of the ratification of the Antarctic Treaty occurred on June 23, 1971. The Antarctic Society was one of the sponsors of a commemorative eight cent stamp to mark the occasion. At a simple ceremony held at the State Department, the Secretary of State, William P. Rogers, read a statement from President Nixon, and Postmaster General Winton M. Blount presented albums containing the stamp to the Ambassadors of their representatives of the Antarctic Treaty Nations.

In his message President Nixon stressed the international character of antarctic exploration and research, and said in part:

In his message to the Senate in February 1960, transmitting the Treaty for ratification, President Eisenhower noted that the Antarctic Treaty was unique and historic, providing that an area of the world equal in size to the United States and Europe combined would be used for peaceful purposes only. To further this aim, the Treaty bans nuclear explosions, radio-active contamination and military utilization of Antarctica. To insure its effectiveness, the Treaty also provides for a broad inspection system. These landmark provisions were later reflected in agreements such as the Nuclear Non-Proliferation Treaty and the Outer Space Treaty.

The Antarctic Treaty and its objectives continue to be extraordinarily relevant in our time, for the overriding goals of the Treaty are the acquisition of knowledge for the use of all men, the preservation of a unique region from environmental degradation, and the extension of peaceful cooperation across national bounds. I am indeed happy that the tenth anniversary of this significant international undertaking has been recognized by the issuance of a special commemorative stamp and I offer my congratulations and warm good wishes to all who are assembled to mark this important event.

Before presenting the albums, Postmaster General Blount also addressed a few words to those present. He emphasized the natural bent of scientists to cooperate across national boundaries. Excerpts from his remarks follow:

It has been said that the intellect of the scientist is not tightly confined by national boundaries. If anyone is a

citizen of the world, he is. He shares his findings with his fellow scientist and in turn benefits from the efforts of others. Thus scientific knowledge spreads throughout the world enriching all of the family of nations.

Nowhere has this international cooperation been better demonstrated than in that great, white continent, Antarctica. Nature's secrets there are being pried loose by men who work together under the terms of the Antarctic Treaty.

For the single day the postal service opened a special "Antarctic Treaty Station" on the first floor of the State Department building. To mark the occasion, the Society had a limited number of covers prepared and cancelled, one of which is included with this issue of the *Bulletin*. Additional cancelled covers may be obtained at \$ .50 a copy, plus a self-addressed stamped envelope (Size No. 12). Please place sufficient postage on the envelope — estimated at 8 cents for 1 to 3 covers. Send your check or money order to the Treasurer, The Antarctic Society, 1619 New Hampshire Avenue, N. W., Washington, D.C. 20009.

Examples of the two covers are pictured below. In ordering please indicate your choice. All proceeds will accrue to the Society's treasury.

## BOOK NOTES

Recent months have not brought too many antarctic books to the attention of the reviewer. It will be greatly appreciated if readers will bring to his attention any books of general interest that they may have come across. Please mention the name of the publisher for a review copy can usually be obtained.

R. L. Penney, *The Penguins Are Coming*, New York: Harper & Row, 1969, pp. 63, illus., 12.50.

To the reviewer this is what a children's book on a factual topic should be. Dr. Penney (the title is a little absurd in this instance) wrote the book for his own children. The text is straight forward, simple, and accurate. It carefully avoids the anthropomorphism and, what is worse, the coyness of so many children's nature books. The illustrations by Tom Eaton complement the text rather than fight it as too often occurs. The reviewer, however, is not a child and, therefore, turned the book over to an expert, age 9, whose comment was that it is O.K. Is there any higher praise? Highly recommended for elementary school youngsters, grades 2 through 4.

L. B. Quartermain, *New Zealand and the Antarctic*, A. R. Sheare, Government Printer, Wellington, N. Z., 1971, \$5.85 N. Z.

This excellent volume recounts the story of New Zealanders in the Antarctic. The first officially sponsored expedition occurred in 1956. Before that time individual New Zealanders had visited the area as members of other expeditions. There were quite a few of them, and for us, it is interesting to note how many of them accompanied Admiral Byrd on his trips to the area.

The main part of the book, however, covers New Zealand activities beginning in 1956 and terminating in 1968. It is a story of remarkable accomplishment by a small body of men with limited resources in funds and equipment. It goes to show that human courage, endurance, and ingenuity can still go a long way in this day of fancy machines and complex equipment. It is pleasant to report that the author acknowledges the assistance that has been rendered by the United States to New Zealanders in the field. This is a well-owed recompense for the many favors granted us by the Kiwis in their native land.

The author has included well-selected illustrations and a series of maps showing how Victoria Land was depicted in 1956 and 1968. Even a cursory examination shows what strides geographic knowledge made in those few years.

The book is highly recommended to those interested in recent Antarctic activities. Unfortunately, the publisher did not inform the reviewer how the book may be ordered by U. S. residents. A letter, however, should elicit this information. Note that the price quoted is in New Zealand dollars.

K. K. Markov, V. I. Bardin, V. L. Lebedev, A. I. Orlov, and I. A. Suetova, *The Geography of Antarctica*, Moscow, 1968, (Translated from the Russian, 1970; available from the U. S. Department of Commerce, Clearinghouse for Federal Scientific and Technical Information, Springfield, Va., 22151) 370 pp., plus map, \$1.45.

Five Soviet scholars have combined their talents to summarize the geographical knowledge of Antarctica up to about 1965. The bibliographies list an impressive number of works not only in Russian but also in other languages. The book is divided into eight chapters covering such diverse topics as the discovery of the Continent, the general geographic background in relation to the Southern Hemisphere, the rock surface of the continent, its ice cover, the areas of bare rock, the natural zones of the continent, and the problems of human existence in the rigorous climate. Much of the discussion is technical in nature and assumes a considerable scientific background in the reader. The translation was prepared by the Israel Program for Scientific Translation for the National Science Foundation. Since the reviewer does not read Russian, he cannot comment on its accuracy, but it is clear, if one knows the technical terms. The authors, in the preface, comment that such a monograph is not an encyclopedia "but merely a review of all the available information." As such, it is well worth the attention of the serious student.

## EDITOR'S NOTES

In his message, the President has invited the comments of members on the proposal to convert the Antarctic Society to a bipolar society. The editor would be happy to receive and to print some of those that are not too lengthy and which bring out the important issues involved.

For the readers' information the 1969 Committee, mentioned briefly by the President, was presided over by Dr. John Stubenbord. After careful consideration, it presented a negative report to the Board of Directors. A majority of the Board accepted the report, although the vote was not unanimous. The Board, however, did not feel that it was appropriate to bring the matter before the members at that time.

As a matter of background, the Antarctic Society is not the only organization dedicated to the polar regions. The American Polar Society has been in existence for over 30 years and its publication, *Polar Times*, carries material on both the Arctic and Antarctic. The Arctic Institute of North America is a joint Canadian-United States venture that publishes *Arctic*, a scientifically oriented quarterly. More specialized in its interests is the American Society of Polar Philatelists. Its bulletin, *Ice Cap News*, carries information of historical interest on past and present activities. Relations between the Antarctic Society and the Arctic Institute of North America have been particularly close.

Whatever your feelings, we would be glad to hear from you. Please send along other news of general interest. The editor needs help.

"WHALES: A PLANETARY CONCERN," the 1973 Memorial Lecture  
of the Antarctic Society, will be presented

by SCOTT MC VAY

at an open meeting of the Society at 8 p.m.

WEDNESDAY, MAY 23, 1973

in the Lecture Room of the

NATIONAL ACADEMY OF SCIENCES

2101 Constitution Avenue N.W., Washington, D.C.  
(free parking adjacent to building)

---

Scott McVay is chairman of the Scientific Advisory Committee on Whales, of the Environmental Defense Fund, and is executive director of the Robert Sterling Clark Foundation. He has served on the U.S. delegation to the International Whaling Commission and is a member of the U.S.-U.S.S.R. Joint Working Group on Wildlife Conservation. He has studied and written extensively on whales and whaling in the Antarctic and in the Arctic and has made substantial contributions to the protection of the great whales. Among his concerns is the possibility that having driven some marine mammals nearly to extinction, man now may prey on other species, repeating the process with equal fervor.

Among background readings that will be of interest are these:

Scott McVay, "The Last of the Great Whales," Scientific American.

August 1966.

\_\_\_\_\_, "Stalking the Arctic Whale," American Scientist,  
January-February 1973. Roger S. Payne and Scott McVay, "Songs of  
Humpback Whales," Science,

August 13, 1971. George L. Small, The Blue Whale, Columbia  
University Press, 1971.

---

Members, their families, and all persons interested in whales and in the  
polar regions are invited to attend.

---

## MEMORANDUM TO EDITORS

For further information  
call Gerald S. Schatz  
961-1360 (office)  
933-3073 (home)

November 23, 1973

Human activity on an industrial scale is increasing in regions once deemed inaccessible, regions in which applicability of national and international law is far from clear.

The recent disposition of a Federal criminal case involving a shooting on Fletcher's Ice Island (T-3), a drifting scientific station in the Arctic, left the matter of U.S. jurisdiction unresolved. Meanwhile, active work toward resource exploitation—particularly oil and gas drilling—has begun in the Arctic.

U.S. logistical operations in support of scientific activity in the Antarctic are shifting from use of U.S. Navy personnel, subject to the Uniform Code of Military Justice, to the use of civilian contract labor, raising new jurisdictional questions. Tourism, not contemplated in the Antarctic Treaty, is growing in the Antarctic. Serious proposals for resource exploitation, covered only vaguely in the Antarctic Treaty, are arising for the Antarctic Treaty area.

In those circumstances in the Antarctic that are uncovered by the Antarctic Treaty and in those areas of the Arctic that apparently lie beyond national territorial and continental-shelf limitations, the questions of civil and criminal jurisdiction are understood dimly if at all, and they may be expected to be complicated by the involvement, in these circumstances, of multinational ventures. Of growing significance, the common legal condition of the polar regions — sovereignty unresolved and international convention unclear — bears striking legal resemblance to the condition that obtains for fixed towers and stations in the seabed beyond national shelves and territorial seas.

The Antarctic Society, an organization of individuals involved in polar operations and polar studies, has scheduled a colloquium, Science, Technology, and Sovereignty, to explore these problems. The program is open to the public without charge and will be held from 2 p.m. to 5 p.m. Saturday, December 1, 1973, in the Lecture Room of the National Academy of Sciences, 2101 Constitution Avenue N.W., Washington, D.C.

Panelists include N. Marshall Meyers, attorney and legal scholar with considerable polar experience; Kenneth J. Bertrand, geographer and historian of polar geography; John C. Miller, labor-law specialist; Justin W. Williams, prosecutor in the T-3 case and scholar in the field of extraterritorial jurisdiction; and William Thomas Mallison, Jr., scholar in the field of international law.

A copy of the program is attached.

# SCIENCE, TECHNOLOGY, AND SOVEREIGNTY

A colloquium sponsored by the Antarctic Society

2-5 p.m., Saturday, December 1, 1973

in the Lecture Room of the  
National Academy of Sciences  
2101 Constitution Avenue N.W.  
Washington, D.C.

## Purpose

Questions of civil and criminal jurisdiction have arisen in the polar regions and in other situations—involving, for example, fixed towers and seabed stations outside territorial seas—where national sovereignty is not resolved and where applicability of national law and international convention is unclear. As human activity increases on an industrial scale in these situations, the questions of legal regime become increasingly important. The Antarctic Society has assembled a variety of distinguished specialists in law and polar operations in an effort not to develop policy recommendations but rather to expose the range of legal and operational situations to be expected and to show, where possible, the lessons in this connection already yielded by experience in the Arctic and Antarctic.

## Program

Opening remarks.....	Peter F. Bermel President, Antarctic Society
Introduction: <i>Transnational science and technology in the absence of defined sovereignty; developments in the polar regions and in legally similar situations</i> .....	Gerald S. Schatz Editor, <i>News Report</i> National Academy of Sciences
Operational considerations.....	N. Marshall Meyers Meyers, Marshall & Meyers Washington, D.C. Kenneth J. Bertrand Professor of Geography The Catholic University of America Discussion
Domestic and international legal considerations.....	John C. Miller Solicitor National Labor Relations Board Justin W. Williams Assistant U.S. Attorney Alexandria Division Eastern District of Virginia William Thomas Mallison, Jr. Professor of Law National Law Center The George Washington University Discussion
Summary remarks.....	Mr. Schatz
Off-record, open discussion	

## Ground Rules

The formal portions of the program each will be followed by a brief question-and-discussion period, on the record, involving principal discussants and a group of invited audience discussants who are specialists in various fields of law and polar operations. The final half-hour of the colloquium will be off the record and open for discussion from the floor. In all discussions, whether on or off the record, speakers should identify themselves by name and professional affiliation. The colloquium record will be held open for 30 days, during which participants—including those in the general audience—are invited to submit, for possible inclusion in the proceedings, statements and documentary material relevant to the colloquium. These materials should be mailed, by January 1, 1974, to Colloquium, The Antarctic Society, 1619 New Hampshire Avenue N.W., Washington, D.C.20009.

NOTES AND IMPRESSIONS AT ANTARCTICAN SOCIETY COLLOQUIUM, 1 DECEMBER 1973,  
ON SCIENCE, TECHNOLOGY AND SOVEREIGNTY

Meredith F. Burrill

The purpose of the colloquium as stated on the attached program was to explore something of the range of polar area problems related to unresolved sovereignty without attempting to provide the answers. This was adhered to. Schatz and the panelists elaborated for about 20 minutes each on various aspects of present and possible future situations. Their prepared remarks will be published in the spring.

A good statement of the general problem was released on November 23 in a memorandum to editors by Schatz, which is also attached. The meeting did not lend itself to note taking, but a few interesting statements and questions can be given here.

The terra nullius concept is a hazy one which may or may not be applicable in the Arctic. It is reported that the Soviets might use language in the Alaska purchase treaty to support claiming in the Antarctic. Situations and questions are now arising that the Antarctic Treaty did not anticipate for several reasons. We know a great deal more about the Antarctic than we did then; the numbers of people involved are far larger; technological progress has revolutionized access, communications, and logistics; the world situation and the mutual relations of nations are quite different; multinational corporate giants have introduced new complications; pressures on resources have pushed industrial and commercial activities, some of which may involve high monetary stakes. Such operations cannot tolerate a legal vacuum.

The homicide on the Arctic ice island is considered not to furnish widely applicable precedents.

Pending legislation, S.1400, which has to do with extraterritorial justice, was mentioned but not discussed at length.

Several questions related to ice as a "ship," since maritime law relates to ships. Should free-floating ice be considered technically as a "ship"? Should an ice shelf, partly afloat and in motion (though very slowly) be a "ship"? Can one set up criteria on which to base such decisions and anticipate consequences?

The latter part of the colloquium was open discussion off the record, a lively interchange between well informed people. Attendance was perhaps 50. At the end the panelists were invited to offer a one or two sentence capsule, which they did as follows:

- Bertrand: historical experience does not provide adequate precedents; military or marine law has been the basis in polar areas exploration even when on land.
- Mallison: international law can solve new problems, requires cooperation by scientists and lawyers to find practical, viable solutions.

Meyers: with today's technology we can reach any area quickly and can do crime laboratory type investigations, etc., on the spot. This permits the effective exercise of jurisdiction in administration of justice.

Miller: under the NLRB act, the US flag is the primary guide line for judging whether a locus is under NLRB jurisdiction; sees no immediate problem for 5TLRB in polar areas.

Williams: the proper exercise of justice in the polar areas will require provision of some regular procedures; since one can't subpoena, some other way of adducing evidence needs to be found, e.g., making depositions, letters of rogation, etc.

On the whole, the colloquium did what it was designed to do, and those in attendance were receptive to the message—that we do not now have for polar and some other areas of unresolved sovereignty the solid legal foundation that our system requires, that we are unsure what we want in the foundation, that current sudden appearance of situations that do not fit previous concepts warns that hasty far-reaching commitments could later be embarrassing or disadvantageous, and that strong pressures may force decisions before we are ready to make them.

The participants will undoubtedly carry the message to some federal agencies and to some colleagues in several disciplines. Others may not hear much about it until some alternatives are identified, or some concrete proposals are put forward, or something spectacular focuses attention.

# *The Bulletin of*

## THE ANTARCTICAN SOCIETY

January 1973

### MESSAGE FROM THE PRESIDENT

Much of our deliberation at board meetings last year related to the possibility of the Antarctic Society becoming a bipolar society. Dr. Ned Ostenso presented a fine and comprehensive proposal. We encouraged members of the Society and of its Board of Directors to send written comments to either Dr. Harry Dater, editor of the *Bulletin*, or to myself. It became clear from the letters received that most members wished the Antarctic Society to remain as it had been since it was founded in 1959. The following excerpt from a distinguished member's letter sums up the sentiments.

An initial premise of the Bipolar Discussion Paper is that 'There is not an adequate constituency for the Antarctic Society to achieve viable size'. What is a viable size? I believe our current dues paying membership must be close to 500, a large percentage of which lives in the Washington, D.C. metropolitan area, yet rarely does our attendance exceed 50 at any given meeting. Perhaps our efforts need to be directed to increased participation within our existing membership, many of whom are already bipolar oriented. It is doubtful that if we are unable to attract these people to the Antarctic Society meetings now that this situation will change simply because of a bipolar organization. I should say here that I believe the continued timely publication of *The Bulletin of the Antarctic Society* will contribute significantly to an increased participation by the membership.

Like many others I am also concerned about the loss of identity of the Antarctic Society in the proposed bipolar makeup and it is mainly for this reason that I believe we should lay aside the bipolar discussion at this time and direct our concerted efforts to improving the Antarctic Society and achieving a more active membership, both in and outside of the Washington metropolitan area.

Thus, on May 31, 1972, at the Board of Directors meeting of the 1972-1973 year to which past presidents, as well as the retiring and new directors were invited, the following motion was introduced and passed unanimously.

It is agreed that the Bipolar Society proposal developed at the request of the Board of Directors be deferred indefinitely, and that the Antarctic Society continue to maintain its emphasis on south polar interests while continuing to exercise a constructive interest in polar affairs generally.

So we are back to where we started several years ago, and the only message I have just now is that we need to play a more important role in Antarctic affairs for we are the only private organization exclusively devoted to the furtherance of knowledge and appreciation of this new and vast continent.

Those of you in the Washington-Baltimore area can look forward to a very interesting program this coming season under the chairmanship of Gerald Schatz. Mrs. Harriet Eklund is chairman of the Education Committee and with Mrs. Lillian Brown of CBS is finalizing plans for the series of radio broadcasts "Antarctica the Peaceful Continent". Mrs. Joanna Turner and Mrs. Katherine Petrin are co-chairmen of the Membership Committee. With this issue of the *Bulletin* we are sending you a membership form. Please pass it on to a non-member and help the Society increase its numbers.

WILLIAM J. L. SLADEN

### U.S. ANTARCTIC RESEARCH PROGRAM, 1971-1972

The past season's activities included research at McMurdo, Siple, Byrd, Palmer, Hallett, and South Pole Stations, as well as at remote field sites across Antarctica. Sixty-five projects were carried on by 210 scientists and technicians from more than 35 different institutions and laboratories. In addition, scientists from more than 6 foreign countries participated in the U.S. Antarctic Research Program this past season.

Antarctica is obviously not the most convenient or comfortable environment to work in. Most of the area is covered with snow and ice, which is fine for the glaciologist but pretty frustrating for the genuine rock hound. For geologic study, however, the areas of open rock in Antarctica are some of the best in the world. They have been deeply cut by glaciers, show little weathering, and have little covering foliage, thus leaving exposed excellent sites for investigation.

This year detailed studies in the northern Transantarctic Mountains were conducted by geologists from the University of Maine. The group, working at the Carapace Nunataks some 120 miles north of McMurdo, investigated the age and origin of the deposits and collected fossil specimens of insects and plants. Nearby, at the Convoy Range, a two-man team from Ohio State University examined the bedrock geology for comparison with previous findings in the central Transantarctic Mountains. Both these teams were supported by helicopters operating from McMurdo Station.

Directly across McMurdo Sound from the station is the Royal Society Range. Of special interest are its dry valleys—

Taylor, Wright, and Victoria. This year the Dry Valley Drilling Project, a multi-national, inter-disciplinary program, was begun. Glaciologists, geologists, biologists, and hydrologists from the United States, Japan, and New Zealand surveyed the valleys for potential drilling sites. Starting next season, a comprehensive drilling project will begin, with plans to obtain as many as ten continuous cores from sites determined this year. In addition to ground surveys, an aeromagnetic survey by helicopter and infrared photography from LC-130's was flown by the U.S. Navy. The U.S. Geological Survey established ground control points for the mapping of the area. It is hoped that this project will clarify the history and mechanisms behind the formation of the dry valleys.

The features and environment found in the dry valleys are some of the best terrestrial analogues of the expected conditions on the surface of Mars. Geologists from NASA studied the texture, reflectants, and photometric characteristics of the soil to test systems that may be incorporated into the Mars landing vehicle.

The Antarctic ice cap is the major reservoir of fresh water in the world, and fluctuations in its volume would have world-wide effects. To adequately study a huge ice cap or sheet' is no easy task. Glaciologists must consider as one unit the movement of thousands of cubic miles of ice.

This year a team from Ohio State University studied the dynamics of the ice sheet at Byrd Station by measuring the distortion within a matrix of stakes that was originally set out in 1963. Seismic measurements were also made to determine the bottom topography. The data obtained will be used to test the classical theories of ice sheet motion as well as a more recent hypothesis that suggests the presence of thermal convection in thick ice sheets.

On a smaller scale, two glaciologists, a man and wife also from Ohio State, continued a long-term study of Meserve Glacier in Wright Valley as a single manageable unit. The main objectives are to understand the mechanisms of glacier movement such as surface buckling and surging.

Studies of the physical properties of the ice itself continue although no deep bedrock drilling has occurred since 1967. It has been found from the 1967 cores that the ice at a depth of three or four thousand feet, for some unknown reason, changes its structure from randomly oriented ice crystals to a bubble-free, strongly-oriented crystal structure. At Byrd Station scientists from the University of Berne utilized a new technique for dating the gases that are trapped in the ice. Their technique consists of sealing off short segments of a drill hole, using a heater to melt the ice between the seals, and pumping the released gases to the surface for carbon-14 dating.

This year also marked the beginning of the International Antarctic Glaciological Project. This project is a joint effort by the United States, Australia, the Soviet Union, and France. The objective is to determine the overall characteristics of the massive East Antarctic ice sheet. Four phases are planned for the ten-year study. They include aerial radar measurements of ice thickness and base rock topography, establishment of strain networks, deep drilling through the ice cap to determine the flow and baserock characteristics, and a resurveying of the strainlines in 1976. This year a series of ice thickness surveys was flown for the IAGP by the United States in an LC-130 aircraft. These radar measurements were carried out in cooperation with the Scott Polar Research Institute of Great Britain and the Technical University of Denmark. Also in

support of the IAGP, aircraft of Antarctic Development Squadron Six established five fuel depots for a French traverse that travelled from Dumont d'Urville halfway to Vostok. This traverse established a series of strain networks for measuring the ice movement as well as obtaining ice cores and temperature profiles.

Despite the harsh conditions—gale winds, cold temperatures, lack of rainfall, and alternating abundance or lack of light—life does exist in Antarctica. The ability of life to adapt itself and survive makes Antarctica a unique biological laboratory. Several cold-adaptation studies were performed this past season. From a shelter on the ice of McMurdo Sound, scientists from the University of California at San Diego continued to investigate the cold-adaptation characteristics of certain Antarctic fish. These fish appear to have a form of antifreeze in their blood that prevents them from freezing in the very cold sea water. It is possible that such a substance might be utilized as a cryoprotectant for the storage of red blood cells, sperm, and tissues.

Another team from the University of California at San Diego studied the ability of the newborn Weddell seal to survive despite the extremely cold conditions it experiences at the time of birth. Though born wet and without much fur the pup can maintain its body core temperature and survive until fur is developed. The capability of creating heat by shivering or regulating core temperature through surface vascular changes is being explored. In order to understand the structural adaptation of the seal to the Antarctic environment, a team of biologists from the University of Oklahoma worked with the California team in performing an anatomical examination of several adult and young seals.

The general characteristics of the life of the seal and penguin were also examined during the past season. A University of Minnesota team investigated the movement and migration patterns as well as the population changes of the seals in the McMurdo area. Battery powered transmitters attached to the flippers of a seal permit tracking its movements from a shelter or helicopter. Underwater television was used to observe the seals directly.

Iowa State University continued to study the embryonic development and incubation of the Adelie penguin at Hallett Station with particular attention to the behavioral adaptations of the newborn chick and the ability of the embryo to adapt to cold incubation conditions.

Recent work has shown a very low number of detectable microorganisms in Antarctic soil, generally considered to be a result of the limited amount of liquid water. In some cases, however, measurable numbers of airborne bacteria have been found. Scientists from the California Institute of Technology continued their survey in the dry valleys for the presence of microorganisms.

The season also saw the pursuit of several oceanographic projects. The National Science Foundation has two polar ships that are used for assessing and surveying the geology and biology of the southern oceans. USNS *Eltanin* for the past nine years has crisscrossed the Antarctic seas in a systematic manner. The average cruise lasts sixty days. During the cruise the scientists study ocean water circulation, the food chain and available food resources, and map the sea floor, which includes a mid-ocean ridge that nearly encircles the continent. *Eltanin* conducted two cruises during the past season. The first, a special biology cruise, was carried out in January and

February and terminated at McMurdo Station in late February. Most of the biologists debarked at that time and were replaced by a team of geophysicists who conducted a thirty day survey during the month of March in preparation for a deep sea drilling program next season.

The other research vessel *Hero* is principally involved in biological research in Antarctic Peninsula and South American waters. Space does not permit detailed accounts of research efforts, either aboard *Hero* or at Palmer Station in the peninsula area. About half of the activity this season was in marine biology with the remainder divided between the earth sciences and terrestrial biology. An international cooperative project with scientists from Argentina, Chile, the United Kingdom, the Soviet Union, and the United States entailed a comprehensive study of recent volcanic activity on Deception Island.

In addition to summer projects, there are programs that proceed on a yearly or winter-over basis. These programs are usually in the atmospheric sciences and primarily involve study of the sun and its effects on the earth's environment. Of great importance is the strong magnetic field found in Antarctica, which permits the measurement, elsewhere impossible without the use of rockets or satellites, of solar effects. During the winter night, these effects can be directly observed by watching the aurora australis wind about the sky like a ribbon. Indirectly, these same effects may be recorded on charts showing rapid variations in the strength of the earth's magnetic field. At McMurdo, the McDonnell Douglas Astronautics Company is studying ionospheric conditions as a tool for predicting deep space radiation levels. Also at McMurdo and at South Pole, the Bartol Research Foundation is monitoring variations in the rate at which high energy particles from space, the cosmic rays, pass through the earth.

This year Siple Station was scheduled to begin year-round research. Owing to operational difficulties, however, construction was delayed and will not be completed until next season. It will then be possible to carry out, on a continuous basis, investigations by Stanford University and Bell Telephone Laboratories that thus far have been conducted during the summer only. These use a unique 13-mile dipole antenna to study the coupling of very-low-frequency electromagnetic energy with charged particles in and beyond the ionosphere. Both projects are in the field of magnetohydrodynamics and are, therefore, of importance to the development of controlled fusion reactions.

Throughout the year members of the National Weather Service observe Antarctic weather and transmit data to the World Weather Watch for the determination of global weather and circulation patterns. The program also provides data for meteorological research and environmental monitoring.

In addition to year-round atmospheric studies, short term projects are conducted. For example, National Science Foundation sponsored studies have found that pollutants such as lead, DDT, and radioactive fallout exist even in the Antarctic. To study the transport of particulate matter in the upper atmosphere, a team of scientists from the University of Wyoming launched two balloons from South Pole Station. On each flight two sets of measurements were made: the first as the instrument, a dustsonde, is carried to the burst altitude of

the balloon (about 100,000 feet), and the second as the instrument descends by parachute. These measurements establish baseline values for particle concentrations over polar regions. Also at South Pole Station, the University of Rhode Island conducted studies to determine the concentration of trace metals such as aluminum and copper and of the halogens—bromine, chlorine, and iodine—in the atmosphere.

Looking toward the future, tests of an unmanned geophysical observatory, begun near McMurdo in January and February, are continuing this winter. Data from two integrated ionospheric experiments are collected and transmitted to the United States by communications satellite. Some weather and housekeeping data are also being collected and transmitted by the same means.

In conclusion it should be emphasized that all of these activities, dissimilar as they may seem, are not a fragmented effort, but parts of a national program, which in turn is integrated into a greater international effort. All of the pieces of information that are gathered are fitted into a pattern, a global pattern of knowledge concerning the world in which we live. It is hoped that the results of studies of this exciting continent will not only elucidate the history of the continent itself but also will contribute to the knowledge, protection, and proper utilization of the global environment. In the words of T.S. Eliot, "We shall not cease from exploration, and the end of our exploring will be to arrive where we started and know the place for the first time."

KENDELL N. MOULTON

## EKLUND BIOLOGICAL CENTER

On February 27, 1972, the biological laboratory at McMurdo Station was dedicated as the Eklund Biological Center. Since its modest inception in 1959, this thoroughly equipped, modern facility has expanded and played a key role in the rapid development of Antarctic biology. The dedication was a fitting, if belated, tribute to the memory of Dr. Carl R. Eklund, pioneer Antarctic biologist. Dr. Eklund initially went to Antarctica in 1939 as a member of the United States Antarctic Service Expedition and returned in 1957 as Senior Scientist at Wilkes Station during the International Geophysical Year. In the period between, he was active in the north polar region. From his experience, he early recognized the importance of adequate laboratories in the field, and as a member of the National Academy of Sciences' Committee on Polar Research, was in a position to further the construction of such facilities.

Known among biologists for his studies of the skua and for the pioneering application of telemetry to ornithological research, Dr. Eklund was a man of many interests. His enthusiasm was infectious and an inspiration to those with whom he was associated. To his friends he was known for his ready wit and endless supply of amusing stories with which he often drove home a point or enlivened an occasion. All these qualities he devoted to the founding of the Antarctic Society and to his work as its first president.

## U.S. ANTARCTIC SERVICE EXPEDITION CACHE DISCOVERED

A cache set by two members of the U. S. Antarctic Service Expedition (1939-1941) was discovered more than 30 years later, in May 1971, by two members of the British Antarctic Service Expedition. The BAS men were members of a surveying field party working out of Stonington Island in Marguerite Bay. Mr. Tim Christie, a surveyor, and Mr. Drummond Small, a dog driver, had been in the field for approximately 30 days when they found the cache.

The cache had originally been set by Mr. Herbert G. Dorsey, Jr., and Mr. Joseph D. Healy on February 9, 1941. They were part of the East Base compliment of the U. S. Antarctic Service Expedition located on Stonington Island. The East Base leader was Rear Admiral (then Commander) Richard B. Black, U.S.N.R. (Ret.). The base was manned by 26 persons from various government departments. It was equipped with one Curtis-Wright "Condor" biplane.

The location for East Base was selected by Rear Adm. Richard E. Byrd, Commander Black, and two Navy pilots — Ashley Snow and Earl Perce — during a scouting flight on March 8, 1940. Three days later U.S.S. *Bear* and U.S.M.S. *North Star*, anchored in the harbor at Marguerite Bay and began unloading operations. Severe blizzards and strong wind storms hindered unloading operations and it was not until March 21 that all cargo for East Base was unloaded, and the two ships departed.

The East Base party spent six days of dawn-to-dusk work in completing the main building. This consisted of a Pullman-like structure with five two-man partitioned cubicles along each wall and a long mess table down the center. The galley was at one end of the building, and the leader's quarters and sick bay at the other end. A deck the length of the building, with the exception of the galley, was raised 16 inches above the insulated main floor. This raised deck prevented the usual crust of ice from forming and resulted in a dryer and warmer environment in the living and working area. By late April they had completed the machine shop, generator building and the science building.

Scientific and geographic exploration, as well as station and equipment maintenance, occupied the winter period. Although the U. S. Antarctic Service Expedition is felt by historians to be the least reported U. S. expedition to Antarctica many papers were published in the Proceedings of the American Philosophical Society, Vol. 89, No. 1, dated April 30, 1945.

The two ships — *North Star* and *Bear* — returned to the Marguerite Bay area to relieve the East Base personnel in February 1941. They found heavy pack ice blocking their way and could penetrate no further south than Adelaide Island, about 100 miles from their goal. When the ice pack began to thicken and move northward, and when the hoped for easterly winds that would clear the bay failed to appear, everyone realized that an emergency evacuation would be necessary to prevent another winter-over.

During this time the men at East Base were investigating alternative areas where they might meet the ships. On one of these attempts to locate an over land route to a relatively ice free harbor north of Adelaide Island, the cache discovered by Christie and Small was set.

When notified of the cache discovery by Rear Admiral David F. Welch, then Commander, U. S. Naval Support Force, Antarctica, Herb Dorsey, now living in Ojai, California, recounted the incident as follows:

"The cache mentioned in Admiral Welch's letter . . . was the lesser of two depots laid on a reconnaissance undertaken to locate an 'overland' route to relatively ice-free coastal harbors north of Adelaide Island in February 1941 after ships of the 'relief force' failed to penetrate much south of there due to heavy pack ice. A cache of food containing rations for 70-dog-days and 20-man-days Was left on the high point of a rocky ridge farther from East Base.

". . . the cache and letter found by Christie and Small was placed on February 9, 1941 at . . . a place we named "Specimen Nunatak", located 69° 59'30" South Latitude and 66 48'30" West Longitude. Elevation above sea level at the base of the rocky pinnacle was 1,540 feet, at top 1,720 feet."

Dorsey also related they named the rocky pinnacle "Specimen Nunatak" since it was a "good example of a nunatak projecting above a broad ice field."

On March 20, 1941, Expedition headquarters in Washington, D. C. ordered *North Star* to Punta Arenas to unload the previously relieved West Base men and take on food for a year and a full fuel supply. Plans called for her to take advantage of any easing of the ice situation and dash in to relieve East Base. The food supply was for a possible winter-over in the ice.

The day after *North Star* departed for Punta Arenas, *Bear* approached Mikkelsen Island and discovered, from the vantage point of the crow's nest, a possible landing site for the East Base Condor on a snowfield which topped the island. Radio conferences between *Bear* and East Base resulted in a decision to attempt an aerial evacuation if the weather turned clear and cold. The cold would harden the snow field and reduce crevasse dangers; the clear weather would be necessary for the flights.

The two Navy pilots — Snow and Perce — took off at 5:30 a.m. on March 22 in the Condor with 12 passengers plus records from the expedition and emergency equipment. One hour and forty-five minutes later the Condor safely arrived atop Mikkelsen Island, a distance of some 120 miles. The Condor returned for the remaining 12 men and at about 11:30 a.m. attempted to take off. The surface, by this time, had softened enough to make a takeoff impossible. Several hundred pounds of clothing, food and other emergency equipment was discarded and after a take-off run of 1 minute and 10 seconds the Condor was airborne. By twilight the entire East Base compliment was aboard *Bear* headed for the open sea. The Condor was abandoned.

When the cache was discovered in 1971 it consisted of Hershey bars, dog and man pemmican, bacon, milk and pipe tobacco. Christie and Small consumed the chocolate on the spot and fed the man pemmican to their dogs. The dog pemmican had deteriorated and was thrown away. The milk was still good and a message from the BAS base on Stonington Island reported ". . . tobacco now in glass jar on bar at Stonington and being smoked."

## BOOK NOTES

Members of the Antarctic Society are literate. Many of them know how to write as well as read. Of the four books discussed below, two were written by fellow members, and *Research in Antarctica* was edited by another, with several of the contributors also belonging to the Society. Perhaps there are others writing on topics of general interest. The Editor would like to hear from them.

K. J. Bertrand, *Americans in Antarctica, 1775-1848*, American Geographical Society (Special Publication No. 39), New York, 1971, 554 pp. + xvi, illus. \$25.00.

Dr. Bertrand, long-time member of the Antarctic Society and Chairman of the Geography Department at the Catholic University of America, has written an important and long-awaited book. In it he sets down the activities and accomplishments of United States nationals in the Antarctic area from the eighteenth century to 1950. In what he set out to do he has succeeded. It is doubtful that anything has escaped his scrutiny. The volume will, therefore, become a work of standard reference.

*Americans in Antarctica* is no more a history of the area than is L. B. Quartermain's *New Zealand and the Antarctic*, noted in the last issue of this *Bulletin*. Both chronicle what the citizens of one nation have done to explore and study the area. Dr. Bertrand is well aware of this limitation and in an introductory chapter briefly sketches the historical background and elsewhere in the volume reminds the reader of contemporary events in which Americans did not participate.

The organization frequently seems repetitious as if each chapter were written to a formula. To appreciate why this is so, a few words about the origins of *Americans in Antarctica* are relevant. Since 1924, United States policy toward territorial sovereignty in the Antarctic has remained unchanged. It recognizes no claims of others and makes no claims of its own, but reserves the right to do so based on the activities of its nationals. After World War II, rising sentiments of interest and nationalism made it appear that this policy might not long remain viable. It was decided that the possible basis for United States claims should be investigated and documented to strengthen our position in negotiating some sort of international settlement or, if that failed, to put forward a claim or claims of our own. Dr. Bertrand was commissioned to prepare a study, or as it was sometime called a "white paper", which would provide the required documentation. The successful negotiation of the Antarctic Treaty in 1959 rendered such a study unnecessary. Dr. Bertrand requested and was given permission to seek a publisher for the results of his research. A good deal of revision of the original manuscript was necessary to put it in a form acceptable for public consumption.

To this reader the chapters dealing with the voyages of the sealers and whalers are more interesting than those retelling voyages of Wilkes in the nineteenth century and Byrd, Ellsworth, Ronne, and others in the twentieth. Even though Dr. Bertrand's summaries of the latter's activities and accomplishments are informative and accurate, persons conversant with Antarctic history are already acquainted with the material. The story of the sealers, however, was known only to

specialists in maritime history, and Dr. Bertrand has gone beyond their published works to dig out additional information from public archives, university libraries, marine society records, contemporary newspapers, and other sources. In so doing, he has made important and original contributions to the history of discovery as well as of the Antarctic.

*Americans in Antarctica* should be on the bookshelf of every serious student of Antarctic history.

L. O. Quam, ed., and H. D. Porter, assoc. ed., *Research in the Antarctic*, American Association for the Advancement of Science (Publications No. 93), Washington, D.C., 768 pp. + illus. and map, 1971, \$24.95 (AAAS members \$19.95).

The editors' preface points out that this volume is an "outgrowth from, but not a complete record of the Antarctic Research Symposium held in Dallas, Texas, December 1968 at the 155th Annual Meeting of the American Association for the Advancement of Science (AAAS)." Thirty-three papers are included, divided into seven sections with the number of papers in each indicated in parentheses: Introduction to Research in the Antarctic (3), Biology (8), Glaciology (4), Cold Poles and Heat Balances (3), Conjugate Phenomena (6), Ocean Dynamics (4), Gondwanaland (5). The last six sections also have brief introductions setting the various papers within the framework of the disciplines involved. Forty-six authors contributed to the volume.

Such a collection of papers is not a systematic review of current knowledge of the Antarctic even though the contributions illustrate the principal fields of research. As might be expected in a book by diverse hands, there exists considerable variance in treatment and clarity among the papers. For example, the reader may question why forty-eight pages are devoted to the glacial geology of a single valley while only ten are given to the "Thickness of Ice and Isostatic Adjustments of Ice-Rock Interface."

It would be presumptuous for this reader, who has no scientific background, even to try to assess the worth of the various contributions. He can only say that he understood and enjoyed some more than others. As a whole the volume gives a splendid overview of the kinds of research being conducted by United States scientists in the Antarctic. The variety and importance of the investigations are a tribute to the U.S. Antarctic Research Program and the individuals to whom it has given support.

*Research in the Antarctic* is highly recommended with the small reservation that the reader should have some general scientific knowledge to appreciate fully many of the articles.

Charles Neider, ed., *Antarctica: Authentic Accounts of Life and Exploration in the World's Highest, Driest, Windiest, Coldest, and Most Remote Continent*, New York: Random House, 464 pp., 1972, \$10.00.

As the subtitle indicates, *Antarctica* is an anthology. No two persons would choose the same works or the same portions of the same works to excerpt. Mr. Neider has included accounts of fourteen authors, all but two of whom participated in United States or British expeditions. The exceptions are the Russian, Bellingshausen, and the Norwegian, Amundsen. Such concentration on the nationals of two countries distorts the historical picture and omits, for

example, French, German, and Swedish expeditions of which engrossing narratives have been written. One also may wonder why the anthologist includes two selections each from the Cook and second Scott Expeditions, and nothing from the first Scott or first Shackleton Expedition. A sketchy chronology at the end hardly compensates for these deficiencies.

In brief, this anthology contains what Mr. Neider likes, and what he likes is good. Also to his credit, the selections are sufficiently lengthy to give the reader a comprehension of the style of the authors. Many explorers wrote well, although Cook, Shackleton, and Byrd had considerable assistance in preparing their accounts for publication. Further, the narratives of most of the early explorers are not available except in the very largest research libraries, and it is a real service to reprint lengthy selections in a handy form.

The editing is minimal. The editor devotes the introduction to an account of his routine trip to Antarctica in 1969 rather than to an explanation of how he made his choices and the significance of each in the exploration of Antarctica. Lack of adequate maps and absence of illustrations may be the fault of the publisher, but they would have helped.

J. M. Dukert, *This is Antarctica*, revised edition, New York: Coward, McCann and Geoghegan, 109 pp. + illus., 1972, \$5.09.

This book is a revised edition of one originally published in 1965. The author has obviously tried conscientiously to bring the work up-to-date both in text and illustrations.

Mr. Dukert has a facile pen, perhaps a little too facile at times, and he occasionally lets his enthusiasm run away with him. On the whole, however, he has accomplished what he set out to do: to present in a short volume "the right highlights in the right proportions." *This is Antarctica* is particularly suitable for young readers at the junior high school level.

Library of Congress, *Antarctic Bibliography: 1951-1961*, Washington, Government Printing Office, 1970, pp. 349, \$4.75.

This publication fills a gap between the U. S. Naval Photographic Center, *Antarctic Bibliography*, 1951 (see, *Antarctican Soc. Bull.* No. 2) and the continuing bibliography also prepared by the Library of Congress and covering the literature since 1951, four volumes of which have been published. The present volume includes 4,773 titles organized into thirteen sections largely on the basis of scientific disciplines but also containing sections on expeditions (history), logistics, political geography, and a catch-all labeled "general." To assist the user, there are three indexes: author, subject, and geographic. Unfortunately, unlike the continuing bibliography mentioned above, only 15 percent of the entries, instead of all, have been abstracted. Brief annotations are provided for another 25 percent. For the remainder, the inquirer must depend upon the title alone to guide him. For those engaged in serious research this publication will prove most useful and should be in any serious antarctic library.

*Addendum.* The editor has been informed that L. B. Quartermain's *New Zealand and the Antarctic*, reviewed in the last *Bulletin*, may be purchased in the United States from Lawrence Verry Incorporated, Mystic, Connecticut 06355 at the cost of \$10.00 (U.S.). Mail orders will be filled. In addition to this important book, Lawrence Verry also distributes other New Zealand and Australian publications. A catalogue is available upon request.

## CHANGE IN NAVY ANTARCTIC COMMAND

On the basis of a National Security Council study, President Nixon in 1971 directed that the Antarctic Program be maintained at the existing level, but that management and funding be consolidated in the hands of the National Science Foundation instead of being divided among the NSF and the Departments of Defense and Transportation. The decision became effective at the beginning of fiscal year 1972, except for funding of icebreaker operations for which the Department of Transportation will continue to pay until certain technicalities are worked out.

Pursuant to this decision, it was directed that studies be made with the objective of rendering the operation more effective and economical. Those studies were carried out during the past year, and many recommendations resulted. The first one to be adopted is to close the Washington headquarters of the U.S. Naval Support Force, Antarctica, and transfer the command to the Construction Battalion Center, Atlantic, at Davisville, Rhode Island, where it will be combined with the already existing Antarctic Support Activities Command. Even though it will be necessary to augment the staff in Davisville by transferring some positions and people from Washington, other positions can be eliminated. These changes, together with savings in rent, services, and other incidentals, reduce the overall expenditure by approximately a half million dollars.

Military personnel whose positions were abolished have been reassigned within their respective services. The records and library accumulated over a period of sixteen years by the History and Research Division of the Naval Support Force, Antarctica, have been removed to the Center for Polar Archives of the National Archives and Record Service where this unique collection will continue to be accessible to those interested in Antarctica. The former head of the division has accompanied the collection to its new location.

The change became effective on September 6, in a ceremony at McMurdo Station, Antarctica. Captain Alfred N. Fowler, USN, Commander, Antarctic Support Activities, relieved Captain Harry W. Swinburne, Jr., USN, as Commander, U.S. Naval Support Force, Antarctica. Captain Swinburne had taken over the command from Rear Admiral Leo B. McCuddin, USN, on August 21.

As far as operations are concerned, the transfer will not result in sweeping changes. The Navy, as executive agency of the Department of Defense in Antarctic Matters, will continue to carry on its logistic support activities much as in the past, except that rather than having its own funds, it will be reimbursed for its expenditures by the National Science Foundation. In the future, further reorganization and shifts of function may occur because of the studies made last year or others to be made in the future.

At 3:14 on the morning of February 11, 1972, the cruise ship *Lindblad Explorer* grounded in Admiralty Bay, King George Island. The exact cause of the accident, which is of course a matter for judicial inquiry, has not been determined, at least publicly. There was, however, a storm raging with high seas and reduced visibility.

Because the extent of damage was unknown, it was feared that the ship might roll over on her side or even capsize. At 3:45 the staff of the tour director, Mr. Lindblad himself, awakened the passengers, instructed them to dress warmly and to report to the salon. There they were informed of what had occurred and told that they would be put over the side into small boats until it became clear how the *Lindblad Explorer* would react. One of the passengers later remarked that the most chilling words of her life were the Captain's, "Stand by to abandon ship".

Approximately ninety passengers remained in the small boats for over four hours by which time it was obvious that the ship was as solidly run up on the beach as if she had been in dry dock. During this period, a party went ashore and examined an unoccupied British base for possible use as a refuge had it proven necessary to abandon ship. It was found adequate for the purpose. Messages requesting assistance also went out. In that sector of Antarctica, stations are maintained by Argentina, Britain, Chile, the Soviet Union, and the United States, and the likelihood is good of vessels of one or more of these nations being in the area. As it happened, the Chilean research ship *Piloto Pardo* and ocean-going tug *Yelcho* were close by and responded immediately. Argentine and British vessels also answered the call. Naval authorities in Washington began an immediate investigation of what the United States might do to assist, but soon discovered that our closest ship, the Coast Guard icebreaker *Southwind*, was five days steaming distance from King George Island.

With assurance of *Lindblad Explorer's* stability, the passengers returned to the ship to await the arrival of the Chileans shortly after midday. With the storm somewhat abated but a high sea still running, the arduous task of transferring passengers, the service crew, and some members of the deck - Crew to *Piloto Pardo* began. Only a handful of the deck crew remained aboard *Lindblad Explorer*.

Obviously the small Chilean vessel was not prepared for such an influx of passengers; food, mattresses, bedding, and the passengers' personal belongings also had to be transferred between ships. Such was the skill of the small boat crews that no one was injured and no property lost.

For seven days the unexpected guests remained aboard *Piloto Pardo*. Beds were found for the women, but the men slept where they could—on the deck, on and beneath tables, in the passageways, and most anywhere else. No one complained. From Punta Arenas, Chile, where the passengers debarked, they flew to Buenos Aires and then dispersed. None was the worse for his experience.

*Yelcho* remained with *Lindblad Explorer*, but even with the assistance of an Argentine tug, was unable to free the stricken ship. The feat was finally accomplished by the German salvage vessel *Arktis*. After being towed to Buenos Aires where initial repairs were made, *Lindblad Explorer* proceeded under her own power to Europe where she entered a yard for refitting.

On May 24, 1972, Prince Bertil of Sweden presented the Vega Medal of the Swedish Society for Anthropology and Geography to Dr. Albert P. Crary, Director of the Division of Environmental Sciences, National Science Foundation. The medal was established in 1880 and was first awarded to the Arctic explorer Adolf Erik Nordenskjöld. Recipients, noted for their work in the Antarctic, have included Sir Ernest Shackleton, Roald Amundsen, and Rear Admiral Richard E. Byrd. Dr. Crary was invited to join this illustrious company because of his work in both polar regions. In reporting the ceremony, the Stockholm newspaper *Svenska Dagbladet* called him, "possibly our time's most experienced polar investigator . . ."

During the International Geophysical Year, Dr. Crary was Deputy Chief Scientist for the Antarctic Research Program and the scientific leader in the field, being stationed at Little America. He led traverses on the Ross Ice Shelf and one to the Victoria Land Plateau. During *Deep Freeze 61*, he conducted a glaciological party from McMurdo Station to the South Pole by way of the Skelton Glacier, arriving on February 12, 1961, after sixty-four days on the trail. From 1959 to 1967 he occupied the position of Chief Scientist of the United States Antarctic Research Program. Other investigations have taken him to Bahrein, Venezuela, Columbia, and the Arctic. He is one of few men to have stood at both poles.

Dr. Crary has belonged to the Antarctica!) Society since its beginning in 1959. He has contributed to the work of the Society in many ways—as a speaker at its meetings, committee member and, from 1966 to 1968, its President.

## CANTERBURY MUSEUM

Perhaps no place in the world has a more intimate acquaintance with Antarctica than the charming little city of Christchurch, New Zealand. Scott, Shackleton, and Byrd passed that way; each year hundreds of Americans en route to the ice enjoy its hospitality. Those who wish to learn about their host country visit the Canterbury Museum and come away informed about the history of New Zealand and the environment in which it unfolded.

To commemorate its first 100 years, the museum has launched a world-wide campaign to raise money for a hundredth anniversary wing. Considerable space in the wing will be reserved to illustrate Christchurch's contribution to Antarctic history and to explain the environment of the continent, islands, and seas south of New Zealand—their biology, geology, meteorology, and oceanography.

Already the museum has collected over two thousand priceless relics of early Antarctic exploration for which it needs proper display space. The National Science Foundation, the U.S. Naval Support Force, Antarctica, and the New Zealand Antarctic Research Program have contributed artifacts illustrating contemporary activities. In addition, the museum has books, maps, photographs, paintings, scientific publications, and what is most important, manuscript diaries and other documents, principally of New Zealanders who have assisted or participated in the many expeditions that have departed from Christchurch. For these materials, it desires to create a study center where some may be exhibited and all may be made available to students and researchers.

Some members of the Antarctic Society have already contributed to this worthy cause; it is hoped that others will desire to do so. Contributions may be sent to the Canterbury Museum, Rolleston Avenue, Christchurch 1, New Zealand, in care of Dr. Roger S. Duff, Director.

## TREASURER'S REPORT

Mr. W. R. MacDonald, Treasurer-Membership Secretary, submitted to the President and Board of Directors the following financial statement covering the period July 1, 1971 to May 8, 1972:

Income		Expenses	
Dues & Initiation	\$ 921.00	General Printing	\$ 345.00
Misc.-Ant. Covers	299.16	Honorarium	116.00
Eastman Kodak Div.	16.00	Mailing Services	136.54
Garden Party	496.00	Antarctic Covers	179.12
		Society Meetings	311.15
		Miscellaneous	81.78
<b>TOTAL</b>	<b>\$1,732.16</b>	<b>TOTAL</b>	<b>\$1,169.59</b>

Cash on hand July 1, 1971	\$1,017.67
Income	1,732.16
<b>TOTAL</b>	<b>\$2,749.83</b>
Expenses	1,169.59
On hand May 8, 1972	\$1,580.24

### Assets

Eastman Kodak  
Stock ... 10 Shares at \$117.00 per share = \$1,117.00

### Membership

Membership		1972 Dues	
Honorary	4	(4)	
Corporate	47	(0)	
Overseas	28	(3)	
General	437	(141)	
<b>TOTAL</b>	<b>476</b>	<b>148</b>	<b>(31%)</b>

## SECRETARY'S REPORT (1971-1972)

During the 1971-1972 winter season, the Society's Board of Directors met monthly at the Arctic Institute of North America offices on New Hampshire Avenue, Washington, D.C. Significant agenda items taken under advisement by the Board were the establishment of an international memorial at International Square, McMurdo Station, Ross Island, for all who have perished in Antarctica; assisting the New Zealand Antarctic Society in its efforts to fund an Antarctic wing for the Canterbury Museum in Christchurch, N.Z., through the purchase of Scott-Amundsen medallions; and an evaluation of

a proposal to recast the Society into a bipolar organization. Recommendation's on these matters will be made to the Society this fall.

The Society's meetings this past year were also held monthly. Highlights of the past year were International Night hosted by the British Embassy when films of Shackleton's last expedition, his fourth, were shown; the Memorial Lecture by Frank T. (Taffy) Davies, a member of the Byrd Expedition of 1928-1930; and a look into future Antarctic scientific programs by NSF personnel.

Suggestions for this season's programs are welcome and should be made known to Board members or Society officers for transmittal to the Program Chairman.

The Society's final event of last season was the annual garden party held at the Stronghold Estate on Saturday, June 10.

F. S. BROWNORTH

## EDITOR'S NOTES

The Editor appreciates the replies from members to his request for opinions about turning the Antarctic Society into a bipolar organization. Because the issue has been resolved, it seems unnecessary to publish them in the *Bulletin*. In his message, the President has indicated the importance of the letters in "assisting the Board of Directors to reach its decision of May 31, 1972.

The Treasurer-Membership Secretary has reported considerable difficulty in keeping the membership list current. In our highly mobile society, Antarcticans; like other Americans, are frequently on the move. Please inform the Treasurer of any change of address by dropping a card to him at The Antarctic Society, 1619 New Hampshire Avenue, N.W., Washington, D.C. 20009.

In 1969 the Editor had the pleasure of visiting the Canterbury Museum in Christchurch, during which he enjoyed a tour of its treasures conducted by the scholarly and amiable director, Dr. Roger Duff. We discussed the plans, then just taking shape, for the museum's expansion. I was fortunately able to arrange the donation of a few items of equipment and some publications. Subsequently, I became one of the first contributors to the fund drive. In the back of my mind, however, the thought existed, and it still does, how nice it would be if the Antarctic Society were in a position to obtain a headquarters building with space for a small museum and library. Just a day dream, of course, but these activities are authorized in the Society's articles of incorporation.

## HISTORY OF UNITED STATES ANTARCTIC PROGRAMS (1948-1971):

### A DISCUSSION OF THE PROBLEM

*Henry M. Dater has led a distinguished career as an historian, notably as the U.S. Navy's eyewitness historian for Antarctica. With National Science Foundation support he has been working at the Center for Polar Archives, of the National Archives, in the early stages of a comprehensive history of recent U.S. experience in the Antarctic. With Dr. Dater's scheduled retirement this year, this project may come to an end, but the need for and the task of writing the history of the U.S. Antarctic effort continue. A few years ago, Dr. Dater summarized in a privately circulated essay some problems that the Antarctic historian must face, and he called for comment. This essay is now published for the first time, below. Readers are invited to submit their reactions to this Bulletin or directly to Herman R. Friis, director, Center for Polar Archives, National Archives, Washington, D.C. 20408.*

- THE EDITORS

By Henry M. Dater

Antarctic expeditions of the nineteenth and the first half of the twentieth centuries came to the area by ship, remained for a limited time — one to three operating seasons — and then returned to their land of origin. Each had a beginning, a period of activity, and an end. Each constituted an entity that could be studied independently and wrapped in a neat little package. The historian once he had tied his packages could arrange them in chronological order, and this was the organization most frequently adopted. Handled with skill, it produced works of outstanding usefulness as, for example, H. R. Mill, *The Siege of the South Pole*, 1905, and W. Sullivan, *Quest for a Continent*, 1957.

The method has inherent faults. The setting down of one expedition after another tends to obscure the relationships between them and to isolate Antarctica from developments in the world at large. The reader is not informed of the political, economic, technological, and scientific factors that made expeditions desirable and practicable, defined their objectives, and guided their organization. The result is to produce what are better described as annals than histories. Even Mill, with his commanding breadth of knowledge, does not escape entirely this difficulty, and Sullivan, a perceptive journalist, wrote a reportage in depth rather than history in any profound sense.

In the half century that elapsed between the writing of Mill and Sullivan, a great many important expeditions took place. With the growing number of packages, the historian had either to reduce the size of each, which made the resulting publication increasingly annalistic, or he had to adopt criteria which emphasized certain expeditions at the expense of others even to the extent of omitting some. Sullivan chose to concentrate on the twentieth century and the activities of the United States and its nationals to the detriment of earlier expeditions by other countries. Two outstanding recent books elected other criteria while retaining the episodic approach. L. B. Quartermain, *South to the Pole*, 1967, confined his attention to a geographic area, the Ross Sea Sector. K. J. Bertrand, *Americans in the Antarctic*, 1971, is just what the title implies, an account of United States activities and accomplishments beginning with the sealers and ending with "Operation Windmill."

A notable exception to the annalistic approach is L. P. Kirwan, *A History of Polar Exploration*, 1960. Kirwan's interests ran to the "evolution of polar exploration in its historical and social context," and to the "motives and impulses—economic, strategic, personal, and political—which have given rise to polar exploration." His book, however, covers the story of both polar regions in a brief 354 pages so that what he has written is more a stimulating and perceptive essay than a detailed history. He also shares the belief of many historians that the passage of time is necessary to establish true historical perspective and skips over the period since 1917 in a scant 34 pages.

The frame of Antarctic reference has changed over the last three decades. Although the Argentines have operated a meteorological observatory on Laurie Island in the South Orkneys since 1905, such permanent occupancy remained an isolated instance until 1944 when the British set up bases on Weincke and Deception Islands. They started a trend that within a decade saw the Argentines, Chileans, and Australians also establishing programs of continuing investigation. For the International Geophysical Year (1957-58), eight other nations joined them. Of the 12 participants in the IGY, 10 are still active in the area. Permanent occupancy has become the rule rather than the exception.

With the decline of geographical discovery as a primary motivating force, the desire to conduct detailed studies of Antarctic phenomena increased, and this implied continuing scientific programs. Although the first permanent stations were established for political reasons, they proved ideal for the making of continuous observations in such fields as meteorology, seismology, and upper-atmosphere physics. Those located on the seacoast could be turned into logistics bases for the support of inland stations and summer field parties. Combined with improved air and surface transport, they permitted researchers to penetrate the most remote areas. These activities required scientific and logistics equipment of growing complexity and large numbers of highly trained individuals to operate and maintain it. Costs inevitably spiraled upward to heights that only governments could afford. The *ad hoc* committees which had mounted and managed the occasional expeditions of the past gave way to official administrative bodies. Problems previously unknown, or safely ignored, began to appear. Political frictions arising from territorial claims and other matters had to be resolved; to insure the best results, the scientific programs of 10 or more nations should be coordinated; cooperative projects, combining the talents and resources of two or more parties, required organization. Neat little packages no longer seemed adequate.

The historian must trace these developments in all their ramifications, indicate their interrelationships, and assess their relative significance in contributing to the general Advance of recent decades. In so doing, he lacks the perspective that only time can bestow, and he must seek some other bases for the exercise of judgment. Perhaps, at this point, the historian should consult the recipients of his work. For one employed by the government, the type of study that will be useful to the organization or program with which he is associated should be a prime consideration. In the Antarctic program there are many diverse elements. True, they are for the most part either scientific or logistical but each of these general categories subdivides into many groups. For instance, the historical needs of scientific managers are quite as different from those of field

scientists, as are those of logistics planners from pilots and mess cooks, and there are always the politicians who are a species all to themselves.

The question is basically one of organization. Even limiting coverage of United States Antarctic programs since 1948 leaves the historian with a great mass of material to read and digest. From thousands of disparate pieces, he must select those which are significant to his purpose and organize them into a coherent whole. For this reason he needs criteria and these in turn will be heavily influenced by the needs of those for whom he writes. Different approaches are discussed in the following pages. They are not mutually exclusive but set forth themes to bring order out of the chaos of wills, interests, and events. An approach not considered below, because it seems too restrictive and also because it appears to be in the realm of political science rather than history, is to treat the Antarctic as a political laboratory. The success of the IGY and the general desire to extend its spirit into the future led directly to the Antarctic Treaty which to a large extent formalized relationships that already existed informally. A political history would have to include a discussion of cooperative scientific programs, but primarily as they affected the political question. The focus would shift from Antarctica to the international stage (See R. D. Hayton, "The Antarctic Settlement of 1959," *American Journal of International Law*, vol. 54, no. 2, pp. 343-371). The problem then is to select an approach which will provide a basis for selection and organization and will not prove so restrictive as to eliminate large segments of important activities.

The Military Departments divide their historical programs into two parts: administrative and operational. The first includes not only the ordinary stuff of administration but also policy formation and implementation, interagency relations, and international affairs. The *Pentagon Papers* may be considered in this category, and the format of a narrative followed by a voluminous appendage of documents is a common one. More germane to the Antarctic problem is my *Operation Highjump II*, 1970, and an article in the *Antarctic Journal*, vol. I, no. 1, pp. 21-32, "Organizational Developments in the United States Antarctic Program, 1954-1965." Operational history covers the whole spectrum of what occurred in the field. For this discussion Bertrand's *Americans in the Antarctic* may be cited as a relevant example. Except for journalistic accounts, little serious work of this nature has been done for the contemporary period other than L. B. Quartermain's *New Zealand and the Antarctic*, 1971, in which the author does not seem to have completely solved the organizational problem. At least, he concludes with two chapters of miscellany that he was unable to fit into his narrative.

Except on a very low level administrative and operational history cannot be completely separated. The decision to be made is one of emphasis. Administrative historians approach their subject from the viewpoint of management, i.e. the Antarctic as seen from Washington. They are more interested in the machinery through which things are done than in the actual doing. Many operational factors appear as problems to be solved. Assessments are made on an overall program basis which may easily obscure the significance of individual events and accomplishments. These criticisms should not hide their usefulness for those involved in the same or similar programs and for all interested in the processes of government.

Operational histories, on the other hand, set forth accomplishments and how and by whom they were brought about.

Their ultimate reduction would be to record the activities of each individual concerned, and this can be done for small units operating over a short length of time as may be seen in P. A. Siple's *90° South*, 1959, and A. Lansing's *Endurance*, 1959. This method is obviously impracticable in a history dealing with programs and events covering periods of several years and involving hundreds or even thousands of individuals. Because of the number of persons and the many disparate events that go into an operation, it is easy to lose the totality in a plethora of detail. Many a military narrative has fallen into this morass as endless files of men march and countermarch for purposes not revealed to the reader. Operational history requires the application of stern criteria and sound judgment. Both research and writing are more difficult than for administrative history.

No matter what approach is adopted, the organization of the United States Antarctic program from 1955 to 1971 into two independent but coordinate elements presents the historian with special problems. The scientific program was funded by the National Science Foundation and managed first by a committee of the National Academy of Sciences and, after 1958, by the Science Foundation itself. Logistic support activities were the responsibility of the Navy as the executive agent of the Secretary of Defense. This dichotomy ran through the entire program, from the highest levels in Washington to the smallest station in Antarctica. The situation was further complicated by the paradox that, although science was the principal reason for being in the Antarctic, logistic support cost more in money, manpower, and effort expended. If the criteria are based on this paradox, research and writing will emphasize support activities and direct the readers attention away from scientific investigation. Overemphasis on science programs, however, would obscure the accomplishments of several thousand people who labored to make them possible. A balance between these two spheres of activity must be found.

In treating the logistics side of the dilemma, one criterion is how did the particular action or activity contribute to the furtherance of the science program. This approach is in line with Rear Admiral George Dufek's remark that, if the scientists would tell him where they wanted to go, he would see that they got there. To carry out this promise often required considerable ingenuity and expense. An illustration from the history of South Pole Station provides a good example. No one seriously thought that building material and supplies could be delivered to this remote spot by other means than aircraft. In 1955, however, no cargo planes of sufficient capacity had been mounted on skis, and wheeled aircraft could not operate from the ice shelf at Little America. As a result, a support base was built on Ross Island where the sea ice of McMurdo Sound was sufficiently thick to sustain wheeled take-off and landing. Thus, a station that was not needed scientifically came into being solely for the support of the South Pole. Wheeled aircraft could not land on the polar plateau any more than they could on an ice shelf so their contents would have to be parachuted to the surface. Because the Navy had neither the equipment nor experience to use this technique, it asked for and obtained the assistance of the Air Force. Although well established as a means of cargo delivery, airdrop had its drawbacks when applied in Antarctica. Damage to material occurred when replacements were hard to come by, parachute releases did not always work, and items dragged by the polar wind disappeared over the horizon. Even when all functioned properly, recovering and stowing cargo placed a

heavy burden on small station complements. When ski-equipped C-130 Hercules became available, the Navy hastened to purchase four of them which it put into operation during the 1960-1961 season. At first employed to transport dry cargo, they took over fuel delivery when large internal fuel tanks were developed to fit into the cargo bay. The Hercules could also haul passengers so that the number of summer support personnel could be greatly increased over what had been possible when the principal passenger aircraft was the ski-equipped Dakota.

This story has been introduced not to follow all its ramifications, but rather to see if it suggests some method to approach the logistics portion of the narrative. If the Hercules with skis had been available in 1955, McMurdo Station might not have been built. Because they were not, the only alternative was airdrop from wheeled aircraft which in turn required facilities that could not be provided on an ice shelf. McMurdo Station was added to the program because of technological imperatives. Without belaboring the point, the opening of Antarctica, the ability to live and work there, the capacity to move about the continent have depended upon the adaptation of an expanding world technology to the unique problems of the South Polar region. Emphasis on this aspect of logistic support draws the reader's attention to the relationship between Antarctic development and one of the main currents of modern culture. Its importance is such that it should be used as a second criterion in organizing the information on support activities. (Kirwan in his *History of the Polar Regions* leans heavily on this approach; a suggestive essay on this topic may be found in the *Antarctic Journal*, vol. V, no. 4, pp. 145-149).

A characteristic of the United States Antarctic Research Program has been its fragmentation, being broken down into a large number of small, specialized projects spread over a number of scientific disciplines. To treat them all in chronological sequence will result in little more than a listing of seemingly unrelated investigations that will be of no value to the general reader and not very much to the specialist. Besides, what the latter wants to know has already been recorded in professional journals and other technical publications. What is needed in a general history is some criteria for relating these manifold and disparate pieces of research to the intellectual, technological, and economic evolution of which they are a part. It is here that the lack of perspective becomes most acute. How long it may take for discoveries in basic science to be translated into technological applications has been amply documented. (Illinois Institute of Technology Research Institute, *Technology in Retrospect and Events in Science*, 1968.) The interrelationship between science on the one hand and philosophy and religion on the other has been investigated by the English scholar, Sir William Dampier. (*A History of Science in its Relations with Philosophy and Religion*, 3d ed., 1946.) The revolutionary effect on all realms of thought of the evolutionary theories propounded by Darwin and Wallace in 1859 is well known, but so towering an event did not spring into life at one bound like Athena from the head of Zeus. As Dampier wrote, "Indeed, it required two thousand years of time and the labours of many quiet and unphilosophic physiologists and naturalists to collect enough observational and experimental evidence to make the idea of evolution worth the consideration of men of science." Today, in Antarctica, such quiet investigators are busy accumulating the evidence upon which new hypotheses may be erected, but

only a specialist in a particular discipline could hope to assess the significance of most of the highly specialized projects and his conclusions would be tentative. The person who can do it over the whole range of studies probably does not exist, certainly not among historians.

There does appear, however, to be ways of presenting interesting material about science programs in Antarctica without becoming lost in detail. The whole concept of the IGY as it developed from a proposal for a third polar year into a program for global geophysical observations underlines the facts that Antarctica cannot be isolated from the rest of the world and that international collaboration is a fruitful way to tackle large scientific problems. The institutionalization of the experience as represented by the Scientific Committee on Antarctic Research and the extension of the collaborative approach into the fields of geology, biology, and mapping deserve attention as does the effect of this same cooperation on the political realm leading to the Antarctic Treaty of 1959 and the subsequent relations between SCAR and the Treaty Governments. (See, "The Antarctic Treaty in Action, 1961-1971," *Antarctic Journal*, vol. VI, no. 3.) The United States has played an important part in all these developments beginning in 1948 with its proposal for international discussions of the status of Antarctica and the publication in 1949 by the National Academy of Sciences of *Antarctic Research: Elements of a Coordinated Program*.

The Academy itself has had a distinguished role in the Antarctic through its management of scientific activities during IGY, its membership in SCAR, and its organization and transmission of the objective of the scientific community to the Government. (For the last, see *Science in Antarctica*, 2 vols., 1961, and *Polar Research: A Survey*, 1970.) In this connection a shift occurred in the general thrust of the science program. During the IGY and for several years thereafter the principal emphasis was descriptive. Antarctica was studied with the objective of discovering and cataloguing what was there. Gradually, however, research has been conducted in greater detail and greater depth. From the labors of quiet men new syntheses have begun to appear. The growing confirmation of the Gondwanaland hypothesis may be cited as an example, and here, as so often, information culled from the Antarctic had to be combined with that gathered elsewhere to establish a viable theory. Perhaps, other instances of this sort may be uncovered by a careful review of the record.

Many of the suggestions in the above paragraphs deal with matters of essentially an administrative nature. This approach can be used to include all aspects of United States Antarctic programs since 1948. The coordination of the separately managed scientific and support activities was an administrative problem which permeated all levels of command structure. The political aspects of the program may be included and, among other things, account for the creation and composition of the Antarctic Policy Group. It will also allow for the part played by non-governmental organizations in Antarctic programs. Significant developments in scientific and support activities may be incorporated in the narrative. Their successes and failures, after all, provide the yardstick by which to measure the effectiveness of the administrative system. Finally, there is the practical reason that the administrative record is more readily at hand than that for any other approach. In brief, an administrative history offers the best chance of obtaining a useful and interesting study of reasonable length in a reasonable time.

ANTARCTICAN SOCIETY NEWS NOTES

- o The meeting described on the reverse will not be given media publicity so as to preserve the "advance showing" nature of the gathering. This is a rare opportunity and members are urged to attend and to bring guests. For further information, call Guy Guthridge, 632-4076.
- o As some members know, we have had problems in mailing the membership certificates. As of the end of this week, the last dozen will have been mailed. If you ordered one and have not received it by the first of May, please drop us a line.
- o Members who have not paid their dues are urged to do so--\$3.00 per year for 1975 (and 1974 if you have not yet paid those). You can order certificates for \$2.00 if you wish, at the same time or separately.
- o The Nominating Committee is beginning to undertake its deliberations to make recommendations to the Board and The Society for a slate of officers and four Board Members to take office this summer. If you wish to make any suggestions, call Walt Seelig on 632-4078.
- o As reported at previous meetings this year, the National Academy of Sciences has raised the rental price of the NAS Lecture Room to over \$100 per meeting. In the belief that your Society cannot afford this on a regular basis, we have been searching for a replacement meeting site with a reduced price tag. Charlie Morrison, 860-6251, would welcome any ideas you may have. He, in turn, would like to know if we have among our members a member of the Cosmos Club who would be willing to act as sponsor for the use of the John Wesley Powell Auditorium by The Antarctica Society. Our understanding is that the usage fee is quite reasonable, but requires a member to act as host. The site would be central and prestigious, and if you meet the criteria, we would like to hear from you.
- o Our new address was made known to all of you in a previous announcement and should be used for all Society correspondence: The Antarctic Society, P.O. Box 40122, Washington, D.C. 20016, In the process of changing our mailing address from that used for many years (1619 New Hampshire Avenue NW), some mail seems not to have been forwarded by the Postal Service, and may be lost. Accordingly, if you have sent dues and the check has not cleared your bank, please get in touch with us. We are up-to-date on our finances and chances are the mail didn't reach us and we are carrying you as a delinquent member.
- o We are having AINA update our address-o-graph mailing list. Please let us know if there are errors in your address as shown on the envelope in which this notice was sent. Also, we have had many letters returned recently on which the Postal Service indicates they know the forwarding address of some of our members, but that the mail is being returned because the forwarding period has expired. If you know of any fellow members who seem to have lost contact with us, let them know we are trying to find them too, and do us both a favor by giving them our new address.
- o Board Members are advised that there will be a Board Meeting at 5:30 p.m. on Thursday, May 1, at the new AINA office, Room 102, 3426 N. Washington Blvd., Arlington, just in back of Kanns Department Store. For detailed directions, call Bob Faylor, 527-2678.

Pete Bermel, President  
(860-6352, or 759-3957 res.)

# THE ANTARCTICAN SOCIETY

P.O. BOX 40122  
WASHINGTON, D.C. 20016

Board of Directors Meeting  
Tuesday, September 16, 1975  
Minutes of the Meeting

A meeting of the Board of Directors of the Antarctic Society, a nonprofit corporation under the laws of the District of Columbia, was held at the Washington offices of the Arctic Institute of North America, 3426 North Washington Blvd., Arlington, Va., on Tuesday, September 16, 1975, at 5:30 p.m. Present were the following Officers, Directors, and ex-officio members: Bertrand, Cooke, Faylor, Hushen, Mahncke, Morrison, Moulton, and Stubenbord.

The meeting having been duly called and a quorum-being present, the President announced that the meeting was ready to proceed with the transaction of business.

The minutes of the previous meeting were read, reviewed, and approved as read.

The Treasurer's report was presented for review and approval. Treasurer Cooke had the report broken down into two sections, copies of which are attached to these minutes. The first was a summary of the financial details of the Garden Party held in June. The bottom line showed a deficit of \$252.43. The second section of the report was a summary of Society income and expenditures from June 30 to August 29, 1975, at which time the balance was \$1,531.48. At this time the Board had a discussion on Garden Party costs and prices. President Bertrand asked that the subject be tabled until a later date to allow time for completion of this evening's agenda. The Treasurer's report was approved as read.

President Bertrand circulated a list of Board members' names and addresses for possible corrections or changes. Copies will be distributed to each member.

The meeting then turned to matters of old business. The first item introduced was that of Honorary Membership for August Howard, Secretary, The Polar Times. After much discussion, which brought out that the Society recognizes his outstanding contribution to The Polar Times, a motion was made and carried not to confer the honor at this time.

The next item of old business dealt with the subject of a meeting place for future Society meetings. Various locations were introduced and discussed, including the Cosmos Club, University Club, area County Libraries, educational facilities, the Officers Clubs of local military

installations and commercial establishments. Considerations such as parking, ease of access to all members, admissibility of females, cost and prestige (would members be discouraged from attendance at the more prestigious clubs?) were discussed. Mr. Faylor pointed out that as a member of other organizations he had helped organize meetings at such places as the Ramada Inn (Clarendon) and Key Bridges Marriott with good results. He noted that the dining facilities available prior to meetings encouraged attendees to look on the meetings as "a night out" -- possibly an added inducement to bring spouse, friends, guests, or lover. President Bertrand appointed Mr. Faylor to investigate the details and report to the Board in time for a possible November 2 meeting.

Another item of old business concerned how extensive the mailing of meeting notices should be. It was agreed that notices of general interest should be mailed to all members (including foreign members) regardless of the additional cost of postage. It was felt that such mailings are the only Society contacts available to members not in the immediate vicinity.

The final item of old business introduced was the problem of finding an individual to letter the Certificates since the gentleman who formerly did the lettering has retired and is no longer available. Mr. Morrison volunteered to find a new "pensman" willing to help the Society.

The Board then turned to items of new business and the unexpired term on the Board of Directors of Mr. Ken Moulton, newly elected Vice President. A motion was made and carried to appoint Mrs. Ruth Si pie to the vacancy. President Bertrand will contact Mrs. Si pie regarding her willingness to serve.

The President then introduced the subject of the Board of Directors seat held by Mr. Guy Guthridge. It appears that at the time of Mr. Guthridge's election to the Board, he was not a member of the Society. Mr. Guthridge has stated his willingness to serve but evidently due to an oversight on his part, his dues have not yet been paid at this point. Another Board member paid the membership fees and a motion was made and carried to confirm the nomination of Mr. Guthridge.

The third item of new business concerned the disposition of the remaining three Amundsen-Scott medallions held by the Society.- After a short discussion a motion was made and carried to retain the medallions for later disposal.

The President then read a letter from Mr. Varian Wilson of Christchurch, New Zealand, who wrote to inquire if the Society would be interested in distributing a medal commemorating the 20th anniversary of the conquest of Mount Everest. Part of the proceeds of the sales would go to the Himalayan Trust through arrangement with Sir Edmund Hillary. A pair of the medals were enclosed as a gesture of friendship toward the Society. After discussion a motion was made and carried to announce the availability of the medals in the next Society newsletter but not to participate in its sales or distribution.

President Bertrand then introduced and opened for discussion the subject of a Society contribution to The Louis Deroche Scholarship Fund at the University of Georgia., A decision was made not to make a contribution but to announce the establishment of the fund in the next Society newsletter so that interested parties could contribute.

The next item of business brought up was the frequency of Society meetings. It was decided that meetings during November, January, March, and May followed by the Garden Party was a satisfactory calendar.

President Bertrand announced that he would appoint a Program Committee and a Finance Committee and various names were submitted by Board members for possible consideration.

A short discussion followed on the merits of a Society newsletter or bulletin. General feeling was for a newsletter and President Bertrand will try to implement the matter.

The number and location of Board meetings was discussed. It was concluded that this location was satisfactory (and appreciated) and the frequency should be as often as needed.

The final item of business was a motion to make the appropriate name changes at the bank so that the new Officers could transact the business of the Society. The motion was carried. [Note: The standard bank resolution was approved and is made a part of these minutes.]

There being no further business to come before the Board at this time, the President asked for a motion for adjournment. The motion was made, seconded, and carried, and the meeting adjourned at 8:00 p.m.

Charles E. Morrison  
Secretary/ Historian

# THE ANTARCTICAN SOCIETY

## NEWSLETTER

Volume 1, Number 1.

November, 1975

---

P. O. Box 40122

Washington, D. C., 20016

---

This is the first issue of the Antarctic Society Newsletter which will replace the Bulletin. Costs of printing and increasing postal rates make economies necessary if dues are not to be raised. Therefore, the Board of Directors has decided to consolidate some of the mailings and to discontinue the Bulletin. The Newsletter will be mailed out before each meeting of the Society and will include the announcement of the meeting.

The Newsletter will contain much the same kinds of information that were published in the Bulletin, but it will be issued at least four times a year which should compensate for its smaller size. Since most of the members of the Antarctic Society subscribe to or have access to the Antarctic Journal of the United States, the Polar Record, and the Polar Times, an effort will be made to avoid duplication of information contained in those journals. Exceptions will be made when a newsworthy event occurs shortly before the publication of a particular issue of the Newsletter. Personal news will be emphasized. To do this the cooperation of the members is necessary, and each one is requested to send in such items to the editor.

Your attention is called to the blank on the last page which you can clip and use to send in your annual dues for 1975-76 which are now payable. Note that they are still \$3.00.

- - - - -

Announcement of the First Meeting of the 1975-76 Season

ACCOUNT OF ANTARCTIC ACTIVITIES, 1975-76

by

Dr. Robert H. Rutford, Head  
Office of Polar Programs  
National Science Foundation

8:00 p. m.

Tuesday, December 2, 1975

Room 543, Office of Polar Programs, National Science Foundation

1800 G Street, N. W., Washington, D. C.

ANTARCTICAN SOCIETY AFFAIRS

As a result of the election at the annual meeting of the Society, June 3, the officers and board of directors are as follows:

President:	Kenneth J. Bertrand	Secretary/Historian:	Charles E. Morrison
Vice President:	Kendall N. Moulton	Treasurer/Membership Sec.:	William Cooke
Board of Directors			
<u>Term Expires 1976</u>	<u>Term Expires 1977</u>	<u>Term Expires 1978</u>	
Fred G. Alberts	Meredith F. Burrill	C. Robert Faylor	
Harriet S. Eklund	Louis DeGoes	Guy G. Guthridge	
William H. Littlewood	Rudolf A. Honkala	W. Timothy Hushen	
Frank C. Mahncke	Mrs. Paul A. Siple*	John G. Stubenbord	

\*Appointed by the Board to fill the unexpired term of Kendall N. Moulton who was elected Vice President.

The following were appointed to the Program Committee by the president. Robert J. Allen, W. Timothy Hushen (Chairman), Thomas F. Kelly, Walter R. Seelig, Roy G. Shults, and George E. Watson, III. The Committee has tentatively arranged the following programs in Washington:

December 2	Dr. Robert H. Rutford, "Account of Antarctic Activities, 1975-76."
January/February	An Antarctic film program, preferably at one of the embassies.
February/March	A lecture on Gondwana Land and Continental Drift in conjunction with the Smithsonian Institution.
April	Annual business meeting and memorial lecture. Lecture to deal with history of aviation in Antarctica in commemoration of 40th anniversary of Ellsworth's first trans-Antarctic flight and the 20th anniversary of the second trans-Antarctic flight by Hawkes, January 13, 1956, as well as other long flights in the 1955-56 season.
May	Polar Regions and global climate

The By-Laws call for four meetings a year; more are desirable, and the Program Committee hopes to take advantage of visitors to Washington who are able and willing to lecture on some phase of the Antarctic. Anyone so interested should contact Tim Hushen, Polar Research Board, National Research Council, 2101 Constitution Avenue, N. W., Washington, D. C. 20U18.

Requests by members for a list of the membership of the Society have prompted the Board of Directors to authorize the sale of the list of names and addresses to any member for \$1.00 to cover the cost of reproduction and mailing.

Science, Technology, and Sovereignty in the Polar Regions, edited by Gerald S. Schatz (Lexington Books, 1974, \$16), the published results of the colloquium, December 1, 1973, sponsored by the Society, has been well received. It is reported that ideas expressed in the book have been seriously considered in subsequent deliberations by government personnel dealing with related problems,

The Society is interested in sponsoring future symposia, and suggestions for topics to be considered are invited. Please contact the president, Kenneth J. Bertrand, 6808 40th Ave., University Park, Hyattsville, Md. 20782.

NEWS ITEMS

Members who purchased an Amundsen-Scott South Pole medal, issued in support of the new Antarctic wing of the Canterbury Museum, Christchurch, New Zealand, will be interested to know that they are now collectors<sup>1</sup> items. No more are available from the Museum. Some members may be interested in obtaining a second medal designed by Jim Berry who designed the Amundsen-Scott medal. It marks the 20th anniversary of the conquest of Mount Everest by Sir Edmund Hillary. Sir Edmund led the New Zealand party which met Sir Vivian Fuchs at the Pole in support of the British Commonwealth Trans-Antarctic Expedition during the IGY. The medal sells for approximately \$5.30 U. S. at current exchange rates with royalties going to the Canterbury Museum and to the Himalayan Trust by arrangement with Sir Edmund. Those interested in a medal can write to Mr. Varian J. Wilson, 33 Roseberry St., Christchurch 2, New Zealand,

The 16th and final map folio of the Antarctic Map Folio Series has been published by the American Geographical Society, Broadway at 156th Street, New York, N. Y., 10032. It sells for \$15. Folio No. 2 is out of print, but it is available on microfilm for \$6.00. Any five folios may be purchased at a 25% discount, and the entire set, less No. 2, is available at a 40% discount. This is a great opportunity to obtain a unique work on Antarctica.

Miss Vivian Bushnell, editor of the Antarctic Map Folio Series, retired in October. In terms of government contracts she was in reality "Chief Investigator", something much more than is implied by the title of editor. Her many friends among polar specialists wish her well in retirement.

We are sorry to report the death from cancer in Dijon of Louis Deroche, 60, Correspondent for Agence France-Presse since 1950, on July 21. He specialized in military affairs and space. He was accredited to Operation Deepfreeze in 1957-59 during which time he became the first Frenchman to set foot at the South Pole. Louis was well known among Antarcticans, particularly in Washington. He served a term on the Board of Directors of the Antarctic Society. When the Society was incorporated in the District of Columbia in 1965, he signed the papers as one of the three incorporators. He was instrumental in having his personal friend, Emilio Pucci, design the official scarf of the Society.

Among his legion of friends there will be many who will wish to send a contribution to the Louis Deroche Memorial Fund, University of Georgia, c/o Mr. Perk Robbins, Vice President for Development, University of Georgia, Athens, Ga., 30602. Louis, who held a bachelor's degree from the University of Lyon, was an exchange student at Georgia where he earned an M. A. Degree in 1937.

Since the last issue of the Bulletin word has been received of the death of Hugh Blackwall Evans on February 8 at his home in Vermillion, Alberta. Evans was made an honorary member of the Society on the occasion of his 99th birthday, November 19, 1973. He was assistant biologist on C. E. Borchgrevink's expedition in the Southern Cross, 1898-1900, and prior to that he was a member of a sealing expedition to Kerguelen.

Evans formed a link between the early work and modern exploration in Antarctica. As a young man he knew and consulted with Sir Joseph Hooker, naturalist with the expedition led by Sir James Clark Ross in the Erebus and the Terror, 1841-43. He was also one of the ten men who wintered with Borchgrevink on Cape Adare. This was the first expedition to build a hut on the continent with the intention of wintering over, and it was the first expedition to use dog teams on journeys away from the base in Antarctica. It

is remarkable that in the September 1974 number of the Polar Record we have the last of three articles co-authored by Evans and A. G. E. Jones in the last three years of Evans's life. It was Jones who discovered that Evans was still living a few years ago and brought him again to the attention of the world of science in a note in the Geographical Journal. Granting honorary membership in the Society to Evans was reported in the Bulletin in the Spring of 1974.

BOOK NOTES

Polar Deserts and Modern Man, edited by Terah L. Smiley and James H. Zumberge, University of Arizona Press, Tucson, 1974. A systematic treatment in 14 chapters by 16 authors. Each is well known in his field. Eight chapters cover the physical environment, three deal with the development of resources and three with modern man's adaptation to the polar environment. The text is supported by tables and diagrams. The maps cover either the north or south polar area and are generalized and small scale. Photographs are numerous, excellent, and relevant.

Scott's Last Voyage, Through the Antarctic Camera of Herbert Ponting, edited by Ann Savours, Sidgwick & Jackson Ltd., London, 1974. The story of Scott's last expedition is told in six chapters. Much of the story is carried by one or two excellent photographs on almost every page. Most of the photographs are Ponting's. Some of the photographs have been published previously, a few of them so often that they are familiar. Many of the photographs, however, have not been published before. The editor has linked the photographs into a fascinating account through pertinent captions, relevant commentary, and well chosen quotations from the diaries, notebooks, and published works of the members of the expedition. Ponting was a camera artist, and as one acquainted with his work would expect, the photographs are excellent to an exceptional degree. Fortunately, they have been reproduced very well.

Edge of the World, Ross Island Antarctica, by Charles Neider, Doubleday & Co., New York, 1974. The author is a professional writer, a literary figure, editor, biographer, novelist, and critic. This book is the first on the Antarctic by a person of such a background. It deals with his experience and impressions gained in a brief visit in November 1969 and during the austral summer of 1970-71 under a grant from the National Science Foundation. Interwoven with the author's account of his experiences, mainly on Ross Island, are relevant accounts of operations of earlier expeditions based on Ross Island as well as the modern U. S. base at McMurdo Sound.

Lecture

THE SCOTIA ARC REGION UNLOCKS SOME SECRETS OF GONDWANA LAND

by

Dr. Ian W. D. Dalziel

Lamont-Doherty Geological Observatory

8:00 p. m., Wednesday

February 25, 1976

The President's Room, The George Washington University Faculty Club  
University Center Building 800 21st Street, N, W.

Washington, D. C.

The University Center Building is located on the west side of 21st Street between H and I Streets. A limited amount of parking is available on the streets. Parking is also available for a fee on the lower level of the University Center Building. Enter the parking area from H Street.

- - - - -

Why not decorate that empty wall of your office, study, or den with an Antarctic Society membership certificate? It is artistically designed and suitable for framing (11" x 14"). If you are interested, send an order to Charles E. Morrison, Secretary, with a check for \$2.00, payable to the Antarctic Society. Please print your name as you want it inscribed, and give the date you want on the certificate.

CAPTAIN CHARLES L. KESSLER DIES

It is with sincere regret that we report that the dwindling band of veterans of the First Byrd Antarctic Expedition has lost another member. Capt. Charles L. Kessler (USNR Ret.) died of cancer at age 72 at his home in Richmond, Virginia, on January 3, 1976. His body was interred at Arlington National Cemetery on January 6. During World War II he was in charge of Navy recruiting and induction in Virginia. From 1960 until he retired he was head of the Virginia state draft board. He is survived by his wife, Juel, and a daughter, Mrs. Rita Barte.

As a member of the U. S. Marine Corps he served as a volunteer on then Commander Richard E. Byrd's expedition to Spitzbergen from where Byrd, with Floyd Bennett as pilot, flew to the North Pole, May 9, 1926. Kessler was also a member of the crew of the Eleanor Bolling on the First Byrd Antarctic Expedition, 1928-1930. On what the crew called the "Ever more Rolling," he made four trips from Dunedin, New Zealand, to the Ross Sea. As an observer for Operation Deep Freeze Kessler returned briefly to the Antarctic in 1960 and 1962.

An entertaining raconteur, Kessler lectured widely on Antarctica. Like many of us, he was facinated by the Adelie penguin, and his popular lectures contained many accounts of their antics. He was an active member of the Antarctic Society. When it was possible, he scheduled necessary trips to Washington on dates that corresponded with Scoeity meetings. He was also a member of the Explorers Club and of the Adventurers Club of New York, the American Legion, and the Writers Club of Virginia. Kessler Peak (83° 37' S., 167° 50' E.), overlooking Lenox-King Glacier in the Queen Alexandra Range, was named for him. The Lenox-King Glacier flows into the head of the Ross Ice Shelf.

\* \* \* \* \*

EXHIBIT OF ANTARCTIC PHOTOGRAPHS AND PAINTINGS

Members of the Antarctic Society who live outside the Washington metropolitan area should be interested in an exhibit of 45 full color nature photographs by Eliot Porter and 15 oil paintings by Daniel Lang which is being circulated by the Smithsonian Institution's Traveling Exhibition Service and funded by the Office of Polar Programs of the National Science Foundation. The exhibit is currently on display until February 29, 1976, at CEMREL Inc., 3120 59th Street, St. Louis, Missouri.

Eliot Porter is best known for his wilderness photographs which have appeared in his books, Birds of North America, Flow of Wilderness, The Tree Where Man was Born, The African Experience, and others. Daniel Lang, known primarily for his landscapes, has had one-man shows in New York, Rome, Chicago, and other major cities. Messrs. Lang and Porter visited Antarctica in the 1974-75 austral summer as guests of the National Science Foundation. They were selected for these working visits with the assistance of the National Endowment for the Arts.

From January 14 to 19 the exhibit was on display at the Dimock Gallery of the George Washington University in Washington, DC. The Dinock Gallery is normally closed in the evening, but it was opened specially for the Antarctic Society on the evening of January 15. Mr. Guy Guthridge, Director of Information of the Office of Polar Programs of the National Science Foundation, spoke briefly of the program under which the exhibit was developed and is being displayed.

At press time there were many weeks for which the schedule is open. Therefore, anyone interested in having the exhibit displayed in their town should contact Miss Deborah Dawson, Traveling Exhibition Service, The Smithsonian Institution, Washington, D. C. 20560. Telephone (202) 381-6631. It is an excellent exhibit.

## UNITED STATES ANTARCTIC PROGRAM

At the first meeting of the new season on December 2, 1975, Dr. Robert Rutford, Head of the Office of Polar Programs, reviewed for us the major objectives of the U. S. research program in Antarctica and discussed the proposed research plan for the 1975-76 season. Through visual aids, he traced the steps leading to the appropriation of funds by Congress and outlined the interrelationship of the logistic operations by the Navy, Coast Guard, and civilian contractors. As in all other elements of our society, the spiraling inflation rate most heavily impacts the logistic program costs, and thus limits the extent of the research that can be supported. As a prime example, Dr. Rutford compared fuel costs in fiscal year-71 and fiscal year-76 which show a 300 per cent increase for that period.

Presently, the U.S., France, Australia, United Kingdom, and the Soviet Union are pooling their efforts in a cooperative undertaking, the International Antarctic Glaciological Project (IAGP), a study of the East Antarctica ice cap. Current interest centers on the so-called "Dome C" area, the thickest part of the ice cap, which is located about 600 miles from McMurdo. The objective is to retrieve an ice core at this point which will probably contain the longest paleoclimatic record ever compiled. The French tried to reach this area in 1971-72 and 1972-73 by ground traverse but were foiled by rough surface conditions. In 1974-75, the U. S. flew the French team to the area to carry out shallow drilling and develop plans for deeper drilling in the future. Unfortunately, two LC-130 aircraft were damaged during attempted take-offs from the site. Recovery of the aircraft was a first priority this season.

On November 4, 1975, during a take-off from "Dome C", a third LC-130, No. 320, suffered damage when a JATO bottle malfunctioned and subsequently damaged the number three engine. A support team has been fielded to prepare a landing strip at the site, after which the damaged engine will be replaced, and the aircraft will be returned to McMurdo. The recovery of the other two aircraft will depend on the success with the repair of 320.\*

Although ongoing research at the stations was not radically modified as a result of the setbacks, all 1975-76 science projects requiring C-130 field support were deferred after the third C-130 accident. This included the Ross Ice Shelf Project, a projected multi-discipline study of the huge floating ice barrier. The total U.S. scientific program on the continent was reduced by about 35 per cent because of the limited aircraft capability.

Projects within helicopter range of McMurdo were supported. Of particular note was the drilling through 2 meters of sea ice and 122 meters of water into the bottom of McMurdo Sound (Dry Valley Drilling Project). The drilling will provide data on subsurface geology, the nature of the bottom fauna, bathymetry, behavior of the annual ice, tidal effects on sea ice, etc.

A study of the abundance and distribution of antarctic bottom fish populations is being conducted with particular emphasis on feeding habits, digestion rates, and food consumption. This is important for the possible regulation of future commercial fishing. Research continues on the role of glycoprotein antifreeze substances which enable fish to survive in the icy waters.

After completing the icebreaking operations at McMurdo, the Coast Guard

---

\*At the date of publication, No. 320 and No. 129 had been repaired in the field and had been flown out of the Antarctic. The repairs will be completed in New Zealand and in the United States. The repair crew closed its camp at "Dome C," and plane No. 319 will remain at the damage site until the next austral summer.

icebreakers Glacier and Burton Island will support ocean science programs in the Ross and Weddell Seas.

Dr. Rutford concluded his talk by describing the increasing emphasis on antarctic resources. Four nations, West Germany, Poland, Japan, and the Soviet Union, will have vessels operating in the Drake Passage this year, investigating the potential for harvesting krill, a small, edible shrimp-like animal, that is abundant in the southern oceans. He referred to the Eighth Antarctic Treaty Consultative Meeting held in Norway this past summer, which devoted considerable time and effort to discussion of antarctic resources, conservation, and environmental protection.

---Abstract of Dr. Rutford's talk by Kendall N. Moulton.

\*\*\*\*\*

#### SIPLE STATION CLOSED FOR 1976

As early as November 4, 1975, when the third LC-130 was damaged at "Dome C" in East Antarctica, it became apparent that the lack of airplanes might prevent resupply of Siple Station, 1,400 miles from McMurdo.

Then, in December, the 12-man summer crew came down with gastrointestinal ailments. In mid-December, one member of the crew showed symptoms of hepatitis. The entire crew was evacuated to New Zealand via McMurdo on January 1. The hepatitis was confirmed in the one person who had shown symptoms at Siple, but the other crew members tested negatively for hepatitis. Because of the sickness and the continuing limited availability of airlift in Antarctica, coupled with the lateness of the austral summer season, the decision was made to close Siple for the 1976 winter.

Plans are to reopen the station in the 1976-77 austral summer.

-This note was prepared by Guy G. Guthridge.

- - - - -

#### MAILING LIST REVISED

The Board of Directors of the Society has been concerned about the number of pieces of each mailing that have been returned undelivered. Also some members have complained about not receiving notices. The matter was discussed at the Board meeting on November 12, and the President appointed an ad hoc Membership Committee which has reviewed and revised the mailing list. Keeping the list current, however, is an ongoing process. Treasurer/Membership Secretary William Cooke suggests that you urge any member who is not receiving notices and copies of the Newsletter to write to him immediately. The zip code number, of course, is necessary, but if pertinent, apartment numbers are also important.

\* \* \* \* \*

#### ANNUAL DUES

Dues are payable annually on October 1. By consolidating mailings and other economies we are trying to keep dues at \$3.00. That is why members have not been billed individually. Dues have been coming in steadily, but a goodly number have not paid dues of 1975-76. If you are in arrears, won't you use the blank below and send a check today?

## MEETING NOTICE

Annual Business Meeting Followed by a Lecture Entitled

DOME CHARLIE, HERCULEAN TASK

by

Commander Jerome R. Pilon

3:00 p. m., Wednesday

April 28, 1976

The President's Room, The George Washington University Faculty Club  
The Marvin Center 800 21st Street, N. W.

Washington, D. C.

The Marvin Center, also called the University Center Building, is located on the west side of 21st Street between H and I Streets. A limited amount of parking is available on the adjacent streets. Parking is also available for a fee on the lower level of the Marvin Center. Enter the parking area from H Street.

\* \* \* \* \*

Commander Pilon, Assistant Manager of Polar Operations Section of the Office of Polar Programs, National Science Foundation, will tell about the recovery of two of the three C-130 Hercules airplanes that were damaged and temporarily abandoned on Dome C on the Polar Plateau of East Antarctica in January and November, 1975. Two of the planes were recovered in the past austral summer. The third is scheduled for recovery in the next summer season.

- - - - -  
**AGENDA FOR THE ANNUAL BUSINESS MEETING**

1. Minutes of the last annual meeting.
2. Report of the Secretary
3. Report of the Membership Secretary
4. Report of the Finance Committee
5. Report of the Program Committee
6. Election of Officers and Board of Directors

The Nominating Committee, consisting of Albert P. Crary (chairman), Peter F. Bermel, Louis DeGoes, and Gerald K. Pagano, have submitted following slate of candidates for election:

Officers: President: Kenneth J. Bertrand (Term 1 year)  
Vice President: Kendall N. Moulton  
Secretary/Historian: Charles E. Morrison  
Treasurer/Membership Secretary: William B. Cooke

Board of Directors: Robert J. Allen  
(Term of 3 years) Richard L. Cameron  
Mrs. Sophia R. Dales  
George E. Watson, III

Nominations will also be accepted from the floor.

- - - - -

MEMBERSHIP CERTIFICATES

Membership certificates are still available from the Secretary for a fee of \$2 00. The certificate is artistically designed (black on white) and suitable for framing (11" x 14"). It makes an excellent wall decoration. When ordering make checks payable to the Antarctic Society. Please print your name as you want it inscribed, giving title, if any. Also indicate the date you wish to appear on the certificate.

REMAINING PROGRAMS FOR 1975-1976

8:00 p.m., Thursday, May 20. (In conjunction with the Audubon Society)

Lecture by Dr. George E. Watson, III, "Bird Life in the Southern Oceans"  
Curator of Birds, National Museum of Natural History, Smithsonian Institution

Decision pending on the meeting place.

4:00 p.m., Saturday, early in June (Date to be determined.)

Annual Garden Party at Stronghold, Sugarloaf Mountain

Notices will be sent at a later date, announcing each of the above events.

- - - - -

Dues for 1975-76

Some members have not paid their dues for this year. If you are one of them, not do it now by using the blank provided below?

## THE SCOTIA ARC REGION UNLOCKS SOME SECRETS OF GONDWANALAND

By

Dr. Ian W. D. Dalziel

The conclusions expressed here are based on work which began in 1968 and has continued through the 1975-76 austral summer. It was undertaken from Lament-Doherty Geological Observatory of Columbia University and supported by the Office of Polar Programs of the National Science Foundation. The latter's research ship *Hero* transported the investigators to the various insular sites which they wished to study, sites which would have been otherwise inaccessible.

Geographically, the Scotia Arc consists of the island chain which loops around the Scotia Sea, linking Tierra del Fuego with the Antarctic Peninsula. It includes South Georgia, the South Sandwich Islands, the South Orkneys and the South Shetlands. In a broader geological sense, the Scotia Arc region extends from 46° S. in Chile to the base of the Antarctic Peninsula. It is this broader region which was the area of investigation. The region is of outstanding significance because it lies along the boundary between the American and Antarctic lithospheric plates. It has been an active plate boundary for at least 200 million years. While agreement has generally been reached on how South America and Africa and on how Australia and East Antarctica fit together in a reconstructed Gondwanaland, the manner in which the Scotia Arc regions matches is still uncertain.

There are two broad physiography provinces in southern South America. The first is represented by the lowland of Tierra del Fuego. The second is the Andean Cordillera. Within the Cordillera, there are three main geological provinces<sup>^</sup> which are only partly represented in the Antarctic Peninsula. In Chile, the western geological province of the Cordillera consists of deep seated parts of old volcanoes, batholiths which were intruded into Paleozoic basement rocks. The latter consist mainly of highly distorted sediments in which purplish chert, massive, thick-bedded sandstones, and white limestones are prominent. The central province consists of mafic rocks, as though they came from the ocean floor. Great masses of mafic gabbro have been intruded into other volcanoes. The eastern province consists of silicic volcanic rocks of Upper Jurassic age. The outer or western province of the Cordillera is similar in origin to the Japanese archipelago. It is an island arc, but unlike Japan, where the gap between the island arc and the continent is occupied by the Sea of Japan, in Chile the gap has been closed by the two parts having been jammed together again with the sea floor being compressed and pushed up.

The collision which closed the gap and raised the floor of the marginal sea resulted from the subduction of the Pacific plate beneath the South American-Antarctic plate. This also caused the eruptions which produced the Upper Jurassic silicic volcanic rocks of the eastern geological province.

The geology of the remainder of the Scotia Arc is consistent with this interpretation of the South American Cordillera. For example, the rocks of South Georgia, eastward on the Scotia Ridge, are similar to those of Navarino Island, off the southern coast of Tierra del Fuego. In South Georgia there are three major components. The first consists of the Lower Cretaceous Cumberland Bay sediments, derived from the

---

\* This abstract of Dr. Dalziel's illustrated lecture before the Antarotican Society, February 25, 1976, was prepared by Kenneth J. Bertrand and reviewed by Dr. Dalziel. Readers are also referred to Ian W. D. Dalziel, "The Scotia Arc Tectonics Project, 1969-1975," *Antarctic Journal of the United States*, Vol. X, No. 3, May/June, 1975, pp. 70-79, for additional information, including illustrations and bibliography. See also articles by Dalziel and associates in *Antarctic Journal of the United States*, Vol. IX, No. 4, pp. 244-246, and Vol. X, No. 4, pp. 180-182.

island arc. The second, the Sandebugten sediments, were derived from the continent. The third component is an igneous complex that forms part of the mafic floor of the small ocean basin which was compared with the Sea of Japan, The interpretation is that as South America drifted away from Africa, South Georgia, a lump of continental material, was left behind, a long way from either of the larger land masses.

The South Orkneys consist of massive sandstones with big folds, the sediments are probably older than those in South Georgia, the marbles of Signy Island are equivalent to the limestones of the Paleozoic basement rocks of the island are geological province of Chile.

The rocks of the northernmost of the South Shetland Islands are also the same as the basement rocks of the volcanic island arc of South America. The Elephant Island group of islands consists of highly deformed rocks, old volcanics interbedded with mudstones deformed into black and green schists. Gibbs Island has purple Paleozoic sediments which appear to have been deposited on the deep sea floor. King; George Island includes younger volcanic necks which raises the possibility of the existence of copper deposits similar to those in the Andes. On Smith Island, however, there are highly compressed dark bluish schists as if formed from the metamorphism of sediments from an oceanic trench. One again, these probably represent part of the old basement rocks. They include thin rhythmically layered silicious ooze from the deep sea, very old and greatly altered.

The Antarctic Peninsula consists mostly of basement rocks intruded by igneous rocks and topped with rhyolite of Jurassic age. Together with the inshore islands, such as Anvers Island, the Peninsula belongs to the volcanic outer island arc province of South America, the rocks of that continent are, however, more deformed than those of the Antarctic Peninsula\* probably due to the island arc being pushed back against the continent. The Antarctic Peninsula was not pushed back against East Antarctica.

Now around the Scotia Arc the South American Plate is going under the Scotia Platelet to form the South Sandwich volcanic chain. South Georgia is being pushed eastward. The volcanism in the Bransfield Strait is due to spreading on the continental side of the young arc, represented by the rocks of King George Island. The Strait of Magellan has been active as a fault zone for 100 million years. There is very slow strike slip movement. The South Sandwich Islands are a very primitive island arc, in the sense that the rocks there are only 4 to 8 million years old.

Some may be interested to know that Grytviken, South Georgia, is now a ghost town although the British Antarctic Survey has a base on one side of the harbor. The Whaling station was last occupied on a lease by the Japanese in 1968. A Norwegian caretaker stayed on a couple of years more to tidy up the property. No signs of Shackleton's party remain at Cape Vallentine or at Point Wild on Elephant Island.

## MEETING NOTICE

Lecture

BIRD LIFE IN THE SOUTHERN OCEANS

by

Dr. George E. Watson, III

Curator of Birds  
National Museum of Natural History  
Smithsonian Institution

8:00 p. m., Thursday

May 20, 1976

The President's Room, The George Washington University Faculty Club

The Marvin Center

800 21st Street, N. W.

Washington, D. C.

The Marvin Center, also known as the University Center Building, is located on the west side of 21st Street, between H and I Streets. A limited amount of parking is available on the adjacent streets. Parking is also available for a fee on the lower level of the Marvin Center. Enter the parking area from H Street.

Dr. Watson is author of Birds of the Antarctic and Sub-Antarctic, published by the American Geophysical Union in December, 1975. He was principal author and convener of the 14th Map Folio of similar title, published by the American Geographical Society as one of its Antarctic Map Folio Series in 1971. Dr. Watson served as American Observer on a Chilean Antarctic expedition in 1963-64. He was a USARP scientist aboard the Icebreaker East Wind in 1966. He also served with NASA aboard the Croatan, going as far south as 60° S. This past February he made a quick cruise around Cape Horn as instructor on a ship sent out by the Smithsonian Institution.

## ANTARCTICAN SOCIETY NEWS

At the annual business meeting of the Society, April 28, 1976, the following were elected for terms of one year.

President: Kenneth J. Bertrand      Vice President: Kendall N. Moulton  
Secretary/Historian: Charles E. Morrison  
Treasurer/Membership Secretary: William B. Cooke

At the same meeting the following persons were elected to 3-year terms on the Board of Directors of the Society:

Robert J. Allen  
Richard L. Cameron

Mrs. Sophie R. Dales  
George E. Watson, III

- - - - -

We are continuing our efforts to correct and up-date the mailing addresses on our membership rolls. After mailing out the last issue of the Newsletter eight pieces of mail were returned by the Postal Service. For each mailing the number has been reduced. If anyone knows of the current address of any of the people listed below, we would appreciate receiving a card or note, telling us what it is.

Mrs. Henry C. Collins  
Mr. William J. L. Felts  
Mrs. John V. Hansen (Ann Bach Hansen)  
Mr. Richard J. Litell

Mr. James B. Pranke  
Rear Admiral James R. Reedy, USN  
Mr. Vernor Stillner  
Miss Linda Victory

- - - - -

The annual garden party for the Antarctic Society is being planned for the latter part of June. Details will be available in the next number of the Newsletter. It will be issued early to give you plenty of time to arrange your social schedule.

- - - - -

ANNUAL DUES

Annual dues are payable on or before October 1. In order to curtail expenses and hold the dues at \$3.00, the Board of Directors instructed the Treasurer not to send out individual notices this year but to rely on reminders in each number of the Newsletter. Apparently this has not been entirely effective, for a considerable number of members have not paid dues for 1975-76. If you are one of them, please use the blank to mail your dues to the Treasurer. If you are not sure, send the check and it will be credited to 1976-77 if you are not in arrears.

THE ANTARCTICAN SOCIETY  
P. O. Box 40122  
Washington, D. C. 20016

Enclosed is my check for \$3.00, payable to the Antarctic Society, to cover my dues for 1975-76. If I am not in arrears, I understand it will be credited to 1976-77.

## ANTARCTICA AND THE ARTS

Once almost the exclusive domain of the seal hunter and intermittently the goal of the explorer, Antarctica in the 20th Century became increasingly a field of investigation for science. Scientific activity reached a peak during the International Geophysical Year (1957-58) and has continued on a high level in the subsequent work of several nations under the direction of SCAR (Scientific Committee on Antarctic Research) of the International Council of Scientific Unions. The attendant publicity of this widespread interest in Antarctica by the scientific community apparently has alerted the people in the Arts to the existence of a unique and unfamiliar world in the south polar regions. It is an environment that has been interpreted until recently, in so far as the Arts are concerned, only by amateurs although some have been very competent. As the following will show, this is now changing.

The new interest in Antarctica by practitioners of the Arts has resulted in works of many forms. They include paintings, photographs, poems, narrative and expository prose, and most recently a symphony. In the United States some of these efforts have been supported in whole or in part by the National Science Foundation, through the Office of Polar Programs, and by the National Endowment for the Arts.

Recent American examples in which the Antarctic provided artistic inspiration are *Some Songs of the South Pole*, a book of poems by Edward A. Bacon, then Deputy Assistant Secretary of the Army (1960); "Barkentine Bear," a poem by Richard S. Black, Rear Admiral USNR (Ret.), *Naval Research Reviews*, Vol. 16, No. 1, April, 1963, pp. 12-13; *The Edge of the World, Ross Island, Antarctica* by Charles Neider, reviewed in the November issue of the *Antarctic Society Newsletter*, and the exhibition of paintings by Daniel Lang and photographs by Eliot Porter, described in the February number of the *Newsletter*. The poem *Adequate Earth* and the symphony based on it are discussed below.

### A REVIEW

Donald Finkel, *Adequate Earth*, Atheneum, 122 East 42nd Street, New York, N. Y., 10017, 1972. xii and 51 pp. \$2.95.

This is a small volume of seven poems on Antarctica. The last poem is entitled "Adequate Earth" and gives its name to the volume. It is the seventh book by Finkel, a native of New York City and a member of the faculty of Washington University, St. Louis, Missouri, where he has been poet in residence since 1960. The poems are based on the writings of such famous Antarctic personages as Scott, Shackleton, Amundsen, and Byrd and on Finkel's own observations during a visit to Antarctica in 1970 under the auspices of the Office of Polar Programs of the National Science Foundation.

In his *Answer Back* (1968), relating to cave exploration, Finkel developed a collage technique which he has perfected in *Adequate Earth*. His reflections, in a variety of verse forms, on the awful and beautiful ice-drowned land and on the reactions of others to it are linked to appropriate quotations from some of the classic works on Antarctic exploration. Finkel warns, "I am concerned, however, lest some readers be led to misconstrue the function of the quoted passages. This is not a work of scholarship, but of the imagination. These precious scraps, culled from sledging journals, memoirs, histories, and technical articles are intended simply as lights in a constellation in which my own observations form an integral part."

To "help the traveller gain his bearings" Finkel points out that the first poem, ONE LAST RESORT, looks out from the door of Shackleton's hut at Cape Royds. ANGELS AND FOOLS related to Cherry-Gerrard's mid-winter trip to the Emperor penguin rookery at Cape Crozier. WONT IT BE FUN deals with the trek across the Ross Ice Shelf by Scott, Shackleton and Wilson in 1902-03. POLE BUSINESS is based on Amundsen's dash to the Pole from the head of Axel Heiberg Glacier, and SOME TIME on the tragic journey of Scott and his companions. HOW LITTLE relates to Byrd's reactions to the solitude of Advance Base. These "points of reference," if not absolutely necessary, are at least an assurance for the Antarcican that he is with the poet, but it is doubtful if they are sufficient for the uninitiated although the glossary (pp. 48-51) may help the latter. Perhaps it isn't necessary for one unacquainted with Antarctica to get some message from the poems.

The poems will probably appeal to a narrow audience because they are oriented around an environment that is strange to most people. However, anyone familiar with the Antarctic and with the epics of its exploration will enjoy Finkel's vivid and incisive reflections. KJB

#### ADEQUATE EARTH, A SYMPHONY\*

While Eliot Porter's photographies and Daniel Lang's paintings were on exhibit at CEMREL, Inc., Saint Louis, Missouri, January 31-February 29, Robert Wykes's "Adequate Earth," a symphonic setting of seven poems published under that name by Donald Finkel, was performed by the Saint Louis Symphony Orchestra, under the direction of Gerhardt Zimmermann, February 5, 6 and 7 in Powell Symphony Hall, Saint Louis. The symphony has been commissioned by the National Endowment for the Arts and the Saint Louis Symphony Society.

The symphony was highly original, and according to the St. Louis Post Dispatch, "the most talked-about piece of new music to be done in St. Louis for at least a decade."

Wykes said, "From the beginning certain design features of the work were dictated by the nature of the poems—the use of multiple chorouses, the use of more than one speaking voice ... Now, in its final form, it seems to me a unique species; I would be hard put to cite a direct historical precedent."

The speaking voices were taken by baritone William Warfield as narrator and by Finkel, himself, as poet. The Washington University Civic Chorous, the University Choir and Madrigal Singers served as the three chorous groups.

The performance was generally praised, but a principal criticism of the work was "the lack of a text which severely impaired the public's ability to follow a work in which the text has been deliberately given primary importance by the composer." This is certainly a matter which is not difficult to correct in future performances, but the complexity and cost of producing the symphony may make them rare.

- - - - -

The exhibition of Antarctic photographs by Eliot Porter and paintings by Daniel Lang will be at Virginia Polytechnic Institute, Blacksburg, Virginia, from October 2-31, 1976. A more complete schedule for 1976 and 1977 will be carried in a later number of the Newsletter. However, the exhibit has an open schedule from June 26 to September 12. Anyone interested should write to Traveling Exhibition Service, Smithsonian Institution, Washington, D. C. 20560.

---

\* The above commentary by the editor has been assembled from articles in the St. Louis Post Dispatch, the St. Louis Globe Democrat, and from the official program of the Saint Louis Symphony Orchestra.

## NOTICE OF ANNUAL GARDEN PARTY

Stronghold, Sugar Loaf Mountain  
Frederick County, Maryland

Sunday, June 20, 1976  
2:00 p. m. to 10:00 p. m.

DINNER BUFFET  
Beginning at 5:00 p. m.

Catered by Comus Inn

Followed by Slide Show and Lectura on  
Wilkes-Casey (U. S. A.-Australia) Station

Price: \$10.00 per person

Cash Bar

-----

Spend Father's Day and celebrate Antarctica's "Mid-winter Day" with fellow Antarcticans. As for the past several years, Stronghold is being made available exclusively for the Antarctic Society. Weather permitting, the party will be held in the extensive gardens surrounding the residence. If it rains, the party will move into the Georgian colonial mansion. Informal or casual clothing is recommended, especially for those who may wish to hike the short distance to the top of Sugar Loaf.

Nearby Comus Inn, the caterer, is noted for the quality of its food. Unfortunately, we have tried in vain to get a reduced price for children. We certainly do not want to exclude children, and we appreciate the problem that this may cause. Therefore, we suggest that if you bring children that you also bring a picnic basket of food for them. \_\_\_\_\_

Prepaid reservations are necessary. Please fill in the blank and send it to William B. Cooke, Treasurer, Antarctic Society, P. O. Box 40122, Washington, D. C. 20016, so as to arrive by Thursday, June 17. If you have any questions, Phone Bill Cooke (Office: U71-1605, Home: 291-2555) or Charlie Morrison (Office: 860-6251, Home: 93S-719U).

-----

I will attend the Antarctic Society garden party at Stronghold with \_\_\_\_\_ guests  
Enclosed is my check for \$ \_\_\_\_\_, payable to the Antarctic Society.

\_\_\_\_\_  
(Name)

If you have never visited Sugar Loaf Mountain, you owe it to yourself to do so now. Come early and socialize. The bar will be open early. Friends as well as members are welcome.

When it is sufficiently dark, the party will conclude with a slide show and illustrated lecture. The lecture will be given by Richard J. Neff, Cartographer with the Special Mapping Center of the U. S. Geological Survey. Mr. Neff spent from November 1974 to February 1976 at Australia's Casey Station as a participant in the International Antarctic Glaciological Program. He was involved in the third year of a 3-year program. He made several overland traverses from Casey Station operating a geo-receiver net. His slides will cover both Casey Station and the interior.

Casey Station was originally Wilkes Station, established by the United States as part of the International Geophysical Year. It was later turned over to Australia. Rudolf A. Honkala and Richard L. Cameron were at Wilkes Station during IGY under the leadership of the late Carl R. Eklund. Each has a collection of slides from that period. They will give short talks to accompany their slides to show the changes that have occurred over two decades at Wilkes-Casey Station.

#### DIRECTIONS FOR REACHING STRONGHOLD

From the Beltway (I-U9!?) take 1-270 (formerly I-70S) northward, past Rockville, Shady Grove, Bureau of Standards, Gaithersburg, A5C, and Clarksburg exits. Turn off at Hyattstown-Comus Exit (16.3 miles from the Rockville exit). Circle under 1-270 and follow route 109 for 3.3 miles to Comus. Turn right at Comus onto route 95 for 2.5 miles. Proceed straight across the paved intersection (Mountain Cross-Roads). Immediately on your left is a small lake. One-fourth mile beyond the intersection turn right onto mountain road through a gateway. Follow this for 4 miles. The first house on the right (k white columns) is the superintendent's house. Around the bend is the Strong residence. The parking lot is on the near or lower side of it.

#### ABOUT STRONGHOLD

Sugar Loaf Mountain (El. 1,283 Ft.) ranks with the Great Falls of the Potomac as one of the two outstanding scenic spots within a few miles of Washington. It has been designated by the Department of Interior as a natural landmark. First mapped in 1707 and used as a lookout post by the Union Army in 1862, it is an historic as well as a scenic spot. The Bank of the United States acquired the mountain in the 1830s and sold it off as woodlots to surrounding farmers. During the first quarter of the 20th Century Mr. Gordon Strong gradually acquired the land which includes and surrounds Sugar Loaf Mountain. Here he built his home, Stronghold, and developed the gardens. President Franklin D. Roosevelt was a sometime visitor. To preserve the scenic beauty and yet make the mountain available to the public, Mr. Strong provided for the creation of Stronghold, Inc., and he left a small trust fund for its support. Among the projects now carried on by the corporation is the development of a blight resistant strain of the American chestnut so that the chestnut forest which covered the mountain until the 1920s may some day be restored.

#### SOCIETY NEWS

At the last meeting of the Board of Directors, May 12, three resolutions were passed. One instructed the Finance Committee to recommend a date to mark the beginning of each fiscal year. The by-laws do not deal with the subject, and in the past there has been no uniform date. The Finance Committee consists of William B. Cooke, chairman, Meredith F. Burrill, and N. Marshall Meyers.

A second resolution instructed the President to appoint a committee to review the constitution and by-laws, and if deemed desirable, to recommend revisions. Meredith F. Burrill, chairman, Richard L. Cameron, and Guy Guthridge have accepted appointment to this committee.

The third resolution instructed the President to appoint a committee to consider the advisability of holding in Washington in the spring of 1977 a symposium or colloquy on Antarctic Resources and the Environment or on some other suitable topic. No funds would be available for travel. The committee consists of Gerald S. Schatz, chairman, Robert J. Allen, Richard L. Cameron, Kendall N. Houlton, and V. Timothy Hushen. The colloquy on Science Technology and Sovereignty in the Polar Regions held under Mr. Schatz's direction on December 1, 1973 was highly successful, the results having been published by D. C. Heath, Lexington Books, in 1974. The book, bearing the same name as the colloquy, was edited by Mr. Schatz.

The present committee, if it is to be successful should have as much input from the membership as possible. Anyone having suggestions for suitable topics or qualified speakers or wishing to volunteer to participate should contact Gerald S. Schatz, National Academy of Sciences, 2101 Constitution Avenue, N. W. Washington, D. C. 20418.

ELLSWORTH'S TRANSANTARCTIC FLIGHT FROM THE PERSPECTIVE OF ITS  
FORTIETH ANNIVERSARY<sup>1</sup>

by

Kenneth J. Bertrand

Place the track of Ellsworth's Trans-Antarctic flight on a modern map and consider that it was made by two men in a single-engine plane of 600 horsepower, capable of a top speed of 230 miles per hour. With the tanks full, the plane supposedly had a range of 7,000 miles, an ample margin of safety. In the event of a crash landing enroute, if they survived, there was no alternative to an overland trek of up to 1,000 miles, and Ellsworth was 55 years old.

In the context of the time, it was a daring but not a foolhardy undertaking. It was well planned and well executed. From today's vantage it may appear to have been merely a stunt, but no more so than a dash to either of the poles. The airplane was one of several devices that benefited from rapid technological development as a result of the urgent requirements of World War I. In the 1920s former military pilots, encouraged by airplane manufacturers, engaged in all kinds of flights to prove the practicality of the airplane. These included races, non-stop endurance flights, long distance flights, trans-continental and trans-oceanic flights, Polar explorers, too, turned to aircraft, first in the Arctic and then in the Antarctic. Most of them had also had Military flight training.

One of these pioneers was Lincoln Ellsworth, no mere adventurer but a man well qualified for the task, a man who might have seemed impetuous but who planned carefully and who was tenacious in his efforts to achieve self-appointed goals. The son of a Chicago industrialist and public minded citizen, he became independently wealthy. The family had been prominent since colonial days in Connecticut. Lincoln Ellsworth was an outdoor man, a man of action. He was a surveyor and engineer who had attended Yale and Columbia Universities without completing work for a degree. He had been engaged in railroad building in Canada and gold mining in Alaska. He had been chief engineer for the construction of the city of Prince Rupert, had been involved in a hardwood timber study in Yucatan, and from 1913 to 1916 had been a field assistant for the U. S. Biological Survey, working from California to Alaska. A physical fitness enthusiast he followed a daily routine

1. This is an abstract of Dr. Bertrand's talk before the Society, March 30, 1976, as the 13th Annual Memorial Lecture.

of vigorous physical activity as long as he lived.

In 1925 Ellsworth and Roald Amundsen had attempted to reach the North Pole in two Dornier-Wal flying boats from Kings Bay, Spitsbergen. In 1926 he, Amundsen and Nobile had flown over the North Pole on a flight from Spitzbergen to Alaska in the dirigible Norge. In 1930 he had been navigation expert and American Geographical Society observer on the Graf Zeppelin on a flight over the Siberian Arctic.

In the meantime the airplane had reached Antarctica. In a matter of 14 months aircraft of four different expeditions were exploring Antarctica. A short reconnaissance flight about Deception Island by Sir Hubert Wilkins, November 6, 1928, was the first, and on December 20 Wilkins made his long flight from Deception Island down the east side of the Antarctic Peninsula to Hearst Island and Stefansson Strait, erroneously reporting that the peninsula was an archipelago. On January 15, 1929, Commander Richard E. Byrd made his first flight from Little America, and on November 29 he made the first flight to the South Pole. Also in that month Commander Finn Lutzow-Holm made several flights from the Norvegia in the vicinity of Bouvet Island. On December 21, 1929, Flight Lieutenant S. Cambell made a flight over MacRobertson Land from the Discovery of Mawson's BANZARE expedition. Wilkins was also back in the 1929-30 season, flying from the William Scoresby. The landing gear of Wilkins's plane was equipped with wheels in 1928, but in 1929-30 the plane was mounted on pontoons. All of Byrd's flights were in planes equipped with skis. The Norwegians in the 1930s explored the coast from 15° W. to 85° E. Mawson explored the coast from 43° E. to 143° E. Both used small planes mounted on pontoons. They had to be launched from the ship for each flight. After making four flights to the east of Little America in 1929, Byrd was back in 1933 to further explore Marie Byrd Land. Such was the situation when Ellsworth turned from the Arctic to Antarctica.

Like so many before and since, Ellsworth was fascinated by the idea of exploring the unknown area between the Ross Ice Shelf and the Weddell Sea. On the advice of Berent Balchen, who was to be his pilot, he discarded the idea of using a catapult ship to launch a seaplane for several flights inland. Having enlisted the aid of Sir Hubert Wilkins, he gave him responsibility for acquiring and fitting a ship, a 400-ton Norwegian herring vessel, re-named the Wyatt Earp.

Ultimately, the plan was for Ellsworth and Balchen to fly from Little America to the Weddell Sea and back in 1933-34, landing enroute to wait out bad weather and to determine geographical positions. For that reason the plane, the Polar Star, was a low wing monoplane whose wings, with a little scooping out of the snow, would rest on or below the surface, fairly secure from the wind. Moreover, it could land at 42 miles per hour. The first attempt, however, was aborted when the plane was damaged as an ice floe on which it was resting in the Bay of Whales split, letting the plane fall into a crack.

The second attempt was made the following year from Deception Island, where the Wyatt Earp arrived on October 14, 1934. Delay caused by a broken connecting rod and bad weather forced Ellsworth to look for a new landing field with a snow surface. On December 2 they anchored off Snow Hill Island. Thwarted in earlier attempts, the last try at a trans-continental flight was made on January 3, 1935 but after two hours and 28 minutes Balchen and Ellsworth were back at Snow Hill Island, much to the leader's chagrin.

The third season Dundee Island was chosen as a base, and the plane was unloaded from the Wyatt Earp on October 18, 1935. This time the pilot was Herbert Hollick-Kenyon, a British-born Canadian who had been a pilot in the Royal Air Force in World War I and who, as a pilot for Canadian Airways, had had considerable experience in the Arctic. The first attempt at the trans-Antarctic flight from Dundee Island was made on November 20, but it was ended one hour and 45 minutes after takeoff by a broken and leaking fuel gauge.

On the second attempt, November 21, bad weather ahead over the Antarctic Peninsula forced Hollick-Kenyon to turn back short of 71° S., not long after they had sighted the Eternity Range and the three prominent peaks which Ellsworth named Faith, Hope, and Charity. They returned to Dundee Island after 10 hours and 27 minutes in the air, but not all was lost. The photographs which Ellsworth had taken later proved very helpful in solving the geographical puzzle in the area.

Finally, November 23 at 4:20 a.m., local time (8:04 a.m. G.C.T.), the Polar Star took off on what was to be the successful trans-Antarctic flight. As in every previous attempt, Ellsworth had spent hours calculating and plotting on cross-section paper the altitude and azimuths of the sun for the presumed position of the plane at each hour at a constant speed of 150 miles per hour. At this speed the entire flight, non-stop, should take 14 hours. The plane was to have kept in constant radio contact with the ship, which was in command of Sir Hubert Wilkins. Unfortunately, shortly after reaching the English Coast, south of Alexander I Island, the plane's radio failed at 16:16 G.C.T., eight hours and 11 minutes after takeoff, and contact was lost, never to be re-established. At 18:00 G.C.T., from an altitude of 10,000 feet the Sentinel Range was discovered toward the southwest.

After 13 hours in the air, in spite of following the plan closely, they were uncertain of their position. Visibility was also getting poor, and at 21:55 G.C.T. they decided to land to ascertain their position. They remained here for 19 hours, at a point later determined to be 79° 15' S., 102° 35' W. Sextant observations were made every six hours, but, unknown to them, the index error-adjustment screw had worked loose, causing unsatisfactory results.

On November 24 at 17:03 G.C.T. they took off, but they landed again in 30 minutes due to rapidly thickening weather. They were grounded for three days while the weather continued unsettled. However, they took 30 careful sights of the sun's altitude, which was fortunate, for when the trouble with the sextant was finally discovered these reading proved critical in making corrections for the others.

They took off again on November 27, but the weather forced a landing after only 50 minutes. For three days they were confined to their tent by a blizzard, but in the meantime they discovered what was wrong with the sextant. Observations were taken which showed their position to be 79° 58' S., 114° 15' W., more than 500 miles from Little America.

On December 4, at 19:15 G.C.T., after much time spent in clearing snow that had drifted around and into the plane, they took off from Camp III. They decided on a fourth landing at 23:10 G.C.T. to check their position which proved to be 79° 29' S., 153° 27' W., near the edge of the Ross Ice Shelf, about 150 miles from the Bay of Whales. They took off again the next morning, but after an hour's flight, during which they sighted the Ross Sea, they were forced down with empty fuel tanks. They made camp, secured the plane, and prepared to set out for Little America which ultimately proved to be 16 miles away, but they were uncertain of the direction and did not find Byrd's former base until December 15.

While Ellsworth and Hollick Kenyoh proceeded to make themselves comfortable at Little America, the world was uncertain of their fate, and moves were on foot to search for them. Mrs. Ellsworth arranged for a plane to be flown to Magallanes, Chile, where it was taken on board the Wyatt Earp on December 22. After waiting at Dundee Island, Sir Hubert had moved the ship to Deception Island. Meanwhile, the Australian, New Zealand and British governments, working the the Discovery Committee, had had the Discovery II diverted from its assignment and ordered to Melbourne where two planes were taken aboard. On January 15, Discovery II reached the Bay of Whales. On December 20 the Wyatt Earp arrived. Ellsworth left for Melbourne

aboard Discovery II. A week after its arrival the Wyatt Earp departed with the Polar Star on board.

Ellsworth's flight, the only trans-Antarctic flight until 1956, covered 2,200 miles in approximately 20 hours of flying time. It provided, for the first time, a view of a vast part of the interior. Hollick-Kenyon and Ellsworth had difficulty identifying features as they flew along the east side of the Antarctic Peninsula, for their map was based on Wilkins's concept of an archipelago. The remainder of the flight was over unknown territory.

Geographically, the important results of the flight are embodied in the maps of W. L. G. Joerg and William Briesemeister. (Geogr. Review, Vol. 26, No. 3, July, 1937, pp. 430-444, Plate III) The maps were constructed from Ellsworth's photographs taken with a 35 mm. Leica camera on the flight of November 21 and on the long flight. While Joerg was not able to apply a precise positions in terms of latitude and longitude, the features are in excellent position relative to one another. When later work made it possible to position the map properly, it proved to be remarkably accurate. (See also, Kenneth J. Bertrand, "Americans in Antarctica, 1775-1948," Amer. Geog. Soc., Spec. publ. No. 39, 1971, 375-381, 302-385). It is regrettable that Ellsworth did not use his camera on the flight of January 3, 1935 and on other short flights from Snow Hill Island and from Dundee Island, for much of the eastern side of the Antarctic Peninsula was then little known and poorly mapped. He could have helped to provide a reasonably good map 20 years before the large scale maps of the Falkland Islands Dependencies Survey appeared.

Ellsworth also photographed George VI Sound as he crossed it, and Joerg has shown that he was aware of its existence. Although he was not using an aerial mapping camera, his 35 mm. photographs of the Sentinel Ranges show features which are identifiable on modern trimetrogon photographs.

In connection with IGY there were many long flights. On December 20, 1955, four planes flew from Christchurch to McMurdo Sound, and between January 3 and 14, 1956, four planes of U. S. Navy Task Force 43 made nine long distance flights. Most notable was flight of January 13 and 14 of Commander William Hawkes in a 2PV Neptune patrol bomber from McMurdo Sound, via the South Pole, to the head of the Weddell Sea and return, a distance of 3,450 miles in 19 hours. All of these flights exceeded Ellsworth's trans-Antarctic flight for distance but not for his 1,200 miles over unexplored territory. Since 1956 long distance flights in Antarctica have become almost routine. As a result of these flights and overland traverses so much of the continent has been unveiled that Ellsworth's record for coverage of unexplored territory is likely to stand.

There is not a great deal of material on the Ellsworth flight. (See Bertrand, Op. Cit., pp. 393-394.) A recent book (Magnus L. Olsen, Saga of the White Horizon, Nautical Publishing Co., Ltd., Lympington, Hampshire, 1972, 199 pp.) will add little, if anything, to the story. The author was promoted to Second Mate before the ship left Montevideo in 1935 after he had been a crew member on the two earlier attempts from the Bay of Whales and from Snow Hill Island. Much of the account is pure fantasy. For example, on the voyage from Dunedin, New Zealand, to Deception Island in 1934, he tells of the ship having entered the Ross Sea and visiting the Bay of Whales. On Christmas Day they met a group of Russians out skiing, and they were entertained on their research ship. While proceeding eastward toward Deception Island they sighted from the Wyatt Earp such features as Mount Siple and Thurston Island which were not discovered until 1940 and then only from the air on a coast that is probably the most inaccessible in Antarctica. In fact, the ship proceeded much more directly from Dunedin to Deception, where it arrived on October 14. Christmas was spent at Snow Hill Island.

## ANTARCTICA: A MULTIMEDIA PRESENTATION, OCTOBER 10-31

Of interest to members of the Antarctic Society is a multimedia presentation on Antarctica which is being held at the Virginia Polytechnic Institute and State University at Blacksburg from October 10-31. Those members who live within driving distance of Blacksburg will want to visit the exhibit and attend one or more of the lectures that have been scheduled.

Central to the multimedia presentation is an exhibit of 14 paintings and two etchings by Daniel S. Lang and 45 full color photographs by Dr. Eliot Porter which will be on display in the art gallery of the Squires Student Center from October 10 to 31. The paintings and photographs are the result of Lang's and Porter's visit to Antarctica in 1970-75 under the auspices of the Office of Polar Programs of the National Science Foundation. They were on display for five days in Washington last January before being sent to St. Louis for exhibition. Dr. Eliot Porter is best known for his wilderness photographs which have appeared in his books, Birds of North America, Flow of Wilderness, Appalachian Wilderness, The Tree Where Man was Born, The African Experience, and others. Daniel Lang's paintings have been exhibited in New York, Rome, Chicago, and other major European and American cities. They were selected for the Antarctic project with the assistance of the National Endowment for the Arts.

In addition to the works of Porter and Lang there will be other visual and audio exhibits, including rocks and minerals and recordings made by Admiral Byrd.

The presentation, which is being sponsored by the Virginia Tech Union in conjunction with the Biology Department and the research Division of the University, will be opened with a reception at 1:00 p. m., Sunday, October 10, in the Squires Student Center. The opening lecture, "The Historical Involvement of Virginians in Antarctica," by Kenneth J. Bertrand, will follow at 2:00 p. m. Dr. Bertrand, president of the Antarctic Society, is author of Americans in Antarctica, 1775-1948, published by the American Geographical Society.

Other lectures are scheduled for later in the month. At 7:30 p. m., Thursday, October 14, Dr. James Craig and Dr. Edwin Robinson of the Geology Department of VPI & SU give lectures entitled, "The Frozen Continent" and "Antarctica's Potential for Resources." "Krill as a Source of Protein in Human Diets" will be given by Dr. Mary Alice McWhinnie, DePaul University, Chicago, and one of the first women scientists to work in Antarctica, at 7:30 p. m., Wednesday, October 20. Dr. Bruce C. Parker, Professor of Botany at VPI & SU and organizer of the Presentation, will give the closing lecture, "Conservation and the Environmental Impact in Antarctica, Past Present, and Future," on Wednesday, October 27, at 7:30 p. m. Dr. Robinson, who participated in the I.G.Y., is currently conducting research on the magnitude of

ocean tides in sea water beneath the Ross Ice Shelf. Dr. Craig visited Antarctica in 1974-75 at which time he discovered the mineral dihydrohalite, a form of sodium chloride which takes its unique crystalline form only at temperatures consistently below freezing. Dr. McWhinnie, a biological oceanographer, is an expert on reproduction and metabolism of marine invertebrates. Fortunately, she has done a great deal of work on krill, a small shrimp-like animal which is a vital link in the Antarctic food chain and which some nations are contemplating harvesting.

The Antarctic Presentation is being staged as part of the Virginia Bicentennial Celebration. This is highly appropriate, for American activity in Antarctica began with the establishment of a Massachusetts whaling fleet in exile in the Falkland Islands in 1775. By 1793 Americans had crossed the Antarctic Convergence to hunt fur seals in South Georgia and fur and elephant seals in Kerguelen. It can truly be said that American interests in the south polar regions are as old as the nation.

It is also appropriate that Virginia Tech should sponsor such a presentation. Admiral Richard E. Byrd is a Virginian who comes to mind immediately when one thinks about Antarctic exploration. At least two officers of the Wilkes Expedition were Virginians. Matthew Fontaine Maury, as head of the U. S. Naval Observatory from 1842 to 1861, frequently urged the importance of Antarctic exploration on the Congress and on the Secretary of the Navy. He was the first to advocate international cooperation in Antarctic exploration. A number of men who played prominent roles in unveiling the Antarctic in the last few decades have been long-time residents of Virginia. Moreover, three faculty members and several students at VPI & SU are currently involved in Antarctic research.

#### THE BIRDS OF THE SOUTHERN OCEANS

George E. Watson<sup>1</sup>

The configuration of the land and ocean has profoundly influenced the kinds of birds that inhabit the southern end of the world. In contrast to the Arctic where extensive land areas extend north of 70° N. and encircle a central ice-covered ocean, the glacier-covered core of the Antarctic is a mountainous continent that extends north to 65° S. and is surrounded by continuous open ocean between 65° and 45° South. Only in the Antarctic Peninsula and island of the Scotia Ridge is there significant land between these parallels. Elsewhere, widely scattered, small, ice-covered islands dot the roaring 40's and howling 50's.

The Antarctic and sub-Antarctic are inhabited almost exclusively by seabirds or coastal birds that derive all their food either directly or at most one step removed from the sea. Song birds and shorebirds, which are so conspicuous in the Arctic, occur only on a few of the more temperate sub-Antarctic islands.

---

1. Dr. Watson, Curator of Birds of the National Museum of the Smithsonian Institution, has provided this summary of the illustrated lecture he gave to the Antarctic Society, May 20. Lacking illustrations in the Newsletter, he has had to alter the form of this summary from the lecture. Readers seeking an amplification of either are referred to the following: George E. Watson, Birds of the Antarctic and Sub-Antarctic, Antarctic Research Series, American Geophysical Union, Washington, B. C. 1975. George E. Watson, et.al., Birds of the Antarctic and Subantarctic, Antarctic Map Folio Series, No. 14, American Geographical Society, New York, 1971. The former is an illustrated handbook; the latter is a set of bird distribution maps.

The open seas of the sub-Antarctic are dominated by tube-nosed albatrosses and petrels that spend most of their lives at sea, only coming to shore to breed. They course over the windswept waters on long narrow wings, searching for squid and fish and often follow ships for a free handout of offal or garbage. The Wandering Albatross is among the largest and most majestic of birds on the wing, with an expanse just short of 12 feet. The two species of smaller mollymawks look like giant gulls and the eerie yet graceful sooty albatrosses haunt ships silently. Ubiquitous giant fulmars play in the wake gliding on stiff wings. Several species of gadfly petrels and shearwaters bank and soar gracefully over the waves. Vast flocks of prions of several virtually indistinguishable species work the waters. Tiny storm petrels dance on the surface, diving petrels plunge through the waves on rapidly beating wings. The seas in some areas teem with food and abound in birds. But, it is around the widely scattered islands where they nest that birds are most abundant. Islands, such as Marion, the Crozets, Kerguelen, and Heard in the Indian Ocean, South Georgia and the Falklands in the Atlantic, and Macquarie and several other islands south of New Zealand are terrestrial oases where birds can lay eggs and raise young, for marine birds are not wholly pelagic; they must return to land to reproduce.

Larger species such as albatrosses and giant fulmars nest completely exposed and need long runways to head into the wind for takeoffs, whereas smaller petrels and shearwaters burrow in soft soil or hide in rock crevices. Penguins of several species abound, and cormorants, a skua, a gull and two terns complete the seabird inventory. Ducks inhabit most of these islands, save Heard; the Indian Ocean islands have a white sheathbill, a peculiar piratical and scavenging shorebird of obscure relationships and vulgar habits. A large pipit, a songbird, inhabits the tussock grass and shores of South Georgia and several Northern Hemisphere songbirds that were introduced in New Zealand have become established naturally on Macquarie. On the latter island, alas, a native rail and a parakeet have become extinct. Incidentally, they are the only permanent victims of 19th century exploitation of the islands by sealers and whalers. Fortunately other races of these two species persist on other nearby islands. Although penguins often sweetened the oil rendering cauldrons when whales became scarce, their populations have recovered. Rats, cats, dogs, pigs, and rabbits ravage some of the smaller nesting seabirds, or they have caused erosion of soft soil and thus reduced the habitat for nest burrows. On most islands, however, birds can still keep a foothold in inaccessible cliffs or offshore stacks.

South of the Antarctic convergence albatrosses, gadfly petrels and shearwaters are scarce, but a small coterie of other species make up the huge populations that breed on the Antarctic continent and Peninsula and southern islands of the Scotia Ridge. Five penguins breed in immense rookeries and the smell of their guano and the sound of their raucous voices give distant evidence of their presence. Only two penguins, the Adelie and Emperor, occur at present on the continent proper although the Chinstrap seems to be extending its range around the continent, perhaps now consuming krill once eaten by herds of vanished Blue Whales. The male Emperor Penguin is remarkable for incubating its egg continuously for over two months in the dead of winter while fasting and losing 30% of its weight. The rookeries are mostly on fast shelf ice and the bird holds the single egg on its feet, kept warm by an overhanging flap of vascularized belly blubber.

The Southern Giant Fulmar, also known as the Stinker because of its carrion feeding, is joined by four other species of fulmarine petrels including the familiar checkerboard-patterned, ship-following Cape Pigeon and the tiny all white Snow Petrel. The South Orkneys and the South Shetlands are the southern most breeding outposts of the Antarctic Prion and the Black-bellied Storm Petrel, but even smaller sparrow-sized Wilson's Storm Petrel nests all around the continent in rock crevices. It must wait until its nest sites are free from snow and ice in summer. Unseasonable heavy snow

can ruin breeding. Nevertheless, millions of the birds migrate north into the North Atlantic Ocean each year.

Anvers and Adelaide Islands at about 65° and 68° S., respectively, on the west side of the Antarctic Peninsula, are the extreme southern limits of breeding by American Sheathbills, Southern Black-backed Gulls, Antarctic Terns and Blue-eyed Shags or Cormorants. Although the gulls have been reported as vagrants at McMurdo, they may well have only colonized the Scotia Ridge islands and the Peninsula by following the sealers during the early 19th century. The familiar plundering skua presents an interesting speciation problem in Antarctica. The large Brown Skua inhabits most of the sub-Antarctic islands, while the South Polar Skua, which is smaller and even delicate by comparison, occurs on the continent. The two overlap and breed side by side on the South Shetland Islands and Antarctic Peninsula. They interbreed fairly often but not enough to swamp out species differences. On Anvers Island, I found individual pairs of Brown Skuas nesting near small groups of penguins which they seemed to be protecting for their own maurauding. I found penguin eggshells and bones all about their nests. South Polar Skuas were nesting nearby in loose groups on the hillsides and they were feeding krill to their chicks which seemed to be a week or two younger than those of the Brown Skuas. A South Polar Skua banded on Anvers Island and recovered in Greenland reveals that this species migrates.

Lastly, the Antarctic avifauna includes the all-time long distance champion migrant, the Arctic Tern. This 125 gram (4+ ounce) swallow-tailed bird breeds north of the Arctic Circle in North America and Eurasia. North American birds cross the Atlantic to Europe, fly south down the coast of West Africa, and make a landfall on Antarctica just east of the Weddell Sea in November. They then work their way westward and molt twice rapidly in the Weddell Sea and South Shetlands before returning north again in April, probably by way of South America. The round trip can be 22,000 miles, but maybe it is worth it if you can feed anytime during 24 hours of daylight almost all year! Certainly Arctic Terns are successful, abundant birds.

Conservation is a problem everywhere that man goes for exploitation. Thus far, except for the now ending plundering of seals and whales, scientists and their support forces and a few intrepid but wealthy tourists are the only exploiters of Antarctica. We have an international treaty that features conservation measures signed and strictly adhered to by all nations that use the frozen continent. Except for a few instances where research station have been built on the sites of penguin rookeries, bird populations are healthy and unmolested. Antarctic birds are wonderfully easy to watch and enjoy for they are remarkably tame. One can quietly approach to within a few feet of even an incubating skua. But this same innate trusting tameness could be the birds's undoing if the treaty and its conservation provisions are not renewed in 1989 when it expires. Let us hope that man's greed will not extend to all parts of our globe and that the birds of the frozen continent will persist for the enjoyment and enlightenment of our children's children.

#### A MID-WINTER DAY BICENTENNIAL GREETING

On the following page is a copy of the letter that was sent to all stations, foreign as well as our own, by President Gerald R. Ford as a Bicentennial mid-winter day greeting. The letter was also read to members of the Antarctic Society who were celebrating mid-winter day with the annual garden party at Stronghold on Sugar Loaf Mountain, Frederick County, Maryland.

**THE WHITE HOUSE**

WASHINGTON

June 16, 1976

Discovery and scientific exploration of the Antarctic account for one of the most remarkable legacies of the past two hundred years.

In the United States, we take special pride during our Bicentennial observance in this nation's dynamic role in Antarctic exploration and in the accomplishments of great Americans like Nathaniel Palmer, Charles Wilkes and Richard Byrd. In the best tradition of these famous explorers, the members of the international scientific community wintering in the Antarctic expand even further our knowledge of this magnificent region. We are equally proud of the fellow citizens who are part of this rewarding international effort.

Mindful that we are a nation of nations whose diverse ancestral heritage binds us in a unique way with the other participating countries, we invite all who winter in Antarctica this year to join in celebrating the two hundredth birthday of United States Independence. We hope this will be an especially productive and satisfying year for each of you. We are confident that the new findings and new friendships which will result will both benefit all mankind.

A handwritten signature in cursive script, reading "Gerald R. Ford". The signature is written in dark ink and is positioned at the bottom of the page.

## MEETING NOTICE

### F I L M   P R E S E N T A T I O N

"Window to the Arctic"

Followed by Short Films on the Antarctic

8:00 p. m., Tuesday

January 25, 1977

Room 540, National Science Foundation  
(Board Room, NSF)

1800 G Street, N. W., Washington, D. C.

The newly released film, "Window to the Arctic," was commercially made for the Oceanographer of the Navy. Primarily dealing with U. S. research based at the Naval Arctic Research Laboratory, Barrow, Alaska, it is a good general interest film on U. S. research in the Arctic.

\* \* \* \* \*

## ANTARCTIC CALENDARS

We have received a supply of Antarctic calendars from 1977 produced in New Zealand for the Public Affairs Division of the U. S. Naval Support Force Antarctica. Each sheet is 12.5" x 17.5" with approximately two-thirds occupied by a colored photography of an Antarctic scene and one third by the calendar for the month. Dates of historic significance relative to Antarctica are given special note. For example, January 3, 1903, Captain R. F. Scott led the first party to reach the polar plateau; January 11, 1971, South Pole Station had a record high of minus 2° F., and on January 25, 1960, the first ski-equipped C-130 cargo aircraft landed in Antarctica. These are only three of the 17 days so noted in January. It is a very attractive and useful calendar.

They will be for sale as long as they last at the meeting on January 25 for \$3.00 each.

January 4, 1977

To the members of the Antarctican Society:

I regret that events and situations beyond the control of the officers and members of the Board of Directors have combined to limit the public meetings of the Society during the fall to one lecture. An abstract of Dr. Anderson's lecture, "Mars, the Permafrost Planet," will appear in the next issue of the Newsletter, The Program Committee has tentatively arranged for interesting speakers for February, March, and April, and we look forward to an active period during the first half of 1977.

To cut our mailing costs we have obtained, as of January 3, a bulk mailing permit as a non-profit, tax exempt organization. Such permits are issued only for the calendar year. Sending them by third class mail will slow delivery of our announcements, but we plan to compensate for this by early preparation of material to be mailed. Hopefully, this issue of the Newsletter will be mailed January 7. If it arrives more than a week later in the Middle Atlantic area, please let us know.

In the case of mail to foreign members and when necessary for domestic mail, first class postage will be used. Returns on undelivered first class mail also will provide a check on the accurateness of our mailing list. We must depend on you, however, to notify us of any change of address if our mailing list is to remain up-to-date.

We also depend on you to make the Newsletter interesting and useful. Please send the editor personal news notes and information about events and projects that relate to Antarctica or Antarcticans, especially those that do not get national news coverage.

I extend best wishes for 1977 to all of you.

Sincerely,

Kenneth J. Bertrand, President

\* \* \* \* \*

MEMORIAL TO PAUL SIPLE

On Saturday, July 24, 1976, in Montpelier, Ohio, in commemoration of its most famous native, Paul Allman Siple, a memorial stone, placed on the front lawn of the Town Hall, was unveiled and dedicated. The ceremony, conducted by Mayor Dean, following the Bicentennial parade, was the culmination of the town's week-long Bicentennial celebration.

Joining the townspeople for this significant event were members of Paul Siple's family - his youngest daughter, Mary Remington, her husband and two young sons; his sister, Carrol Kettering, her husband and their son, Paul Siple Kettering; and his widow, Ruth Siple.

SCHEDULE FOR TRAVELING EXHIBIT ON ANTARCTICA

In two previous editions of the Newsletter reference has been made to the exhibition ANTARCTICA, distributed by the Smithsonian Institution Traveling Exhibition Service. Prepared by the Division of Polar Programs of the National Science Foundation, the exhibit consists of 45 full-color photographs by Eliot Porter, which are mounted on aluminum panels measuring 36" x 38", and 11 paintings and two etchings by Daniel Lang.

Porter and Lang traveled and worked in Antarctica in December and January, 1974-75, under the auspices of NSF. Eliot Porter is best known for his wilderness photographs, which have appeared in his books, Birds of North America, Flow of Wilderness, and others. Daniel Lang, known for his landscapes, has had one-man shows in New York, London, Rome, Chicago, and other major cities.

The exhibit has already appeared in Washington, St. Louis, at Virginia Tech in Blacksburg, and in Philadelphia, and it has been very favorably received. A 57-minute film, entitled "Antarctica", accompanies the exhibit. Members may be interested in the schedule for the exhibit for 1977 which is:

- Jan. 8 to Feb. 6 Philbrook Art Center, Tulsa, Oklahoma.
- Feb. 26 to March 25 Florida Center for the Arts, University of South Florida, Tampa.
- April 15 to May 14 University Art Collection, University of Maine, Orono.
- June 3 to July 2 School for the Arts, Boston University, Boston.
- July 22 to Aug. 20 Dept. of Geology, University of Wisconsin, Madison.
- Sept. 9 to Oct. 8 Dept. of Geology, Northern Illinois University, Dekalb.
- Oct. 28 to Nov. 26 Dept. of Meteorology, Texas A. and M. University, College Station.

If the Exhibit appears in your area, we recommend that you plan to see it. The 1978 schedule for the Exhibit is not yet entirely filled, with open dates available for summer and fall. The Exhibit will be closed January 9, 1979. Anyone wishing further information should contact Ms. Deborah Dawson, Science Coordinator, Traveling Exhibition Service, Smithsonian Institution, Washington, D. C. 20560. Telephone: (202) 381-6631.

MEMBERSHIP CERTIFICATES

Why not decorate that empty wall of your office, study, or den with an Antarctic Society membership certificate? It is artistically designed and suitable for framing (11" x 14"). If you are interested, send an order to Charles E. Morrison, Secretary, with a check for \$2.00, payable to the Antarctic Society. Please print your name as you want it inscribed, and give the date you want on the certificate; i.e., current date or date of joining the Society.

## MEETING NOTICE

Lecture

PALMER STATION: WHAT IT DOES AND WHY IT'S THERE

By

Guy G. Guthridge

Head of Polar Information Service  
Division of Polar Programs  
National Science Foundation

8:00 p. m., Tuesday

March 29, 1977

Room 543, National Science Foundation

1800 G Street, N. W., Washington, D. C.

Arrangements are being made to have, if possible at the time of the meeting, live voice communication, via satellite, between Palmer Station and the meeting room. If connections are successfully made, members of the audience will be able to ask questions of personnel stationed at Palmer.

\* \* \* \* \*

## NOTICE OF FUTURE MEETINGS

Due to illness, Peter J. Anderson, Assistant Director, Institute of Polar Studies, Ohio State University, Columbus, had to postpone his lecture on "Exploration of Antarctica by Air," scheduled for March 23. Hopefully, this can be rescheduled in April or May.

The annual business meeting is tentatively scheduled for Tuesday, May 3. Following the annual reports and the election of officers, Dr. William J. L. Sladen

of Johns Hopkins University will deliver the annual memorial lecture. He will speak on his recent experiences in Siberia. A notice of the definite time and place will appear in the next number of the Newsletter.

WITH REGRET

We have belatedly received word of the deaths of two members and a former member of the Antarctic Society. Mr. Barrett N. Coates, 1007 Cragmont Avenue, Berkeley, California, died in September, 1976. Mr. Arnold H. Clark died at his home in Pleasantville, New York, in March, 1976. To their families and friends we offer sincere condolences. A former member, Admiral George J. Dufek died February 10, of this year.

\* \* \* \*

Arnold H. Clark, then a 21-year old engineer from Greenfield, Massachusetts, was a member of the winter party at Little America in 1929 on the First Byrd Antarctic Expedition. He was the strong silent type, a quiet man with an excellent and well developed physique. He was always pleasant and ready to help, however, and was one of the best-liked men in the party. Although he was the assistant to Frank T. Davies, physicist of the expedition, more of his time was spent as a jack-of-all-trades, a commentary on his wide-ranging ability and general amicability. He was praised by Commander Byrd for the manner in which he worked the Ford snowmobile during the difficult unloading operations in February 1929. In addition to assisting Davies in the geomagnetic research, he helped Davies and Larry Gould in an investigation of the crevasses in the vicinity of Little America. He earned the gratitude of his camp fellows by volunteering to serve as assistant cook, a job in which he was very successful. In his spare time he did secretarial work for Commander Byrd.

The same versatility and industry characterized Clark's later life. After working for the General Electric Corporation, he joined the staff of the Woods Hole Oceanographic Institution. In that capacity he participated in "Operation Crossroads," the atomic bomb test program on Bikini Atoll from 1946 to 1958. After retiring from Woods Hole he bought an old farm house on six wooded acres near Pleasantville in Westchester County, New York, to which he devoted many long days of labor in restoration. Mrs. Clark, the sister of Leland L. Barter, a member of both the First and Second Byrd Antarctic Expeditions, continues to reside there, 380 Hardscrabble Road.

\* \* \* \*

Rear Admiral George J. Dufek, U.S.N. retired, first commandant of "Operation Deep Freeze," 1955-1959, died of cancer in the Bethesda Naval Hospital, February 10, 1977, at the age of 70. A native of Rockford, Illinois, Dufek was a 1925 graduate of the U. S. Naval Academy. His first Antarctic experience was as navigator on the U.S.S. barkentine Bear during the first year of the U. S. Antarctic Service Expedition, 1939-40. With Admiral Byrd aboard, the Bear first cruised eastward from the Bay of Whales beyond Cape Colbeck to the coast of Marie Byrd Land in the latter part of January. Three flights were made by seaplane from the Bear. Enroute from the Bay of Whales to establish East Base on Stonington Island, off the Antarctic Peninsula, three more flights were made from the Bear in the latter part of February, resulting in the first sighting of Thurston Island and portions of the Walgren and Eights Coasts.

During "Operation Highjump," 1946-47, then Captain Dufek, returned to the same area as commander of the Eastern Task Group, consisting of the seaplane tender Pine Island, the tanker Canisteo, and the destroyer Brownson. Three Martin Mariner flying boats were aboard the tender, which also carried a small seaplane and two helicopters. Operations extended from the Ross Sea to the Veddell Sea. In late December and early January, on flights from the Pine Island, the coast was photographed from the Getz

Ice Shelf to the eastern end of Thurston Island (127° 30' W. to 95° 30' W.). During a "white-out" in this area on December 30, one of the flying boats crashed on Thurston Island, killing three of the nine-man crew. The survivors were rescued on January 12, 1947. Later photographic operations by the Task Group in the Bellingshausen Sea, in Marguerite Bay, and in the Weddell Sea were obstructed by either weather unsuitable for flying or by low-lying clouds over the coast.

Beginning in September, 1954, Dufek was in charge of planning for Operation Deep Freeze I to establish bases and provide logistical support for the United States scientific programs during the International Geophysical Year, scheduled for July 1, 1957, to December 31, 1958. This was to involve field operations on an unprecedented scale. A preliminary reconnaissance cruise was carried out by the icebreaker Atka in 1954-55. Operation Deep Freeze I followed in 1955-56. An air facility was constructed at McMurdo Sound, and a staging base was set up at Kainan Bay from which a tractor train was to proceed to 80° S., 120° W. the following season to construct Byrd Station. On December 20, 1955, four naval aircraft flew from New Zealand to McMurdo, an historic first. Later in January, nine long distance flights were made from McMurdo, including flights to the Budd Coast and to the Weddell Sea, both via the pole. Seven ships were involved. In 1956-57 the operations were designated Deep Freeze II. On October 31, 1956, Admiral Dufek commanded the first airplane to land at the South Pole. This was part of the program to establish a base at the South Pole which was to be supported entirely by aircraft. Other scientific stations were built at Cape Hallett, Filchner Ice Shelf on the Weddell Sea, and Windmill Islands, off the Budd Coast of Wilkes Land, and the projected tractor trek to build the proposed Byrd Station was also carried out. Although there were some tragic accidents, the surprise is that there were not more with 12 ships and some 3,000 men engaged in the unprecedented and ultimately highly successful project. The success of the scientific program depended on a successful logistical program. In addition to the naval aircraft used in Deep Freeze I, Deep Freeze II was provided with eight C-121 Globemasters from the Air Force, ultimately making long distance supply missions from New Zealand to McMurdo and from McMurdo to the outlying stations almost routine.

Admiral Dufek commanded successive Operations Deep Freeze until 1959. After he retired in 1960 he became Director of the Mariners Museum at Newport News, Virginia, from which he retired in 1973. He continued to make his home there. He is survived by his wife, Muriel, two sons and a daughter. To them we offer our condolences.

#### BOOK NOTE

The Arctic Diary of Russell Williams Porter, Herman R. Friis, editor, University of Virginia Press, Charlottesville, 1976. Published under the auspices of the National Archives Trust Fund. Quarto, xii and 172 pp. Illus. \$20.

Russell Williams Porter (1871-19U9), trained as an architect at Massachusetts Institute of Technology, is one of the lesser-known Arctic explorers in spite of the fact that between 189U and 1912 he accompanied 10 Arctic expeditions. He served variously as artist, photographer, surveyor, cartographer, scientist and astronomer. It was in this last capacity, studying the heavens through a vertical transit on the Fiala-Ziegler Polar Expedition of 1903-05 in Franz Josef Land, that he began to appreciate the challenge of astronomy, and more particularly the properties of light and optics. This led to his major life work in astrophysics and optics, culminating at the California Institute of Technology in his part in the design and construction of the 200-inch telescope on Mount Palomar.

Porter prepared the manuscript for the present book in 1930-31 in Pasadena from his journals, notebooks, sketches, and photographs from the 10 arctic expeditions in which he participated. All this material is now in the Center for Polar Archives of the National Archives in Washington, the gift of Porter's daughter, Mrs. Caroline Porter Kier. Porter's Arctic Diary is a delightful, non-technical account of his experiences in the Arctic which began with Dr. Frederick A. Cook's ill-fated expedition to Greenland in the Miranda in 1894. In 1896 and 1897 he sailed north on Robert E. Peary's Hope to carry out special scientific missions and in 1899 he was on the Diana of the Peary Arctic Club's relief expedition. He was a member of two expeditions to Franz Josef Land, and he mounted three small expeditions of his own. While with Dr. Frederick A. Cook in Alaska in 1906 he surveyed the area of the southern approach to Mount McKinley, resulting in a reconnaissance map of the area on a scale of 1:250,000, with a contour interval of 200 feet, published by the U. S. Geological Survey.

Friis has included some 80 illustrations in the Diary as published. Four are maps by Porter, and four are color reproductions of water colors or oil paintings. The remainder are pencil sketches, many of them full-page reproductions. Recalling Porter's training as an architect, it is perhaps not surprising that these illustrations are truly works of art. They alone make the volume worth having. The polar historian's appetite is whetted by the mass of manuscript material in the Center for Polar Archives relating to Porter, to Peary, and to Cook that Friis calls attention in his footnotes.

K.J.B.

#### TRAVELING EXHIBIT ON ANTARCTICA

In the last number of the Newsletter the schedule of the exhibition Antarctica, of photographs by Eliot Porter and paintings by Daniel Lang was given. For those who may have missed that notice, we call attention to the coming dates:

February 26 to March 25 Florida Center for the Arts, University of South  
Florida, Tampa.

April 15 to May 14 University Art Collection, University of Maine, Orono.

June 3 to July 2 School of Arts, Boston University, Boston.

The Treasurer of the Antarctic Society, Mr. William B. Cooke, reports that there are still some members who have not paid their dues for this year. If you are one, won't you please use the form at the bottom of this page? Your \$3.00 is tax deductible.

## MEETING NOTICE

Annual Business Meeting Followed by the Memorial Lecture

SNOW GEESE AND DETENTE

by

Dr. William J. L. Sladen

The Johns Hopkins University

8:00 p. m., Tuesday

May 3, 1977

Room 628, The National Science Foundation

1800 G Street, N.W., Washington, D. G.

- - - - -

This year it has been necessary to combine the annual business meeting and the meeting at which we have the memorial lecture. The agenda for the business meeting, which should be short, is on the next page. Dr. William J. L. Sladen, distinguished ornithologist from the Johns Hopkins University, Antarctic veteran, and past president of the Antarctic Society, returned earlier this past winter from a fourth visit to the U.S.S.R. He will speak about his experiences in cooperative efforts with the Soviets, especially in Siberia. His talk will be illustrated by slides and a short film. Those who have heard previous talks by Bill Sladen or who have seen his film on penguins on television will be looking forward to a very interesting evening.

In 1963 the Board of Directors of the Antarctic Society decided that it would be most fitting for the society to sponsor, on occasion, a memorial lecture commemorating all former members of the society and anyone else who had contributed to our knowledge of the Antarctic. At the time, they were particularly motivated by the sudden death on November 11, 1962, of Dr. Carl R. Eklund who had been instrumental in founding the society. As it turned out, "on occasion" has been annually, and this will be the 14th lecture. Carl Eklund was also an ornithologist, and it is noteworthy that Bill Sladen gave the first memorial lecture, entitled, "Penguins and Skuas."

AGENDA FOR THE ANNUAL BUSINESS MEETING

Minutes of the last annual meeting, April 28, 1976  
Report of the Secretary-Historian  
Report of the Treasurer-Membership Secretary  
Report of the Audit Committee  
Report of the President  
Election of officers and members of the board of directors  
Other business

REPORT OF THE NOMINATING COMMITTEE

The nominating committee, consisting of A. P. Crary, Chairman, Gerald K. Pagano, Walter R. Seelig, and George E. Watson, III, has proposed the following slate of candidates:

President .....	Ruth J. Siple
Vice President .....	Meredith F. Burrill
Secretary/Historian .....	Charles E. Morrison
Treasurer/Membership Secretary .....	Sophie R. Dales
Four members of the Board of Directors (3-year terms)	
Peter Barretta	Paul C. Dalrymple
Fred S. Brownworth	Jerry W. Huffman

The committee has also proposed that the Board of Directors consider presenting to the society at a meeting in the near future an amendment to the By-laws, combining the offices of Secretary/Historian and Treasurer/Membership Secretary into one office, called Secretary-Treasurer. It was impossible to act on this proposal before the election because - Article X, Section 1, Amendments, states, "These By-laws may be altered or repealed at any regular meeting of the members. A copy of any proposed amendment shall be served upon or mailed, postage prepaid, to each member of the Society not less than thirty (30) days prior to the meeting at which the proposed amendments shall be discussed."

- - - - -

Notes on Antarctic Society Meetings

We are happy to report that the largest crowd of the year turned out to hear Guy Guthridge's talk, "Palmer Station: What it Does and Why It's There," on March 29. As announced, an attempt was made to hold a live voice communication, via satellite, between the meeting room and the personnel at Palmer Station. This, too, was very successful. Only once did the reception fade slightly; otherwise, it was strong and clear. Personnel at the station reported on their work and answered questions from persons at the meeting. The audience had been well prepared for the occasion by Guy's talk which was illustrated with slides taken during his stay at Palmer Station during the past summer season.

We are hoping to schedule a meeting in May in which Charles Neider, author of *Edge of the World; Ross Island, Antarctica*, will also speak on his experiences at Palmer Station.

The annual garden party is scheduled for Sunday, June 19, at Stronghold, on Sugarloaf Mountain in Frederick County, Maryland.

## NOTICE OF ANNUAL GARDEN PARTY

Stronghold, Sugar Loaf Mountain  
Frederick County, Maryland

Sunday, June 19, 1977  
2:00 p. m. to 10:00 p.m.

DINNER BUFFET  
Beginning at 6:00 p.m.  
Catered by Comus Inn

Followed by Selected Movies  
On Antarctica

Price: \$10.00 per person

Cash Bar

Spend Father's Day and celebrate Antarctica's "Mid-winter Day" with fellow Ant-  
arcticans. As for the past several years, Stronghold is being made available  
exclusively for the Antarctic Society. Weather permitting, the party will be held in  
the extensive gardens surrounding the residence. If it rains, the party will move into  
the mansion. Informal or casual clothing is recommended, especially for those who may  
wish to hike the short distance to the top of Sugar Loaf.

Nearby Comus Inn, the caterer, is noted for the quality of its food. Again this  
year we have been unable to obtain a reduced rate for children. We certainly do not  
want to exclude children, and we appreciate the problem that this my cause. Therefore,  
we suggest that you consider bringing a basket of food for your children if you wish.  
The Comus Inn people count the number of persons who go through the line at the buffet  
table, and the Society is charged accordingly. Therefore, if you do not wish to pay for  
a child, please do not let the child go through the line, even if he or she takes  
nothing and merely accompanies you.

.....  
Prepaid reservations are necessary. Please fill in the blank and send it to Mrs.  
Sophie R. Dales, Treasurer, Antarctic Society, 4214 North Second Road, Arlington,  
Virginia 22203, so as to arrive by Thursday, June 16. If you have any questions,  
telephone Mrs. Dales (Office: 382-5820, Home: 524-1853), Bill Cooke (Office: 471-1650,  
Home: 291-2555), or Charlie Morrison (Office: 860-6251, Home: 938-7194).

-----  
I WILL attend the Antarctic Society garden party at Stronghold with \_\_\_\_\_ guests.  
Enclosed is my check for \$\_\_\_\_\_, payable to the Antarctic Society.

\_\_\_\_\_  
(Name)

If you have never visited Sugar Loaf Mountain, you owe it to yourself to do so now. Come early and socialize. The bar will be open early. Friends as well as members are welcome.

#### DIRECTIONS FOR REACHING STRONGHOLD

From the Beltway (I-495) take I-270 (formerly I-70S) northward, past Rockville, Shady Grove, Bureau of Standards, Gaithersburg, AEC, and Clarksburg exits. Turn off at Hyattstown-Comus Exit (16.3 miles from the Rockville exit). Circle under I-270 and follow route 109 for 3.3 miles to Comus. Turn right at Comus onto route 95 for 2.5 miles. Proceed straight across the paved intersection (Mountain Cross-Roads). Immediately on your left is a small lake. One-fourth mile beyond the intersection turn right onto mountain road through a gateway. Follow this for one-quarter mile. The first house on the right (4 white columns) is the Superintendent's house. Around the bend is the Strong mansion. The parking lot is on the near or lower side of it.

#### SOCIETY NEWS

At the annual business meeting, May 3, 1977, the slate proposed by the Nominating Committee and published in the last issue of the Newsletter was elected. The officers elected for one-year terms are: Mrs. Ruth J. Siple, President; Dr. Meredith F. Burrill, Vice President; Mr. Charles E. Morrison, Secretary/Historian; Mrs. Sophie R. Dales, Treasurer/Membership Secretary. Also elected to the 12-member Board of Directors for 3-year terms were Peter Barretta, Fred S. Brownworth, Paul C. Dalrymple, and Jerry W. Huffman.

The first meeting of the Board of Directors of the new administration was held May 24. Kenneth J. Bertrand, immediate past president, was appointed to the Board to fill the remaining two years of the unexpired term of Mrs. Dales, newly elected Treasurer/Membership Secretary. The recommendation of the Nominating Committee that the offices of the Secretary/Historian and Treasurer/Membership Secretary be combined was discussed, but action was postponed until next fall. The Board approved the arrangement for the annual garden party which are in charge of a committee consisting of Robert J. Allen, William B. Cooke, Rudolf A. Honkala, and Charles E. Morrison.

#### Society Records to the Archives

Officers of the Antarctic Society have been concerned about the safety and preservation of the Society's records. As the records pass from one group of officers to another there is always a danger that some records will be lost, and this danger increases with time as the older records have little if any current use.

On November 27, following preliminary inquiries, the Board of Directors passed a motion, instructing President Bertrand to investigate the possibilities of the records

of the Society being accepted for deposit by the National Archives and Record Service. In a letter of January 5, 1977, Dr. James B. Rhoads, Archivist of the United States, replied to Bertrand's Inquiry that he would be pleased to accept the records of the Antarctic Society for deposit in the Center for Polar Archives. Discussion between Bertrand and Dr. Franklin W. Burch, Director of the Center for Polar Archives, led to a motion by the Board of Directors of the Society on January 18, authorizing Bertrand to sign an instrument of gift conveying the records earlier than 1975 to the National Archives and Record Service. It took some time to get the records collected and deposited in the Center for Polar Archives. They were then inventoried, and an instrument of gift was drawn up. This was signed by President Bertrand on May 3.

The National Archives is primarily a depository for records of the federal government and its agencies. However, the records and papers of individuals who have been engaged in government activities are felt to reflect on those activities and are therefore also accepted for deposit. Consequently, the personal papers of a number of persons recently active in Antarctic exploration, such as the late Paul A. Siple, and some of the older explorers are now in the Center. The papers of an explorer involved in a private expedition but who laid claims to territory in the name of the United States, such as Lincoln Ellsworth, are also at the Center.

Since many members of the Antarctic Society have been involved in the Antarctic programs of the United States and since many of the activities of the Society have a bearing on or relate to these programs, the records of the Society are considered acceptable for deposit in the Center for Polar Archives. No conditions are attached to the instrument of gift by the Society. That is, the records are open to anyone who has been granted the privilege of examining unrestricted records at the National Archives. Records, i.e., minutes and correspondence, from 1975 onward have been retained by the Society as current records, subject to deposit when no longer needed in the operations of the Society. The records on deposit are open for review by officers of the Society, and the staff of the Center for Polar Archives will make available to the officers of the Society, on request, a reasonable number of copies of any record of the Society. The staff will also supply on request specific information from a specified record to an officer of the Society. Not only are the records of the Society now safe, but any information contained in them is now more readily available, should it be needed by the officers of the Society, than it was until now.

#### CAPTAIN KESSLER MEMORIALIZED

Mrs. Juel Kessler, widow of the late Captain Charles L. Kessler (USNR, Ret.), at a special dinner in Richmond this past winter, was presented with a plaque honoring her husband by the national office of the American Legion and by Post 84 of Richmond. Captain Kessler, who was a member of the crew of the Eleanor Bolling on the First Byrd Antarctic Expedition, 1928-30, died on January 3, 1976. (See Antarctic Society Newsletter, Volume 1, No. 2, February 1976.) During World War II he was in charge of Navy recruiting and induction in Virginia. From 1960 until he retired he was head of the Virginia State draft board. As a member of the U.S. Marine Corps he served as a volunteer on then Commander Richard E. Byrd's expedition to Spitzbergen from where Byrd, with Floyd Bennett as pilot, flew to the North Pole, May 9, 1926.

According to unconfirmed information, a tree and stone marker were also to be designated as commemorating Captain Kessler in Richmond. If further information is available, it will appear in the next issue of the Newsletter.

SCHEDULE FOR TRAVELLING EXHIBIT ON ANTARCTICA

Three earlier editions of the Newsletter have contained information about the exhibition ANTARCTICA which is distributed by the Smithsonian Institution Traveling Exhibition Service. Briefly, in review, it consists of 45 full-color photographs by Elliot Porter and 14 paintings and two etchings by Daniel Lang. A 57-minute film, entitled Antarctica, accompanies the exhibit. It has been most favorably received wherever the exhibit has appeared. For the benefit of members living in those areas where the exhibit will appear and who may have mislaid earlier announcements, the schedule of the exhibit for the remainder of 1977 is as follows:

June 3 to July 2	School for the Arts, Boston University, 147 Bay State Road, Boston, Mass.
July 22 to August 20	Queen's Museum, New York City Building, Flushing Meadow Park, Flushing, New York.*
September 9 to October 8	Department of Geology, Northern Illinois University, Dekalb, Illinois.
October 28 to November 26	Department of Meteorology, Texas A and M University, College Station, Texas.
December 17 to January 15	Canterbury Museum, Rolleston Avenue, Christchurch, New Zealand

\* The booking at Queen's Museum replaced that at the University of Wisconsin, Madison, which was cancelled.

The exhibit will be closed January 9, 1979. There are still open dates for summer and fall, 1978. Anyone wishing further information should contact Ms. Deborah Dawson, Science Coordinator, Traveling Exhibition Service, Smithsonian Institution, Washington, D. C. 20560, Telephone: (202) 381-6631.

BOOK REVIEW

Conly, Maurice, and Peat, Neville, Ice on My Palette, Whitcoulls Ltd., Christchurch, New Zealand, 1977. \$N.Z. 14.95. 64 pp. quarto.

Ice on My Palette is a collection of 52 drawings and paintings by New Zealand artist Maurice Conly with a text by Neville Peat, New Zealand writer who served as information officer at New Zealand's Scott Base, Antarctica, in 1975-76. The 23 paintings--oils, water colors, and acrylics-- are beautifully reproduced. They and the charcoal sketches are the result of two visits by Conly to Antarctica. The first was sponsored by the Royal New Zealand Air Force. Conly's second visit was made to provide the Antarctic Division of the New Zealand Department of Scientific and Industrial Research a pictorial record of Antarctic activities, both in the field and at the bases. Antarctic scenery, men, historic huts, birds, seals and killer whales are depicted in paintings and sketches. Publication of the book was timed to coincide with the March 4 opening of the centennial wing of the Canterbury Museum which houses the National Antarctic Center. While not an essential piece of Antarctic literature, it is a beautiful book which will appeal to anyone with an appreciation for Antarctica's scenic beauty. It will make an attractive conversation piece on anyone's desk or table.

Upon inquiry, Mr. Robert Houison, Export Manager of Whitcoulls, has written that payment in U. S. Dollars by check on any American bank will be acceptable. The price for Antarctic Society members, including postage for one copy is \$U.S. 15.10. For two copies the price is \$29.50. Books will be dispatched on the day of receipt of the order which should be addressed to Whitcoulls Ltd., Export Division, P.O. Box 5844, Auckland, New Zealand. Mr. Houison has thus made ordering as easy as if the book were published by an American firm. Allow several weeks for delivery, for shipment will be by surface mail.

K.J.B.

PALMER STATION: WHAT IT DOES AND WHY IT'S THERE

by Guy G. Guthridge

Palmer Station, at 64° 46' S., 64° 05' W., lies on Gamage Point adjacent to Arthur Harbor, which is on the southern side of Anvers Island (50 by 80 kilometers) off the west coast of the Antarctic Peninsula. It is the only U. S. Antarctic station north of the Antarctic Circle, and it is operated separately from the logistics complex that serves the other three U. S. stations.

The relatively mild, maritime climate (mean annual temperature -3° C; annual range +7° C to -26° C) supports a rich biota. Many species of birds nest on islands within 5 kilometers of the station. Lichens and mosses abound. Antarctica's two flowering plants can be seen near the station, as can the two land insects. Marine species, including mammals, are plentiful.

Man has known Anvers Island since 1831, when John Biscoe (Great Britain) probably landed. Biscoe thought the island was part of the mainland. DeGerlache (Belgium) in 1898 saw that the feature was an island and named it. Other explorers who saw Anvers Island were Nordenskjold (Sweden) in 1901-1903 and Charcot (France) in 1904 and in 1908-1910. In 1954-1955 Britain established Base N on the western side of Arthur Harbor and operated it through the International Geophysical Year.

Before 1965, the only U. S. station near Antarctic Peninsula was East Base of the U. S. Antarctic Service Expedition, 1939-1941, on Stonington Island (60° 11' S., 67° W.). It was re-occupied by the Ronne Antarctic Research Expedition in 1947-1948.

The United States began to consider a permanent station on the Antarctic Peninsula in 1962. Biologists working at McMurdo (78° S.) needed to make comparative studies at lower latitudes, and productive research in other disciplines was likely.

The icebreaker Staten Island surveyed 33 prospective sites between 18 January and 5 March, 1963, spending more time (4 days) at Arthur Harbor than anywhere else. In April 1963 the National Science Foundation chose Arthur Harbor. The site had bare land in summer, shores suitable for a dock, a sheltered harbor, fresh water in melt-water ponds, a potential landing strip on the adjacent Marr Ice Piedmont, a varied biological environment, and places for satellite camps within 80 kilometers.

In January 1965 men from the icebreaker Edisto and the navy cargo ship Wyandot brought equipment and supplies and built an 11 by 25 meter prefabricated T-5 building on Norsel Point that was dedicated as a temporary Palmer Station on 25 February, 1965. Three glaciologists, two biologists, and four navy support men wintered the first year. The scientific work was mostly reconnaissance and included trips 50 to 60 kilometers from the station. Rain was recorded in every month. In the second year, eight people wintered.

Seabees built the permanent station (the present one) in four 3-month seasons, beginning in January 1967 and finishing in March 1970. The station first was occupied in 1968 with a winter population of nine. It is 2 kilometers from the original

---

\* This is an abstract provided by Mr. Guthridge, Head, Polar Information Service, Division of Polar Programs, National Science Foundation, of his talk presented to the Antarctic Society on 29 March, 1977, at the National Science Foundation. It was illustrated by many excellent Kodachrome slides. The briefings, via satellite, by station personnel, referred to in the last paragraph, are, of course, not included here.

building, which still stands and is used from time to time.

The new station consists of two buildings. The main building, a three-story, steel-frame structure with about 100 square meters of floor space, has a biological laboratory, storage areas and workshop, living quarters for 24, a dining and recreation room, a kitchen, a medical office, utilities, and a second-floor porch overlooking the sea. A second building, slightly smaller, contains quarters for 16, a garage, recreation rooms, storage space, and two 150-kilowatt diesel-driven generators. Also, there are two 475,000-liter fuel tanks, radio antennas, a helicopter pad, and a dock.

In October, 1966 the keel was laid for a 38-meter-long, sail-equipped, ice-strengthened research trawler (Hero) for use with the station. The wooden ship was launched in March 1968 and arrived at Palmer for the first time in December 1968. Overflights in September 1964 and August 1966 indicated that the small ship could operate near Palmer in winter, although this has never been done. The ship supports Palmer in summer, extending the range of researchers, and does research off Argentina and Chile in winter.

The navy operated Palmer until 11 December, 1973, when Holmes & Narver, Inc., a contractor to the National Science Foundation, took over. Holmes & Narver also operates Hero.

Science projects at Palmer have stressed assessment of a now undisturbed ecosystem that is threatened by possible large-scale exploitation. Most investigators have scrutinized particular aspects of the system - a species of bird or the intertidal fauna, for example. Work to date has produced an assessment of populations in the area, and investigators also have performed detailed anatomical and behavioral studies.

Other disciplines have included glaciology, meteorology, geophysics, oceanography, and upper atmosphere physics. Sophisticated equipment, such as meteorological radar, has been installed, and real-time voice and data communication via NASA's ATS-3 satellite was established in February, 1977. Using this system, the Palmer Station team on 29 March, 1977, briefed the Society on its science projects and responded to questions for 45 minutes.

# THE ANTARCTICAN SOCIETY

P.O. BOX 40122  
WASHINGTON, D.C. 20016

OPENING NIGHT, 1978-9 ANTARCTICAN SOCIETY SEASON

Thursday evening, October 26th, 8 p.m.

Board Room, National Science Foundation  
18th and G Streets, N.W.

features

Dr. Mary A. McWhinnie

in an illustrated lecture

"Antarctica, A Changing Scene"

We are indeed fortunate in having a real Antarctic speak to us on a timely subject in which she is most eminently qualified, the biology of the Antarctic. She has promised to tell us all that we ever wanted to know about krill, but never dared to ask. Her presentation on this subject at the annual meeting of the Association of American Geographers in New Orleans this past spring highlighted a special session on Antarctica, and we want you to circle the date on your Antarctic calendar and come and hear a most interesting professional presentation. Dr. McWhinnie was the first woman to be a station scientific leader in the Antarctic, occupying that position at McMurdo in 1974. She is on the Polar Research Board, on the Panel on Biology and Medicine, Committee on Polar Research, and on the Advisor Committee for Research at the National Science Foundation. Her list of publications would stretch all the way from McMurdo to the South Pole.

# THE ANTARCTICAN SOCIETY

P.O. BOX 40122  
WASHINGTON, B.C. 20016

## B E R G Y   B I T S

The Antarctic Summer Picnic ran amuck some errant bookkeeping by the management at Stronghold, who ran a fund raising activity on our confirmed date. We tried a rerun in September, feeling that the people might want to enjoy the cooler fall weather. But our response was so low that we had to scrub that date. We are open for suggestions about what we should do for next year, as this is your organization and we want to please.

.....

Antarcticans were all sorry to hear about the Chapel of the Snow burning to the ground -?- snow in late August. Was it the chapel with the longest record of church services in the Antarctic? It was an active church in 1956, very active with Father Condit as priest-in-residence.

.....

The Antarctican community was greatly shocked to learn of the death of one of the big men in Antarctic research, Dr. F. Alton Wade, who died on October 1, 1978 at his home in Texas. Death was due to sudden internal hemorrhaging from a ruptured gastric ulcer. He was President of the American Polar Society at the time of his death, and was still active in Antarctic research. He never really packed away his parka when he came back from the 2nd Byrd Antarctic Expedition, 1933-35 -- he must have hung it on a peg by the back door awaiting his next opportunity to go south. He went back with the Antarctic Service Expedition, 1939-41, and then returned with his students in 1962-63, 1964-65, 1966-67, and 1967-68. He was well known by many of our members, and his loss will be deeply felt by the entire scientific community.

.....

Another great Antarctican passed away since our last meeting when Dr. Thomas Poulter died of a heart attack on June 14th while working at the Stanford Research International in Menlo Park, California. He was second-in-command and chief scientist of the 2nd Byrd Antarctic Expedition, 1933-35. He was the recipient of two Congressional medals, as well as a gold medal from The National Geographic Society. His most recent research was devoted to helping the deaf, as he was working with a surgeon on experimental implants. For many years he was director of Poulter Laboratories at SRI, and was renowned for his contributions in the field of detonation and shock pulse. Like Dr. Wade, he was a high ranking officer in the American Polar Society, being one of its vice-presidents at the time of his death.

One of the local Antarcticans did a most kind and considerate act when he wrote Mark Leinmiller about his forthcoming trip to the Antarctic as the official Eagle Boy Scout commemorating the 50th Anniversary of Or. Paul Siple's going south with Admiral Byrd back in 1928. He sent Mark some very personal mementoes of his own earlier trips to the Antarctic. We have Mark's word, on Scout's honor no less, that he will appear before the Antarctic Society when he gets back from the ice and tell us his firsthand impressions. At that time we hope that he can meet this kind gentleman, Admiral Richard B. Black.

. . . . .

The last newsletter had some cropping done on the story about the Boy Scouts. But we think the material is worth putting back in, so here goes. When the six finalists were here in town, they were taken on a short Sunday night tour of Washington and then were going to Madame President's home for some ice cream. One of the cars stopped for a red light in beautiful downtown Arlington, and a earful of some of Washington's finest girls of the evening pulled up alongside and one of the girls asked the scouts, "Do you have the time?" As Madame President was in the front seat they remembered their Scout oaths, plus the fact that she had a vote to cast for one of them later in the week. The girls sped off into the night wondering what had happened to the red-blooded youths in this country. - - - The other anecdote revealed that there was a second selection committee that never surfaced, but we do know that it consisted of an august group of secretaries in the National Science Foundation. We found out-how they voted, though, and you lost out this time, Mark. It seemed that "the one with the dimples" won in a snowslide. At least one girl was overheard saying that he was the one she would most like to be caught with in an avalanche.

. . . . .

The National Science Foundation's Division of Polar Programs put out the word that they wanted 1) an old Antarctic type, and 2) an entertaining speaker for their keynote lecturer for their Antarctic Indoctrination Program in mid-September. They found him a long way from any snow and ice, basking in the sun on a lonesome sand dune on Cape Cod. It did not take Bob Nichols long to put on his braces (can any man who wear suspenders nowadays be all bad?) and come on down and tell how he did it all for Tufts, for God, for Country, for NSF, and for MAN. In closing a most interesting spiel about manhauling in the McMurdo area, he answered why he went to the Antarctic and went back again. His first reason was "its masculinity". When last seen, Bob was running for his life through the lobby with a herd of not-so-mannish Antarcticans in hot pursuit.

. . . . .

Everyone is trying to write a book, and some are succeeding. One of the truly knowledgeable people on polar lands is Fred Milan of the University of Alaska, and he has recently published ESKIMOS OF NORTHWEST ALASKA: A BIOLOGICAL PERSPECTIVE (Academic Press) and has another one about ready to go to Cambridge University Press on BIOLOGY OF CIRCUMPOLAR PEOPLE. We have strong hopes that Fred will speak to our Society later in the year. He is a raconteur non-pareil. Bert Crary has a couple of books under consideration. He did a lot of thinking about those books this past summer as he watched his tomatoes grow. One will be a historical documentation on the IGY. He never saw the trees for the forest back in those days, so now he wants to know who did what and why. We understand

that Bud Waite has a book under way. If it is all about his adventures, it should be worth reading. I first saw Bud Waite in a small town in Maine back in 1935. He gave a talk on the 2nd Byrd Antarctic Expedition, 1933-35. The next time I saw him was in January 1957 when he was flat on his back in the sick bay at Little America V, victim of falling off a sled and having it pulled over him! Tell it like it was, Bud, and we'll all buy it. Incidentally Bud has retired to Florida. How soft life can be on the beach with all those Cheryl Tiegs!

. . . . .

Jerry Pagano had a letter this summer from Gus Shinn. Those of you who are true Antarcticans will remember that he was the diminutive pilot from Tobacco Road who flew Que Sera Sera to the South Pole back in 1956, making the first landing and takeoff at the South Pole. He now lives in Pensacola, Florida, which, incidentally, is the home of Que Sera Sera. Gus still hopes for one more trip to the Antarctic. Don't we all live with that eternal hope?

. . . . .

Pete Burrill remains a most active geographer, presenting a paper at the 74th Annual Meeting of the Association of American Geographers in New Orleans in early April of this year. Also on the program was his son, Bob who is a professor at the University of Georgia. It was sort of old home week for Pete to be at the meeting, as he was one of a handful who had attended the last meeting in New Orleans back in 1940 when the AAG total membership was only 163. Its membership now approaches that in the Manhattan telephone directory if one goes by the milling crowds in the corridors. - - - Another father-son story is being unfolded this year with Dick Cameron's son, Andy becoming a second generation winteree as he will be one of 17 men at the South Pole with Dr. Michelle Ramey. Better for Michelle that it be Andy rather than Sir Richard!

. . . . .

The annual migration of Washingtonian Penguins from their rookery at 18th and G commenced in early October when Emperor Penguin Walt Seelig and Adelie Penguin Josephine Seelig led a small contingent southward. It is always a good sign when you see those Emperors getting off their rocks at the massive local rookery and returning to the ice.

. . . . .

Our Memorial Day lecturer of last spring, NOAA's eminent climatologist, Dr. J. Murray Mitchell, will be going to the South Pole for a ten-day visit in mid-January to visit their Clean Air Facility. Dr. Mitchell, who is on the Polar Research Board, is most excited about the visit in spite of a lifetime of travel' ing all over the world. Incidentally, he has bought 35 acres of choice wooded foothills in Boulder, Colorado. His years in Washington could be limited as he lost his heart to the Rockies many long years ago.

. . . . .

Charlie Bentley will be in town in late October. Sometime we want him as a lecturer, as we think he should stand accountable for all his trips to the Antarctic. If he were not so dang intelligent, you would have to assume that he

goes back to the Antarctic each year to help correct some of the mistakes which he made the previous summer. Penguins at McMurdo are always somewhat lethargic until they see Charlie get off a C-130. Then, and only then, are they assured that summer has arrived. Something has to be radically wrong with Charlie though, to leave that real beautiful wife Marybelle back in Madison to go back and dig another snow pit. I was under the impression that snow pits were like cathedrals, when you had seen one, you had seen them all. Charlie locks Marybelle in the house and takes the key with him. What a guy!

. . . . .

Speaking of Charlie going back to his Capistrano every summer, I wonder who has made the most trips to the Antarctic. I suppose Mother Superior, alias Helen Gerasimou, could come up with the stats. Ken Moulton probably holds some sort of an insignificant record, perhaps that of being the man with the most trips who does not have a girl friend in New Zealand. His idea of a wild night on the town in New Zealand is having a cold sarsaparilla before his self-imposed nine o'clock bed check.

. . . . .

Past President Morton Rubin will be in the local area in mid-October. He is living the good, clean life with his lovely Australian bride, Rosa in Geneva, and they are sweeping through on a little old home leave. He is with the World Meteorological Organization as a GARP (Global Atmosphere Research Program) Action Officer. He and Gordon Cartwright constitute a minority of two Antarcticans in Geneva. Let's hope Mort shows up at the meeting with a shave.

. . . . .

People who have been to the Arctic and Antarctic Research Institute in Leningrad have surely had the pleasure of meeting their interpreter, Anna Minevich. We were happy to learn that she will be in town in mid-October with the Russian delegation attending the two World Meteorological Organization's workshops on sea ice. They will be staying at the Burlington Hotel.

. . . . .

The next newsletter will feature two solicited articles on women wintering over at the South Pole. In deference to Dr. McWhinnie being our speaker this month, the articles are being withheld from this issue. One is by a would-be explorer entitled "The End of a (Great) Era" and the other by a woman pretender-to-go to the land of snow and ice entitled "It's About Time". It should be good reading, and each and every one of us will find ourselves in one of the articles (but not in both).

. . . . .

We hope that you have liked "Bergy Bits" and do not feel that we have been too flippant. We are trying to stimulate interest by putting in a little news about some of our members, and also to have a little fun at the expense of some of our friends (or ex-friends). If we had a center fold, we would not have to write this column, but without our Penguin of the Month, we hope that you have found something here of interest.

## AN ANTARCTIC PROFILE - RICHARD L. CAMERON

We are considering running an Antarctic Profile in each newsletter. It will depend upon the reader's interest, and if we can get some of our members to tell all about themselves. We started out with Dick Cameron of the Division of Polar Programs, as he has been an active member of the Antarctic Society and is one of the most interesting devils in town. After all, you would not want to profile some dull individual. Dick is certainly not that. We hope you enjoy it.

Dick was born in the late Pleistocene, circa 1930. The Laurentian Ice Shield had once covered his birthplace in Laconia, New Hampshire. It is beautiful kame and kettle country, and in his earliest youth he was made aware of the glaciated features that surrounded him. He went to the University of New Hampshire, tripping over the footsteps of another Antarctic, Rudy Honkala, who had preceded him on campus. He did not emulate the bon vivant-pseudo athletic Honkala as a big man on campus, as he was a quiet, introverted scholar and sought refuge in the Geology Department. How times have changed!

Dick went to summer school in Oslo at the end of his junior year, heeding the good advice of one of his professors, a Don Chapman. He also worked at the Polarinstittutt in Oslo. He was introduced to his first glacier that summer, and if it were not instant love, it made enough of an impression to stimulate him to want to become an ice man. Most reluctantly he bade farewell to the lovely Nordic beauties he met during the summer and returned to New Hampshire to graduate the following year.

He contacted SIPRE (Snow Ice and Permafrost Research Establishment at Wilmette, Ill.) about a job, and they informed him that Valter Schytt was over from Stockholm and was going to Greenland for them, and that Dick could accompany Valter as an assistant. This turned out to be a double victory, as not only did Dick get to apprentice under a world-recognized expert, but it ended up in Dick following him back to Stockholm at the end of the summer to enter graduate school. While he was studying at Stockholm, Bert Crary was desperately trying to uncover glaciologists who

could pass psychiatric tests and carried a U.S. passport. Bert wasn't very successful in this endeavor, but he did find Dick.

Everything was looking up for Dick, and like many a soul bound for the ice, decided that he would leap into matrimony before he leaped onto the ice breaker. He thought since he was probably the best qualified glaciologist he would really go to the Antarctic. Well, he never quite made it, because when the ship dropped anchor it was still north of the Antarctic Circle, deep in the Banana Belt at Wilkes. But there were several redeeming features, one being that he was with a bunch of rowdy, fun-loving, hard-working rogues who were led by the equally rowdy, fun-loving, hard-working rogue Carl Eklund. To try to make Dick feel needed, they established an interior camp site where he could diligently dig a deep snow mine and do all those things that glaciologists do to ice crystals. There is absolutely no truth to the statement that they created the camp to send people into exile, although Rudy Honkala seemed to have been left there alone an unexplainably large number of times. Dick's bride presented him with the fruits of their pre-Antarctic farewells with the announcement of the arrival of young Andrew. That had to be one of the highlights of Dick's I6Y, as well as an island off the Wilkes Coast being named for him.

Dick returned to the States, his pockets jingling with money, and his head full of dreams of getting his PhD degree. He wintered over from 1958 to 1961 in Columbus, Ohio. There were some awful thoughts that he had reached the age of 30 and should consider getting a job. The Air Force had an Arctic Research Laboratory at Hanscom Field, and its alumni looked fairly respectable (Bert Crary, Joe Fletcher, Louie DeGoes). Dick was still clean-cut and looked like a good enough gamble for the military, so they hired him. But the office was wiped out before the bureaucracy could complete the paper work to get him aboard. But he did end up in their Terrestrial Science Laboratory. This wasn't a particularly happy marriage because even though he was the boss, he had a low grade and had an ornery bunch of senior, higher-graded personnel working for him. It lead to an early divorce from the Air Force, a separation which was assisted by his bride's hostile feelings about Massachusetts and her passion for the mid-west. He received his PhD at Ohio State in 1963, and by this time had fathered Sarah.

He-blended into the Columbus environment, and for the next ten years could be found in various administrative positions. He was Assistant to the Director of the Institute of Polar Studies, Associate Director of the Ohio State University Research Foundation, Assistant Dean in the University College, and Assistant Dean for International Programs in the Office of Academic Affairs. He decided to see what the bureaucracy was like in Washington, and came here in 1973, joining the International Program staff at NSF. It was just a short elevator ride upstairs the next year to join the Office of Polar Programs.

But what separates Dick from other Antarcticans are his extracurricular activities. He produced SINFONIA ANTARCTICA with Ralph Vaughan Williams writing the music. This was played by the Columbus (Ohio) Symphony Orchestra, and was the background music used in the film "Scott of Antarctica". He is a poet of some ability, and has written seven poems to be put to music. Three have already been completed and have been performed in recitals at The Ohio State University. He also does sculpturing in marble, and one of his best sculptures was of Anita Ekberg - no, sorry, it was just an ordinary iceberg. He is also a photographer of some note, and has exhibited his artistry behind the lens at several photographic exhibitions. One of his favorite photographs is one he shot in Leningrad several long years ago. He claims he is a tennis player of modest ability, but to date his only claim to fame is beating the mild-mannered, soft-playing Ken Moulton.

An interesting thing happened to Dick on his way home from the office one evening last year. He was cruising along a downtown Washington street when he noticed that his driving was attracting more than its normal amount of admiration from people on the sidewalk. Cars started honking at him, and he was feeling real happy with his new-found popularity. Then he noticed that his happiness was giving him an unduly warm feeling, and he turned to find that the microbus was aflame. He pulled over to the curb, grabbed his attache case (which was seared by the flames) and joined the people on the sidewalk watching the vehicle slowly burn as the fire department put in a belated arrival. One of the spectators noted that Dick seemed to be enjoying the fire as much as they were and asked him, "Why are you smiling to yourself as your automobile is being completely burned to nuts and bolts in front of your very eyes?" All Dick said was, "You wouldn't understand". You see, the microbus belonged to his wife, and that very week Dick had divorce proceedings going on in two states plus the District!

Dick now has completely recovered from Divorce #1, and has a French lady in waiting, who is bottle green in color, well built, tinted glasses, and very stylish. He gets 40 miles to the gallon with her, a charming Renault 5 suitably autographed on the side in bold letters "Le Car". Dick lives in Rockville. His daughter Sarah is away at school in Tyrone, Pennsylvania and his son Andy is about to change his mailing address for the next year to South Pole, Antarctica. This past summer Dick took Sarah and Andy with him to Iceland, and they all had a ball for themselves. He had also taken Andy and Sarah with him to Paris. No greater love has a father for his daughter than when he takes her to Paris! Dick won't be lonesome this year though, as this personable man of multiple interests knows the best looking girls in town. And there is always the Kennedy Center for a change of pace. Dick is no dull boy!

October 1978

A PRE-HOLIDAY SPECIAL TREAT

Tuesday evening, December 5th, 8 p.m.

Board Room, 5th Floor, National Science  
Foundation 18th and 6 Streets, N.W.

features

REAR ADMIRAL RICHARD B. BLACK

Famed Explorer and Poet Laureate of the Antarctic

presenting with great enthusiasm his 16mm film

"ANTARCTICA REVISITED"

\*\*\*\*\*

DO PLAN TO ATTEND!

BRING A FRIEND!

---

Officers for 1978-79:

President - Paul C. Dalrymple

Vice President - Meredith F. Burrill

Secretary-Historian - W. Timothy Hushen

Treasurer-Membership Sec'y - Mrs. Sophie R. Dales

Board of Directors:

Robert J. Allen  
Kenneth J. Bertrand  
Richard L. Cameron  
George E. Watson III

Peter Barretta  
Frederick S. Brownworth, Jr.  
Jerry W. Huffman  
Mrs. Paul A. Siple (Ruth)

Mrs. A. P. Crary (Mildred)  
Mrs. Henry M. Dater (Alice)  
Richard Y. Dow  
Peter Espenchied

Antarctican Society Membership

I have recently reviewed the membership file and have found out that we are carrying quite a few "free loaders". Our mailing list shows 275 members, but only 152 paid their dues in 1977-78. This was a drop of 29 from 1976-77. DUES ARE NOW PAYABLE! They are \$3.00 for the 1978-79 year, but the Board has voted to raise the dues a year from now (1 October 1979). So if you want to beat our inflationary rise (which I am sure will be within Jimmy Carter's guidelines), why not make your check for several years in advance? We would appreciate back payment from the delinquents, although we are writing off all debts prior to 1975. I we don't hear from the long-standing delinquents by 8 January 1979, we will drop them from our mailing list. Please fill in the whole form so that we will know more about you and your likes. Then mail to:

The two articles beginning on the next page are invited papers on women in the Antarctic. The first article is by Mildred (of the House of Albert) Crary. She was the third person hired in the IGY office, and constantly hounded Hugh Odishaw of "Odishaw Sends" fame with pleas to send her south. So, she is writing about a broken dream that was never fulfilled. As for the opposing article, I did not feel that it was proper to ask for a show of hands of those who were still practicing male chauvinists who were willing to write such an article, and, besides, who would have been better qualified than myself! So I did the con; My background was two years without women, back-to-back, one at a large coastal base with 108 men (Little America V) and the other at the South Pole with 18 men. I would like to soften my remarks by saying that my article applies only to women at interior stations like the South Pole and Siple. I feel I am as eminently qualified on my side as Mildred is on her side, as I was the only married man to winter over for both IGY years, and can attest to the fact that it did absolutely nothing for my past marriage. If you have any comment; send them in, and see yourself in print!

WASHINGTON, D.C. 20016

IT'S ABOUT TIME!

[This represents an attempt to be as comprehensive as possible in the time allowed. I hope to hear from those readers who know more about the subject than I have learned.]

Mildred Rodgers Crary

"But no words can describe the beastly stench wafted across to us – the first sniff nearly bowled me over!...Just imagine a sickening vapour of tepid blood trickling along the deck in barrelsful, and down the ship's side: entrails, blubber, train-oil, and boiling oil..."

In such an atmosphere lived the first woman on record to visit antarctic waters, Mrs. Adolpho Andresen, on the whaling factory ship Gobernador Bories in 1908 and possibly as early as the 1906-1907 whaling season. On occasion Mrs. Andresen even accompanied her husband (a Chilean national of Norwegian birth) out to hunt whales on the little iron whale-boat Almirante Uribe. Mrs. Andresen's own name and nationality are not recorded.

Into such an atmosphere ventured Mrs. Ingrid Christensen, who sailed with her husband, Lars Christensen, on all his expeditions; they lived on the oil-tanker Thorshavn but visited whaling factory ships. She took women friends with her: Mrs. Mathilde Wagger in 1930-1931, Mrs. Lillemor Rachlew on the 1932-1933 and also the 1936-1937 expeditions, Mrs. Ingeborg Bryde Dedichen in 1933-1934, and Mrs. Solveig Widertte, wife of the expedition's pilot, and the Christensen's daughter, Mrs. Sophie (Fie) Bratt, in 1936-1937. Mrs. Rachlew's vivid description of a visit to the factory ship Solglimt appears above. The women celebrated Christmas with gifts for the ship's company, traditional Norwegian holiday fare, and real Christmas trees brought along from Sandefjord, Norway.

And in such an atmosphere a Russian stewardess (name unobtainable) bore the first child born in Antarctica. A boy, delivered on January 11, 1948, on the Slava, a Russian whaling factory ship operating in Antarctic waters, was named "Antarctic" by his proud mother. An account of the baby's birth appeared in All About Antarctica, an Australian publication. The story is vouched for by the Russian scientist, Marie V. Klenova, and by I6Y antarctic veteran, W. (Slava)Aver'yanov, whose father was aboard the ship at the time.

Klarius Mikkelson, master of the oil-tanker Thorshavn during the 1934-1935 season, took his Danish wife Karoline to Antarctica with him too. They penetrated the pack ice as far south as 68°29' at a latitude of 78°36' East, where they landed on February 20, 1935, thus making Mrs. Mikkelson the first woman on record to set foot on the Antarctic Continent. They modestly named the land they had discovered the Ingrid Christensen Coast, and only Mount Karoline (or Caroline) Mikkelson on that coast commemorates Mrs. Mikkelson's record "first."

On Christensen's 1936-1937 expedition, chiefly one of exploration, the soundings in the middle of Olaf Pryda Bay indicated a bank only 150 meters deep in water from

800 to 900 meters deep. In honor of the four ladies of the party, it was named "The Four Ladies' Bank."

Mrs. Christensen did see the coast named for her: on January 27, 1937, she flew as a passenger over the land and dropped a flag. Mrs. Rachlew also flew as a passenger that day and saw the Vestfold Mountains. Three days later, at 2:00 a.m., Mrs. Christensen went with a landing party to establish a depot of supplies near Mount Karoline Mikkelson, thus becoming the second woman to go ashore on the Continent. As an observer on another surveying flight, she dropped the Norwegian flag onto the newly discovered Prince Harald Land on February 4, 1937.

Whether intentionally or not, Mrs. Edith (Jackie) Ronne and Mrs. Jennie Darlington became the first women to winter-over on the Antarctic Continent a decade later. Taking Mrs. Darlington as a companion, Mrs. Ronne accompanied Captain Finn Ronne's private Antarctic Research Expedition from Texas to Panama and then on to Valparaiso, Chile, ostensibly to finish the necessary paper work for the expedition. Ronne then decided to take his wife on to the Antarctic; and the members of the expedition agreed not to leave on the spot if Mrs. Darlington would go along, the theory being that two women were better than one. On the Antarctic Peninsula (then called the Palmer Peninsula) the Ronnes had a hut separate from the men's bunkhouse, but the Darlingtons spent their honeymoon in a bunkhouse cubicle containing two bunks. When Ronne and chief pilot Harry Darlington disagreed on the conduct of flight operations and Ronne grounded Darlington, the two women sided with their husbands and were not on speaking terms for much of the 11 months spent on Stonington Island.

Ronne named territory at the base of the Peninsula for his wife (though the Board on Geographic Names changed Edith Ronne Land to Ronne Ice Shelf in 1966). But Mrs. Darlington achieved another distinction: on the way back from a visit at the British Debenham base (only a hundred yards away-from the Ronne base), she became the first woman member of the Antarctic Swimming Club; she was dunked from her sledge into the waters of the bay but quickly rescued. That year's thaw did not free Ronne's ship, the Port of Beaumont, Texas, which they had deliberately frozen into the bay the previous winter; and a Navy icebreaker had to break a channel for the ship, thus saving the then pregnant Mrs. Darlington from bearing the first child to be born on the Antarctic Continent.

That honor went just this year to Silvia Morello Palma, wife of Captain Jorge Emilio Palma, chief of the Argentine Esperanza base on the Antarctic Peninsula. Last year, to lend more credence to the permanence of their Esperanza base, Argentina sent the pregnant Mrs. Palma and her other three children to live there for a year. A son, born January 7, was christened Emilio Marcos Palma on February 14. Argentina stationed five more soldiers with wives and 15 children at Esperanza; two of these women were pregnant, but further reports of births there have not been received.

The first woman to engage in serious scientific work in the Antarctic was Professor Marie V. Klenova. An arctic veteran, Professor Klenova had participated in arctic research since 1925 and was a member of the Council for Antarctic Research of the U.S.S.R. Academy of Sciences. A marine geologist, she made oceanographic and geographic observations from the ships Ob and Lena and on shore at the Russian base Mirny in the austral summer of 1956. At the end of February the Ob left Mirny and sailed along the coast of Wilkes Land so that the scientists aboard could map unknown areas there. East of the Davis Sea, near the Knox Coast, the ship found an unknown archipelago of three islands, which they called "March 8" commemorating their annual holiday, International Women's Day, and in honor of Professor Klenova and the seven women stewardesses on board. It was reported in Wellington that she and the stewardesses received the same salary.

On the first commercial flight to Antarctica, a chartered Pan American World Airways plane flew from Christchurch, New Zealand, to McMurdo Sound and carried two stewardesses. Ruth Kelly and Patricia Hepinstall visited the station on October 15, 1957, entered a dog sled race, judged the local beard-growing contest, and attracted a crowd of some 50 admirers.

The paucity of women has been noted by the men in past years. In 1962 at McMurdo a single word was written on the "Suggestions to the Recreation Committee" box in the mess hall: "WOMEN." For feminine company the men had only three mannequins: Emily Glutz, kidnapped by helicopter from the Coast Guard icebreaker Eastwind in February 1962 and gracing the Chief Petty Officers' Wardroom at McMurdo; Margaret, a blonde in a bright red dress at the South Pole Station; and Miss Gallagher at the New Zealand Station at Scott Base, who on occasion flew to Wellington for a new permanent.

Although Commander W. H. Withrow announced in June 1965 at a meeting of the New Zealand Antarctic Society that the United States would build a barracks for six women at the McMurdo Station, he was contradicting Rear Admiral Fred E. Bakutis, who had said that he would not give up the tradition of keeping Antarctica womanless. The hard-line Bakutis had just taken over from Rear Admiral James R. Reedy as commander of Operation Deep Freeze; and Reedy had been unable in his three years' command to mollify his wife, whom he described as a leader of the "squaws," a women's group whose aim was "high heels on southern ice."

In the austral summer of 1968-1969 four Argentine women scientists conducted hydrographic research around an island off the Antarctic Peninsula. This first team of women comprised Professors Irene Bernasconi, Maria Adela Caria, Elena Martinez Fontes, and Carmen Pujals, all women with 20 to 40 years of scientific research experience. Among women scientists, only Professor Klenova had preceded them.

The Navy, which handled a major part of the transportation and logistics but not the scientific work, managed to keep U.S. women scientists off the ice until the austral summer of 1969-1970. For that season Dr. Lois M. Jones was instructed to select an all-female contingent to pursue studies in the dry valley around Lake Vanda, near McMurdo. She herself studied weathering and salt accumulation. Mrs. Eileen R. McSaveney studied the glacial history of the area in the lake's beaches. Mrs. Kay L. Lindsay, an Australian entomologist who was also a member of the Jones team, studied the interaction between the environment and the life forms present. A 19-year-old geology student, Terry Lee Tickhill, recorded changes in the chemistry of the lake's water.

That same season Dr. Christine Muller-Schwarze was allowed to accompany her biologist husband, Dr. Dietland Miller-Schwarze, as his assistant to live and work at the Cape Crozier emperor penguin rookery. And Jean Pearson, a reporter for The Detroit News and president of the National Association of Science Writers, went to Antarctica as a journalist.

Dr. Jones' team did achieve one "first," though. Accompanied by Mrs. Pam Young, New Zealand scientist, and by journalist Pearson, Jones, McSaveney, Lindsay, and Tick-hill hitched a ride on a Navy supply plane to the Amundsen-Scott South Pole Station. In the interests of peace, the six women joined hands and jumped simultaneously from the back ramp of the plane so that all six would be the first women to set foot at the South Pole. They walked 200 yards to the "candy cane" marker at the actual South Pole, then walked around the world in five seconds, and celebrated at the under-ice lounge, Club 90. After a tour of the base, they left for their own scientific work near McMurdo; and Mrs. Young rejoined her husband, Dr. Euan C. Young.

The Youngs and three other men did research work into the habits of penguins and

skua gulls at Cape Bird, where she lived in a tent for ten weeks. She was the first New Zealand woman to work for a season on the ice. In her opinion, "Others in the field party who had been on previous all-male expeditions in Antarctica considered that having a woman in their midst had made little difference to their lives at Cape Bird, possibly because all were well known to each other before coming to Antarctica. I think that, particularly in this type of field work, women can fit in very well, helping in the research work as well as in the day-to-day running of the camp."

Journalist Louise Hutchinson and Edith Ronne, in a group of 37 visitors, became the eighth and ninth women to set foot at the South Pole on December 7, 1971. Mrs. Ronne left the same day, but Hutchinson spent the night, thus earning what she described as "a minor footnote to South Pole history: the first woman to spend a night there."

Now the U.S. Antarctic Research Program routinely sends women scientists for summer assignments in the Antarctic, even to isolated stations, such as that improvised at Lake Bonney in the dry Taylor Valley. In 1972-1973 Paige Geering and Gail Tomimatsu, student biologists, and three male scientists studied the lake's ecosystem. Geering explained, "we sleep under the lab tables here in the hut, and the guys sleep out there in the tent."

The U.S. Navy has come around too. Among the austral summer staff at McMurdo in 1973-1974 was Lieutenant Ann E. Coyer, the first woman assigned by the Navy to the Antarctic. She acted as administrative officer of the Navy support force there. The following year the Navy sent two more women officers, and in 1976 they assigned 13 women to the Antarctic.

Dr. Mary Alice McWhinnie, 1974 station scientific leader at McMurdo, admits that her application to the National Science Foundation might have passed the first hurdle because she habitually signs her name "M.A. McWhinnie." As the first women scientists ever to winter-over in the Antarctic, Dr. McWhinnie and Sister Mary Odile Cahoon studied the mechanism of low temperature adaptation by marine organisms, with emphasis on krill. The group of four scientists (two of them men) operated from the protection of movable "fish houses," under which they drilled holes in the ice to obtain their specimens. It was Sister Cahoon's first trip to the far south, but Dr. McWhinnie had already been to McMurdo five times since 1962 as one of a number of women scientists on Eltanin voyages, and she had spent a week on the ice in 1971. Dr. McWhinnie felt that "winter was the better time for sustained, steady work," without the distraction of the summer visitors.

Husband-and-wife team Drs, Yuan and Arthur DeVries in the 1974-1975 summer season together studied Trematomus borchgrevinki and Dissostichus mawsoni, cold fish biologically adapted to antarctic waters by means of antifreeze in their body fluids. DeVries a biologist, did the fishing while his Chinese-born wife, a biochemist, did most of the laboratory work, including cooking a tasty Dissostichus mawsoni.

After 17 years the South Pole Station established and commanded by Paul Siple during the 1957-1958 International Geophysical Year had become so deeply covered with snow that it had to be abandoned. For the dedication of the nearby new base on January 9, 1975, Siple's widow (the first widow of a station commander to visit Antarctica Mrs. Ruth Siple was invited to participate as an honored guest. The old Antarcticans hold her in such regard that last year she was elected the first woman president of the U.S. Antarctic Society.

The McMurdo station scientific leader in 1977, biological oceanographer John Oliver, took his wife along for the winter season, a wintering-over "first" for a husband-and-wife team. Donna Mitchell Oliver, a laboratory technician at the Scripps

Institution of Oceanography, assisted him in his studies of marine life, tending the lines and gear over the diving hole while he went underwater for winter-time studies of these sea creatures. Oliver, a veteran of many all-male antarctic trips, said that having his wife along "makes the winter a lot more bearable" and commented further that scientists' selection "should be based solely on an individual's work qualifications and personality - without regard to sex."

The tourist possibilities of Antarctica are self-evident, and in 1958 and 1959 the Argentine cruises of Les Eclaireurs and Yapeyu had carried some tourists and visited Melchior and Deception Islands and the Peninsula. Lindblad Travel of New York began organizing expeditions, chartering the Argentine cruiser Lapataia in January 1966 to carry groups to the Peninsula to visit the Argentine Esperanza Station as well as British and U.S. stations. Among the women on the first such cruise was 86-year-old Mrs. Essie C. Sweeney, the oldest woman ever to go so far south. A majority of the passengers on these cruises were women. Contrary to expectations, the tourists were not litterers but behaved with restraint and respect for nature and were full of scientific curiosity. Captain Edwin A. McDonald, who accompanied one group, described them as "exceptionally good hikers and ardent conservationists," scrupulously careful not to trample lichen beds or disturb penguin rookeries. In January 1968 the Lindblad tour ship Magga Dan carried a group of tourists south of the Antarctic Circle into the Ross Sea area to McMurdo. Although the U.S. Navy disclaimed any responsibility for the tourists, who remained quartered aboard the ship, when the Magga Dan went aground on a shoal at McMurdo, the icebreaker Westwind freed her.

In mid-October 1978 a doctor, chosen as the "best qualified" applicant, left to winter-over at the South Pole Station to take care of the medical and dental condition of the 17 men there, to handle medical emergencies, to help with a scientific experiment on infectious diseases, and to manage the station store. The doctor just happens to be a beautiful 27-year-old woman named Michele Eileen Raney. Dr. Raney takes the whole thing calmly, as does Ron Peck, who will be in charge of the station. Having met her wintering-over companions, she described them as "young enough to be in tune with giving a woman equal opportunity" and had the perception to note that those who are "most worried about it seem to be the people who aren't going down there."

Yes, it's about time - to start taking it for granted that qualified people, male or female, go to the Antarctic, whether as glaciologists, biologists, doctors, journalists, distinguished visitors, stewardesses, or support staff members. So what if now for the first time a woman will winter-over alone with 17 men! As Dr. Raney would say, "What's the big deal?" - and get on with her work.

(Q) 1978 by Mildred Rodgers Crary

. . . . .

THE END OF A (GREAT) ERA . Dedicated to Larry Gould, Bud Waite, Eddie Goodale,  
Dick Black, and other members of the Society who lived  
the good life.

Antarctica was really made for men, stout hearted men like those they sing songs to and tell tales about and drink beer to when men gather together. Antarctica had to be made for men. Why else would it have been placed at the bottom of the earth, why else would it be so desolate and so cold and so deep with snow, and why else would it be guarded by thick packs of ice with fierce seas beyond them? Not for women, that's for sure. When God created the world, he had this place in mind as a place where men could retreat

and continue their youthful games of playing in the snow and flying balloons. It was an ideal place for men who did not want to drive taxis but dog teams and snowcats, who did not want to take out the garbage but wanted to be seismologists and blast everything to bits, who did not like traffic and lights but loved flying helicopters in whiteouts and sledding over hidden crevasses, and who just like living and working with reasonable people like themselves. After all, the only sane people in the whole world were the men of Antarctica.

If Antarctica had not been intended "for men only", why was there a New Zealand? If there were a New Zealand half way to the moon, there would already be a permanent settlement on the moon. It is such a delightful place, and memories of docks crammed with lovely Sheilas seeing their new-found friends off to the Antarctic remain pleasant memories for many old Antarcticans, who live with the warm feeling that they have already experienced part of Heaven here on earth.

When did the great era start to crumble? The steel bird was the beginning of the end. It put the continent within a few days of the Washington Monument. Gone were the delightful cruises through the Panama Canal and across the South Pacific; gone were the cruises to the continent when you really had a chance to experience in slow motion the thrills of seeing the Antarctic waters with the pack ice and tabular bergs and seals and whales. It is still there, but not all of us want to join the Navy. Scientists are rushed there like perishable vegetables. It is the Great American Way - fast, faster and fastest. It was not so long ago that Paul-Emile Victor brought back one of his French expeditions by way of Tahiti, where they stayed for over a week. Ah, those French, they know how to run an expedition.

The steel bird has also increased the length of the austral summer. Outside of Mid-winter Day, there is no date in the Antarctic which is more joyful than when the last summer tourist has pulled out and you realize that it is you and your buddies and the environment for the next six or eight months. The Antarctic winters are hot long, it is the summers which are endless. Stations like Siple are fortunate in that they are off the beaten trail, and personnel are not constantly being plagued by summer tourists. It must have been great, really great, in the old days when you went there on one ship, maybe two, and did not have a weekly influx of new people. The people going there today may have it easy, but they have lost the thrill which the old timers had of doing it themselves in their own pioneering way. The camaraderie that developed must have been fantastic. The great polar explorer, Sir Hubert Wilkins (the first man to fly in Antarctica, as well as the first man to go under an ice pack in a submarine) on his last trip to the Antarctic in 1957 alluded to this in an interview given at McMurdo. Sir Hubert was never a person to pull any punches and he said that Scott-and Shackleton had better camps with higher morale (than McMurdo). As one who was there at the time of the interview, I can believe it. Unfortunately for Sir Hubert, the interviews found their way back to McMurdo where the Deep Freeze admiral's blood pressure hit a new Antarctic high, and before it came down poor old Sir Hubert had been ostracized. But it must have been great to have been there with Shackleton, Scott, Amundsen, or Mawson. They had to be the halcyon days of the Antarctic.

It is good to see that there are still some small camps, and let's hope they can survive down through the ages. The Russian concept that anything bigger is better does not apply to research stations in the interior of Antarctica. The new South Pole station photographs well, but it is fast becoming a polar village, a conglomerate of outlying buildings beyond the protective mother hen geodesic dome. Wonder how it will compare with the old station after an equal number of years?

Now woman has come to the South Pole. Not just to join hands and jump out the rear end of a C-130 for the benefit of photographers, but to unpack the unmentionables and to buy a year's supply of toothpaste at the camp's store. Wow! Women should be given every

opportunity to qualify for any job, and should be given equal pay, but why at the South Pole? Isn't anything sacred any more? The South Pole is not exactly a fun place. Then are no mountains to climb, there is no barrier edge to walk to, there are no Kiwis over the hill to visit with, and there are no penguins or skuas. There are times when even the strongest of men may want to go for a walk by himself to get away from a camp which suddenly seems to be closing in on him or to think about a problem at home. But where do you go when you want to be alone, when it is -75°F, when it is dark, and when the snow in front of you looks like that all around you? The answer is "nowhere". Several beers may help, but you really don't want to talk to anyone. And at times like these, I can imagine a woman would have all the appeal of a bad case of the mumps. Men can have a much better time alone in an isolated spot than they can with women around. It may make it like home to some, but without one of your own who wants or needs temptation? Men can say things and do things in a relaxed manner when they are in a man's world, but it won't be the same this year.

Back in the old days there were men who went to the ice to get away from women. Some of us know one man whose wife wanted him home so she could divorce him, his fiancée wanted him home so she could marry him, and his girl friend wanted him home because she loved him. Fortunately for this man, he was left on the ice for another year while the women cooled their heels (or bodies). I don't think there are many red-blooded youths like him around, but I can't help feeling that there must be some fellows in each camp who are escaping women and don't particularly cherish the thoughts of sharing a roof with a woman. Most Antarcticans are pillars of virtue, I am sure, at least after they leave New Zealand, but what about the jealous wife whose security has already been rocked by her dearly beloved husband opting to leave her for fifteen months and then suddenly realizing that he is wintering over with a good looking female, one who is probably better looking than she herself. She remembers her dating game with her husband, recalls that he was a Don Juan with her, and her imagination runs wild. Who needs a nagging wife saying to her husband on New Year's Eve in 2000, "Just what did go on between you and that woman at the South Pole in 1979? You never told me; something must have gone on, if I know you". Women are elephants, they never forget.

Temptation is a terrible thing. I have been in only one place where women were never mentioned, and that was in a prison camp during World War II. If you have an empty stomach, you don't think about women. But people eat pretty good at the South Pole. I wonder if the psychiatrists who interviewed the people going to the South Pole this year had ever read Jennie Darlington's classic MY ANTARCTIC HONEYMOON. That should be required reading for all Antarctic head shrinks. It won't go down in history with the ghost writing job that George Bernard Shaw did for Cherry-Gerard in THE WORST JOURNEY IN THE WORLD, but it is great reading. A Holmes and Narver man told me at the indoctrination program for those going to the Antarctic that things have changed from my time. I admit to at least one generation gap, and if pinned down might admit to two, but boys have always been boys and will continue to be boys. It is my opinion that the men would have a better time and be happier without any temptation. I have tried to think how I would have felt back in 1958 if Kirby Hanson or Palle Mogensen had been a pretty girl (you could use the word "girl" in those days). I think I would have been plain miserable as it would have reminded me most vividly of what was at home. But when you are all of the same kind and in the same situation, then the coffee tastes better and time flies faster. I was also told by the same Holmes and Narver man that the woman doctor was the best qualified. This I don't question, but I do question why you need the best qualified doctor at the South Pole. It is probably the cleanest environment to live in on this globe. It is all downhill after the tourists leave with all their germs. When I was at the South Pole, the doctor spent the whole year drinking coffee from the end of the table, taking time out periodically to initial messages for transmission. He did wear mukluks though.

It was bound to happen, sooner or later. Changes are coming fast for women. This was the year in which women reporters were allowed into men's dressing rooms to interview the likes of Pete Rose wearing nothing but a large smile. Some even took note pads

with them. Unfortunately for men reporters, there is no way that they can interview Virginia Wade strolling out of a shower with a towel draped around her neck. In retrospect, probably the most amazing thing is that there is only one woman going to the South Pole this year.

I have an alternative plan for the South Pole which I think is tremendous. Old Antarctica is slipping away from us men, in fact, it has gone. We might as well concede, advance to the rear, and regroup. I propose that the National Science Foundation take full recognition of women and understand their frustrations in missing out on all that fun at the South Pole for the past 20 years, and really give it to them. Not a token woman, but a whole camp full of women. If one woman can have fun there, think of all the fun that 18 of them could have there with no men to bother them from February to November. Then the next year NSF would let the men go back to relive a bit of the good old days. Personnel would then be rotated, with the women being there on the odd years.

Yes, the Antarctic has changed. This is the end of 50 years of this country's participation in Antarctic research. It was truly a golden era, although the goose that laid the steel egg has killed the glory days for the men. It is now just a scientific laboratory which happens to sit at the bottom of the world. It has been completely liberated. When you see and hear people like Mary Alice McWhinnie, you are sort of glad that it did happen, but pardon an aging male for saying that he is particularly glad that he was given the opportunity to go there "when". I liked it that way, and I had a hell of a good time, even though Kirby and Palle weren't much to look at. And I bet there are a pack of Antarcticans out there who feel just the same as I do. They may not want to come to the surface and be counted, and there is no need to as this is not a call to arms. But honest, Dr. Todd, Antarctica was really made for men. And God bless New Zealand and dear Margaret!

. . . . .

BERGY BITS

Our unannounced theme for this administration is going to be "with a little bit of nostalgia" as we are coming up on the 50th anniversary of the first Byrd Antarctic Expedition.

. . . . .

We were happy to hear from Larry Gould, Bill Field, Bob Rutford, and Edwin MacDonald. Dr. Gould has offered to talk on 50 years of Research in Antarctica to the Society in March/April 1979 when the Polar Research Board meets in Washington. We are planning on making this the Memorial Lecture for 1979. Dr. Gould is like E.F. Mutton, when he speaks, everyone listens. In an effort to build up interest this newsletter is going out to all the living members of the first two Byrd Antarctic Expeditions, thanks to Henry Harrison, John Herrmann, and Admiral Black who provided the addresses.

. . . . .

Henry Harrison, meteorologist on the 1st Byrd Antarctic Expedition, was talking to Ruth Siple this week, and is doing well in Asheville. One member of that same expedition, Richard Konter, is 97. Another member, Norman Vaughan, still races dog teams in Alaska and finishes his races too. They grew men in the old days.

MORE BERGY BITS

Capt. Edwin MacDonald writes that when he was deputy to Admirals Dufek and Tyree they had him on a yo-yo between Christchurch and the ice and that his trips to Antarctica probably number into the 30's. Can anyone top this?

. . . . .

Three of our most active Washington members have been hospitalized or bedridden in the last month. Dr. Ken Bertrand, the noted Antarctic historian and past president of the Society, has had some bad days with internal hemorrhaging. Our affable vice-president, Dr. Meredith "Pete" Burrill, the State Department's Mr. Geographic Name, has been confined to his home with a pesky infection. Col. Peter Barretta, one of our two biggies in polar philately and a born-again student who is working on an advanced degree at G.W. - his thesis is on the 7th Continent - had a heart attack in mid-October. I am sure all Antarcticans wish them well during their current hard sledging days.

. . . . .

In case you have not seen it, the CIA has published a new POLAR REGIONS ATLAS. It is very nicely done, and if you ask your friendly connection in the Agency for a copy, I am sure he will send you one. It covers a broad range of topics (climate, sea ice, exploration, IGY, Antarctic Treaty, fish and krill, whaling, minerals, and other goodies Your taxes paid for it, you might as well have your uncle give you one.

. . . . .

The American Geographical Society has a new issue of FOCUS out on Antarctica, which also includes several pages on towing ice bergs. It sells for \$2.00 per copy, and Lord knows the AGS could use the money. Broadway at 156th St., New York, NY 10032.

. . . . .

We are deeply indebted to another organization which is experiencing financial heart burns, and that is the Arctic Institute of North America. Our Newsletters are typed there, and John Sater has been very lenient with us in letting Ruth Siple do the typing. So join the AINA, and help support the Antarctic Society! The address is University Library Tower, 2920 - 24th Ave. N.W., Calgary, Alberta, Canada, T2N 1N4. Dues are \$15.0i for regular members, \$7.50 for retired persons, students, or non-North Americans.

. . . . .

When the Russians were in town last month, Anna Minevich thought she had better call up the leader of their delegation (who is a prominent member of their Arctic and Antarctic Research Institute) and tell him that she was visiting with Morbert Untersteiner. Before Anna could get half way through Norbert's last name, the Russian said emphatically, "Come back to the hotel immediately". Those Russians can sure smell out when one of theirs is in danger!

. . . . .

The XV meeting of the Scientific Committee on Antarctic Research (SCAR) was held in the shadow of Mount Blanc at Chamonix, France, May 22-26, 1978. The twentieth anniversary of the organization was marked with the first growth in membership: Poland and West Germany were added to the original 12 member countries. The next SCAR meeting is tentatively scheduled for August or September, 1980 in New Zealand. Way to go, fellas!

. . . . .

Steve Ackley of CRREL is about to leave for the ice on an interesting mission. He is going to attempt to put some data buoys in the Weddell Sea, some on the sea ice. The C-130 will fly across the continent from McMurdo, refueling at Byrd.

STILL MORE BERGY BITS

Proceedings of three SCAR symposia (polar oceans, Montreal, 1974; biology, Washington, 1974; and circum-Antarctic marine geology, Sydney, 1975) have recently been published. Three others (glacial history and paleoenvironment, Birmingham, 1977; geology and geophysics, Madison, 1977; and polar atmospheres, Seattle, 1977) are in preparation. Future symposia are being planned on meteorology (Canberra, 1979) and glaciology (Columbus, 198

. . . . .

Our Memorial Lecturer of last spring, Dr. J. Murray Mitchell, is taking his forthcoming trip to the South Pole real seriously. He is having a minor operation on his leg (varicose veins) as a precautionary measure.

. . . . .

Although this does not pertain to an Antarctic, it is such a good story that it merits being told to all you good folks. And it is true. A well known Russian academician was a house guest in Washington at one of our bureaucracy's top climatologists, and our man thought that his guest should be treated to a little Americana. So he took him to MacDonald's, they ordered Big Macs, french fries, and drinks, and then sat down to eat. But the Russian didn't eat - he sat there speechless. Our man said to him, "Is something wrong?" And the famous Russian said, "No, but how do you get the girls to work so hard? They would never work like that in my country". He was told, "It is the difference in the systems in our countries; if our girls do not work hard they will be fire in the morning. In your system you have total employment, but no one really puts out". The Russian thought a minute and then agreed with his host. How about that, sports fans

. . . . .

Sophie Dales will get to the Antarctic again on another Lindblad tour from mid-January to mid-March. Bon Voyage, Sophie! ..... So members, please be sure to mail your dues to the Arctic Institute address as indicated on page 2 above the form. Thank you!

# THE ANTARCTICAN SOCIETY

NOTICE

OF

MEETING

Wednesday evening, January 31, 1979

8 p.m.

Board Room 543, National Science Foundation  
18th and G Streets, N.W.

A MOST TIMELY PRESENTATION

ON

SATELLITE OBSERVATIONS OF ANTARCTIC SEA ICE

by

Dr. Jay Zwally

NASA Goddard Space Flight Center, Greenbelt, Maryland  
(Formerly of Office of Polar Programs, NSF)

WASHINGTON POST, January 8, 1979 .... "Formation of Antarctic sea ice is being watched closely by weather satellites".

COME AND HEAR AND SEE HOW "CLOSELY" CLOSELY CAN BE!

# THE ANTARCTICAN SOCIETY

Kenneth J. Bertrand, 1910-1978 - A Profile

Ken and I were colleagues and close friends for more than 40 years. But then, he was always everyone's friend, giving of himself without reservation or thought of personal gain. When I heard Sir Vivian Fuchs comment in a 1964 lecture that despite all the newfangled machinery and equipment the one indispensable ingredient in Antarctic exploration is absolute and transparent integrity, I thought of Ken.

The fact that he captained the Wisconsin cross country team in his student days helps us understand his subsequent career. Cross country is no glamour sport, it's a character builder. Run over stamina-testing courses largely devoid of spectators except at start and finish, each runner has to do his utmost on his own, for the team score is the sum of individual performances. One has to be unusually dedicated to succeed in this sport as Ken did.

After completing residence requirements for the doctorate at Wisconsin he joined me and another geographer at Oklahoma State in 1937, where he finished his dissertation and got his degree from Wisconsin. Characteristically, he volunteered to coach a cross country team for OSU and developed one good enough to take a shot at the national title. He took no pay except satisfaction.

When World War II intervened he volunteered for that, too, but wasn't accepted because of imperfection in his bite. It shouldn't have mattered; he would never have bitten anyone anyway. Consequently when I assembled a BGN (Board on Geographic Names) staff to provide some millions of names posthaste for wartime maps and charts he welcomed the chance to have a part in it and joined me again until the end of the war. In September 1946 he joined the faculty of the Catholic University of America. A devout Catholic, this was not just a job, it was the fulfillment of a dream. He chaired the Geography Department until his retirement in 1975.

In his last half year at BGN he was the staff man for a special committee that had been appointed on 23 July 1943 to tackle the chaotic and ticklish problems of Antarctic names. The committee members were W.L.G. Joerg, Capt. Harold E. Saunders USN, and for a few months Lawrence Martin, all of whom had worked extensively on Antarctic exploration history. CD agreed that Ken would take the Antarctic as his special research field, and the shift from BGN to CU didn't cause him to miss a beat. To have his sources handy he began amassing a private library on the area that grew to more than 500 volumes and includes some rare items secured by having a standing order with a London bookseller.

When BGN received statutory authorization in July 1947, thus becoming legitimate at the age of 57, the special committee became the Advisory Committee on Antarctic Names. In October 1947 Ken was made a member and in 1962 became chairman. When new government regulations in 1973 complicated life for any advisory committee that had even one non-government member, Ken promptly and quietly resigned to simplify the committee's work.

The enormous difficulty of the Committee's task in the beginning has already been related in print. In point here is the fact that the committee for three years actually met two or three half days a week, and for six more years at least one half day a week to go through all available literature, records, notes, photographs, maps, fitting things together piece by piece. Some semblance of order had to be introduced at the start, so Ken and I drafted a statement of policy and procedure guidelines that was refined through discussion in committee meetings with several Antarctic explorers, then accepted, implemented and widely copied by other countries either verbatim or with slight modifications. It helped the committee to be objective in its recommendations and to defuse emotional situations. It also helped initiate a period of wholehearted cooperation with foreign institutions and explorers, a decided turn-around contributing to a climate in which Antarctic treaty negotiations could later take place. Another of Ken's notable early contributions was the compilation of the first reasonably comprehensive catalogue of Antarctic expeditions, identifying dates, leaders, commanders, sponsors, ships and their captains, and areas of operation. This sounds easy but really wasn't.

Before the treaty talks came into the picture the Department of State set about preparing a white paper that could bring together the bases of territorial claims if any were to be made. As the compendium grew an editor was needed and Ken was chosen. After the treaty the white paper wasn't needed, and since it seemed a shame to waste all that effort Ken was given permission to seek a private publisher. He felt that before publication further effort should be made to locate missing critical information on the period of the sealers and early sightings of the continent. He made numerous visits to likely sources up and down the east coast and traced every lead he could uncover, adding significant new material. He also addressed the problems of illustration and index. The American Geographical Society published the book under the title Americans in the Antarctic 1775-1948. It received highly complimentary reviews all over the world. Ken got no money out of the publication, didn't expect or want any.

He continued research and writing to the very end. In the course of his work he became more and more impressed with the American, James Eights, first scientist in the Antarctic, impressed enough to write a nearly completed article about him. On a recent trip to New England he and his wife, Leone, detoured to try to locate Eights' burial place. They looked at every grave marker in three cemeteries, in pouring rain at one of them. Cross country men run in all weathers. Scholars do not fail to run down leads. Ill health never deterred him. Severe colitis for years dictated drastic dietary restrictions until an ileostomy put him back in condition. He made his first visit to Antarctica after that, in 1962. His next visits were as lecturer on two Lindblad cruises, in 1977-78. He returned from the second one ill with what turned out to be cancer. He bounced back from surgery and radiation to resume normal activities, and was optimistic almost to the end on 17 December 1978.

In his retirement year the students at Catholic University dedicated the yearbook to him. The Board of Geographic Names gave him an Outstanding Service Award, the only one it ever bestowed, and presented him with a picture of the Bertrand Ice Piedmont. The Association of American Geographers cited him for meritorious contributions, the Department of the Interior gave him a rare Public Service Award, all of us gave him what he appreciated most - love and friendship. Father Theall of Catholic University said at the funeral that Ken was more than a gentleman and a scholar, he was literally a gentle man. In truth he was, and rich all his life in the ways that really matter. He left those riches to us; we are all richer for having given him our friendship.

Meredith F. Burrill

BERGY BITS

We are deeply indebted to Pete Burrill for the Memorial Profile for our much loved and respected former president who put up a most courageous fight to the very- end on the 17th of December. Pete was especially close to Ken down through the years, and was the right man to do the profile. The Antarctic Society presented Ken in mid-November with a copy of Eliot Porter's Antarctica, and I'm sure he must have enjoyed looking at the beautiful pictures of Antarctica. Dr. Bertrand was pure grit down the home stretch. He removed a wall in front of his home last summer and graded the lawn to the street --a hard job for a young man, let alone one suffering from cancer. Although hospitalized with internal hemorrhaging in November, he insisted on being allowed to come home so that he could vote in the fall elections. Quite a fellow, Ken Bertrand. The Antarctic Society meant much to him, and this was reflected in the essays on Antarctica which he carefully prepared for our newsletters when he was our President. He was able to come to our October meeting, and this was truly a memorable meeting with Mary Alice McWhinnie. We have asked his widow, Leone, to fill out her husband's term on our Board of Directors. She too is a true Antarctic, and he will live on in the Antarctic Society through her and his many friends. Nearly 20 Antarciticans attended his funeral, one which was attended by a multitude of friends from all walks of his life.

. . . . .

Wasn't Admiral Black just great! Gerry Schatz told Ruth Siple that he was straight out of the 19th century -- a real romanticist. Everyone agreed that he did a great job, and it was a beautiful trip through his many Antarctic expeditions. A real pro with regal-like dignity. And the wonderful home baked cookies and bread were provided throuc the generosity and culinary talents of Ruth.

. . . . .

Our attendance has been up this year but we can always handle more. Come on out and hear Jay. Bert Crary has heard his presentation and gave him a 4-star rating. Parking is no problem in the evening around NSF. What better way to end the month than to come to the meeting and learn something about a subject which is becoming a red hot item among polar scientists!

. . . . .

What's a humanist? I thought at first it had to be someone who was not a supervisor, then I thought that perhaps it had to be someone who was not a husband. Anyway, the National Endowment of the Humanities is looking for someone for either three months, six months, or twelve months to do whatever humanists do and they want them to do it in Antarctica. It wasn't quite clear from their letter what they were looking for, as they mentioned U.S.-Soviet and international law scholars among appropriate kinds. I think it would be just great if they gave the stipend to a rookery of Adelie penguins so that they could fly around the Antarctic and visit the various stations and do unto people what people have been doing unto them in the name of science for all these years. Can't you see Ken Moulton walking around with a transmitter strapped to his chest, a color coded numbered identification collar around his neck, and a brand on his backside! Penguins have a long-standing interest in humans and human behavior, and I think it is about time that we got a birds-eyeview of how humans must appear to the local indigenous population. Although the closing date (January 2, 1979) is past, they may still be looking for their "person". If you are an interested humanist, call Dave Coder or Joe Neville at 202-724-0333. Maximum stipends are \$5,000 for three months, \$10,000 for six months, and \$20,000 for twelve months.

. . . . .

The National Endowment for the Arts will also be involved in the venture, but we do not have a letter from them. It's a great opportunity for some artist to get an expense paid trip to the ice, plus a wallet full of greenbacks.

MORE BERGY BITS

The WASHINGTON POST does not have any such motto as "All the News that's Fit to Print" they publish anything which anyone on the street walks in and wants to sell to them. They bought an article early in 1979 which pertained to about 6,000 tons of radioactive soil supposedly being on a ship locked in the ice off McMurdo. The long article was full of such gross inaccuracies that it is our understanding that the Navy won't even bother to make comment on it. The editor of the POST has told the Navy that they are extremely embarrassed by the article. There is no ship in the ice with any radioactive material on it, in fact, the ship to get the last 300 cubic feet of soil was still at dockside at Port Hueneme waiting to depart for Antarctica at the time the article was published. The article quoted the Executive Secretary of the Polar Research Board, one of our more handsome overweight members, and the authoress had never even bothered to call this person. I talked to Lt. Commander Alan C. Johannesmeyer, nuclear physicist at Port Hueneme who has been involved with the moving of the material from the site of the nuclear plant at McMurdo, and he assured me that its radioactivity is so low that it does not require any special handling for transportation. It is 50 times below the lowest specific activity figure requiring handling precautions. Alan quieted his mother's fears last year by telling her that he would be subject to greater radiation taking a sun bath in his back yard than he would if he slept on the soil on its way back to the States. Alan is a nephew of our previous president, one Ruth Johannesmeyer Siple. Incidentally, before he got off the line he wanted to say that he did not share the same feelings about the beauty of the Antarctic as those expressed by his Aunt Ruth. He spoke of his great disappointment on coming up from Williams Air Field and expecting to see a beautiful pristine McMurdo! I felt like telling Alan the obvious, that his aunt is one truly beautiful person, one who is ugly blind, who can only see great beauty in all people, in all places, and in all happenings. Incidentally, Alan's father, Chuck (Ruth's brother) is shooting for a pentathlon world record in the North American Masters this year where he will compete in the 60-64 year old bracket. He has been the champion in the 55-59 age group in four of the last five years. He holds the U.S. record for the 60-65 age group;- 2,924 points, and goes for the international record this year. This is something which he got interested in when he took up jogging and aerobic exercising in 1967. He is one of four boys which his good wife, Ev has had to bring up, and this is the first year in decades which the local Catholic church basketball team in San-ford, N.C. has not had this easy-going Protestant as a stalwart to their offense. Ev has had to live with a javelin in the bedroom, the discus in the kitchen, the high jump in the living room, and a jumping pit among the dogwoods. But Chuck never did promise her a rose garden. Chuck is 6'4", and like his sister, Ruth, has legs which go all the way to his armpits. Let's go Chuck, get that world record, and for you Alan, stay cool.

. . . . .

James Hays, Columbia University, told the AAAS at their annual meeting in Houston earlier this month that the next glaciation of earth will take place by 2979 A.D. and will double the ice cover over both hemispheres in less than 300 years. But before you go to the barn to dust off that beautiful Flexible Flyer you had as a kid, listen to the words of Roger Revelle at the same meeting. He told them that we might see a doubling of carbon dioxide in the atmosphere within the next 75 years which could raise the average temperature of earth 5 to 6 degrees! We're going to have nude bathing at McMurdo, you just wait and see!

. . . . .

There was another airplane crash in the Antarctic when a Russian IL-14 turbo-prop lost its port engine on take-off from Molodezhnaya on the 4th of January. Three people were killed in the crash. The United States dispatched a C-130 from McMurdo which went to the South Pole, refueled, and went on to Molodezhnaya to pick up five others who had been injured in the crash. They were evacuated to Dunedin, N.Z. where one of the survivors was reported to be in serious condition.

. . . . .

A U.S. helicopter crashed at Darwin Glacier station on the 8th of January. One scientist and two crew members were injured, none seriously - just broken bones. The helicopter is a total loss.

MORE BERGY BITS

The drilling programs at J-9 on the Ross Ice Shelf have had very successful seasons. The Americanized Russian, Igor Zotikov, was able to obtain a complete core through the ice, one of 420 meters. There is an outside possibility that Igor might be back in the States in time to go to the upcoming meeting. If we could only get Christine Russell, science writer for the WASHINGTON STAR, to the meeting, we would be assured of Igor as he is her biggest admirer. Americans who have met Igor have their own Igor stories. When I first met him, I told him that my ex-wife had remarked that I was a good guy before I went to the Antarctic, and Igor replied that his wife had told him the very same thing! Ah, those wives!! Igor is going to the Cold Regions Research and Engineering Laboratory (CRREL) for five months. I did not realize that the Corps of Engineers was ready for Igor. I know their commanding officer, Al Devereaux, and I think Igor will be good for him! -- Browning has had good luck in their drilling programs, and have made two bore holes. Peter Webb, University of Northern Illinois, has retrieved a 125 cm core from the sediments on the ocean floor beneath the ice and water. They have captured over 4,000 anthropods.

. . . . .

Our last Newsletter mentioned that Steve Ackley of CRREL was going to the Antarctic to deploy some data buoys in the Weddell Sea. Steve is back home, the buoys (six in number) have been deployed and they have just begun transmitting meteorological-oceanographical data to NASA. Eight more buoys will be set out by the POLAR STAR when it gets into the area later this season. Steve said that they had just a delightful thirteen consecutive hour flight all the way across West Antarctica, over the Weddell Sea and then on into the South Pole - with one hour of fuel left in the tanks. They arrived at the Pole totally "pooped" and after quick refueling, both gas and coffee, they continued on down to McMurdo Sound. He said that the seventeen hours' flight with one stop may have constituted a record distance-time for a single scientific mission.

. . . . .

There were some political type problems between the Chileans and the Argentines which affected the waters where the HERO could and could not go. It resulted in the HERO having to go all the way to Montevideo, with its summer work being several weeks behind schedule. The National Geographic Society was going on the HERO to do a study on Mary Alice McWhinnie and her research. Unfortunately the NGS coverage had to be scrubbed. I think the Antarctic Society should make Mary Alice its Pin-Up Girl of the 1970's. She is fantastic.

. . . . .

There is good news to report. The new Siple Station is running ahead of schedule, and everything looks good for the station being occupied this year.

. . . . .

We understand that the flights of the Royal Australian Air Force from Christchurch to McMurdo were the first such flights ever for the Aussies. Wonder how many kegs of beer the blokes had aboard?

. . . . .

Dwayne Anderson is leaving the Division of Polar Programs at the National Science Foundation at the end of this month. This former polar scientist from CRREL at Hanover who has been Chief Scientist in DPP for several years is leaving to become Dean of Faculty of Natural Sciences and Mathematics at the State University of New York at Buffalo. We have all heard that old acorn about Deans ending up losing their faculties, but we wish him well, even though he never became a member of our august organization when he was in DPP!

MORE BERGY BITS

Another person going somewhere is Guy Guthridge. He and his tennis playing bride are going to the Bahamas to do a little scuba diving, some sunfish sailing, and an occasional set of tennis. We are deeply indebted to Guy for much of the material in Bergy Bits. He gives us the facts, and then we misuse them. Guy is a real co-operative fellow, and we would be lost without his support.

. . . . .

We are gratified at the many early returns on the 1978-79 membership drive. Several have been a little bit miffed at my heavy handedness in trying to collect past dues, but I never promised finesse when I said that I would be a candidate for president. I have written personal letters trying to soothe some of the ruffled feathers, and hope to come out of all this with only a few black and blue spots. One thing which has confused members is that our membership is not on a calendar year, that it is similar to an academic year. We start in the fall and conclude with our Mid-Winter Day summer picnic somewhere around June 21st. There have been some late billings in the past, and this has led to the confusion. But we aren't going to be hard-nosed and zap memberships from people who have been in good standing over years and have missed a year or two recently. I have been trying to get those good people who have not paid for many years to divvy up, and I have treated admirals, doctors, lawyers, scientists, tourists, and friends alike. The returns have been gratifying, and we had over 125 paid up by the first week in January. Also many have taken advantage of the current three dollar rate to sign up for the long run. One man, a former president of this Society, sent in fifty dollars for his and his wife's memberships. Ron McGregor of ONR took the bit in his mouth and sent in dues for eight years! Captain Edwin MacDonald is in good standing for five years, and one of our new members, Ed Roos a former member of the Byrd Antarctic Expedition, 1928-30 and 1933-35, signed up for three years.

. . . . .

One of the things which we are trying to do is to get some essay type articles for your edification and enjoyment. One of my ex-roommates at Little America V decided on his way to getting his doctorate in meteorology that he really wanted to be a man of the cloth. He is now a minister in upstate Minnesota where he ice fishes, drinks a moderate amount of beer, and is a national leader in ecumenical work between the Lutherans and Jews. He is a delightful man (just became a member) and I think he might have some interesting comments on the humans, near-humans, and would-like-to-be humans who end up in Antarctica. I asked the lovely Marybelle Bentley if she would write a treatise on what it is like to be a typical, average, mundane, girl-next-door type Antarctic wife who is left behind in cold Wisconsin each winter while her husband does God knows what to all that ice in Antarctica. But she wrote back she wouldn't touch that subject with a ten foot pole, not knowing what in the world I might do with it. She knows me! She wrote, "Numbing as it is, I will take my secrets to the grave". Good on her. But I am sure I will hear in due course from dear Margaret in New Zealand and she will have a message for all us men. I am hoping to get an article from Dick Chappell to put in the Newsletter announcing the meeting with Scout Mark Leinmiller. Mark has evidently had a good summer in Antarctica, having spent the working portion with George Denton's group from the University of Maine. He is now visiting the variou U.S. bases and should be home sometime around the first of February. He sent Ruth a cachet from the South Pole on New Year's Day, which included a nice note closing with "Love ya, Mark". You've got to watch those Explorer scouts all the time. Can't trust them.

MORE BERGY BITS

One of our newest members is Kennard Bubier, who was an aircraft mechanic with Commander Byrd on the First Byrd Antarctic Expedition. He was a sergeant in the Marine Corps at the time, and he came out a light colonel. This success story is nothing compared to the great tribute that Byrd paid him in LITTLE AMERICA. He said that Ken was the diplomat of the camp, that his ambition was to make things run smoothly, that he backed up orders with an aggressiveness which was so slickly applied that it seemed gentle. He must have been a great man to winter over with, and we are indeed happy to count Ken as one of our fledglings.

. . . . .

Another one of our new members, Fred Milan, professor of Human Ecology in the Institute of Arctic Biology at the University of Alaska was in town for a recent meeting of Man and the Biosphere. Fred, alias Mukluk, is head of Section 6B which pertains to people of the high latitudes. Old Fred was over in Novosibirsk for ten days, and afterwards the Russians took him as their guest to Lake Baikal. He has a damnable looking beard, so they were probably glad to send him back to Alaska. While attending meetings at Akademgorodok, a Russian approached him and asked him if he were Dr. Milan. It seemed the Russian wanted to congratulate him on his pioneering research in cold weather physiology at Little America V back in 1957.

. . . . .

Another of our new members comes from the entertainment field, Jim Zumberge of Dallas. He free lanced with his show, and was voted the hit of the summer tourist season on the Ross Ice Shelf in 1958. His hit in the Rec Hall at Little America was a rendition of a little known song - probably composed by Jim - which had to do with Lydia Pinkham's pills. After a year of keeping a stiff upper lip as the \*x!"#'\* boy scout tried to play the Wurliztr, Zumberge was as welcome at the keyboard as a fresh warm breeze from the north! Some may know Jim as a geologist, some as a job-hopping administrator, but believe me, it is as an entertainer that his light really shineth before men, pardon me, people!

. . . . .

One of our youngest members is Pete Demas out there in Studio City, California - that is, when he's at home. He was an aviation mechanic with Commander Byrd on his first two Antarctic expeditions, as well as being with the Commander in the Arctic in 1926. He has lived in and about planes all of his life, putting in 30 years with Lockheed between 1940 and 1970. He represented them on PAA's first round-the-world flight, June 17-30, 1947. He assisted in flight tests of the P2V ski airplane which led to Cdr. Jack Coley's first landing of the craft at the South Pole, was a consultant on the ski design of the C-130s, and was a flight test engineer of C-130 prototypes. He surfaced here in Washington last summer at the news conference announcing the selection of Mark Leinmiller as the 3rd Antarctic Eagle Scout. Recently he participated in a documentary film, The Arctic Adventure, which was presented at the Ontario Science Center on November 13, 1978. Wonder what this graduate of McKinley High here in Washington is going to do for an encore in 1979? This fellow actually soloed in an airplane (Curtis Jenny) back in 1925 when he was still in high school.

. . . . .

There is great enthusiasm mustering from afar about Larry Gould being our Memorial Lecturer, tentatively scheduled for Thursday evening, April 19th. It will coincide with the semi-annual meeting of the Polar Research Board in Washington. Larry evidently still has some sex appeal. Bill Field writes that "it takes dynamite to move

MORE BERGY BITS

me these days", but swiftly added that Mary started packing their bags when she heard that Larry would hopefully be our speaker. Bill is one of the nicest guys to ever carry an ice axe. It is hard to figure how a guy with an eternal love affair for glaciers can find peace and happiness in the concrete jungle of the Big Apple.

. . . . .

Bob Nichols sent a nice letter from Harwich Port. He is a member of the "Ends of the Earth". They have a New York City chapter, as well as a London chapter. Bob wrote that the most wonderful banquet which he ever attended was the annual meeting in London. This confirms comments that I had heard previously from the old sage of Fuchs British Transantarctic Expedition, one Ralph Lenton. Bob raised the question as to whether the Antarctic Society would be interested in having a joint meeting with the Antarctic Society. Sounds great, but where do we get the money - the daily double or the state lottery? Individuals interested in knowing about the Antarctic Society should contact Dr. Raymond Adie, Department of Geology, Birmingham University, Birmingham, England. Keep those suspenders up tight, Bob, as I think some of the female Antarcticans are still tracking you.

. . . . .

Speaking of women in Antarctica, Mildred Crary's article received fine reviews from you folks, and the plaudits were justly deserved. Rear Admiral David Welch wrote a very nice long letter and said that he wanted to go on record at this time as saying that the Navy welcomed the women, that the six ladies who were the first to visit the South Pole did NOT hitch a ride but were invited. Evidently they linked arms with the Admiral and all seven jumped from the back ramp of the C-130. If it had been the North Pole, would it have been Seven Up? Mildred is going to do further research on women of Antarctica, and she has been given a copy of the Admiral's letter. The Admiral pointed out that Lois Jones and her crew worked in one of the dry valleys and that the valley will forever more be known as "The Valley of the Dolls".

. . . . .

Anna Minevich keeps creeping into print here in Bergy Bits, but if you knew Anna you would not begrudge her the ink. Besides, she wrote that I was a great writer, and I like people who have the audacity to tell a lie. Anna sent me some lovely polar stamps, including a 4 kopec stamp of a beautiful emperor penguin with a chick, a 3 kopec stamp of a snowy petrel, a 10 kopec stamp of an elephant seal, and a 20 kopec stamp of a large walrus. She also included a cachet from North Pole-23 which was cancelled on July 16, 1978, which was the date when the ice island got closest to the Pole (89°55'N).

. . . . .

George Llano is on the lecture circuit, going to the Antarctic at the end of this month on a German ship, the WORLD DISCOVERER sailing out of Miami. He is going to give three lectures a day. I'm glad I'm not going on that cruise. It's not that I wouldn't enjoy old George, but three times a day would seem like going back to college. Imagine paying out all those thousand dollar bills and not being able to enjoy your cruise because of class work. The WORLD DISCOVERER is sort of a poor man's Lindblad, although you still need a sizable check book. George has a daughter with great big brown teddy bearish eyes who just got her Master's degree from Georgetown. She and the rest of the family have good sense and wanted George to retire to that great state of Maine. But George has his priorities sort of twisted and has bought a place in Naples, Florida. You'll be sorry, George!

STILL MORE BERGY BITS

Admiral Abbot writes that he is putting together a Dog and Pony Show on the salvage of the crashed C-130s at Dome C in East Antarctica. The title of his presentation is "And Then There Was One". He hopes there will be a sequel to this Dog and Pony Show, with money being made available in another season so they can go back and salvage #321. The Abbots are down in Mobile, Alabama.

. . . . .

We had a nice "Dear Sir" letter from Mary P. Goodwin out in Los Angeles. Usually a "dear sir" letter is almost as lethal as a "dear John" letter, but this one was a great one. This lady became Antarctic smitten back in 1951 when she audited a course in glaciology at UCLA. She bought a paper back edition of THE WORST JOURNEY IN THE WORLD for 15 cents and this started a 26 year old love affair. From a card file in a blue Edgeworth pipe tobacco tin she has built up what could be the largest private Antarctic Library in this country -- 1500 to 1800 volumes gathered from combing bookstores in London, Paris, Australia, and elsewhere. It is not certain whether her husband still has a room in his own house, but as soon as a child becomes of age, she apparently puts the kid out on the street and makes his room an alcove of her library. Her library is strong in rare books, beginning with Cook. She no doubt knows that Cook once called Antarctica "Dalrymple's Continent". Thanks for all the info, Mary P. We are going to pass it along to the Polar Center at the National Archives. Who was that professor who lighted the flame? Could it have been Bob Sharp? (P.S. The current edition of HARVARD (University) MAGAZINE has an excellent article "Captain James Cook, An Improbable Hero" by J. H. Parry, a former Navy man who is Gardiner Professor of Oceanic History and Affairs at Harvard.)

. . . . .

We have another member who is an artist, a fellow by the name of Lee Winslow Court who has the good judgment to not only live in Vermont but to spend his summers on beautiful Monhegan Island, Maine, where his son Rusty is a bona fide lobsterman. He went to the Antarctic on a tour ship, and evidently did a lot of canvases. Many of his paintings are in the Polar Center at the National Archives, but he still has some which he is interested in selling. Anyone want to buy a belated Christmas present? Contact Lee in West Townshend, Vermont 05359. Lee was slowed up temporarily by open heart surgery in March 1976, but people from Vermont are hardy old bucks and he cut himself four cords of wood in 1977.

. . . . .

Pennie Rau of Pennie Rau's Originals in Hollywood (are whatever they are really originals?) went to the ice on the Magga Dan back in 1968. Imagine paying good money to roll all the way to the Antarctic and roll all the way back on an ice breaker! They should have paid her to have gone. Wasn't that the trip where they went aground in McMurdo? Sometimes the Antarctic is just like the infantry during combat!

. . . . .

We have enough tourist types to start a rookery. Veryl Schult was on the very first tourist "expedition" to the Antarctic. It was with Lindblad in 1966 on the Lapataia. Veryl want to know who the "I" was in the Newsletter. "I" is Paul Dalrymple, and I am your current outspoken, candid president who is trying to get you all to read the newsletters and to support your Antarctic Society. Some of the other tourist members are Constance Swan from the Boston area -- it was great having you down from the Cultural Capital of the Nation for Admiral Black's presentation -- Katherine Petrin of Virginia Beach who used to come regularly to our meetings when she lived in Washington, Ruth Rogers, Miriam Free, and, of course, Sophie Dales.

STILL MORE BERGY BITS

We also have a goodly collection of presumably good inspectors, as Ernest Dukes, Kelsey Goodman, William Kinsey, and Robert Yoder were at one time or another members of the State Department inspection teams that visited Antarctic stations to see that the Antarctic Treaty was being honored.

. . . . .

I am remiss in not knowing more about a lot of you folks, but I am learning. Joe Dukert, whose name I misspelled, is the author of THIS IS ANTARCTICA, which was published in two editions. He has written about the Antarctic in the WASHINGTON POST, the SMITHSONIAN, and in LAMP. He also produced a documentary movie about Antarctica.

. . . . .

Do you know your Board members? George Watson of the Smithsonian is one of them. Dr. Watson was a US observer on the 18th Chilean Antarctic Expedition, 1963-64. He visited the American sector in 1966. He has also authored BIRD ANTARCTIC, SUBANTARCTIC

. . . . .

We don't have membership cards, Bill Pugh, but we might look into the possibility if we grow and grow and grow. We will probably go in the hole this year, as it takes about a hundred dollars to run off each newsletter. We hope to build our membership up to over 200 (last, 150). We have been mailing newsletters to close to 300, but this is coming to a screeching halt as we are dropping those who have not paid since 19

. . . . .

Albert Armstrong, an architectural engineer with the Department of Navy, Bureau of Yard and Docks, who was responsible for designing many buildings in the Antarctic, including the design of support facilities for the PM3A nuclear plant at McMurdo, the 10-bed infirmary at McMurdo, and the standby for the 1500 KW generator plant at McMurdo is recuperating from eye surgery. We had a nice letter from his wife Florence, and I am sure that all Antarcticans wish him the best.

. . . . .

Here and There: Blackie (Little America V, '57) and Kathy Bennett have bought 10 acre of land outside of East Lansing, Michigan and are contemplating building a solar house. Art "Red Jacket" Jorgensen, (South Pole '58) had the thrill of seeing his son Eric's name flashed on the giant electronic Scoreboard at Meadowlands this fall when his team went to the New Jersey championships. Art once masqueraded as a lineman at Roselle High School, but never made a tackle in three years. It wasn't all his fault though, as the guy on his right was named Roosevelt Grier and he always tackled the whole back-field of the opposing team, releasing them one by one until he found the guy with the ball. Eric comes of good athletic lineage - his mother is a mighty fine tennis player

. . . . .

We have heard from some of our overseas members. Fraser Myers sent us a letter on 31 December from Okinawa - must have been an awfully quiet New Year's Eve. Fraser wrote, "I am much indebted to Dr. Bertrand for getting me into the Society" and ends up with "All the best then from the far Pacific to you there in Washington, D.C.". One of our latest additions is Lt. Commander Paul Jacobs who was O.I.C. at Palmer in 1972. He is building up a collection of polar exploration books, and says he has many of the classics. They should come in handy on Adak in the Aleutians where he is stationed. I thought the war with Japan was over. Have I missed something?

# THE ANTARCTICAN SOCIETY

c/o Arctic Institute of North America  
3426 North Washington Blvd.  
Arlington, VA 22201

NOTICE OF MEETING  
SOMETHING NEW, SOMETHING DIFFERENT  
HEAR A DOCTOR AND GET NO BILL

DR. CHESTER PIERCE  
PROFESSOR OF EDUCATION AND PSYCHIATRY  
HARVARD MEDICAL SCHOOL

AND

NATIONAL ACADEMY OF SCIENCES' POLAR RESEARCH BOARD  
WILL SPEAK ON

A PHYSICIAN'S VIEW OF ANTARCTICA

THURSDAY EVENING, 22 MARCH 1979

8 p.m.

Board Room 543, National Science Foundation  
18th and G Streets, N.W.

Dr. Pierce is an old Antarctic himself, has been directly involved in several medical studies in the Antarctic, and might even tell how some of us got by the Navy's shrinks!

Trivia Quiz Time (requested by Pete Bermel)

1. What famous American polar scientist was a disciple of a famous geologist by the name of William Hobbs (of Hobb's Theory)?
2. What famous American scientist was born in Montpelier, Ohio, which has honored him with a display in a museum commemorating his polar research and exploration?
3. What Chief Scientist went on an unannounced, unplanned swim in Kainan Bay?
4. Which former Deep Freeze commander also went for a swim when (on an earlier expedition) he was catapulted straight into the air during breecher's buoy practice when the ships rolled in opposite directions?
5. Who was the father and who was the son involved in a man's carving his son's name into his bunk, seemingly knowing that his son would come to the ice and make a name for himself at a later date?
6. Who was Bravo?
7. What former lieutenant in the Transportation Corps in Antarctica is now one of the top men in the scientific hierarchy of Carter's administration, being on the staff of another Antarctic, Frank Press, Scientific Advisor to the President?
8. What are the names of the 11 stations which the U.S. has operated throughout at least one full year in the last 25 years?
9. Who was the first polar explorer to fly in the Antarctic?
10. The first mechanized vehicle to reach the South Pole over snow was 1) Ferguson farm tractor, 2) Tucker Sno-Cat, 3) weasel, or 4) Caterpillar D-8?
11. Who was the first Russian at the South Pole?
12. Who said to whom, "Come on down, I have some hot soup for you"?
13. What expedition summer relief arrived so unexpectedly that they caught the camp by complete surprise, climbing down a ladder and entering the camp with out prior detection?
14. Who was the first woman who wanted to go to the Antarctic?
15. What do these people have in common: Paul Blum, Ted Young, Betty Gillies, Doc Haus, and Jules Madey?
16. Two members of the Antarctic Society were members of the 3-man team who rescued Admiral Byrd from Boiling Advance Weather Base in 1934. Who are they?
17. An expedition has had Siberian ponies, an expedition has had a cow, one had a bunny who was quite well known. Who was the bunny and what was the expedition?
18. What Antarctic received a film award for best documentary film of the year? (Hint, award-winning film NOT on the Antarctic.)
19. What famous Antarctic dumped 500 fifths of Golden Wedding Whiskey through a hole drilled through the floor of his observatory?
20. What's Lapataia?

Answers on page 13

The updated listing of the names of members of the Society was prepared as a not-so-subtle reminder to those who do not find their names on the list that they are delinquent, and we will take their money at their earliest convenience. There were people who asked for our membership list, so perhaps it will make some people happy, too. If you don't like your classification, that's too bad! We just put down something which we thought would indicate who you are or were once-upon-a-time. We are NOT going to publish addresses on account of those guys and dolls up on the Hill passing something called a Privacy Act several years ago, but if anyone wants to get in touch with some particular member, we will leak the address.

We have good news, and bad news on the membership. We are over 200 at this time, which is our highest in years (maybe all time). Last year we had only 150 paid members. And I deeply appreciate the many long-standing delinquents who unabashedly have sent in checks covering their delinquent years. We still have about 40% of last year's members who have not renewed. That is the bad news. I recently saw one of our longest delinquent members in Switzerland, and I figured at the cost of a hotel and meals in that country he is going to be a tough one to corner.

We had another outstanding presentation at the last Antarctic Society meeting when Dr. Jay Zwally of NASA came back on home to NSF to give a most interesting presentation on the satellite interpretation of Antarctic sea ice. Guy Guthridge who has been with the Antarctic Society for lo these years said that it was the best presentation he had heard at the Society. Ruth Siple said she learned a new word, emissivity. We had too small an audience, but they had a great interest, keeping Jay for over an hour after the last cup of coffee had been drained. The old continent used to keep its secrets pretty well covered, but that big eye in the sky is a Peepin' Tom of the first magnitude.

Let's get out and support Dr. Pierce's talk on the 22nd. You'd be surprised how many people from out-of-town have written saying that they wish they could make our meetings. We have outstanding speakers, have a nice place for the meetings, have good cookies this year after purging the feeble efforts of the cookie mongers of yester-year, and there is ample parking, plus the subway, to make it easily accessible. Dr. Pierce's credentials are staggering. He has authored three books and written over a hundred scientific articles in professional journals. He knows more about what men are really thinking and dreaming about at night than their wives. It could be very interesting and revealing, so you Washingtonian girls had better get on down to 18th and G that evening.

Excitement continues to grow relative to Larry Gould being our Memorial Lecturer on 19 April. He wants everyone to know that his presentation will be on "MY 50 Years of Antarctic Exploration and Research". That is just the way we want it, vintage Gould regaling us with stories about the good times (and probably a few bad times). I think it will be a most memorable occasion, and we are hoping that some of the Byrd Antarctic Expedition men from 1928-30 can make it to the meeting.

We have established a committee under the chairmanship of Pete Burrill to ascertain what formal recognition will be taken by the Society to commemorate the 50th anniversary of the Byrd-Balchen flight to the South Pole. Others on the committee are Ruth Siple of the Arctic Institute of North America, Guy Guthridge of NSF, Fred Brownworth of the US Geological Survey, and Pete Barretta, retired military who is an outstanding polar philatelist.

Other people are looking forward to commemorating the 50th Anniversary of the Byrd-Balchen flight over the South Pole. The National Science Foundation, through its Public Information Branch, will release a one-minute television news clip to over 200 major television markets throughout the U.S. which will include footage of the actual flight as well as footage shot this year from a C-130 flying the same route. An eight-page brochure is being written which will feature the flight as the beginning of an era of Antarctic air exploration and research. The Henry Ford Museum in Dearborn, Michigan, home of the Ford Trimotor used by Byrd-Balchen on the flight to the South Pole, will put on a special program commemorating the flight. Don Lopez, Assistant Director of Aeronautics at the Smithsonian, is considering a special exhibit. A memorial flight to the South Pole will be made on November 29, 1979 by a C-130 carrying Navy and NSF representatives. Dennis Hansen of AUDUBON is writing an article on the Byrd Expedition which will appear in AMERICAN HERITAGE. A radio news clip will be released by NSF to major radio markets on the day of the anniversary. The Navy has indicated that articles commemorating the flight will be published in its major publications.

One of my acquaintances from the old days, Lou Casey, is Curator of Aircrafts at the Air and Space Museum, and I decided to give him a call the other day to see if they were going to do anything to commemorate the initial South Pole flight. One thing led to another, and it seems that the Smithsonian may have the Fairchild LC-2 which Byrd took to the Antarctic in 1928. I told Gerry Pagano at the Polar Center, National Archives, about Lou and his thoughts on the Fairchild, and they have been working on positively identifying the aircraft. At this point, it seems that Casey's feelings are valid. Souvenir-hungry New Zealanders evidently stripped the plane of its canvas on the ship's stopover on the way back. It is rather exciting to think that one of Byrd's planes is at the Smithsonian Air and Space center at Silver Hill. This would have been the plane which brought back Admiral Byrd and Larry Gould from the Rockefeller Mountains after the Fokker had cracked up. One of Lincoln Ellsworth's planes is at Silver Hill, and it is in excellent shape.

The current issue of MODERN MATURITY (Feb-Mar 1979) has a picture of the youthful Pete Demas, who was with Byrd on his first two expeditions and is a member of our Society. Pete has set up a mail order business for plasticizing mementos and photographs. If you want to have your medals plasticized, write Pete at 11144 Sunshine Terrace, Studio City, California 916904.

One of our newest members is meteorologist Henry Harrison of the Byrd Antarctic Expedition, 1928-30. Henry has been a tower of strength in rallying together men of BAE I. He is the official secretary for the group. We tried to get Henry up here last spring for the Memorial Lecture by J. Murray Mitchell on Climate Change, but his health would not allow it. We are sure glad to have you aboard, Henry.

There are quite a few old Byrd men in the Society. Besides Larry Gould and Henry Harrison, there are the aircraft mechanics, Ken Bubier and Pete Demas, Leland Barter, Admiral Richard Black, Bud Waite, the widow of Louis DeRoche, Eddie Goodale, Charles Murphy, Ed Roos, the widow of Arnold Clarke, Gordon Fountain, and last but by no means least, the widow of Paul Siple.

There was a recent conference in Washington at the American Institute of Architects' headquarters which had polar overtones. It was on CLIMATE and ARCHITECTURE and was hosted by the Department of Energy and NOAA. The late Dr. Paul Siple did pioneering work in this field when he presented climatic data and analyses by fifteen regions in the U.S. His research was published as HOUSE BEAUTIFUL's Climate Control Research Project. Among those who came to Washington for this conference was Arnold Court, feisty bald-headed Antarctic from the Antarctic Service Expedition who had worked with Dr. Siple on the original study.

Did you see Scout Mark Leinmiller on the Good Morning America show on 6 February? I have a suggestion for you, Mark, on what you can do with that moustache! Mark did a little sun basking on Christmas eve at McMurdo, modelled black tails on the South Pole, and was the first active Scout to ever visit Siple Station.

Did you see that cartoon about windchill in the Washington Post? A middle-age couple werewalking down the street, all bundled up, and one said to the other, "I could take the cold so much better before they discovered the windchill factor". The August 1978 issue of WEATHERWISE had an article "Wind Chill Factor Makes it Feel Colder" and the January 1979 issue of EDIS (Environmental Data Information Service), a NOAA publication, had one on "Those Chilling Winter Winds". The Miami Herald, January 30, 1979, under Action Line, had an excellent summary about Dr. Paul Siple and his derivation of the windchill factors. Gordon Barnes, who masquerades as a weather forecaster on a Washington television outlet, sent out copies of the windchill table, along with his projected guesses of winter storms, plus a large photo of himself. I feel partly responsible for Barnes, as my ex-wife was his Sunday School teacher in Bermuda. You can't win them all.

On your next weekend trip to Anchorage, you should get tickets to Terra Nova. It got an excellent review in the Washington Post, which some might say does not mean a heck of a lot. The play was said to be "one of the finest American dramas in far too long ... about a 'new land' in vivid, poetic images about Robert Scott's 1911 failure to beat Roald Amundsen to the South Pole ... complex in design, impressive for its research, Terra Nova is gripping because it explores not the ignobility of man but his aspirations". If you don't want to go to Anchorage, it is also playing in Los Angeles.

Mt. Erebus showed her indignation at some intrepid scientists fooling around on her flanks Christmas week by putting forth two volcanic eruptions on December 23rd. Phil Kyle and Bill McIntosh of Ohio State were with four New Zealanders examining the lava lake in the inner crater of Mt. Erebus. When the Old Lady erupted Warner Giggenbach of New Zealand was hit on the leg by a fragment, but was not hurt. I imagine they hot-footed it out of there in one big hurry, probably establishing a new streaking record for the Antarctic. A second eruption happened before they could get out!

Peter Anderson, formerly of the Office of Polar Programs at NSF, currently Assistant Director of the Institute of Polar Studies at Ohio State University, is working on a book tentatively entitled "The U.S. Air Force in Antarctica". He welcomes correspondence/contacts with Air Force participants and other knowledgeable people. Peter is also a Major in the Air Force Reserve and is assigned to the Office of Air Force History at Bolling AFB. Peter, why don't you contact me (664-1561) next time you're in town and see if there are enough guys like you around so that perhaps we could have a half day session sometime this fall on aviation in the Antarctic? If not, we should have you for a speaker at one of our evening meetings.

J. Murray Mitchell, our Memorial Lecturer for 1978, recently returned from his first trip to the Antarctic. He spent ten days at the South Pole where he concentrated his efforts on the operations of the Clean Air Facility of NOAA. He almost got a ride to Dry Valley, but the helicopter pilot left him standing on the ground looking up at him. Murray is a very religious man, but I imagine that a few good olde Anglo Saxon words must have spilled over his lips. He felt that five minutes was long enough to be at McMurdo. Time does not change some things! Murray is in the process of selecting three panels of experts to prepare a report on the climate of the Antarctic. This is being done for the National Academy of Sciences' Polar Research Board, and will cover the three themes which he discussed in the Memorial Lecture.

I presume that most of you have seen the February 2nd issue of SCIENCE with 11 articles on the Ross Ice Shelf Project's studies. The cover of the magazine shows equipment being lowered through the 30-inch diameter access hole in the Shelf. One which may be new to many of you is the latest GLACIOLOGICAL DATA out of the Institute of Arctic and Alpine Research at the University of Colorado in Boulder. The December 1978 issue is just out and is on World Data Center A Activities. Don't be misled by the title of the journal or the subject of this issue. It is actually readable in parts. Everyone seems to be mapping glaciers. Kotlyakov and Dreyer of Moscow have an article on "The World Atlas of Snow and Ice Resources Compiled in the Soviet Union"; and Ferrigno and Williams of the USGS at Reston have one on "Satellite Image Atlas of Glaciers". I noted that the latter comes in two parts, one on the geographic distribution of glaciers, and one on topics of glaciology and related environmental phenomena. One of our more distinguished members, Bill Field (you can pay your 1978-9 dues any time now, Bill), plus George Denton, John Mercer, and other outstanding glaciologists did a magnifique job on glacier atlases for both the northern and southern hemispheres in the past decade. I wonder if all this extra effort will be worth the time and money, although I can understand why the Russians have to do it -- we had already done it.

John Behrendt of the U.S. Geological Survey office in Denver reports that his aero-magnetic surveys showed the Dufek Intrusion in the Pensacola Mountains to be much bigger than previously thought. It is the second biggest basic layered intrusion in the world - the Bushveld in South Africa being numero uno. Those who knew old George probably think it is rather appropriate that the Dufek Intrusion is one of the biggest.

Just when you think that it is a new Antarctica, something happens which reminds one of the good old days when things used to slip through the cracks in the floor. Ian Williams achieved quite a bit of local fame at Columbus when he took a history graduate student, a taxi driver, and two glaciologists to the Antarctic back in 73-74 to study the Byrd Station Strain Net. How did those glaciologists ever slip in there - had to be a mistake! Ian is back at Dome C this year and his team now consists of a glaciology graduate student, a physicist, and an astronomer. Why doesn't someone write a book about the glaciologists of the Antarctic? During the IGY, Big Bert could only find one bona fide glaciologist. Well, this isn't exactly so. He found another, but the psychiatrist found him lacking!

There must be a lot of Antarctic lovers in Columbus. You would think that after the last few winters there would be no snow lovers, but the NSF-SITES (Smithsonian Institution Travelling Exhibition Services) road show "Antarctic" - a collection of Antarctic photographs by Eliot Porter and paintings by Daniel Lang - drew over 113,000 people through the turnstiles during the 30-day exhibition period the display was open to the public. Way to go, Columbus! Did Woody Hayes come through, or was he practicing his left cross to the jaw? This was second from last stop for the exhibition which ended in Tucson February 25th.

We are sorry to report that Dr. James M. Schopf, retired supervisor of the USGS Coal Geology Laboratory at Ohio State and an active member of the Institute of Polar Studies, died on September 15, 1978. Jim worked as a paleobotanist in the Antarctic during several seasons. The highest peak in the Ohio Range is named in his honor.

Society member Emanuel Rudolph is now the Acting Chairman of the Department of Botany at Ohio State. This former director of the Institute of Polar Studies is a well known polar botanist. He will continue his work as Director of the Environmental Biology Program. Wonder if he ever misses those pretty girls of Wellesley College -- my male chauvinism shows again!

Doc Abbot wrote asking if we ever knew Gus Shinn, whom he described as being about 4' 16". I actually flew to the South Pole in his R4D8 back in December 1957. Doc had an interesting story about Gus, and it is worth passing on to you as Doc writes it: "Gus had a theory about weather: - that it can't remain zero-zero at a particular spot on earth for very long. Accordingly he would blithely leap off for a destination which was reporting no ceiling and no visibility, on the notion that things would improve by the time he got there. The fantastic thing is that most of the time he made it". I think Gus had something there. He almost plowed in at the South Pole, though, on Friday the 13th of December, 1957 when he made his 9th landing at the Pole. It was pretty close to a complete whiteout, and he pulled up just before he was to hit the surface at about a 50 degree angle! He held the record for most landings in the first two years. Made six the first year. Harvey Speed had a little bit of Shinn in his flying pants. Anyone know where old Harvey might be? He was a close friend of baseball Hall of Famer Eddie Mathews. They were old beer-drinking buddies.

Continuing on the flying theme, Barry Newman reported in the Wall Street Journal on January 30, 1979 that Air New Zealand had taken some 2,000 people to the McMurdo area. The DC10s make an 11 hour, non-stop, round trip, and seem to have no trouble finding takers at \$320. Some trips even get New Zealand's most famous apiarist giving "live commentary".

The same article spoke of Antarctic daredevils. A French mountaineering couple were in Port Lyttelton getting ready to sail their 33 foot aluminum hulled sloop to the Antarctic. Besides doing it because it is there, they want to dive under an iceberg. But it is not just the French. Last year an Italian yachtsman and a journalist collided with a school of whales (who evidently did not know the laws of the sea giving the right-of-way to sailing ships). The Italian spent 73 days on a raft before he was rescued, the journalist was not so fortunate. And even the British can go astray, as eight British climbers in a converted tug were lost at sea in 1977. Barnum was right, but there are sure a lot of disbelievers.

Last month I was down on Tobacco Road, and ran into a couple of Antarcticans at an evening meeting of the Research Triangle Park chapter of the American Meteorological Society. One was Paul Humphrey, former meteorologist with Reichelderfer's era at the U.S. Weather Bureau, who played an active role in selecting meteorologists to go to the ice back during the IGY. He went down to the Antarctic several times via ships. Paul has aged about 10 days in the past 22 years, so he must be doing something right. For one thing he is retired, for another he never got married. He told me one of the funniest stories I ever heard about an incident which happened between him and one of the real big names of the Antarctic on the CURTISS on the trip to the ice back in January 1957. I called him back the next morning and asked him if I could use it in "Bergy Bits" if I did not use any names, but he wouldn't give me a release. Paul was always a cautious man! The other Antarctic was Allen (Vanda-69) Riordan, who is a professor in the Meteorology Department at North Carolina State University. Allen always looked about 16 years old, but now at the age of 33 he appears to be about 18, and you can actually detect a beard. He and Mary are expecting their first child this summer, a little Heinz (not of the 57 variety, but like his most esteemed thesis advisor at Wisconsin, Lettau the Elder).

I have had a couple of letters recently from Mike (Plateau-67) Kuhn of Innsbruck. He has been on the M/V WORLD DISCOVERER lecturing on "ice and clouds to a group of Germans and some other nationalities". He enjoyed the trip immensely, saying that the scenery was "just too beautiful not to go on deck and stand there for hours watching the scenery drifting by". Mike is still very much single, and still looking for the perfect girl. If any of you single girls are perfect, you should send

your vital statistics directly to Mike at the University of Innsbruck. But before you waste your money on an air mail stamp to Austria, let me tell you confidentially that I met one of his rejects several years ago while in Innsbruck. She looked like Grace Kelly, spoke seven languages, skied like Rosie Mittamier, figure skated like Sonja Henie, and had a personality like Doris Day. Can you top that?

Donald Finkel, who signed his letter as poet in residence, Washington University of St. Louis, says he perhaps was the first humanist to reach the South Pole, at least in an official capacity. Followers of Edward Wilson might challenge Donald's claim. It seems that when Phil Smith of our Society was in the Office of Polar Programs he conceived the idea of sending various kinds of artists and humanists to the ice. Donald was in the first series that included the painter Daniel Lang, the critic and historian Charles Neider, and photographers William Curtsinger and Eliot Porter. Donald visited Antarctica during the austral summer 1969-70. One of the results was the book-length poem, ADEQUATE EARTH, which was published by Atheneum in 1972, and which was to win the Theodore Roethke Memorial Award in 1974. Since then it has been given a musical setting by composer Robert Wykes, and performed by the St. Louis Symphony Orchestra, three choruses, and three soloists in 1975. Donald still remembered the Antarctic, and once again put his pen onto paper and ended up with another book-length poetic sequence on Shackleton's famous expedition of 1914-15 which he aptly named ENDURANCE. Atheneum was again the publisher, putting it in a double volume with a sequence on cave exploration.

Along the same general vein, Robert Yoder wrote from Springfield, Vermont about a most remarkable man who grew up in Springfield and went on to polar exploration in the Arctic, was a fine artist in his own right, and then achieved great fame as an astronomer at the Mt. Palomar Observatory, Russell Porter. Some of his water colors and pastels of the Arctic can be seen in the Polar Center of the National Archives. He loved music and composed a string quartet recreating the rhythm and shuffling of the Eskimo. He designed the Mt. Palomar portable 8-inch f1 Schmidt camera. He may be the only polar scientist who has a major crater on the moon named after him. Porter's account of some of his Arctic experiences were edited by Herman Friis and published by the University of Virginia Press for the National Archives. The original manuscript had the wonderful title of ARCTIC FEVER. It was too bad that the title wasn't retained, as I think most polar people can safely remember having such a fever. Yes, Robert, I knew Dr. Porter, knew him in his late years. He used to return to Port Clyde, Maine during some of his summers and I even bought a piece of the rock from his widow. Mr. Yoder pointed out that his biographer, Beton Willard wrote a most interesting book entitled RUSSELL PORTER, ARCTIC EXPLORER, ARTIST, AND TELESCOPE MAKER. It was published by the Bond Wheelwright Company, Freeport, Maine (home of L.L. Bean). But if you are in Freeport, don't try to find Wheelwright. It is one of those places which you just can't find, and should you get there, it is just a barn!

We had a real nice letter from Penny Rau. She wrote that the trip on the MAGGA DAN was the greatest experience of her life. I am becoming convinced that these tour ships are doing something right, because even with doubling and tripling their fares, people are fighting for reservations. We have an attorney member in Cleveland who went south with Lindblad in both 1969 and 1977, and is already booked for 1980. Our treasurer Sophie is back down on her second right now. But back to Penny who writes that she is a jewelry designer and manufacturer. For the past ten years she has been commissioned to do annually an animal for the Swedish American Line. One of her originals is of a seal group on ice. Her address in Hollywood, California is 1351 North Curson, zip 90046. She is a real good looking lady (she sent a snapshot along from the MAGGA DAN?), so you Girl Watchers in the area, drop in and check her out while you are looking at her originals!

Doc Mumford wants a party. He and Paul Jacobs were at Palmer together in Deep Freeze '72, and the two of them have tentatively set a date of 21 June 1982 for a 10th reunion. They want to get the word out "to as many as possible who were at Palmer during DF 72, Navy, scientists, R/V HERO types, FIDS from the nearby B.A.S. bases and support ship RRS BRANSFIELD". Later on he said that there was no reason to limit the reunion to just Palmer types. If anyone wants to party with these Palmerites, please contact Dr. Joel H. Mumford at 18 Chestnut Street, Charlestown, Massachusetts 02129. Rudi Honkala is an old Palmer man as well as an old Wilkes man as well as an old party man, and all you have to do to get Rudi to go to a party is to pop the cork on a bottle.

Most of you seem to be reading "Bergy Bits" and it seems worth considering as a convenient way of passing information about Society members and also getting out late news on the Antarctic. Hal Vogel is in the process of initiating an interdisciplinary Polar Studies Program at the undergraduate level at Trenton State College in New Jersey. He said that he was going to make the Newsletter mandatory reading for his students because we "should expose them to the human side of polar work. So many are becoming technically one-sided that they do not realize that man is not a machine, or an excuse for a computer". Thanks for the kind comments, Hal. Much better than what my boss said a couple of years ago about my write-ups of Softball games which I did at home at night and passed out to team members - "They should be distributed to every junior high school in the country as an exhibit on how not to write!" Bosses are crazy anyway! One thing which I am trying to do is to keep things somewhat on a low level, treating all members alike.

I had the opportunity to attend the World Climate Conference in Geneva in February, and this was a confusing pleasure. There did not seem to be too many people in agreement on any score. Walter Sullivan wrote an article in the New York Times about polar warming and the melting of the ice floes and some of the ice sheets. If you quote the right-? people, you can get some pretty distressing predictions, but if you weighed all the climatologists together, you would not be overly concerned. As long as there is ice and snow in Antarctica, it represents a water equivalent which could wipe out such monstrosities as New York and Tokyo. A polar warming would not be all bad! Also it will concern Congressmen, and result in research dollars for the Antarctic. So no one should really knock it. Among the Antarcticans seen at the Conference were the aforementioned J. Murray Mitchell, Joe Fletcher, Claude Lori us of France, and the Geneva-Mirny twins, Gordon Cart-wright and Mort Rubin. Mort has an English secretary by the name of Mrs. Nicholls who makes all the big decisions in the office and keeps him straight. When I last saw Mort he was walking with the aid of a crutch, as he had injured himself out on the ski slopes the preceding weekend. Mort should check his birth certificate, and then act accordingly. It's too late for him to become another Hans Klammer.

Oh yes, the big Russian bear, Alexander Treshnikov, head of the Arctic and Antarctic Research Institute was at the Conference. He presented one of a set of Russian discourses on stopping the arms race and armament, with the monies being put into climate research with peace and cooperation forever more. He mentioned the Antarctic as an example of how people of all nations can work and live in close harmony. We stayed in the same hotel and once walked to the World Meteorological Organization building together. His English is getting better. My Russian is limited to "Dobra Ultra" and how many times can you say "good morning" walking down Guiseppe Motta? So his English prevailed.

Readers of the New York Times on February 14th blinked their eyes at headlines which read "Climatologists Are Warned North Pole Might Melt". Actually the Pole remains intact, they are just conjecturing about the sea ice. Herman Flohn of Germany said that if the Arctic ice melts summer droughts would become frequent between 45° and

and 50° North, and John Mason of England said that a rather unexpected result would be that the mid-latitudes in the U.S. would be cooled by as much as 16° F. Washington summers become tolerable!

Four days later Walter Sullivan interviewed our J. Murray Mitchell on haze in the Arctic. Sullivan cited the rags to riches development of Murray from a hapless serviceman at Eielson flying over the hazy Arctic to a leading climate specialist sitting in a NOAA Ivory Tower in Washington. Murray was quoted as saying something to the effect that if he could just find a way to melt 9,000 feet of ice at the South Pole he could show us just as intense haze in the Antarctic as in the Arctic. Don't do it, Murray, we're willing to believe you. Besides, with women at the South Pole, we have enough to worry about without hazing.

You eligible girls who might have gotten interested in my earlier comments about Mike Kuhn can put them on a back burner. I recently visited Mike and his ex-girl friend (who, incidentally, vehemently denied ever being a reject) in Innsbruck, and Mike is starry eyed and punchy from meeting his new love on the WORLD DISCOVERER. He went to the Antarctic as a lecturer in December and January, and the cruise ship turned out to be LOVE SHIP for Michael. He found a 23 year old buxom blonde beautiful fraulein who did not know a ski from a snowshoe, and decided that this was the one he had been looking for all these years. All his previous girl friends were athletic and wore him to complete exhaustion before the sun went down. Now he is enjoying evenings again.

Another story from Doc Abbot, one of our many ex-admirals. He was confessional in his last letter, writing "I'm sort of glad the co-ed dream didn't come true until after my watch. I don't think I could stand it if some very young, very green pilot from VX-6 had gotten himself all shined up for the arrival of 'The Nurses from Marble Point' and have the nurses actually show up!" Perhaps it would have called for a deleted expletive, no?

Meteorites Galore, in fact, 309 have been discovered in the past summer by U.S. and Japanese scientists, including a 300 pound fragment. Dr. William Cassidy of the University of Pittsburgh led the U.S. team -which made collections during a three month period. Two extremely rare carbon bearing meteorites called carbonaceous chondrites were found which appear to have undergone little change since they were formed at the birth of the solar system 4.5 billion years ago. The large 300 pounder was of a metallic type and came from near the Darwin Glacier.

Everyone likes figures. What does 17-8-73 mean? Easy. Seventeen people wintering over at the South Pole, eight at Siple, and seventy-three at McMurdo. Six scientists at the Pole, three at Siple, and six at McMurdo, one of whom is the Russian visiting scientist. We also have an upper atmospheric type at Vostok. There is no final figure on Palmer as they are still with summer folks. They total 23 as we go to press, but will button down the hatches for winter with about 10. There is also a mascot at McMurdo who answers to DUNE, evidently a pup out of a litter at Scott.

Dick Cameron has joined the house boat set on the Potomac. Ever since he read about that Congressman of yore entertaining Liz Ray and Friends on his cabin cruiser, Richard has been yearning for a place on the aromatic waters of the Potomac. Just wait until the dog days of next summer when it hasn't rained for ten days and the Potomac really gets ripe. Then Dick will find how romantic it really can be, and will yearn for dear old New Hampshire.

The German magazine BUNTE for January 25, 1979 did a spectacular job of displaying some of Eliot Porter's Antarctic photos. Six double spreads, fantastic. Better than in his book. Fourteen pages in all.

## Trivia Quiz Answers

1. Our Memorial Lecturer for this year, Laurence McKinley Gould, studied under Professor Hobbs at the University of Michigan and went to the Arctic with him on the University of Michigan Greenland Expedition.
2. The late Dr. Paul A. Siple was born in Montpelier on December 18, 1908 and the Siple display is in a museum at the Fair Grounds.
3. Dr. Albert P. "Bert" Crary either tripped and fell, was pushed, or was on a hunk of calving ice shelf which inadvertently resulted in his taking a ride to sea during 1958.
4. None other than Deep Freeze's first commander, the late George Dufek.
5. Martin Ronne was the perceptive father, Finn was the blessed son.
6. Lt. Jack Tuck's dog at the South Pole in 1957, being the first dog to winter over at the South Pole.
7. Who else but Phil "Crevasse" Smith, still Washington's most eligible bachelor.
8. Amundsen-Scott, Little America V, Byrd, Ellsworth, Wilkes, Hallett, McMurdo, Palmer, Plateau, Eights, and Siple.
9. The late Sir Hubert Wilkins in 1929, who was also the first man to go under the ice in a submarine, doing it on the original NAUTILUS in the Arctic in 1931 (?)
10. If you did not say the Ferguson farm tractors, you are dead wrong. Ed Hillary put tracks on the wheels of his Fergusons at Scott Station, and drove them all the way to the South Pole in support of the British Commonwealth Trans-Antarctic Expedition.
11. Vladimir Rastorguez, who was the first Russian Exchange Scientist, wintering over as a meteorologist at Little America V in 1957.
12. Richard E. Byrd, greeting the arrival of his rescue team from Little America in August 1934.
13. Maudheim (Norwegian-British-Swedish Expedition, 1949-52) was caught completely unawares by the fresh spirited incoming relief!
14. Eve. She was very much allergic to fruit, and a recent Georgetown historian found a cassette where Eve said to Adam, "When can I catch the next C-130 to the ice?"
15. All were stalwart amateur radio operators who did yeoman service running phone patches and sending ham-grams during the IGY.
16. Bashful Bud Waite and Pete Demas.
17. Almost as famous as Harvey, Bunny Fuchs, later to become Sir Vivian, leader of the British Commonwealth Trans-Antarctic Expedition.
18. George Lowe of New Zealand, whose CONQUEST OF EVEREST beat out THE LIVING DESERT and CORONATION OF A QUEEN for the best documentary film of the year 1954.
19. The late Dr. Thomas Poulter (see his THE WINTER NIGHT TRIP TO ADVANCE BASE, BYRD ANTARCTIC EXPEDITION, II, 1933-35), who was a strong supporter of the Admiral's policy of a dry camp.
20. The first Lindblad cruise ship to the Antarctic, back in 1966 (with Very! Schult).

Each answer is worth 5 points. 80 or over and you are definitely a grizzled old explorer; 70 to 80 allows you to wear a penguin tie or scarf; 60 to 70 means that you don't really know your Antarctic men, and below 60 you should keep quiet when in the company of true Antarcticans.

We had to scrub the idea of writing "The Tales of a Living Legend" which was to be those stories which Big Bert Crary had told in his partying days. They did not seem to come out befitting a distinguished, happily married father living in an exclusive section of Northwest Washington (where his back yard neighbor is a terrible tennis player by the name of Art Buchwald). Besides, when we ran a draft across his living room, Mildred kept exclaiming, "That's not my Bert". We will use some Craryisms from time to time, but you won't be getting the real good stuff.

We tried to get Walter Sullivan lined up for the future. His reply included, "The answer is a much qualified yes. I would love to do so, but the practical obstacles are considerable. My visits tend to be unpredictable and hectic. Nevertheless, I'll keep the suggestion in mind". He went on to say that he would have really enjoyed hearing Dick Black's talk before our group.

Bouquets of thanks to Ruth, Guy, Tim, Fred, Pete, Bob and those of you who wrote in letters making this Newsletter possible.

Distribution of the drifting buoys operating correctly on 2 January 1979 in the belt bounded by 20°S and 65°S latitudes. (From GARP Newsletter, Jan.'79)

DR. LAURENCE MCKINLEY GOULD

PRIDE OF LACOTA, MICHIGAN

and

SECOND-IN-COMMAND

and

CHIEF SCIENTIST

BYRD ANTARCTIC EXPEDITION, 1928-30

**APRIL 19, 1979**

**8 P.M.**

NATIONAL ACADEMY OF SCIENCES

2101 CONSTITUTION AVENUE N.W.

WASHINGTON, D.C.

## BERGY BITS

This Newsletter highlights the Byrd Antarctic Expedition of 1928-30, or, as the boys themselves call it, BAE I. We are doing this because Dr. Gould is our Memorial Lecturer, and we know that many of you folks out there in Wichita must have a yearning to know about the men of that expedition. Seven of the eleven living members of BAE I are members of our Society, and we have six additional members from BAE II. One member of BAE I who did not want to join the Society said he did not know the names in our Newsletter and could not equate with cruise ships of tourists. He said he felt he was on the last great expedition. I think it is wonderful he feels that way about his expedition. I remember the late Dr. Paul Siple saying that once you had been there, your life would never really be the same. And it is great that most of us can look back on our time there with a warm feeling.

The information about members of BAE I came from a most remarkable man, Henry Harrison of Asheville, North Carolina. He is The Glue who keeps in contact with the men, and he periodically publishes BAE I News with comments on the whereabouts and activities of the expedition members. This Newsletter will go to all the members of BAE I and BAE II as Larry Gould was and is a Man for All Ages, not just the Quaternary and the Pleistocene. When Henry came back from the Antarctic, he and the late Victor Hugo Czegka, who served on the expedition as the chief mechanic and tool maker, toured 13 countries in Europe in a Model A Ford with a rumble seat. Henry showed great wisdom in selecting a travelling companion who was not only a mechanic, but also a U.S. Marine Corps sergeant. We are greatly indebted to Henry for all the information, and just wish his health would allow him to come up and hear Larry. Like all former meteorologists, he is a handsome man. You are doing a great job, Henry, and thanks for making news about your mates available for us to use.

For those who will be able to come to the Larry Gould Show, there will be a memorial program at the door. The National Academy of Sciences' Polar Research Board will publish the program which should make a good souvenir of an outstanding evening. Essentially it will include Larry's picture, a biographical resume, news items about living members of the Expedition, and a listing of the deceased members. We are putting this information into this Newsletter because almost half of our membership lives outside of town. For the program there will be some cutting and editing of the bio to make it presentable for the blessings of the Academy.

Dr. Gould supposedly only wears red ties, so let's make it a red tie affair that high A little ketchup will do wonders for a gray tie! Pete Demas, John Bird, Charles Murphy, Ruth Siple and Finn Ronne will be among the Antarcticans with a BAE I connection who will be there to hear Larry. We also hope that Eddie Goodale can make it.

Because the Antarctic Society normally closes its annual lecture series with the Memorial Lecture, this will be our last Newsletter until the fall. However, there may possibly be a Mid-Winter Newsletter with a blatant plea to come to our annual picnic party on June 17th. Because the Larry Gould Show on April 19th will be open to the public and because we don't want to cut in on Larry's time, this Newsletter will be the vehicle for conducting our Business Meeting. The last page is the ballot for the election of members of your Board of Directors and Officers for the coming year, and also for proposed changes in the By-Laws. Please return the ballot to The Antarctic Society at our new mailing address, c/o Arctic Institute of North America, 3426 N. Washington Blvd., Arlington, VA 22201, or bring it to the Memorial Lecture. Someone will be at the door of the auditorium to accept it.

LARRY GOULD, ALL ANTARCTICAN, 1928-1979

Dr. Laurence McKinley Gould was born in Lacota, Michigan, and this was probably the greatest thing ever to happen in Lacota. He did not stay around home very long, and became a country school teacher at the tender age of 17 in the now famous tennis resort of Boca Raton, Florida. He survived two years of teaching the whole ball of wax to kids from kindergarten through the eighth grade. Life after those two years was all downhill for one born to learn, one born to teach, one born to explore, one born to lead.

Dr. Gould was a geology professor at the University of Michigan prior to going south with Commander Byrd as his senior scientist and number one deputy, Second-in-Command, on the 1928-30 Byrd Antarctic Expedition. Following the expedition he accepted a position as geology professor at a small, delightful college with very high credentials, Carleton College in Northfield, Minnesota. Dr. Gould's light so shineth before the Board of Trustees that they elected him President of the College in 1945. And he remained in this exalted position until his retirement in 1962. But retirement was in name only, as he immediately surfaced at the University of Arizona where he found a haven in the Geosciences Department which allowed him to continue representing his country on the highest level polar research decision-making committees while teaching one of his true loves, a course entitled "Glacial and Quaternary Geology".

During World War II he took two years absence from Carleton College to serve as Chief of the Arctic Section of the Arctic, Desert, and Tropics Information Center of the Army Air Force Intelligence. The International Geophysical Year saw Dr. Gould becoming a powerful force in the planning and initiation of the entire Antarctic program. He was a member of the U.S. National Committee for the IGY, 1957-58 and was the Director of the U.S. IGY Antarctic Program. In 1956 he took leave of Carleton College to return to Antarctica to join Admiral George Dufek, Commander of U.S. Naval Support Task Force, to help supervise the establishment of the six U.S. scientific stations. He returned again in the fall of 1957 and was welcomed home by both penguins and scientists. The august International Council of Scientific Union created a Scientific Committee on Antarctic Research (SCAR) in 1958, and naturally turned to Dr. Gould to assume its presidency. He was president for seven years, and his presence is still felt through his becoming an honorary life member. In the same year, 1958, he became a charter member and chairman of the Committee on Polar Research at the prestigious U.S. National Academy of Sciences. He was its chairman for 14 years, and continues on as an ex-officio member of the Polar Research Board (which succeeded the Committee on Polar Research). Small wonder that he retired from the presidency of Carleton College in 1962, as he must have been spending more time in Washington than in Northfield!

In 1964 he was elected President of the American Association for the Advancement of Science which just happens to be the largest scientific organization in the world and whose interests span the whole spectrum of science. He was also the first Chairman of the Advisory Panel for the Office of Polar Programs at the National Science Foundation and to this date remains a consultant to the Division of Polar Programs at NSF.

He had a labor of love in 1969, when he made his fifth trip to Antarctica to not only look over the scientific programs but to lay a wreath at the South Pole on the 40th anniversary of the first flight made by Commander Byrd and his three companions. This fall Dr. Gould will go to the Antarctic for the seventh time, and will be on the commemorative flight from Little America to the South Pole on the 50th anniversary date of that epic flight.

Dr. Gould has enough honorary degrees and medals to completely cover the Beardmore Glacier. The latest edition of American Men and Women of Science shows that he has received twenty-one honorary degrees. Probably the one which gave him the most pleasure was the 20th, given to him by Carleton College in his last year as their president. Along with the honorary degree of Doctor of Humane Letters came a new jeep, a gift from his faculty, complete with a road map to some fine trout fishing waters in the rugged Wyoming mountains. They say that college deans never die, they just lose their faculties, but it is apparent that college presidents like Larry Gould make out much better. There must be one more honorary degree in the wings, as Southern Methodist University has not given him one yet. Dr. Gould's name has been synonymous with Phi Beta Kappa. He was elected to its Senate in 1964 and served multiple terms. He was vice president of the United Chapters from 1955 to 1958 and president from 1958 to 1961, and one of his suggestions led to the establishment of the \$1000 Phi Beta Kappa Award in Science, offered annually for books in the literature of science.

He has been the recipient of six distinguished medals. He was the 20th man to be awarded the Explorers Club Medal in 1959. Dr. Gould officially went onto the Gold Standard in 1930 when the American Geographical Society presented him with the David Livingston Gold Medal. It felt so good that he accepted two gold medals the next year, the Congressional Gold Medal and the Chicago Geographical Society's Gold Medal. The U.S. Navy bestowed its highest civilian honor, the Navy's Distinguished Public Service Medal, in 1957. And two years later the late King Haakon of Norway awarded him the Cross of St. Olaf. Because gold is such a heavy metal, because Dr. Gould's chest is already covered with gold, because the Antarctic Society has no gold, let alone a gold medal, we cannot bestow a medal on him. But he should know that he is dearly loved by us all, and that love is more precious than gold!

Dr. Gould is an ageless Antarctic, and an Antarctic for all ages. He is one of those few fortunate people who have been able to marry their avocation and their vocation. It has resulted in his remaining a young man in his twenties, who marches to the drums of dog teams and of penguins and of skuas, alongside icebergs and glaciers and mountains. May that beat go on and on and on - eternally.

#### Information about the living members of BAE I.

Quin Blackburn, who was sort of geologist-geographer-dog team driver on BAE I, lives in Boise, Idaho. He returned to the Antarctic on the Second Byrd Expedition, 1933-35 and commanded a three-man dog sled party which explored 1,500 unknown miles. He worked 35 years for the government, and upon his retirement from the Bureau of Land Management, Department of Interior, was presented with one of its highest awards, the Meritorious Service Award.

Jack Bursey was a dog team driver, and was severely smitten with the polar regions. He went back to the Antarctic on the U.S. Antarctic Service Expedition, where he led a three-man team on one of the longest dog sled trips in history, exploring Marie Byrd Land. He has spent 42 months in Antarctica, including three winters. He also participated in the U.S.-Canada Arctic Expedition. This retired commander in the U.S. Coast Guard Reserves, who recently joined the Antarctic Society, lives in Montague, Michigan.

Ken Bubier was an aviation mechanic, and lives in Corona Del Mar, California. He retired as a lieutenant colonel from the U.S. Marine Corps in 1953, and worked for Lockheed Aircraft for another 11 years. He is another active member of our Society.

Frank T. "Taffy" Davies was a physicist on the expedition, and this elder statesman of the polar regions lives in Ottawa, Canada. His geophysical research took him to the Arctic several times where he conducted extensive field research. He is a member of the Explorers Club, the Scott Polar Research Institute, a Fellow of the Arctic Institute of North America, the Greater Circle of Ottawa, and, naturally, the Antarctic Society.

E. J. "Pete" Demas was an aviation mechanic on BAE I, and when this man stops long enough to unpack his bags, his home is in Studio City, California. Pete was very close to the Admiral, and was the only man to accompany him on all of his expeditions - North Pole, Transatlantic, and the first two Byrd Antarctic Expeditions. He was one of three who rescued the Admiral from Boiling Advance Base in 1934. After his Antarctic expeditions, he worked for many years for Lockheed. Another member of the Antarctic Society.

Eddie Goodale was one of the Harvard boys who went to the Antarctic with Commander Byrd as a dog team driver. He served as a member of Larry Gould's geophysical exploration party into Queen Maud Mountains, where he and another Harvard man had to suffer in silence when Larry's alma mater, Michigan, beat Harvard while they were on the trail. Eddie remained active in the Antarctic working as the USARP (U.S. Antarctic Research Program) representative in Christchurch, New Zealand. He lived through this terrible ordeal, has retired to two places in Maine and one in Alabama, and is an ardent sailor. He was a member of the Antarctic Society, but his stop-and-go type existence seems to find him one step ahead of our Membership Chairman.

Larry Gould. What can be said that you don't already know? He has done it all. His bio appears in some detail elsewhere in this program.

Henry Harrison was a meteorologist on the expedition, and he put his meteorological knowledge to good use in choosing Asheville, North Carolina as his retirement home. After working five years for the Weather Bureau, he joined United Air Lines and worked for them for 34 years. Yes, he is a member of our Society.

Howard Mason was a radio operator on the expedition and worked in civilian life as an electronic engineer. He retired in Seattle in 1966 and his hobby is pipe organs. Latest report is that he is hale, hearty, and handsome.

Dean C. Smith was one of the pilots on the expedition and now lives in Los Angeles. He flew for United Airlines, then American Airlines, and then became an employee of Hughes Tool. He was a Public Relation Consultant for Douglas Aircraft. He and his wife were guests of Air New Zealand on its inaugural DC-10 flight from the west coast to New Zealand.

Norman Vaughan was born for the dogs. He drove them in the Antarctic, he drove them in the Jimmy Carter inauguration parade, and he still races them in Alaska. He lives in Anchorage where he works for the University of Alaska. He distinguished himself during World War II doing rescue work for the U.S. Air Force in northeastern Canada.

In addition to the above wintering-over expedition members, there are several living members of the crews who served on the "City of New York" and the "Eleanor Boiling". John Bird lives here in the Washington area, making his home in Great Falls, Virginia! Leland Barter and Ed Roos are both members of the Antarctic Society - Leland lives

in Mount Holly, Vermont, and Ed lives it up at Cocoa Beach, Florida. Alan Innes-Taylor is the Sage of the Arctic, living in Whitehorse, Yukon Territory. Carroll Foster still makes his home in Reykjavik, Iceland. And, last but not least, Richard Konter is in his late nineties living in Brooklyn.

And lest we forget -

The departed members of BAE I (in alphabetical order).

Alexander, Clair D.	Mystery man of expedition, whose name was rumored to be a pseudonym. Vanished after expedition.
Balchen, Bernt	Chief pilot and Third-in-Command. Died of cancer at Mt. Kosco, New York, on October 17, 1973.
Black, George H.	Storekeeper. Died of lung cancer, Fort Carswell AFB, Texas, on July 28, 1965.
Braathen, Christopher	Dog team driver. Reported killed in airline accident in Norway.
Clarke, Arnold H.	Assisted physicist, meteorologists, and cook. Died of heart attack at Mt. Kisco, New York on March 12, 1976.
Coman, F. Dana	Doctor and surgeon. Died near Ft. Churchill, Canada while carrying out field experiments in January 1952.
Crockett, Frederick E.	Dog team driver. Died in Boston, Massachusetts on January 17, 1978 following heart surgery.
Czegka, Victor Hugo	Chief mechanic and toolmaker. Died in Ipswich, Massachusetts on February 18, 1973.
de Ganahl, Joseph	Dog team driver. Died at an early age, no details.
Feury, James A.	Fireman. Died of cancer at Paterson, New Jersey on December 30, 1977.
Gould, Charles F. "Chips"	Carpenter. Died many years ago, no details.
Haines, William C.	Chief Meteorologist. Died about 1952.
Hanson, Malcolm P.	Radio operator. Killed in airplane accident in Alaska early in World War II.
June, Harold I.	Pilot. Died on November 22, 1962.
Lofgren, Charles E.	Secretary to Commander Byrd. No details on death.
McKinley, Ashley C.	Aerial photographer. Died at Belleair, Florida on February 11, 1970.
Mulroy, Thomas B.	Fuel engineer. Died in New Orleans, Louisiana, June 1962.
O'Brien, John S.	Dog team driver. Died of cancer in mid-1930's. New
Owen, Russell	York Times correspondent. No details of death.
Parker, Alton N.	Aviation pilot. Died of heart attack in Miami, Florida during World War II.
Peterson, Carl O.	Radio operator. No details of death, but apparently at early age.
Ronne, Martin	Sail maker. Died, in 1932.
Roth, Benjamin	Aviation mechanic. No details on death.
Rucker, Joseph T.	Photographer. No details on death.

Siple, Paul A.	Boy Scout. Died in Arlington, Virginia on November 25, 1968 of a heart attack, having suffered a severe stroke two years earlier.
Strom, Sverre	Handy man. No details on death.
Tennant, George N.	Cook. No details on death.
Thorne, George A.	Surveyor, dog team driver. Died while flying his own plane in the 1930's.
Van der Veer, Willard	Photographer. Died in 1963 or 1964.
Walden, Arthur T.	Chief dog team driver. Reportedly died shortly after returning from Antarctic.

And some other distinguished Antarcticans who have passed away in recent years.

MacDonald, William	Cartographer who planned U.S. Navy aerial photographic flights over a million square miles of the Antarctic for mapping purposes. Died on November 9, 1977.
Poulter, Thomas C.	Second-in-Command, Second Byrd Antarctic Expedition, 1933. Died on June 14, 1978 of heart attack in Menlo Park, Calif.
Wade, F. Alton	Geologist, Senior Scientist, U.S. Antarctic Service Expedition, 1939-41, and President of American Polar Society. Died on October 1, 1978.
Roberts, Brian	Ornithologist, British Graham Land Expedition, 1934-37 and Head of Polar Regions Section, Joint Research Department, Foreign and Commonwealth Office. Died in England on October 9, 1978.
Bertrand, Kenneth	Geographer and Antarctic historian, and Past President of the Antarctic Society. Died on December 17, 1978.

#### BERGY BITS continued

The Society has had a pretty good year membershipwise, although we probably won't hit the pre-season goal of 250 paid members - we are 15 short as this is being typed. We have about 40 delinquents. Some are famous becoming infamous. We never would have come out in the black this year if we had not been quite successful in collecting past dues. Of the people who had been delinquent over a year, there was only one who paid who did not pay his other past dues. We picked up \$258 in dues for 1975, 1976, and 1977. Our paid-up membership of 235 is 85 above what we had for last year. We have picked up 34 new members, recruiting some and some finding us. But for all you people who have paid, have a peaceful and restful summer! And if you are a delinquent, and you still love us, you had better come aboard fast as the dues are going up (see the ballot).

Our Society has had excellent speakers all year, starting with Mary Alice McWhinnie, then Admiral Richard Black, followed by Jay Zwally, and Chester Pierce, with Larry Gould waiting in the wings. That's a powerhouse team of All Antarcticans. I was happy to see a goodly turnout for Dr. Pierce, with many new faces in the audience.

One of the real nice things about the meeting was that people hung around after the talk and questioned Dr. Pierce at greater length or met with their friends. We had twelve for the Board meeting preceding the regular meeting, and this was our largest Board turnout in the last couple of years. I certainly appreciated the great turnout by the Board and the Society members who came to the lecture. Dr. Pierce was all that I had: heard he was, and it was a great change of pace. I was glad that he stopped before he said something about people wintering over being slightly off their rockers.

We have some new members of late, most of whom were most welcomed, my ex-roommate at Little America V being the exception. On the form accompanying his check, he filled in the blank after what he wanted in the Newsletter with "better grammar". One of our newest members is David Paige, who was the official artist on the 2nd Byrd Antarctic Expedition, 1933-35. Another new member from Admiral Byrd's expedition is Commander Jack Bursey, U.S.C.G. (Ret.). Still another new member is John Bird, who was on the "City of New York" 1929-30, and who lives in the Washington area. Mike "Plateau" Kuhn, our Austrian bon vivant bachelor glacial meteorologist, took time out from courting his beloved Stephany to send in enough Austrian marks to become a member. We also picked up a "head shrink" from the Navy, Captain Royce Royal, who still goes to the Antarctic as a debriefer. John Spletstoeser has been one of my favorite polar men because of his reasonable approach to solving administrative problems while at the Institute of Polar Studies at Ohio State. He put down that he would like "as little as possible" in the Newsletters. You can bet your old mukluks that we are going to erase that from John's form!

One of the recently deceased members of BAE I was James Feury who was a member of the Society until his death in December 1977. Henry Harrison wrote that he was still operating his grog shop in Paterson, New Jersey at the time of his death. He had two specialties at Little America I - the Ford Snowmobile, which was believed to be the first snowmobile in the Antarctic, and making Eskimo pies. Feury, Sverre Strom, and G. H. Black were on the trail about a hundred miles from camp when their vehicle broke down, forcing them to man-haul back into camp.

William Everett, who was the Commanding Officer of VX-6 in Deep Freeze 62 and 63, would like to hear from all VX-6 pilots that served in his command. His address is 719 NE 98th Terrace, Kansas City, MO 64155.

I have been thinking that it might be a good idea to designate the Memorial Lecture as reunion time for certain years. The 25th anniversary of the IGY will be coming up in 1982, and that Memorial Lecture could rally together men of the IGY. It could also bring together men having their 10th reunion, the old college approach on graduation day. I think it has some merit, as reunions are better while you still have the wherewithal and the desire. If we had a prominent speaker, it could be the lead off for a weekend of reverie and reunion parties. Maybe even a cameo appearance by Liz Ray. What do you guys think?

The Boy Scout, Mark Leinmiller, is back in Georgia and helping out his Dad who has been temporarily put on the sidelines with nerve damage to one of his legs. POPULAR PHOTOGRAPHY is going to run a 4-page spread of his photos in their June issue. He is also going to be shown in TECHNICAL AND FUNCTIONAL PHOTOGRAPHY, PHOTO WEEKLY, and NIKON WORLD. Mark hopes to write a book. He has done a lot of local lecturing, but has not been sent on the road by the Reader's Digest Foundation. When he is able to get away from home and is in the Washington area, we expect to have him for a special meeting. Good luck to you, Dad Leinmiller!

The Boy Scouts of America commemorated the 50th anniversary of the Byrd Antarctic Expedition, 1928-30 with a week long, cold weather program called OKPIK in northern

Minnesota at the Charles Sommers Wilderness Canoe Base, 22 miles east of Ely. OKPIK (the Inuit name for Snowy owl) hosted over 1,000 Boy and Girl Scouts this past winter. Oh, how Scouting has changed! The five Regional finalists for the Antarctic selection all went to OKPIK, and experienced colder weather in northern Minnesota than Mark did in his three months in the Antarctic! Temperatures never rose above 0°F. and it got as cold as -46°F. They lived out in the bush for three of those days. The moral of this story - be a winner and go to warm, comfortable sunny Antarctica. The patch for OKPIK is a beauty, being about six inches in diameter, showing the white Snowy owl in full flight across a blue background, with "50th Anniversary 1928 Antarctic Expedition, 1928, Admiral Byrd/Paul Siple" emblazoned around the bird. In bright red, OKPIK across the top and "High Adventure-BSA" across the bottom. We heard from the finalist Scott Miller of Santa Barbara after the winter exercise, and he still harbors hopes of going to the ice some day.

Mrs. Jackie Ronne wrote Mildred Crary a letter (and sent me a copy) relative to that part of Mildred's article which pertained to her husband's expedition in which both she and Jennie Darlington wintered over. The 2 1/2 page, single space letter is too long to put in the Newsletter, but we do want to try and present Jackie's message which is that Finn originally had no intentions at all of having his wife or Mrs. Darlington accompany the expedition. Jackie had an excellent job in the State Department and had intended to be the stateside liaison to the expedition. There were a series of extenuating circumstances, such as a belated departure from the States because of problems in arranging the ship's insurance, the ship being understrength for an ambitious scientific program, of losing a key man when Finn's dog sledging companion could not get a leave of absence, and a newspaper contract (North American Newspaper Alliance) calling for three articles a week. The women were not supposed to go beyond Panama, but Jackie wrote, "In Panama, my husband persuaded me to continue to Valparaiso, hoping to convince me to go the entire way." Further, "Those who participated in the final decision at Valparaiso, Chile were well aware, that for many reasons, I did not wish to go to the Antarctic. Even after the decision was made I was most hesitant for reasons you could not possibly be aware." Jackie feels that our Newsletter is going to becloud these facts when future historians start researching the subject. Jackie wrote that there are "many published accounts of how and why the last minute decision was made which caused me to accompany my husband on the expedition." Mildred is answering Jackie's letter, but I thought that Jackie's thoughts on the subject merited being presented in the Newsletter, as I have tried to make BERGY BITS an organ where personal views and feelings can be expressed.

Guy Guthridge just bought a 26-foot yacht. It seems that Antarciticans are attracted to the sea. We have a yacht club right in our Society, with Johnny Dawson having his tied up down by Ft. McNair, Skip Dawson's over near Annapolis, Eddie Goodale's on Penobscot Bay, and the Queen of the Penguin Flotilla, Dick Cameron's house boat, in front of Hogate's. And there must be more yachtsmen.

I don't keep in very good touch with him, but there is a medical doctor in Thomaston, Maine, a member of our Society, who was in the Antarctic some twenty years ago, and who is just the finest gentleman, Tom Dixon. He has eye problems, has had surgery on one eye this winter and will have to have another on the other eye. For those of you who may have served with him, he is still very much the Harvard man he once was and will ever be. A real class gentleman. We wish you the very best, Tom, and hope to see you later this spring.

We had a card from Mary Goodwin, our west coast archivist in Los Angeles who converts her children's bedrooms- into Antarctic holdings as soon as they are weaned. She had seen the stage play Terra Nova which we mentioned in the last Newsletter. She said it is a very good, provocative play, and that it will be performed in the Big Apple

next year. Admiral Byrd's daughter and family are close friends of the Goodwins. Sorry Mary, nothing to report on the publication date of the article by Dennis Hansen,

Peter Anderson, Assistant Director, Institute of Polar Studies, who is an authority on aviation in the Antarctic has agreed to be one of our speakers in the fall. If the Copyright Office doesn't catch up with him before hand, he promises a talk well illustrated with many old photographs. His presentation may be tied in with the 50th anniversary of the Byrd flight in November. Would be a good time to get some of the old pilots in on space available. No one has come up with an address for Harvey Speed.

We might have an early kickoff next fall. After all they play professional basketball the year around, although someone said they got July 4th off last year. So our season may be rushed to take advantage of the 10th Antarctic Treaty Consultative Meeting in Washington from 17 September through 5 October. We understand they work their tails off during treaty discussions. It would be great if anyone in the Society had enough influence to get Richard Laws, Director of the British Antarctic Survey, to speak one night while he is here.

Peter Anderson does a mighty fine job covering the Antarctic for the Encyclopedia Britannica. Those Argentines are something. They have established an immigration office and a custom house in the Antarctic. Eight families, including two pregnant women and 19 children, wintered over. Is that any way to run an expedition? You're right, Steve Corey, the good old days were the old days.

A Craryism. During the IGY Bert was the Deputy Chief Scientist for the Antarctic and in residence at Little America (Harry Wexler was the Chief Scientist and was in residence in Bethesda). A tall Texan Navy captain by the name of Willie Dickey was senior Navy man at Little America. Shortly after the summer tourists pulled out, Captain Dickey went to see Crary one night and said, "Bert, my boys don't like the idea of doing pots and pans all the time for you sandcrabs, and I don't blame them. I think the IGYs should share the kitchen duties with my Navy boys." Bert took another swig of Budweiser and looked at Captain Dickey and said, "Sounds like a great idea Willie, what do you say you and I start it off tomorrow morning?" Captain Dickey slunk out of Bert's cubicle as fast as he could, and the Navy did the pots and pans for us sandcrabs for the whole year.

Australia's Antarctic station, Mawson, celebrated its 25th year of research operation on February 13. The station, which lies 3220 miles south west of Perth, Western Australia, was established in 1954 and is the longest continuously operating station manned inside the Antarctic Circle.

Australia maintains two other stations in the ... Antarctic ... at Davis and Casey. ... Transporting personnel and equipment to and from the three stations has been the biggest problem facing Antarctic research programs. In the past access has been by ship only. However in January the Minister for Science and the Environment, Senator James Webster, said air transport might be about to usher in a new era in Australia's Antarctic operations. He was speaking on his arrival at Casey station after a 1351-mile proving flight from the United States station at McMurdo. Senator Webster flew to McMurdo from Christchurch, New Zealand, on a regular U.S. Hercules flight then on to Casey on the proving flight by a U.S. ski-equipped Hercules aircraft.

The proving flight demonstrated that air transport was an entirely feasible means of access to Australia's Antarctic outposts, Senator Webster said. There was an urgent need for Australia to improve its transport links if it were to ... increase its scientific activities ... and participate effectively in resource development.

Earlier this Antarctic summer a seven-man Australian team returned to the Casey base after four months field work reaching 620 miles into the interior of Antarctica with

temperatures down to minus 58 degrees Fahrenheit. It was the longest traverse carried out by Australians in this region since 1962 when a party travelled to [and from] the Soviet station Vostok. (Extracted from Australia Bulletin, No. 62, March 12, 1979)

Jack Anderson

WASHINGTON POST March 2, 1979

---

## U.S. Scientist Is Unsung Hero of Antarctic

In the frozen hell of Antarctica, three Australians trapped in a snow-going tractor were teetering on the brink of icy death. A young scientist, David Schneider inched his way across 10 agonizing feet of treacherous ice to their rescue. One misstep could have sent them all plunging to the bottom of a glacial abyss.

In subzero temperature, the 35-year-old government map expert extricated the three Australians from the cab of their vehicle, which was tilted over a 60-foot-deep crevasse. Painstakingly, he hauled them to safety. For his courageous exploit, Schneider is our first nominee to a modern-day Hall of Heroes, which we are establishing to honor those whose unselfish acts of valor might otherwise go unrecognized.

Schneider's challenge came on May 18, 1974. With three fellow scientists, he had set up a remote encampment on the South Pole icecap to conduct ice-drilling experiments. That day their routine was disrupted by a barely audible bleep of distress on their radio.

The faint SOS came from a three-man Australian crew out of Casey Station base camp. Their snow caterpillar had skidded and toppled across a deep crevasse, wedging the men inside the vehicle. Without hesitation, Schneider and an Australian colleague raced to their own snow cat and set off to the rescue.

A native of Wisconsin, Schneider is no stranger to snow. But the conditions that day were almost unimaginable—a "whiteout" in which all depth perception is lost and the eye can see only a few feet ahead. The thermometer read 20 below zero.

"We found them with a lot of luck," Schneider recalled. "We weren't even sure we were headed in the right direction until we came across their tracks."

On the scene, Schneider ventured on foot to the trapped Australians. They were staring from their vehicle into the frozen pit beneath them, almost afraid to breathe. The ice-glazed surface concealed other treacherous crevasses, and Schneider had to find bridges of solid snow to reach the helpless men. "You get so you can tell from the sound whether it's safe or not," Schneider explained. "If there's a hollow crunch, you figure there's a crevasse."

The slender American finally reached the disabled vehicle, canted at a 70-degree angle over the ravine. He pulled himself to a rear door, pried it open with an ice axe and threw a rope to the occupants so he could haul them out.

Schneider wasn't finished yet. The Australians' caterpillar contained \$50,000 worth of scientific equipment, so he and the others scaled down the sides of the crevasse to lash the tractor securely until heavy rescue equipment could arrive.

Only then did Schneider take the three men he had rescued back to Casey Station. Asked what they did to celebrate, the laconic Schneider told us: "There wasn't much to celebrate with. There was no liquor allowed at Casey Station, and we were allotted only six cans of beer a month."

Now working at the government's mapmaking center in Rolla, Mo., Schneider is reticent about his Antarctic experiences. "In fact, when we first sought him out, he neglected to mention a later heroic exploit during his months at the

South Pole. We learned of it from one of the three Australians he saved, Paul Varma, who headed the polar party at Casey Station.

In August 1974, the middle of Antarctica's winter, Varma assigned Schneider to lead a trek inland toward the South Pole. The expedition was caught in a punishing blizzard 120 miles out and was snowbound for 12 days.

The stranded party lost radio contact with the base camp. It was restored only after Schneider devised a way to radio another station nearly 1,000 miles away! Varma highly praised Schneider for maintaining the morale and well-being of his four companions "during this period of extreme anxiety and isolation."

When we prodded his memory on the August escapade, Schneider finally volunteered some information. "That was even scarier than the other," he told our associate Sam Fogg. "The wind was so great, we couldn't see more than six feet, and could move from one tent to another only by hanging onto guide ropes."

A friend of Schneider's told us that the modest government scientist does have an Achilles heel. As a surveyor in the Louisiana bayou country, years ago, he had a really bad time. Our nominee for the Hall of Heroes is afraid of snakes.

\*Footnote: In this age of the cynical antihero, self-sacrifice is supposedly out of fashion. But we're convinced there are many Americans who risk their lives to help their fellow man. We're looking for stories of these unsung heroes. If you know of one write to The Hall of Heroes, P.O. Box 2300, Washington, D.C. 20013.

We got permission from Jack Anderson's office to publish this article. I understand there is going to be a sequel to this story, one which will tell that the Australian government is awarding Schneider some sort of a citation or medal.

Two of our members have moved up the polar ladder. Ned Ostenso has become President of the American Polar Society and Dick Chappell a Vice President. Our congratulations to the two Antarctic IGY classmates, Class of 57,

The illustrious Jim Zumberge has an article in the January-February 1979 issue of the AMERICAN SCIENTIST. It's "Mineral Resources and Geopolitics in Antarctica." The journal is the organ of the Society of Sigma Xi. We just got a copy of it, and it is a real fine article, naturally.

If you aren't into climate nowadays, you are just not with it. A budget for a proposed World Climate Program Plan shows 260 meetings for a four year period, one every 5.6 days! That doesn't leave any time for coming home to get clean laundry. The Polar Research Board at the National Academy of Sciences has established a program on "The Role of the Polar Regions in Climatic Change." Murray Mitchell will chair the group, and they will hold their first meeting in Washington on April 12th. Their members are famous names out of Who's Who in the Polar Regions. The paleoclimatologists consist of Jim Hays, George Denton, Chet Langway and Troy Pewe. Those studying the role of polar ice and snow in global climate dynamics are Joe Fletcher, Jim Baker, Larry Gates, Uwe Radok, and Norbert Untersteiner. And then we have those intrepid glacial types who will make an assessment of the stability of present day polar ice sheets: Charlie Bentley, Roger Barry, Terry Hughes, and John Mercer. As long as that committee stays in existence and as long as they meet in Washington, we should have a wealth of talent to draw on for future speakers. Larry Gates spellbound the attendees at the World Climate Conference in Geneva in February with his smooth as silk delivery. Don't you hate guys like that who not only have talent but never put on weight and look like undergraduates? We should do some recruiting there, as the only ones we have in our camp are Mitchell, Bentley, and Langway. Joe Fletcher used to be, but he evidently found a better place to put his bucks.

When Thor Heyerdahl was asked on national TV on March 30th why he did not have women on his last sea epic, he said it would never have worked to have one woman with 11 men, that you would need 11 women. Smart man!

Another Craryism. Prior to the IGY, Bert went to Stockholm for a planning session on the Antarctic. Bert was at a table with a distinguished Russian scientist and tried to act sociable like any country boy from Canton, New York would and started talking to the Russian. He got a gruff answer, but this only slowed down Bert in his efforts to promulgate U.S.-Soviet relationships. Bert said something further on and the Russian looked at him disgustingly and said, "Look, when we talk we talk, when we eat we eat!" This was the same conference when a waitress came up to Bert after a meeting and said, "When you get back to Moscow will you tell your people that we are in sympathy with you?" As most of you know, Bert had a moustache in those days and looked like a real Siberian.

Cold Regions Science and Technology will soon go to press. The first issue of this quarterly journal is scheduled to appear in May 1979. It is only \$75.50 a year from Elsevier Scientific Publishing Company, P.O. Box 211, 1000 AE Amsterdam, The Netherlands.

"Mid-Winter" picnic will be on Father's Day, Sunday, June 17th at Evans Farm Inn on Chain Bridge Road in McLean. You can also get there from Dolley Madison Highway. We have the Plantation Room from 3 to 9 p.m. There will be another announcement later, but for the time being circle June 17th.

B A L L O T

(Nominees listed alphabetically)

<u>OFFICERS</u>	(Vote for one, or write in choice)	<u>BOARD OF DIRECTORS</u>	(Vote for <u>four</u> )
PRESIDENT:	Paul Dalrymple [ ]	Barbara Honkala [ ]	
	-----	Tony Meunier [ ]	
VICE PRESIDENT:	Fred Brownworth [ ]	Lisle Rose [ ]	
	Pete Burrill [ ]	Gerry Schatz [ ]	
TREASURER:	Ruth Siple [ ]	Bill Tobin [ ]	
	-----		
SECRETARY:	Tim Hushen [ ]		
	-----		

THUMBNAILED: Dalrymple, Little America V, 1957; South Pole, 1958.  
 Brownworth, 3 summers (68,69,70) in Antarctic with U.S.G.S.  
 Burrill, Past Pres. Assoc. Amer. Geog.; Head, Board Geographic Names.  
 Siple, widow of the late Dr. Paul Siple; South Pole, summer 1975.  
 Hushen, Staff Officer, Polar Res. Board, U.S. Nat'l Academy of Sciences.  
 Honkala, Naturalist who waited for husband who wintered thrice.  
 Meunier, South Pole, 1974; U.S.G.S.; working on Master's; expectant father.  
 Rose, Polar Affairs Officer, State Department.  
 Schatz, Editor, News Report, National Academy of Sciences.  
 Tobin, Historian, Chief of Staff, Pentagon; formerly Office Polar Programs,

BY-LAW CHANGES (Proposed by Board of Directors)

1)	Elimination of Initiation Fee	YES	NO
2)	Dues for Antarcticans within 75 mi. radius of Washington \$5.00	YES	NO
	" " " " " beyond " " " " 4.00	YES	NO
	" " " members of BAE I and BAE II 3.00	YES	NO
3)	Honorary Membership to Mr. August Howard, American Polar Society	YES	NO
4)	In absence of Treasurer, President can appoint an officer or Board member to act in his/her behalf	YES	NO
5)	Board of Directors review delinquents at first meeting in fall, and make decisions on all 'drops'	YES	NO
6)	Officers not eligible for reelection until 4 years after serving	YES	NO

A word about the election. It is almost mandatory that the Officers and Board of Directors come from the Washington area, even though almost half of our members are from outside suburban Washington. We are trying to get more people involved in the Society, and that is why it is proposed that Officers cannot be eligible for reelection until after being out of office four years (currently, only one year).

Be sure to vote for four members of the Board. They have to serve for three years. We have 12 members on our Board, with four coming off / four going on each year. All nominees for the Board have given their word that they will participate in Board activities. We feel that they will. Four of the nominees were regular attendees at our meetings this year.

There is one other change being enacted in the By-Laws, and that is an official (but non-mailing) address for the Society. It is now shown for the former address of the Arctic Institute of North America. To keep our non-profit status, we may have to have a District address on our By-Laws. If such is the case, the Board decision will be considered the vote of the Society.

August Howard is a jewel. He has put the POLAR TIMES to bed for over 30 years, and has done a tremendous job, a labor of true love on his part. When you say non-profit, you're saying August Howard and the POLAR TIMES! They're synonymous.

Guy Guthridge and Walt Seelig served as the Nominating Committee.

.....

The membership blank is in each Newsletter. We are still trying to corral some delinquents. If your name is printed, you are delinquent. If any of you want to take advantage of our current \$3 a year membership, you can fill in your name and use the form to extend your membership. We'll be raising our dues next year. If you're voting, which we hope you will, we will also count your votes on the other side.

RESERVATION FORM on page 10!

August Howard Goes Honorary.

The Board of Directors of the Antarctic Society is highly pleased and most honored to announce that Mr. August Howard has been awarded and has accepted an Honorary Membership in the Antarctic Society. Although I have never had the pleasure of knowing him personally, I have long known of him and his works, and have heard so many good things about him and his wife Rose that I almost feel I know them both. He is the AMERICAN POLAR SOCIETY, it has never known any other father. He formed the Society 45 years ago, and it gave birth the following year to a beautiful child, THE POLAR TIMES. Since that time the family has increased by 86 new arrivals. August's offsprings go out to some 2300 homes scattered over the globe in over 32 different countries, and this avid stamp collector sends them out with beautiful commemorative stamps. What a nice touch! Rose must be an understanding wife, as after all those publications, it must seem to her at times as if he is married to a mailing list rather than to her. But like all Boy Scouts - he was their Public Relations Officer from 1928 through 1970, and came into polar activities through the Boy Scouts of America sending of Explorer Scout Paul Siple to the Antarctic in 1928 - he appears to be a kind, considerate, and generous man, and no doubt is a loving and devoted husband, particularly after the semi-annual mailings go out. If anyone in our Society is not a member of his Society, you just aren't with it. But you can be for a most nominal fee, \$2.00 a year, \$5.00 for three years, checks payable to the American Polar Society, whose address is August Howard, Secretary, 98-20 62nd Drive, Apt. 7H, Rego Park, New York 11374.

Our membership list reached my pre-season goal of 250 paid members prior to the Larry Gould Show. We were 253 strong that night, which was 153 more paid memberships than we had last year. We are now up to 267. We have 54 new members. Some like Bob Nichols actually felt that it was better to send in five dollars and join rather than to be harassed by my caustic comments on complimentary copies. I am particularly happy with the NEW members from the Byrd expeditions: Roos, Bubier, Harrison, Bursey, Bird, Morgan, Dyer, Mason and Rawson. We also picked up two corporation renewals, one from Holmes and Narver, one from Lindblad. They sure help.

Bergy Bits is NOT the Voice of the Antarctic Society, nor should it in any way be considered the position of the Antarctic Society on any issue. It is strictly thoughts and comments by the incumbent president, who is by birth an uninhibited soul who thinks in terms of superlatives, who believes that the good old days of the Antarctic were the golden days, who believes that good grammar should not necessarily get in the way of a good story, who confesses to male chauvinism at the same time that he sings the praises of a Mary Alice, and who believes that THE WASHINGTON POST is detrimental to the health of all Antarc-ticans. Pending impeachment, there will be one more year of the same biased bergy bits, same tongue-in-cheek writing, same caustic comments.

We feel greatly indebted to the excellent speakers we have had this year. They were just fabulous. There was a great mix of the old and the new with Larry Gould and Admiral Black telling us about the Golden Years, and the fabulous Sweetheart of the Society telling us everything about krill, Jay Zwally giving us the very latest on how the big eye in the sky interprets sea ice, and then Chester Pierce giving us a physician's view of those crazy Antarc-ticans. Let's hear it for them all, they were fantastic.

## BERGY BITS

The Larry Gould Show kicked off an important five days for the National Academy of Sciences, in which Larry was the biggest hit (of three spectaculars). Two days after Dr. Gould entertained us, the Academy unveiled the controversial and much discussed Albert Einstein monument on its front lawn. As most of you know, the statue did not have the full blessing of the scientific nor of the artistic communities. Then two days later, President Carter walked onto the stage sanctified by Dr. Gould and made an urgent plea to the National Academy of Sciences for their backing of his energy bill. Gould, Einstein, and Carter - how about that! And WE know who was the most popular in that certain week in April.

Larry Gould's birth certificate isn't worth the paper it's written on, as he is still a young man, full of all boy. He rolled back the calendar on April 19th, totally disregarding the last 50 years, and once again was back at Little America and in the Rockefeller Mountains. He regaled an enthusiastic audience at the National Academy of Sciences with stories about the good old days. Shortly after Larry started to relive some of his better memories, Pete Demas, one of his wintering-over colleagues from the expedition was overheard saying, "He still has the old zing." Yes, for well over an hour Larry was back on the trail with his dogs, just like it was yesterday, and the audience was right there with him. As he went from one story to another, he ran his fingers through his still generous endowment of hair while the video camera ground away at this latter day Huckleberry Finn. His tousled head of hair became completely disarrayed, a total tonsorial disaster - all recorded for posterity! Larry was having fun being a boy again, and how the audience loved it. It was truly vintage Gould with a lot of pizzazz. As he looked back with us, he was actually looking ahead. His heart was with his many accomplishments, but his spirit was looking forward to the fall when he plans on being on the 50th anniversary flight over the South Pole. And as he spoke of going on this flight, you sensed that this would not be his swan song to the 'Antarctic, that it would just be another delightful experience that would be followed by others in succeeding years. Towards that end, he has assured the Antarctic Society that he is quite willing to come back and give the Memorial Lecture in the year 2000 on a Century of Antarctic Exploration (or any other topic that he may see as fitting the occasion).

Pete Demas, who just may be the foremost Grecian Antarctic explorer of all time, came on from California to attend the Larry Gould Show. He wanted to meet Alice Dater, and it resulted in a touching scene as he bestowed his personal gratitude for the letter he had received from her late husband in which a mountain range in the Antarctic was named after him. Pete has more or less dedicated his life to vindicating the flight of Commander Richard Byrd over the North Pole. Pete was with Byrd in the Arctic in 1926, was a witness to most of the Trans-Atlantic flights in 1927 (including Commander Byrd's), and was a member of the First and Second Byrd Antarctic Expeditions. Pete is a short, square-shouldered man who is in excellent condition. In fact, he appears to be slightly down in weight from what he was when he was one of three who rescued Admiral Byrd from Boiling Advance Base in 1934.

Admiral Richard and Aviza Black were a distinguished looking couple. It is always good to see them both; and it was great having the Admiral as one of our 1978-79 speakers. Actually there were three from the 1933-35 wintering-over party: Black, Demas, and Charlie Murphy, who was with CBS and served as the

Expedition's Communications Officer. Charlie Murphy looks like Charlie Murphy - big, handsome and affable with a map of Ireland on his face. John Bird and his wife were also there - he went to the Antarctic on the CITY OF NEW YORK to help bring back the members of the First Byrd Antarctic Expedition. John is tall and ramrod straight, still trim of figure, and his wife is most attractive - she is actually much prettier than John!

Norman Vaughan, B.A.E. I, is dog team driver par excellence. A proposal is being circulated in Washington seeking funds to film Colonel Vaughan's entrance and racing in the 1980 Leonhard Seppala Iditarod Sled Dog Race. It is a 1,049 mile race, from Anchorage to Nome. Norman reports that he has some real fine dogs, and he feels at age 75 that he is just approaching the maturity that one needs to travel by dog team alone for 20 days in the wilderness of Alaska, covering two mountain ranges, rugged mountain passes, two wild rivers, temperatures down to -50°F, with windchill equivalent temperatures of -100°F. Norman holds the record for the longest snowmobile trip on record, a little junket from Alaska to Boston. He did this when he was a kid, only 65. He has already raced in the Iditarod race, and finished, although one year he pulled a Chappaquiddick and made the wrong turn. That could have been costly, he could have ended up in Siberia. If his agent finds a sponsor, you will be seeing Norman Vaughan on the Sony in your living room. While Larry was here in Washington, Norman called him from Alaska. Wonder if he availed himself of the opportunity to remind him of the Harvard-Michigan score back in 1929?

We have quite a few of the B.A.E. I members in the Society. Besides Larry and Pete, Ken Bubier, Taffy Davies, Henry Harrison, Jack Bursey and Howard Mason are in good standing. Eddie Goodale is slightly in arrears in our treasurer's books, although we haven't given up on him. That leaves only two out of the fold. And then we have Ed Roos and John Bird from the CITY OF NEW YORK. We have not been so successful courting members of B.A.E. II who are a hard group to crack. We do have the aforementioned Pete, Admiral Black, and Charlie Murphy, plus John Dyer, Gill Morgan, Kennett Rawson, Bud Waite, and Gordon Fountain. Dyer was not able to get to Washington in time to hear Larry, although he was here a few days afterwards. John says he is still kicking, and also evidently pulling, as he has a female Siberian husky who pulls a sled with the grandchildren and then demands and gets a ride herself. He wrote, "Bursey would shudder at that." He has just finished reading Jack's book and said it "brought back many pleasant memories." Gill Morgan did not write much news, although he sent along best regards to fellow members of the Expedition together with a check for \$100 to cover his membership. Those are the kinds of memberships we love! Kennett Rawson is with Rawson, Wade Publishers at 630 Third Avenue, New York, N.Y. 10017. Finn Ronne lives here in town, but we have not won him over - yet. Their daughter was married on May 5th - a big social event in Georgetown.

We asked August Howard if he could run a check on Richard Konter, who presumably is the oldest living member who participated in a phase of B.A.E. I, and who had sort of dropped out of sight a few years ago. August is the U.S. Antarctic community's Canadian Mountie, and he came up with the information that Richard recently celebrated his 97th birthday and is at St. Albans Naval Hospital in St. Albans, New York. His family's address is 3029 Brighton 12th Street, Brooklyn, New York 11235, and their telephone number is 212-648-3936. He was a ship mate of John Bird and Ed Roos on the CITY OF NEW YORK.

Several people wanted to know why Bud Waite's name, Lloyd Berkner's name and some other people's names were not included in the program that was passed out at the door. The reason is quite simple - we were only paying homage to those who actually wintered over with Dr. Gould in 1928-30,

We did try to get members from B.A.E. I to come to Washington for the Larry Gould Show. We appreciate the letters that many of them sent saying they wished they could come and asking us to give Larry their regards. The Society is going to put together a few of these momentos and give them to the Goulds. There are always some funny comments when the Old Guard gets together. When I mentioned that we had made an effort to get a certain expedition member to Washington, one of the members present said, "He wouldn't come if he had a special invitation to the second coming of the Messiah!" It was also rather comical when all the "old boys" walked off the stage leaving Dr. Gould at the podium - they all sort of responded as one giving him some good natured ribbing.

Although he was not a member of the Byrd expeditions, he was on the Ronne Antarctic Expedition and at heart is a throwback to the good old glory days of Antarctica Bob Nichols has joined the Society. He gave me one of my biggest thrills all year when he was the "commencement" speaker talking to all the graduates going to the Antarctic this past year. He flew down from Boston in the late afternoon, flew over to the hotel, and flew into his speech. The hall was full of women going to Antarctica, but if anyone from USARP had bothered to brief him ahead of time that Antarctica had gone to the women, he chose to either ignore it or let the chips fall where they may. After a rip-roaring account of the good old days sledging on the trail, he came to the end and wanted to wrap it all up with a good solid wrap up, telling the audience with underlines why he loved Antarctica. And as this huge hunk of an athletic man paced before the audience with the microphone, he bellowed out a la Knute Rockne, "What I love most about the Antarctic is its masculinity." Whatever he said after that was lost. Somehow or other he was able to get out of town with his life, but I imagine the women of Antarctica have placed a price on his scalp. They will certainly slash his ever present suspenders if he ever slows down. I file all members according to some key category, and good old Bob's card is right behind mine under "Male Chauvinist".

Had a nice letter the other day from John Cadwalader. John put together a nice little booklet, "Antarctic Ice - How to Live With It" - a primer for all people who went south during the IGY. From his booklet I extracted "bergie bits" to describe small pieces of information that we use in the Newsletter. He worked in the Antarctic Programs Office following four good years with TF43. He wrote how much he liked the late Harry Dater, the late Carl Eklund, and Max Brewer. He returned to the Antarctic in 1968 as a lecturer on a Lindblad tour. But a funny thing happened to him while on his way back to the Antarctic (with Lindblad), he was befriended by a passenger, and as a result John went on a World Wildlife Fund expedition to Malaysia. In fact, he has just returned from that expedition. John was one of the original members of our Society, and regrets that his home town of Blue Bell, Pennsylvania is so far from our meetings. Rudi Honkala says that he made life bearable on the ship going to Wilkes in 1956, that his savoir faire in dealing with both sandcrabs and military prevented them from killing off one another before the ship ever got there. Thanks for the nice letter John, you must be a real nice guy.

THE WASHINGTON POST sure has a way of infuriating Antarcticans. They outdid themselves, which isn't easy to do, in an article in the Style Section of their

Friday, April 13th paper about four Americans who finagled their way to the Antarctic on a tour ship and then went on a lark. The headline said "To The Bottom of The World". Hardly the bottom, they never even crossed the Antarctic Circle in their outboard rubber raft. And in italics under the author's byline was "No one in the whole world knows where we are tonight" with the name of the clod whose diary had contained it. Any high school kid in the country could have put those same words in his diary on any given night and not have been wrong. They quoted one of the guys as saying "It's really neat to go somewhere where no man has ever walked ..." What kind of a man talks like that, even to his grandmother? They tried to get NSF to sponsor this fiasco, but thank God they turned down the debacle. The POST said "The trip was considered so dangerous that the National Science Foundation refused to sanction it". Tommy rot, there was no science. If Ed Todd turned these guys down, let's get Congress to renegotiate his contract. However, we may not have heard the end of these characters, one of whom is a woman. It seems that these guys have the backing of Roone Arledge, top dog at ABC, who was boosting them for part of his American Sportsman series and who wants to send them back next year to televise to the States from the top of Mt. Tyree, at 17,000 elevation. David, they must not desecrate your mountain. Roone Arledge is an important man, and behind him are people like Barbara Walters, Phyllis George, and, heaven forbid, Howard Cosell, a bunch of locusts. Phyllis George just might ask her latest husband to buy Mt. Tyree. She told her political-sportsman husband on their honeymoon last fall that if he bought Bob McAdoo his basketball team, the once famed Boston Celtics, might gain respectability. Before they were served dessert, the Celtics had McAdoo and had practically given up their birthrights, three first-round draft choices for a man who never learned that basketball was a team game. Preserve Mt. Tyree from Phyllis and Howard, please.

On the other side of town, Christine Russell did a real fine job in THE WASHINGTON STAR on April 25th when she wrote on "Dr. Laurence Gould, Superstar of the Antarctic". He is a legend in his own time. No Picasso, he! Christine Russell is truly a delight to read. She is no-nonsense, factual, and still interesting. Her Antarctic articles in the STAR in 1977 were very well done. We think the STAR should make her a member of our Society.

We have tried to make the Society more personal this year by humanizing the Newsletter. Part of our game plan was to encourage mail, and to be responsive to it. Towards that end we moved our mailing address to the Arctic Institute of North America's office in Arlington where mail is picked up daily. The mail bag is overflowing, and we love every letter (well, nearly every letter), especially those from our West Coast sweetheart, Pennie Rau. I had a real nice letter from Admiral Tyree written immediately after the Larry Gould Show. I knew Admiral Tyree by name only, as I was before his time. I asked my friend Ken Moulton about the Admiral, as Ken always heads for the Antarctic after the annual collapse of his beloved Red Sox and knows all Antarcticans. Ken told me what I should have known, that he was a most kind and considerate man, never swore and was always a gentleman. Another nice letter came in from Herman Friis. He had worked with Larry during World War II, said that he had about 200 letters from Larry, and that he had really wanted to be there that evening, but couldn't as he had just had both knees operated on for arthritis. His many Antarctic friends will be happy to hear that Herman appears to be making a good recovery. Bill Littlewood checked in from Jakarta in Indonesia. He was one of the early members of the Society.

He claims to be the most distant from Washington, and we would have to agree. We have members in Okinawa and in the Aleutians, but Southeast Asia nyet. Bill seems to live a double life, a working one in Malaysia and a social one in Denmark, homeland of his wife and adopted homeland of their daughter. The Littlewoods recently celebrated their silver anniversary - almost a record in today's society. She requested and was granted (for her wifely accomplishments over the years) two trips into the primitive regions of Indonesia. I once heard that his bride Bente had the largest penguin collection in the world, but that's only hearsay. Peg Tuck has quite a rookery up there in God's country, New England. Although he has never taken the elastic off his roll and joined the Society, it behooves me to pass along the bad-good news about Arnold (U.S. Antarctic Service Expedition) Court's wife, Corinne, who has been seriously ill this winter but who is apparently making a good recovery. I did have the pleasure of meeting this fine lady a couple of years ago, and she is light years ahead of Arnold in the beauty parade.

I have found out that no matter where you go, Antarcticans are going to ask "What does anyone hear from Harriet Eklund?" I have never had the pleasure of meeting this lass, but I have sure heard about her prowess as a hostess. It is my understanding that her home in England serves as a clearing house for all Antarcticans going to Europe. August and Rose Howard visited with her last fall, Jane Wade is dropping in for tea and crumpets and lodging this spring, and George and Sallie Toney are booked for early summer when all three will travel to Ireland. Mort and Rosa Rubin want to visit Harriet, but she is booked solid into next spring. I have it from a reliable source that the Eklunds would throw a party on a minute's notice. It seems when the IGY was about to burst and the town was loaded with young spirited lads being briefed on how to behave on the ice that a little wall-to-wall get-acquainted party was given by the Eklunds. The evening got off to a banging start when one of the unsuspecting IGYs, who was to winter over with Carl that winter, who had not checked his score card to see who was who, suggested to Harriet that they should get better acquainted. Ruth heard from Harriet recently, and she is in great spirits.

Joe Fletcher of Fletcher Ice Island and points both north and south has decided that an old dog can be taught new tricks and is trying to learn how to play tennis. You say, "Why now, Joe?" and he scratches his long-since bald head and says, "I've a goddaughter who likes tennis, and I want to be ready when she asks me to hit a few with her". It seems his goddaughter is only 16, has her hair in pig tails, is recently out of braces, and wears pinafore dresses. If this all sounds familiar, it should. His goddaughter is the child prodigy who answers to the name of Tracy Austin. She accumulated over 200 grand in her first six months on the professional circuit. Joe had a good year, but he did not do quite that well. Actually Joe should never have taken up tennis, he should have stuck to dominoes. Tracy grows up in a hurry when she walks on to any tennis court, the racquet becomes a deadly weapon, and she will just murder old Joe, even if he did introduce her pater and mater.

I had no idea when I asked Father Kendall to give the memorial part of the Larry Gould Show that he was brought up next door to Sir Ernest Shackleton. This Golden Voice of the Pulpit was a Wing Commander of a bunch of Spitfires during World War II, and he must have seen it all during the Battle of Britain.

Jim Zumberge turned out to be All Pro in his introduction. He was smooth as silk in his remarks, and beautifully bridged the transition from the memorial service to introducing our Antarctican thoroughbred from Lacota. Larry paid a beautiful tribute to the late Paul Siple which meant much to the Siple Clan who were represented by his widow, his only sister and her husband who were here from Canton, Ohio, and one of the three Siple daughters who attended with her two children.

Mort Rubin, one of our elitist past presidents (he is also our scrubbiest past president with that damnable beard) had run out of passes from Geneva so could not make the Larry Gould Show. But he wrote, and how he wrote, flooding the East Coast with copies of his letter in case planes got lost en route. And this is how he feels about Larry: "It has been just about 25 years since I first experienced the pleasure and honor of being associated with you in responding to the challenge of the International Geophysical Year program in Antarctica. That excitement is still fresh in the minds of all of us who have known Antarctica and its challenges at first-hand.

"A lot of ice has come out of the continent since then. Countless scientists and support personnel with new and ever-more advanced techniques and equipment have studied the Antarctic since then. Gaps in our knowledge have been closed, while new vistas in science have been opened, many of which have been pointed out by you and your associates over the years. In the final analysis, of course, it is men who do these things, men like yourself with vision and courage. For this we owe you a great debt, one which we are paying still through continued efforts in Antarctic science as well as science elsewhere.

"At this juncture in your life - 50 years in Antarctic research - you must feel satisfied and even proud of what has been accomplished through your own efforts and those of others who have joined with you in the U.S. and international programs such as those of SCAR. I shall always regret not having been able to be with you and the members of the Antarctican Society on this occasion".

I have a love affair with New Zealand, and those Kiwis are sure delightful characters. One such man is David Skinner, who mixes geology and opera. He puts a tape recorder in his specimen bag, and takes advantage of blizzards by singing in his tent for several hours a day. He was in the field for 77 days in 1975-76 before he became Guglielmo in Mozart's "Cosi Fan Tutti", and was in the field for 80 days in 1977-78 before becoming Leporello, servant to Don Giovanni.

We have a blithe spirit on our Board of Directors. His name is Jerry Huffman, and he is our link to the Pepsi Generation, as well as our Fashion Plate-in-Residence. But we have bad news and good news about Jerry, as he was recently severely burned when his sports car burst into flame while he was driving it at the Summit Point, West Virginia race track on April 28th. The good news is that he survived the fire, all of his organs are in good shape, and he is on his way to recovery. He will have to remain in the Burn Care Unit at the Washington Hospital Center for a couple of months. Skin grafting was started within the first week, and he has been responding well to medical science. After nearly a week of being plugged in to various and sundry tubes, they were removed on May 4th and Jerry was given some juice and water. He thought it was truly the Nectar of the Gods. Jerry was born bald, maybe this will stimulate a little facial growth on top. By the end of the second month they had better put some of the faster nurses into his ward! As he is in a sterile section of the hospital cards and letters should be sent to him at his home address, 3806 Towanda Road, Alexandria, Virginia 22303. Good news on the 7th! Jerry had his first solid food - a double serving of eggs and bacon.

If anyone is still reading, we will throw out some facts and figures on the membership. We have been heavy-handed in leaning on delinquents this year, but we were carrying one delinquent for every paid member, and that's no way to run an organization. We have picked up 93 delinquent man years memberships. We also have dropped about 50 from the rolls, most of whom had not paid since before 1975. No one was dropped without repeated prodding. I look forward to the coming year with more or less a stabilized membership of approximately 275 paid members. We have 94 members who have pre-registered for the 1979-80 season, another 44 for the 1980-81 season, and 24 have signed up through 1981-82. So we are pretty well underway for next year, although our membership year does not start until after Mid-Winter Day, June 21st. Including past, present and future, we took in over 500 man year memberships since last fall. But we had higher operation costs this year, as each of the six expanded Newsletters cost us over \$130.00. The Society also had members of B.A.E. I as dinner guests prior to the Larry Gould Show. If we had not collected past dues, had two corporate members (Holmes & Narver, and Lindblad), and the generous \$100.00 check from Gill (B.A.E. II) Morgan, we would have gone into the red. We have hopes for a program in/conjunction with the celebration of the 50th anniversary of the first flight over the South Pole, although nothing has been formalized at this time. We don't expect to top the Larry Gould Show in glamour and appeal, but we do hope to have a name speaker and a fitting commemorative program.

Professor George Woolard, world renowned geophysicist who was intimately involved in the Antarctic, both as a teacher of Antarcticans and as the director of many of the geophysical field traverses, passed away in Hawaii in mid-April. The late Ed Thiel, Jack Behrendt, Jim Sparkman, and the Fearsome Twosome from Chippewa Falls, Ned Ostenso and Blackie Bennett, all got their degrees from Woolard while he was at Madison. Professor Woolard was an expert on gravity measurements, and wherever Woolard went, the gravity meter went too. He flooded the globe with graduate students who often did not even have passports or inoculations, but always had gravity meters. The Antarctic has lost a good friend.

We lost another Antarctic last month when Dr. John Boyd died in England. He was a member of a prominent Washington family - his older brother Walter wintered over as a Craryite at Little America V in 1957. John was an ornithologist and was known as the Quiet Boyd. He was active in the Antarctic in the mid-60's, spending the 1963-64 summer with Martin Halpern's Wisconsin group on Navarine Island, and the next two summers with Bill Sladen's group from Johns Hopkins at Cape Crozier.

There is a possibility that arrangements can be made to have the National Academy of Sciences' Polar Research Board loan out the video tapes of the Larry Gould Show to elements of the Antarctic Society. We have quite an Antarctic colony out in the Bay Area, and it just might be that they would like to get together for some Coors and watch/listen to Larry Gould. I would like to suggest that those of you who have an interest in borrowing the tapes contact me via mail this summer, and we'll see what can be arranged for the fall-winter season. But no promises!

HAVE A GOOD SUMMER!

ANTARCTICAN SOCIETY, c/o AINA, 3426 N. Washington Blvd., Arlington, VA 22201

1978-79 Dues - \$3.00

Initiation Fee - \$2.00

Please make checks payable to THE ANTARCTICAN SOCIETY, and mail this form and check by JUNE 9th - to the Society, c/o AINA, 3426 N. Washington Blvd., Arlington, VA 22201

OR call in your reservations by JUNE 14th to Ruth Siple at home, 522-2905, or to Mildred Crary, 244-3730.

Our last Newsletter contained information on those members of B.A.E. I who have died. Additional information on B.A.E. II members has been sent to us by August Howard.

Bowlin, LCDR William	Navigator and pilot. Died at age 74 at his home in Lemon Grove, California, on or about August 7, 1973.
Boyd, Major Vernon	In charge of transportation and mechanic. Died of cancer at age 57 at the U.S. Naval Hospital in Oakland, California, on or about May 30, 1965.
Byrd, Admiral Richard E.	see B.A.E. I
Czegka, Victor Hugo	see B.A.E. I
Grimminger, George	Meteorologist. Died at age 67 in Washington, D.C. on or about December 18, 1973.
Haines, William C.	see B.A.E. I
June, Harold I.	see B.A.E. I
Noville, George O.	Executive Officer. Died of self-inflicted wounds at Guadalajara, Mexico, on or about January 2, 1963, age 79.
Paine, Stuart D.L.	Radio operator, navigator, dog driver. Died at age 50 in Burlingame, California on or about March 15, 1961.
Pelter, Joseph A.	Chief photographer. Died at age 61 in Pensacola, Florida, on or about August 12, 1969.
Peterson, Carl O.	see B.A.E. I
Poulter, Dr. Thomas C.	Second-in-Command. Died of a heart attack at age 81 on June 14, 1978.
Siple, Dr. Paul A.	see B.A.E. I
Tingloff, Ivor	Carpenter. Although from Chichester, New Hampshire, died in Dunedin, New Zealand at age 40 on March 4, 1935.
Wade, Dr. F. Alton	Geologist. Died at age 75 in Lubbock, Texas on October 1, 1978.

And support personnel on ships:

Anderson, Charles F.	Post Office Representative, Little America P.O. for 16 days, 1934. Died at age 69 in Washington, B.C. on July 22, 1944.
Bryant, Glenn H.	Conducted fortnight study of seismic soundings. Died at age 61 in Stillwater, Oklahoma, on or about May 8, 1967.
Gay, Byron	Resigned from Expedition, February 1934. A song composer who died at age 59 in Los Angeles, December 23, 1945.
Lindley, Granville P.	Chief Engineer, JACOB RUPPERT. Died at age 66 at his home in Wickford, Rhode Island on December 18, 1956.
Murphy, John	Caretaker, BEAR OF OAKLAND. Drowned near Army Base, South Boston, Massachusetts on or about March 21, 1938.
Queen, Walter K.	Chief Engineer, JACOB RUPPERT. Died at age 80 in Stamford, Connecticut on June 14, 1960.
Rose, Capt. Stephen	First Officer, BEAR OF OAKLAND. Died at age 62 at his home in Marblehead, Massachusetts.
Verleger, Capt. William F.	Master, JACOB RUPPERT. Resident of New Canaan, Connecticut who died at age 77 in St. Albans, New York Naval Hospital, November 4, 1955.
Buckley, Thomas C.T.	Dog team driver who resigned February 1934. Died at age of 53 in Geneseo, New York.

BERGY BITS

(Bergy Bits is the voice of the President  
and in no way should be construed as the  
voice of the Society.)

Welcome to the Antarctican Society's 21st Year! First  
we will present your duly elected officers:

President: Paul Dalrymple  
Vice President: Fred Brownworth  
Secretary: W. Timothy Hushen  
Treasurer: Ruth Siple

and the Board of Directors:

<u>Term Expires 1980</u>	<u>Term Expires 1981</u>	<u>Term Expires 1982</u>
Peter Barretta	Mildred Crary	Tony Meunier
Meredith F. Burrill	Alice Dater	Lisle Rose
Barbara Honkala	Richard Dow	Gerald Schatz
Jerry Huffman	Peter Espenschied	William Tobin

As for proposed amendments to the By-Laws, here are the results. We were trying to eliminate the \$2.00 initiation fee, but you voted to keep it, 33 for, 28 against. However, you went along with the plank on dues, which was to raise them for Washing-tonians living within 50 miles of the Washington Monument to \$5.00, with those beyond 50 miles paying dues of only \$4.00. And you went along with \$3.00 dues for members of the first two Byrd Antarctic Expeditions. August Howard was swept in by an avalanche of votes as our newest Honorary Member. We tried to railroad through a proposal whereby officers would not be eligible for reelection until after four year's grace sitting on the sidelines. Thank heavens it passed, but only by five votes

The treasurer's report is good for the most part. We made some money last year, but it wasn't all that great. The delinquent dues plus those collected for future years put us over the hump.

1978-79 Antarctican Society Credits and Debits

IN		OUT	
Bank holdings as of 1 September 1978	\$1,113.19	Cost of printing Newsletters	\$1,015
Membership dues collected during year	2,191.50	Post Office charges	180.
Antarctic calendars	324.52	Cost of calendars	288
The Larry Gould Show	480.00	The Larry Gould Show	608
Mid-Winter Picnic, June 17th	759.00	Mid-Winter Picnic	802
Dividend on Eastman Kodak stock	31.30	Refreshments, etc.	46
Late payment for dinner wine	1.56	Refund (cancelled reservation)	44
		Bank service charge	1
	<u>\$4,901.07</u>		\$2,987
	<u>-2,987.97</u>		
as of 1 September 1979	\$1,913.10		

We went after the delinquents, and collected from about three-fourths of them. And we dropped all of the long-standing delinquents, regardless of who they were or think they are!

We made \$799.91 last year, although we would have been in the red if we had counted only 78-79 membership dues. Some of you might be interested in the expenditures. First, we have to keep a sum of money in the Post Office which banks it against our mailings. We put \$100.00 in last year, which should last for some time. We have to pay \$40.00 a year for our bulk mailing privilege. Last year we inadvertently paid \$80.00, but we got credit for the additional year. We sell Antarctic calendars locally, which is the biggest aggravation per dollar gained. We get the calendars from the Navy from New Zealand. Our mark up last year was so small that we netted only \$35.67! We don't push them as they come in towards the end of the year and it is no picnic mailing anything out of Washington at Christmas time. The difference in the Larry Gould Show take and output was in the cost of dinners for Byrd Antarctic Expedition members who were our guests. The Mid-Winter picnic cost the Society only the \$75.00 charge for the room, as the tickets paid for the rest.

Now about the membership. We have two corporations who pay \$100.00 per: Holmes and Narver, and Lindblad. We also received a \$100.00 membership from Charles Gill Morgan, a geophysicist who was on the 1933-35 Byrd Antarctic Expedition. He lives in Texas, and those Texans sure do things big! We collected 96 delinquent dues, and also have collected 270 dues for future years. We have 292 members who are paid up. We have already collected dues for the coming year from 179 of you folks. Last year was a nightmare, really, as our bookkeeping was nil from 1970 to 1975, but it is under control now. If you have not paid your annual dues, your name will be printed on the membership blank in each Newsletter. If there is no name, praise your foresight and forget it. One thing which pleased me was that we picked up 73 brand new members last year. Our paid-up membership is probably an all-time high for the Society, although in the 1960's (when Lindblad signed up all members on a cruise) there were 420 members. But in reviewing the files I could not find that the Society ever had over 220 members in good standing.

We hope you like our new stationery. It resulted from my "courting" a member of the U.S. Antarctic Service Expedition last year, trying to get him to release a few of his Californian dollars to join our ranks. He wrote back that he hardly knew anyone in our Society, and he preferred August Howard's POLAR TIMES to our Newsletters. I agree that the POLAR TIMES is great, and August does a tremendous job, but I think our lecture program in Washington is very good, our Memorial Lectures really memorial, and some people do read the Newsletters, judging by our mail. So I decided we would do a little billboarding on our stationery, singing the praises of those who have done so much for the Society.

You should all come out to hear Gentleman Jim (Zumberge) give the "fire and brimstone" orientation speech to fresh spirited young men and women about to assault the Antarctic through the courtesy of your tax dollars. I opened my Little America V diary to see what kind of an impression the "young geologist from Michigan" made upon arriving in Antarctica for the first time back in 1957. The first comment beyond his youthfulness was that he had all new instruments. Many of us had had to bum, borrow and steal, with the accent on the latter, to get our equipment, so he impressed us with his wherewithal. Then the next sentence said he had arrived with a suitcase full of medicinal spirits to counteract any lethal bites from poisonous snakes that might be inhabiting the crevasses around Roosevelt Island. And the third sentence said that even before he took off his backpack, he had opened a bottle of Scotch to help ward off any infectious diseases that might be running

rampant at Little America. It was obvious that he was a health nut. The next notation was several days later, when Saturday Night Live meant a seemingly endless party in the recreational hall. His performance was greatly admired by wide-eyed youngsters and grizzled veterans alike. With what could have been only a few hours' sleep, he showed up next morning in the Chapel and played the Wurlitzer and sang hymns like he was right out of the Mormon Tabernacle. The Boy Scout had won the right by total camp default to play the Wurlitzer for church services that year, but if there was one thing which Dick Chappell never achieved as a Scout, it was that he never got a merit badge for piano playing. So Jim's performance in the Chapel was like a fresh summer breeze off Kainan Bay. Jim wanted to make a trade with Bert Crary for Peter Schoeck, a German who considered himself a one-man task force, but Jim lucked out when Peter fell into a crevasse and had to be evacuated to New Zealand. My last notation showed that Gentleman Jim was not always a gentleman, as he wiped me out in two straight shuffleboard games on November 7th, not even allowing me a token point on my home court.

Robert Thomson of New Zealand, who last spoke to us on September 11, 1969, is coming back to tell us all about New Zealand activities in the Antarctic. The date is October 2nd, and the place will be the Board Room at the National Science Foundation. He will be in town attending the 10th Consultative Meeting of the Antarctic Treaty, and has agreed to speak to us one more time. Now let's have a big turnout, even though it is early in the fall. Remember, if there wasn't a New Zealand, would we still want to go to Antarctica? They certainly have made it all the more pleasant, that's for sure.

We are trying to get Sir Edmund Hillary to use that American Express card and come to Washington to speak to us. He passed through Washington in June while he was in the States plugging his latest book. Most of his efforts are devoted to the Himalayan Trust, of which Sir Edmund serves as director. He wrote, "Dear Paul: 1958 seems a long time ago and much water has flowed under the bridges since then. Like everyone I've had my good moments and my bad, but on the whole I have been very fortunate. After all, who in 1958 would have thought that I might appear on an American Express advertisement - probably American Express didn't even exist then. I don't often visit Washington but will certainly keep your invitation in mind if I should ever happen to come your way." We who were fortunate enough to be wintering over at the South Pole in 1958 were doubly blessed by Ed Hillary and his team coming into camp several weeks before Bunny Fuchs and the British Trans-antarctic Expedition arrived, so we got to know quite a few of the blokes. One of Ed Hillary's travelling companions was Peter Mulgrew, his communicator. Peter stayed at the South Pole for several weeks of intensive coffee drinking, but he more than paid his fare by putting himself on perpetual kitchen police. As many of you' already know, Peter lost both of his legs later on while climbing with Hillary in the Himalayas. He is now with W. R. Grace (NZ) Ltd. and hopes to get to New York later this year. If I can talk Peter into coming down to Washington, perhaps we can have some sort of an informal or formal get-together of Antarcticans. If he gives us any notice, we could even get Peter to talk to us about the interesting sledge trip which the New Zealand people made over to Cape Crozier in 1957, repeating the Worst Journey in the World.

I also heard from another one of my favorite Antarcticans, Murray Ellis of Dunedin, who was another one of Ed Hillary's men. He and his family are manufacturers of fairydawn mattresses, blankets, and sleeping bags - probably the warmest and finest sleeping bags in the whole world. Murray is the rallying force for all Kiwi Antarcticans, and at a reunion of the men (remember, once Antarctica was all men) at Scott Base in 1957, all 23 members showed up, coming from England, Canada, Australia and New Zealand. I tried to hold such a reunion of IGY people here in Washington

for our 20th reunion, and believe it or not could not even get some from right here in Washington to come. The U.S. Antarctic Service Expedition is planning to hold their 40th reunion this fall, and we wish them luck. Murray Ellis had another reunion this year, and said that he was the oldest person there. There must be a message. Murray went back with Ed Hillary in 1967 when they climbed Mt. Herschell and travelled to Cape Adare. He said he felt his age a bit when climbing in and out of cold sleeping bags, although all was most enjoyable. Murray wrote, "I have a very strong friendship with Dr. Trevor Hatherton . . . and he often speaks in glowing terms of Larry Gould." I would love to see New Zealand again - a great place and great people! One of our newest members is Jack Dymand (10 Staffordshire Street, Burwood, Christchurch), who was a cook on the JACOB RUPPERT and the BEAR OF OAKLAND on the 1933-35 Byrd Antarctic Expedition. Welcome aboard, Jack! We just heard from Jim Caffin, that supernumerary editor who puts together the fabulous New Zealand Antarctic Society Bulletin. He's off to Europe, returning to Christchurch on the 8th of October. He was a commentator, deputy to the aforementioned Peter Mulgrew, on an Air New Zealand tourist flight in 1977. Jim wishes to be remembered to all his friends in our Society.

It's going to be that we won't be able to get candidates for our officers and Board. Not only did we lose Ken Bertrand last year, but Jerry Huffman had a narrow escape when he was caught in his Porsche as it burst into flame at a race track in West Virginia. Everyone is happy to know that Jerry is home now and making good recovery, although it is going to be a long haul. He does expect to be able to get back to work some time this fall, but he will have to wear a Space Age type suit (with slits for his eyes, nose and mouth) for the next year. Pete Barretta is making good progress after his heart attack. Mildred Crary had to go to the hospital early this summer for an operation, although it did not hold down this Daughter of the South very long. Ruth Siple ruined her summer when she slipped on some mulberries while mowing her back yard, ending up with a triple fracture and dislocation of her left ankle. They set it, then reset it with some screws, and now some two months plus later she is not looking forward to the next operation when they will take out one of the screws. The moral to this story is: cut down your mulberry tree or buy sheep.

The highlight of this year will be the celebration of the 50th anniversary of the first flight over the South Pole on November 29, 1929. We are still hoping to have some sort of a commemorative program, but at this time the chairman of our program committee for the occasion, one Pete Burrill, is in China on a tour with a group of geographers.

Mayor Stewart Bell of Winchester, Virginia (the birthplace of Richard E. Byrd) is planning some sort of a local celebration in their high school auditorium. It seems that each time the Admiral returned from the Antarctic one of his first stops was to give a Homecoming Lecture in the high school auditorium. Presumably this will be before the departure from Washington of those who will be going on the commemorative flight from the Little America region to the South Pole on November 29th of this year. It is our understanding from an impeccable source that the only bona fide Antarctican from the good old days on that flight will be Larry Gould. Crevasse Smith is supposedly on the flight list, but he does not qualify as one of the good old boys, because in spite of his exalted positions in the Office of Polar Programs, OMB, and on the President's scientific staff he was only a "summerite." But he does have CLOUT! It will be interesting to see who actually makes up the rest of the passenger list.

But some of you will be able to share in a half-hour documentary being prepared by Ashland Oil Company for Public Broadcasting Television on the contribution of

Admiral Richard E. Byrd to the Antarctic. It is our understanding that Payson Stevens did the researching, and Jeffrey Kirsh was the producer. KPBS, San Diego, will be distributing the film, which will be shown in the western states near the anniversary date of the flight, November 29th. Its distribution in the east has not been determined at this time, but Washingtonians will get a chance to see it eventually as a copy is to be given to the Division of Polar Programs.

The Antarctic Society is celebrating its 20th anniversary this year, and we will be presenting material and information on the first 20 years in our Newsletters this year. It was pretty difficult trying to put together the pieces, not only for the first couple of years but particularly for several years in the early 1970's when records were not kept or were most sketchy. One has the feeling if there had not been a Henry Dater there would be little recorded history. It is also quite evident that the Society got off to a rousing and happy start due to a well-stocked liquor locker in the home of its first president, the late Antarctic Eagle, Carl Eklund.

We found an interesting and delightful account of what could be presumed to be the birth of the Antarctic Society. No author is shown, but perhaps some of you may know who wrote it.

Future historians, in attempting to trace down the origins of the Antarctic Society, will find the record silent as to just when and by whom it was founded. Rumors as to the existence of such an organization were in circulation during the early fall of 1959, and presently an anonymous notice was received by persons interested in the Antarctic, announcing that a meeting would be held at the Cosmos Club on the late afternoon of 8 October. Intrigued, some by the clause in the notice that membership in the Society involved no payment of dues, others by hints of liquid refreshment, a large number of the recipients converged on the Cosmos Club at the appointed time. Here arose another source of the confusion which troubles researchers in this matter, as it developed that a meeting of the Explorers Club was being held at the same time and place. Membership in the Explorers Club has long been held by its members to be a great honor, and the sudden invasion of their meeting by a whole lot of non-members, and the bafflement of the latter at the dirty looks which they were getting from the former, added further to the uncertainty as to what it was all about. The law of natural selection now manifested itself, through the Explorers Club members withdrawing from the presence of the non-members, who thus found themselves milling about in an outer chamber, somewhat removed from the bar. A measure of order was presently restored by the circumstance that some members of the Explorers Club had received the Antarctic Society notice, and through their good offices, the non-Explorers were permitted to approach the bar, one or two at a time, though subjected to the withering stares of assorted rhinoceros hunters, world travelers, and similar notables.

Mr. Wayne Fisher of the State Department now began to whip some semblance of discipline into this leaderless mob, and under his sure guidance, a meeting was presently called to order. Everyone had meanwhile become increasingly aware of the presence of Ambassador Daniels, and it was apparent that whatever the Antarctic Society was, he was a large part of it. Not much further light was cast on this obscure topic by the meeting which followed, but everyone agreed that it was a great success, and thus the recorded history of the Antarctic Society began.

The next meeting of the Society was a more orderly affair. The Antarctic

Treaty Conference, which began shortly after the occasion recorded above, involved long and weighty discussions on all aspects of Antarctic affairs, conducted by diplomats of great stature who were only slightly handicapped by the fact that hardly any of them had ever been to the Antarctic. It was felt that this handicap, negligible as it was, could be rectified by viewing an Antarctic film, and the infant Antarctic Society rose to the occasion!. The auditorium of the National Academy of Sciences was procured for the evening of 19 November; invitations to the delegates to the Conference and to the members of the Society (construed to mean all those who had attended the opening meeting) were sent out, and the film "U. S. Navy Supports the IGY in Antarctica" was duly shown. The delegates who attended professed themselves greatly pleased. This event established a milestone in the Society's history, as certain expenses were incurred in mailing the invitations and meeting the NAS fee for janitor services, and it was borne in upon the membership that since it collected no dues, it had no funds and had better find some.

The mysterious forces which from the smoke-filled room had been guiding the destinies of the Society, now sent out another notice, announcing a business meeting, to be held at the home of Dr. Carl Eklund on the evening of 8 January. The announced purpose of the meeting was to elect officers and a Board of Directors, and to adopt by-laws. It was duly called to order by the Chairman pro-tern, Dr. Eklund, Mr. Fisher acting as Secretary pro-tern. At once it became apparent that a lot of thought had been put into the preparations for this meeting, and indeed a set of by-laws had been included with the notice. There was some debate about a few of those, in particular as to the definition of the word "person" in the clause defining eligibility for membership, but no conclusion was reached on this controversial topic. Other differences of opinion were ably arbitrated by Ambassador Daniels, but even his talents were unequal to resolving this problem. With minor revisions the by-laws were adopted as proposed. Next came the election of officers, which was carried out in a highly democratic way under the single-party system. One candidate for each office was proposed and elected unanimously, and these by coincidence included the two officers pro-tern. The successful candidates were as follows:

President - Dr. Eklund  
Vice-President - Dr. Wexler  
Secretary - Mr. Fisher  
Treasurer - Captain Cadwalader

The need for the latter position is explained by By-law No. 7, which established annual dues of \$1.00 to forestall any further embarrassment such as experienced at the second meeting. . Also included with the notice of the meeting was a slate of directors, who were likewise unanimously elected, no further nominations or discordant notes having been introduced.

Business being concluded, the host, Dr. Eklund, and his charming wife served a repast consisting of the residue from some of Carl's biological collections, which proved delicious. There was also a well-stocked bar. Altogether the evening was a pronounced success, and it was felt by all that the Antarctic Society, having at last come out into the open and established such a fine precedent for future meetings, was off to a brilliant and profitable career.

There were 41 members shown on a membership list published on December 24, 1959. Among that hard core, those still with the Society are, in alphabetical order,

Rear Admiral Richard Black, Capt. John Cadwalader, Gordon Cartwright, Bert Crary, Ambassador Paul Daniels, Larry Gould, Bill Littlewood, George Llano, Herbert Nichols, Walt Seelig, Phil Smith, Mort Turner, and George Whetmore. By April 1962, the Society counted 141 members, although it was duly noted that only 94 were in good standing. There were 159 members by April 1963, 231 members by July 1964, 244 members by October 1966, 406 in May 1969, and 417 in May 1970. This was our highest "paper number", although these figures are highly inflated by today's standards of counting only paid-up members.

The Antarctic Society has one unique feature which no other Society can boast about, having half of its membership represented on geographical features in the Antarctic. And these are names that have been officially approved. I visited the office at the Defense Mapping Agency where the Antarctic place name files are kept, and with the Society's paid-up membership list in hand, went through their whole file. I came up with 146 geographic namings, but am sure I probably missed some. If I missed you, please have mercy upon me, and let me know gently. It does not pay to be too English, because when they got around to naming something for Ron Taylor, they felt the Taylors had already been too well represented on the map. So Ron will have to spend the rest of his life trying to justify to his relatives that Ronald Ridge is actually named after him. Ditto for Peter Anderson, who has been immortalized with Peter Nunatak. And then there is a member with a hyphenated name who found his bluff is only Malva Bluff! Paul Siple named a mountain after his wife Ruth, as well as about a dozen other mountains after miscellaneous and sundry professors at Allegheny College and Clark University who never wintered over south of the Ohio River. But Ruth got purged when the Board of Geographic Names got down to approving the list of names, and all the professors survived! I had some of those same professors when I was in college, and believe me they are nowhere near as great as Ruth! Admiral Black's first wife, the late Ruth Black, was almost immortalized by Mt. Ruth Black, but the Board cut off the last name and it is now just Mt. Ruth. I personally think it is a shame that a Board sitting in Washington, consisting of many members who never wintered over, can turn down the wishes of the likes of Dr. Siple and Admiral Black. The wives who "winter over" in the States and bring up the children are certainly the Unsung Heroines of the Antarctic. For decades the American way was to reward women by naming ferocious and destructive hurricanes after them! I sometimes wonder what the delightful Ade"lie penguin would have been called if named by an American Board, probably it would have ended up as the Rockefeller or the Mellon. Long names are not necessarily a deterrent, as Splettstoesser is there in its entirety. Of course they had to find a long glacier to get old John's name on the map, but they found one. Actually, some of our members made out quite well. I know one who was there for a short time one summer who has two features named after him! To the best of my knowledge, the only member of our Society who wintered over who does not have a feature named after him is Allen Riordan. He wintered over with the Kiwis at Vanda, and that in itself should have been enough reward. But for whatever they may or may not be worth, here is the unofficial listing of geographical features named after active members of our Society. My list includes features named after members or the late husbands of members (Eklund, Siple, Dater, Bertrand). Where there is more than one member with the same last name, the first name or nickname is added to specify which member. (See the following page.)

Two of the finest out of the Division of Polar Programs are going to McMurdo to help out the USARP Reps with their administrative work. One is Nadene Kennedy, who is a member of the Antarctic Society, and Celia Heil is the other lady. Let's hope they can disco as well as type.

Who was Iceberg?

Why Not?

Bert Crary and Tom Jones are born-again authors, thanks to a small two-year grant from the Mellon Institute (administered by Swarthmore College) whereby Bert and Tom will tell all about their Antarctic administrative experiences. Most of the book will be about post-IGY, although the first chapter will be Bert's version of how the IGY Antarctic program came into existence. I hope old Bert mentions Yum Yum, as she certainly was the glue in the Antarctic IGY office back in 1956. Be there a man alive who went to the Antarctic back in 1957 who didn't know Yum Yum? If so, he must have had a bad case of stigmatism. The Bert and Tom narrative will also address the subject of the Antarctic Treaty beyond its current termination in 1991, with material which hopefully will be of great use to the decision makers.

We have heard that a well-known Washington Antarctic has written a book and has found a publisher. It is one of those kinds of books where the high and mighty might be crucified. I mentioned to Bert Crary that he could expect to be the recipient of some choice paragraphs and he replied, "Good! I wouldn't want to be left out!"

I had the pleasure this week of reading a most delightful biography of Commander Ike Schlossbach, one of the members of the 2nd Byrd Antarctic Expedition, the U.S. Antarctic Service Expedition, the Ronne Antarctic Research Expedition, Deep Freeze II, and a trip to Mawson with the Australians. "Ike's Travels" was written by Peggy Goodrich, historian with the Neptune (N.J.) Historical Museum in 1974. A very limited number of copies was published, which is too bad, as it is one of the most interesting biographies I have ever read on any Antarctic. This bachelor lived on the edge of danger and death through much of his early life, being one of the pioneers in the submarine service as well as Naval aviation. The book is resplendent with hilarious tales of many of the mishaps which happened to him. He is still very much alive, although eyesight in his one remaining eye is very poor and he cannot read. But we understand that someone still takes him up for a flight once a month. Ike was 88 on August 20th this year. We believe he is the oldest living member of the Army-Navy Club.

The next page will present you with a complete listing of all of the Officers and Board of Directors since the Society's evolution at the bar of the Cosmos Club in the fall of 1959. We spent too much time going through incomplete records not to present the summary listing. So for historians and other interested members, turn to page 12.

I have come to one conclusion - all Antarcticans have some kind of a seafaring boat. Since I started writing about Antarcticans with yachts, all kinds of boat owners have been coming off their moorings with "What about me?" The latest is "Red Jacket" Jorgensen, who writes that he has one of his very own, a 30-foot sloop which he named the FRAM. Art was always proud of the roles that Scandinavians played in polar research, and he used to remind us at the South Pole of the greatness of Amundsen. That makes two yachts out of South Pole '58, as Johnny Dawson is a long time Ted Turner Pretender. Skip Dawson writes that he has taken 378 separate cruises since April 1973, and has logged some 1,275 hours at the tiller. He said he and Walt Seelig take the cream of the rock fish harvest out of the Chesapeake each year, and that they got a 47-pounder and a 36-pounder this year. We can believe the 36, but honestly, you don't expect us to believe the 47, do you, Skip? Walt Seelig looks too much like a used car dealer to believe, so we will insist upon other witnesses. Skip wishes to be remembered to all. We understand that Louie DeGoes has a cabin cruiser that sleeps eight, which should make him the Commodore of the Antarctic Society Yacht Club, as you can't have a race without a cruiser to start you off and bring you across the finish line.

Iceberg was a Guernsey bull calf born of Klondike on the JACOB RUPPERT on December 19, 1933, 247 nautical miles north of the Antarctic Circle enroute with the 1933-35 Byrd Antarctic Expedition. When Iceberg returned to the States he didn't know that the green stuff called grass was edible, so his keepers had to spray it white to make it presentable to him. Honest! He went on a world-wide tour after he came back, presumably meeting the finest heifers abroad.

You know that Troy Pewe is a pretty important fellow out in the permafrost and has a quick eye for an ice wedge. But when it comes to horsemanship (is that the right word?) his daughter takes the honors. Last year she was ranked 11th nationally as an equestrienne in her age bracket. Way to go!

Ken Moulton, one of those fellows who lives in the shadow of a more famous brother, departed Washington the morning of August 23rd for the Antarctic. He is supposed to go into McMurdo on or about the 27th, and will be back here in Washington around Labor Day. I find it hard to believe that flights go into the continent this early, and that the whole trip will be made in less than two weeks. Although Ken has undoubtedly been to the Antarctic more different years than anyone (around 20), he will be remembered as the kid brother of Dick who wintered over in the good old days with the U.S. Antarctic Service Expedition, 1939-41. Dick is also one of the premier dog sled drivers in North America, and he and his dogs do right well, thank you.

There are a couple of new explorers on the way. Tony (South Pole '74) Meunier, with a little help from Betsy, had a baby boy, Jeffrey, this spring. Tony and Betsy came to the Larry Gould Show, and practically left the car engine running in case they had to make a quick departure for G.W. Hospital. But the kid held off, and put in his first official appearance at the Mid-Winter picnic, resplendent in a jersey embroidered with "Future Antarctic Explorer" across the front. Tony is one of our new incoming Board of Directors, and he is going to be a hard man not to agree with as he is well over six feet and has all the muscles of a defensive tackle. Then the Allen (Vanda) Riordans announced the arrival of James Carl on June 24th. Allen is one of Lettau the Elder's disciples, and Allen wrote, "He doesn't resemble Dr. Lettau at all, so we were afraid to name him Heinz." I wouldn't have been afraid, as Bernie's father and mother are two of the nicest people you would ever care to meet.

Rudi Honkala, Dick Cameron, and Dick Berkeley, all at Wilkes in '57, recently got together here in Washington and hoisted a few.

George McCleary of the University of Kansas, who was with the Navy around McMurdo in the olden days, is one of the touring seminar leaders for the Harvard University Laboratory for Computer Graphics and Spatial Analysis. For \$495 hre will tell you in two days all you should ever need to know about the Principles of Effective Map Design. Just show up with your money in hand September 17-18 at the Harvard Faculty Club in Cambridge, October 1-2 at the Fairmont in San Francisco, November 8-9 at the Sheraton National in Arlington, Virginia, or December 5-6 at the Sheraton O'Hare in Chicago.

Gentleman Jim Zumberge was an illustrious tour guide - lecturer on the M.S. WORLD DISCOVERER this past summer, leading a group of Southern Methodist University Alumni on what was billed as "A Spitzbergen Cruising Expedition" from July 14-31. Wonder if The Doaker was along?

I want to thank all you folks for your mail. Even though I may not answer, believe me it is appreciated. Keep those letters flowing, as they are my primary source of information for Bergy Bits. My thanks to Guy Guthridge and Ken Moulton for giving me news items which make the Newsletters current rather than historical. And my thanks to Ruth Siple, crippled with her broken ankle, typing all these pages when she should have had her leg up resting.

# THE ANTARCTICAN SOCIETY

ARCTIC INSTITUTE OF NORTH AMERICA  
3426 NORTH WASHINGTON BOULEVARD  
ARLINGTON, VIRGINIA 22201

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

**Presidents:**

Dr. Carl L. Eklund, 1959-61  
Or. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.), 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter f. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Mr. Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979

Vol. 79-80

October

No. 2

The Antarctic Society Proudly Announces  
that One of Our Very Own

Peter Anderson  
Assistant Director  
Institute of Polar Studies  
The Ohio State University  
and

Foremost U.S. Authority on Antarctic Aviation  
and Almost-Was Biographer of Admiral Byrd

will present  
the

50th Anniversary Commemorative Lecture  
on Byrd-Balchen November 29, 1929 Flight to  
the South Pole

ADMIRAL BYRD AND ANTARCTIC AVIATION

Tuesday, November 27th - 8 p.m.

Board Room, Room 540  
National Science Foundation  
18th and G Streets N.W.

Let's go, Washingtonians - Be Visible Members!

Bring a friend or a relative!

Light refreshments.

New attractive Commemorative Note Paper  
depicting landing of Ford Tri-motor  
plane at South Pole will be on sale.

Bring mega bucks!

Other Commemorative dates - details within.

- November 15. Winchester, Virginia. Byrd Homecoming.
- November 29. Dearborn, Michigan. Ford Aerosports Club.
- November 29. New York City. American Polar Society.
- November 25. 30-minute documentary on Admiral Byrd on PBS TV.
- November 29. 1-minute film clip and radio scripts released by NSF for TV and radio.

(This Newsletter is the voice of the current  
President of the Society and in no way is to  
be construed as the voice of the Society )

BERGY BITS

This Newsletter has several things of interest to all you guys and dolls, so please read this one if you don't ordinarily read them, particularly you Washingtonians. I am totally frustrated and at wit's end as to how to get you local people to our meetings. Do you know that with an outstanding speaker, the head of the New Zealand Antarctic programs, on a fair weather evening, we had only 22 people out to hear him, and some of those were walk-ins from the USGS and of philatelic interests who are not members of our Society? That is disgusting! We need a good long bull whip that will reach out to the suburbs to get you all to the meetings. And as long as I'm at it, please make sure you sign your checks when you renew. Just recently two members failed to do so. And two new members conned us out of the initiation fee by using last year's form! Each Newsletter will have the form for renewing or recruiting, and membership rates will be on each form. But please get out to our meetings! We are now up to 300 members, and over half are right here in the Washington area. You clamored last year for advance notices on meetings, and you are getting them early. Remember, free parking on the street opens up after 6:30 p.m., subway stop Farragut West is only three block away, the area is well lighted and patrolled, and the cookies and coffee have been upgraded.

Ambassador Paul C. Daniels, the Founding Father of the Antarctic Society, was in town in mid-September. A group of some of the early pillars in the Society, plus some of your officers, got together one evening with Ambassador Daniels, and after appropriate libation commemorating the occasion adjourned to discuss the current status of the Society and its future. Among the subjects that came up was how we could make the Society better for out-of-town members. This is a real tough one, as there are only a few enclaves of people large enough to warrant regional meetings. Our biggest cluster is in San Francisco where one man last year asked for a list of local members in hopes of establishing some sort of a local chapter. There are small groups of about 10 in the Los Angeles area, in the Boulder area, and in the New York area. We will probably publish a list of out-of-town members with addresses later this year. If anyone feels this violates the Privacy Act, let me know now and your names/addresses will be excluded.

The big news this month is what is going to happen next month relative to celebrating the 50th anniversary of the first flight over the South Pole on November 29, 1929. The Society here will have Peter Anderson, Assistant Director, Institute of Polar Studies, The Ohio State University as our Commemorative Speaker on the evening of November 27th. As most of you know, Peter is and has been an Antarctic historian for more years than he would probably care to admit. Once upon a time he had designs on doing a biography of Admiral Byrd, but as he proceeded on his course, he found that a family member was not willing to release material which was essential to doing such a biography. He subsequently turned his attention to Antarctic aviation, and is doing his thesis on this subject. He is also an authority on Bernt Balchen who was the chief pilot for the flight. So we have a real authority who has all the ingredients we were looking for - an impartial authority who is one of us who comes at no cost (courtesy of the US Air Force Reserves).

The first of several events commemorating the 50th anniversary of the first South Pole flight will be held in Winchester, Virginia, the birthplace and childhood home of the late Admiral Richard E. Byrd. It seems that in his expedition days one of first things he did when he got back to the States was to return to Winchester to

give a "Homecoming Lecture" in the local high school auditorium. The current mayor, Stewart Bell, Jr., thought that the 50th anniversary of his historic flight would be a good time to have another "Homecoming" in their high school auditorium, so on Thursday evening, November 15th, there will be a program in the Hanley High School auditorium on Valley Avenue in Winchester. This is open to the public, and we hope that many of you Washingtonians can attend. The famed U. S. Navy Band will play from 7 p.m. to 8 p.m., and the speakers are, in order of appearance, Dr. James A. Miller, President, Winchester-Frederick County Historical Society, Mayor Stewart Bell, Jr., Senator Harry Byrd, Jr., and Dr. Laurence McKinley Gould, Second-in-Command and Scientific Leader on the Byrd Antarctic Expedition, 1928-30. There will be a reception afterwards. You don't want to miss this one.

On the evening of Sunday, November 25th, the Public Broadcasting System will show a new 30-minute documentary on Admiral Byrd which we mentioned in the last Newsletter. In most regions, it will be shown late in the evening, but mark your calendar and check your local TV schedule that Sunday. There is also a one-minute documentary being released by NSF which hopefully will be shown on the news broadcast the evening of November 29th. This will include footage taken on a flight over the Little America-South Pole course last summer.

The Ford Aerosports Club, a group of loyalists who have an ongoing love affair with old Ford planes, is having a first order ceremony on the night of November 29th in the Heritage Hall of the Henry Ford Museum in Dearborn, Michigan. Between 125 and 150 people from aviation and historical fields will gather to celebrate the event with appropriate beverages followed by a formal dinner. Jack Bursey, a bona fide Newfoundlandite who is an adopted son of Michigan, will be their honored guest. Plastic model Ford Tri-motor planes bearing the Byrd Expedition insignia will be table centerpieces. As Jack is Coast Guard, the Navy may send a representative in an attempt to gain equal time on the program. They plan on a phone hook-up with McMurdo, hopefully to talk with people like Larry Gould. Then after the speeches, they will all be escorted to the aircraft collection in the museum presumably to pat the fuselage of the Floyd Bennett with sincere whisperings of "Well done, Old Boy." It sounds like a great affair. Incidentally, if you have a Ford Tri-motor in your garage or barn, you are a millionaire. That is now the going price of this plane which was manufactured with a sticker price of \$50,000.

The American Polar Society is planning an anniversary celebration in New York City on the evening of November 29th. Later on in this Newsletter we hope to have definite information on their program. (New Yorkers, call August Howard - 896-6892.)

Three members of our Society will be taking the hearts of the other 297 members on the VIP commemorative flight to the South Pole on November 29th. One could say that Larry Gould will be representing all the good old boys, that Phil Smith will be representing the summer forces, and Grover Murray all the decision makers. I suppose it is my duty to have to tell you who their traveling companions will be when they slam the door of the plane on November 24th when it leaves Washington. I know of several B.A.E. members, including a retired Admiral, who dearly wanted to go, and there was another disappointed B.A.E. chap whose son pilots C-ISO's. I think I can explain the passenger list best by saying that the news first appeared on the social pages of the only Washington Antarctic paper, THE WASHINGTON STAR. Honest! At the risk of making some of you cry, the others deemed worthy are Lucy Benson and Tom Pickering of the State Department, Senator Harry Byrd, Jr., Senator Henry Bellmon, Representative John Wydler, Drs. Norman Hackerman and Herbert Doan of the National Science Board, and Dr. David Mann and Rear Admiral Ross Williams of the Navy. What, no Amy? I wonder how many of them could identify Bernt Balchen, let alone Ashley McKinley and Harold June?

Bad News-Good News Department. We seem to have more than our share of bad news when

it comes to the health of our members. On the good news side, Board of Director member, Jerry Huffman is back in the office at the Division of Polar Programs, National Science Foundation, three days a week (Tuesday through Thursday) after his near fatal burning when his Porsche caught on fire at the race track back in April. He has to wear a protective suit over his whole body for a year, has to go to therapy twice a week, and will require more surgery later. I am sure he feels fortunate to be able to live in a cocoon, because even though he won't emerge as a beautiful butterfly next spring (Jerry wasn't overly pretty to start with!), it could have been a lot worse. It was surely good to see Jerry out for the Antarctic orientation session in September. Our Treasurer-Typist-Right Arm, one Ruth Siple, had the pin taken out of her ankle (broken ankle 15 June) and she is hobbling about at about 63% mobility.

Bad News-Good News continued. The whole Antarctic community was rocked late in August when they heard that Mary Alice McWhinnie had suffered a stroke and was in a hospital in Chicago, Everyone who knows Mary Alice loves the woman, and we in the Society were most fortunate to have her as a speaker a year ago this fall. It appeared that she was well on the road to recovery when she not only had a second stroke but a third one as well, both of which were more serious than the first. We are happy to report that she has improved greatly of late, even though only her family are permitted to see her. Her mind and brain are in great shape, she is off intravenous feeding and evidently is eating so heartily that the hospital has doubled their daily order from the Chicago stockyards. There is spastic paralysis of the arms, but she is undergoing therapy and there is hope. She will be in the hospital for several more months (Room 936, Mercy Hospital, 2510 South King Drive, Chicago, Illinois 60616). Send her a card, even if you don't know her, as she is a lovely person, an excellent scientist, a real credit to Antarctica, and a good "guy".

Special Event. TERRA NOVA is playing the Eisenhower Theater at the Kennedy Center from January 22nd through February 23rd, with no Sunday evening performances. TERRA NOVA is a story about Amundsen and Scott, their dreams and realities. It played in Anchorage last winter, and in Los Angeles last spring. The reviews in the papers, if they can be considered worthwhile, have been favorable. One of our Society members saw it in Los Angeles but did not go into ecstasy over it. But on the other hand, how often does Antarctica play the Kennedy Center? The cost of the tickets are Redskin -prices. We have been in contact with John Seward who handles block sales at the Kennedy. They do not handle groups of less than 20, and there is no reduction in ticket prices. Tickets Monday through Thursday will be \$13.50 in the orchestra, and \$13.00, \$11.50, and \$10.00 in the balcony; on weekends they go up to \$15.00 in the orchestra, and \$14.50, \$13.00, and \$11.50 in the balcony. With this much advance notice, we hope you can program your family dollars so you can attend. We are going to make Mildred Crary our program coordinator, as she is the one who came up with the idea, and people who have ideas are just volunteering in my book. So, I am asking those who have an interest to call Mildred on her new number 365-3730 (she hasn't left Bert, they just moved out to Bethesda to get away from their backyard neighbor, Art Buchwald!). Just tell Mildred if you are interested, what night would be your pleasure, how deep you want to go into your pocket, and then we will discuss all this prior to the meeting on November 27th.

I asked for it when I printed a list of geographic features named for members of the Society. First, my original research was not bad - I just left off names in my transposing. Second, I did not include delinquent members. We didn't have Bud Waite's correct address last year, so he fell through the cracks, and Bill Sladen was delinquent at the time! Greenbacks count more than rank and order in this austere regime! But with apologies and a red face, please note the following additions:

Abbot Ice Shelf after Rear Admiral Doc Abbot of Mobile, Alabama Bursery Icefalls after Commander Jack Bursery of Montague, Michigan Dater Glacier after the late Dr. Henry Dater, long time secretary of the Society DeGoes Cliff after Louie DeGoes, Executive Secretary, Polar Research Board, NAS Grass Bluff after Bob (South Pole) Grass of Broomfield, Colorado Halpern Point after Martin Halpern of Dallas, Texas  
Rawson Plateau after Kennett (BAE II) Rawson of the Concrete Jungle, N.Y.C.  
Shults Peninsula after Capt. Roy Shults, USN (Ret) of McLean, Virginia  
Waite Islands after Amory H. "Bud" Waite of Little America fame (see this News-Cape Waits after the same Bud Waite letter)  
Mount Hermanson after Capt. Marcus Hennanson, USN (Ret) of North Bend, Washington  
Mount Sladen on Coronation Island, South Orkneys, 60°41'S, 45°18'W, named by the British after Bill Sladen of Johns Hopkins University in Baltimore

We have it from a Most Beautiful Source, one that merits an ear, that there is also a Bentley Crag and a Bentley Subglacial Trench to go along with Bentley Mountain which was cited. It is meet and right that after all those years Charlie Bentley should have three features named after him.

One of the best known Antarciticans, and certainly one of Antarctica's most interesting sons, is Bud Waite. No matter where you go, you invariably get the question asked, "What is Bud Waite doing now"? Well the answer is trying to get his memoirs written, especially the account of his pioneering research in the radio ice depth sounding which has assured the name of Amory H. Waite, Jr. being preserved forever in the history of Antarctica. He lives in South Venice, Florida (3248 Valencia Drive), and the years have not been overly kind to this 78-year old youth who has truly lived with gusto. The Bicentennial year took its toll on Bud, as that was the year that he came down with Menieres Syndrome in his left ear. He was the Radio Operator of a local US Power Squadron of 300 odd boats, and had to give this up. But what hurt equally as much was that he had to give up his pride and joy, a beautiful fiberglass cruiser. That same year he was involved in OPERATION SAIL (what a magnificent event) when a misfortune befell him which has crippled him for life. He was putting up an antenna on a 200-year old ship when a rung broke loose, dropping Bud 30 feet to the deck, resulting in a broken hip. His right leg is now an inch shorter than his left leg, and he needs crutches to get around. Previous to this he had had his prostrate out, and was considered by the local hospital as one of their best customers. He must have been "snake bit", as a heart attack followed in 1977. He decided if he was going to die, he might as well go out warm and moved to Florida in 1978, buying a house that November. And then he had a perforated appendix, and Bud thought he had really cashed in the chips. But he recovered and only the good Lord knows what will happen to Bud next. Menieres Syndrome causes terrible buzzing in his left ear to the point of acute dizziness and nausea, so he can't stand the electric typewriter for any prolonged period. He desperately wants to get his life story done as his tale will be something that will stand the test of time. Among his accomplishments are "first communications across the English Channel for Ike on D-Day, development of the first radio remote controlled atomic weapons and their testing on 14 "A" bomb tests, origination of radio ice depth sounding techniques now carried on by nine nations, various studies of the electrical characteristics of ice that I carried on and kept the U.S. ahead in for ten years, first electronic studies at Cape Canaveral for the Missile Range, 64 flights over unknown areas of Antarctica and Greenland from 1958 to 1965 sounding 14,000 feet of ice, and my tremendous 1970 task of drawing the 49 full sized (24" x 36") technical details of our under-ice oil-carrying submarine patent." Bud wrote that ALONE does not even begin to tell the story of what happened back in 1934, and that his book will have it all. His letter told how "five of us went out on a lousy Citroen tractor in the mid-winter, walking and bouncing around in pitch darkness without eating or sleeping for 81 hours at 72° below zero." As you probably know, this was on the first attempt to get through

to the Admiral, a trip which had to be aborted, as did a second attempt. Bud wrote that Iceberg was the "worst looking spavined swaybacked looking bull calf that anyone ever saw." He saw Iceberg in North Carolina when he was giving one of his "3400 odd lectures." Bud was my first introduction to a real live Antarctic, and I can remember very vividly riding in a rumble seat on a bitterly cold night back in 1935 to hear Bud regale an audience in Thomaston, Maine about the 1933-35 Byrd Antarctic Expedition. Carl Eklund's brother dropped in to see Bud in Florida, and they had a hell of a good visit. Bud wants Dick Cameron to get off from dead center and find enough money to pay for the photographic parts of his book-to-be-written on "The Origin of Radio Echo Sounding."

Jack Bursey has written a short, 76-page book, ST. LUNAIRE, ANTARCTIC LEAD DOG, published by Glory Publishing Company in Grand Rapids, Michigan in 1974 and selling for \$4.95, which many of you folks, particularly dog lovers, might be interested in buying. It is rather a unique story and entirely different than any other Antarctic book I have ever read. St. Lunaire came from Newfoundland (as did Jack) and the book is all about the life of this dog who was bought for the Antarctic long before Jack was selected to go to the ice. It is a heart-rending story, a nice story, and it has a happy ending with St. Lunaire back in Newfoundland with the boy who had to sell him to help pay for his mother's appendectomy. A great book to give some dog-loving child for Christmas! And how many books do we have on the Antarctic where the man plays a subordinate role to his dog? You did a real nice job, Jack.

Hastings House has just published Capt. Finn Ronne's new book, ANTARCTICA: MY DESTINY. It should be in your local bookstore by the time you get this Newsletter. As we have not seen it, we're not going to comment on it. Most of you know Finn much better than I so you can use your own judgment on whether you want his latest book.

There is a new book out on penguins, one of those large books with many colored photographs. It is by a former member of the Society, Roger Tory Peterson, and is entitled PENGUINS. It has a good healthy price tag so it is only for those who have everything or do panic-buying the last week of Christmas.

Mark Leinmiller, the Eagle Scout who went to the Antarctic last year - the 50th anniversary of the trip made by Eagle Scout Paul Siple with Byrd back in 1928 - has learned the hard way about what the media can do to you. He made POPULAR PHOTOGRAPHY in September and BOYS LIFE in October. He is particularly upset with the latter, as they took one of his tapes and popularized it for the "8 - 14-year old readers." Each magazine includes colored prints of shots he made while at McMurdo, the South Pole, and Darwin Glacier. Presumably he is the cover boy on BOYS LIFE. At least there is a caricature of someone who slightly resembles Mark in a wild sort of a parka. We know it is supposed to be Mark as it says, "South Pole Scout: Camping on an Antarctic Glacier." Mark has been appointed to the Executive Board of the Boy Scouts of America, and will be in Washington for their National Executive Committee meeting on February 8th. We have hopes that we might get Mark to talk to us when he is in town.

The six Boy Scout finalists from a year ago all seem to be doing well. Mark and Steve (Allegheny College) Weirich were both at Philmont in New Mexico this past summer. Harris (University of Milwaukee, Green Bay) Buttz spent the summer putting together an environmental study program at Lands-Between-the-Lakes High Adventure Base in Kentucky. Harris was joined by Scott (University of California, Santa Barbara) Miller after he had spent most of the summer working (for the second consecutive summer) as an entomologist research scientist at the Smithsonian. Rob Moran of Texas visited Mark while he was enroute to the National Order of the Arrow Conference in Ft. Collins. Both Mark and Scott are members of our Society.

There are Antarcticans meeting somewhere. Paul Jacobs wrote from Adak that Antarcticans there had a Mid-Winter eve bash at the wrong end of the earth. Believe it or not, there are 15 ex-Antarcticans on Adak, which puts them into competition with

Washington as the largest active chapter. They are all military, dating back to a tractor driver on DF 58 (who is he, Paul?) to three who wintered over in DF 78. They had champagne and the works as the sun set at 2240 hours. They broke out their slides, scrapbooks, and dusted off their favorite lies. Oh yes, wives were included to make it a truly modern day Mid-Winter party.

The Polar Research Board at the National Academy of Sciences held one of their semiannual meetings in mid-October. As most of you know, the conscientious, hard working, efficient Executive Secretary is Louie DeGoes. Louie has held various positions in our Society, and is well-known, but how many of you realize that he is one of our glamor boys? He is a little bit over the hill now, but once he was an All-American football player. In fact, when SPORTS ILLUSTRATED came out with their silver anniversary issue several years ago they published pictures of the All-American team of their first year of publication, and there was Louie. Louie and three high school buddies from Los Angeles started out at Southern California, but left after their freshman year when they discovered that football players at Southern Cal were not supposed to be students - Louie and his friends were very naive. They wanted an education, so they transferred to the Colorado School of Mines in Golden, Colorado. Louie also played basketball against Curt Gowdy, when Curt was an All-American on the NCAA championship University of Wyoming team. Can you imagine either Louie or Curt making a legitimate college basketball team nowadays? You would have to put Louie on Curt's shoulder to make one bona fide player today. After Louie graduated, he was actively recruited by the Pittsburgh Steelers, the St. Louis Cardinals, and Uncle Sam. And you know who won. He became a navigator on the famed Billy Mitchell B-25 bombers, and he flew and he flew and he flew. When the war to end all wars came to an end, and they started adding up hours, days, months, and years, who appeared on the list of the Top Ten navigators in terms of flying hours but All-American Louie DeGoes. Louie is one of the real nice guys, and is on the Scholarship Committee at Colorado Aggie. If any of you people have a kid who is an A student in high school, who is 6'2", 205 pounds, and can carry a football 100 yards in 9.5, call Louie collect as he wants to talk to you.

Speaking of football players, everyone has heard of that all-time football immortal, the fabulous Bronko Nagurski, who never bothered to run around people but always took the direct course and ran right over everyone who dared to get in his way. It seems that he also used to wrestle around the mid-west, and an impeccable source who used to live in Minnesota and knew the Bronk told me that Nagurski once said, "I'll wrestle anyone except Larry Gould, but he has big feet and I am afraid to wrestle him because of his big feet." I swear it's a true story.

And while we are talking about Antarctic has-been athletes, let's not forget good old John Mirabito who was Mr. Meteorology at McMurdo during its first few critical summers. John, who has found peace, happiness, and riches working for NOAA conducting shuttle board meteorology diplomacy between Rockville and Nairobi (United Nations Environmental Program), was a baseball pitching phenomenon for the Boston Red Sox prior to World War II. He did his college hurling for Wake Forest, whose coach said that his Charley (curve ball for you straights) was better than Johnny Vander Meer's. Herb Pennock, one of Connie Mack's immortals, was high on John, and used to work diligently with him. Back in those days, baseball was big on the Eastern Shore of Maryland, and John pitched a no-hitter against the Yankee farm team at Easton. He pitched an extra inning game which might have contributed to baseball history. His second baseman, Bobby Thomson, the Staten Island Scot, made three consecutive errors behind him at second and John lost the game. Thomson went on from there to become an outfielder, and hit that miraculous home run against the Dodgers on October 1, 1951 that was heard around the baseball world. John made it to Montreal before World War II beckoned him. Leo Durocher heard about his pitching in the military, and after the war asked him to come to Brooklyn to work out.

John and his C.O. hopped in a plane and flew up to Floyd Bennett Field so John could work out in front of the Lip. John was happy in the military, and decided that he wouldn't give it all up unless Leo tossed in a house. Leo had no houses that week, and John stayed with the military and instead of Ebbets Field it became McMurdo Sound. Wasn't he lucky!

Jim Zumberge regaled the 1979-80 Antarcticans with a little bit of the old and a little bit of the new at the orientation lecture in Washington on September 16th. One bit of vital Antarctic history should be cleared up - his tidbit about "goobers beer." There were three beers in Antarctica during the IGY (but don't tell this to people who wintered over at Byrd in 1957, as all they had was one case for the whole camp for the whole year!) - Budweiser, Pabst, and Schlitz. Needless to say, all beer was stored outside, which meant all beer was frozen. And when they thawed, one brand noted for teams of horses, a St. Louis baseball team, and Ed McMahon turned up with goobers floating around in it. It also gave one the trots, which meant that Pabst and Schlitz were the front runners. Wonder if today's Bud has goobers?

Work on the USGS "Satellite Image Atlas of Glaciers" is progressing smoothly according to Co-Editors Richard S. Williams, Jr. and Jane Ferrigno. The Atlas will consist of articles written by 50 or 60 scientists from over 40 countries concerning the geographical distribution of glaciers as well as other topics in glaciology and related environmental phenomena. The optimum satellite imagery to be used by the authors of each chapter has been received by the USGS and is in the process of being distributed. Charles Swithinbank, of the British Antarctic Survey, is the senior author on the Antarctic chapter. Bill Schoonmaker, a member of our Society, is the junior author. The chapter will discuss the various types of glaciers of Antarctica. In addition, an index map of Antarctica showing nominal scene centers of Landsat images along with a table identifying the optimal images to date for each locality will be presented.

We have some big-time travellers in our Society, but I would imagine that Doug Waugh is the greatest of them all. I met Doug back in his halcyon days when the American Geographical Society was a healthy and thriving organization, and he worked with the late William Briesemeister. He was responsible for putting all those place names on the Antarctic sheets, hand lettering the entire 1:5,000,000 map of Antarctica back in 1957, updating it as new information was received. This has become the standard map for the continent. After 16 years with the ACS, he had to bite the dust when they cut back their staff. He's now with the American Electric Power Company, and really misses his Antarctic connection. He still travels annually (32 consecutive years of going abroad) and has now been to 120 countries on all seven continents.

There is a growing interest in Antarctic books judging by the mail we are receiving. Would anyone in the Society be willing to prepare a list of their favorite books, as we keep getting requests for what has been published? I understand John Roscoe is a real authority on Antarctic literature. We did ask John whether he would prepare a list of his top 25 for publishing in the Newsletter, but have not heard from him. Hey, Dr. Mucfcluck Milan up there in Fairbanks, you are a walking encyclopedia on the polar regions, why don't you leave the Eskimos alone long enough to compile a reading list for us? I suppose we could have a contest to see what the runner-up to THE WORST JOURNEY IN THE WORLD would be! The expedition which always impressed me was the Norwegian-British-Swedish Expedition to Maudheim, 1949-51. The list of scientists who participated in that expedition reads like a Who's Who in Antarctica. John Giaever's THE WHITE DESERT is an excellent book on that expedition.

Future Programs. We are going into respite as far as a December meeting is concerned, as you Washingtonians have shown us that you don't want to be disturbed when you are getting ready for the holidays. It takes time, but we do get the picture

eventually. But we are lining up some good ones for next year, and if variety is the spice of life, we should do well. Occasionally, very occasionally, maybe once or twice in a lifetime, you run into someone who is truly outstanding, and I had the privilege of sailing with such a man, one Mike Benkert. I was a lowly weatherman on the North Atlantic, and he was the exec on the USCG YAKUTAT. He went on to greater fame and glory, became an admiral without any great trouble, and recently retired from the U.S. Coast Guard where he headed up their entire ocean pollution program (Mike wasn't polluting it, he was trying to clean it up). Well, Mike has promised me that he will speak to the Society, and I can't wait to hear him as he is truly a Legend in the Annals of the Coast Guard. He skippered two ice-breakers, and made three trips to the Antarctic in the mid-60's on the EASTWIND. Some of you no doubt remember that he was trying to traverse the Arctic Ocean north of the Soviet Union, and the Russians told Mike where to go, but in true Benkert fashion he ended up telling the Russians where he was going. He was made out of the same mold as Bert Crary. Mike's a man's man. This doesn't mean that women should stay home when he talks, as that kind of person can charm the skin off a snake, too. Look for Mike in January.

Then we hope to have the Boy Scout for a speaker in early February. This will be rated F for family, and everyone should bring a boy even if they have to get one off the streets of Washington. If you can't find a boy, bring a DAR member! They would love Mark Leinmiller, too.

We are asking Lindblad to come and tell us what it is they are doing so right that people are booked ahead for second and third cruises. We have a small segment of tourists in our membership, and the rest of us should get to know something about that Antarctic Fantasy which attracts so many to pay so much to have such a great time. Hopefully this will be in March.

We have asked Charlie Bentley to give the annual Memorial Lecture. We feel that anyone who has been the recipient of so many tax payers' dollars for doing research year after year, ad infinitum, must have one hell of a memorial story to tell us. He hasn't said yes, but he hasn't said nyet either. We imagine that Marybelle will provide us with the correct answer at the proper time.

In a continuing effort to identify members of our Society to counter some comments expressed in letters to the Society that we are a bunch of no-names, we are publishing a list of our members who have wintered-over at various Antarctic stations. If your name is missing, it is because you never indicated your station and year on the membership form.

Relative to the above, I have been attacked in one corner by being out-of-touch, that the real work in Antarctica is being done by the summer-time scientists, and that this is the name of the game today. I duly noted that the person who said this had never wintered-over! But because I respected his judgment, I thought he might have something. Then one of my impeccable sources told me that he had heard Mary Alice McWhinnie say just how great it all became when the summer folks went packing on back to Washington, Columbus, Boulder, and Menlo Park, and the wintering-over people were left alone to do their work. Now next to Bert Crary, there is no Antarctic I admire more than Mary Alice. So if she still feels that way about the glory of wintering-over, that is good enough for me. I do think the hard core of the Society are the wintering-over types. If you look at our membership you will probably find more who have wintered-over than you will penguins who return each austral summer. One of the good old boys who was hospitalized last spring, Henry (B.A.E.I) Harrison is in good health and enjoying life in Asheville.

Have you noticed that penguins are showing up on everything, umbrellas, ladies' shopping bags, even linen? Woodies, which is as Washington as bean soup and cherry trees, had a mid-October sale on sheets and pillow cases with penguins and top hats and canes and the works. But that was nothing compared to the penguin mugs which Bloomingdale's is selling. I picked up a couple for the incumbent treasurer of the Society, who is a long-time penguin fancier, and arrived at her house bubbling over with pride with my new purchase. I suggested we baptize the mugs with some hot chocolate, and as she is a sucker for a party anytime, she immediately went to the kitchen to make some. With full cups of hot chocolate, we toasted the Society - well, almost. As she raised her cup she screamed, "My cup is pornographic." I took a better look at my cup, and sure enough, penguins were all around the cup in all sorts of compromising positions. Not knowing exactly what to do or to say, I took a good long swallow and uttered something like, "You know, you're right, but they looked like such good penguins that I never suspected." It would take a boy penguin to recognize a girl penguin, anyway, and I am sure that these penguins must be from Charcot or Dumont D'Urville, not from Cape Crozier or McMurdo. You know, you never could trust those French penguins.

There is a brand new book out published by the Columbia University Press called LITTLE AMERICA: TOWN AT THE END OF THE WORLD written by Paul A. Carter. There are 261 pages of text, and it sells for \$15.95. As Madame Treasurer has just received it, there hasn't been time to read it. It is primarily about the early Byrd expeditions, but does go up to the early 1970's. The name is a bit misleading, as I noticed he even wrote about the Ronne Antarctic Expedition which was a couple of leagues away on the Antarctic Peninsula.

We are going to offer a few Antarctic type things for sale. You'll find the order form on the next page. This is essentially for out-of-towners, so you localites please do your buying at our meetings and save us the mailing, okay?

1. Antarctic wall calendars with large colored prints of typical Antarctic scenes. As these are made in New Zealand for the US Navy, we have to purchase them through the USARP representative in Christchurch. As of press time (20 Oct.) we have no price on them. Presumably \$4.00 will cover the cost of the calendar and mailing. Based on last year, we can get them out before Christmas. We will honor all purchase requests for out-of-town mailings received by 10 December when we will close the sale. They will all be mailed at the same time, on or about 15 December.
2. Special 50th anniversary note paper prepared for the National Science Foundation honoring the South Pole flight of November 29, 1929. Blue and white scene of South Pole with Tri-motor coming in for landing. Available immediately. \$1.00 for single, folded note paper with envelope, or 6 notes and envelopes for \$5.00.

At a later date we hope to have a limited number of these envelopes stamped with a cachet (made especially for the occasion of the 50th anniversary of the flight) and cancelled at the South Pole on November 29, 1979, for sale to Society members. The price on these will be \$2.00 each. These will also include the note paper inside. Better get your order in early to make sure you get some. At this time, sales will be limited to 5 per person.

3. Special shoulder patch which will be worn by USARP men and women in Antarctica this year. Comes in four or five colors, depicts a map of Antarctica, at an oblique angle, with Ford Tri-motor coming in for landing. Made especially for Holmes and Narver. We will be selling these for \$2.00 each.

We are not in competition with the Ship Store at McMurdo or with L. L. Bean. And it is no fun processing the paper work, packing and mailing, especially when there is no kickback! So if you do order, use the blank on the other side and be patient.

Order for following Antarctic items:

#1. 1980 calendars \_\_\_\_\_ \$4.00 each \$ \_\_\_\_\_  
No.

#2. Byrd 1929 Flight Anniversary \_\_\_\_\_ \$1.00 each \$ \_\_\_\_\_  
Note Paper No.

\_\_\_\_\_ Set of 6 for \$5.00  
Sets

#3. Official Antarctic Cachets of item #2 above,  
cancelled at South Pole (limit of 5 per person\*) \$ \_\_\_\_\_

\_\_\_\_\_ \$2.00 each  
No.

\_\_\_\_\_ Total of enclosed check \$ \_\_\_\_\_

1980 Antarctic Calendars

50th Anniversary Flight Cachets

ON SALE

This column does NOT in any way present any official position or thinking of the Antarctic Society on any of the subjects covered in this column. Bergy Bits is strictly the prejudiced voice of the candid president, with topics selected by himself. Much of this issue will present material relevant to the tragic air crash of the Air New Zealand tourist flight on 28 November 1979. We wish you to bear in mind throughout your reading that the final report resulting from ongoing investigations will not be completed for another three months, and then the OFFICIAL report will be submitted to the New Zealand Minister of Civil Aviation. However, we feel that our members would like to be updated as much as possible on the information which has been released to the media, and consequently we have devoted a large part of this issue to happenings on Black Wednesday.

How does one start a tale so sad as the one about the crash of the Air New Zealand DC10 tourist flight of 28 November 1979, the blackest day in the whole history of the white continent? I was one of the many Antarcticans who called Peter Mulgrew a personal friend (see Newsletter of September 1979). On board were the former director of the Atmospheric Science Laboratory at the White Sands Missile Range, Dr. Henry Thompson, and his wife. A polar climatologist from an American university, J. G. Houghton, who was spending his sabbatical at the University of Otago, was also among the unfortunates. I'm going to devote a lot of this issue to Peter Mulgrew. If your life was not enriched by knowing him personally, you should know something about this remarkable man who lived with so much gusto.

First of all, where was it? Well, the media refers to the crash scene as being on Mt. Erebus. I would prefer to say that it happened on the coast of Ross Island, on the lowermost slopes of Mt. Erebus. I have traced a sketch map which appeared in the Christchurch Press of December 13th, and I think this will give you as good an idea as any as to where it happened:

The aircraft was descending about 60 kilometers east of the normal track into McMurdo, which is shown above as a dotted line. Forty minutes behind the DC10 was a USAF Starlifter carrying the VIPs who were also bound for McMurdo prior to taking the Little America-South Pole Memorial Flight on the 29th. The late Admiral Byrd's grandson, Robert Breyer, was aboard that VIP flight and he was later quoted in a New Zealand newspaper to the effect that their pilot overheard the pilot of the DC10 saying that he was descending to 600 meters. The newspaper said the airline's minimum altitude was supposed to be above 1800 meters. The plane was supposed to be bound by V.F.R. (Visual Flight Rules) restrictions when descending over the region. Civil Aviation regulations require pilots flying under VFR to maintain specified horizontal and vertical distances from all clouds. Standard set for aircraft flying less than 3000 meters above sea level is a visibility of 5000 meters through an area "clear of cloud and in sight of water". The DC10 was travelling at about 650 kms/hour, which meant that barely .10 seconds had elapsed from the time the aircraft passed over the coast of Ross Island until it slammed onto the snow surface at an elevation of only 450 meters. There was a short warning to the pilot, as the last few seconds of the tape revealed that the automatic alert "Whoop! Whoop! Pull Up! Pull Up!" was activated by the ground proximity warning system. The alert 'was heard four times, and it is estimated to have lasted about six seconds. The crash occurred less than 2 kms from the coastline, on a slope of 20 degrees. There was a solid definition of the DC10 imprint on the snow, with both wings and the fuselage clearly depicted, showing the tremendous force of the impact. As the imprint included virtually the entire underside of the plane, it indicated that the aircraft was in a slightly nose-up situation as it struck the mountain slope. There was a 500 meter long trail (upslope) of debris from the accident, and the width extended 200 meters. The tail piece was catapulted to the far end of the trail, and was the biggest single piece of the plane. Another section which was recognizable was a wing tip, and a set of wheels was nearby. There is no way that any passengers could have humanly lived through the tremendous concussion experienced upon slamming into the snow.

The sketch map has a small "x" to the west of the crash site. Twelve minutes after the DC10 crash, a U.S. Navy helicopter, returning from a routine mission, was forced down there by bad weather. They landed within seven kms of the smoldering DC10 but never realized that the wrecked plane was nearby. The helicopter remained on the snow surface for 50 minutes waiting for a low cloud to clear. At the time of their takeoff, the crash site was still concealed beneath a cloud veil. There was a 10-hour delay in finding the wreckage as none of the DC10 five emergency locators was transmitting. There was good reason why four were not transmitting, as they have to be manually activated. The cockpit voice recorder contained two words said by the crew after the ground proximity warning system sounded seconds before the impact. The cockpit recorder and the flight data recorder are being analyzed by U.S. experts. The full transcript of the voice recorder will NOT be made public, as recorders are accepted by crews only as a flight safety aid. Occasionally extracts are published in final reports, but only when publication will make some contribution to flight safety. The accident investigation is now focusing on the aircraft navigational system. Studies so far have cleared the DC10 of any major problem.

The Christchurch Star of December 13th quoted a lawyer specializing in aviation crash damages claims as saying "potentially this will be the most complicated litigation in the last 10 years." Among the problems cited were 1) sovereignty of the crash area, 2) New Zealand no-fault accident compensation law which apparently rules out payments on behalf of victims, and 3) indication that New

Zealanders can't sue for damages, and U.S. law which allows actions to seek just compensation. Legally, as well as physically, the crash could scarcely have occurred in a worse place. Passengers were not covered by accident compensation after the plane was 12 nautical miles off the New Zealand coast. The crew was covered, Mulgrew was covered, as well as all journalists and photographers. American Express insures all card purchasers with \$75,000 under its own travel accident insurance scheme, and they have indicated that the dependents of the nine passengers who used their American Express Company cards will receive the stated amount. In a "believe it or not", when next-of-kin went to the parking lot at Auckland Airport to removed the deceased's cars, they had to pay \$2.00 a day for each day the car was in their lot. This computer age has no heart.

Let's flash back to October 15th's Christchurch Star. In bold headlines, at least an inch high, stood "Pole Overflight Airlines Likely to be Warned." The byline was from Washington, D.C. and the first sentence read "Air New Zealand and Qantas probably will be warned soon that an emergency landing in Antarctica would not get an adequate response." Eight days later, the same newspaper, the Christchurch Star, interviewed Bob Thomson, Superintendent of the Antarctic Division of the Department of Scientific and Industrial Research (and our October speaker) about Air New Zealand sightseeing day flights. Bob said, "There are no problems. The flight crews are in radio contact with the U.S. Navy at McMurdo and the nearby Williams Air Field. I think that people should have the chance to see something of the place. It's better for them to be in the air than walking about McMurdo. I think the chances of a mishap involving an aircraft are one in many millions." He probably wasn't the best person for the newspaper to ask as he was personally involved serving as one of the guides on Air New Zealand Antarctic tourist flights. Bob Miller was the guide on the first Air New Zealand flight this austral summer, followed by Ed Hillary on the November 14th flight, Bob Thomson on the November 21st flight, and then Peter Mulgrew on the ill-fated flight of November 28th.

This was Air New Zealand's 14th tourist flight to Antarctica. The first one was on February 15, 1977. They had one more that summer, and since have scheduled four a season. Fourteen hundred people have made the 12-hour journey which costs \$NZ359. The plane which crashed was one of Air New Zealand's newer DC10s, having been delivered on December 14, 1974. One thing which was hard for me to imagine was that the Antarctic flights were not equipped with special survival gear and that passengers all wore their own clothes from home. Qantas had an Antarctic tourist flight scheduled four days after the crash, and it was allowed to go. They did, however, outfit their passengers with polar gear. There was some un-happiness in New Zealand over this flight, particularly when the plane supposedly flew over the recovery site. The Qantas flight was a fund-raising venture by the Australian Boy Scout Association and was fully booked (over 300 passengers).

There are all kinds of sad stories connected with this crash. A 63 year-old manufacturer from Tauranga, Edward James Palmer, took his two sons and his son-in-law with him on the trip. Four wives waited in vain for their return. There was a 71 year-old hermit by the name of Watty Thompson, who mined gold in Central Otago and lived in a windowless, corrugated iron, kerosene-lit hut. The one thing in life which he always wanted to do was to visit the Antarctic, and a good friend paid his passage on a trip last year. He went but never saw anything as the continent was socked in with clouds and the pilot circled and came back. His good friend then bought him another ticket this year. He has yet to see Antarctica. Antarctica is certainly for all ages. The victims included an 85 year-old gentleman from Pakuranga, Alexander Plumber, and three young ladies of 82 (Myra Harty of Auckland), 78 (Mrs. Bryn Gibbs of Wellington) and 76 (Valgria Rawlins of Mount Hope).

The hostesses were all beauties, and one, Susan Marinovic, had spent most of the past year working diligently so that 230 disadvantaged children could fly to Disney World. A primary school teacher who was teaching a class on the Antarctic, Christine Margaret Nicholson, went on the trip just to get some additional knowledge about Antarctica. A former rugby wing great, David Balmer of Auckland, was aboard. Three people who thought they were lucky as a result of winning raffle tickets found out they were actually losers: Mr. and Mrs. Frank Kerr of Auckland and Constance Trevor Maskelyne of New Plymouth. The plane carried 180 New Zealanders, 24 Japanese, 22 Americans, six British, two Canadians, and one each from Switzerland, France, and Australia. Only 92 bodies were identifiable. It was the fourth worst air disaster in history, the very worst disaster in the whole history of New Zealand, which included a great earthquake disaster.

Now, if you will please bear with me, I would like to tell you about Peter Mulgrew. Like nearly all of you, my first word about the crash came early on the morning of the 28th. Later at work, a man walked over to my cubicle and said that he had just heard over NBC news the guide's name and that it began with an "M". I got a sickening feeling in the pit of my stomach, as I knew it had to be Peter. I called up NBC in Washington to find out if it were so. They denied it, saying their release, was inaccurate. But the afternoon paper confirmed that Peter was the guide. I knew Peter well, as he stayed with us at the South Pole from the date he arrived with Ed Hillary, January 4, 1958, until the last plane left the Pole that summer on January 26, 1958. He was a very outgoing sort of a chap, and he drank tons of our coffee during those three and a half weeks. My journal is full of notations about Peter. I also should hasten to add that he volunteered for the worst job in camp, permanent KP on pots and pans for the duration of his stay. That tells you a lot about the man.

Peter thrived on action, and he turned to the Navy after graduating from Lower Hutt Memorial Technical College. Later he was also to graduate from the Royal Naval College in Greenwich. He became one of Ed Hillary's most trusted mountaineers and closest friends. These two swashbuckling comrades truly led lives of high adventure until fate cruelly struck both of them down in the 1960's. While both were in their active prime, they came to the Antarctic in 1957 and wintered over at Scott Base that year. While at Scott, prior to the onset of the winter season, Peter, Harry Ayres - a famed New Zealand mountaineer who taught Hillary how to climb mountains which seemed to be forever getting into his way of life, Murray Ellis - another fine Kiwi mountaineer and one hell of a nice guy, and Jim Bates took a trip to Cape Crozier. Imagine the fun these good friends must have had repeating the epic trip that Cherry-Garrard immortalized in his "The Worst Journey in the World". Later on Peter, Murray, and Jim were to go on a much longer oversnow trek, accompanying Ed Hillary to the Pole. While at the Pole, I taped Peter's feelings about being at Cape Crozier. They had found one of the sledges left by the earlier party, even found some of Dr. Wilson's drawing pencils. Peter said that the things left behind were in such fantastically good shape that it gave him an eerie feeling, and he turned to Murray and said, "Murray, I have this very strange feeling that Dr. Wilson, Cherry-Garrard, or Birdie Bowers might walk up this slope at any moment and tap me on my shoulder." And Murray answered, "You know, Peter, it would not surprise me either, as I have the very same feeling". For those of you who have been to the Antarctic Museum in Canterbury Museum in Christchurch, you may recall having seen some of the things which they brought back from Cape Crozier.

Peter was reunited with Ed Hillary shortly after the IGY when he went to the Himalayas with him in 1961 on the Anglo-New Zealand Mountain Expedition. Peter was climbing Mt. Makalu (a giant of a mountain at 27,824 feet which lies adjacent to

King Everest), and he started to suffer pulmonary edema at about 21,000 feet. He was climbing with an American when he finally collapsed within 120 meters of the summit, suffering severely from thrombosis and crippling frostbite. Both legs had to be amputated below the knees and he also lost several fingers. So goodbye to his beloved Himalayas. Hell no, just an interlude while he got used to his new legs. He was back with Ed Hillary in 1964 on the Himalayan Schoolroom Expedition to build school houses in the highest mountain village. Two years later he went back again with Ed on the Himalayan Hospital Expedition of 1966. He was voted one of the outstanding young men of New Zealand by the Jaycees in the early 1960's. He went into business, and occupied top executive positions with several New Zealand companies. At the time of his death, he was Managing Director for the large American company, W. R. Grace, Ltd. in Wellington, and he served on the Board of Directors of AHI Aluminum, L. J. Fisher and Company, Fisher Windows Ltd., and Hylock Company. Then there was yachting to be tried after he lost his legs, and he became one of the very best. He was the New Zealand representative in the World One Ton Yachting Championships off Sydney in 1972. The following year he went on a yachting expedition to Cape Horn. Peter has authored several books: NO PLACE FOR MEN, GENTLEMAN'S MAGELLAN, and I HOLD THE HEIGHTS. What a guy! He remained slim and in great shape throughout his life. We had hoped to have him as a Society speaker sometime this year as he wrote me last summer that he would be coming to New York City this winter and would be getting in touch with me. His last breath was almost spent in his best element - a snow mountain environment. The bad part was the timing, as he was only 52 and had just started to live, and the fact that Peter went on the lower slopes. He was no one for the lower slopes, he was a Summit Man. He had many dear friends in this country, and was a national hero in his homeland. I guess there is not much more to say, Peter. I feel honored for having known you for ever so short a time, you were truly a great bloke, a real achiever, and an inspiration to both the handicapped and the fittest. We are sure going to miss you, fella, but the good guys will be catching up with you later. But one thing, Peter, I don't think that you should tell Scott, Shackleton, Mawson, and Amundsen that you were in a big steel bird that held 257 people and that you all ran smack into Erebus at some godawful speed. Let them think of Erebus as tall, majestic, beautiful, pure, a welcoming beacon to all arriving in Antarctica. And when Scott asks about Siberian ponies, tell him that they now have learned how to survive on snow, that they are all over the Ross Ice Shelf, and that some even walk up a pony trail on the Beardmore to graze on the Polar Plateau. And if Amundsen asks whether people are still sledging with dogs tell him, "They sure are, Roald. They tried mechanized vehicles once, but they were an utter failure. And then just a few years ago the United Nations outlawed all vehicles on the ice." And when you see Sir Hubert, don't tell him that the place is overrun with women. You know Sir Hubert never got married until he was 40 when he tied the knot with that Ziegfield Follies queen, and that wasn't exactly his greatest polar connection. Tell them the good stuff, how there is an International Peace Treaty, how many nations pool their scientific talent to complete large studies, and for a lark, tell them that we still have oddballs who think the West Antarctic Ice Sheet may go surging towards the Ross Sea. You have a lot to tell them, Peter, but at least now you have time on your side.

What happened to the VIP flight? They got into McMurdo all right that afternoon, and waited with all other hands for word about the overdue, unheard-from plane. Finally, early on the 29th the plane had been found, and it had been determined that there could not have been any survivors. They all went to bed, and when

A MOMENTO OF HISTORIC EVENT - BUY A CACHET

they awoke Larry Gould said something to the effect that this was no place for them to be when so much important recovery work had to be done. He proposed returning to New Zealand to allow the camp personnel to get on with their work. However, a Congressman overruled Larry and said he thought it best, since they were already at McMurdo, to complete their mission by having a quick flight to the Pole and then return to New Zealand. Larry never went on the flight as he "had not left anything at the Pole." The rest flew to the Pole on the 30th but they did not re-fly the old flight path from the Bay of Whales; instead they went via the Beardmore Glacier International Highway. They were only at the station for a short cup of coffee, but in the few minutes they were there, Senator Harry Byrd endeared himself to camp personnel by his warmth and friendliness. It was a return for the late Admiral's grandson, Bob Breyer, as he had been in charge of the construction party which helped to build the current South Pole station. I have no idea how Norman Vaughan enjoyed the trip. Every interview with Norman in the New Zealand papers was about his current dog sledging activities in Alaska, and his Antarctic involvement was masked. The plane flew back to McMurdo, picked up Larry, and returned to New Zealand. I thought about getting Larry to give us his impressions of it all, but then I thought this gentleman deserved to be left alone with his family over the holiday season.

I imagine most of you saw Larry on Uncle Walter's evening CBS news broadcast that fateful week. CBS sent a three-man crew to the Antarctic, and they captured Ed Todd and Larry Gould at the museum in Christchurch (if my information source is correct). I thought Dr. Todd had blown it for sure when he was telling the taxpayers how they were spending some fifty million dollars a year at the end of the world, telling the people in Peoria that what they were getting for this kind of money was information on what the surface of the ground looked like beneath some of those glaciers. But then they interviewed Larry and asked him if it were important to find out those kinds of things. I thought Larry was going to leap right out of his parka and go for that guy's jugular vein, right there in front of millions of evening news watchers. But he restrained himself at the last second, bristled back smartly with something out of Cherry-Garrard to the effect "when men lose their scientific curiosity for finding out the kind of information being learned in the Antarctic, he ceases to be man." At that time I was in the Executive Office Headquarters of the Antarctic Society (another name for Ruth Siple's dining room table) and we gave you a rousing S.O. for that, Larry. How do you ever get so smart so young? And let me tell you, Larry, you looked your true age that night, a youthful 28 years. Larry Gould is going to have to live eternally, as there is just no voice like his who will tell it as it is. I like guys who don't cop out, and we have a lot of "copper-outers" in the Antarctic. You can easily recognize them as they will tell you that women are the greatest thing to ever happen to the Antarctic! But from Larry you will get the truth. I like a statement that he gave the New Zealand press to the effect that he hopes "they never find any resources in the Antarctic which are worth a nickel" as he wants the continent preserved as it is. Sir Hubert actually carried this theme one step further in a much saltier farewell statement to the departing IGY scientists at Davisville, Rhode Island, in mid-October 1956, when he pleaded with the men to preserve the purity of crevasses!

There were some fine ceremonies commemorating the 50th anniversary of Byrd's flight over the South Pole. Peter Anderson of the Institute of Polar Studies was our Commemorative Lecturer, and he did an outstanding job. He presented a most scholarly professional discourse on Admiral Byrd. We taped it for posterity, and I am sure

CACHET OF 50th ANNIVERSARY OF FIRST POLE FLIGHT (see page 15)

that other historians of the Antarctic will find it of great interest. It was ironical that at the same time the Washingtonians were filing into the commemorative meeting, the plane was crashing on Ross Island. We had several out-of-town members, including Constance Swan from Boston who comes down for quite a few of our meetings. She even stopped off in New York two nights later to attend the American Polar Society meeting commemorating the historic flight. Our heartiest congratulations to Dick Black on becoming the most recent honorary member of the American Polar Society. He was formally inducted at the New York meeting. Ruth Siple went along just to be sure that it was all done with the proper aplomb.

An excellent meeting was arranged by the Winchester-Frederick County (Virginia) Historical Society on November 15, 1979. A formal dinner at the local country club preceded the large program at Handley High School. Larry Gould was the Star of the Show, and he did not disappoint anyone. Like the true superstar that he is, he can always reach down into his rich repertoire of proper things to say at the proper time, and this was no exception. After being the glamour boy/honored guest during a long cocktail hour, sitting through a lengthy dinner in which he was sandwiched between two dowagers from the landed gentry of Virginia horse country, listening to several speeches from others on the platform, Larry hopped up to the podium like a six year-old coming out of a cold shower and said, "It certainly gives me a nice warm feeling to be here tonight in the company of such a lovely flock of Byrds." If he didn't own the house before, he did then. I thought he was great last spring as our Memorial Lecturer, and he was, but he even outdid himself on this night. It was all about Little America and Admiral Byrd, and the night ended much too early. Wouldn't you love to take the clock away from Larry and just turn him loose? Dick Black gave a very touching talk on his last visit to Admiral Byrd - (Dick was one of fourteen selected to visit the Admiral a month before he died, and he vividly recalled this intimate visit. Admiral Arleigh Burke led the group to Boston, knowing this would no doubt be the last time any of them would ever see Admiral Byrd alive. At the time he was down to some 80 pounds. It would be good to have Dick put all of this onto paper.) Both Byrd daughters were there, as well as one of the grandsons and a granddaughter. Senator Byrd was a late arrival, but he still had time for a speech. The Senator said he hated the cold, but it was obvious that he would not be giving up his seat on the VIP flight to the Antarctic which left a week later! After the meeting, the Senator pressed skin while Larry signed autographs. The U.S. Navy Band was there for pre-meeting listening and enjoyment. It was taped for local televising and we hope to get a copy of the tape. Coming back to town, I had my beautiful 1962 Ford under full control at 50 mph when the Senator and his Cadillac went by in overdrive. I often wondered how fast senators drove at night in their home territory. I still don't know!

Senator Harry Byrd has a daughter who is a well known international photographer by the name of Beverley Byrd Greenhalgh, and she was in New Zealand "shooting" (she has a book of photographs coming out on the Dunedin area) at the time her father was going to the South Pole on the VIP flight. She was working at a beach location near Wellington when an elderly fisherman came along and told her about the plane crash in Antarctica. She identified herself, and told of her father being Admiral Byrd's nephew and that he was in Antarctica. The fisherman told her that he had been a member of the crew on two of the Admiral's ships, the CITY OF NEW YORK and the ELEANOR BOLLING. Then he helped her find out the details about the crash. Small world, isn't it? Ed Roos was on the CITY OF NEW YORK. Do you know who the fellow might have been, Ed?

ANTARCTICA IN COLOR - BUY A CALENDAR (see page 15)

One of the great young Antarcticans, Epaminondas James "Pete" Demas, a native-born of Allisos, Greece, passed away at age 74 on November 17, 1979 in Granada Hills, California. Without a doubt Pete was the most well-known and best loved Grecian Antarctic. He was a victim of hepatitis (and other complications). However, the serious nature of his illness was not known to his family until seventeen days before he died. So the short-on-stature, high-on-polar-achievement "Byrd man" did not suffer for long. And there was no one who wore the designation of "Byrd man" more proudly, as he was always a staunch loyalist of the late Admiral. He was only 11 when he came to the States, and was a graduate of McKinley Tech High School in Washington, D.C. As a high school student he had soloed in a Curtis Jenny, and was smitten by aviation. He accompanied Commander Byrd on his North Pole Expedition in 1926, and the next year was with Byrd as he prepared for his Trans-Atlantic flight in 1927. And, of course, he went south with him on both the 1928-30 and the 1933-35 expeditions. Somehow or other, between and around expeditions, he achieved a boyhood dream of going to college. He was a graduate of New York University and also attended M.I.T.

The news on Mary Alice McWhinnie is anything but good, and the family is prepared for the worst. Ruth talked to her sister, Vivina Ortner, on New Year's Day. Plans were to move Mary Alice on January 4th from the rehabilitation hospital into a convalescent hospital. Father John R. Cortelyou, C.M., president of DePaul University, goes to the hospital twice a day to see Mary Alice, and her sister goes every day to give her lunch. She said that Mary Alice has not really communicated with them since last September. It has been particularly hard on Father Cortelyou as she used to help him so much with university work. Vivina said that Mary Alice "needs medical help like you would not believe." It is going to take a near miracle to turn things around now. Please remember her in your prayers.

Richard Konter, who at age 97 was the oldest living member of any of the Byrd expeditions (he was a member of the crew of the CITY OF NEW YORK), passed away in August. You know, there is still one surviving member of Scott's 1910 expedition, Bill Burton of Richmond, New Zealand. He was a member of the crew on the TERRA NOVA. He was not a volunteer, as he joined the Navy at age 19 and later found himself assigned to the ship - much to his great pleasure. He lives alone with his dog, and is my kind of a man - still uses a hand pusher for a lawn mower, the only manly way to do it.

There was a short article in one of the Christchurch newspapers stating that the bodies of Scott's ill-fated party returning from the South Pole are about to be committed to the sea. They perished some 125 kms from the barrier edge, and some scientists (unnamed) have figured that it is about time the ice entombing them would have reached the stage of breaking off. If so, they were silent residents on the Ross Ice Shelf for 67 years.

I'm anxious to read the new book on Scott and Amundsen which has created such a storm in the U.K. I saw and read serializations from the book in a Christchurch newspaper and found it most interesting. I used to work alongside the late Sir Hubert Wilkins, and enjoyed listening to him talk about the old boys. The book evidently substantiates some of the things which Sir Hubert used to say about Scott's abilities. The serialization which I read quoted several times from letters from both Lawrence Oates and Apsley Cherry-Garrard. Both men were from the landed gentry and both paid a thousand pounds to Scott to go on the expedition. Both were well educated, Oates being a graduate of Eton, Cherry-Garrard from Oxford. Oates was an officer in the Inniskilling Dragoons, played polo, went shooting, rode point

ALL ENGLISH LEATHER MEN NEED SHOULDER PATCHES

to point, kept a yacht and a racehorse or two. He evidently had a miserable time as he wrote, "I dislike Scott intensely and would chuck the whole thing if it were not that we are the British Expedition and must beat the Norwegian." He said that Scott was the most absent-minded person he had ever met. I knew that Cherry-Garrard was a man of great means as I recall Sir Hubert saying he wanted to do one thing of significance in his life, and decided that it would be going to the ice with Scott. If he were a young man today, wonder what his choice would be - maybe a trip into space or, even better, a year-round residence on one of those beaches on the French Riviera. The book tells about Cherry-Garrard taking a team of dogs and going out to meet Scott returning from the Pole. Amazement was expressed that Cherry-Garrard actually ever got there, as it said that he was totally unfamiliar with dogs, that he himself was a fish-out-of-water in the Antarctic. Scott's son, Sir Peter, was trying to prevent the book from being published by Hodder and Stoughton. It was to sell at about \$NZ41.95. That is only about the price of two tankfuls of gas at your friendly corner service station.

An Antarctic-bound Russian ship, the 9243-ton OLENEK, came out second-best when it collided with a sister Russian ship, the 22,632-ton tanker GENERAL SHKODUNOVICH, on October 31, 1979. This happened in the Green Belt between Zealand and Fyn, Denmark's two largest islands, in the main passageway from the Baltic Sea to the North Sea. The Antarctic ship was off course, being to the port rather than the starboard side. It caught fire after the collision and was a total loss. First report showed one dead, four missing, two seriously burned, four others less seriously burned, with 94 rescued. However, I believe I read in a Portland, Maine paper that two had died in the fire.

And then the good ship LOLLIPOP, pardon me, the Lindblad EXPLORER, ran aground on Anvers Island on Christmas Day. There were conflicting stories about how much or how little damage was done, depending on who was being quoted. They must have been singing Christmas carols too loud as it either "ran aground or hit an unknown object" according to my not-so-favorite Washington Post. The same paper published this, "...positioned 10 miles north of Paradise Bay in the Palmer Peninsula, Antarctica about 150 miles away from America's Palmer Coast Guard station in Grahamland, Antarctica." Where did that ever come from? Buckingham Palace? The cruise ship had been hired by a Japanese film crew to make a science fiction movie. The so-called actors who were aboard were Glen Ford, George Kennedy, and the former Boston Celtic basketballteer and Brooklyn Dodgers baseball hopeful, Chuck Connors. However, they had all left the ship before the accident. The Chilean Navy transport PILOTO PARDO took 108 people off the tourist ship which had not run aground since February 11, 1972. The crew of 54 waited on the slightly listing, five degrees, ship until the Russian ocean-going tug URAGAN came along and pulled it free and took it to nearby King George Island for temporary repairs on its hull. We expect to have the president of Lindblad Travel, Inc., Lars-Eric Lindblad, as our speaker on March 11th - or at least he was to be, prior to this paragraph - and he can tell us all about their navigational expertise in Antarctic waters! Our Society speakers seem to be jinxed, as Mary Alice was stricken ill within a year, Bob Thomson had to organize and direct the recovery operations on Ross Island within two months, and now Lars-Eric Lindblad will have to follow his ship's misadventure.

The United States is the Red Cross of the Antarctic. There was another mercy flight across the continent this austral summer, when a C-130 with a crew of nine flew non-stop from McMurdo to Molodezhnaya (3829 kilometers, 7½ hours) in early November to evacuate to New Zealand a Russian scientist who had cancer. The Rus-

sians had no aircraft capable of making the flight, so Uncle Sam did it again. Accompanying the stricken scientist, Vilally Khazarin of Leningrad, was a Russian doctor, a Russian nurse, and a Russian interpolator. On the way to Christchurch, they landed to refuel at the South Pole and McMurdo, completing the flight in Christchurch within a 24-hour elapsed period. Way to go, Navy! This is the second year in a row in which they had to make a mercy flight to Molodezhnaya. It was estimated that last year's flight cost \$23,000. But it is my understanding that once we figure up the bill, we tear it up and put it in the circular file. Our Ambassador to New Zealand has told the press there will be no charges involved in supporting the Ross Island rescue operation in connection with the DC10 tragedy. The operations were considerably speeded up by the fact that we have helicopters at McMurdo and there are none at Scott.

Bud Waite dropped us another long letter. Bud is an interesting old devil, claiming to be 78-years old, admitting to 16 grandchildren and 8 great-grandchildren. I don't think Bud has missed much in life, he has lived with gusto, and if he did miss anything it must have been when he was asleep. But he wants me to correct the printed record in some things which I wrote last year. So the floor is yours, Bud:

"The Fordson reached only 67 miles in the 1928-30 Expedition, not 100. When Harold June and I made the first successful tractor trip in Antarctic history, in January 1934, we found the Fordson, dug it out (buried five years). Ours, unlike Shackleton's and Scott's, or Byrd I, was the first tractor to RETURN to base under its own power. I then made every major tractor trip, but two, until 1956, when Bursley made the Byrd Station joke. They had to walk home! He was dog-driver!!!!

Bud had some comments on that Rockefeller Fokker:

"They had staked the plane down on 20 foot thick solid clear ice (transparent ice from meltwater run down off the western slopes of the Rocks, but no where any mountain) and that during the night the wind came up high enough to pick the plane up and fly it backwards with nobody in it about 100 yards. When I saw it five years later, it was still undrifted. Bramhall, Morgan, Demas, Joe Hill, and I photoed it and studied it carefully in January 1935 on our return from the longest exploratory tractor trip ever made (815 miles) and found the remains of the tie-down stakes etc but all three propellers blades were bent 180 degrees at their ends. That engine had been going full speed when it hit and at 50 below that engine wasn't about to turn that fast with the wind blowing on it. No! They had nosed over, when they landed!"

Bud also wrote about

"the three rescue trips that ended with Byrd's safety, staying there with him in a 9'x 13' shack for two months and four days with the temperature at 35 below on the floor alla time. Guy Hutcheson also made one tractor trip in 1934-35. Also for the record, the first rescue attempt was 81 hours at 72 below without eating or sleeping, with all but the driver outdoors walking or on the roof all that time, in pitch darkness, and one severe, long blizzard also. This is the coldest trip in history, barring even Cherry-Garrard. Winds to 70 mph in cotton tents, etc ... Someday I'll write the facts ... Got 'em started already."

The above is only a smattering of what Bud had to say or write. I would rather quote him than try and translate it, though. I certainly appreciate him keeping

HELP BAIL THE SOCIETY OUT - BUY A CACHET

me honest. I feel a little bit akin to old Bud, as his lecturing on the Antarctic in Thomas ton, Maine on a cold winter night back in 1935 helped flame my desires to visit the continent. Bud has volunteered to be a reviewer of Finn Ronne's new book. This will probably be one of the most interesting reviews ever written for mankind. I suppose we could have found a local reviewer, as Dick Black lives right here in the Washington area! Maybe we should have two or three reviews. If any of you other good old boys want to write your review, send them on in. We might even give the winner of the best review an honorary membership in the Society for the upcoming year! Promises, promises, promises!

A Christchurch newspaper had an article which said that there would be seventy, yes, 70, women from New Zealand and the United States at Scott and McMurdo stations this summer. I can't believe it. What ever happened to the good old days? They quoted an Ensign in our Navy, one Kris Chase, as saying, "Part of my work is to make the time fly this summer for people working in McMurdo. I'm involved in morale welfare and recreation." On top of that, she has a staff of three full-time military personnel. I thought people were still willing to give an arm or a leg, and work 20 hours a day, just for the opportunity of going to the ice. Now they have to be entertained, if not coddled. Ensign Chase has suggested that softball be played in the Antarctic. You mean that our government actually pays people to come up with such great ideas? I think I could come up with a better idea about how fewer women could make more men a whole lot happier, but I don't think I could get it by the Board of Chaplains.

There is a new record for the South Pole. It isn't exactly a station record, being more of a personal achievement. But as you all know, there was a female doctor at the station during the past year. That alone was history-making, as she became the first female pole sitter to winter over at either Pole. But she also became the first and only bona fide female member of the 300 Club. As I understand it, one has to undergo in the altogether a temperature difference of 300 Fahrenheit degrees, with one of the temperatures being at least -100°F. To make it official one has to tiptoe through the sastrugi patch and remain outside in the buff for at least one full minute, and it has to be authenticated by a photograph. What Paul Siple used to do in the interest of science, determining when stouthearted men froze their extremities in the interest of refining the windchill monogram, is now not only done by men but also by a woman as a routine lark. And who says nothing ever changes?

And how about this, from the Australian Bulletin, No. 79, d/December 17, 1979? There is this 35 year-old adventurer by the name of Hans Tholstrup who is planning on crossing Antarctica next year ON WHEELS. He is going to lead a team of volunteers - Bud Waite, you must have one more trip left in your bones - driving three four-wheel-drive vehicles across the continent. They will be using "a new range of diesel, petrol and liquid petroleum gas-powered Datsun light commercial vehicles", and they think they are going to make the trip in a week.

One of the joys of Christmas is receiving another beautiful color photo card of some beautiful glacier from Bill Field. I was thinking the other day that if there were such a society as the Friends of Glaciers and if they ever held an election, Bill would win in a landslide -?- the title of King of the Good Guys. I could never figure out what such a nice guy as Bill was doing in New York City!

We had a real nice letter from Ron Thoreson, currently with the Department of Interior, National Park Service. It must have been typed by his secretary, as there

ANTARCTIC CALENDARS - GREAT GIFTS

are full sentences, even paragraphs, and no misspellings. Bud Waite, please take note! Ron managed the Bio-Lab at McMurdo during Operation Deepfreeze '70, and like all the rest of us is looking for that secret potion which will deliver us back onto the ice. He loved the winter, and even wrote glowingly of the summer when a labyrinthodont fossil was found near Coal Sack Bluff (different people, different strokes, eh what?) and how a group of guys looking like they were from space showed up in tennis shoes wearing baseball caps and claimed they were from NASA. One said his name was David Scott, and they immediately wrote his name off as a non-achiever! Now Ron is a park ranger naturalist at Yellowstone, but let him tell you in his own inimitable way where his heart lies. "My memory is often jogged back to those earlier 'Mickey Mouse boot' days, even here in an environment influenced by the forces of heat and steam rather than cold. This is particularly true when the sun is low and glinting mica-like off a white expanse of geyserite in one of the thermal basins. Hissing steam and fantastic sculpted mounds of mineral that form vents and hot springs add to the otherworldly feeling. It's a common impression with one that I've had before and I can almost imagine myself standing on the sea ice again, looking across the frozen Sound towards peaks covered by the orange glow of midnight." Man, you should be in here writing the Newsletters rather than out there running around in a Landrover and having a ball in the National Park Service. Want to switch?? Sorry we left your name off the wintering-over men and women of McMurdo.

There is a REAL newsletter being published, the Biomass Newsletter. Our old friend of yore, Sayed El-Sayed, is evidently Mr. Big with this newsletter. He sent me a copy of Volume 1, Number 2, dated 20 September 1979, and it comes resplendent with a beautiful logo up in the corner. It is ten pages long, and one thing is immediately discernible, it pays to be into biomass. They meet in such exotic places as Buenos Aires, Horten (Norway), Hamburg, Krakow, Pretoria, Kiel, Cambridge (UK), and Woods Hole. I learned too late in the educational chain that oceanographers do it best. They cruise in the Mediterranean in the summer, in the Caribbean during the winter. Ever see the cruise trail of a WHOI ship in the arctic in winter? They know better. What do climatologists do, they go to Geneva in February. They never learn.

We are late in offering our congratulations to J. Murray Mitchell of our Society (and 1978 Memorial Lecturer) on his receiving the second highest honor given by the American Meteorological Organization, the Second Half Century Award, "for his broad fundamental contributions to the study of climate and climate change, ranging in scope from ice ages to the effects of urbanization." This evidently means that what he has accomplished in the first two-thirds of the second half of this century is so outstanding that it cannot be eclipsed, and that now he can rest on his laurels. That's great, Murray. He also has some precious medals at home, as the Department of Commerce awarded him their Silver Medal in 1964 and upgraded it with the presentation of their Gold Medal in 1973. But this soft-spoken choir boy from McLean's most valued possessions are a lovely wife and a beautiful family. There is also a large friendly dog who has no great achievements to date although he may be keeping them to himself.

Here's a name out of the past - John Annexstad. He did not know we existed and we had forgotten all about him. He spent 1958 with Charlie Bentley at Byrd, and ran the geomagnetic program for the good old Coast and Idiotic Survey (as it was affectionately called in those halcyon days). Then he got mixed up with those sourdoughs in Alaska, such as Troy Pewe, Bucky Wilson, John Dawson, Bob Benson, and others. John is now in Texas at the Johnson Space Center in Houston where he

SHOULDER PATCHES - THEY ARE GREAT

is Associate Curator of lunar samples. He vehemently disclaims that he has lost any of the moon rocks. But his new love is meteorites, and this has taken him back to the ice this summer where he will spend 60-80 days completing a survey of the Allan Hills. He will also be taking a recon traverse north along the mountains to explore a new site for future meteorite hunts. Isn't it remarkable what Uncle Sam will fund? All you have to do is to establish your own little bailiwick, work quietly along, not create any waves, and get those interim reports in on time!

Helen Gerasimou retired? How will DPP ever survive? When Helen came aboard all the telephone numbers - they were two digit numbers back in those days - for the National Science Foundation were listed on one sheet of paper. The total contract grant program for NSF was \$40,000. This must have been back in the Garfield administration. Her career actually started in the Pentagon, where her annual salary was less than a thousand dollars - and she banked twenty greenbacks a month. She was polarized some nineteen years ago. The only men who have survived her are grey beards Mort Turner and Ken Moulton. They gave her a great party at NSF. I never saw such a crowd. Either Helen has a hell of a lot of friends, people in NFS love a party, or they wanted to be sure that Helen did actually retire! A portfolio of cartoons depicting some of the more outstanding highlights in her career brought the house down. They even composed three different songs dedicated to Helen, and had a strong vocal group from the hallowed halls to lead the singing. She is heading off to the tall cactus country, leaving here the first of March and her first landing will be a bend in the road north of Phoenix in some such place as Wickenburg. It is not considered a USARP stronghold, and Helen thinks it will be a great place to live.

There has been a certain problem in writing up material on our next speaker. The real good stuff could not be put into this family publication. But I did not want to let him get away completely unscathed, so I wrote something and sent a copy to his office. I got a call two days later from Mike and he asked me if I ever got his bio. I had to admit I did. What I didn't have the nerve to tell him was that his bio was just as deadly as all the rest of them. Mike merits a few considerations, so we will quote from his colorless bio! He headed the U.S. Delegation to the Inter-Governmental Maritime Consultative Organization (IMCO) conferences resulting in the 1973 International Convention for the Prevention of Pollution from Ships, the 1974 Safety of Life at Sea (SOLAS) Convention, the 1978 Convention on Standards of Training, Certification and Watchkeeping for Seafarers. He also led the U.S. Delegation to the IMCO Maritime Safety Committee. He currently serves on the National Academy of Sciences Maritime Transportation Research Board. He is president of the American Institute of Merchant Shipping (AIMS), which represents 28 companies, which own and operate over 200 American-flag tank, bulk, chemical and liquefied gas carriers. Now let me tell you the real good stuff about this fellow who spent several years as captain of the ice breaker EASTWIND, both in the Arctic and in the Antarctic, where he circumnavigated the continent. I knew him when we both were considerably younger, when he was the Exec on the USCG COOS BAY. At that time he had the quickest left hook and right upper cross in the services, and he could usually find enough occasions when the cutter went into port to keep both tuned to a fine edge. When Mike went down that gangplank, he had only one thing in mind - to have a good time. He considered time precious, something not to be wasted. If there was any action around, he was bound to find it; if there was no action, he was sure to create it. He was dearly loved by his men, was always a champion of the enlisted man. Probably no admiral in history ever had more seaman blood in his veins; his topic selection, "Antarctica: A Sailor's Point of View" is ever so characteristic of the man. Don't miss the Ancient Mariner who served with the Coast Guard for thirty-eight glorious years.

Order form for following Antarctic items:

- #1. 1980 Calendars \_\_\_\_\_ \$4.00 each \$ \_\_\_\_\_  
No.
- #2. Byrd 1929 Flight Anniversary \_\_\_\_\_ \$1.00 each \$ \_\_\_\_\_  
Note Paper No.  
(Set of 6) \_\_\_\_\_ \$5.00 set \$ \_\_\_\_\_  
Sets
- #3. Antarctic Cachets  
(Cancelled at South Pole  
November 29, 1979) \_\_\_\_\_ \$2.00 each \$ \_\_\_\_\_  
No.
- #4. Shoulder Patches  
(First flight over S. Pole  
November 29, 1929) \_\_\_\_\_ \$2.25 each \$ \_\_\_\_\_
- Total of enclosed check: \$ \_\_\_\_\_

-----

Our sales program is sputtering, but you people have been most-tolerant and haven't bugged us. Ruth and I run sort of a Ma and Pa shop here, we both have regular jobs there was something called Christmas followed by a New Year which interrupted thing: Then calendars were late coming off the press in New Zealand, we under-ordered on shoulder patches, we over-estimated on cachets, and we have almost been driven to drink. Here is where we are today:

Note Paper. We had 200 and are down to 47. We limited orders in our last Newsletter, but now will sell out - first come, first served.

Cachets. We had 481 good ones, and have 366 left. However, we have not yet sold to local members at a meeting. But presumably we have plenty for any member of the Society. No restrictions. They are a collector item, and how often does one commemorate the 50th anniversary of the first flight over the South Pole?

Calendars. They are here now, and we expect mailing tubes momentarily. We have about 75 which are not spoken for, so if you want one for your in-laws, your butcher, your gasoline dealer, or someone who might possibly help you in 1980, send us an order. They are quite nice, good color, with interesting tidbits about happenings on special Antarctic days.

Shoulder Patches. We have had to reorder as we got only 100 initially. These patches are beautiful and of fine quality. We had to pay a whole lot more for the reorder, so our price is up a trifle - \$2.25. They should be in our hands by the end of February.

Membership Dues

Some members are slow in paying their dues, so thought I would list those who haven't, as of early January, sent in dues for the current year. If there is a number behind your name, it shows the number of years you owe. We have axed quite a few delinquents, and those with multiple years can expect it to fall on them unless they ante up. We may be non-profit, but that doesn't mean we have to be charitable, too.

WILKES EXPEDITION, 1838-1842

FIRST ROUND-THE-WORLD NAVAL EXPEDITION

by

Dr. Herman J. Viola

Director, National Anthropological Archives

Smithsonian Institution

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Mr. Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979

Tuesday Evening

March 11, 1980

8 p.m.

Board Room, Room 540

National Science Foundation

18th and G Streets N.W.

Don't miss this outstanding speaker presenting material on one of  
the most historic expeditions of all times!

- BRING A FRIEND -

B E R G Y     B I T S

BERGY BITS is the biased, candid writings of the President of the Society, and in no way should be construed as the Voice of the Society.

We spent a lot of time last issue running down facts on the DC10 crash on Ross Island and failed to uncover another South Pole historic occasion which was celebrated at McMurdo. Because of the terrible air tragedy of the 28th, it was decided that there would be no commemorative South Pole flight on the 29th. Following a memorial service at noon at McMurdo, Dr. Norman Hackerman, Chairman of the National Science Board, announced that a meeting would be held at 2 p.m. at McMurdo to carry out the ceremony that had been scheduled for the South Pole. There were the usual speeches and at the end of the ceremonies Dr. Hackerman presented Larry Gould with the National Science Foundation's Distinguished Public Service Award. This seemed to have been overlooked by the media, as Larry wrote, "The announcement of the award seemed to have been lost in the shuffle. It has been given little attention and very few people know about it. I am very proud of it, of course, and consider this a great honor." Larry sent us a copy of the citation, but as it is long, and most of you already know his great accomplishments, we will skip to the last paragraph:

His lifetime of dedication and performance in the conduct of research, and his national and international leadership in geology and in Arctic and Antarctic affairs are recognized with appreciation and commendation.

It was all written in the best tradition of a government bureaucrat! If you haven't already read Herman Friis's bio on Larry Gould in a supplement of a Cosmos Club Bulletin (July/August 1979), you should get hold of a copy. It is just great, but then you have to remember that Larry and Herman have been dear friends since they first met at the Battle of Gettysburg, or do I have the wrong war? Larry reechoed what we reported in the last Newsletter about Senator Byrd winning the hearts of the people at the South Pole, writing "Senator Byrd made a wonderfully friendly impression upon all of the people who travelled with us. It was an extraordinary interesting group on the whole, and I enjoyed them greatly in spite of the fact that actually none of the things we had planned could be carried out." Incidentally Larry must go from one award ceremony to another, as the Explorers Club in New York will pay tribute to *Larry* in late March when he will be cited as their annual exemplary explorer of notoriety - my Explorers Club friends are either out of town or sleeping, so I made up the nature of the award!

The reference to "another South Pole historic occasion" should bring back memories to Larry Gould, as I was referring to the official dedication of the Amundsen-Scott IGY South Pole Station at McMurdo held on January 23, 1957. I was a mere spectator, although both Larry and Bert Crary took part in the ceremonies. It became a source of much irritation to Paul Siple and the boys at the South Pole because they never found out about the big, formal dedication at McMurdo until the next plane arrived some 20 days later, on February 12th, when some late arrivals were flown into the South Pole. With the way messages used to fly around, they felt slighted when no information message was sent telling them of their station name.

As you may recall, one of Admiral Byrd's grandsons, Robert Byrd Breyer was on the VIP flight to the South Pole. He was a substitute for Phil Smith who had to scratch, and it was a return trip for young Breyer. He had helped with the construction of

the new South Pole station, having answered a Holmes and Narver ad in the paper for construction workers for the South Pole. He has sent out the souvenir 50th Anniversary First Flight over the South Pole note paper with a small U.S. flag enclosed along with a sheet of paper with:

"Well, it's done .... the American flag has been advanced to the South Pole .... there is not a man in this camp who did not assist in the preparations for the flight. They are splendid."

Admiral Richard E. Byrd  
November 29, 1929

Greetings from the South Pole! This card and the American flag are to commemorate Admiral Byrd's flight 50 years ago and to recall his premise that Antarctica should be preserved forever for peaceful purposes among nations.

Richard Byrd Breyer  
November 29, 1979

What a nice gesture on the part of this young man. His mother, Katharine Byrd Breyer, has just joined our Society. It is nice to have her aboard, the very first member of the Byrd family to join us.

While we are writing about the Byrds, there was a very interesting article on the Admiral's papers and the Admiral Richard E. Byrd Foundation in the Christian Science Monitor of January 11, 1980. I know some of you folks have already seen it, but because it is of such great interest, I'm taking the liberty to quote valuable sections from the article:

# Admiral Byrd's legacy In limbo

By Emilie Tavel Livezey  
Staff writer of The Christian Science Monitor  
Boston

Friday, January 11, 1980

More than 50 four-drawer file cabinets bulging with his memorabilia, as well as some 400 reels of 35mm film, and much of the equipment used on his various expeditions are salted safely away in storage in Boston and Washington, D.C., waiting for the Admiral's children to settle differences over their mother's will.

When the Admiral passed on 23 years ago, the papers went to his wife, Marie Ames Byrd, an enthusiastic supporter of her husband's explorations, for whom he named a vast stretch of Antarctica "Marie Byrd Land." In 1966 she established the Admiral Richard E. Byrd Foundation. But she did not will his papers to the foundation. When she passed on six years ago they became involved in the contest over her will.

Many people are eager to study those papers. Any important institution dealing with manuscript material would naturally be glad to have such a valuable historic resource, says Frank Burch, director of the National Archives Center for Polar and Scientific Archives. "Everybody who knows that Admiral Byrd had a large collection of personal papers has been wondering where they are going to be deposited."

Institutions eager to possess them include:

- The National Archives itself. Mr. Burch's unit already has much still and motion film taken by the Admiral on his expeditionary flights.
- The manuscript division of the Library of Congress.
- The Naval Historical Foundation in Washington, a private organization that collects and deposits for research the papers of important naval officers.
- Colleges and universities having special interest in polar matters, such as Dartmouth, Bowdoin, Harvard, and Ohio State.

When Mrs. Byrd established the foundation, the broad purpose she assigned to its trustees was "to establish and maintain a library, reference or information center, or museum to collect, catalogue, document, publish and make available for the general public, scientific and educational purposes and for any agency or department, of the US Government all records, notes, manuscripts, film, data, equipment, and other material relating to Arctic and Antarctic explorations commanded or guided by Admiral Byrd."

In July, 19&7~Mrs. Byrd willed to the foundation the Byrd home on Brimmer Street in Boston (exclusive of furnishings) which had been in her seafaring Yankee family since the early 1900s. Apparently she considered the house a possible headquarters for the foundation, as it indeed became during her later years.

The home is one of those noble red brick town houses at the foot of Beacon Hill. Its tall windows look out on the Charles River Basin. The four Byrd children and all 13 grandchildren revelled in sliding down its plunging five-story banister, occasionally overshooting the newel post and landing on Grandmother Ames's battered alabaster lamp.

Mrs. Byrd also provided a modest trust fund, believed today to total about \$30,000, to finance the foundation. In her will, probated following her passing, she divided her estate "in equal shares to my children." The result is a legal tangle.

At present the Byrd collection of papers and expeditionary gear are widely scattered:

The National Archives' Polar Center has many still pictures on nitrate film - the first systematic aerial film ever taken of Antarctica. Used to produce maps of the region, they were personally given to the archives by the Admiral in 1938. He also gave the archives some 35 reels of motion picture film covering his early flights and expeditions up through 1930. All this footage has been converted to safety film.

In addition, the archives is holding in courtesy storage nearly 400 reels of 35mm movie film of later Byrd expeditions. Most of these were deposited by Mrs. Byrd in 1959 after the Admiral's passing.

William Murphy, in charge of the polar unit's motion pictures, says these nitrate films, now in cold storage, "have not been converted to safety film because they have not been legally given to the archives. They will be endangered if not transferred. But before doing so, we would have to have some indication from the Byrd estate that they are willing to let the archives have this film permanently."

He says the movies might be good for another 10 to 20 years, "but we don't want to wait that long." He hopes to have final word on the disposition within six months, so that these films may be converted under a project now underway.

"There is no doubt about the films' historic value," he stresses, "because these were historic expeditions. The film the Admiral took for a visual record gives a dimension that you cannot get from books or a journal." It would be used, he says, as the other Byrd film now is used — as a resource for biographical, documentary, and TV film production.

A short distance away in the National Museum of History and Technology of the Smithsonian Institution are several thousand Byrd artifacts, ranging from aerial navigational instruments and polar survival equipment to the battered

khaki uniform Byrd was wearing when he ditched his plane off the coast of France when fog prevented a landing at Paris's Le Bourget Airport in 1927. (Admiral Byrd carried the first US Air Mail on that non-stop cross-ocean flight, as well as the first passengers, and accurately forecasted that the multi-engined plane would be the commercial air carrier of the future.)

Dr. Philip K. Lundeberg, curator of the Smithsonian's Division of Naval History, says the scientific studies Byrd carried out in the Antarctic were not simply concerned with the terrain but showed how man can survive in extreme climatic conditions, and thus have importance in the space age. "His Antarctic expeditions were the threshold to the space age, so far as man's survival in a hostile environment," he says.

Yet only about 30 percent of the nuts and bolts — the furs, sleds, etc. — of the Byrd expeditions now in the Smithsonian's hands are owned by it. The rest, like the film at the National Archives, is on courtesy storage awaiting disposition by the Byrd family.

The Smithsonian, Dr. Lundeberg says, which collects artifacts rather than manuscripts, is not interested in having the Byrd papers, but is eager for access to them to help it document the equipment it has. When the Smithsonian completes its Hall of Armed Forces History, he says, it will definitely contain an exhibit on Byrd's contributions.

In yet a third location of the nation's capital is the little hut which sheltered Byrd in total isolation at an advance base of Antarctica for nearly five months in 1934 while making meteorological observations. This high-risk self-assignment was the basis of his-immensely popular book, "Alone." It's been published in 30 languages.

Fifty of those four-drawer file cases containing his papers — his detailed preparations for his expeditions, his correspondence with notable people all over the world — are currently on courtesy storage just outside Boston at a regional center of the National Archives — the Federal Archives and Records Center in Waltham. In addition to these there are other papers in storage at undisclosed locations in the Boston area.

The Admiral's secretaries who once handled his files, have long since retired. The one person now who knows more than anyone else about the contents of the cases is Commander Richard E. Byrd Jr. The only son of the Admiral and Mrs. Byrd, he won his Navy rank while accompanying his father on two of the Antarctic expeditions.

In 1938, he says, his father turned over to him as "overseer" the collection of expedition equipment and supplies which at that time were kept at 7 Brimmer Street, the house next door to the Byrd home, which the Admiral used as his office.

A few days before his father passed on in 1957, Comdr Byrd says the Admiral told him: "Take care of the files. They are the record."

Since then the Commander has dedicated himself fulltime to safeguarding all the Byrdiana, and telling the story of his father's illustrious career. He regards the Admiral's record, as "priceless," since the Antarctic was the last land mass or earth to be explored.

After his father passed on, the Byrd collection became dispersed still further. No. 7 Brimmer Street was sold. Much of its contents were crowded into 9 Brimmer. Equipment was stored in different places, with 50 of the file cabinets going to a fireproof building at the South Boston Naval Annex.

According to Comdr. Byrd, from 1957 until his mother passed on in 1974, the two of them carried on the Admiral's work, "doing research and answering inquiries from scholars, schools, and the general public."

Asked the question: "Are the Admiral's papers part of your mother's estate or of the Byrd Foundation?" the Commander replied: "They were turned over to my custody and ownership by Mrs. Byrd before she passed on, because I was the only, one left, besides herself, who knew the files and papers, with the final end in mind for them to go to a proper and satisfactory repository and to continue the work she had been carrying on.... My career is to carry forward what she had in mind. That is what I have done all through my lifetime. Why should I change now?"

In 1975, the Navy transferred South Boston Annex to the City of Boston. Some expedition equipment went to the Smithsonian. It was at this point that the National Archives offered the executor of Mrs. Byrd's estate, the State Street Bank and Trust Co. in Boston, to store the papers on a courtesy storage basis in its Waltham branch. The bank accepted.

What remains in the house at 9 Brimmer Street, which Comdr. Byrd continues to use as the Byrd Foundation office, is not a matter of public knowledge. Despite a complaint filed in Suffolk County Probate Court by the executor — a court action still pending — the bank has been unable to gain access to the premises for the purpose of distributing its contents according to Mrs. Byrd's will.

From the exterior, the property presents an unkempt appearance. Shrubs have become trees, overgrowing windows. Some shades are drawn. Part of the front stoop railing is missing.

Neighbors, concerned about the volume of items brought into the house from No. 7 and elsewhere, filed a complaint with Boston's Housing Inspection Department in January, 1977. A clean-up order was complied with; inappropriate material was removed, and the case was closed in May that year.

Frank P. Henry, director of the Housing Inspection Department, says that during his inspections he saw many file cases and boxes of papers throughout the house. Comdr. Byrd has assured the Monitor that the only files now there are those containing current correspondence dating back about two years. The rest of the papers, he said, are in storage in the Boston area.

The Commander carries on this work of answering queries alone with no paid office help. He says only a very minor part of the Byrd papers has been catalogued. The foundation is not listed in the Boston telephone directory.

This manner of operating the foundation as a private organization rather than as a public, charitable trust, as it was set up, has aroused the concern of the Massachusetts Attorney General.

The original trustees of the foundation were Mrs. Byrd, her son, and a friend. Legal action by the Attorney General's office resulted in an agreement whereby a new board of trustees was formed. It is composed of Comdr. Byrd, his son, Richard E. Byrd HI, and three highly qualified professionals: Bradford Washburn, director of Boston's celebrated Museum of Science; Dorothy Brown, vice president of the Boston Safe Deposit and Trust Company and a trustee of the noted Peabody Museum in Salem, Mass.; and James B. Ames, a senior partner of the Boston law firm of Ropes & Gray and past president of the Massachusetts Historical Society.

Since the trustees began meeting last March, they have been besieged by inquiries as to what the foundation intends to do to honor the memory and continue the work of Admiral

"There are two broad areas in which the foundation can work," says Dr. Washburn, who was a personal friend of the Admiral. "First, disposition of all these papers and artifacts so that where they wind up they will do the most good. That could proceed right now, if the family wants it to.

"Second, when the Byrd estate is all settled to everybody's satisfaction, we expect there is going to be some money left for use by the foundation. We are willing, eager; and enthusiastic to do with such funds something that would have made Dick Byrd very happy.

"But right now," he continues, "we are on dead center and will remain so until the family has worked out an equitable arrangement of Mrs. Byrd's affairs to the point where we know what resources we have to work with. Until that is resolved, we can't do a "thing except wait — slightly impatiently."

Carol Fubini, assistant attorney general in the division of public charities, says her office has a legal obligation to insure that the property at 9 Brimmer Street, which the foundation clearly owns, is used for the purposes for which it was intended in Mrs. Byrd's trust.

The trustees' responsibility, she explains, is to make the judgment whether or not the estate can be settled and whether or not they can obtain any of the Admiral's memorabilia.

"If not," she says, "then I think they will have to use the house for some kind of charitable purpose or sell it and use the proceeds. Our position is that they have a reasonable amount of time to make that decision." She did not spell out what she means by "reasonable."

One realtor estimates the Byrd home could bring as much as \$200,000. An option open to the trustees is to use proceeds from the sale of the house to set up a scholarship in the Admiral's name for polar research at some educational institution.

Since the house is not fireproof, it would appear to be an inappropriate repository for the Byrd collection. Certainly, however, the house could qualify as a historic site of national importance. But experts estimate it would require an endowment of \$1 million or more to support it as a house museum.

And the necessary city permit to do so might be difficult to secure. The Beacon Hill Civic Association has a long history of opposition to institutional expansion. Its standing position is against any museum in the area that would take a house off the city's tax rolls or increase traffic on this stylish but narrow street.

Conceivably the National Park Service could gallop to the rescue. It would take an act of Congress to authorize it, but the NFS does have in its bag of historic-preservation tricks a variety of combinations under which it could take over ownership of such a house and operate it, or operate it for its owners, perhaps even tapping the expert knowledge of Commander Byrd as its superintendent. Byrd Foundation trustee Dorothy Brown says that "because of the tremendous knowledge the Byrd family has of the Admiral, we all want them to feel very related to the foundation and its purpose. The board would like to have the family pleased with our ideas and conclusions and with whatever action the board takes."

Word from attorneys representing the estate is that negotiations have now reached a delicate stage. Young Richard E. Byrd III says, "Everybody in the family — all the Admiral's children — are very much interested in this foundation. Everybody wants to get the thing settled up so that we can go ahead with it, and everybody can go back about their business."

The US Postal Service is currently considering issuing a centennial stamp to commemorate the Admiral's birth in Virginia in 1888.

"We are all hoping," Dr. Washburn says, "that the problems of Mrs. Byrd's estate can be resolved as soon as possible so that the foundation can move forward on two broad fronts: First, to take action that will honor! Admiral Byrd as one of Boston's most distinguished citizens; and second, to use whatever funds that may become available to the foundation to do the most appropriate and effective things possible with the extraordinary resources that Admiral Byrd left to the United States and the world."

Jack Burse did make the Dearborn 50th Anniversary Dinner commemorating the first flight over the South Pole. His wife Ada wrote Ruth that one of their friends drove Jack there and that he had a great time. There were 162 people at the banquet, and after Jack talked "they gave him a standing ovation which really thrilled him." He had to reach down for that extra effort to make it, as he had not been feeling well and was quite weak. Unfortunately Jack has had a heart attack since the Dearborn meeting. Hang in there, Jack, the whole Society wishes you the best and our prayers are with you. Capt. Raithel of the U.S. Navy was also on the program and showed films of the 1928-30 expedition.

It has recently come to our attention that Alan Innes-Taylor (B.A.E.I, CITY OF NEW YORK and B.A.E.II), formerly of the Canadian Mounted Police, passed away last year in Anchorage, Alaska. Say there, David Hickok, could you or your bride do a little researching there in town for a fellow Leningrad traveler and let us know the circumstances? He sort of kept a low profile in his later years, so his passing caught most people by surprise. He was an old dog team driver, and served our military as an expert on cold weather survival.

The great white continent claimed its forty-fourth U.S. victim, excluding the DC10 crash, when a young and enthusiastic Antartican by the name of Casey A. Jones, age 22, from Connecticut, was killed in an accident at the South Pole on January 9th. Casey was a cook, and a great one from all accounts, and was employed by Holmes and Narver. He had wintered over at Palmer in 1978 and was part of this year's summer crew at the Pole. The accident happened when he was attempting to clear an overhead air duct, several feet in diameter, of the snow and ice which had filled the cylinder which extended through the air plenum building to an opening in the geodesic dome. All of a sudden the whole accumulation came crashing down on top of him and he died from asphyxiation. He was cremated in Christchurch on January 16th and at the request of his parents his ashes were strewn over the continent which he truly loved.

The U.S. has just completed another trans-continental mercy flight in Antarctica, flying to the Russian station Molodezhnaya with oxygen for an unconscious seaman on the Japanese ship FUJI. The man could not be moved as he was on a respirator, so a C-130 flew over, parachuting 4 oxygen cylinders from 900 feet. A Japanese helicopter then picked up the cylinders and carried them to the ship. Our plane had to stop at the South Pole to refuel before returning to McMurdo. Another international job well done in the very best of humanitarian interests.

I had the good fortune in late January of being able to sit in on a meeting of the U.S. Committee for the Global Atmosphere Research Program and it was interesting to hear how successful the Southern Hemisphere drifting buoys program was during 1979. Previous Newsletters have shown you the location of the buoys. There were 300 buoys deployed from October 1978 to mid-June 1979. Eighty percent of the ocean area from 20°S to 65°S was within 500 km of a working buoy. It has been found that there are a lot more lows out there than they had suspected, in fact, about five times as many! The Australians are very happy with the data buoy program, saying that it has improved their forecasts by 25% (they must have been pretty bad before, right?). We have an old data buoy man in our membership, Steve Ackley of the Cold Regions Research and Engineering Laboratory at Hanover, New Hampshire. In fact, in December he presented a paper entitled "Sea-Ice Atmosphere Interactions in the Weddell Sea Using Drifting Buoys" in the session on Sea Level, Ice Sheets, and Climatic Change of the XVII Assembly of the International Union of Geodesy and Geophysics in Canberra, Australia. Steve appears to be a likable sort of a guy, and I think we should get him to come here some time and tell us all that we ever wanted to know about data buoys. How about it, Steve? It sure gave me a nice warm comfortable feeling to go to that meeting and hear that something beneficial was gained, as GARP cost us taxpayers a pretty penny or two.

There is a new kid on the block, and his name is ASOC (Antarctic and Southern Ocean Coalition). Its parentage includes World Wildlife Fund, U.S., Sierra Club, Friends of the Earth, and Monitor International. They want to get into the act relative to formulating policy at the Antarctic Treaty Consultative meetings, and are trying to get accredited to participate in the meetings next May in Australia. Their long-range objectives supposedly are:

- (1) protection of the unique and fragile Antarctic environment;
- (2) preservation of endangered species, especially blue, fin, and humpback whales;
- (3) freedom of scientific research over the entire region inside the Antarctic Convergence;
- (4) continued demilitarization of the area;
- (5) prevention of substantial commercial exploitation of Antarctic fish, squid and krill until scientists understand enough about the region's ecology to ensure that harvesting does not cause unacceptable harm;
- and (6) prevention of adverse climatic change due to human activities.

They have published 42 pages of proposed amendments to the Washington Draft of the Convention on the Conservation of Antarctic Marine Living Resources! The Antarctic Society will stay clear of this one, as our charter does not allow us to get into politicking. But if any of you want to read all about it, their address is 1751 N Street N.W., Washington, D.C. 20036.

I have never had the pleasure of meeting Harriet Eklund, but she must be something. Everywhere you go people ask about her, both males and females. Her forte seems to be entertaining, and occasionally, very occasionally, she does write letters. She wrote recently that there was good news coverage on British TV when Captain Scott's wife's love life was being questioned. She said Gordon Robin, Terence Armstrong and Peter Scott were all on and "I loved it." American explorers were so

reserved, why couldn't one of them have had a few exciting skeletons in his closet just to humanize it all a bit? Or do I live with my head in the sand? Harriet described herself as a happy heretic. Whatever she is, she sure is loved by an army of Antarcticans.

Mark Leinmiller, the 50th anniversary Boy Scout, was in town recently to attend the Boy Scout's National Executive Board meetings. He is serving a two-year tour as the Youth Representative on the Board, and is on the Exploring Committee and the Program Support Committee. While here he found out that he had been selected as the Outstanding Young Man of the Year (1979) by the Boy Scouts of America. Mark is a sophomore at Georgia Tech in mechanical engineering, and is just now getting rested from all that hard work in the George Denton Concentration Camp at Darwin Glacier of a year ago. It seems that after Mark was on Good Morning America, he had two fan letters from girls awaiting his return home. He should not get too cocky though, as Ed Hillary had mountains of letters awaiting his return from his successful climb of Mt. Everest, including about 500 letters proposing marriage. Mark is still active in Scouting, and continues his love affair with Philmont (in New Mexico). Nikon World Vol. 12, No. 1, June 1979 has some of Mark's better Antarctic pictures. Mark has an agent who hopes to sell one of his snow patterns for a dress design. Nikon gave Mark one of their cameras (plus lenses) which goes to show that it pays handsomely to be a winning Boy Scout!

As most of you know, Finn Ronne died on January 12th at the age of 80, passing away in his sleep. He had recently returned from a trip to Scandinavia where he had enjoyed being in the presence of the King of Norway. Ruth saw him after his return and she said that he didn't have a wrinkle in his face, that he looked at least twenty years younger. I never knew the man personally, although I knew a lot about him through working with his close friend, Sir Hubert Wilkins. Naturally I am well aware that he was a person who seemed to affect people very strongly. Also he probably was the most controversial figure to visit the Antarctic in the modern era of exploration. Finn was buried with full military honors in Arlington Cemetery following the funeral service in the chapel at Ft. Myer. "The Surveyor" was among those in attendance. I understand that Finn was laid to rest downslope somewhat from President Kennedy, off to the right, about half way between the President and Admiral Byrd. I have known Bob Nichols for many long years, and I knew that he had wintered over with the Ronnes on Stonington Island. He has written a warm and touching eulogy. His penmanship looks something like a robin's footprint in the sand, but I think I have deciphered it pretty much as Bob intended:

Memorial to Finn Ronne

(1899 - 1980) by

Robert L. Nichols

Captain Finn Ronne, U.S. Navy (Ret.) died on January 12, 1980. Born in Norway he earned his degree in marine engineering and naval architecture from Horten Technical College. He came to the United States in 1923 and was a member or a leader of thirteen Antarctic and Arctic expeditions -his first being with Admiral Byrd in 1933. When on the U.S. Antarctic Service Expedition 1939-1941 he and Carl Eklund sledged with Siberian huskies 1264 miles in 84 days. This effort alone assures Captain Ronne of a unique place among Antarctic explorers. He has been the recipient of many honors and was the author of "Antarctic Conquest", "Antarctic Command", "The Ronne Expedition to Antarctica" and "Antarctica-My Destiny" published a short time before his death.

Finn Ronne took me on his 1946-48 expedition and was one of the men who helped to make my life interesting and rewarding. It was with sorrow that I and many others learned of his passing. Now that he has gone it gives me much satisfaction to remember that *I* told him more than once how much I owed him.

There was much to admire about Finn. He always kept himself in good physical condition, was of course an excellent skier, was a good athlete and a good competitor and he ran the mile in under 4:35, not good now but very good when he was a young man.

Finn was an excellent organizer and a skillful promoter. He had to be for his Antarctic Expedition 1946-1948 was a private expedition. He persuaded the U.S. Navy to lend him an ocean going tug, the U.S. Air Force to let him have a plane and two experienced pilots and the U.S. Army to give him all kinds of supplies. He had been thinking about running his own Antarctic expedition for many years. It was obvious to those he had to deal with that he had the necessary background and experience to know what he needed. He had a winning personality and he had the physical and mental drive to organize and run a successful Antarctic expedition. He was proud of his Norwegian ancestor/ and proud too that his father had been with both Roald Amundsen and Admiral Byrd.

I can well remember meeting Finn for the first time. Bob Dodson had taken me to meet Finn and to urge him to take me to the Antarctic. I was much impressed with his charm and with his pleasant Norwegian accent. A Boston Globe newspaper reporter was interviewing Finn at the time. The reporter asked him what he hoped to accomplish in Antarctica and Finn said it would be better if he answered that question on his return. I was much impressed with this modest statement and decided then and there that I would go south if he asked me.

Finn was very good to me. He made certain that Bob Dodson and I were supplied with the huskies, sledges, tents, fuel and food necessary for 4 months of geologic sledging. He named a feature after my university and I will not forget that Finn and Jackie Ronne often asked me after dinner to their small living quarters where I was plied with ice cream, cookies and good conversation.

When I think of Finn I often recall Jackie, his wife who accompanied us to the Antarctic. She was a great help to the expedition. She kept very complete records of all the important events and happenings of the expedition and worked on expedition matters both before we left the States and after our return. Finn in the dedication of his "Antarctic Conquest" wrote, "To my wife Edith, who was an anchor to windward and saw the whole expedition through with me".

Finn has now taken his place next to Admiral Byrd, Paul Siple, Al Wade, Carl Eklund and the other Americans who although no longer with us made notable contributions to our knowledge of Antarctica and who are now gathered around a huge Swedish primus cooking their hoosh and heating their pemmican in the small cold corner of Valhalla reserved for the Antarticans of all nations.

The Book Shelf: Charles J.V. Murphy, CBS with REB on BAE II and Byrd's chronicler, is co-author (with J. Bryan III) of one of the best non-fiction sellers (as listed by the New York Times) entitled "The Windsor Story". Paul Carter's "Little America: Town at the End of the World", is an alternate selection as book of the month for members of The Library of World History. This sure surprised me as I personally

thought it left something to be desired. I actually preferred Finn Ronne's "Antarctica - My Destiny" much more. And in the latest magazine put out by the American Association for the Advancement of Science, Science 80, in the third issue of March/April, there is a feature article by good old Bill Cromie on "When Comes El Nino?" Bill (Little America V, 1957) is now Director of the Council for the Advancement of Science Writing. His success must make Bill Field feel happy, as Bill, whose credentials for the Antarctic were the skimpiest, went out on a limb and recommended Cromie to Bert Crary. He knew more about booze and women than any ten men that I ever knew, having worked hard in both fields when working in mines in Montana. At Little America he spent an hour each night writing about the happenings of the day, but for some reason, thank Heavens, he never published. I believe Bill was the ghost writer for the astronauts' articles in Life magazine. He would be an interesting speaker. Believe me, if he ever got turned loose, he would make Mike Benkert sound like a choir boy. And from New Zealand, "Shackleton's Argonauts" by Frank Hurley, Collins, Auckland, \$NZ 19.95.

I'm throwing in the towel, but still keeping my dues paid in Active Practicing Male Chauvinists, as women appear to be here to stay. Last year Dr. Michele Rainey broke the barrier by wintering over at the South Pole. This year we will have the first wintering-over female scientist at the Pole, a 22 year-old (is anyone really that young?) physicist from New Providence, New Jersey by the name of Martha Kane. She's into cosmic rays and was quoted in the New Zealand papers as saying "she doesn't expect any problem." Wonder if anyone at NSF knows she is wintering over, because when I said something to Guy Guthridge on February 15th about another woman being at the South Pole, he had not heard. It just is no longer newsworthy. It may not be newsworthy to him, but it is still shocking to me! Gwen Adams, the administrative assistant to the Division of Polar Programs at NSF, thought she may have made history this year in being the first black woman to visit the South Pole. She made three landings at the Pole this summer, but, alas, another black woman, who I believe was on the National Science Board, had been there last year.

Dick Muldoon, the likable editor of the Antarctic Journal, who has done one heck of a job on the Journal in the short time he was aboard, has moved downstairs at NSF to take a position with Jack Renirie in the public relations area. Guy told me the real reason he left was that this would allow him to pursue his interests in journalism. But there are promotional possibilities which one cannot ignore with the way inflation is soaring. We hope that we keep Dick as a member, even though he hasn't paid this year's dues!

We are going to have a Million Dollar Baby for our Memorial Lecturer, and it won't be a professional basketball player. Who will it be? Charlie Bentley, who else. He has probably walked out of NSF with just about that many dollar bills over the last twenty years. And he is going to bring another Million Dollar Baby with him, his beautiful wife Marybelle. It's not that she is up for sale, it is just that ... well, she sure is lovely. The date is May 1st, a Thursday evening, and we have the large luxurious auditorium at the National Academy of Sciences on Constitution Avenue. The National Academy of Sciences' Polar Research Board will co-sponsor the Memorial Lecture, and Ruth Barritt is going to be the hostess with the mostest problems. But she has a superabundance of class, and we can guarantee that everything will be done in perfect taste. We plan to have a pre-Lecture cocktail party-dinner. Drop the Society a card if you want to go to the pre-Lecture dinner so we can get a feel for the size of the group. We are trying to make the annual Memorial Lecture a reunion time, when Antarcticans from any expedition can gather here to tell lies and some truths about the old days. Towards that end we will try to get an Antarctic figurehead here, make him our honor guest at the dinner, and have a fine old party before we go south several blocks to hear Chucking Charlie Bentley. Late

flash, here is the title of the Memorial Lecture, "Collapse of the West Antarctic Ice Sheet: Fact or Fiction?"

Wasn't Mike Benkert just great as our last speaker! His earthy language is still ricocheting around the hallowed walls of the National Science Board Room. No pictures of penguins, just a map of Antarctica and a piece of chalk was all that he needed. We probably should invite him back for a man's only evening, as we only heard about the tip of the iceberg that night. Mike has written a book about some of his exploits with the Coast Guard, but he is holding it up a couple of years while society catches up to his speed. Some of the women folks could not believe he had put in 38 years with the Coast Guard, as he doesn't look a day over 38 now. Just shows you what happens when you lead the clean wild life. That stately, statuesque good looker who has been to our last two meetings is the new administrative assistant to Louie DeGoes and Tim Hushen in the Polar Research Boards, and we understand that she is ready to enlist on Mike's next cruise. I don't think I would want to sail with him if he is going to take any more 68 degree rolls on an ice breaker. Mike called up and thanked us for asking him to be our speaker. Some kind of a guy. It is people like him, Bert Crary, and Larry Gould who make the ice such an attractive place. Without the characters, without New Zealand, it would lose some of its glamor. That was Mike's bottom line, that Antarctica almost became tolerable for the sailors because of Valparaiso, Rio, Buenos Aires, Wellington, Sydney, and Melbourne. One left that night knowing full well that Mike did not miss much in those ports.

Mike was skipper of the EASTWIND, and now the Canterbury Museum has a 27 cm model of that ice breaker. This was all made possible through the efforts of Lt. K. F. McNamara, Public Works officer with the U.S. Navy Antarctic Support Force. The 30 year-old Naval officer has made about 150 models in the last 20 years. Wonder why he wasted the first ten years of his life? Probably just another late achiever! The EASTWIND model consists of 85 parts.

Remember the PRIVATE JOHN R. TOWLE? Still plying the seas, still going to the ice. Celebrated her 35th birthday in Port Lyttleton on January 21st. Lt. William F. Byrd III, a distant cousin of Admiral Byrd, serves on the ship, which is the very last of the Victory class vessels made during World War II which is still in the U.S. fleet.

Tryggve Gran died at the age of 90 at his home on the south coast of Norway. He was the very last surviving member of the Robert Scott shore party, 1910-13. Fridtjof Nansen had introduced him to Scott "to show them how to use skis in the best manner". He was the first to reach the tent containing the bodies of Scott, Wilson, and Bowers and it was his skis which formed the cross on the snow cairn. He found the letter Amundsen had written King Haakon informing him of their reaching the South Pole. Amundsen had asked Scott to pass on the letter, and Tryggve did it in person. Not much was heard of Tryggve after the mid-thirties as he was a strong Nazi sympathizer and fell into disfavor.

I think it is damn unfortunate that Antarctica has to be the play yard for crackpots seeking personal fame and glory. The next group is already packed on the ice, waiting to cross the continent next summer in SKI-DOOS motor toboggans. They are led (?) by Sir Ranulph Twistleton-Wykeham Fiennes, who is described in Christchurch papers as "a British aristocrat" and also as "a dashing 34 year-old explorer". With a name like that it seems like he must be straight out of some comic strip! Well he, Charles Burbon, 38, and Oliver Shepard, 32, are "spending this coming winter in especially designed and prefabricated buildings, made mainly from treated cardboard". Oh yes,

Lady Virginia, Ranul's wife, is also there. This is all part of a 83,700 km British expedition around the world via both Poles. They left the Thames on September 2nd. The SKI-DOOS will be pulling sledges on the 3220 km journey across Antarctica. They are supposed to reach the South Pole in January, Scott Base in March. Neither the U.S. or New Zealand will provide food, fuel, or transportation support. Bob Thomson of New Zealand is a realist and says that the attempt to cross Antarctic in light-weight, open snow toboggans will "almost certainly result in a rescue mission". So what else is new?

Arthur DeVries had an Antarctic experience this summer - he recaptured an Antarctic cod that he tagged in 1974. It had gained eight pounds and grown six centimeters, which was said to lend further evidence to its slow growth rate. I wish I were an Antarctic cod!

The Christchurch Press of January 15th said that the LINDBLAD EXPLORER would not be back into service until after March. Lars-Eric had to postpone his talk to us as he will be out of the country for most of the month. But his secretary assured Ruth that he still is willing to talk to our Society at a future date.

There is not much new on the DC10 crash on Ross Island. There is speculation that it could possibly be the way the navigational system works on DC10s. Once the plane got out of the range of Invercargill, there were no compensating data to correct variances in three information sources. It was said that on long flights over the South Pacific there have been errors of several hundred kilometers. People are just going to have to wait at least two more months, possibly as many as five more months, until Mr. R. Chippindale, Chief Inspector of Air Accidents, finishes his investigation and publishes the report.

The University of Auckland School of Medicine had the task of identifying the victims. Teams of pathologists, dentists, and police examined carefully the 347 bags containing remains. They were able to identify 213 out of the 257 on the plane, identifying 19 of the crew of 20, 194 of the 237 passengers. One report said 17 of the Americans were identified. They held an interdenominational service and burial on February 12th for the unidentified forty-four. All deaths happened immediately on impact. None died from exposure or smoke inhalation, nor was there any evidence of alcoholic consumption by the crew.

New Zealand, U. S. and Japanese expedition members have built and erected a wooden cross on a rock outcrop two km from the wreckage. The Japanese sprinkled saki - Japanese rice wine - around its base. The last flight to the crash area was made on December 20th. The U. S. has continued to make other governments aware of our concern about tourist flights. Tom Pickering, Assistant Secretary of State, Oceans and International Environmental and Scientific Affairs, took the opportunity in New Zealand and Australia to mention to officials of their Foreign Ministries the special strain which tourist flights place on our science program. It is rumored that Air New Zealand may have permanently discontinued its Antarctic flights.

Everyone seemed to enjoy a great summer field season studying the geology of the Ellsworth Mountains. Bob Rutford wrote "without a doubt the most beautiful place on the continent" and John Spletts had a ball being "back home" where he and three others had mapped the entire range, using motor toboggans in 1961-62. There were some 35 scientists, most of whom were Americans, but included scientists from New Zealand, Japan, Soviet Union, and West Germany. A temporary camp similar to the Darwin Glacier camp, was built on the northern end of the Heritage Range, in an open area just off the Minnesota Glacier and in full sight of the huge Sentinel Range

It was named Camp Macalester as the chief scientist, Gerry Webbers, was of Macalester College in St. Paul, Minnesota. Major emphasis was placed on the paleontology, stratigraphy, and sedimentation of Pre-Cambrian and Paleozoic sediments that formed in the highly folded rocks of the Ellsworths. There were several good old young boys in the team put together by Gerry Webber: Bob Rutford, John Spletstoeser, Cam Craddock, Ian Dalziel, and Masaru Yoshida. It is always reassuring to me to know that there is still a place in science for a guy like Craddock who proudly displays a pre-World War II haircut. George Denton took his group to Ellsworth to find out what the West Antarctic Ice Sheet has been doing; Bill Cassidy checked for meteorites there were none; Ed Zeller and Gisela Dreschhoff, with the help of two members of the West German Geologic Survey, did a reconnaissance of radio activity. Most of the field work was done from small tent camps put in by helicopters which transported people throughout the 200 mile long range. VXE6 and Holmes and Narver provided excellent support and were universally lauded by the scientists. All the planned science was accomplished in only 21 days of helicopter flying. Hot showers, super food, and Jamesway sleeping at Camp Macalester was only icing on the cake. It was a wonder that they were able to ever get those guys (and dolls) to come on home. Our thanks to Mort Turner for the info used in this paragraph.

Our Sales Program. What a bag of worms! We had difficulties about everywhere we turned. We will have to return monies sent us for calendars. This was one item where we guessed right on the demand, and sent a check off to New Zealand in mid-November for 200, but got only 150. We have orders for about 30 which we will never be able to fill. Refunds will be made shortly. We regret this snafu but it was out of our hands to do anything about it. We sold out our 200 note papers commemorating the 50th anniversary of the first flight over the South Pole, but Vernice Anderson came to our rescue and made some of the National Science Board's supply available to us. This has enabled us to fill all orders to date, and we still have some for late orders. The South Pole cachets were not as popular as I had anticipated, and we were able to sell only slightly over 300. We have a master plan designed by our own master philatelist for selling the remainder to master philatelists. The shoulder patches are again available. We had to go back to the manufacturer to reorder, the minimum order being 220, so we do have them, although our special run did not turn out quite as good as the first run.

There were 75 out-of-town people who ordered items. Cachets attracted the most, 56, with 51 wanting calendars, 46 wanting shoulder patches, and 34 seeking note paper. I handled all of the orders, so if you did not get what you were supposed to get, please let me know. Please check it against what you got. Someone got a second set of cachets from the South Pole, as I am missing five through poor bookkeeping.

\_\_\_\_\_ calendars      \_\_\_\_\_ note paper      \_\_\_\_\_ cachets      \_\_\_\_\_ patches

Elections will be held by ballot, as they were last year, with the slate being presented in the next Newsletter. Our By-Laws make no provisions for how officers and Board of Directors get nominated, although most people think the By-Laws call for a Nominating Committee. This is not so. Last year we voted that all officers be elected for a two-year term, with the stipulation that they could not be renominated for at least four years. This is not so for the Board of Directors, who can come back on after a year's absence. Our current officers and Board members are listed below. We will need a new President and a new Secretary, plus four new Board members. We have a good Board now, meaning they show up at meetings and really participate. Please don't nominate someone who may be a great guy but does not want the job. Nominate workers, not names. Board members can be nominated as officers.

Current Officers and Board members:

Outgoing President - Dalrymple  
Vice-President - Brownworth  
Treasurer - R. Siple  
Outgoing Secretary - Hushen

Outgoing Board	through 1981	through 1982
Barretta	M. Crary	Meunier
Burrill	A. Dater	Rose
Huffman	Dow	Schatz
B. Honkala	Espenschied	Tobin

The end is near for Mary Alice McWhinnie, and she may have already died by the time you read this. Ruth has been keeping in contact with her sister who sent out a letter to Mary Alice's friends on February 13th summarizing the events of the last month and a half. She is being tube-fed through the nose so she won't starve or dehydrate. She wrote "all that can be done now is to keep her comfortable and not prolong her suffering anymore. She sleeps most of the time and we just hang in there day by day." In mid-January they put a shunt into the back of her head to drain off the fluid into the abdominal cavity and relieve the pressure on her brain. She came through the surgery and after a week another brain scan was taken which showed metastatic disease in the parietal and occipital area. It was conjectured that this was probably there all the time and was why she had gone downhill each day. Her sister has asked "please remember her forever in your prayers and never forget the beautiful memories you have had of her". Amen.

I asked Henry Harrison, the Glue that holds the members of BAE I together, if he would give me a story on the late Epaminandos Demetrius Demopoulos, better known to us all as Pete Demas, and he came up with the following:

It was midwinter at Little America I with forty-two men living in three houses on floating sea ice which was the north edge of the Ross Ice Shelf. Commander Byrd lived in the Edgar Barrett House along with Larry Gould, Bernt Balchen, Dr. Coman and twelve others. There were some in the winter party who were apprehensive about the stability of our ice base, fearing that it might crack up under pressure of winter cold and leave us on an iceberg to drift northward into the open sea and almost certain death. New York TIMES correspondent Russell "Step-and-a-half" Owen was one of the chief "nervous nellies". Russ was also an easy mark for the several talented pranksters in the camp. My diary tells how they worked one of the meanest and deadliest of all hoaxes at Little America I, on June 20, 1929.

"A really sensational hoax was worked on the gang at 5:30 a.m. by Pete Demas - especially for the benefit of Russ Owen but others fell for it as quickly as Russ did, so realistic did the whole thing seem. As night watchman, Pete rushed into the Edgar Barrett House at 5:30, let out several ungodly screams and then yelled, "All hands out. A crack in the barrier has opened up and the camp is threatened!" Cyclone Haines, Taffy Davies, Charlie Lofgren, Russ Owen, Alton Parker, Jack O'Brien, Malcolm Hanson, Tom Mulroy and Ashley McKinley all jumped into their clothes and some of them even ran all over the camp in the dark trying to find the crevasse. Russ and Hanson were like two scared

rabbits and Hanson almost wrecked his radio lab in his rush. When I woke up, everyone was rushing for the door and there was an air of intense excitement and tension.

I knew that something like this had been planned before but so realistic did it all seem that I was almost ready to turn out too when I suddenly heard a suppressed gurgle from Larry Gould's bunk. Then I was able to lie back and enjoy the fun.

The affair was discussed and rehashed all day with the "suckers" being kidded unmercifully. All agreed, however, that it was a risky joke to pull off. Willard Van der Veer seems to have been the instigator."

Gerry Pagano has all of Pete's memorabilia packed up ready to be shipped to a museum in Greece. There is one large box marked "Penguin in Glass". It's too bad that Pete couldn't have lived long enough to have delivered all of his things in person, as it would have been a most historic homecoming.

John Dyer wrote from his home in Center Sandwich, New Hampshire that Dick Watson, radio operator on the BEAR OF OAKLAND (BAE II) died about two months ago after a long bout with cancer. John wrote, "Dick was one of the nicest people that you could wish to know. He was not on the winter party unfortunately, as he would have been a fine person, but he had to go with the BEAR to New Zealand. We had a weekly contact with him for the benefit of the New Zealand BAE II office." Dick lived right here in the Washington area (Silver Spring), but we were not aware of it, unfortunately. John and Bud Waite keep in contact on a weekly basis via ham radio. John says that all Antarcticans should be ham radio operators.

Lee Winslow Court, one of our artist members, knew Admiral Byrd before he ever went to the Antarctic. They were both members of the Boston Art Club. REB went north with McMillan on the PERRY (that is right, as the BOWDOIN wasn't born then) and they stopped off at Monhegan Island. Lee wrote, "We had a hellova blow around one hundred knots. Dick decided that he would rather spend the night in the studio that I was using on Fish Beach. Under his bed (like a Linus blanket) was his new baby, made from pieces of tin cans, et al, ... his sun compass. In the morning when he had made his bed he allowed that it was the easiest ever since the wind was still howling and you simply lifted the sheets on one end and they rippled out to lay flat on the bed!" Those of you who have not discovered Monhegan Island are missing a great treat.

On Her Majesty's New Year's List a year ago was old Bob Biller, Deputy to Ed Hillary at Scott Base in 1957, which immediately made him Sir Holmes Miller which is certainly more profound, if a bit stilted. You historians out there, how many Antarcticans have been knighted? There's Shackleton, Mawson, Wilkins, Hillary, Fuchs, and Miller that come to mind. There must have been more.

We keep harping on dues, but please let me explain our weights and balances. First, I will admit that my administration has been costly, as the Newsletters do not come cheap nowadays. We published six last year, will have six more this year. The six Newsletters this year will cost approximately \$1000 for printing. The pro-rated cost, including envelopes, mailing, bulk mailing permit, is about \$3.65 per member per year. We should have about 330 paid-up members by the end of the year (currently 291) but remember a lot of you (141) paid up for future years when membership was only \$3.00 per year. All of the wintering-over people from BAE I and BAE II get a \$3.00 membership. We buy cookies, coffee, and the accessories for each local

meeting. In the past the Society has paid for the cost of the establishment where we have held our Mid-Winter picnic in June. So we could very well lose money this year. Our sales program has some meat on the bones, but it's more like spareribs than tenderloin. Last year we had two corporation dues, plus a \$100 membership from Gil Morgan of BAE II. This year we don't have any to date. Some of you have been very kind and added some spare bucks to your memberships which really help out. No one get unceremoniously dumped, as each and every one who has been cut in the past two years (about 75) has had at least six pleadings/warnings about being delinquent. So if you want the Newsletters, want to be a member, it behooves those of you who have not paid for this year (July 79-June 80) to get your money up. Green talks.

and Capt. Edwin MacDonald, veteran of countless trips to the Antarctic, will also be the

MAKE IT REUNION TIME!

Show up, with or without your most Favorite Penguin!

BERGY BITS is the biased, candid writings of the President of the Society, and in no way should be construed as the Voice of the Society.

One sure way to hear from members of the Society is to goof on something. We pulled a major one in the last issue when we reported that Alan Innes-Taylor had passed away. It seems that one of my reliable, impeccable sources of information let me down. We tried to run a check on it, but came up empty handed, so we went ahead and printed it. The telephone rang off the hook for the first few days after the Newsletter went out. The only thing I could do was to write a sincere letter of apology to Alan, saying how happy we were to be able to report back to the Society that the report of his death was "greatly exaggerated". We also sent him some of the goodies the Society has been selling for the 50th anniversary of Byrd's first flight over the South Pole, and hope they will help placate Alan.

We can generally count on you readers to point out our miscues, but it is like pulling teeth to get help when you ask for it. Only one member, good old Bob Nichols, came up with additional names of knighted Antarcticans. One was the late Sir Charles Wright, whose name appears on our letterhead as an Honorary Member! Another was Sir Raymond Priestley, the famed geologist who was on Scott's last expedition. I was really remiss here, as I had gotten Sir Raymond to autograph a cachet for my collection when I met him in Wellington in December 1958 prior to his going back to the ice. Another knighted man from Scott's days was the meteorologist, Sir George C. Simpson. Edward R.G.R. Evans became Admiral Lord Mountevans (of Cape Evans). Bob pointed out that Captain Robert Scott would have been knighted had he survived, and, that his widow did become Lady Scott. Dr. Edward Wilson would probably have been knighted also. So we have Wright, Priestley, Simpson, and Evans to add to Shackleton, Fuchs, Wilkins, Hillary, and Miller. Did Griffith Taylor ever make it?

But before we close the book on the knighted, how about one of our own - old George Doumani. Back in 1963 the Lebanese Republic bestowed the National Order of the Cedars on George, which must make him the ranking Lebanese Antarctic explorer-scientist of all time. I took a trip up the mountain to see the Cedars of Lebanon back in 1968, and it is my prediction that those gnarled old trees will outlive George as there is a strong sense of permanence in their trunks and they have a bunch of priests up there protecting them.

There was at least one criticism about the information we printed on the DC10 crash. Every sentence written on the flight of the plane, its course, and the accident was taken out of a Christchurch newspaper. If you were one who was on the ice or in New Zealand at the time, you no doubt know a lot more about it than I could ever hope to know sitting back here in Washington. One of the difficult things about writing a newsletter, particularly when one's daily work is not in the polar community, is that you have to rely on outside sources of information which isn't always easy. There seems to be a feeling of what I call Antarctic ownership by some people working in the field and they aren't always ready to share their knowledge/information. Another obstacle is a Washington malaise; people just do not return telephone calls. And in one office it appears that the modus operandi is to keep you from talking with the boss.

Pete Barretta was the one responsible for getting the Society cachet which we put on our envelopes commemorating the 50th anniversary of Byrd's flight over the South Pole.

It was designed by a very talented New Zealand commercial artist, Max Hamilton, who has been doing similar work for a long time for Operation Deep Freeze and USARP. He has designed some 30 items and souvenirs (stationery, pictorial envelopes, postcards, labels, T-shirts, and auto plates) for Antarctica. He has also done illustrations for the Antarctic calendars. We are deeply indebted to Max for coming up with such a nice cachet, and want to thank him most sincerely. Pete and Max have a World War II connection which is interesting. Pete was a bombardier on a battered old B-24 Liberator bomber which flew in and out of Piva Riva on Bougainville Island, and Max was there as part of a Kiwi servicing squadron. Pete and his buddies would land following bombing missions over Rabaul and Truk, sometimes after taking a lot of damage from enemy fire, and Max and his buddies would help patch up Pete's plane with baling wire and tape so he could get back up in the air and help preserve the South Pacific. Max, also a young artist at the time, painted squadron emblems on the RNZ Air Force Corsairs. It was lucky Pete was on a bomber, as it might have taken a shoe horn to get this Meadville (Penn'a) lad into a fighter plane. Pete and our Treasurer are both from the same town, but he had a more interesting youth riding buckshot on trucks engaged in moving alcoholic beverages across borders during prohibition days. World War II was sort of dull and mundane for Pete.

We also owe a vote of thanks to one of Ruth's sons-in-law who not only set up our new stationery with the "billboard" of names but also had the Max Hamilton cachet printed on our souvenir envelopes. I think the stationery is super, and the cachets very professional looking. Since these jobs were done at no cost to the Society, he will remain anonymous.

Jack Bursey died. I never knew him, but he did write us a nice letter last fall on November 1st saying that he enjoyed the Newsletters. He was the author of two books on the Antarctic, ANTARCTIC NIGHT and ST. LUNAIRE, ANTARCTIC LEAD DOG (which I thought was just delightful). Everyone knows that he was a valued member of the 1st Byrd Expedition, that he went back on the Antarctic Service Expedition, and also went down for Deep Freeze I. Wasn't it good that he was able to get to the Dearborn Museum meeting last November as Most Honored Guest when they celebrated the 50th anniversary of the first flight over the South Pole. They gave him a standing ovation after his short speech, and his wife Ada wrote Ruth how much he enjoyed it. If you have to go, that's the way to go, with the echoes of a wildly cheering group of admirers in your ears. Maybe we can get Henry or Larry to write something about Jack that we can put in the next Newsletter, which will be the last one for the year 1979-80.

As those of you who have perchance been reading some of these Newsletters in the past two years know, I have been championing the good old boys. I have also let my male chauvinism hang out and evidently it included tourists, too. So I got this three-page single-spaced letter from this chick, Dotte Larsen, up in Pittsford, New York saying she doesn't like being called an Antarctic tourist. She made a splendid plea for her cause. I was still feeling bad five minutes after reading her letter so decided to take a nap until the guilty feeling went away. But it didn't work! I realized that she and I had a lot in common. We both had an Antarctic fixation at an early age. In my case I was able to treat the malaise when the IGY opened a door for me. For her it was Lars-Eric Lindblad, and away she went in December 1977; then again in January 1979; and she was booked for this past January until the ship ran aground down there at Christmas time. She became enraptured with not only whale watching but with whale counting, and next to her loving and generous husband, nothing turns her on more than a whale tail. In fact, her stationery sports an elegant whale tail breaking water. Now how can you hate a girl who loves whales? She counted them religiously and sent her statistics to Ken Moulton, John Twiss and about 30 other people. I didn't know Ken was into whales, but after all his years down there, I wouldn't be surprised.

So I wrote this lovely lady who sent such a nice letter, calling her both a whale spotteress and a whale counteress. She wrote back that she had been called many things in her life, but not those two. However, it appears that either or both were much better than being called that seven-letter word. Now what do *I* call the others?

I hope you Washingtonians have had a chance to visit our National Gallery of Art to see what two million and five thousand dollars worth of icebergs look like close up. I was impressed by not only the magnitude, 112 inches wide, but also by the beautiful colors. But did you hear how the Director goofed when he was being interviewed by the aging, aspiring Greek goddess, Deena Clark? He told her that *The Icebergs* by Frederic E. Church was painted in the Antarctic! Who can you trust nowadays if you can't trust the Director of the National Gallery? They commented on the fact that *The Icebergs* could almost be three separate paintings, and indeed it could. I sort of wished that Church hadn't seen fit to put so much into the painting, such as the broken mast in the center foreground, and that large erratic sitting atop the small berg on the right. Andy Wyeth would never have put a big boulder up there! Lee Winslow Court, do you have a sequel to *The Icebergs* which someone will uncover a hundred years from now and sell for five million?

Another fine Antarctic (how am I doing now, Dotte?), Mary P. Goodwin, one of the good girls lost out there in all that Los Angeles smog, sent me a copy of *Terra* (Vol. 18, No. 3) of the Natural History Museum of Los Angeles in which she presented the results of five years of original research on "The First Book Printed in the Antarctic". This is all about Sir Ernest Shackleton and his limited edition book entitled *AURORA AUSTRALIS* which was written, edited, illustrated, printed, and bound in his hut on McMurdo Sound in the winter of 1908. Shackleton was third officer on the Scott 1901-03 Expedition and was editor of the *South Polar Times*, a monthly typed paper along with a more popular, less intellectual sheet called the *Blizzard*. When the opportunity came for him to lead his own expedition in 1907, he was determined to produce a real book. Four of the men whom he picked (Ernest Joyce, Frank Wild, George Marston, and Bernard Day) were destined to become amateur publishers. Women of Antarctica, arise! as the dedication page is to two ladies, "who have ever shown the deepest interest in Antarctic Exploration, and our welfare." I bet 2 to 1 they were New Zealanders! There are two short prefaces by Shackleton, ten articles, eleven full page illustrations in the 120 pages which were published by Penguin Press with a "delightful double Emperor penguin trademark in the lower right corner in coral ink." The article which would appeal to me was the one by A. F. Mackay, a surgeon, which was entitled "Interview with an Emperor." A haughty Emperor penguin with Scottish accent accosts two expedition members as poachers! Although there were 75 to IOC copies of each page, only 25 to 30 copies were sewn and bound. The first blank end paper usually had an inscription, as these few volumes were reserved for members of the expedition, and many were given by them to family and friends or sponsors. The Irish Stew edition belonged to Sir Raymond Priestley, the Bottled Fruit edition was Edith Shackleton's, and there were other equally delightful names for other copies. There is one copy in the Huntington Library, San Marino, California. This was truly an enjoyable article about a great expedition and fantastic leader by a most dedicatee Antarctic who is currently studying the little known life of the illustrator and water colorist, George Marston. Thanks for bringing this to our attention, Mary, and I trust the Society can keep the copy of Terra.

Did you see Mike Hoover's little production on *American Sportsman* in late March showing three guys and a babe climbing on the northernmost part of the Antarctic Peninsula? I spent the whole hour saying, "I hope they fool around so long that they miss the ship out", although I knew from the *Washington Post's* disgusting article of last year that they had gotten out. I will say this for it, the photography was just out-

standing. I don't know when I've seen better shots in the Antarctic. Superb! But as I watched and listened I had this sickening feeling in my stomach that I was watching Bill Hartigan all over again. [Remember how Hartigan was in a party which went boondoggling back in 1956 on glaciers near McMurdo? The rest of the party went up ahead, and later in the day Hartigan set up the camera and photographed himself as he stood there telling the folks that this could very well be a re-enactment of the tragic Scott expedition, that his partners were long overdue, and that they might have perished.] Hoover milked the Scott trek to the South Pole to a fare-thee-well, showing shots of Scott going to and from the Pole, in their tents, trying to make you think that his experience (which was north of the Antarctic Circle) was comparable. He said, "the same winter that trapped Scott is now trapping us". But that wasn't so bad as a couple of statements about Scott, one to the effect that Scott's insistence on bringing back rock specimens from the Pole made sled hauling more difficult, and then saying that Scott and his party would have made it back safely if he hadn't stopped so many times to write in his diary. Hoover's group even staged a performance of letting the girl go out into a crevassed area until she broke through so they could photograph a rescue. [That reminded me of Peter Schoeck's falling into a crevasse near Roosevelt Island and Big Bert Crary's talking to people back at Little America about who should be sent to replace Peter. The first name proposed was that of a Society member who was most prominent in those days for his love of crevasses. Bert's reaction was a violent "Hell, don't send him, I don't want someone who can tell me how to get into a crevasse, I want someone who will tell me how to stay out of them."]

Rudy Honkala brought to our attention an article on "Piri Reis and the Hapgood Hypotheses" by Paul Hoye and Paul Lunde which appeared in the January-February 1980 issue of *Aramco World Magazine*. I know we have a lot of history buffs in the Society, and if your bent is Antarctic cartography, you should get a copy of this magazine which is published by Aramco, a Corporation, 1345 Avenue of the Americas, New York, New York 10019. It seems that in 1929 scholars working in the archives of the Ottoman Empire in Turkey's Topkapi Palace Museum made an exciting discovery, a section of an early 16th century map signed by an Ottoman captain, Piri Reis, dated 1513. Then this fellow Charlie Hapgood, Harvard trained, history of science professor assigned his class at Keene State College in New Hampshire the task of examining the map. They spent seven years studying it and came up with the finding that not only was the coast of Antarctica there but also mountains that were not known until sonar measurements! I often wondered what guys at Keene State College did when they weren't shovelling snow. Nine pages later in the article they tell about Oronteus Finaeus Delphinus (Oronce Fine to his friends) who was one of the first "modern" cartographers. Fine's world map, done on a "cordiform" or heart-shaped projection, was drawn in 1531 and published in Grynaeus' *NOVUS ORBIS*. The most striking feature of the map is its representation of Antarctica, which was called "Terra Australis." Later the article says that "the first cartography to indicate a southern continent was by the great Leonardo da Vinci himself, who depicted it on a globe and the planispheric map made by Francesco Rosselini. Dated to about 1508, the globe shows a vast land below Africa, labelled Antarcticus." So Antarctica was known about before Larry Gould. The Italians must have given it all up when they found out it was more fun to pinch girls in the Forum than it was to pinch penguins in their rookeries.

Dr. Cyril Poonamperuma, chemical evolution researcher at the University of Maryland, College Park campus, says that the Antarctic meteorites are the best extraterrestrial samples yet found. The ice, cold and dry conditions of the Antarctic serve to preserve the meteorites in the same condition as when they first entered the earth's atmosphere hundreds of thousands of years ago, thus giving evidence of an organic history predating their arrival on earth. A new meteorite area has been found near

Reckling Peak which is about 320 km north of McMurdo, according to a NASA News Release This area is several times larger than the Allen Hills area according to John Annexstad who discovered the field with other members of the NASA-NSF team. And wouldn't you know it, John says it will take several seasons to survey the area. Spoken like one of the good old boys. They spotted 27, evidently quite accidentally, as the press release quoted John, "We weren't really looking for them, they just caught our eye." If you weren't looking for them, John, what were you looking for? The article said that the Antarctic meteorites, which now total more than 1,600, are the next best thing to actually going out in space and retrieving a meteorite. They don't expect me to believe that, do they? Not as long as there is still a New Zealand! And besides, I'll bet if you gave John a lasso or a butterfly net and tried to force him into a space ship to go out and catch a live one, you would have to stick a gun in his back to get him into the capsule. I think those meteorite chasers have it made right there in the shadow of good old Reckling Peak.

Did you see the great LANDSAT picture of a near cloud-free view of the Vatnojokull Ice Cap in Iceland which Richie Williams got on to the cover of Science, 29 February 1980? Richie will miss the Bentley Memorial Lecture because he will be giving a series of lectures in Scandinavia at that time. Imagine Copenhagen, Tivoli, and Carlsberg in the spring. He will never come back.

Dick Miller, President of the Latin American Natural Area Programs of Foresta Institute wrote us from Castle Rock Ranch in Tucson and shortly thereafter showed up at our last Washington meeting. Dick collaborated with the late Carl Eklund and Maria Buchinger at the Buenos Aires IGY Conference in 1959 to help develop the wording for conservation measures which were adopted by the geophysicists and later were recommended to and adopted by the Washington Treaty of 1959. Dick is still working on the Atlas of Antarctic Fishes. He has been deeply involved with global environmental quality through the NGOs of the United Nations. He has produced a series of conservation films, one of which is about Antarctica, having been filmed by him in 1959 at Cape Hallett. It is sold to schools through Ames Films in Burbank, California.

We have a new member, Robert Baron of Dearborn, Michigan, who had an intimate relationship with the Ford Tri-Motors. In fact, he was the guy who released the Floyd Bennett Ford Tri-Motor 4AT-15 to Bernt Balchen. He also was the man who worked on the restoration of the plane before it was installed in the Henry Ford Museum. He said that some of the originally installed accessories are missing. Baron was the last man to technically leave the Ford Tri-Motor Manufacturing Facilities. Welcome aboard, Bob, good to have you with us.

I was always disturbed that the Hillary-Fuchs meeting at the South Pole was so beclouded with inaccuracies. I was there when Hillary arrived; I was there when Fuchs arrived; and I knew both of their radio men quite well, the late Peter Mulgrew, Hillary's communicator, and Ralph Lenton who served in the same capacity for Fuchs. Towards a clarification of the issue, I wrote Peter last summer for his remembrances. His reply of July 9, 1979 may have been his last written words on the subject, and I would like to share them with you.

"As regards your question re Hillary and Fuchs at the Pole: there was certainly no feud. There is no doubt that Fuchs would have preferred our party to have remained at DEPOT 700 as originally planned until he arrived, but he did not, as overall leader, give us a direct instruction. He did, however, suggest obliquely by radio that he would prefer us not to push on to the South Pole. On Hillary's part, there was never any intention other than to go to the Pole. He deliberately took extra fuel and also carefully planned the radio messages that I sent in such a way that should we receive an instruction either from

Fuchs or the Ross Sea Committee not to proceed, it would be too late as we would have passed the point of no return. Once we reached the Pole, followed by Fuchs (16 days later), he and Hillary had a fairly cordial meeting, as Fuchs was sufficient of a realist to know that the deed was done and that, providing he maintained progress and reached Scott Base around the date planned, he would hopefully emerge victorious, probably be knighted and push Hillary's rather spectacular 'dash to the Pole' into the background.

Ed published a very interesting book which you may or may not have seen - 'No Latitude for Error'. This gives a fairly plain account of the incident. The thing which caused Fuchs more concern was Hillary's suggestion published world-wide that, because of slow progress, Fuchs should abandon the programme for the year at the South Pole, return to the UK for the winter and come back the following year to complete the crossing. This idea in no way turned Fuchs on and, in fact, made him more determined than ever to reach Scott Base on the day predicted. I believe, in fact, he was within two days of his target date."

And long as we are into it, let's hear from another one of Ed Hillary's men, Murray Ellis, who was also on the traverse into the South Pole with Big Ed. In his letter to me of last June 6th Murray wrote:

"There was never any rivalry whatsoever between Hillary and Fuchs, in fact, we were all quite surprised ourselves that so much was made by the newspapers of our effort. The reason for our going on to the South Pole was purely to pave the way for Fuchs who was running so far behind his timetable and we were still striking a considerable number of crevassed areas on the Polar Plateau around the area in which he wanted his last fuel dump. At no stage was the Queen ever in communication with the organizing committee back home - in fact communication was very poor between ourselves in the field and Scott Base or with Fuchs' crossing party. The only person that we seemed to have good communication with was the Good Lord, as there was several times we felt he was with us in some dangerous crevasse country. The reason for Hillary suggesting Fuchs stopping at the Pole, and continuing the following year, was purely his concern at the lateness of Fuchs reaching the South Pole and wanting to continue on with his complete scientific investigation across the Polar Icecap. However, once he reached the South Pole and knew our vehicle route, then time was not such a significant factor as it was first considered. Two years ago, Sir Vivian Fuchs was out at the Canterbury Museum opening the Antarctic Wing in conjunction with Prince Phillip, and we had a very pleasant weekend with Fuchs and several members of the New Zealand Crossing Party. The relationship between Fuchs and Hillary was as friendly as ever and they got on very well, as did the rest of us. Fuchs was- greatly appreciative of the effort made by the New Zealand support party."

It was good to see Kirby Hanson (South Pole 58) in town in early March. Kirby still has an umbilical cord to the South Pole, as he is in charge of the network of stations which includes the South Pole, for monitoring climatic change. In fact, his program is called "Geophysical Monitoring for Climatic Change." He was back down several years ago and visited our old cubicles. Must be like returning to the womb to go

back and see your old office. He brought his bride Lisa with him, and what a doll! They have been grandparents for several years, but if she isn't the sweetest looking grandmother I ever saw, then I am a monkey's uncle. She had to undergo a real serious operation last year, but everything came out just great, thank heaven! Lisa is really something, and she can drive a nail and saw a piece of timber! The two of them built this canyon mansion out there in Boulder which must be a show piece. Kirby, Lisa, Ruth and I were going out to dinner that Saturday night; about two in the afternoon it started to snow and was really coming down. But two old South Pole veterans couldn't let a Washington snowstorm keep them in, so we braved the elements. By the time we left the restaurant, Washington had had more snow in those few hours than the South Pole gets in a year! Art "Red Jacket" Jorgensen, also South Pole Class of 58, has been in town twice recently. On his first visit, Red Jacket, Ruth and I got together with another member of the class, Johnny Dawson; and the two sailors swapped stories about Johns on yachts and the new regulations until Marge served up a few thousand calories. Boy, did we demolish two heaping plates of delicious brownies!

Boy Scout finalist Scott Miller said he would run a security check back in Santa Barbara for missing Charlie Greene of South Pole Class of 58. Did you ever find him, Scott? Scott has done real well. He got the 1979 Boy Scout Exploration Award for science research and the Hornaday Award for conservation. Our congratulations! He never made it to the ice, but he is a member of our Society. He has been east working in the Carbon Dating Lab at Queens College and will be back for a third Smithsonian summer in a few weeks. Scott hopes to go to graduate school at Harvard a year from this fall. Another Scout finalist, Steve Weirich, came to Washington last month with the Allegheny College Choir. Ruth, a most loyal alumna who tries to convince people she once sang in the Allegheny Choir, went to hear their concert, and there was Steve. Everyone who met Steve while the Scout finalists were here two years ago was deeply impressed by him, as he has a very humane way about him. We covered Mark Leinmiller, the winner and still champion, in our last Newsletter.

Just about everyone knows that Dave Canham was the first Navy commander at McMurdo back in 1956, that he is the current director of the Sacramento State College Research Foundation, and that he does not run around his backhand. But when you say Canham in this country, you are talking about some pretty important people. The editor of the Christian Science Monitor is a clansman; the athletic director at the University of Michigan who has made millions out of athletic equipment/supplies is another clansman. But just who is good old Dave? So we asked him straight out and he told us, "I was Forrest Evasheski's roommate at Michigan." Not the Forrest Evasheski? Yes, the one and same. It seems he played in the line in front of Evasheski, which meant that he must have had fast feet and hands, because if he did not clear out the opposition he knew that Evasheski was going to blow him out so No. 98 Tommy Harmon could run to All-American stardom. There is only so much glory to be passed around on a team, and after the PIO man got through hyping the running back and then his blocking back, there was no ink left to cover an offensive linesman. So Dave became All-American at McMurdo.

Here is one to impress your teen-age son or daughter. What famous rock star was sired by an Antarctic? If you didn't say James Taylor, you are wrong. I can't tell you much about him because he doesn't sing with Lawrence Welk, but he is supposed to be one of the giants in the industry. I've seen pictures of him, though, and he is one fellow who should take a trip to a barber shop. The Washington Post on May 29, 1979 said, "In his early years, Taylor made such neurotic, fragile music that one came away with the impression that the artist was due to self-destruct at any time. The very best one could hope for from this new-wave folkie was a fireball career - bright and brilliant, if only for a few moments." It went on to say that "time has genuinely mellowed Taylor. His marriage to singer Carly Simon appears to have prospered." The daddy - Ike Taylor who was the doctor at McMurdo the same year Dave Canham was there.

And Bob Rutford was a jock. He evidently played in the shadow of Gino Capelletti up there in Minnesota. Later he became an athletic director at a small midwestern college. One morning he decided that he would not emulate Don Canham at Michigan, but would pack it all up for science. Some people have no regard for money or publicity. If he had stayed with it, who knows, Rutford might have become a household name like the rest of those athletic directors/humanitarians who helped wayward basketball players attend fictitious classes (to gain accreditization) in a Los Angeles garage, so they, too, could go off to college and become political scientists of the future. But now he is going to have to live the rest of his life with that Ross Ice Shelf image.

Had a nice letter from Dick Goldthwait who will always be one of my favorites. He did many favors for me, with great help from old John Spletts, when he was Director of the Institute of Polar Studies at The Ohio State University. He appears to be another Bill Field, retiring but still doing his thing while combining the best of all features - New Hampshire in the summer time, Florida in the winter time, and travelling to such places as Norway where he will be doing some research this summer. He lives on a barrier island in Anna Maria, surrounded by water, and says that it is most important for a glacial geologist to be able to watch sea level rise and fall. He misses skiing while zooming around in an 18-foot power boat. He still gets his kicks out of singing in church choirs, although he doesn't hit the high notes like he did in his undergraduate days at Brown University. He claims he is 68. No way!

Rudy Honkala of Wilkes 57, Wilkes 60, Palmer 67, plus another Antarctic summer and heaven only knows how many years in Alaska and atop old Mt. Misery (Mt. Washington, N.H.) went up to the annual Explorers Club bash in New York City in late March. He took along his two daughters, and after the festivities they took off on their own for a little night life. Rudy meandered his way down to the bar at the Waldorf Astoria and walked in on all those sports celebrities who had been taping another Miller's Lite commercial. He was in his rightful element here as not only does he have a long drinking record, but he claims he played the best third base in the history of Salisbury High School in New Hampshire. It doesn't take birds of the same feather long to get together, and soon Rudy found himself deep into conversation with Marvelous Marv Thorneberry, infamous, almost-was baseball player and celebrity of the futile New York Mets in their foundling years. Marv and Rudy, two peas in the pod for sure! But Rudy came away greatly disillusioned as all those famous sports stars of yesterday were into hard stuff, with nary a bottle of Miller's to be seen after they turned off the kleig lights.

Here is another question. What famous polar explorer was a Lenin look-alike? That's almost too easy for you older guys, but you young fellows might have to think a bit. Good old Sir Hubert Wilkins. If you have ever been through the excellent Arctic and Antarctic Museum in Leningrad, you will recall dozens of large photographs which included Lenin. When I started my tour I said, "Oh, there is Sir Hubert." But then I realized where I was and came to my senses. The fellow who looked like Sir Hubert was a fellow by the name of Lenin! Sir Hubert rode a high popularity wave in the Soviet Union because of all the time and effort he spent flying over the Arctic Basin looking for a downed Russian pilot. I'm sitting on top of Sir Hubert's last trip report to the Antarctic, one which was suppressed by his home office because the Navy wanted to get their hands on it. It is a salty trip report, but by today's standards would only qualify for a PG rating!

Doc Abbot, the retired admiral who was in charge of Operation Deep Freeze in bygone days, may make the watering hole of the Executive Dining Room his 19th Hole on May 1st I sure hope so, even if he has to wear his spikes. Remember that Pete Rose commercial where he says, "A man wants to smell like a man"? After 18 holes, Doc should be that

man! He will be in town for a meeting of the Association of Naval Aviation, a meeting which is evidently going to be held in part on a golf course. Those Navy pilots always did know how to enjoy themselves. Doc describes himself as a Bull Ferry Pilot (for Bertram Yachts of Miami). He flies from Mobile to Miami, picks up a Bertram, and brings it back (sailing?). He and Margaret recently returned from their 20th ferry trip. He drives a Cholmondeley, which translates into a 1980 diesel Coupe de Ville. He is looking forward to getting Cholmondeley XVIII in the near future, so it pays to be a bull ferry pilot. Probably his retirement paycheck is almost enough to keep it in gas.

The Society is very fortunate in having Charlie Bentley give the Memorial Lecture, as his topic is on the cutting edge of today's technology. In fact, Charlie led a conference on the subject of global warming and whither the ice sheets at the University of Maine, April 8-10. Everyone is getting into the climate act, and it makes one wonder whether anyone is back at the bench doing any research. Jerry Brown at CRREL is doing a position paper on "Physical and Hydrological Effects of Climate Change on Permafrost" which will go into a big volume being put out by the AAAS and the Department of Energy this fall on Environmental and Societal Consequences of a CC>2 Induced Climate Change. Then in January 1981, Mike Kuhn of Innsbruck, another member, will be giving one of the invited papers at NASA on snow and ice at a conference on land surfaces and climate change. There will be the Mitchell Report coming out later this year for the Polar Research Board of the National Academy of Sciences. We have quite a few members on the Mitchell Committee, Charlie Bentley, Chet Langway, and Troy Pewe. Other committeemen are Jim Baker, Roger Barry, George Denton, Joe Fletcher, Larry Gates, Jim Hays, Terry Hughes, John Imbrie, John Mercer, Uwe Radok, and Norbert Untersteiner (who incidentally has just put on the NOAA uniform of oceanography). The 5-Year Draft of the National Climate Program relegated studies on the cryosphere to a secondary importance, although it can always be upgraded in the next revision which will be in two years.

Bud Waite will be sharing the stage with Charlie Bentley on the night of the Memorial Lecture. Not that Charlie needs support, but these two are very close friends and represent the best of the past and the present. Bud is making a herculean effort to get up here from Florida just for the festivities. He says it will be his swan song, as he has more ailments than Carter has little liver pills. There never will be another guy like Bud because in this era of specialization it could never happen again. He could regale us for hours with his memories of his many trips to the ice, which he is currently chronicling in his memoirs. His mind is still keen, his voice has the strength of a fog bell off the Grand Banks, and he talks with all the animation of a sophomore in high school who has just been picked to be the starting quarterback in the annual Thanksgiving Day game versus the Bad Guys. Bud is the only one left of the people who went out to Advance Base to rescue the late Admiral Byrd. You can read about it in several books; in fact, you can read about it in his journal now in manuscript form. But we are giving you Bud live for ten minutes (not to exceed fifteen minutes!) in which he will give us a short slide show on rescuing REB. It's a once-in-a-lifetime chance for you young Antarcticans to come and hear the Grand Old Man. And while you're listening to a man who played his whole life with gusto, let's not forget his contribution to the history of Antarctica and, particularly, his pioneering research on the use of radio echo sounding in the determination of depths of snow and ice, a technique which he perfected and then took airborne, breaking all time barriers and all areal coverage, making a motion picture out of what was a still picture taken with seismic shots. You would have thought it would have put the Charlie Bentleys out of work, or at least kept them home in Madison. But guys who dig snow pits are a breed unto themselves and they don't give up easily. In fact, Charlie has been deep into taxpayers' pockets for over two decades, and that evening we will be looking at one of the sections of the jigsaw puzzle, the West Antarctic Ice Sheet.

Charlie is more at home there than he would be if he were dropped half a mile from his home on Lake Mendota Drive.

We are having a little version of Antarctic Saturday Night Life just preceding the Memorial Lecture, in the Executive Dining Room of the National Academy of Sciences when we'll gather at 5 p.m. for a Happy Hour, pay-as-you-consume bar, followed by a Prime Rib or Crab Imperial dinner (\$15 per). As we go to press we have reservations for 70. We can handle another 25, so get your reservation(s) in to either Ruth (office 527-2678, home 522-2905) or to me (office 664-1561) by the 29th. I don't think we will sell out, but I would love to. Regardless of whether you are coming to the dinner party ahead of the lecture or not, let's get ourselves into gear and down to the National Academy of Sciences for the Memorial Lecture. Let's have a good turnout. Bring some friends, even your in-laws. Attendance has been picking up lately, so let's keep it up, Washington.

The South Pole is "boring because there is no place to get away from it all". So said Dr. Michele Raney, the first woman to ever winter-over at the South Pole, when she spoke to the St. Vincent Medical Center Auxiliary in San Marino, California on April 16th. Dr. Todd, don't tell me you promised Michele a rose garden. My sources told me it was an exciting year, in fact, you could almost say it was a barn burner. She also told them that "it was beautiful". Well, it is fantastic getting there and coming back, but I don't think an almost featureless expanse of snow extending into infinity is beautiful unless you have a love affair with "white".

Mary Alice McWhinnie died on March 17th following a long illness. Her sister is making a rather extensive mailing of obituaries, articles, and pictures of Mary Alice which many of you should be getting about the same time you receive the Newsletter. There will be a Memorial Service at 2 p.m. on April 25th at DePaul University. Natural History, March 1980 has an article coauthored by Mary Alice and Charleen Denys entitled "The High Importance of the Lowly Krill". Mary Alice went to the Antarctic ten times, starting in 1963 when she was aboard the ELTANIN. She was the first woman scientist to winter-over in the Antarctic, being at McMurdo in 1974. Her research in recent years has been centered at Palmer where she designed large flow-through sea-water aquariums which made possible long-term captive maintenance of krill with consequent breakthroughs in the understanding of the biology of crustaceans. She was truly a giant in Antarctic research, and she will be deeply missed by all those Antarcticans whose lives have been enriched by having known her. Dr. Sayed El Sayed, probably Mary Alice's closest professional colleague and dear friend, just returned to his office at Texas A & M in mid-April. He is going to write a memorial tribute for Mary Alice which we will print in the next Newsletter.

Charles (BAE II) Murphy's wife died in March following a long illness. Charlie plans to pull up stakes in the District of Columbia and move to Grafton, Vermont which is about a 180° change. Our sympathies to Charlie on his recent loss.

It may be time for the Antarctic Poet Laureate, one Admiral Richard Black, to sit down with pen in hand and write another poem about an Antarctic ship. The HERO left Ushuaia, Argentina in mid-April, bound for the west coast. Her fate is a bit up in the air, as she needs an overhaul which would probably cost one and a half million dollars. People in NSF are now going through a lot of budget exercises to see what stays, what goes. The HERO represents the best of Maine craftsmanship, having been built in the famous Carnage shipyards. This is only her second trip back to the States. At NSF they are also deliberating over what to do with the ELTANIN. This isn't a good time to be a ship, as the price of keeping them in service is getting to be out-of-sight.

After 12 years of supporting the Antarctic operations, Holmes and Narver is now out. The new contract, which became effective on April 1, 1980 (no April Fool, we hope) is with Antarctic Services, Inc., which is owned by Federal Electric Corporation, which, in turn, is part of International Telephone and Telegraph. Federal Electric has been involved in Arctic operations for quite a few years, as it seems to me they were running many of the DEW Line stations back in the early 60's.

The University of Iowa is holding a symposium on May 2-3 as a centennial celebration for one of their more famous alumni, Vilhjalmur Stefansson. A number of years ago a Canadian artist completed a bronze bust of Stefansson to be presented to the Canadian National Gallery. Some alumni and faculty members developed the idea of casting two additional busts, one to go to the National Portrait Gallery in Washington and the other to be presented to the University of Iowa on May 3rd. The Art Department is hosting the ceremonies and they anticipate about 100 visitors attending the symposium. This past year Stefansson was honored in Moscow (October 30), at Dartmouth College (October 31) and in Ottawa (November 2).

The Christian Science Monitor republished Emilie Tavel Livezey's excellent article on "Admiral Byrd's Legacy in Limbo" (which we got from their New England edition in January) in the Eastern edition on March 11, 1980. This edition had a picture of the Admiral's son and two of his grandsons. We had verbal permission from the Christian Science Monitor to use the article in our Newsletter, but a follow-up letter showed that our credit line should have read:

Reprinted by permission from The Christian Science Monitor

All rights reserved

Thank you, Christian Science Monitor. Kathleen Allison, their Copyright and Trademark Administrator said that the author was "simply delighted to learn that you are going to use the article" as she is interested in those who know about the papers and have a direct interest in them bringing "their influence to bear in seeing that the papers are properly cared for and available for study." Amen.

Hit and Run: The Diploma program in Polar Studies at the Scott Polar Research Institute has been replaced by a M. Phil. Degree in Polar Studies. The degree is granted upon completion of a one-year course of study and the associated scheme of examination, which includes a 20,000-word thesis and five 2,000-word essays, as well as orals at the discretion of the examiner. Did not say how many words would constitute an oral! I thought the U.S. was the only place where they measured theses in inches and/or pounds. If you have a copy of the Geographical Journal, Vol. 145, Part 3, November 1979, you might want to read J. G. Lockwood's review of "The Antarctic Ice-Sheet: Regulator of Global Climates". Rudy Honkala has a series of maps in the February 1980 issue of the Mining Congress Journal accompanying an article he coauthored on "A Cartographic Look at Constraints to Mineral Exploration and Development".

Speaking about Antarcticans who have enjoyed cruises on both the LINDBLAD and the WORLD DISCOVERER, there is no one finer than Pennie Rau out in Hollywood. One of the better things about being president of the Society is the mail bag, and we have heard more from Pennie than from anyone else. She has been a very good friend to the Society, and has given the Society some penguin pins, and a few whale pins, for us to sell. These sold for \$15 each on the LINDBLAD, but we will sell them for \$10, including mailing. The penguins are about 1 1/2 inches tall, the whale about 1 inch. She is also working on a belt buckle for us, one which will have a map of Antarctica on it. It will be a thing of beauty, as Pennie will see to that. She runs a topdrawer jewelry business, and you can be sure, if it's by Pennie. She is commissioned by a Scandinavian shipping

line to do one piece a year for them, and many of her pieces depict the local citizens of the polar regions. She is a most delightful person. Ruth and I have talked to her several times, the last time on Easter. She was spending that afternoon writing Congressmen, editors, and organizations about her friends from the animal and mammal kingdom who, she feels, merit more protection.

The Society is now into its third decade. It is pretty hard to predict its future. One thing which has particularly interested me has been in making the Society a thread to the past for the old-timers. I always felt that those currently involved in Antarctic research do not need anything beyond the Antarctic Journal which is really their organ. But when your hair starts to get gray, your waistline gets out of control, your comrades start falling by the wayside, and your dentist is making bridges and partials rather than filling cavities, then it is getting towards memory lane time. One of my wishes has been to upgrade the Memorial Lecture meeting, making it get-together time for those who want to reunite themselves. The Larry Gould show was our first expanded Memorial Lecture, and the Charlie Bentley bonanza hopefully will continue in the same vein, with Bud Waite being an added attraction. However, I would like to see the Memorial Lecture increased by another magnitude, one where the Society would induct an Antarctic into our own Antarctic Society Hall of Fame. My idea would be that the Board of Directors would establish some kind of an ad hoc committee which would select nominees for the Hall, and then the Society members would vote on them sometime during the year. It should be very restrictive/selective, with only one person being selected each year. That person would then receive a Hall of Fame citation at the annual Memorial Lecture. If the person were still alive, hopefully he or she could attend the Lecture; if the person were deceased, then a close relative could be our guest. We could have a nice plaque made up to be presented to the recipient. I think it would add a continuing interest to the Society, and help build up attendance at the Memorial Lecture. I also feel we could finance the whole deal by getting corporations involved so that it wouldn't cut into our operating funds. We are a non-profit organization and hopefully can survive on membership dues. I hope future administrations will not carry deadwood members such as we inherited, because that would put the Society under, at the current cost of sending out Newsletters. Louie DeGoes of the Polar Research Board at the National Academy of Sciences had suggested that we make an award to the Antarctic Scientist of the Year, but after thinking about it for awhile decided that this might become too controversial. There is more to the Antarctic than science, and a Hall of Fame should include scientists, explorers, and just folks who have made some significant contribution, such as an architect of the Antarctic Peace Treaty. The Hall of Fame could become a popularity type thing, but if we have good screening committees on nominations, all the nominees would be highly qualified. We could get into difficulties trying to evaluate whether some glaciologist is better than some botanist or some physicist. And the Society is not a scientific society. What do you people think? Please let us know.

The Antarctic Journal, Vol.XIV, No. 4, December 1979, has 17 pages on the 10th Antarctic Treaty Consultative Meeting. If you had been a participant in all of their meetings you would have gone to Canberra, Buenos Aires, Brussels, Santiago, Paris, Tokyo, Wellington, Oslo, London, and Washington. There are thirteen consultative parties (Argentina, Australia, Belgium, Chile, France, Japan, New Zealand, Norway, Poland, South Africa, UK, USSR, and USA) and eight adhering nations (Czechoslovakia, Denmark, The Netherlands, Romania, German Democratic Republic, Bulgaria, and the Federal Republic of Germany). One would assume that Leningrad, Warsaw, and Capetown may be hosts for future meetings. Just imagine all the great meals and embassy parties which have gone into those ten meetings. If you don't have the talent to be a world class tennis player the next best thing is sitting in the Antarctic desk at the State Department. The Consultative Parties have issued guidance for Antarctic visitors, which are more or less spelled out in 10 Do-Not Commandments: do not disturb wildlife, do not litter, do not

use sporting guns, do not introduce plants or animals, do not collect eggs or fossils, do not enter specially protected areas and avoid sites of special scientific interest, do not interfere with scientific work or enter unoccupied buildings, do not paint names or graffiti on anything, do not wander away from your party, and do not fail to take care of Antarctic historic monuments. I, personally, am more concerned with the Mike Hoovers of this world, those adventurers who want to capitalize commercially on the continent. We had a letter from a fellow serving as coordinator of the 1980-81 Trans-Antarctic Expedition, a boondoggling affair if I ever saw one. He wants to take 112 dogs to McMurdo and then cross the continent with five dog teams. He didn't say how many people were involved, nor had he done any homework on the subject. I wrote back and asked him why they couldn't just be good boys, stay in Alaska where they belong with all those highly organized dog sled races for big prize money, and not bother anyone in the Antarctic. The continent is supposed to be a scientific laboratory, and not a three-ring circus with quacks running all over the place. They already have those birds from the U.K. all perched on the shore to attempt a crossing next summer. Can't you see them and five dog teams all arriving at the South Pole together? McMurdo could become the Coney Island of the late 1900's.

-----

I (like)(do not like) the idea of an Antartican Society Hall of Fame.

I (like)(do not like) the idea of an Antartican Scientist of the Year.

I have another idea. Here it is:

I want a Pennie Rau Penguin Pin (gold finish) at \$10.00.

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

**Presidents:**

- Jr. Carl L. Eklund, 1959-61
- Jr. Paul A. Siple, 1961-2
- Mr. Gordon D. Cartwright, 1962-3
- RADM David M. Tyree (Ret.), 1963-4
- Mr. George R. Toney, 1964-5
- Mr. Morton J. Rubin, 1965-6
- Dr. Albert P. Crary, 1966-8
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumini, 1970-1
- Dr. William J. L. Sladen, 1971-3
- Mr. Peter F. Bermel, 1973-5
- Dr. Kenneth J. Bertrand, 1975-7
- Mrs. Paul A. Siple, 1977-8
- Dr. Paul C. Dalrymple, 1978-80

**Honorary Members:**

- Ambassador Paul C. Daniels Jr.
- Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard

**Memorial Lecturers:**

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Mr. Peter M. Scott, 1971
- Dr. Frank T. Davies, 1972
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979

TOURISM IN ANTARCTICA WITH THE WORLD DISCOVERER

by

Dr. George A. Llano  
of  
Society Expeditions

on

Thursday Evening

June 5, 1980

8 p.m.

Board Room, Room 540  
National Science Foundation  
18th and G Streets, N.W.

This is our last official function of the 1979-80 season. Come and find out just what it's like to take an Antarctic cruise, what makes the cruise ships so very popular, and what the future looks like for cruises and tourism. George heads up the lecture program on the World Discoverer after a long and distinguished career working at the National Science Foundation in what is now the Division of Polar Programs. His last assignment there was as Chief Scientist.

\* \* \* \* \*

## B E R G Y    B I T S

We went to some effort last summer to track down lectures which had been presented to the Antarctic Society, so for you folks who like to keep track of the Society's history, we are starting out Bergy Bits with Two Decades plus One of all the lectures presented. Like all the rest of Bergy Bits, they are subject to errors of omission. Bergy Bits remains the voice of your outgoing President, and should in no way be construed as the official position of the Antarctic Society on any subject.

Lectures of the Antarctic Society 1959-1979

1959-60

- November 19, 1959      Film shown. "U.S. Navy Supports the IGY in Antarctica."
- April 6, 1960          Panel Discussion of International Antarctic Scientific Symposium, Buenos Aires. Participating were Bert Crary, Carl Eklund, Mort Rubin, and Harry Wexler.
- June 3, 1960          Capt. Edwin A. McDonald and Philip M. Smith. "Antarctica, 1959-60."

1960-61

- January 10, 1961      Dr. Harry Wexler. "Antarctic Heat and Water."
- April 11, 1961      American Observers in Antarctica. Dr. Henry Dater (with Argentineans), Admiral Richard Black (with Belgian resupply ship), Erv Volbrecht (with Australians at Mawson and Davis), and Walter L. Boxell (with Japanese).

1961-62

- September 18, 1961    Sir Charles S. Wright. "Scott Expedition, 1910-13."
- November 27, 1961    Mr. Harold Lewis and Mr. John Sieg. "Nuclear Power Plant, McMurdo Station."
- January 26, 1962      Film. Herbert Ponting's film, "90 Degrees South."
- April 30, 1962      Admiral David Tyree and Philip M. Smith. "Operation Deep Freeze 62 and USARP 62."

1962-63

- November 1, 1962      Dr. Laurence McKinley Gould. "Reflections on the Antarctic."
- February 14, 1963    Dr. Martin A. Pomerantz and Dr. T. Neil Davis. "Atmosphere and Beyond."
- May 7, 1963          Admiral James R. Reedy, Mr. Robert Mason, and Dr. George Llano. "Highlights of 1962-63 Antarctic Season."

1963-64

- October 2, 1963      Honorable Paul C. Daniels. "Antarctic Treaty."
- November 6, 1963      Dr. Raymond Spaulding. "U.S. Navy's Experience with Psychiatric and Psychological Evaluation of Deep Freeze Personnel."
- January 30, 1964      Honorable George Laking. "New Zealand Antarctic Activities."

1963-64

March 31, 1964 First Memorial Lecture. Dr. William J.L. Sladen. "Penguins and Skuas."

April 30, 1964 Admiral James R. Reedy and Dr. Albert P. Crary. "Highlights of the 1963-64 Antarctic Season."

1964-65

September 30, 1964 Dr. Kenneth J. Bertrand. "Early History of Antarctica."

November 12, 1964 Dr. Meredith F. Burrill. "Antarctic Geographic Names."

January 14, 1964 Capt. Robert H. Graham, RN, MVO. "Two Years in HMS PROTECTOR in Antarctic Waters."

March 10, 1965 Second Memorial Lecture. Admiral David M. Tyree. "Technological Advances in Antarctica."

May 25, 1965 Major Francois Bastin, Royal Belgian AirForce. "Belgian Activities in the Antarctic, 1959-60."

1965-66

September 28, 1965 Rear Admiral Rodolfo N.M. Panzarini, Director of Argentine Antarctic Institute, Vice President of SCAR. No title shown for speech.

November 23, 1965 Capt. Frank H. Radspinner, USA. "Army Helicopter Operations in Antarctica."

March 15, 1966 Third Memorial Lecture. Dr. Roger Tory Peterson. "Impressions of Antarctic Wildlife and Conservation."

May 12, 1966 Rear Admiral Fred E. Bakutis, USN and Dr. Thomas O. Jones. "Highlights of Antarctica, 1964-65."

1966-67

October 11, 1966 Ambassador Paul C. Daniels. "Does Science Contribute to World Peace?"

November 15, 1966 Admiral Richard Black. "Antarctica Revisited."

February 21, 1967 Dr. Samuel C. Silverstein and Mr. Charles Hollister. "American Antarctic Mountaineering Expedition, 1966-67."

March 21, 1967 Harry S. Francis, Jr. "Japanese Antarctic Research Expedition, 1965-66."

April 11, 1967 Fourth Memorial Lecture. Dr. J. Campbell Craddock. "Geologic Studies in Antarctica."

May 16, 1967 Rear Admiral James L. Abbot, Jr., USN and Dr. Thomas O. Jones. "Highlights of Deep Freeze 67."

1967-68

October 26, 1967 Col. Merle R. Dawson, USA (Ret). "Eleven Against the Ice."  
December 5, 1967 Mr. Thomas F. Kelly and Mr. Ralph H. Lenton. "Antarctic Philately."  
January 26, 1968 Dr. Gordon deQ. Robin. "The Norwegian-British-Swedish Antarctic Expedition, 1949-1952."  
February 20, 1968 Capt. Lewis O. Smith, USN. "Operation WINDMILL, 1947-48."  
May 28, 1968 Fifth Memorial Lecture. Mr. James B. Pranke. "Events and Activities at Plateau Station, Antarctica."

1968-69

October 18, 1969 Dr. Laurence McKinley Gould. "Fortieth Anniversary of the Byrd Antarctic Research Expedition, 1928-30."  
December 5, 1968 Dr. Ernest Stuhlinger, NASA. "Antarctic Research, a Prelude to Space Research."  
February 6, 1969 Mr. Amory H. Waite, Jr. "The History and Development of Radio Ice Depth Measurements."  
March 20, 1969 Dr. Maurice Levy. "Dumont d'Urville: The Space Year."  
April 24, 1969 Rear Admiral James L. Abbot, Jr. and Dr. Albert C. Crary. "A Review of Deep Freeze 69."  
May 12, 1969 Mr. George Doumani. "Antarctic Trail Exploration."

1969-70

September 11, 1969 Mr. Robert B. Thomson, Superintendent, Antarctic Division, Dept. of Scientific And Industrial Research of New Zealand. "New Zealand Antarctic Research Program."  
October 14, 1969 Mr. Richard H. Schirmacher and Dr. R. Regula, both of Lufthansa. "Third German Antarctic Expedition, 1938-39."  
November 18, 1969 Dr. Carleton Ray, Johns Hopkins University. "Underwater Investigations of Polar Marine Mammals."  
January 13, 1970 Col. Bernt Balchen, USAF (Ret). "First Flight over the South Po."  
March 10, 1970 Films. "OCEANOGRAPHER in the Polar Regions" and "Passage to Prudhoe."  
April 14, 1970 Rear Admiral David F. Welch and Dr. Louis O. Quam. "Deep Freeze 70."  
May 13, 1970 Sixth Memorial Lecture (also called Presidential Address). Dr. Henry M. Dater. "Antarctica, A Study of Technology."

1970-71

March 3, 1971 Seventh Memorial Lecture. Mr. Peter M. Scott. "Antarctica - Past, Present, and Future."

1971-72

November 3, 1971 Dr. David H. Elliot, Ohio State University. "Antarctica: Key to Gondwanaland?"

January 13, 1972 Dr. J. Michael Lock. "Shackleton\*s Last Antarctic Expedition."

February 9, 1972 Mr. Frank Mahncke. "Antarctic Treaty Inspection Visit."

March 8, 1972 Eighth Memorial Lecture. Dr. Frank T. Davies. No title shown.

April 19, 1972 NSF Presents Highlights of the 1971-72 Antarctic Season.

May 8, 1972 Mr. Morton Rubin. "NOAA - The Oceans, The Atmosphere, The Solid Earth and Space."

1972-73

October 30, 1972 Mr. Herman R. Friis, National Archives. "Work and Resources of the Center for Polar Archives", plus Operation HIGHJUMP film entitled "The Secret Land."

December 8, 1972 Dr. Robert E. Benoit. "Environmental Monitoring and Conservation in Antarctica."

January 17, 1973 Dr. David R. Rodenhuis and Dr. Gunter Weller. "Influence of the Polar Regions on Global Circulation of Ocean and Atmosphere.'

1973-74

November 12, 1973 Rupert B. Southard and William R. MacDonald, USGS. "The Cartographic and Scientific Application of ERTS-1 Imagery in Polar Regions."

December 1, 1973 Panel Discussion on "Civil and Criminal Jurisdiction of Unclaimed Polar and Offshore Territories." Panelists were N. Marshall Meyers, Dr. Kenneth Bertrand, Justin W. Williams, and William Thomas Mallison, Jr.

January 8, 1974 Dr. Fred G. Armstrong. "Environmental Considerations in Construction of the. Trans-Alaska Pipeline System."

April 7, 1974 Dr. George H. Denton. 'The History and Possible Disintegration of the West Antarctic Ice Sheet."

April 30, 1974 Dr. Roger Duff, Canterbury Museum, Christchurch, New Zealand.

May 21, 1974 Ninth Memorial Lecture. Mr. Joseph O. Fletcher. "Antarctica and World Climate."

1974-75

- April 29, 1975 National Science Foundation film, "Antarctica."  
June 3, 1975 Tenth Memorial Lecture. Mr. Herman R. Friis. "The Records in the Center for Polar Archives and the National Archives - A Memorial to United States Participants in Polar Activities: 1750-1975."

1975-76

- December 2, 1975 Dr. Robert H. Rutford. "Account of Antarctic Activities, 1975-76"  
February 25, 1976 Dr. Ian W.D. Dalziel, Lamont-Doherty. "The Scotia Arc Region Unlocks Some Secrets of Gondwanaland."  
March 30, 1976 Eleventh Memorial Lecture. Dr. Kenneth J. Bertrand. "Ellsworth Transantarctic Flight from the Perspective of its Fortieth Anniversary."  
April 28, 1976 Commander Jerome R. Pilon. "Dome Charlie, Herculean Task."  
May 20, 1976 Dr. George E. Watson, III. "Bird Life in the Southern Oceans."

1976-77

- November 4, 1976 Dr. Duwayne M. Anderson. "Mars, The Permafrost Planet." Film.  
January 25, 1977 "Window to the Arctic" - about NARL at Barrow, Alaska. Guy Guthridge.  
March 29, 1977 "Palmer Station, What It Does and Why It Is There"  
May 3, 1977 Twelfth Memorial Lecture. Dr. William J.L. Sladen. "Snow Geese and Detente."

1977-78

- December 13, 1977 Dr. Mort Turner and Col. Peter Barretta, USA (Ret). "Polar Philately."  
February 2, 1978 Mr. Norman Wulf, NSF. "The Antarctic Treaty and Antarctic Resources."  
March 9, 1978 Dr. Richard L. Cameron. "Icebergs, A Water Resource."  
May 25, 1978 Thirteenth Memorial Lecture. Dr. J. Murray Mitchell. "Climate Change in the Polar Regions."

1978-79

October 26, 1978 Dr. Mary Alice McWhinnie. "Antarctica, A Changing Scene."  
December 5, 1978 Rear Admiral Richard B. Black (USN Ret.). "Antarctica Revisited."  
January 31, 1979 Dr. H. Jay Zwally. "Satellite Observations of Antarctic Sea Ice."  
March 22, 1979 Dr. Chester Pierce. "A Physician's View of Antarctica."  
April 19, 1979 Fourteenth Memorial Lecture. Dr. Laurence McKinley Gould.  
"My 50 Years of Antarctic Exploration and Research."

1979-80

October 2, 1979 Mr. Robert B. Thomson. "New Zealand Antarctic Research Programs."  
November 27, 1979 50th Anniversary Commemorative Lecture. Mr. Peter J. Anderson.  
"Admiral Byrd and Antarctic Aviation."  
January 29, 1980 Rear Admiral William M. Benkert (USCG Ret.). "Antarctica: A  
Sailor's Point of View."  
March 11, 1980 Dr. Herman J. Viola. "Wilkes Expedition, 1838-1842 - First  
Round-the-World Naval Expedition."  
May 1, 1980 Fifteenth Memorial Lecture. Dr. Charles R. Bentley. "Collapse of  
the West Antarctic Ice Sheet, Fact or Fiction?"  
June 5, 1980 Dr. George A. Llano. "Tourism in Antarctica with the World  
Discoverer."

\* \* \* \* \*

May Day was certainly the highlight of the Antarctic Society 1979-80 season, as Senator Harry Byrd, Bud Waite, and Charlie Bentley combined their talents to make one truly memorable evening. The chemistry that evening was electrifying; a script could not have made it better. We had over 100 reservations for the pre-Memorial Lecture dinner, only to find out about three o'clock in the afternoon that the fire ordinance did not allow more than 75 in the room! We agreed in case of fire that only 74 bodies would be discovered. Senator Byrd had accepted our invitation with enthusiasm, although he had an evening commitment which precluded this Nouveau Ant- arctican (member of the Gould-Vaughan-Breyer VIP flight last November commemorating the 50th anniversary of the Byrd-Balchen-June-McKinley flight of 29 November 1929) from staying for dinner and the Lecture. He came explicitly to thank Bud Waite, the only surviving member of the rescue team which went out to Advance Base and brought back his ailing uncle in 1934. He spoke at some length with Bud, Dick Black, and Charlie Murphy, all of whom were on the 1933-35 Expedition, as well as with Ruth Siple, widow of Paul Siple who was on that Byrd Expedition as he was on all of Byrd's Antarctic expeditions. The Senator then briefly addressed all those at the dinner,

saying the very proper words about how great it was to go to the Antarctic, and how important the U.S. research programs in the Antarctic were to science and to the world. Our letter of invitation pointed out that we had more Virginians in our Society than members from any other state, and that we all were of voting age; our letter of thanks promised him that we would put into operation a most successful technique employed by the loyal Boston Brahmins for James Michael Curley in Massachusetts, that of voting both early and often on election day. So you Virginians remember that each and every one of us has an obligation to vote at least five times that day for Senator Byrd. That figure should be considered a minimum!

Bud had an excellent 22-minute slide show on Little America II, showing the camp, camp life, and the rescue trips to Advance Base to bring back REB. Bud had more problems with waiters walking in front of the projector than he did with surviving in the Antarctic. His presentation was a fitting climax to dinner, and everyone was most grateful that he took the time to show us and tell us a bit about the 1933-35 expedition and rescue.

Charlie Bentley gave two lectures in one. People came to hear if they should sell their coastal property and head for the hills. Charlie showed us a lot of bottom contours, although not quite as beautiful as the bottom contour that Bud showed us on his last slide at dinner. A disturbing thing about Charlie's presentation was the showing of the Russian map of Antarctica, which he said was the best of its kind to date. Here we were in the main auditorium of our prestigious National Academy of Sciences hearing that after nearly 25 years of intensive Antarctic research the Russians have the best map of the subsurface features. The Memorial Lecture was a natural in that the disposition of the West Antarctic Ice Sheet has been the subject of much speculation in the past few years, especially after John Mercer wrote a highly publicized article in Nature several years ago. And when one reads about the tremendous polar warming predicted by the Manabe-Wetheraid Model, you have all the ingredients that scientists need for having symposiums, lectures, and, most important for them, monies for grants investigating all the possibilities. I predict that the West Antarctic bottom will become one of the best known bottoms in the world. Then Charlie showed his candid camera potpourri collection of scientists in action in the Antarctic. They were hilarious, to say the least. Charlie paid a beautiful tribute to Bud Waite, which will follow later in this Newsletter. This Lecture brought together a man who has had a tremendous input into today's technology, but, by his own admission, has been slowed down physically by the ravages of time, and a man who has benefited for the past two decades by using the technology developed by the Grand Master. It meant a lot to Bud. It was something like still being alive and hearing a eulogy at your own funeral, except it is not often that a minister-priest-rabbi is as eloquent as Charlie.

What did Charlie say about old Bud? Well, he said that prior to Bud the only way one could get ice depth measurements was from setting off a seismic explosion which took a couple of hours at best to get a single sounding. Bud had reduced it from three hours to 30 microseconds, but he still had not put Charlie onto the bread line. He had just made it all better. Charlie said that Bud was the first one to measure long distance transmission through the ice, doing this in Deep Freeze I (1955-56) at Camp Cold Bottom, a suburban paradise located on the seaward side of Crevasse Valley near Little America V. He also said that Bud was the first one to get a bottom echo from the ice sheet, but this was one bottom which Bud did not recognize, at least at first sight. It was only in retrospect that he realized the strong signal which he got came from reflection off the bottom of the ice shelf. The time, January 1957. The next season, in December 1957, Bud made the first bona fide sounding with the help of the late Eagle of the Antarctic, Carl Eklund, when they made a sounding of the ice

sheet on the ramp at Wilkes Station. Jim Sparkman happened to be standing by with a gravity meter (Woollard had flooded the Antarctic with graduate students toting gravity meters) and evidently he was instrumental (sic) in establishing the validity of Bud's findings. Bud never really spent much time at home, he knew he had a good thing going, and went to Greenland later in 1959 and that September-October made the very first airborne sounding of the Greenland ice sheet. In December 1961 he made the first airborne soundings in Antarctica. Charlie said that the closest analogy to Bud's breakthrough was when oceanographers changed from the lead line to sonic soundings to determine the depth to the bottom of the sea. He also cited one other major contribution of Bud's, that of matching the electronics and the vehicles. He said Bud always emphasized the importance of antennas being properly coupled to the aircraft or the vehicle transporting the electronic system.

I was sitting next to Bud, and when Charlie proposed that radio echo sounding should really be called Waite Sounding, Bud muttered something to the effect that he had never received such accolades in his life as he had that evening. And I thought how good it was that one of his daughters and one of his grandchildren could be there with him to share some of his glory. I cranked up my 1962 Ford Falcon and drove the Waites back to their hotel after the Lecture. Bud said they had a seven o'clock departure back to Florida next morning. I told Ruth he didn't need a plane reservation, that he was on Cloud 9 after hearing the kind words from Charlie. Sure enough, when I checked at the Delta counter in the morning there was no record of Bud being on the plane, he honest-to-goodness did ride Cloud 9 all the way home.

William Loeb's Manchester (H.H.) Sunday News for February 17, 1980 had an excellent pictorial story on Ed Moody (Byrd 1933-35 Expedition) and his dogsleds. Ed evidently turns out the Rolls Royce of dogsleds at really cheap prices. You can get a Lombard racing model for as low as \$275 which must be the stripped model. A novice model starts at only \$150 which must be the sub-compact. The long distance racing model is \$400 and up. He also makes the Rosalind, named after his daughter. Ed started making dogsleds back in the 1920's, and turns out about 60 a year. They are in 23 states, as well as in Canada, Switzerland, Sweden, Norway, Finland, and Holland. Ed's sleds are made of white ash, and he personally selects each tree. After the component pieces are carefully constructed, shaped, and bent by steaming, they are lashed together with buffalo skin rawhide. For those Byrd men who may have lost track of Ed, he served during World War II with the 87th Mountain Infantry ski troops and then was with the First Arctic Search and Rescue Squadron in Greenland. Later on he became a film star of sorts, appearing in dogsled sequences from Sun Valley. Wonder if he was on the Road to the Yukon with Bob Hope and Bing? If your gas guzzler is killing your pocketbook, and you need a new dogsled, Ed is still in business in Rochester, New Hampshire. Quite an enclave of Byrd Antarcticans are up there with John Dyer and Leland Barter also living in New Hampshire, Steve Corey going there each summer, and Charlie Murphy will be just across the Connecticut River in Vermont in the near future.

Speaking of Lombard, what a great man Roland Lombard has been to dogsled racing. I knew old Doc somewhat because once when I was the proud owner of a beautiful Siberian Husky he was her vet, as we both lived in the same town of Wayland, Massachusetts. Doc had about 50 Siberians which he raced, and he still amounts to a folk hero in Alaska. An Alaskan racer once told me that he taught them two things: that it was important for the dogs to be fed a good diet, and that it was very important for the driver himself to be in excellent shape. Old Doc used to run along the side of his sled most of the time.

I have a feeling that those Byrd men were made of stainless steel. How else can you

account for Larry Gould galloping around like a colt, and Norman Vaughan completing the grueling 1,049 miles Iditarod Dog Sled Race in Alaska this March? You aren't supposed to be doing those sorts of things after you grow up, they're for strong young studs. But Norman must not believe the calendar, as he broke his own record as the oldest man to ever finish the race, when at age 75 he completed the course in 24 days, 9 hours, 19 minutes, and 25 seconds. We gave him three cheers at the Memorial Lecture for his great achievement. He had a close call this year when he lost his team for four hours. He had to climb a 30-foot cut-bank on the trail, and in the process of helping push his 65-pound sled 30 feet straight up, the dogs gave a quick lunge forward "and they were all gone." Norman had taken off his hat, had taken off his parka and was "in my underwear and a thin pair of gloves and nothing else, except my pants, of course." He could track the dogs in the deep snow, but it was extremely hard walking. The wind was blowing so hard that "I was shivering on the right side and perspiring on the left." He came upon a lake where he found a cabin in which was a small stove. He wasn't sure whether it would work or not, but went out and cut several small trees. While he was trimming the branches he looked up and "saw two black ears sticking over the snowbank. Those were the ears of my wheeler." He went around the corner and found the rest of his team, still tied to the sled, asleep! Our thanks to Gordon Fountain, BAE II, Bear of Oakland, who sent us articles from the Bering Straights and also a clip from the Nome Nugget which Gordon had received from his Eskimo friend, John Taxac.

Our Hollywood agent, the unconquerable Pennie Rau, sent us a copy of an article in the Los Angeles Examiner, February 22, 1980 by Alan Markfield, an American reporter-photographer who was aboard the Lindblad when it ran aground Christmas Eve, 1979. Much of the article is about the film, "Virus", which the Japanese producer hoped to have ready for showing this month at the Cannes Film Festival. The movie is about "a super-lethal germ that can only be stopped by extreme cold, so 855 survivors gravitate to the Antarctic to start life anew.... In the new society in the Antarctic, men and women are assigned to each other as lovers, without concern for love or romance. The only concern is to re-populate the world." The script called for a black girl and a physically big man who is a "tough guy." The girl is played by Stephanie Faulkner, who in the movie is already at the South Pole, presumably with USARP as the article said "member of an Antarctic expedition already at the South Pole." They had all kinds of troubles with personality conflicts and Stephanie's 6'6", 225 pound ex-Marine lover said, "Stephanie can't act and when I'm with her the temperature falls to 100 below." Sounds like real life, eh what! The article said that the unquestioned star of the movie is the Antarctic. Good! The Japanese chartered the Lindblad for \$620,000, but \$300,000 of that was recouped by selling empty spaces to Japanese tourists. Even though they exceeded their 15-million dollar film budget by 1.5 million dollars, the Japanese were extremely happy. The reason? They "had been negotiating with Air New Zealand for space on their flight that eventually crashed in the Antarctic. Had we been on that plane, we'd all be dead."

As for the Lindblad, it could have been a lot worse. It seems on that ill-fated Christmas Eve the third officer had plotted a course through the middle of Gerlache Strait. When the captain came on duty he made a course correction which he reasoned would be a shortcut of two and a half nautical miles. The charts showed the depth to be 216 feet. They slammed onto an uncharted reef, punching holes in the propeller shaft and throughout the ship's hull. The engine room flooded, knocking out the engines. The emergency motors that could have pumped out the water had been knocked out, as they operated on electricity. No power, no heat. They were beached in ten feet of water, but nine yards away it dropped off to 216 feet! So what did they do? Well, they went off and shot three more hours of movie film. Santa Claus arrived early on Christmas Day, trading in his reindeer for a Chilean Naval vessel, the

Piloto Pardo. The Japanese do things differently, first the luggage and provisions went off, then women and children! By 11 p.m. on Christmas all except 19 Swedish officers and crew had been transferred. Shortly thereafter the Russian salvage tug rescued the Lindblad.

I never should have brought up the knighted Antarcticans. While looking through a publication on the Antarctic Museum Centre at Christchurch, I discovered yet another one, Sir Philip Brocklehurst, geologist-photographer on the Shackleton Expedition, 1907-09. So now we have Sir Ernest Shackleton, Sir Douglas Mawson, Sir Raymond Priestley, Sir George Simpson, Sir Charles Wright, Sir Hubert Wilkins, Sir Vivian Fuchs, Sir Edmund Hillary via Mt. Everest, Sir Holmes Miller, Admiral Lord Mountevans. Lady Scott, and Sir Philip Brocklehurst. I hate to mention it, but that character perched on the Weddell Sea, Sir Ranulph Twistleton-Wykeham Fiennes, who plans on crossing Antarctica next summer in Ski-doo's, is already knighted. But with a name like that, he needs all the help he can get. My only objection in his case is "Why Antarctica, now or ever?"

We goofed in the last Newsletter when he had Dick Goldthwait singing for Brown. That former member of the U.S. Olympic ski team, Line Washburn, blew the whistle when he read it and hastened to write that Dick hit all those melodious notes when he was singing "Men of Dartmouth." You know, Line, my Dad took my brother and me up to Hanover for that famous fifth down game with Cornell in (about) 1939, when referee Red Friesell lost count of downs in the heat of battle in the closing seconds when nationally top-ranked, undefeated Cornell was trying to score against a small, over-matched but determined Dartmouth team which would bend but not yield. It was a great game. But I didn't feel so bad when I saw the winter issue of the Explorers Club Newsletter and read where that exalted organization had goofed on Larry Gould, who had written them, "That I am still listed as deceased on the roster of medalists surprises me." I see they have a Bill Vickers on their Board of Directors. Do you remember when that character showed up at Little America, Bert Crary, Mier Bruce Lieske. Ron Taylor, Muckluck Milan, and Dick Chappell (all Society members), and he thought he was going to go right out to Kiel Field and sign out an R4D or a P2V and fly himself around Antarctica? Gad, what a character. You wonder how some got past the psychiatrists.

We ran into a little problem on getting an obituary on Mary Alice McWhinnie. Originally we asked George Llano, but because we didn't hear from him for some time after our request, we asked Sayed El-Sayed. And I guess you can imagine what happened. We ended up with two. Originally I thought we would publish both, but Sayed wanted to use George's in his Biomass Newsletter. Since this has a much wider distribution than our Newsletter, including a large overseas mailing, we are just going to publish Sayed's. I think you will find it very touching, very warm, and very personal. What a terrific impact that lady had on the Antarctic and all Antarcticans!

Mary Alice McWhinnie

1922 - 1980

It was in mid-June 1963 on the Stanford University campus when Curley Wohlschlag, organizer of the Symposium on Current Antarctic Ecological Research introduced a speaker who looked vaguely familiar to me. (J. had seen her before on an NBC documentary on the Antarctic which was narrated by the late Chet Huntley). Her name was Mary Alice McWhinnie. Sitting in the

back of that huge auditorium, I was deeply fascinated by her remarkable gift for holding her audience, by her facility for rattling off data of her experiments, by her ease and humor in responding to questions from the audience. Since I was reviewing that symposium for the American Institute of Biological Sciences (AIBS) I introduced myself to her and asked if I could borrow the manuscript she was reading from. She was chuckling over my request, obviously flattered, and I realized that there were no manuscript or cards on the lectern!! From that moment on, Mary Alice entered my life as a close friend to me and my family and as a trusted colleague until she died last March.

Mary Alice was born in Chicago, Illinois, in August 1922. She received her Bachelor's and Master's from DePaul University. After receiving her Ph.D. from Northwestern University, she returned to her Alma Mater where she rose from rank of instructor to Professor and Chairman of the Biological Sciences Department at DePaul.

As a well-trained physiologist, she delved in metabolism and biochemistry of marine crustaceans, but it was the Antarctic zooplankton, and particularly, krill (Euphausia superba) that fascinated her; a fascination that lasted and dominated her professional life.

And it was with her deep interest in the biology and physiology of the krill and with my interest in the organisms on which the krill feed that we embarked on many collaborative research cruises in the good ole' days of the U.S.N.S. ELTANIN.

For it was on ELTANIN Cruise 46 that Mary Alice and I, as the Chief Scientist, with the help of several of our colleagues from Scripps Institution, Texas A&M, DePaul University, University of Georgia, Oregon State, Smithsonian, University of Michigan and the CSIRO (Australia), that we were able to put together the first integrated marine ecosystem study cruise in the Southern Ocean. There was a repeat performance of that study, the last biological cruise on the U.S.N.S. ELTANIN (Cruise 51) when, in recognition of her scientific prowess and leadership, the Office of Polar Programs, NSF, appointed her as the Chief Scientist and USARP Rep.

I have extremely fond memories of those productive and pace-setting cruises; many which relate to the utter devotion our fallen colleague had to her profession, and to the job she set out to do with her fellow scientists and technicians on board. I well remember the series of seminars she organized during the cruise "so our graduate students/ship officers/technicians have an appreciation and understanding of what we are trying to do", she used to say.

We who worked closely with her can testify to her remarkable ability to work continuously for a couple of days or more without sleep. Then, when thoroughly exhausted, she would drop out of sight for nearly an equal period.

Before departing Perth (Australia) on ELTANIN Cruise 46 (one that would have us spend 60 days at sea, including Thanksgiving and Christmas), Mary Alice organized a collection among a few of us. Before the ship left port she shopped, and stowed away gifts (complete with festive wrapping, ribbons, etc.) for every member of the scientific and support teams, dipping deeply into her own purse to accomplish this.

When the ELTANIN was turned over to the Argentines (ISLAS ORCADAS) in 1974, Mary Alice moved her center of operation to McMurdo to continue

her research. In that year she became the first U.S. woman scientist (with Sister Mary Odilex from DePaul University) to winter-over at McMurdo. And in 1975/76, in order to be closer to the krill stocks, and to take advantage of the R/V HERO she again shifted her research activities to Palmer Station where DPP built a krill aquarium facility for her. Thanks to her efforts and to her international reputation as one of the foremost krill biologists, Palmer Station became the hub of activity of krill research, and graduate students and researchers from several countries vied for the limited space at Palmer Station to work with her. Research vessels from West Germany, Poland, Argentina and Chile made frequent calls at Palmer Station to enable their scientists to discuss and exchange views with Mary Alice regarding the biology, distribution and life history of that elusive crustacean.

Recognition for her scientific reputation was reflected in her membership on the numerous committees, panels, consulting groups, editorial boards, and many other such groups. At one time or another she served on practically every committee that has anything to do with the Antarctic: Panel on Biology and Medicine; Polar Research Board (NRC/NAS); ad hoc Committee for Environmental Impact Statement Appraisal, Ross Ice Shelf Project; U.S. Organizing Committee, 3rd International Symposium Antarctic Biology; Advisory Committee for Research, NSF; Consultants group, Environmental Impact Statement governing a regime for mineral exploration/exploitation in Antarctica, Marine Living Resources, 1976; Antarctic Section, Ocean Affairs Committee, Department of State; Division of Polar Programs, NSF; U.S. Scientific Committee on Interim Measures for Antarctic Marine Living Resources Convention (for DOS), NOAA; Ocean Sciences Committee, NSF; Chairman, PROBES evaluation committee, NSF. In short, she covered the whole water-front!

On the International scene, her stature as one of the leading krill biologists resulted in her appointment as a member to the Krill Biology Working Party of the BIOMASS (Biological Investigations of Marine Antarctic Systems and Stocks) Program. As an ardent and staunch supporter of BIOMASS she worked tirelessly to promote that program. In recognition for her esteemed position, and as a tribute to her, her BIOMASS colleagues have dedicated the soon-to-be published BIOMASS Vol. II (Selected Contributions to the Woods Hole Conference on Living Resources of the Southern Ocean, 1976) to Mary Alice McWhinnie's memory.

Three years before she died she made an extended tour that took her to Norway, U.K., F.R.G. and Japan to discuss with biologists/food technologists various aspects of krill biology, harvesting and technology of processing them as food. In the process she compiled an impressive bibliography on krill, with some 1,800 entries. This compilation "Euphausiacea Bibliography; A World Literature Survey" by M. A. McWhinnie, C. J. Denys and P. Angione, will be published soon by Pergamon Press. This book is a testimony to her zeal, drive and hard work. Also among her last major projects was: "Antarctic Marine Living Resources with Special Reference to Krill, Euphausia superba; Assessment of Adequacy of Present Knowledge" (which she submitted to NSF last December). She also edited "Polar Research - To the Present and the Future", which was published in 1978.

She gave much of herself to advance the cause of science; those of us who were privileged to know her took advantage of that trait of hers. I never recall that she ever turned down a paper she was asked to review or a report to write or a lecture to give. And she did all that with

amazing thoroughness and infinite attention to details. All of us, from editors of scientific journals to program managers, organizers of symposia, etc., took that selfless woman's energies for granted. Amazingly, she didn't complain and was even cheerful about those time-consuming chores. I still recall that after ELTANIN Cruise 46, at the invitation of our Australian colleague, Harry Jitts, we visited the CSIRO Laboratory in Cronulla (Australia). After touring their beautiful facilities, George Humphrey, Director of the Lab, asked us if we had plans for lunch. Anticipating an invitation to have lunch with him and some members of his staff, I eagerly said no. Whereupon George said, "Fine, we have arranged for you to give us a seminar during lunch!" Utterly dismayed with this sample of Australian hospitality, I looked at Mary Alice; she smiled and chuckled and nodded, "Yes, we can do that, George." And she gave a memorable seminar - on an empty stomach!

I also recall a time at the SCAR/SCOR meeting in Kiel, F.R.G., when Prof. G. Hempel arranged to have her give a public lecture at the conclusion of a three-day meeting; it was an impromptu event, hastily arranged after a "beer-break." With a can of German beer still in her hand (of which she was oblivious!) Mary Alice plunged into a highly informative discourse on her recent krill work at Palmer Station, with facts and figures at the tip of her tongue, much to the great fascination of the young German scientists who packed that auditorium.

Tributes from national and international colleagues are to be expected at a time like this, but even more significant is an unsolicited comment from one of the 40 graduate students who earned their degrees under her tutelage. I have received this comment from one of her students who worked closely with her, "Personally, I think one of her most outstanding attributes as a person was her sense of humour and her devotion to the ideal that scientists and support people were a team in Antarctic work. She had a remarkable ability to make anyone feel very special because she believed it very strongly."

To the end she was still hard at it, writing proposals and editing some of her reports and manuscripts. Although the strong will that dominated her life was still there, her failing health was too much to take that burden. Late last September, about a week after she was admitted to the hospital, I spoke to her; again I was greeted with that familiar laughter and voice full of confidence (reminiscent of my first meeting with her at Stanford University). She was sure that she would bounce back and told me that early that day she had told her sister, Vivina, "Get me a few sheets of paper and a pen and I will write my part of our cooperative investigation." The following day she suffered a sharp decline from which she never recovered. Mary Alice died peacefully on 17 March, and with her death she left behind an enormous vacuum which will be impossible to fill. But she also left us a legacy of selflessness, extreme dedication to her profession, and deep loyalty to her family, friends and colleagues. We all loved her, admired her, respected her and will deeply, deeply miss her.

Sayed Z. El-Sayed  
May 9, 1980

Time flies. This past spring saw the birth of the first two great grandchildren of the late Admiral Byrd. If my stats are right, DickByrd III fathered Alice, a 7 1/2 pound girl born on March 25, 1980. But Ames and Lee outdid the Dick Byrds by having a 9 pound-4 1/2 ounce future pro-football star when Cameron Ames Byrd made his appearance about a month earlier. Cameron and Alice received three hip-hip-hoorays at the Memorial Lecture. Richard E. Byrd III is our latest Society member from the Byrd family.

This is the last Newsletter of 1979-80, and also the end of my two-year term as your President. There have been some lost battles, but on the whole we came out ahead. I think we made some substantial changes for the better in the past two years, some of which may not be obvious to you as much as to Ruth and me who have been concerned with streamlining the administration, as well as establishing some credibility to our membership. These are some of the things which have made us happier:

1. Moving the mailing address to the Arctic Institute of North America in Arlington, meaning that we monitor the mail bag daily. Before, when it was in the District pick-up was more like bi-monthly.
2. We were carrying about 150 delinquent members, some of whom had not paid in years. We picked up a 100 missing dues for 1-2-3- and 4 years; we dropped 74 members who never responded to our reminders.
3. Recruiting has gone well, adding 78 new members last year and an additional 38 this year, resulting in a vigorous Society with over a third of our membership being new additions. Paid members will be about 325.
4. Recruited heavily from the first two Byrd Antarctic Expeditions to give the Society some prestige and credibility with the good old explorers. We now have 25 members who were either on the 1928-30 or 1933-35 expeditions or were widows of members or are members of the Byrd family.
5. Recruited heavily from Polar Research Board (12 members) and SCAR Sub-groups (8 members), educating them while they educate us!
6. Held Board meetings prior to Lecture meetings, thus freeing an evening and eliminating possible filibustering in an open-ended meeting. Have had excellent turn-out for all Board meetings.
7. Attempted some special features (profile on Dick Cameron, articles on women in Antarctica, quiz on Antarctica, and obituaries) which hopefully might be of interest to some members.
8. Initiated new identification card file on members, putting down their Antarctic connection in order to get a better feeling of who is who. Published list of members by wintering-over stations; published list of members who have geographical features named after them, listing their features.
9. Had new stationery made, showing our presidents, honorary members, and Memorial Lecturers, thus making us look more professional.
10. Introduced new address system, utilizing gummed labels with xeroxed names and addresses which are legible.
11. Printing of the Max Hamilton cachet on the 50th anniversary envelopes resulted in professional-looking envelopes, done at no cost to the Society by a son-in-law of Ruth's who also set up our new stationery.
12. Established a sales program which included out-of-town members, selling 50th Anniversary First South Pole Flight note paper, cachets and shoulder patches, calendars, Pennie penguin and whale pins, and soon brass belt buckles with

sterling silver map of Antarctica.

13. Gained co-sponsorship of Polar Research Board for the Memorial Lecture, which allowed us to use the National Academy of Sciences' main auditorium at no cost. They also graciously picked up the cost of the Larry Gould program, as well as the cost of photographers.
14. Established communication with Society members which paid dividends in getting new and interesting information for Bergy Bits.
15. Gratefully accepted the talents, generosity and graciousness of Pennie Rau to the benefit of the Society.
16. Appreciation to the Arctic Institute for letting Ruth take her office type writer home so she could spend some delightful weekends typing Newsletters.
17. Made a typist out of Treasurer Siple, thus saving us cost of typing of News letters (although almost costing friendship).
18. Convinced about 51% of members that our dues are from July through June, but not able to get through to other members just what constituted our fiscal year.
19. Survived the two years without any solid, organized opposition from women libbers; some light but insignificant firing from the flanks, but inconsequential, either misfiring or being off target.

There are certain people who have made my two years as President more meaningful with their kind letters. We've heard a lot from Larry Gould. He is Mr. Antarctica, at least from the banks of the Potomac to the top of Mauna Loa. A letter from Larry is almost as good as one from Bo Derek. Henry Harrison was sending us a lot of mail; he and I are both from Worcester, Massachusetts, and we are both baseball freaks, although he was a much better athlete than I, as he made the Worcester North tennis team and I never made anything. Bud Waite inundated us this spring. I would have loved to have used some of Bud's material, but there was a problem of editing and space which I never got around to facing, always saying that I'd work it into the next Newsletter. I have become most fond of one member of the Society through all the mail and all of her kindnesses to me, to Ruth, and to you members in general. She is Pennie Rau of Hollywood. I don't know exactly what you would call Pennie, but I call her a very sensitive and dear person, one who is very much concerned with conservation, and who spends a lot of time writing editors, Congressmen, Senators, and even our President about endangered species. Her game is actually jewelry, and she is evidently very successful at it. She has given us at no cost over 50 penguin pins and several whale pins, to help keep the Society afloat and well. Our membership dues do not cover the cost of operations, and we survive only because some people send along some extra dollars with their membership dues, we have some Corporation Memberships, and because of Pennie. Right now she is designing an Antarctic belt buckle of brass with a sterling silver map of the continent on it. She is footing the cost of the molding and the designing, and we are anxiously looking forward to the end product which we will sell at a reasonable price. Pennie said that Antarctica changed her whole life around and now she wants to do things for other Antarcticans. Ruth and I have talked to her several times, and she is just delightful. We wish she lived around here, so we could drop by her place after work and have a few cocktails with her.

I would like to say a lot of things, all good things, about our Treasurer Ruth Siple. She has the perfect disposition, no blood pressure, no ignition point. Everything is always just great. Now I know why Paul Siple got away with all those trips to the ice. She is probably the only person in the world who would be the same the day of depart-

ure as the day of return. She comes with a smile, and it was lucky for me that she does, as we commandeered her dining room and turned it into our Oval Office. There was one big concession on my part, though, as I file horizontally, spreading things out, but the house rules at 905 called for vertical filing. You don't buck city hall when you have a good thing going, so now I am a reluctant vertical filer. Ruth is the kind of woman who, unfortunately for mankind, is becoming an endangered species with all these women nowadays feeling their importance. So it was doubly good working with one who was not impressed by her capabilities or her accomplishments. She worked hard for the Society this year as well as last year, even handling the refreshments at the lecture meetings. She was also the Society's censor, as she wielded a rather strong veto over Bergy Bits. Ed Todd said that this was the best thing I did in my two years, allowing Ruth four scissor jobs per Newsletter. I don't agree with Ed, of course, as I think some of my censored stories, such as the one about the New Zealand girl, when asked to pose (supposedly in her bathing suit), decided to make it all most worthwhile for the South Pole-bound scientist by stepping completely out of her bathing suit and striking some provocative poses au naturel. You folks really missed out on some good stories, but blame Ruth, not me. She is as close to perfect as they come, but her ladyness got in the way of some real funny stories. But, regardless, let's hear it for Ruth, as she worked hard without complaining and without compensation.

Election time, folks. We'll make it easy for you to vote by presenting a slate of faithful lecture attendees and recognized hard workers. The positions of Vice President (Fred Brownworth) and Treasurer (Ruth Siple) are not up for election, as both are serving the second year of their terms. So we need a new President and a new Secretary, plus four for the Board of Directors. Nominees are:

President: Pete Burrill. Mr. Geographic Names in the U.S., serving as Executive Secretary of the Board on Geographic Names, and Director, Office of Geography, Department of Interior until he was superannuated.

Secretary: Pete Barretta. Perennial student, doctoral candidate at George Washington University where he is doing dissertation on Antarctica. Retired Air Force Colonel.

Board of Directors: Vernice Anderson. Executive Secretary, National Science Board, National Science Foundation. Has visited Antarctica.

Mike Metzgar. Wintered over at South Pole in 1978. Gainfully employed by the U.S. Geological Survey. Has beard, looks like an explorer.

Joanne Turner. Former Board member, and very active in Society over the years. Of the House of Mort and Joanne.

Bob Allen. Another former Board member who has been Sociel loyalist for many years. Part-time retired, part-time employed by the U.S. Geological Survey.

Our incoming President has a long list of credentials, but we are running out of space But we should mention that he is from the great state of Maine and still returns to the hearth each summer showing that maturation has not dulled his better judgment. He is also a Clark man in the great tradition of Siple and Dalrymple, plus a pyrotechnic by the name of Goddard, who probably never amounted to anything! Pete Barretta is sort of a showpiece as Secretary which is more of a figurehead position. But there is no one in Washington who is a more willing and dedicated Society member. When you call Pete up for help, it is never "Wait until I check with Edna", it is always "When do you want me there?"

I will introduce a suggestion at the next Board meeting that we increase our Board of Directors by three, by electing At-Large members from outside Washington to serve as a direct contact with the out-of-town contingent. We have many faithful members who have served us well through the mail, and their ideas and enthusiasm should be put to better use. I hope I will get no objections from the Board, and that we will be able to vote this into our By-Laws at the Business Meeting. I am proposing that the first At-Large member be Pennie Rau.

We have had little response to whether we should consider establishing our own Hall of Fame or Scientist of the Year. Everything seems to point to forgetting the latter, because it would only cause hard feelings. And there have been several voices of caution about having a Hall of Fame. I still think it has some merit, but it has to be handled carefully. I hope the idea isn't categorically rejected until some sort of an ad hoc committee has studied the pros and cons. It could be a big bonus for the Memorial Lecture. We have had two big ones, back to back, people seemed to have enjoyed themselves, and I would like to keep the momentum going with the hope that we could make these Lectures homecomings, like class reunions at college. I think an initiation into our Hall of Fame, plus the Memorial Lecture preceded by a catered dinner would be attractive to many people. After all, we are in to our third decade and are getting a little historical ourselves. Any of you who haven't responded on this issue and have a feeling one way or the other, why don't you write us?

Our Sales Office is still open, with these items still available:

50th Anniversary shoulder patches (good quality)	\$2.25 ea
Limited number of cachets cancelled at South Pole on November 29, 1979 (including note paper)	2.00 ea
Very limited number of 50th Anniversary note paper (without envelopes)	.50 ea
Pennie Penguin pins (gold finish)	10.00 ea

If you are interested in the Pennie Antarctic belt buckle and want to be notified as to availability and cost, please send us a card and we'll contact you.

We are down to a mere handful of members who have not paid for this year. We will assume if we do not hear from you by the first of July that you want to be dropped from our rolls. On our Most-Wanted list are:

Blan chard	DeRoche	Green	Radspinner	Tuck
Britton	Ege	Kuhn	Schirmacher	Zohn
Chapman	Frantz	Paige	Shapley

ARLINGTON, VIRGINIA 22201

## HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

### Presidents:

Dr. Carl L. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Canwright, 1962-3  
RADM David M. Tyree (Ret.), 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton j. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80

\* Growler #1

July, 1980

Now that Paul Dalrymple's masterful campaign has swept me into office as his successor, it is time for me to speak up. Under the constitution Paul could not be reelected, else he surely would have been; someone had to succeed him. Although you might well wonder whether agreeing, to follow his outstanding performance indicates more courage than judgment, I hope you will conclude that it really indicates faith in the Society and its members. From the beginning people have always been ready to contribute time, talent and constructive criticism. Well, usually constructive.

### Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emtlio Pucci  
Sir Charles S. Wright  
Mr. Hugh Black-well Evans  
Dr. Henry M. Dater  
Mr. August Howard

For starters, Paul will continue to do the Newsletter; Ruth will delete some of his expletives and will continue to look after the day-to-day business; Mort Turner has agreed to serve as Program Chairman. Those indispensable functions are in good hands. Pete Baretta is a bear for work and an idea man. Fred Brownworth is in the wings if I fall into the orchestra pit. We have a multi-talented and enthusiastic Board of Directors. Our finances are in good shape. I see the Society continuing its present basic course and, as in the past, trying out projects and innovations that we judge to have merit. I intend to follow Paul's brand of democracy, making maximum use of inputs from the members, while keeping things moving.

### Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Mr. Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Benrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979

In the lull before the fall activities, will you take a few minutes to jot down and send in your ideas about the Society's performance and your suggestions for improvement? Don't hesitate to suggest projects, to volunteer to help with them, or to provide information. In addition to stories about "who struck John" that don't appear in official reports but help us to appreciate the human side of Antarctic activity, tell us what you're doing and how it's going. Tell us what you see as the significance of accomplishments by others too modest to brag a little (I understand there now are such people). Paul can tell it in his inimitable style in the Newsletter, but only if he knows about it. The Officers and Directors will try to do what you'd like if you'll tell us, and if in true dalrymplian democracy we think it's a good idea.

Meredith F. (Pete)  
Burrill President

\*Growler; the identifier I shall use for occasional communications, distinguishing them from "Bergy Bits".

## BERGY BITS

Bergy Bits is the voice of a single member of the Society and does not in any way constitute the opinions of the Antarctic Society. It is slanted toward activities of Antarcticans. People interested in progress reports on scientific programs should subscribe (\$7.50 per five issues) to the Antarctic Journal, Division of Polar Programs, National Science Foundation, Washington, D.C. 20550.

Wasn't it ever so nice and compromising of President Pete to write those kind words about Bergy Bits exactly the way I drafted them and read them to him over the telephone? I knew he was going to make a great president. His credentials are so outstanding. I told you a bit about Pete in the last issue, how he was a loyalist from the state of Maine, how he got his PhD in Geography from Clark University where Paul Siple and Jim (Hallett '57) Shear got theirs. But space ran out before we could really acquaint you out-of-towners with Pete. Pete is as close as you can come to Mr. Geographer, USA. He must have played with a globe in his crib, as it seems he had an unusually early thirst for knowledge about this old world. He went to his first Association of American Geographers meeting back in the mid-1920's and I doubt if he has missed a meeting of the AAG since then. He is a past president of AAG, 1966, and for years and years headed up their By-Laws Committee. He was the second president of the American Name Society, 1955, an organization pertaining to place names rather than name-calling. He was chairman of the U.N. Conference on Standardization of Geographical Names, held in Geneva in 1967, and from 1960 to 1977 was chairman of the U.N. Group of Experts on Geographical Names. Pete was executive secretary of the Board on Geographic Names, and director of the Office of Geography, Department of the Interior, until he was superannuated in 1973. He has taught at Lehigh, Oklahoma State, and George Washington. He was introduced to the polar regions in 1940 and 1941 when he went to Alaska on behalf of the General Land Office, and shortly thereafter in 1943 he started working on problems related to Antarctic names. In 1949 he produced the first U.S. Gazetteer on Antarctic Geographic Names, and followed that with another one in 1956. He visited Antarctica in 1959. In fact he is always visiting some exotic place. As you read this, Pete is probably in Iceland where he is spending several weeks this summer. Last summer he was in China. He is going to restore some dignity and class to the office of Antarctic Society president. He has been committed to "Telling the Truth" ever since he appeared on the national TV show of the same name a decade or more ago. However, that does not mean that this column will have to abide by such stringent, stifling restraints. For those of you who have never seen him in the flesh, he looks like a model in one of those whiskey ads for a Man of Distinction. Now I have saved the real good news until last - he is a broad-minded male chauvinist to the best of my knowledge. Isn't that just great! So now that you know a little bit about your new president, sit back and enjoy his regime, give him your fullest support, and look forward to his breezy Growler column in each Newsletter.

And speaking of presidents, Gentleman Jim Zumberge made headlines across the country on May 21st when he went Hollywood, trading in his presidency chair at Southern Methodist University for a comparable one at the University of Southern California. Now why in the world would a nice geologist want to forsake being King at SMU to become a Prince at Southern Cal? He will never be No. 1 at Southern California, as this spot is reserved for the very latest fleet-footed running back who can turn 4.4 for the 40 in football togs. People are going to say that Gentleman Jim is just

the titular head of the school where O. J. Simpson, Anthony Davis, and Charlie White ran for daylight and megabucks. Several Antarcticans are real worried about what Gentleman Jim might do at Southern Cal. It is quite well known in sporting circles that he rubbed out the collegiate baseball and golf teams at SMU in an economy kick, and if he cans the baseball team at Southern California he will bring down the wrath of the entire baseball world because through the years the Trojans have always been able to recruit outstanding academicians who just happened to be very talented baseball players. The major leagues are full of Trojans. One, Bill Lee of Montreal, was once a stalwart in their geography department! I have written Gentleman Jim asking him to send that silly white stallion who races the length of the football field after every touchdown off to the glue factory. I would much rather see their cheer leaders leaping. I suppose now for the first time in decades Lady Zumberge will know at least one day a year when her spouse will be home, as I imagine that Gentleman Jim will be riding in the annual Rose Bowl parade on New Year's morning, waving and smiling from atop some Arabian horse dressed to the hilt in a golden saddle. This will probably be Gentleman Jim's last stop on the presidency trail until he reaches South Bend. He probably wanted to be around Bo Derek and a few other 10's before becoming president of Notre Dame; besides, he is still too young to be called Father Zumberge and wear a clerical collar. Someone told me that Zumberge would never be president of Notre Dame as they didn't think he was a Catholic. I don't think that really matters at Notre Dame as long as they can get the best; Knute Rockne and Ara Parseghian weren't Catholics to the best of my knowledge. Notre Dame needs a folk hero, as the current generation can't remember the Giffer and the Four Horsemen. Well, Ronald Reagan can, but who is as old as Ronald? Well, Jim, good luck at Southern Cal and be kind to Pennie Rau there in Hollywood. She is a real 10!

About four years ago I was involved in a reunion of IGY Antarcticans. We all gathered together in Bert and Mildred Crary's basement and had our own Saturday Nite Live. I recall we had about 26 IGYers, and with spouses and children somewhere around 65, if my memory is correct. We are now coming up - in 1982-83 - to the 25th anniversary of the IGY, which will coincide with the 100th anniversary of the First Polar Year and the 75th anniversary of the Second Polar Year. A couple of months ago I mentioned over the phone to Mildred Crary that we should get fired up for the 25th anniversary of the IGY, as there is nothing Mildred likes to do more than throw a big splash. But I want more than a big party this time, I want some ceremonies, perhaps a seminar, and attractions to bring people here for three days. Mildred said I should get in touch with Alan Shapley in Boulder as she knew he was involved in a number of things developing on recognizing the contributions of the IGY to past, present, and future science. So I wrote him on June 16th, and he wrote back on June 24th, and indeed there are two committees - one within ICSU (International Council of Scientific Unions, Paris) and the other within our National Academy of Sciences. Alan is a member of both committees, but let's go to his letter (I apologize for the acronyms which may not be familiar to many of you outside of or even in science; they are a hideous creation of the devil himself who turned to them as a form of self-punishing scientists, but to the best of my knowledge are not immoral, indecent, or logical.)

... We are not now thinking of a "giant international reunion". Rather we are suggesting to international science organizations that they include in their normal meetings in 1982 or 1983 special sessions or appropriate talks on the impact of IGY/IPY in their fields of science. Thus far it looks like there will be something by ICSU (1982, probably England), SCOSTEP/COSPAR (1982, Canada), and presumably IAU (1982) and IUGG (1983), both in Germany. There undoubtedly will be some others.

In the USA, we will similarly encourage AGU, AAS, APS, USNOURSI, etc. to commemorate in their own way. Nothing definite is yet known. We will try to arrange something suitable at the annual meeting of the HAS in Washington, probably the one in 1983.

Thus for a U.S. Antarctic reunion in late spring 1982, there does not seem to be (a) competition and (b) something now planned which you could piggy-back on.

But I think the Antarctic people could easily go it alone. I would think the NSF and the NAS Polar Research Board should be interested in not only sponsoring but arranging in Washington a stand-alone symposium on "Antarctica in Perspective - IGY plus 25", or something, with speakers from then and from now. Northern spring 1982 would be appropriate since while the IGY proper didn't start until July 1957, the Antarctic IGY program necessarily began when the last ships and planes left the ice in February. Your reunion, the human side of the commemoration, and your Society's Memorial Lecture could very appropriately be tacked on to such a scientific symposium. I think a lot of IGY Antarctic alumni would indeed find ways to come to such a series of activities.

Back to my thoughts. I feel that the 25th anniversary is the best one to point to, as it is historic in its connections with Polar Years. One's earning potential should be near its zenith 25 years after the Antarctic, so if people could ever afford to come to a reunion, it would be this one. Also, one's health does not get better with age; the only thing age seems to bring is a finer appreciation for the things you could do easily as a young man - such as playing baseball, right? And past records have shown that people don't show up for older-than-25 reunions.

Washington has a good hard core of Antarcticans from the IGY, some of whom are retired, some of whom are still working. I think I know most of the wintering-over people who live around here. They would include Bert Crary, Bob Benson, George Toney, Rudi Honkala, Palle Mogensen, Dick Cameron, Ron Taylor, Johnny Dawson, Ron Viets, Ned Ostenso, myself, and within a year, Mort Rubin. Others who were active back in the States would include Tom Jones, Phil Smith, John Mirabito, and Jim Sparkman. There are some pretty big names there, and I think if we could ever get organized locally, we could come up with a good three-day program. If we tied it in with the annual Memorial Lecture of the Antarctic Society, if we could talk the Polar Research Board into having their spring meeting here in Washington and opening one of their sessions to Antarctic alums, if we could somehow swing our own symposium, I think we would have enough attractions to really bring the folks to Washington. We would have to have a broad program as not all of our people ended up in science, and the idea would be not to discourage anyone from coming. It should be open to all interested Antarcticans, all stations, all years. The excuse or motivation, though, would be to reunite the IGY Antarcticans, and, for example, to once again hear the Boy Scout's fabulous unedited tape recording of a typical Saturday night skit at Little America. We might even be able to get out a paperback volume for the reunion, one in which we would publish articles about people and their accomplishments. The Memorial Lecture that year could be the time of unveiling our Hall of Famers, should the Society decide to go forward with anything of that nature. The easy part of such a reunion would be the partying, as Bill Crombie is a professional M.C. and Rudi Honkala knows all about beverages. You just don't turn down lifetimes of expertise and experience at a critical time such as the 25th reunion. So what do you other Antarcticans think about such an event for early 1982? Is it plausible? Does it ring bells for you? Let's hear all your thoughts, pro and con,

as I m sure after everyone returns to Washington from Nantucket this fall we can form some sort of a local committee and start making plans.

Speaking of the IGY, Yum Yum is back in the area. There wasn't anyone who went to the Antarctic back in the IGY who didn't know personally or had not heard of Yum Yum. As I understand it, and my memory isn't as good as my imagination, this beauty from West Virginia showed up in the office of Bert Crary and the late Dick Hubley to apply for an opening as a secretary. They interviewed her, in fact interviewed her pretty thoroughly. It seems that her credentials did not impress the only girl already in the office doing their typing, and as this gorgeous creature sashayed out the door their secretary said, "Well, you aren't going to hire her, are you?" And my source of information said that Bert's rebuttal was, "Hell yes, we are, she can type 20 words a minute." And so Yum Yum came to the Antarctic office and became much better known (to the men) than either the late Harry Wexler or Hugh Odishaw. And if Yum Yum isn't enough of an excuse to have a 25th reunion, then I don't know if there is one.

Ruth and I had the pleasure of being guests of our affable president at the annual meeting of the Washington area Explorers Club (Pete is their treasurer) and the Washington Women Geographers where Jackie Ronne presented an illustrated lecture on the Ronne Antarctic Research Expedition. They had wall-to-wall people at the Cosmos Club, and Jackie did a real fine job narrating the film which I had not seen before. I was real impressed by it. Among the attendees was Vilhjalmur Stefansson's widow who now lives in Georgetown.

David Burns of the AAAS reviewed "Scott and Amundsen: The Race to the South Pole" by Roland Huntford in the book section of the Washington Post on July 13th. This is the same book we commented on in our Newsletter of last January, when I extracted from material which appeared in a Christchurch newspaper. I don't think David really did justice to this most controversial book, nor do I really know why the Post picked him to do the review. I have known David since he left AID several years ago and joined the AAAS office here in Washington where he got into the climate game. He called me and asked who in the Washington area might know something about Amundsen and Scott. I gave him several contacts, but I doubt if he called any of them. The good news is that we can now buy this book in the States. It is selling for \$19.95 and the publisher is G. P. Putnam's Sons. Any Antarctic worth his pemmican should have it in his private library.

Science magazine for 1 August 1980 had an excellent review of Fred Milan's "The Human Biology of Circumpolar Populations" published by Cambridge University Press, New York. For only \$75.00 you can buy the book (382 pages) with reports by 19 authors about the Lapps, Ainu, and Eskimos. It's too bad they put a Fairbanks price on a book which they want to sell in North Conway. As many of you know, old Muckluck was in charge of the U.S. program to study Circumpolar people during the International Biological Programme. He and his ground forces studied the Eskimo village of Wainwright on the coast of the Arctic Ocean. The remarkable thing is not that the book got published as much as it was that they ever got old Muckluck to terminate his study. He has bee studying Eskimos so darn long that he began to look like one about 20 years ago, and I doubt if there is an Eskimo along the coast of Alaska who hasn't been strapped into one of old Muckluck's thermocouple harnesses. He must be the world authority on rectal temperatures of Eskimos at rest, at play, and at work. I was happy to see that Fred was put onto a biomedical panel (headed up by Chester Pierce) of the Polar Research Board. This could be the vehicle by which the Society could get Fred to speak to us. Even though he sort of half mumbles when he talks, he is such an authority in his field that we should try to sign him up. His physiological work at Little America in 1957 was at that time the most complete work of its kind done in Antarctica.

Peter Anderson of the Institute of Polar Studies at Ohio State University and the presenter of the Antarctic Society 50th anniversary commemorative lecture on the Byrd-Balchen-June-McKinley flight of November 29, 1929 has a three-page article on Colonel Bernt Balchen in Air Force Magazine for July 1980. His war time exploits are legendary, and Peter has some interesting accounts of some of the rescues which Balchen pulled off in Greenland. The article ends with a quote from Lowell Thomas, "He was the last of the great Norsemen."

Another Society member, Henry Heyburn of 3918 Leland Road, Louisville, Kentucky 40207 wrote an article in the January 1980 Polar Record under Profile on "William Lamond Allandyce, 1861-1930: Pioneer Antarctic Conservationist." And our good friend Mary Goodwin out there in Los Angeles is still trying to keep me out of trouble. As readers of this column know, she is a real authority on the early Antarctic expeditions, and she has pointed out that Philip Brocklehurst was not knighted - he inherited his title before joining Shackleton's 1908 group. She also pointed out that he paid a rather large sum to go on the expedition.

I have mentioned Harvard Magazine from time to time as it has great articles. The current issue for July-August is no exception. Christopher Reed has one of particular interest to those of the Dotte Larsen whale-watching cult on "How to Watch Leviathan." I didn't realize that whale-watching was such a big business; they have gotten to be worth more alive than dead. There are at least seven boats now taking people out of Lynn, Marblehead, Gloucester, Boston, Plymouth, and P'town. Operators of east coast whale-hunting trips expect to take in a half million dollars this year. The Avellars out of P'town will take some 18,000 customers out this season. The same issue of Harvard has "A Conversation with Eliot Porter", and the first two pictures are from his Antarctic travels. This summer the 78-year old photographer is in China. How many of you knew that he was past 60 before he published his first book? I sure didn't. And he is a state of Mainer in the good old summer time. For all of you who are Eliot Porter fans, and that means everybody, you have three new books to look forward to: "The Greek World", with a text by Peter Levi, will appear this October; "The American Book", with a text by Wallace and Page Stegner, will come out in the fall of 1981, and then the book on China in 1982. All of these books will be published by Button.

Secretary Pete has been instrumental in getting some of the biggies from polar philately into our Society. I want to particularly thank the editor of Ice Cap News, Bernard V. Coyne, for the kind words which he said about Bergy Bits in their March-April 1980 issue. I also would like to publically thank Mrs. Malva-Gomes, the wife of a geological member of our Society, who wrote in part, "Mrs. Siple, we want you to know that we think of you as the pillar of the Society. We know how much time and work you freely give to it." Ruth does all the work behind the scenes, and a lot of our information is gathered from letters sent her by past associates of Paul. Probably her greatest contribution to the Society has been in trying to keep Bergy Bits a parental guidance-type column. She gets four censorship jobs per issue. Some day I will publish all of the scissor jobs she has done to me and I will become momentarily rich until I go bankrupt from multiple law suits brought against me.

Red Bauhs, South Pole '59 meteorological technician, has died in the past two months. He was one of the real Antarctic characters of this or any other generation, but a lovable soul who liked people and casting a fly into a trout stream. Some of you may remember seeing him on the Groucho Marx show about 15 years ago when Groucho introduced him as if he were a latter day Fridthof Nansen. Seems when he was at the South Pole this lady ham operator in L.A. handled some of his traffic, and she invited him to drop by when he got back to the States. Unknown to old Red, she was

Groucho's sister. Red was more famous for a beach happening at Brighton, New Zealand which occurred on his way to the ice. Attending one of the celebrated bashes which Admiral Dufek was noted for hosting, Red met this lovely Sheila from New Zealand. He invited her to go to the beach with him the next morning, and having nothing else to do she went. There was nothing wrong with Red's eyesight - he was quick to notice that she cut a nice figure in her bathing suit. Like all Antarciticans, he traveled with camera, and asked this lassie if she would mind posing for some pictures for him to take to the South Pole. Red's intentions were fairly honorable, but he underestimated the strong zeal that New Zealanders had in the old days for anyone going south. He didn't realize just how hospitable she was until she jumped up and gingerly stepped out of her bathing suit and started posing in the buff. Red was so darn nervous he couldn't hold the camera steady, so the pictures weren't very professional. But it made him famous, and he was a true celebrity by the time he hit McMurdo. Red is gone, but memories of him will linger on among those of us who knew him on the ice.

Charlie (South Pole '58) Greene has surfaced in Santa Barbara. We found him through Scott Miller, one of the 1978 Eagle Scout finalists for the Antarctic, who is spending his third consecutive summer at the Smithsonian doing whatever entomologists do when they get together. Seems Charlie's sons are good friends of Scott back there in Santa Barbara. And when we knew Charlie he wasn't even married. He spent a month last summer on FRAM-1 and will be doing some work on FRAM-3 next summer. As you read this he is up in the Canadian Beaufort listening to bowhead whales. If you are a whale nowadays, you don't have any privacy. This leaves only one civilian of South Pole I and II who is unaccounted for - James Barry Burnham. His evaporation into nowhere is so unlikely as he was a true son of the snow and even went back for a second wintering-over year. But we have hopes of locating him through the Alumni Office at Brown University - old Jim was very much a Brown loyalist. He's too much of a character to let vanish.

Dave (Navy Commander-in-Charge, McMurdo Sound '56) Canham had a pretty serious major operation this spring. It was the Big C, and he spent a long time under the knife. They removed a lot of old Dave, but they didn't take his heart which is really the major part of his body. Dave spent the early part of the summer recuperating at home, but is now back at his base as director of the Sacramento State College Research Foundation. Dave is a fighting man, and you know he'll battle anything which touches upon his or his family's lives. He expects to be back out on the road for the Foundation in August and to hit Washington. We were also saddened to hear that John Splettstoesser's wife had a cancer operation this past spring. We trust that she, too, is making a speedy recovery. I never met John's wife that I can recall, but if she is half as good as old John she has to be some person. Remember them in your prayers.

The National Science Foundation is going to host a 2-day "Snow Watch Workshop" on October 2-3. Just when you think you have heard everything, they come up with something new. But actually they are not getting together to tell each other what color snow is and how you can identify it. At least as a taxpayer I hope they aren't. About 50 people have received invitations to come to the Workshop to review the state of the art in the research of snow cover variations and their role in climate dynamics. What they are actually going to do is to discuss a more effective use of snow cover data in climate monitoring and modeling, including improving the quality of the observations and developing closer cooperation among snow-minded people. Let's hope it doesn't really turn out to be another Washington Snow Job!

The once proud and mighty, the prestigious American Geographical Society, has fallen upon hard times. Broadway at 156th was not only a nice place to visit, but people

who worked there enjoyed it. And has there ever been a nicer guy than Bill Field? I doubt it. The ACS is still alive, mind you, but they have had to do some serious retrenching. The Smithsonian has taken over the sale and distribution of the ACS Antarctic map folios, as well as some of their books. I don't know of a better bargain in town than Ken Bertrand's book "Americans in Antarctica, 1775-1948." This was marketed for \$20.00, but you can pick it up now from the Smithsonian for \$6.00. The whole Antarctic map folio- series (exclusive of Folio 2) can be had for a total of \$40. If you want a list of everything which is for sale, contact Smithsonian Oceanographic Sorting Center, Washington, D.C. 20560.

The Division of Polar Programs, NSF, has had to make some substantial changes in their Antarctic planning because of some retrenchment of available dollar bills by the people on the Hill. The increased cost of fuel has really hit them right between the eyes. The planned retrieval of planes at Dome C has had to be postponed; Siple Station will be closed next year although it will be opened this austral summer; there will be a reduction in some of the scientific programs; and urban renewal at McMurdo will be restricted to the power plant. The cutback in the Division of Polar Programs has not cost anyone their jobs, so they are still a lot better off than the automobile industry and a lot of other people.

Some of the old hands in the Division of Polar Programs are upset, though, with Jerry Huffman. He has been making great gains of late in his recovery from severe skin burns suffered in his automobile fire of a year ago last spring, and he has been into surgery several times this spring and summer. Now his colleagues are yelling that the new Jerry Huffman is going to be better looking than the old Jerry Huffman who used to be around the office. They are worried about the competition. But Jerry really paid his dues wearing that skintight cocoon as long as he did. It is just great news that most of it is now behind him.

Dick Cameron of the Division of Polar Programs presented a paper entitled "Promise of and Warnings from the Polar Regions" at the First Global Conference on the Future, held in Toronto, July 20-24, 1980. Supposedly he wrote it between three o'clock and seven o'clock on the day he presented it. Anything written that early in the morning has to be good.

Al Fowler, he of Antarctic Navy fame and currently wheel in the Division of Polar Programs, had an out-of-this-world experience this summer. He broke 80 on the golf links for the first time, and is seriously considering getting his PGA card and going on the winter tour next year!

We have recently heard that Bob Rutford has been named the Acting Chancellor at the University of Nebraska. Does that mean their Big Red football machine will be up-graded?

The XVI meeting of the Scientific Committee on Antarctic Research (SCAR) will be held in Queenstown, New Zealand, 13-24 October 1980. The delegates are expected to focus attention on the possible revision of the structure of SCAR and to review the "Biological Investigations of Marine Antarctic Systems and Stocks" (BIOMASS) program, including the establishment of a BIOMASS secretariat. SCAR will also consider the Antarctic Treaty Nations' request for additional advice on scientific information needed to estimate the possible environmental impacts of mineral exploration and exploitation in the Antarctic and to assess what actions are necessary with regard to the Antarctic contribution to the World Climate Program.

The SCAR Working Group on Biology will consider the impacts of tourism on the Antarctic environment, recommend sites of special scientific interests needing protec-

tion, and consider plans to integrate continuing Antarctic biological research into the BIOMASS Program. Its Subcommittee on Bird Biology, which was reconstituted as a BIOMASS Working Party on Antarctic Seabirds, will refine plans for an International Study of Antarctic Seabirds. Other bodies meeting will be the Subcommittee on Conservation and the Logistics Working Group. A Symposium on "Research in the Ross Sea Region: 1957-1980" will also be held.

The First International BIOMASS Experiment (FIBEX) is scheduled for January-February 1981. It is expected that research vessels from 12 countries will participate in FIBEX. The major purpose of FIBEX will be a multiship krill acoustic survey in the western part of the Atlantic sector, with supporting parallel studies in the eastern Atlantic, Indian, and Pacific sectors. The objective of the survey is to estimate the total number of krill and to determine the feasibility of echo surveys for krill stock assessment. Accompanying observations will be made on phytoplankton abundance and primary production. Mesoscale and small-scale studies of krill swarming behavior are scheduled to begin at the conclusion of the acoustic survey. Complimentary shore-based studies and a survey of Antarctic seabirds are planned.

There was an error of omission by yours truly in setting up our letterhead last year and also in the list of lectures published in the May Newsletter. There was a Memorial Lecture in 1973 as Scott McVay gave a presentation entitled "Whales: A Planetary Concern." Incidentally, we hope to have new stationery updating our "billboard" by the next Newsletter.

What member of the Society has a home where George Washington used to routinely drop by, visit awhile, and even sleep over? If you didn't say Admiral Dick Black, you were wrong, as his Woodbridge, Virginia home "Rippon Lodge" is one of the famous houses in the Greater Washington area. PM Magazine showed "Rippon Lodge" on television. It was too bad that Dick and Aviza weren't out in the petunia patch to give it some local current color and beauty.

A separate Society mailing is being done at this time announcing the availability of the Pennie Rau Antarctic belt buckle. It's not only an object of great beauty but is very functional in that it will keep a man's pants up in grand style. The sterling silver map of Antarctica is riveted to the solid brass buckle, and will withstand bellying up to the bar. The very low price of \$35.00 was only made possible by Pennie subsidizing the model building and production costs, and the Society taking only a very modest markup. We are hoping that the low price will result in many members purchasing one. When your order comes in, we will forward it to Pennie and then she will do the wrapping and shipping. Be patient, please, and allow two months for delivery, as Pennie is a professional lady with other business affairs. Incidentally, each buckle will be numbered and catalogued... If you live in Washington and want to know where to go to purchase a suitable belt for the buckle, you might want to check out Georgetown Leather in the Springfield Mall. They have a large selection, and their prices seem to be as reasonable as anywhere.

We held our Annual Business Meeting prior to the Llano lecture on June 5th. The only change in the By-Laws was the creation of three more members on the Board of Directors members who have to be from outside the Washington area and whose chief functions will be to make recommendations and suggestions, and give advice to the Officers and other Board members as to how the Society can be improved for out-of-town membership. The first one elected in this category was Pennie Rau. A second one will be elected next year, and the third the following year. Like fellow Board members, they will serve for a three-year term.

Our Officers and Board of Directors for the coming year are:

President: Meredith F. Burrill  
Vice President: Fred Brownworth  
Secretary: Peter Barretta  
Treasurer: Ruth Siple

Term Expires 1981

Mildred Crary  
Alice Dater  
Richard Dow  
Peter Espenschied  
Paul Dalrymple

Term Expires 1982

Tony Meunier  
Lisle Rose  
Gerald Schatz  
William Tobin

Term Expires 1983

Robert Allen  
Vernice Anderson  
Mike Metzgar  
Joanne Turner  
Pennie Rau

Hear ye! Hear ye! Hear ye! This is the beginning of a new Antarctic Society year, our 22nd, and dues are now payable for the 1980-81 season IF your name appears on the form below. Some 127 of you have already prepaid your membership. For those of you who like to know how we are doing, we now have 332 paid members. Two years ago we had 150. We have nine delinquent members from last year who will be dropped if we don't get their dues by the next Newsletter. Last year we picked up 45 new members, the year before 78. Four members died last year (Pete Demas, Jack Bursey, Mary Alice McWhinnie and Kenneth Brown). We dropped five long-standing delinquents (Marty Pomerantz, Roger Tory Peterson, Walter Boyd, Chris Jorgensen, and Beatrice Prendergast), and two resigned (Donald Busky and Robert Stinchcum). Dues continue the same, at least for another year.

I wonder how many of you Home Baptists saw the ending of Charles Kuralt's Sunday Morning news summary on June 29th and on August 3rd when he ended up with some spectacular penguin scenes from Antarctica. I particularly enjoyed the first one on Emperor penguins. Is it my imagination or are they becoming more manly?

-----  
ANTARCTICAN SOCIETY, c/o AINA, 3426 N. Washington Blvd., Arlington, VA 22201

Membership Dues: \$5.00 a year . . . Local (within 50 miles Washington)  
\$4.00 a year . . . Out-of-town  
\$3.00 a year . . . BAE I - BAE II members

ADD \$2.00 Initiation Fee for NEW Memberships.

Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980

This is a Special Newsletter about a Special Guy who just happens to be All Antarctic. The story which you are about to read is about Jerry Huffman, engineer with the Division of Polar Programs, National Science Foundation. Most of you are aware of the tragedy which be-struck Jerry on April 28, 1979, when he miraculously escaped the burning inferno which was once his proud Porsche as he was test-driving it at a West Virginia race track. The account of the accident and his courageous fight back to near normal health is a very powerful human interest story which was featured on the front page of the Washington Star's Sunday edition, August 24, 1980. Some of you have already read the article, but because Jerry has been so intimately involved in the Antarctic programs since 1962, we feel that the many out-of-town Antarcticans would like to read this most interesting and heartrending story. Jerry was literally brought back from the dead. This is not only the story about Jerry and his fight against staggering odds, but also about how his devoted wife Gundel made the life-saving decision to get him into the Washington Hospital Center and about a doctor who worked around the clock for two days to save Jerry's life. The surgeon is a young man, just 36 years old, who had the confidence and the courage to perform some new and innovative surgery. Jerry says the story as printed in the newspaper is about as accurate as one could put it together. He never saw the article until after it was published. We think that Howie Kurtz did a tremendous job of covering this tragic happening, and we appreciate the Washington Star letting us rerun the article.

But, first, a little bit about Jerry, a native of Lancaster, Wisconsin who now lives with his wife in Alexandria, Virginia. He earned his bachelor's degree from the University of Wisconsin and received his master's from the University of Missouri. By education, Jerry is a mining engineer. He came into the Antarctic picture in 1962 when he

was chosen Station Scientific Leader at Eights for the 1963 wintering-over season. Eights was one of those good old stations, off the beaten track of tourism, out there in No Man's Land somewhere near the base of the Antarctic Peninsula. When he came back from Eights, he joined NASA at the Goddard Space Flight Center on the outer fringe of Washington's Beltway. After a year at Goddard, he transferred to the Division of Polar Programs at NSF and every year since has traveled at least once a year to the Antarctic. He was single at the time, and those stopovers in New Zealand were wearing him out. A couple in Annandale who knew Jerry quite well felt that he should settle down and they invited him to meet their German-born friend, Gundel Passarge. The chemistry was right and Gerry and Gundel got married. The sequel to this story is that the couple who brought them together have since been divorced, making it a true-to-life American love story.

Jerry is retiring from the National Science Foundation this month, as he can no longer go to the Antarctic. He isn't completely out of the woods yet, but he is well on his way. In another month or so he will finally shed the Jobst vest. He faces half a dozen more trips back to the hospital over the next year for additional surgery; in mid-September it will be on his right hand so that he will be able to close his fist. Jerry will be going into business for himself. It won't have anything to do with snow and ice, but it will be his second love, the automobile business. He and Gundel will continue to live at 3806 Towanda Road, Alexandria, Virginia 22303.

The accident story was told in the Washington Star to further acquaint readers with the specifics of burn injuries and skin graft techniques. Since Jerry left the Washington Hospital Center, the Burn Center Director, Dr. Marion Jordan, has established a regional skin bank, one of only a few in the country. Individuals can now donate their skin upon death, much the same as past donors have contributed eyes, kidneys, and other vital organs to the living. Interested persons can contact the Washington Hospital Center, 110 Irving Street N.W., Washington, D.C. 20010, for further information.

WASHINGTON, D.C, SUNDAY, AUGUST 24, 1930

## A Burn Victim's Ordeal of Pain And Skin Grafts

By Howie Kurtz  
Washington Star Staff Writer

When Jerry Huffman was carried into the burn unit at Washington Hospital Center one-Saturday night, the numbers were clearly against him.

The burn specialists use a grim formula to predict which of their patients will survive: The age of the patient is added to the percentage of his body that has been burned. The higher the total, figure, the greater the chance that the patient won't make it.

Huffman was 45-years-oW, and more than 50 percent of his body —

his face, neck, chest, arms and legs: — was covered with searing, third-degree burns. Even if the Fairfax County resident's condition could, be stabilized for a day or two, the odds were greater than 95 percent that he would soon die from shock or infection.

In recent years, medical specialists have developed new grafting techniques to cover burn wounds with healthy skin and the equipment to do it with microscopic precision.

Still, some victims have been so badly burned that even the region's major burn center couldn't save them. The doctors didn't know if they could help Huffman beat the odds, but they were determined to try.

### The Accident

Jerry Huffman was having a hard time keeping his mind on the latest studies of Antarctica. He loved his work as an engineer for the National Science Foundation, but he

was looking forward to a special activity that weekend. He even stayed late at his office to finish up the paperwork.

When Saturday morning arrived, Huffman got up early and headed for the Summit Point racetrack in West Virginia. Once again, he would have an opportunity to drive his silver Porsche away from the crush of urban traffic. It was April 28, 1979.

Four times a year he would come to the track with a group of other sports car enthusiasts. The average track speed was only 50 miles-an-hour, but it was a chance to handle the car on the open road. His wife, Gundel, usually came along on these trips, but on this hot and humid morning she decided to stay home and mow the lawn.

When his turn came, Huffman got into his nine-year-old Porsche and pulled onto the track. About a third of the way around the track, as he speeded up to 40 miles-an-hour, he heard a pop. Huffman did not see any flames, but instinctively he knew what had happened.

# Ordeal of the Burn Victim: Excruciating Pain, Skin Grafts and Jobst Suit

Later *he* would surmise that the humid weather had caused the car's gasoline to expand until it was ignited by a random spark. But that was of no concern at the moment.

He pulled over to the nearest safety station and tried to scramble out of the car. For a few excruciating seconds, he could not unhook his seat belt. The flame spread to his yellow cotton T-shirt and synthetic pants, scorching his skin. Finally he freed himself and tumbled onto the grass to snuff out the flames.

While one safety worker grabbed a fire extinguisher and sprayed the car with powder, the others quickly cut Huffman's clothes off and placed him on a stretcher. A doctor who was also a member of the Porsche club climbed into the waiting ambulance and gave Huffman a saline solution intravenously as they raced toward Winchester Hospital in Virginia.

The dazed Huffman was going into shock as the blood seeped through the burned areas of his skin. Yet he didn't feel any pain. The flames had seared away many of his nerve endings.

When they reached the Winchester emergency room at 1:55 p.m., so much fluid had escaped from Huffman's capillaries — small blood vessels — that his body had blown up like a balloon. His eyes were swollen shut, his face round and puffy. His hands were twice their normal size.

The burns also had constricted the skin on Huffman's right arm and hand to the point that all circulation was being choked off, and he was in danger of losing the arm. Dr. Stanley Hirschberg, the surgeon in charge, took a scalpel and made two deep, foot-long cuts on either side of Huffman's right arm. The skin split open like a hot dog for an inch on either side, and blood began to flow into the limb once again.

## The First Hours

Then Hirschberg gave him a shot of morphine and Huffman passed out. But although the surgeon's quick action had saved Huffman's arm and hand, the outlook was still extremely bleak.

Gundel Huffman was home in Fairfax when Hirschberg reached her.

"He's going to die," the doctor told her.

It was already dark when Gundel Huffman reached the small hospital in the Shenandoah Valley. As a medical secretary for a plastic surgeon in Washington, she understood seriousness of Jerry's injury.

After looking around and talking to the doctors, Gundel was convinced that the small, rural hospital couldn't adequately care for her husband. She wanted to move him immediately to the burn center back home. Dr. Hirschberg agreed to call Washington Hospital Center.

Dr. Marion H. Jordan had just returned to his McLean home after a hard day's work when he received Hirschberg's call. The Georgia-born physician had brought a new sense of purpose to the 19-bed unit in his first year as director, and he insisted on being called for every major emergency.

Soft-spoken in manner but aggressive in approach, the 36-year-old Jordan tended to operate early, using new techniques that had not yet gained wide acceptance in the field.

Jordan and Hirschberg agreed to transfer the patient by helicopter, but bad weather forced them to put him in an ambulance instead.

Jordan drove to the hospital center on Irving Street NW and declared a "code yellow alert." A dozen beepers sounded at once. A handpicked team of 12 specialists quickly assembled at the Medstar shock trauma unit and was ready when Huffman was carried into the unit at 11 p.m.

He was having trouble breathing because of the smoke he had inhaled, so they quickly put him on a respirator. They took his pulse and heartbeat and checked the oxygen content in his blood. A catheter was inserted into his bladder, and an intravenous tube was placed in one arm while the patient's blood pressure was taken on the other arm.

Having determined that his vital signs were stable, the team wheeled Huffman's stretcher into an elevator and up to the burn unit on the fourth floor.

The most urgent need was to cleanse his open wounds. Huffman had lost much of the outer skin that protected his body from bacteria and was extremely vulnerable to infection.

The team wheeled him into a small room that contained the Hubbard tank, a huge, hourglass-shaped stainless steel bathtub. Two nurses helped Huffman into the 104-degree water.

He began to scream. Despite the morphine, the hot water washing over his open wounds was incredibly painful.

Kneeling at the edge of the tank, the nurses cut off his dead skin with a knife and washed the burned areas of Huffman's body with sponges and soap. After 30 minutes,

they helped him out of the tank and took him to a small cubicle in the intensive care unit. There they bandaged his body with cotton gauze and a quarter-inch of antibiotic cream, designed to keep the bacteria from multiplying.

The next problem was that Huffman's burns were causing leaking of fluid from his capillaries into his tissues, bloating his body while creating a shortage of blood — the condition known as shock. Left untreated, he would continue to lose blood until he died.

The nurses weighed him with a bed scale so they could monitor his blood loss. Jordan figured he would need about eight liters of saline solution — a plasma substitute — to remain stable, and the nurses started supplying it through the intravenous tube.

But Huffman continued to lose fluid as the night turned into morning. Jordan monitored the patient's urine output through a bag attached to the catheter, and each time the level dropped off, the nurses had to pump more fluid into his body. Jordan was afraid the growing amounts of fluid might overload his heart.

All day Sunday, Jordan kept the vigil. Finally, as darkness fell, Huffman's kidneys started to process the excess fluid. His condition began to stabilize. He had taken 28 liters, almost two full gallons of fluid.

When Gundel entered the room, she was shocked. She didn't recognize her husband, whose bandaged body was grotesquely misshapen. He was barely conscious, but he saw her looking down at him. He asked her what month it was.

Jordan later took her aside. Even though Jerry's condition had stabilized, he told her, the outlook remained grim.

Gundel wanted to hear some words of encouragement, but Jordan didn't want to get her hopes up. He had seen too many patients struggle through the first couple of weeks, only to die soon afterward. The early deaths were caused by shock, he explained, but the later deaths came when the patient was overwhelmed by bacteria or viruses.

"Infection is still the ghost in the closet," Jordan told her.

## The Skin Grafts

On Monday night, after camping out in his office for two days, Jordan went home to get some sleep for the next crucial phase.

Many doctors wait at least a week before trying skin grafts with a severely burned patient. But despite the risk, Jordan decided he had to move quickly if he was to save Huffman.

The next morning, May 1, Huffman was wheeled into the operating room. A nurse placed an oxygen tube in his mouth while the anesthesiologist injected him with a narcotic called ketamine.

Jordan took a special eight-inch knife and cut the dead skin off Huffman's right arm. Then he prepared to take some skin from another part of Huffman's body. The task was difficult because so much of the body was covered with burns. The doctor decided to take the skin from an unburned area on the patient's right leg.

Jordan picked up an electric instrument called a dermatome, a kind of surgical carving knife, and carefully set the measurements he wanted. The instrument provides far more precision than even the most skilled surgeon can achieve with a simple scalpel.

Slowly, Jordan used the dermatome to scrape a cellophane-thin slice of skin from the back of Huffman's right leg. It was just 12 thousandths of an inch thick, almost-translucent. The only problem was Huffman didn't have enough healthy skin on that leg to cover the wounds that Jordan wanted to cover that day.

So Jordan took the fragile slice of skin and placed it in a machine called a mesher. The device stretched the skin even thinner, like a piece of dough, until it was three times as large as it had been. The stretching tore several holes in the skin, but the doctor hoped these would be filled in when healing began.

Jordan took the fragile skin and placed it over part of the burned area on Huffman's right arm. Then he wrapped it in three layers of cotton gauze so the skin wouldn't slide off.

This done, Jordan went back to the leg and began the process all over again.

Five hours later, the operation was over. Yet Jordan had been able to place skin grafts over just 15 percent of Huffman's body, primarily the wounds on his right arm and left leg. Any further surgery would simply be too risky for a patient in Huffman's condition. He had already lost five pints of blood, which had to be replaced.

And Jordan still wasn't sure whether the grafts would "take." The liquid plasma seeping from underneath the wounds contained a natural protein called fibrin. The hope was that the fibrin would attach itself to the undersurface of the grafted skin, forming a chemical bond.

Still, if any dead skin was left on the surface, or if the body already were infected, the grafted skin could dissolve and slide off. But if all went well in the next 48 hours, blood from the capillaries below would begin to flow into the grafted skin, making it a living part of the body.

Huffman was wheeled back to his bed in heavy bandages. He was not allowed to move for two days for fear that the fragile skin would break loose.

By Thursday morning, Jordan felt confident enough to try a second operation. This time he took the healthy skin from Huffman's chest and grafted it to the burned parts of his left arm and right leg. Again, the operation required nearly five hours.

On Friday, Jordan removed the bandages from the first operation. It seemed to have been a success: 95 percent of the grafted skin had taken. The doctor put a new, lighter bandage over the area.

Over the weekend, Jordan was able to take Huffman off the respirator, and the nurses began feeding him by mouth. They served steaks, milk shakes and other fattening foods, because Huffman required twice as much nutrition as he would normally need.

Jordan also removed the bandages from the second operation. This one, too, had gone well. Now Huffman was able to move around a bit.

The next day, however, brought bad news. Huffman had pneumonia and was running a 103 degree fever. The doctors treated the virus with antibiotics and hoped for the best.

On Tuesday morning — 10 days after Huffman was admitted to the hospital — Jordan operated a third time. He was able to cover the rest of Huffman's right side, including his shoulder and chest, with grafted skin. Nearly two-thirds of the wounded areas were now covered.

But Huffman had literally run out of skin. Jordan had scraped nearly every square inch of healthy skin on his body for grafting, and there was no choice but to wait for Huffman to grow some more.

"He's not out of the woods yet," the doctor told Gundel.

## Physical Therapy

Toward the end of May, as Huffman's temperature dropped to 100 degrees and he grew more alert, Cheryl Leman became a very important person in his life. The bubbly young physical therapist drained his swelling hands of excess fluid so he could begin to work with them again. She tied his fingers to a specially molded plastic splint to stretch the muscles and prevent them from curling up permanently.

She set up pulleys on his bed so he could lift small weights by himself. Huffman's left hand was beginning to respond, and he could now feed himself with special utensils. But his badly burned right hand remained a claw.

Bach day, Leman would take him to the Hubbard tank, place him on a bed attached to a crane, and lower him into the water. Kneeling beside the tub, she would make him lift his legs, rotate his arms and stretch his muscles and joints — all to keep the burned skin from contracting. The pain was terrible, and some days he couldn't help snapping at her in frustration.

On May 20, Jordan decided Huffman had progressed to the point where he could move from intensive care to a regular bed in the burn unit.

Five days later, Huffman had generated enough new skin for Jordan to do a fourth operation. This one was a "patch" job in which the doctor grafted skin onto some neglected areas of Huffman's body and, for the first time, his face.

As with the other operations, Jordan used pigskin to cover the places on Huffman's legs where he had scraped off the healthy skin. The pigskin could stay on for only three weeks until the body rejected it as a foreign substance, but it provided a covering that allowed the real skin underneath to heal. Jordan would have preferred to use human skin from cadavers, but he had not yet been able to open a skin bank for the center.

One day, as the arduous regimen of exercise stretched into the middle of June, Jordan walked over to Huffman's bed.

"Why don't you just go home?" Jordan asked.

Huffman was taken aback. The nurses had been doing everything for him from errands to exercises. He wasn't sure how much he could do on his own. But, reluctantly, he agreed.

On June 16, seven weeks after he came to the burn center, Jerry Huffman went home.

The first few days were a nightmare. Unable to use his fingers fully or raise his right arm above his waist, Huffman couldn't button his shirt or zip his pants. He needed help to open a door or go to the bathroom.

Gundel had to help with all those routine tasks. She cut his food into little pieces at each meal. She let him in and out of the house. She learned how to shave him each morning since he couldn't hold an electric razor. The constant demands put a strain on both of them that sorely tested the resiliency of their marriage.

The pain of readjustment was

insignificant compared to the ordeal that began when Huffman had to put on his so-called Jobst garments for the first time.

The Jobst outfit — a complete body stocking and gloves made of synthetic elastic with a rubber core — was specially tailored to Huffman's body. The tight-fitting suit applied severe pressure on the burned areas of his skin and, in the course of a year, would prevent him from forming visible scars. Without the garments, the scars would be permanent.

Huffman had little idea how trying it would be. The mere process of taking off the suit for a bath and putting it on again was agony. Gundel had to help him each day; there was no way he could do it by himself. At first it took them nearly three agonizing hours just to put on the suit.

Some nights, when it was unbearably hot and itchy beneath the suit, the temptation to take it off was tremendous. On all but a few humid evenings, he resisted.

Huffman also had to wear a Jobst mask to prevent serious disfigurement of his face. The mask covered his entire head, with small holes for his eyes, nose and mouth.

There was no respite: both the mask and the suit had to be worn 23 out of 24 hours every day.

Yet despite the discomfort, Huffman was determined to wear the garments as long as necessary.

The mask was by far the hardest part. It was tremendously tight, so tight it hurt his teeth and pushed in on his eyes. It blurred his vision, forcing him to get new prescription glasses.

And, while the suit could be worn underneath regular clothes, the mask made him feel like a social outcast. People on the street stopped and stared. Little children asked what was wrong with him. A frightened woman at the teller's booth thought he was a bank robber. On

rare occasions he would take the suit off when he and Gundel went to a restaurant — not for himself, but to avoid making others uncomfortable.

In October, as he learned to write and dial the phone with his left hand, Huffman went back to work part-time. He would visit the hospital for therapy at 7 a.m. before friends drove him to work.

But the stares and whispers around the office intensified, and he tired of answering the same questions over and over. So he put a picture of himself wearing the mask in the employees' newsletter at the National Science Foundation, along with a brief story describing his plight.

Throughout the long winter, Huffman looked forward to the next operation. Jordan, his doctor, was to graft new skin to his armpit in a procedure that would allow him to raise his right arm above his waist for the first time.

But on the morning of Feb. 11, as he was waiting to go into the operating room, the surgery was canceled. Some last-minute lab tests revealed that Huffman had hepatitis. Apparently he had contracted the disease months before, but it had gone undetected.

Huffman could barely contain his disappointment. Instead of regaining the use of his arm, he spent three bedridden days wrapped in bandages, trying to recover from the hepatitis.

It wasn't until April that Jordan was able to perform the armpit surgery. When the operation was over, Huffman took off part of the Jobst suit for good.

Finally, on June 1, the biggest day in Huffman's recovery arrived. With Gundel's help, he was able to take off the hated mask for the last time. He experienced an indescribable feeling of relief.

## The Aftermath

On June 9, when comedian Richard Pryor was badly burned in an explosion, Jerry Huffman sent him a telegram of encouragement. He knew the pain that Pryor would be going through.

For Huffman, the long ordeal is now nearly over. He is wearing only the Jobst vest and the right glove, and in two months he will take those off as well.

He has finished his outpatient therapy at Washington Hospital Center and needs only some further plastic surgery on his face. While the physical scars are slowly beginning to fade, the painful memories come rushing back every time Huffman opens his bedroom closet and sees the mask.

"You aren't yourself when you wear that mask," Huffman said with a shudder as Gundel nodded in agreement. "It's a psychological barrier. You don't ever get used to it."

## Bill for \$66,000 Paid by Insurance

Jerry Huffman's bill for the treatment that saved his life was \$66,000.

Fortunately as a federal employee his Blue Cross medical insurance covers the entire cost. Most insurance firms cover burn treatment, although some policies have a ceiling on how much they will pay. Medicare and Medicaid also pay for the care for the poor and elderly.

Washington Hospital Center officials computed the bill for Huffman's 49-day stay this way: \$900 a day for round-the-clock care when he first arrived; \$600 a day for intensive care in the burn unit; and \$300 to \$400 a day for the less intensive care he needed before he could be discharged.

THE WASHINGTON STAR

---

### BERGY BITS

The first meeting of the 1980-81 season will be on Tuesday evening, October 21st in the Board Room (Room 540) at the National Science Foundation, 18th and G Streets N.W. The kick-off will be at 8 p.m. and we are most fortunate in having a very prominent practicing Antarcticist, Dr. James W. Collinson, Associate Professor, Department of Geology and Mineralogy at The Ohio State University, as our speaker. His topic should be of interest to all of us - "Gondwana Geology in Antarctica and Tasmania." As this is a month away mark it on your calendar now so you won't forget it. Dr. Collinson has been to Antarctica several times and like all other healthy and active field geologists on Planet Earth, he was on the Ellsworth Mountains project in the last austral summer season. He has just returned to Ohio State following seven months in Australia where he was a Senior Fulbright Scholar.

Our 1980-81 membership drive is underway, and I am happy to report that 60% of you have already paid up. There are still 132 who have not yet sent in this year's dues; if your name appears on the form below, you are one of the 132. We like everyone to pay early because it expedites about 20 hours of tedious work of labeling, folding and stuffing Newsletters. Course, if I stopped writing notes on the Newsletters, that would speed things up. But you have to have some fun, too.

The Pennie Rau Antarctic Belt Buckle has been a much bigger success than I had anticipated. As of now, she has filled orders for the first fifty. If you have not received your buckle(s) yet, please be patient! This a labor of love for Pennie, and she does all the wrapping, packaging, and mailing herself. There are nights when she never goes to bed. We mail orders to Pennie once a week, she mails out once a week, but she was swamped with the deluge of early orders.

Charlie (Little America 1933-35) Murphy's new address is Pickle Street, Grafton, Vermont 05146.

In the next Bergy Bits we are planning to include an Antarctic reading list. Why not send us a list of your favorite books? I think we might find a real variety of Antarctic interests. One of my favorite books, is the story of the Norwegian-British-Swedish Expedition to Maudheim, THE WHITE DESERT. Let's hear what you like, Antarcticans.

President Pete Burrill is still being held hostage by the State of Maine at his hideaway near Pemaquid Point. If he stays off the shellfish during the current red tide problem, we expect to see him back in Washington at about the time of the first heavy frost. Then there will be a Growler for us all to read.

Congratulations to our super-duper whale spotteress, the inimitable Dotte Larsen. She walked off with First Prize, Wilderness, in the first Sierra Club Photo Contest - her subject, Iceberg at Arthur's Harbor, Antarctica. Way to go, Dotte! And the referenced woman whale watcher in E. J. Kahn's article in the June 30th edition of the New Yorker was, naturally, Dotte. I am trying to negotiate a bilateral agreement with her husband whereby I have unlimited correspondence rights with his wife. I felt it was better to keep it all out in the open, and as a Man of Dartmouth, he should agree.

Our total membership has just now reached 340 which includes 11 new members who have joined this past month. Many of the newest members are from IGY representing South Pole Station, Little America V and Wilkes Station.

-----  
ANTARCTICAN SOCIETY, c/o AINA, 3426 N. Washington Blvd., Arlington, VA 22201

Membership Dues:	\$5.00	a year	. . .	Local (within 50 miles Washington)
	\$4.00	a year	. . .	Out-of-town
	\$3.00	a year	. . .	BAE I - BAE II members

ADD \$2.00 Initiation Fee for NEW Memberships.

## HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

### Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.), 1965-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82

Vol. 80-81

October

No. 3

First Meeting of 1980-81

Tuesday, October 21 - 8 p.m.

PLEASE

Dr. James W. Collinson

PLEASE

COME !

Institute of Polar Studies  
The Ohio State University  
and  
Antarctica

COME !

### Honorary Members:

Ambassador Paul C Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

"Gondwana Geology in Antarctica and Tasmania"

Board Room, Room 540, National Science Foundation  
18th and G Streets

Growler #2

### Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Mr. Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980

Several members of the Society attended a skillful, effective briefing session for those going South this year. The group seemed to be able, young, matter-of-fact, ready to get going on their several special projects. I talked with a few of them, and wondered to myself whether any might feel, as I had felt two decades before, a little guilty that getting there and living there have been made so easy. Perhaps - if they have read enough about how tough it once was, how Antarctica is becoming more and more a laboratory. The horizons have been looked over, now we're looking under rocks. The change has to affect who goes there and their attitude toward the place.

At the end of a two-week look at Iceland's ice and land last August I visited by telephone with Carroll (B.A.E. I) Foster, long retired but full of pep, golfs on a nice nine-hole course at Reykjavik. His wife Helga is an Icelander and they have chosen to live there. He seemed pleased to hear the news of our doings and asked me to convey his best wishes to all. I was with a small group sponsored by the Explorers Club and guided by Icelander Bjorn Ruriksson, looking particularly at geology and natural history. Iceland is the part of the Mid-Atlantic Ridge that is above water and one can see it splitting apart; combining icecaps and volcanoes lead to some spectacles, too. I managed to tear a muscle while trying to climb onto a glacier, and so didn't go to Maine on my return as I had told Paul I planned to do. Otherwise his Bergy Bit about me would have been on the mark.

I have been holding off on a planning meeting to include your comments and suggestions as invited in Growler #1. None came but they'll still be welcome after our Board meeting on the 7th of October.

Meredith F. (Pete) Burrill

Bergy Bits is an entirely unrehearsed, uncensored conglomerate of Antarctic information, and misinformation at times, and it does not in any way constitute any official position of the Antarctic Society, being just the prejudiced voice of a solitary member who does not know when not to write. Plans on making this particular column one devoted to Antarctic books have gone awry as man's best laid plans seem to go, as personal business and an earlier-than-expected Newsletter have eroded the time necessary to put together a book column. And we also got zero comments from you on your favorite or not-so-favorite Antarctic books. However, we feel so strongly about Huntford's Scott and Amundsen that we will be presenting our thoughts on this great book later on in the Newsletter. We are going to slant some of this issue towards our many California members, as there are so many Antarcticans in California that the seat of power could shift to the Bay Area. We would rather appease early than face a coup later.

The Antarctic belt buckle has had to be withdrawn from sales because of a series of circumstances beyond my control. We were laboring under the misimpression that there would be no cut-off date and all orders would be filled as they came in. It all happened so suddenly that it caught us with a pocketful of money for orders which had to be returned, and nothing has grieved me more in my lifetime. But a combination of losing money and time involved resulted in Pennie Rau calling halt after producing 100 belt buckles. It turned out to be somewhat of a costly operation for the Society, as we ended up giving Pennie all of our mark-up. We came out of this deal over \$300 in the hole, and I feel bad about it as I was responsible for getting us into the buckle business. I feel really sorry for those who ordered a buckle who will not be getting one. Those of you who did get the buckles you ordered have a valuable pants holder-upper, believe you me. Enjoy them and wear them in good health!

I goofed it up on who's on first as the first great grandchild of the late Admiral Byrd. Alice of the House of Richard E. Byrd III was born on March 25, 1980, and that beat Cameron by 18 days. Sorry about that, Alice, no offense intended, you did get here first. But Cameron, we gave you both three "hip, hip hoorays" in the hallowed auditorium of the National Academy of Sciences prior to the Charlie Bentley Memorial Lecture and we expect both to join our Society in due course.

Our membership continues to grow, and our 19 new members put us up to 348 members in good standing. And we have collected this year's dues from over 250. If you have not paid, your name will be printed in ink on the membership form on the last page. It sure does help when mailing out the Newsletter if we don't have to take time to write in names, so please pay at your earliest convenience. We picked up quite a few of the old IGY gang, which makes us happy as we head down the road towards our 25th reunion in 1982-83. From the South Pole we have Ed Flowers, Floyd Johnson, and John Guerrero from 1957 and Dee Witt Baulch from 1958; from Little America V we added Wild Bill Cromie from '57 and Steve Den Hartog and Lyle McGinnis from '58, plus Nolan Aughenbaugh from Ellsworth '57 and Gil Dewart from Wilkes '57. If one wintered over twice, Big Bert Crary would call you a two-time loser, so I guess Gil was a two-time loser as he went back for a year with the Russians at Mirny. I don't know just what Big Bert would call Floyd Johnson - not only did he go back to the South Pole for another year of post-graduate work, but he also went to Ellsworth with the Argentines. Floyd's trip to Ellsworth was supposed to be another one of those regular one-year affairs, but the camp was never relieved (ice conditions) and Floyd was able to get credit for a 4th winter on the ice. Floyd met

the USS Curtiss at dockside in Port Lyttleton in January 1957 and briefed us on the wonders and glories of New Zealand. He told us there were a lot of pretty girls in Christchurch, that some of them might enjoy the company of an American, but that we should not waste our time on any in the Warner Hotel as they were beyond approach. We all thought well of Floyd for giving us this heading as time was of the essence, particularly because the late Harry Wexler, Chief Scientist of the Antarctic IGY forces, carried out a mandatory evening lecture series off the lobby of the Warner Hotel. But it didn't take long to find out that Floyd's admonition was self-serving and that the Warner was really the happy hunting grounds. Bill Gromie should be good copy any time, as he lived the full life. I don't think Bill missed much in his bachelor days. Ed Flowers sought and found refuge at the South Pole from the worst job in the old Weather Bureau, answering crank letters about busted weather forecasts. But Ed must be snake bitten, because now he has charge of the National Solar Radiation network, another loser with all kinds of calibration problems. Steve Den Hartog put Bert Cray on the front page of the New York Times, immortalized him for life with his account of Big Bert's unique high platform dive and swim at Kainan Bay. Steve is with the Army's Cold Regions Research and Engineering Laboratory at Hanover, New Hampshire.

Not all of our new members are old, not all of them are men. Jackie Ronne, Michele Raney, and Nan Scott have all recently joined. All three are in the record books, Jackie for being one of the first two women to winter over in the Antarctic, Michele for being the first woman to winter over at the South Pole, and Nan and Donna Much-more were the first women scientists to work at the South Pole (1975). Nan and her professional cohort, Harold Muchmore, go to the Antarctic each summer to interview people at the end of the year to see what kind of stresses they endured during the winter. This seems to me like a marriage counselor interviewing both combatants after the divorce has become final. My recollections may have become dimmed by time, but it seems to me that the winters were the periods of no stresses and that the stresses appeared only when planes started landing, bringing in people asking silly questions. A lot of things are done backwards on the ice - the wintering-over people should really be interviewing the summer folks. Like that cartoon of a summer folk talking to the old man sitting in a rocker on the porch of a general store in Maine. She is saying, "There are sure a bunch of strange people living here in Maine", and he answers, "Yup, there are, but they all leave here the day after Labor Day."

We are especially pleased to include Helen Poulter as a new member of our Society. She is, of course, the widow of the famed scientist, Tom Poulter, who served as the Chief Scientist on the 1933-35 Byrd expedition. Helen had an operation this summer for cancer but claims that she feels "great and am able to continue life where I left off." She hears occasionally from John Hermann, but I presume from her letter that she would like to hear from some of the others who were there with Tom.

Huntford's Scott and Amundsen - what a book! I think it's the most fantastic Antarctic book I have ever read, as it covers two Antarctic giants, plus a little of Shackleton and a sprinkling of other "names" at the turn of the century. The book is very emotional, most powerful, and will affect each and every reader in one way or another. You'll find yourself in the pages, as I doubt if there is a soul alive who does not have a little bit of either Captain Scott or Amundsen in himself. If you are a lover of Captain Scott, forget the book; it will only result in a case of ulcers. Amundsen does not come out as Mr. Clean either. From what I had heard prior to reading, I thought it was a book which scalped only Scott. Not so. There are no real true winners in this book (unless it is Nansen),

because Roland Huntford put everyone under microscopic dissection and I doubt if there are any Antarcticans who could stand such scrutiny. England got caught with their windproofs down in this book, as they willingly and unwittingly opened all their files for Huntford's perusal. Bunny Fuchs reviewed this book in the July 1980 The Geographical Journal and his two-page review had only one sentence praising the book, "it is apparent that Mr. Huntford has done a remarkable piece of very detailed research on which he is to be congratulated, for there is much new and interesting material and his style is very readable." I have never seen a book with so many quotes, though I hasten to add that I am not a book reader. There are 999 notes on the 579 pages. He examined the diaries and journals of 47 different Antarcticans and armchair Antarcticans. His bibliography of Antarctic books shows 222 different authors. The index is fantastic, as it shows not only the pages where a particular name crops up, but he includes the subject presented. If one wants to find out where Amundsen studied about magnetic observations, it is right there in the index under Amundsen. The strength of the book probably lies in the quotations from the various diaries and journals; its Achilles heel would be the personal interpretations Huntford gives to events. The British are livid with the interpretation given to the final days of Scott's party on the ice shelf. Huntford pretty well stripped Captain Scott as both a leader and as a polar expert, and these were attributes where Amundsen shone. I once was privileged to work in the office next to Sir Hubert Wilkins and got to know him even better when he visited Little America V where I was pulling up stakes to move on to the South Pole. Sir Hubert's opinions about Scott's qualifications to lead a polar expedition were very similar to those proffered by Huntford. Captain Scott never really saw fit to train himself for his polar exploration and there is even some doubt at the very end if he really had a good understanding of the polar regions. Amundsen, on the other hand, spent a quarter of a century in the polar regions. Scott was more a man of the Admiralty, Amundsen a man of Hardangervidda. Scott had Markham, Amundsen had Nansen. Scott was a navy man with a lackluster professional career, Amundsen learned about the seas from family ships and sealers. They were as different as a chocolate éclair and a molasses cookie. I came out of the book with only one regret, that the six years Amundsen was on the MAUD on its North-East Passage were covered in less than two pages. But I found it exciting as the devil to read about Amundsen's race to the South Pole. You will find yourself right there with him, Amundsen reaching the South Pole prior to Scott was presented as a triumph in personnel selection, the recognition of the importance of both skis and dogs, careful planning and execution, plus dedication. In contrast, Scott made so many poor decisions that it was rather excruciating to read of his man-hauling journey. The British sure have a corner on knowing how to suffer.

Did you know that the tent which Amundsen left at the South Pole was made by Martin Ronne, modeled after an aerodynamic tent designed by Dr. Cook? It contained the first congratulations received by Amundsen when he reached the Pole because carefully sewn into the tent, were two labels, one reading "Bon Voyage" and the other "Welcome to 90 degrees." Incidentally, Paul Carter is incorrect in his recent book when he wrote that Martin Ronne had wintered over at Framheim with Amundsen. He went south with Amundsen, did outstanding work on the ship working long hours on a rolling deck making tents, but stayed on the FRAM which returned to South America to do oceanographic research in the South Atlantic while Amundsen went to the South Pole. The book ends with a quotation from our own Larry Gould with his comments upon finding Amundsen's cairn on Betty's Knoll. I suppose the most surprising thing to me was the obsession that Scott had for a member of his first expedition, Ernest Shackleton, who completely alienated Scott by returning to the Antarctic with his own expedition and trying to go to the South Pole. While Amundsen was constantly worrying about the whereabouts of Scott, Scott was actually rejoicing over breaking

marks set by Shackleton. There were many historic firsts set by Amundsen, but one had to be painful. Shortly after leaving the South Pole on the return trip, one of his men came down with a toothache. Amundsen pulled it while the guy was in his sleeping bag. Welcome to the South Pole!

There are quite a few pictures, about a hundred, half of which could have been left out with no loss. The sketch maps are not in keeping with the calibre of the book, but this is being picayunish. The book is loaded from cover to cover, and I doubt if you can lay it down once you pick it up. It is a Holy Mackerel book. Every four or five pages I found something which led me to exclaim, "Holy Mackerel!" I think you will, too. A real bargain at only \$19.95 from G. P. Putnam's Sons.

Historians are probably not going to be too kind to Scott, as we are living in an era of letting it all hang out for everyone to see. The late George Finkel, in his Antarctica: The Heroic Age (Williams Collins Publishers Pty. Ltd., Sydney about 1975) said, "It was near heresy to question Scott or his methods. Any mistakes (and Finkel listed ten) he made were glossed over by the tragedy of his party." He quoted the well-known Australian geographer, Dr. Griffith Taylor, who spent most of his life teaching in Canada, as saying that he never spoke to Scott after his first interview. You know these must be awful trying days for Sir Peter Scott. In Huntford's book, the acknowledgments stress that Sir Peter totally disassociated himself from anything in the book.

When you think about it, there is precious little biographical material written in this country on Antarcticans. Lowell Thomas did a real fine book on Sir Hubert Wilkins, although it included only the first half of his life. And if one wanted to be technical, even though Sir Hubert spent most of his adventuresome years working in or out of the United States, he was an Australian by birth. I know Peter Anderson is interested in doing biographies on Admiral Byrd, Bernt Balchen, and Wilkins, but we seem to have a dearth of other Antarcticans who want to write on our own heroes.

I think George Dufek would have enjoyed Amundsen, as Amundsen took a dim view about doing it with scientists. And during the IGY, there were those among us operating out of Rumour Central at Little America V who felt that Uncle George felt the same way. We also felt that Father Dan Linehan served-as Dufek's own private one-man scientific task force. Father Dan loved to operate the amateur radio ham rig at McMurdo, and when he wasn't playing with dynamite, that was his hang out. It seemed to us that whenever George got fed up with the scientists - and this was quite often he would go and get Father Dan out of the radio shack, shove him into a plane with a few reporters, and take off for some seismic shots and a few headlines of his own. Amundsen had another way of doing it; he left all scientists at home and just took snow and ice experts, not even a doctor. Amundsen wasn't wholly anti-scientists, he just didn't want them around challenging his leadership. He had gone to medical school, although he never graduated. And whenever he felt a need for knowledge on such subjects as magnetism or oceanography, he took crash courses, prior to departures, on the subjects from the leading experts in those fields in Norway.

One of my all-time favorite expeditions was the Norwegian-British-Swedish Expedition to Maudheim, 1949-1952. Has there ever been an expedition with so many famous names? Just look at them - like a Who's Who in Polar Research: Valter Schytt, Gordon de Q. Robin, Gosta Liljequist, Charles Swithinbank, Fred Roots, Ove Wilson, Alan Reece, and others. And Professor Sverdrup and Brian Roberts came down on the NORSEL in the summer of 1950-51! I always felt that the micrometeorological program of Liljequist never got its due recognition. He did a fantastic job, and his publications

of results are still classics. And for sheer drama, it is hard to duplicate the miraculous operation which Ove Wilson pulled off when he was told by London that he had to remove one of Alan Reece's eyes if he were to have any chance of keeping the sight of his other good eye. Alan, a geologist, had been struck in his eye by a piece of the rock at which he was hammering. Ove had never even seen an eye removal, let alone perform one. He got his instructions over the BBC, tooled his own surgical instruments, selected his assistants and gave them detailed" instructions - all unbeknown to Alan. They finally were ready to go, told Alan three days ahead of time, and he gave his consent. As Alan lay on the operating table he remarked, "Boys, I'm scared stiff inside." The operation took two hours and forty minutes, and was pulled off "without a hitch." In fact, Alan was able to join in sledging trips later on in the expedition. Imagine my great surprise and pleasure in the late 1960's to find out that Dr. Wilson was actually working one summer in the very same laboratories where I was employed. Needless to say, one of my prized possessions is the book on this expedition, The White Desert by John Giaver, 256 pages, E. P. Dutton and Company, Inc., 1954, with a nice inscription from Ove. If you haven't read this book, you should. The expedition was the first large-scale international expedition ever organized. Three of the expedition members (there were 15 altogether) drowned and another was rescued from a drifting ice floe.

Lisle Rose of the State Department, who is also on our Board of Directors, has just written a book on Operation Highjump, Assault on Eternity. We have not seen it, but you folks should be getting a notice of its availability very soon (if not already) from the publisher, the U. S. Naval Institute. I understand it's a thick tome and will be selling for \$19.95.

Another new book is Elephant Island: An Antarctic Expedition by John "Chris" Furse, a Commander in the Royal Navy. It is published by Anthony Nelson Ltd., 7 St. John's Hill, Shrewsbury SY1 1JE, Salop, England, and sells for 9.95 pounds. It is the story of an unique expedition, the members of which were 16 quite ordinary servicemen from Lance Corporal to Naval Commander, none of whom were professional explorers. The purpose of the three-month expedition in 1976-77 was to make the first scientific exploration of the unknown islands, and the appendices provide a series of papers describing the structure and life of the island group. It was, apparently, the first Antarctic expedition to use canoes - ten strong Tasman canoes; the members used them to cross the sea to make the first ascent of Clarence Island, 6312 feet. The Geographical Magazine said, "The diary style succeeds very well in recreating the atmosphere of immediacy which characterizes the book from cover to cover ... excellent maps, superb colour plates and photographs." I have NOT seen the book, let alone read it, but we did want to bring it to your attention as a recent Antarctic book.

Dr. El-Sayed has written a book review of Antarctica: No Single Country. No Single Sea by Creina Bond, Roy Siegfried and Peter Johnson, published by C. Struik, Pty. Ltd., Cape Town, South Africa, 1979. 175 pages, 101 color plates. \$24.

.... A journalist and former editor of African Wildlife (Creina Bond), a well-known ornithologist (Roy Siegfried) and a world-renowned natural history photographer (Peter Johnson) have pooled their talents and collaborated in the production of this well-written, profusely illustrated and handsomely covered book on Antarctica.....

.... The book is written with objectivity, clarity and sensitivity. It carries an important message. This message is succinctly summarized in the book's sub-title: No Single Country. No Single Sea.

"In the international corridors of power", the authors wrote in the Preface, "there is a growing recognition of the scientific, ecological and economic importance of the Southern Ocean and Antarctica. There is a growing concern, too, for the future of the area's natural systems, and this is reflected in current negotiations on a proposed Convention on the Conservation of Antarctic Marine Living Resources." The authors expressed hope that their book will show "that Antarctica and the Southern Ocean influence all the world..."

The text of each of the twelve chapters is accompanied by superb photographs of the breath-taking beauty of Antarctica, its surrounding seas and their marine life – photographs that are among the very best that this reviewer has seen.

Historians, oceanographers, marine biologists, glaciologists, mammalogists and conservationists, etc., will feast on the chapters (written in prose style) on the history of antarctic exploration and read about the heroic deeds of the men who struggled against the winds and the monstrous seas to explore the inhospitable continent. They will also read descriptions of the physical setting of the White Continent encircled by its frozen seas, glaciers and icebergs. They will delight in reading about the history of the formation of Bouvet Island and other oceanic islands and will be fascinated by the vivid description of the recent volcanic eruption in Deception Island. Then there is the Chapter on "The Long Night" with its moving account of the story of the survival of the Emperor penguins and their chick-rearing ordeal. There is also a marvellous account of the Wandering Albatross "that circles the world for three years before making landfall" and despite all the research carried out on these long-lived birds, we are told that we know next to nothing about 90 per cent of the 50 years that these magnificent birds spend at sea.

But it is in chapters on the plight of whales and seals, two of the antarctic boom-and-bust industries, that the authors have made their poignant plea for reason lest the tragedy that has befallen the whales and seals also engulf another soon-to-start fishery on ... krill. In that chapter the authors traced the history of Antarctic whaling expeditions, their spectacular rise to an ignominious decline and pointed out how a greedy industry never heeded the advice of the scientists. Now that man has thoroughly decimated the whale population, he is eyeing the food of these whales, thus he will become the exploiter of both prey and predator of that system.

The chapter on "Supermarket Supershrimp" is simply super! It discusses the life history of the krill, *Euphausia superba*, and the contributions to our knowledge of this creature by the DISCOVERY scientists, studies which have laid the foundation of our present knowledge of much of the Southern Ocean. The chapter ends by discussing the BIOMASS (Biological Investigations of Marine Antarctic Systems and Stocks) programme and the concern of the Scientific Committee on Antarctic Research (SCAR) and other international scientific committees to ensure that the living resources of the Southern Ocean are properly managed and the antarctic marine ecosystem is saved from further abuse.

Our Society official court writer would have to be Charlie (B.A.E. II) Murphy, as he has done quite well by the pen. You will recall that his last literary piece, *The Windsors*, which he co-authored last year with J. Bryan III, was on the best seller list for quite a long period. Right now Charlie is working on a biography of the late James Forrestal, and after that he has programmed a history of the military and foreign policies of the Eisenhower presidency. Then he is going to do a narrative of the Second Byrd Antarctic Expedition, one which he writes "will be lighthearted." I wish Charlie would change his priorities and do the book on BAE II first, especially after reading his game plan (which will remain a secret!). When you think of the importance of the first two Byrd Antarctic expeditions, there really has been precious little published.

Deborah Shapley, on leave from *Science* magazine, is writing a book on Antarctica for the Carnegie Endowment for International Peace. Her book "will deal mainly with the upcoming foreign policy issues of living and mineral resources and how the United States and other Treaty powers should deal with them." But it will have some interesting things, too, as she writes that she is "including as much Antarctic lore as I can, as well as the IGY, the science programs, U. S. exploring expeditions, and maybe even a passage on Antarctic philately." I have always enjoyed her articles in *Science* as they were so readable and understandable. I think it is rather exciting that she is writing this book on the Antarctic. I'll certainly be in line when it comes up for sale.

Line Washburn told *The World* what needed to be done in polar research in the August 8th issue of *Science*. It was a foolproof article as he had run it through Bill Benninghoff, Charlie Bentley, Cam Craddock, Louie DeGoes, Bob Helliwell, Tim Hushen, Murray Mitchell, Ed Todd, and Jim Zumberge, plus nine other guys who have not seen the light and joined our Society. I would now like to see a companion article (with the same thoroughness) on what has been accomplished in the past 25 years, because that would be pretty impressive, too. Polar research will always have a future in this country as long as the Soviet Union faces us across the Arctic and maintains their great interests in polar research. Line said one thing which I, as a former Pole sitter, would have to take deep exception to, namely that there are "alternating 6-month periods of continuous daylight and darkness at the poles." This really isn't so in spite of its common usage. When the sun goes down there are 16 more days with civil twilight, which is followed by 37 days of astronomical twilight, and then there are 81 days of darkness before astronomical twilight-civil twilight and then the sun returns. And half of those 81 days with darkness aren't really all that dark because of the moon. A little bit of moon goes a long way when you have a white surface and few clouds towards making the outside environment "lightable". My program necessitated my going 500 feet from camp several times every day of the year, and I always took both camp dogs with me. The dogs always responded more to light than to temperature. If the temperature was below -90° F, they would still want to go for a walk and their only reaction would be not leaving their paws on the snow surface long, continuously picking them up and putting them down. But upon seeing the moon after a couple of weeks with no moon they would take off together like a couple of drunks and run like crazy all over the place. You folks who have never spent a winter at the South Pole have missed out on one of the real pleasures of life, as the weather is almost entirely free of storms. Sunless, but by no means dark, and ever so quiet and peaceful.

Another new book on the Antarctic, *Beyond Cape Horn* by Charles Neider, is being published by the Sierra Club. This 400-page book, priced at \$16.95, is about his third trip to the Antarctic in the summer of 1977 when he visited McMurdo Sound and the Antarctic Peninsula on the BURTON ISLAND. It is also his third book on

the Antarctic. It has eight pages of color photos, including, I think, the Dotte Larsen Sierra Club Award winning shot of Arthur's Harbor mentioned in the last Newsletter. Sure looks like the same picture, anyway. Neider was born in Odessa, Russia and calls himself a "literary writer and humanist." If you're one of those folks who enjoys going next door and seeing your neighbor's slides of their summer vacation, you will like this book. It starts off well, being dedicated to "Laurence McKinley Gould, scientist, explorer, teacher, friend." That would be the highlight of the book except there are three rather interesting chapters: Chapter 12, Conversation with Sir Charles Wright; Chapter 13, A Talk with Sir Vivian Fuchs; and Chapter 15, Conservation with Laurence McKinley Gould. Jerry Huffman comes off as a pretty nice guy with Neider saying that Jerry had "less of the bureaucrat in him than almost any other civil servant I had ever met." And Lyle McGinnis will be happy to read that he "had a keen look about him and was in very good shape physically." Frank Mahncke was described as the "most easygoing member of the inspection team." The book is written diary style and is a good running account of how much money he won and lost at the poker table each night. Being published by the Sierra Club, it is not surprising to find both The Antarctic Treaty and The Antarctic Conservation Act of 1978 in the appendices. An annotated bibliography is poorly done, strongly personalized and most incomplete. Of Admiral Byrd's books he shows only Little America and Alone, not even mentioning Discovery. He would have been better off by not including such a bibliography. I wouldn't call the book outstanding, by any standard, but then I think most Antarctic books are mediocre, and you just might like it.

Another Antartican, Alton A. Lindsey (Allegheny '29) presented sixteen of his recent articles and essays from popular nature and environmental magazines as a 1980 book, Naturalists, Explorers, and Pioneers, published by Lynnden, West Lafayette, Indiana. Two chapters tell how Paul A. Siple (Allegheny '32) worked out the now familiar wind chill factor in Antarctica, and another chapter deals with the men of the second Byrd Antarctic Expedition, with which Dr. Lindsey was zoologist in 1933-35. Dr. Lindsey, emeritus professor of ecology at Purdue University, received the Eminent Ecologist Award in 1976.

John Behrendt of our Society was one of four co-authors on an article in the August 29th issue of Science entitled "Aeromagnetic and Radio Echo Ice-Sounding Measurements Show Much Greater Area of the Dufek Intrusion, Antarctica." The survey made in 1978 over the Dufek layered mafic intrusion suggests a minimum area of the intrusion of about 50,000 square kilometers, making it comparable in size with the Bushveld Complex of Africa. Uncle George, we never really suspected the magnitude of your spread!

The U.S. Antarctic community is waiting with bated breath for two books being put together by Bert Crary and Tom Jones, one of which will recount how the Antarctic IGY program became a reality. They are both out there beating the bushes for all the information they can gather. Every time I ask Bert how things are coming along, he say they are still in Chapter I, so maybe we shouldn't hold our breath for its publication. I hope it doesn't read like a history book, and I also hope it has some of Bert's personality in it. It also appears that Mildred of the House of Crary is gathering more information on the women of Antarctica, so could she too be thinking of publishing?

Frank (B.A.E. I) Davies is evidently having a rough go of it. Our last word was in late August when his wife renewed his membership. She wrote then that "Frank has had a massive stroke in May and left paralyzed, all left side. He'll be in Civic Hospital many months and no hope he will ever walk again." All Antarticans are grieved to hear of his problems, and our hearts and prayers go out to both "Taffy" and his wife during these trying days.

If you are a good Antarctic, you will be able to identify at least half of the above as the list is full of famous persons, starting at the top with one of the daughters the late Admiral Richard E. Byrd and going all the way down to the bottom where we find that musician-raconteur-entertainer-amateur jogger-international traveler-good-will ambassador- and some-time university president, Gentleman Jim Zumberge. Helen Poulter, the widow of the famed scientist Dr. Thomas Poulter who was chief scientist on the 1935 Byrd Antarctic Expedition. David Paige was the official artist on that same expedition; Ken Bubier was an airplane mechanic on the 1928-30 Byrd Expedition; Gordon Fountain was on the BEAR OF OAKLAND, 1934-35. Dave Canham was the Navy Commander at McMurdo in 1956; John Guerrero was one of Paul Siple's men at the South Pole in 1957. John Roscoe was on both High Jump and Windmill and is an Antarctic historian; Mary Goodwin runs her own Polar Archives; Gil Dewart was one of Carl Eklund's boys at Wilkes and later on wintered over at Mirny and I think was the first American to go on a traverse from Mirny to Vostok. Michele Raney was the first woman to winter over at the South Pole; Bob Helliwell writes controversial articles in Science, and he and

John Katsufraakis are two of the most famous names in Antarctica today. Nicholas Clin went to the Antarctic as leader of the first U.S. mountain climbing expedition on the continent. Pennie Rau was a celebrated tourist with Lindblad and by profession is a designer and manufacturer of jewelry, many items being polar creatures. Rob Flint wintered over at Byrd, wintered over at Plateau, and then wintered over at Vostok. We are glad to see that he finally made it to the coast of East Antarctica where he visited Dumont d'Urville last summer. Art Ford lives in the Antarctic and comes home periodically to check his mail box at the office and presumably to appear in person before his family. Robert Feeney culminated his years in the Antarctic with a delightful little book, Professor On The Ice. And James Oerding is laboring over a thesis on the political claims of Antarctica. Scott Miller, the West Coast Eagle Scout finalist in 1978, was given the Exploration Award for Scouting this year. He hopes to use the money, five thousand crisp one dollar bills given by TRW, towards graduate school at Harvard. He has one more year at the University of California at Santa Barbara. Californians seem to do right well by themselves.

Speaking of the political claims of Antarctica, I wonder how many of us have at one time or another milked that subject for a credit course in college? I took a seminal in political geography one time and my professor was the current president of Queens College, one Saul Cohen. He couldn't have cared less about the Antarctic, and he was so tired from writing a book on the Middle East that he literally slept through the whole semester as one after another of his students presented their papers. The Making of a President!

The going price for Antarctic books is as inflationary as our society. I once made a very judicious purchase back in December 1958 on my way home from the South Pole. I found myself doing a little U. S. - N. Z. goodwill missionary work up in Wellington where the late Les Quartermain, whom I had met on the CURTISS going to the ice in January 1957, invited me to go to a local chapter meeting of the New Zealand Antarctic Society. Was I ever lucky! Not only was the immortal Sir Raymond Priestley at the meeting (he was heading back to the Antarctic shortly thereafter), but I met a Wellingtonian who told me about an upcoming auction of Antarctic books. Meanwhile Eddie Goodale was in Christchurch biting his nails that I might never leave New Zealand. He eventually called me up and told me to come on back. He had panicked; the pilot wasn't ready to leave; and after a quick trip to the Hermitage, I resumed my missionary work in Wellington. I had left a bid on six famous Antarctic volumes, all first editions, and I got all six for a total of \$28! Two of the volumes were of Sir Douglas Mawson's The Home of the Blizzard. Today these two must sell for over \$300, as this was the going price in the mid-70's in New Zealand! Two of the volumes were Captain Scott's, and they were autographed by Kathleen Scott to Lord Curzon of Edleston. At the time I had no idea who Lord Curzon was, figuring he was just another lord, but I did know that he wasn't very grateful for the gift - none of the pages had been cut! Well I later found out who he was, and The Geographical Journal (July 1980) has a story about Lord Curzon. He was a past president of the Royal Geographical Society and it seems he was a feisty old soul. Amundsen resigned his membership in the Royal Geographical Society (it was not accepted) after Lord Curzon slighted Amundsen at a dinner in 1912 when he ended a speech with "I propose three cheers for the dogs." The R.G.S. later denied that Curzon had said it, but it seems it not only was so but was in keeping with his true character. So I guess I have a valuable set of books, eh what?

We are rerunning the list of Society members who have wintered over on the ice or wherever in the Antarctic. We have dropped some who did not pay last year's dues, and I am almost certain that I have missed some of the new ones because our dues form no longer includes a question about wintering over or summer trips. We sure

have a handle on the South Pole IGYs. Only the whereabouts of James Barry Burnham, the Brown University flash from Rutherford, New Jersey, is unknown to us.

My apologies to Nan Scott and Harold Muchmore for what I wrote up forward. It seems that I did not know exactly what they did, and got carried away by a statement in the December 1975 Antarctic about their "studies of human adaptation to the stresses of living through the winter at the South Pole." But it was too good a story to have Ruth retype the whole page. What they actually do, it seems, is to run the world's southernmost mobile Red Cross blood bank, but it is not as much Red Cross as it is Oklahoma Medical Research Foundation. They ask no silly questions, just line the guys up and take their blood to study the immunologic changes in people who winter over at the South Pole. Their studies are designed to evaluate any loss of immunity that might result from the winter isolation. Imagine going all the way from Oklahoma City to the South Pole for a fill up of a few gallons!

We had a real nice letter from Susan Patla who has "switched over from doing sea water to wine analysis." Now before you guys all start flooding her with your job applications, she didn't mention any openings. Once upon a time, not so long ago, she was "the sole representative of over 50% of the human race on a ship with 220 men." That ship was the GLACIER. She sounds like a pretty good egg as she admitted to this self-confessed, last of the practicing male chauvinists, that "perhaps the answer lies in having completely separated camps, for a time." This is what I advocated a couple of years ago. I hope that I live one year past the year that the South Pole is an all-woman station. Susan was in the Antarctic twice, once on the good ship CONRAD off Enderby Land, and then on what she referred to as an oceanographer's delight, "a jaunt on semi-solid ice at the RISP station in '78 which also included a short geological field trip to Minna Bluff." She writes an awfully nice letter and I feel sort of squeamish and rotten for my feelings about women in the Antarctic when I read such letters. The only antedote is to have a cold can of Budweiser and hope that the feeling will go away with the next full meal!

Murray Hamlet of the Army Research Institute of Environmental Medicine gave the talk to the Antarctic troops on how to live in the cold regions. He gave them the M1 lecture which is given to the soldiers in the Arctic, and pulled out all stops when it came to showing some pretty gruesome pictures of trench feet. One future Antarctic, evidently not aware that there has not been a single case of trench feet in the Antarctic in modern history, passed out! Michele Raney brought him to so he could enjoy some more pictures of the same. My favorite medical type, as all of you who read this column know, is old Fred "Muckluck" Milan up there at the University of Alaska in the Institute of Arctic Biology who headed up this country's program on Circumpolar People during the recent International Biome Program. Muckluck wrote recently that he had "returned from the Alaska Range serving as gun bearer for a gold miner who inherited some 500 acres of gold claims from his grandfather who staked it in '98. Beautiful treeless country with grizzly bears all over the terrain. But them bears ain't going'ta eat old Muckluck!" That's good news, as we would hate to lose old Muckluck to some ornery old grizzly. Muckluck's book on The Human Biology of Circumpolar Populations (Cambridge University Press, 1980. \$75) was reviewed by Charles Utermohle of the Smithsonian in the August 1, 1980 issue of Science.

Since we started this Newsletter we have added two more members, #349 is the NOAA hydrologist of note, Donald Wiesnet, and #350 is good old Charlie (South Pole 58) Greene. Charlie and I shared the end of the Science Building at the Pole in 58. He ran the ionosphere program and I had to put up with that stupid C3 going off every fifteen minutes or so. He was one of those phlegmatic types who was incapable of getting excited or mad, always being the same, congenial and unflappable. In other words, he was the exact antithesis of my roommate, the hot Latin from Argentina Mario Giovinetto! Charlie had a love affair going with a girl from my home town, and

he came back to marry dear Barbara. It is great to finally get our 350th and especially nice that it is such a good guy as Charlie.

Don Wiesnet was co-chairman of a workshop at NSF in early October which was called "Snow Watch." The workshop didn't result from Washington getting snow in early October last year (opening day of the World Series in Baltimore), but because a bunch of people interested in snow cover wanted to get together and plan an all-out assault on snow cover. I talked my boss into letting me go over and listen to the snow watchers, and it was quite enlightening. You want to know something? I bet there wasn't a single soul in the packed room who ever held an ice axe in his hands, who had ever dug a two meter snow pit, who had ever done the stratigraphy of a pit. These Men of Science are those who sit in the warm confines of their ivory towers and analyze satellite data. How boring. But I walked out with a smile on my face, as the snow surface refuses to tell everything to the eye in the sky which these scientists need to know. You can't get away from ground truth, but there are sure a lot of devious characters who are plotting to do it! But it still was an excellent workshop.

We are deeply indebted to the Ford Aerosports Club which put together a 57-page brochure on their Byrd Polar Flight Anniversary Dinner of November 29, 1979, and which they so kindly sent to the Society. There is rather a funny letter in it from Dean C. Smith who was one of the pilots on the 1928-30 expedition. He wrote, "would like to see the Floyd Bennett, poor misfit with the Cyclone in the nose and Evinrude outboard. My memories of it are not fond." But Larry Gould referred to it in his letter to Mr. Hagelthorn as "that wonderful old plane." Must depend on whether you're flyin it or it's flying you. There were nine people at their anniversary function "who actually contributed some form of labor in the construction, testing, and delivery of the 'Floyd Bennett'." Their newsletter of February 1980 had a note about their, and our, Bob Baron, the fellow who released the Floyd Bennett to the Byrd Expedition. Bob has been repairing another tri-motor, one belonging to Island Airlines which they wrote would soon be flying at Put-in-Bay once again. Now where in heavens is Put-in-Bay?

Snow Flakes: Board of Director member, Gerald Schatz, Editor of NAS News Report, is recovering from a back operation. Sorry about that, Gerry. Hope you have a speedy recovery..... One of our local faithfuls, who hardly ever misses a meeting, Carl Fisher, who looks in his mid-forties, retired after forty-two years of government service. Congratulations, Carl! . . . Wonder Woman, a gifted young Washington lady, added a bit of excitement to Gerry Huffman's retirement luncheon at NSF. Too bad to have missed that one!

The Germans Are Coming, The Germans Are Coming....to the Antarctic

DR. THOMAS WRIGHT

Geologist, National Science Foundation

will address the Society on

GANOVEX-79, The West German Antarctic Research Expedition to  
Northern Victoria Land, Antarctica

(with slides)

Tuesday evening, December 2nd, 1980 at 8 p.m.

Room 540 or 534, National Science Foundation  
1800 G Street N.W.

**Honorary Members:**

- Ambassador Paul C Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard

Our last meeting before the holidays. Let's have a really big turnout. Come and hear about the reentry of the Germans into the Antarctic scene by the only U.S. participant in the expedition of a year ago.

Light refreshments. Good company. Bring a friend.

\* \* \* \* \*

**Antarctic Belt Buckle News**

Although the Society is completely out of the belt buckle business (see your last Newsletter), it appears that the designer and manufacturer, Pennie Rau (1351 North Curson Avenue, Hollywood, California 90046) will consider filling additional orders at this time. BUT, the buckle being offered by her now will have a silver plated map of Antarctica, NOT a sterling silver one. We do NOT have confirmation of the price, although we believe they will be available at \$35 each. But individual purchasers should contact Pennie for price confirmation. This will be strictly between you, the purchaser and Pennie, the producer.

NEWS ITEM: Kelsey Goodman of our Society has generously offered us three Arctic volumes for auctioning to help our treasury. One is an autographed copy of Dr. Frederick Cook's My Attainment of the Pole. The other, two quarto volumes of Greely's The International Polar Expedition. Report on the Proceedings of the U.S. Expedition to Lady Franklin Bay, Grinnell Land, published by GPO in 1888. Details about bidding in next Newsletter.

**Memorial Lecturers:**

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Mr. Peter M. Scott, 1971
- Dr. Frank T. Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980

This column is only the uncontrolled, uninhibited voice of a single member of the Society and does not constitute any official position of the Society on any item herein. We strive for accuracy, but compromise for a good story! P.C.D.

James Collinson of the Institute of Polar Studies was sparkling as our debut lecturer for the 1980-81 season. I have never really been turned on by all this talk about Gondwana, and in my infinite ignorance looked at it as part snake oil, part witchcraft. But he not only made a believer out of me that evening, but he did it painlessly and most interestingly. And what slides! I don't think that I have ever seen such beautiful slides before. Just superb! You know the Antarctic Society has found the Institute of Polar Studies at Ohio State a real bastion of resistance down through the years. Oh, we had Emanuel Rudolph and Peter Anderson locked in as members, but the rest were just outliers, geologically speaking, to our Society. But now we have other IPS luminaries such as Collinson, Dick Goldthwait, Lonnie Thompson, and Philip Kyle. Glad to have them aboard, and it has been great having two of them as lecturers in the past year.

If you kept the last Newsletter, you can add three new members to our wintering-over party. Bucky (Little America V 1958) Wilson is sort of a legendary Alaskan-Antarctic type from the University of Alaska. Edward Grew is another Mirnyite and he is currently with the Department of Earth and Space Science at UCLA. We're going to have to close out memberships to Californians, especially those in the Los Angeles area, as we here in the east are seeing our political base eroding fast and are a bit uneasy about it! And we picked up Charlie (South Pole 1971) Gadsden of the National Weather Service, too. Those NOAA-National Weather Service types come hard although we do have a precious few. The whole recruiting program has been one of deep satisfaction to me as we have continued to grow and have upgraded our membership considerably with this new blood. We finally corralled Jay Zwally of NASA who gave such a great lecture on the satellite interpretation of sea ice two years ago. We landed another Alaskan Antarctic in Vera Alexander of the Institute of Marine Science at the University of Alaska. Vera is also a member of the most prestigious National Academy of Science's Polar Research Board. Welcome, you all! The University of Alaska is now represented by Muckluck Milan, Gunter Weller, Bucky Wilson, and Vera Alexander of their staff, plus alums Bob Benson and Johnny Dawson right here in Washington. Membershipwise we now total 364, with 34 of those being new this year. Last year we picked up 45 new members, the year before 78.

We haven't been getting as much static lately about Bergy Bits, although we had one person write "It is obvious you have never forgiven Scott for not making it back from the Pole." My comments on Huntford's book were certainly opinionated, but the book is also. I have never read a more powerful and potent book on the Antarctic, and it deeply affected me. But both men had reached the South Pole, and it was a terrible thing that men who had worked so hard, who had endured so much hardship, had to perish so close to home. Several people have asked where they might purchase Huntford's book Scott & Amundsen. It can be ordered from G. P. Putnam's Sons, 1050 Wall Street West, Lyndhurst, New Jersey 07071. Include your check for \$21.45 (\$19.95 for the book, plus shipping costs). Sayed El-Sayed writes that Antarctica (see last Newsletter, Oct. 1980, No. 3) has been published in this country by Mayflower Books Inc. or you can buy it at Scribner's Bookshop on 5th Avenue in New York City.

It seems there is still a tempest in the British teapot over the last days of Captain

Scott's party plus the friendship of Mrs. Scott and Nansen. The Guardian for June 4, 1980 had an eight-column spread across the top of p. 28 about "controversial new evidence." It seems that someone has uncovered two letters pertaining to Scott and his companions. One was written by George Bernard Shaw in 1948 to Lord Kennet (who was Mrs. Scott's second husband); the other was written by Lord Kennet to Scott's son Peter in 1957 urging him to do his best to stop Shaw's letter from being published. These two letters are kept at the Cambridge University Library. The text of Shaw's letter was revealed in full on a television program (First Edition) to Southern (England) television viewers. Shaw was a close friend of Garrard and Lord Kennet blames Shaw's "denigration" on "the influence of Garrard...an emotional man with a grievance against his leader, whom he believed to have neglected his merits." Garrard's book, The Worst Journey in the World, is stored in strict secrecy at the Scott Polar Research Institute. It is not an ordinary first edition, with its extra comments on the expedition in Garrard's own handwriting, and was given to the Institute after Garrard's death under a stipulation that no one would be allowed to inspect it. The article in The Guardian has some pretty racy comments, but since this is a family newsletter, you will have to find a copy of that famous publication to read all about it for yourself. I wouldn't dare touch it in Bergy Bits, even if I could get by Madame Censor, our devoted treasurer and Lady Antarctic Societyite.

We had a couple of communiques from everyone's girl friend, Harriet Eklund. She had spent a month in Norway and had a fantastic time. She sent us a beautiful color post-card of the FRAM. It looks much more elegant than I had anticipated it would. After spending a month there she wrote, "These Vikings are really something." Well, I bet those Vikings feel that Harriet is really something, too. Admiral Byrd's niece, Jackie Lever Gustaves is now visiting Harriet.

And speaking about the FRAM, what of the DISCOVERY? Well, it is also open to the public, having been handed to the British National Maritime Trust in 1979. They intend to keep her afloat at St. Katherine's Dock on the Thames and she will become the home for a museum of exploration and discovery. The DISCOVERY must be one of the strongest wooden ships of all time as she was built with 30 cm square frames, then two thicknesses of planking, the outer one being greenheart (very hard and very smooth) with English elm on her bottom. The bow is packed solid with frames going diagonally and two additional stringers. She has a rudder and propeller which could be hoisted and unshipped when in dangerous pack ice. She must be quite a ship! If you're in the vicinity of London Tower you are only minutes away from St. Katherine's Dock. And to celebrate seeing the DISCOVERY, there is a very stylish pub nearby on the cobbled quayside. It is called Dickens Inn and once was an ancient brewery. So if someone in your party is not Antarctic or ship inclined, you can drop them off at the pub for a yard of ale and they will be eternally grateful for your consideration. And what happened to the DISCOVERY after Scott's expeditions? Well, first she was sold to the Hudson Bay Company and was used as a transatlantic store ship. In 1914 she was chartered by the French government and used to transport war materials to Russia. Then she was laid up in 1919. But she was bought by the Discovery Committee in 1923 and went back to the Antarctic to study the life cycle of the whale - you were born too late, Dotte! She was later commissioned to carry Sir Douglas Mawson's British-Australian-New Zealand Research Expedition. Then the Sea Scouts used her. The British Admiralty took her over in 1955 and she was used by the Royal Naval Reserve. Old ships never die!

The Canterbury Museum in Christchurch made an interesting purchase for a thousand dollars, a clasp knife owned by Roald Amundsen, one which he used to sharpen the stake which was driven into the snow at the South Pole to fly the Norwegian flag. The knife is an all-purpose type with one blade, a screw driver, a corkscrew, a spike tin opener

and a gimlet. All those gadgets can now rest in peace, as the knife has been retired for posterity and will only be a showpiece. Amundsen carved his initials "R.A." on one side of the knife, and Oscar Wisting carved on the other side "14.12.12 Syd Polin Amundsen had given this knife to an old friend in Seattle and then it was passed along to several other friends. I have never been able to understand why recipients of gift from famous people didn't hold onto them like they hold onto family jewels.

Want a nice book of Antarctic photos at a reasonable price? How about Herbert Ponting and Frank Hurley's collection of Antarctic photos, 1910-1916 Antarctic Photographs, bound in Australia and sold in this country by St. Martin's Press, 175 Fifth Avenue, New York, New York 10010. The price is only \$12.50 plus postage. It's a steal at that price. Came out in 1979.

Speaking of Australia, their government has approved a proposal to rebuild Casey, Mawson, and Davis at an estimated cost of \$A52,000,000 over the next ten years. And Dr. Ken McNamara, curator of paleontology at the Western Australian Museum in Perth, has found tracks (fossilized) of large prehistoric animals belonging to the eurypterid family, a scorpion-like amphibian that lived about 400 million years ago. This, supposedly, shows the Australia-Antarctic link, as up until a year ago the only place they had been found was in the Antarctic. Ken's tracks were more than 11.8 inches across and indicated that the animals were at least 4.9 feet long, being the largest tracks found to date. And, if you can't beat 'em, join 'em, so Louise Holliday of Sydney will become the first female Aussie to winter over on the Antarctic continent when this winter she will be the Michele Raney at Davis, where she will be the camp doctor. Six women have wintered over at Macquarie Island since 1976 and a number have been to Casey and Macquarie in the good old summer time.

The Russians have come to Hobbs Coast, setting up a station on a rocky outcrop on Cape Burks last year. The coordinates are 74°46'S, 136°52'W which places it 500 miles east of the Little Americas and 200 miles west of Mt. Siple on Siple Island. Nine people wintered over this year, with the scientific program primarily focusing on surface and upper air meteorology.

The Antarctic Society is doubly happy for all the good things which are happening to Christine Russell, the Washington Star science writer who endeared herself to all Antarcticans with her fine coverage of the summer programs while on the ice in 1978, then for her great writeup on Superstar Larry Gould at the time of the Society's Memorial Lecture by Larry in 1979. She has recently been awarded the National Association of Science Writers' annual award for journalism for a five-part series on child-birth practices in the United States. It is one of the top national awards given by science writers themselves and carries a \$1,000 stipend. Christine's series was chosen from entries from 54 newspapers. The award will be presented at Duke University on December 2nd. Prior to that she will have a very special little personal award to give to her husband, as in early November she will present him with their first baby. It is good to see that she does not live by the typewriter alone. Christine's series also won second prize from the American Medical Writers Association. She has been the Washington Star national science and medicine reporter for five years and spent two years researching the series while covering the science front full time.

It's a bit ridiculous for me to be writing Bergy Bits with all the real writers and Antarctic authorities in our membership. Jim Sparkman at NOAA used to be a science writer for the Christian Science Monitor (Lettau the Elder always said that old Jim's paper products at Madison were in a class by themselves), and Bill Cromie earns his bread by his typewriter. Bill wrote that he has been to the Soviet Union twice, once involving a science writers exchange. That must have been just before detente went

down the drain. The second time he went to chronicle the adventures of the US working group on electrometallurgy when they visited various republics as part of a science and technology exchange. He wrote that they exchanged ingots and toasts, with the highlight being the pepper vodka in Georgia. The lowlight was the discovery that where you have seen one steel mill, you have seen them all. Bill plans on returning to the USSR as soon as his liver recovers.

The National Endowment for the Humanities has just announced their third Antarctic Fellowship Competition. The Antarctic Fellowship will be awarded for a continuous period of either three, six, or twelve months of full-time study and research, with a maximum stipend of \$5,500 for three months, \$11,000 for six, and \$22,000 for twelve. The Fellow will be expected to spend one to three months in the Antarctic between October 1981 and March 1982. Applications must be postmarked no later than January 2, 1981. But there is a kicker, "All other things being equal, preference will be given to those who have not been to the Antarctic before." Doesn't that amount to reverse discrimination? Wonder what brain thought that one up? Application materials can be obtained from: Antarctic Fellowship, Division of Fellowships and Seminars, National Endowment for the Humanities, 806 15th Street N.W., Mail Stop 101, Washington, D.C. 20506.

As most of you know, a Memorial Fund in honor of the late Dr. Mary Alice McWhinnie has been set up at DePaul University to purchase books for the Department of Biologic; Sciences. To date they have collected \$3,440, which includes two matching gifts from General Electric and Hartford Insurance. There is a sticker picturing two Emperors and a baby chick with "In Memory of Dr. Mary Alice McWhinnie, 1922-1980, Department of Biological Sciences, 1946-1980, DePaul University" which is being put on the inside cover of each book. Vivina Ortner (Mary Alice's sister) took the penguins off a card Ruth Siple had sent her, a card designed by a lady in Wyoming. The current austral summer will see the dedication of the Mary Alice McWhinnie Marine Science Center at Palmer Station, where a photograph and plaque to Mary Alice will be unveiled.

Norman Vaughan has become a 75-year old center fold in a national publication. Yes sir, right there on pages 82-3 of the October-November issue of Modern Maturity is a big spread on Norman, including a beautiful colored photo of Norman and two dog teams racing across the tundra. About the only thing new to me was that he planted the Harvard flag at the South Pole last summer. He will be racing again this year in "the last great challenge", the 1,049-mile Iditarod sled dog race. And just think, our high schools are full of kinds who have to have a late model sports car to make it a half mile to school.

Had a nice letter from Clay (BAE II) Bailey. He was kind not to mention that I had left him off the list of members who were on the Antarctic Service Expedition. He was with the late Paul Siple at West Base (Little America III). He is having 1934 and 1940 put on each side of the continent on his Antarctic belt buckle. He had talked to both Murray Weiner and Walter Giles recently, and was surprised to find they weren't members. Ruth has Murray's address, and if you think Walter might be interested, Clay, send us his address. We need members from that expedition. I knew that Arnold Court tried to stir up interest in the expedition members getting together for a 40th reunion this year but got little response. I used to know Don Hilton. Wonder where he is now? I believe he had a yacht made in Hong Kong and then sailed off over the horizon to wherever the winds might take him. What a way to go!

Lisle Rose's book on Operation Highjump is now on the streets. I assume by now that you all have received a notice of the publication by the Naval Institute of Assault on Eternity. It is a superbly bound book and has beautiful pictures and a couple of

small scale (large areas) maps. There were 4,700 men and 13 ships on that expedition, one which was more a military polar exercise than it was of scientific discovery. But they did discover nine mountain ranges and an unfrozen lake which became famous as Hunger Oasis. You will find many well-known names throughout the book, such as the late Paul Siple, Admiral Richard E. Byrd, and Admiral George Dufek; and among the living, good old Bud Waite, Gus Shinn, Walter Sullivan and others. I would say that it is a book which Antarctic historians will want to have, as it covers the first truly large expedition which tried to combine ships and aircraft and scientists. And if Lisle hadn't written this book, it might never have been written, as it takes a certain deep dedication and perserverance to write such a detailed book where logistic play the key roles. But the book is strictly about the austral summer expedition of 1946-47 when a bunch of survivors of World War II banded together to go south. The book is unique in itself as there is nary a picture of a penguin. Congratulations to Lisle and to the Naval Institute.

Gentleman Jim Zumberge has been talking like a man who doesn't like his new job (as President of Southern Cal), and after the local citizenry had really rolled out the red carpet for a gala social "Welcome Aboard, Jim" at the Beverly Wilshire Hotel, which included a rousing program by the United States Marine Band! While the cheers were still echoing in Jim's ears, he released an in-house study which splashed across newspapers throughout the country and became an editorial in Sports Illustrated for October 27th. He has all kinds of radical, far-out ideas about how to run an athletic university. To begin with, Gentleman Jim is going to close the rear entry door for athletes and require that they seek admittance through the Dean of Admissions' office. Now is that any way to keep your university in the top 10? Of course, it isn't. But you haven't heard anything yet. Those who get in are going to be required to actually go to classes. Pure heresy. Southern Cal used to have a speech class, but you know and I know that a halfback who can run 40 yards in 4.4 has no need whatsoever to be a Dale Carnegie. In fact, five years after college he can buy and sell a dozen Dale Carnegies. I have been crusading for Gentleman Jim to be the next president of Notre Dame, but I am heartbroken as they will never touch him now. He might be able to catch on with Penn State though, as Joe Paterno has been trying to convince a lot of Doubting Thomases in Appalachia that all those Ail-American, All-Pro linebackers in University Park are scholars. Jim should have suspected the worst at Southern Cal, because how else could a small school (only 12,000 enrollment) be national champion 8 times, appear in 23 Rose Bowls, win 17 Rose Bowls, and have 8 gold medals from the 1976 Summer Olympics? The past decade has seen 330 academically marginal athletes being admitted to Southern Cal, and 32 received credit for that suspicious speech course. I wish Jim would consult with me before he makes any more wild and rash press releases about athletes at Southern Cal. Sports Illustrated seems to take Gentleman Jim's comments with a degree of salt as they wrote, "Until Zumberge and, more importantly, USC's rabid alumni indicate that they would accept more than occasional defeat on the playing field, the intense pressure to win, which helps cause academic corruption, will continue." If this all sounds vaguely familiar to you Antarticans who follow sports, it sure is. There was a similar blowup at UCLA back in 1956, and right in the middle of it was Joseph Kaplan, who was Mr. IGY as well as the man who canned about 120 athletes. I remember finding myself in the chow line at Davisville behind Dr. Kaplan, and not being a physicist and wanting to be friendly, I brought up the UCLA sports scandal. He answered me by saying, "I get two kinds of mail, mail from disgruntled UCLA football fans and from people who are mad with me because of the slowness of our space program to get a satellite off the ground." - Well, Jim can always make it as a piano player, so that job at Southern Cal wasn't all that important anyway. Besides, who needs all that tinsel and glitter of Hollywood?

There has been quite a bit in New Zealand newspapers this past summer on the investigations surrounding the DC10 air disaster last November on Ross Island. One thing which appears to be clear is that there were no malfunctionings on the plane itself.

I didn't take notes on the many press clippings I read because I didn't think at the time I wanted to write about it again. But since then I have come to the conclusion that perhaps some of you might like to know what has been found out. There are at least three books being written on the tragic accident, and at least one paperback, *Whiteout*, was published by an Australian author last summer. Mr. Robert Thomson, Superintendent of the Antarctic Division of the Department of Scientific and Industrial Research, and who headed up the New Zealand removal of the bodies and vital parts of the plane, was supposed to have his book out by the end of September. That should be the best account of what is really known. It appears that perhaps the biggest single factor leading to the crash may have been a typographical error by an Air New Zealand man who typed the wrong coordinates into the flight plan which went into the plane's computer. It resulted in an error which brought the plane into a direct line with Mt. Erebus rather than through McMurdo Sound. However, this error had been discovered on the previous Air New Zealand tourist flight when it was noticed by the crew as it flew up McMurdo Sound. All 14 previous Air New Zealand flights had been made in perfectly clear weather and the planes had been flying visually around the area without having to resort to the computer flight plan. Two days before the fatal flight, the crew of the plane was told of the error in the flight plan, but evidently no one seemed to remember it at the crucial moment. The papers said that four words could have averted the accident, four words of a reminder of the error in the flight plan. There was criticism of the fact that the plane had only one captain aboard, with the other pilot's position being filled by a flight officer. There was criticism that this flight, for some strange reason, did not avail itself of the routine briefing given by USARP flight personnel in New Zealand to tourist flights. Bob Thomson was critical of the fact that they didn't have enough people aboard who were familiar with Antarctica and especially the Ross Island area. One thing I didn't realize was that the plane made a couple of circles off from its course prior to plowing onto Ross Island. Just before they reached the island they swung off to the starboard side and made a complete 360 degree loop followed by another larger and elongated loop on the opposite side which resulted in their returning back onto the same track. They were evidently biding for time to get a better idea of just where they were relative to their approach to the McMurdo area. There was some discussion as to whether the radar should have shown up the land mass directly ahead, but this was evidently thrown out as inconclusive. There was speculation as to whether there was a whiteout. Thirteen pictures taken by tourists on the plane, some taken within the last 45 seconds (estimated) of the flight, were part of the evidence introduced into the hearings. There are law suits all over the place, and disgruntled rescue people who claimed they got practically nothing in remuneration for doing a necessary job which has left them with indelible memories which will affect the rest of their lives. This whole catastrophe seems to linger and get worse with each passing month, and is mute testimony to why no more tourist planes should ever be allowed to go to the ice. The continent has enough trouble with glory-seeking quacks trying to capitalize on it without opening itself to another unnecessary air tragedy.

Let's take a paper cruise to the Antarctic a year from now. What choices are there? Both of our corporate members, Lindblad-Swire and Society Expeditions have their brochures out for 1981-82. The LINDBLAD EXPLORER will be making only two cruises next year, both out of Bluff, New Zealand, the harbor for Invercargill. Both cruises will be of 24 days duration and hit a lot of islands (Snares, Balleny, Ross, Macquarie, Campbell, and Stewart) as well as making McMurdo, Cape Royds, and Cape Adare. The WORLD DISCOVERER will be making three Falkland Islands-Antarctic Peninsula trips of 21 days length, plus a longer cruise of 30 days to the Antarctic Peninsula through the Ross Sea to Ross Island (Cape Royds, McMurdo, Scott) and Cape Adare, then Balleny, Macquarie, and Campbell islands, and on into Port Lyttleton. As I understand it, the LINDBLAD EXPLORER and the WORLD DISCOVERER are sister ships, the WORLD DISCOVERER being

the larger, having 75 cabins vs only 50 on the LINDBLAD EXPLORER. The LINDBLAD EXPLORER has ten cabins on the boat deck which is one deck above the main deck; there are no cabins on this deck on the WORLD DISCOVERER. The WORLD DISCOVERER has 16 cabins, including two suites, on the main deck; the LINDBLAD EXPLORER has no cabins on this deck. Another difference is that you walk down a gangplank on the LINDBLAD EXPLORER when disembarking on a Zodiac, while on the WORLD DISCOVERER you walk directly out onto a disembarking platform. Incidentally, neither outfit is too familiar with the proper spelling of Antarctic places they visit. The WORLD DISCOVERER people misspelled Cape Adare; the LINDBLAD EXPLORER folks misspelled Cape Hallett. And both misspelled Macquarie Island. One of our members, George Llano, heads up the lecture program on the WORLD DISCOVERER. They have given him a promotion in retirement, referring to him as the former head of the Polar Science Division of the National Science Foundation! Prices per person next year, exclusive of travel to and from the ships, are currently being advertised as follows; but if you are really interested, contact your travel agent.

Ship	At Sea (days)	To	Plus 1 Deck	Main Deck	-1 Deck	-2 Deck
LINDBLAD EXPLORER	24	Ross Sea Islands	\$6,900 (D)	none	\$9,040 (S) 6,420 (D)	\$8,560 (S) 5,940 (D) 5,440 (T)
WORLD DISCOVERER	21	Falklands- Ant. Penin.	none	5,790 (D)	8,990 (S) 5,290 (D)	7,990 (S) 4,700 (D)
WORLD DISCOVERER	30	Ant. Penin. Ross Sea Islands	None	8,625 (D)	12,420 (S) 7,780 (D)	11,100 (S) 6,940 (D)

(S is a single room. D is double occupancy. T is three in a room.)

It appears to me that the two ships are very competitive pricewise, with neither having an edge on the other. It also appears that the tourists should have a bank roll or know pretty well in advance that their horse is going to win the Irish Derby. Both ships must be doing a lot of things right as they seem to find plenty of people who want to go on their cruises. I know that within our Society not only is the LINDBLAD EXPLORER Alumni Association very strong, but they also go back for post-graduate work on follow-up cruises. The WORLD DISCOVERER is the new kid on the block and they seem to be off to a good start. So pick your cruise by where you want to go, mortgage the house and kids, and go and have the time of your life.

The National Academy of Sciences' Polar Research Board met in Washington on November 6th and 7th, and WTH very kindly invited me to attend. Their meetings are always something extra special to me because they combine the best of good fellowship with a liberal sprinkling of all the science news south and north. You get the whole ball of wax in one action-packed day. Larry Gould showed up, and he still acts like a little boy who has skipped school for the day. Where he gets all that vim and vitality I'll never know. I was fortunate in being at the same lunch table with him, and his reactions are still those of a fun-loving kid. He spoke on the use of wind generators in the Antarctic, telling how the one put up by the BAE II people was still functioning when Bud Waite took it down in 1955. I believe Larry is going to open up the Ross Sea Windmill Company, Ltd., within the next few years, and if you want to get in on the snow floor, you can buy seed stock from Larry on April 1st. Pay Larry direct, don't pay your broker. John Steele of the Woods Hole Oceanographic Institution spoke about many things, but he raised the question as to why krill wanted to be so close to one another. No one answered what to me is very obvious, that they are just

oversexed. How else can you account for the large number of swarms? It is always good to see Cam Craddock and that pre-World War II haircut. It makes me feel so good. Now if he would only wear white bucks! Kaye Everett was there, and I haven't seen him since he worked for me back in the mid-1960's and tried to drink all the beer that Carlings made in a local brewery. He found out they could keep ahead of him, got mad and went back to Columbus, Ohio. Sayed El-Sayed talked about all the work going on in BIOMASS, and, to me, this was the highlight of the whole day. They have made big advances of late and in our next Newsletter we will dwell a bit on some of these accomplishments. Troy Pewe said not to mention that his equestrian daughter and her Arabian horse tied for second place nationally this year. I assured him that I would hardly mention it, so you folks forget it right away, ok? Bill Benninghoff was there without Anne, but there was a legitimate excuse, she was still unpacking from their trip to New Zealand where they did some island hopping - is Australia an island? Colin Bull, one of those Society holdouts, was in rare form. Colin is Mr. E.R.A. Antarctica. It was he who tried unsuccessfully to introduce women into Antarctica when he was connected with the Kiwi program, and it was he who produced a Lois Jones and did the deed shortly thereafter. And Colin seems like such a good guy. One never knows, does one? And The Most Statuesque one really outdid herself with a lovely buffet board. You just can't keep class down on the farm. Polar Research Board, you did yourself proud. Congratulations on another fine session.

I wonder how many academic degrees have come out of Antarctica; it must be a most significant number. I think NSF would be pleasantly surprised if they knew how many dissertations had resulted from their funding. Our Society does not have the money to go to the microfilm center in Ann Arbor, but how about you guys and dolls who have gotten degrees from your Antarctic research sending in your titles, and also those of any non-Society members who are or were connected with you or your institution? Then we will publish them at the end of the Society year.

Hugh DeWitt is vacating Maine this winter for Washington, D.C., a dubious change to say the least. But he does have a legitimate reason, working four months in the Fish Division of the U.S. National Museum. He hopes to attend a few of our meetings and we surely hope that he does. We were real happy to see some out-of-towners at the Collinson lecture, including the chairman of the National Academy of Sciences' Polar Research Board, Line Washburn, and Roy Cameron of Argonne Laboratory who has worked in Antarctica several summers. Great to have them, and we hope other members in town at time of meetings will bless us with their company. Hugh DeWitt, incidentally, is on sabbatical leave from the University of Maine, and has just returned from a cruise to Bouvet Island with the French on the MARION-DUFRESNE.

What about Antarctic hams, those who come up on single side band and run phone patches the unsung heroes of the Antarctic? We should run a story or two on them. We sent Newsletters to about a dozen of the biggies of the IGYs but never heard a word from any of them. Don't they love us any more? Have they all died? Have we done something wrong? What is the matter? And who were the Jules Madeys of the 1970's? HELP

Does anyone know a Richard Harrington who wrote an article "Antarctic Report - Conservation" in the September 1980 issue of Adventure Travel? I would like to get my hands on that guy as he had the nerve to put my name and office address at the end of his article as a source of contact for more information. I've been flooded with requests from every little ... junior high school social study student in the country, as well as from a bunch of grown-ups. It did result in our getting a new member, Daniel Lemann of Langnau-Emmental in Switzerland!

Pete Bermel, one of our past presidents, has recently had an operation for a detached retina. It happened about the same time Cheryl Tieg was in town for an autograph ses-

sion, and there is a strong possibility this might have been triggered by putting an inordinate amount of strain on his eyes. Actually it happened rather suddenly at a meeting, and he was lucky to get out of there and into the hospital when he did.

Charlie (South Pole'58) Greene was in town this past month, and Johnny Dawson and I broke bread with Charlie and his bride of some twenty years, Barbara. Neither Johnny nor I had seen Charlie since he hopped on that big steel bird and left the Pole at the end of 1958, in spite of the fact that he is involved in polar activities with the Polar Research Laboratory in Santa Barbara. Barbara is a tennis nut, and they are both into cycling. Charlie said he has recently discovered the deserts and they are enjoying them, too. It was good to see that an MIT man and a Smith girl have not gone westward ho completely as they have one son at Brown University and another at Princeton. Roots!

Helen Poulter writes that some fellow in West Virginia is writing about the snow cruiser. That brings back the old days. I can remember all the excitement it created in Worcester, Massachusetts as it went through on its way to Boston to be placed aboard a ship to go to the Antarctic.

News Flash. Former Board member, Bob Allen has just announced his engagement to an associate at the U.S. Geological Survey. The best of luck to them both. And also in the good news department, current Board member, Gerry Schatz is back at his newsstand at the National Academy of Sciences after recovering from a back operation. Jerry Huffman continues his recuperative program and a late October operation fixed up the pinky on his right(?)hand so that he will be able to make a fist by Christmas. Watch out, Gundel!

Dotte Larsen, our lady whale spotteress, was in town for the Jim Collinson Show. She looks just like someone who is deeply into whales, as you could almost envision her up on the flying bridge peering to port and to starboard for her dear friends. Dotte is going back down again this winter on the LINDBLAD EXPLORER.

There will be NO CALENDARS for sale this year by the Society! Not only are they double in price, but they are an inferior product this year with over half of the pictures being fuzzy. We just did not have the nerve to market it, as we felt it would bring more unhappiness than smiles. If next year's calendar is a good one, we'll be back in business. And who needs an Antarctic calendar in 1981 with two fine ones on the market, one on baseball and one on Bo Derek?

-----  
ANTARCTICAN SOCIETY, c/o AINA, 3426 N. Washington Blvd., Arlington, VA 22201

Membership Dues:   \$5.00 a year . . . Local (within 50 miles Washington)  
                      \$4.00 a year . . . Out-of-town  
                      \$3.00 a year . . . BAE I - BAE II members

ADD \$2.00 Initiation Fee for NEW Memberships.

This column, is NOT the voice of the Society, just a collection of bits of information that have interested one member and which he put together in his own prejudiced way, hoping that you will find the stories interesting and the style not overwhelming.

Two long-standing members of our Society, our exalted, prestigious President, Pete Burrill, and his geographical companion, Betty Didcoct, are going to tie the knot on February 21st. Both have been members of our Society for years, and both have been prominent members of the Washington geographical community. Pete is really Mr. Geographer here in the Capital City, and Betty was once an exalted geographer with what used to be referred to as The Agency, and is the immediate past president of the Society of Woman Geographers. Anyway, they have decided to pool their great knowledge of geography under one roof, and presumably dinner talk will be full of Isaiah Bowman, Alexander von Humboldt, Mercator, and Wallace Atwood. Pete is a "Mainiac" through and through, although he got his PhD at Clark University, Betty is a mid-westerner, but she had the wisdom and the foresight to go to one of my favorite colleges, Mt. Holyoke. Naturally the Society wishes luck to anyone who is about to enter into such a risky endeavor as marriage, but this is a marriage where both parties were made for one another and they should get along just fine.

Tom Wright gave us an excellent resume of the West German Antarctic Research Expedition of 1979-80 at our meeting in December. Tom is one of those rawboned geologists who came out of the same mold as Bob Nichols and George Denton, and no one dared to question him on anything. He had visual proofs of the destructive power of Antarctic winds, as damage to their helicopters, and camp was most severe. This is the Year of the Hammer (Geology) for our Society, reflecting the interests of our Program Chairman, Mort Turner, and if we weren't believers of Gondwana before Collinson and Wright, we sure are now. Let's see you guys and dolls out there on the 27th to hear California's gift to the state of Maine, Hugh DeWitt, tell us why it is better on board ship than on snow and ice. He has been on nine cruises to the Antarctic, starting back in 1958-59 on the GLACIER; and including seven cruises of the ELTANIN/ISLAS ORCADAS. Hugh is the author and architect of the American Geographical Society's Antarctic Folio #15, Coastal and Deep Water Fishes of the Antarctic. He was Stanford all the way through his PhD, and then went to the University of Southern California for five years, followed by two years at the Marine Sciences Institute of the University of South Florida at St., Petersburg. After all this education and training, he was deemed qualified to assume a lofty position at the University of Maine. Like many good men, he has sort of gravitated away from the campus life and now works full time at their Marine Laboratories in Walpole, Maine. Now when you are in Walpole, you are really nowhere, but it is God's country and among his pleasures are sailing on beautiful Muscongus Bay. This is Andy Wyeth-Pete Burrill-and my mother's country, so you had better believe. Incidentally, Hugh is among the legion of Antarcticans who does not like the cold, as it seems he frostbit his fingers so many times riding to and from school in the San Joaquin Va3.ley that they are supersensitive to cold.

The British BBC is going to do a major dramatized documentary on Sir Ernest Shackleton which will be shown on TV in 1982. Chosen as the producer is Mr. Christopher Railings. This film saga on the Antarctic is to be the annual documentary for that year. Are we detecting, perhaps, a reevaluation of Sir Ernest in light of Huntford's portrayal of him?

What do you say about the time bomb which the Washington Post detonated on the front page of its Metro Section on Christmas Day with a headline screaming "'Political Admiral', Book Debunks Image of Explorer Byrd, Calls Him a Vain, Mystical Egocentric"? A Washington Post staff writer, Bill McAllister, was abstracting from Lisle Rose's new book, *Assault on Eternity*. Unfortunately, he must have read only three paragraphs in the whole book, and then he read only what he wanted to read. The Washington Post has not been kind to the Antarctic for several years. Last year's story on nuclear waste at McMurdo was pure unadulterated barnyard material, and this article was simply a hatchet job in the best tradition of the local paper. Unfortunately, they included four photos from Admiral Byrd's past, and anyone who looked at the paper that day was sure to see the article. McAllister didn't fabricate the material as Lisle has it in his book, but he took certain phrases out of context and made them poisonous. Lisle is too young to have ever known the late Admiral which he admits in the book. One gets the impression that Lisle's thoughts on Byrd were pretty much gathered exclusively of any of the Byrd expedition men. We could have ignored this article, but it is going to surface in the Antarctic family and you might as well read it here as elsewhere. Lisle's book, even before McAllister's review, left me somewhat cold and I never bothered to finish reading it. It does, however, fill a need historically as where else can you read so many words in one publication on Highjump? But unless you were or are involved in logistics I can't see its widespread appeal. Both Lisle and Jackie Ronne have been on local radio stations plugging, respectively, *Assault on Eternity* and *Antarctica, My Destiny*. Given a choice of the two, I would vote unhesitatingly for Finn's over Lisle's. But I do know of three Antarcticans who have enjoyed Lisle's book. Different people, different strokes. But wouldn't you think McAllister would know how to spell Antarctica?

Whether you want to believe it or not, Transglobe is going to make it across the Antarctic, and much ahead of schedule at that. They might even be at McMurdo by the time you get this Newsletter, as they are already down the Scott Glacier as this is being written early in January. Their position on December 29th was 85°30' S, 151°50' W. Scott Glacier, 100 miles long, was discovered by our own Larry Gould in December 1928, and it had never been descended by a ground party until the three-man Transglobe party made it. Their crossing of Antarctica must be a victory for technology, and especially for "made in the U.K." However, it sure helps to have a plane at your beck and call flying out fuel and supplies whenever you need them. The Division of Polar Programs made their position perfectly clear to Transglobe prior to their going to Antarctica - that they would not be in a position to support them in any way. Well, they evidently didn't believe DPP, as they still requested up to 6,800 liters of fuel be available to them upon arrival at the South Pole. USARP stood firm, and said they could not have any of our precious fuel. So Sir Ranulph went by way of the back door, had the British government make a formal request to our Department State, and he ended up with his fuel, although the British have to not only replace it, but they have to pay for the additional fuel needed to fly it to the South Pole. More recently Transglobe has requested additional fuel, and it seems they will get an additional 800 gallons of J4. The U.S. position now appears to be to give it to the blokes and get them out of Antarctica so everyone can get on with thier work. Unfortunately now that these adventurers, and they are nothing more, have made it, there will probably be an avalanche of other characters thinking up harebrained ideas for Antarctica. And the continent is supposed to be a scientific laboratory? Will SCAR be able to stop them now that the dike has been breached? I think the whole Transglobe trek was put into its true perspective when they arrived at the South Pole and Lady Virginia was flown in to be "briefly reunited" with Sir Ranulph (Christchurch Press, December 18, 1980). Presumably she didn't go there to see if he had lost any fingers or toes on the 1,100 mile, 46-day trip to the Pole. The

three travelers are Sir Ranulph Twistleton-Wykeham-Finnes, age 35, and the so-called leader, Charles Burton, 36, and Oliver Shepard, 33, both signaler-navigators. They will be taken out of McMurdo on the BENJAMIN BOWRING which is due on the Antarctic coast on or about January 20th. Transglobe is due at the North Pole on April 1982, so you had better get used to hearing about them. You Antarcticans, here's a question for you, "How many overland parties have now reached the Pole?" (Answer later on in the Newsletter.)

We have invited certain well-known Antarcticans to provide us with their Top Ten favorite Antarctic books, those which were the most interesting to them. We plan on putting these in Bergy Bits from time to time. I knew that John Roscoe was one of the big collectors and that he's probably Mr. Average Antarctic, being young at heart with the solidarity of maturity. But his selections were anything but average. No. 1 on his Hit Parade is J. C. Palmer's *Thulia: A Tale of the Antarctic*, published in 1843, which John writes is the "only contemporary, first-hand account of the historic solo journey of the schooner FLYING FISH, written entirely in poetry and music". No. 2 is Luc-Marie Bayle's *Le Voyage De La Nouvelle Incomprise*. He says it's a delightful spoof-like account of Paul-Emile Victor's first expedition to Adelie Land, led by Andre-Frank Liotard in 1948-50. No. 3 is Thomas Poulter's *The Winter Night Trip to Advanced Base. Byrd Antarctic Expedition II. 1933-35*. The "meat of this book lies in the facsimile reproductions of the notes passed between the Second-in-Command and members of the Expedition Staff concerning whether or not it was necessary, prudent or proper to 'rescue' Byrd at Boiling Advanced Base - and if such a hazardous rescue operation were needed during the bleakness of the winter night, how should it be done and who should participate." Incidentally, Bud Waite is writing a sequel to this book, his own version of what was actually the worst journey in the world. Then John puts Finn Ronne's *Antarctic Conquest*, E.W. Kevin Walton's *Two Years in the Antarctic*, and Jennie Darlington's *My Antarctic Honeymoon* as 4, 5, and 6 - "three totally divergent books concerning two expeditions." He prefaced his comments with "Perhaps none of these three would be on my list if it were not for the fact the other two were published." John's No. 7 was the four publications of John Giaever on the Maudheim Expedition. They were published in Norway, France, England, Canada and the U.S. and "were fascinating as an exercise in comparative publication" with "no two alike in physical size, shape, paper quality, etc., but that they also had differences in the illustrations and text." No. 8 is Ken Bertrand's *Americans in Antarctica, 1775-1948*, cited for "its high quality scholarship and because it filled a need." No. 9 is T. W. Bagshawe's *Two Men in the Antarctic* which, John writes, is "my favorite because I have unbounded admiration for those who challenge formidable odds for a good cause. Bagshawe was 19 when he and Lester began what was to be the smallest Antarctic expedition, one which turned up more scientific information per capita than any before or since." And No. 10 is William Reed's *The Phantom of the Poles*, which John likes because it reminds him that "feet of clay are omnipresent." He went on to say that "Reed's masterpiece of pseudo-erudition clearly and logically explains why no explorers had been able to attain the Poles, as well as the flattening of the earth at the Poles, the cause of the auroras, why icebergs are found, why meteors fall more often near the Poles, the cause of colored snow, and the reason the compass doesn't work well in polar regions. All this comes about because the earth is hollow with openings surrounding what would be the Poles." What a fascinating list, just terrific! John wrote that "the books selected were favorites because each of them in its own way made me realize what an explorer, a visitor, a scholar or a charlatan could contribute whether purposely or through serendipity."

As those of you who read Bergy Bits know, Mary Goodwin of Polar Archives, West,

is one of my favorite Antarcticans. Mary keeps Poppin up with contributions to this column and her list of books makes a good companion piece to John Roscoe's selections. They both included Palmer's Thulia among their Top Ten which shows that great collectors think alike, Mary broke her selection down into categories -she must have been a school teacher or a librarian, eh what? Under historical she has Walter Sullivan's Quest For A Continent, Apsley Cherry-Garrard's The Worst Journey In The World, Sir Douglas Mawson's The Home Of The Blizzard, and James Murray and George Marston's Antarctic Days. You can't really knock the first three unless you are against motherhood, apple pie and ice cream, and baseball. She has an autographed copy of Antarctic Days by both authors plus Sir Ernest, so we can excuse her if she might be a bit prejudiced about this book which she describes as a "very light-hearted account of the 'goings-on' on the Nimrod Expedition." Under scientific, she shows Frank Debenham's Antarctica ("clear and scholarly written") and Sir Raymond Priestley, Raymond Adie and Gordon Robin's Antarctic Research ("succinct and comprehensive scientific details"). For rare books, the aforementioned Thulia and Shackleton's The Heart Of The Antarctic, the two-volume edition published by Heineman in 1909, Under biographical, she shows E. M<sub>0</sub> Suzyumov's A Life Given To The Antarctic, which Mary describes as "charming hero-worship (Mawson) by a Russian scientist in the Antarctic in the 50's<sub>0</sub>" And in the oddest category is Aurora Australis, written by members of Shackleton's 1908 expedition, with only 20 to 30 bound copies. Like any good woman worth her salt, she just could not stop at 10, so she added Eliot Porter's Antarctica under photography, Walt Disney's The Penguin That Hated The Cold ("of the 23 children penguin books which I have, this is certainly the silliest and most ineptly written and illustrated"), and Admiral Melville's Finding The North Pole By Cook and Peary, 1908-1909 as the book with the most mistakes. And then a parting comment to the effect that she will not comment on the many novels set in Antarctica running from James Fenimore Cooper's The Sea Lions to the recent Hawkland Cache by Eugene FitzMaurice. Mary had a plea for Walter Sullivan to reissue his book to "include the last 23 years and speculation on the impact on resources." The lady has spoken, Walter, now get on with the job!

As we all know, Charlie (BAE II) Murphy is one of the good old boys, but he has departed the local scene to take up residence with his two Ware cockers in "a small and alien village" in southern Vermont. He did survive autumn, but said it was arduous. Murphy may be a good name in South Boston-, Charlie, but it doesn't play well in rural upstate New England where they want to know first what your lineage is to Miles Standish. He sent us a very interesting instant replay of what happened to certain philatelic covers on his expedition and has given us permission to use it. I'm sure it will strike a responsive chord among those of us who have spent countless hours during the winter night cancelling thousands of envelopes for people that we never knew and in all likelihood would never meet. Charlie wrote (and the following is verbatim except for some rather personal evaluations about the retired Navy yeoman which were bleeped out by me of all persons!):

Admiral Byrd had persuaded the U.S. Post Office to issue a special stamp bearing the expedition's cachet. A stamp which the Post Office let him have for two cents (if memory serves) apiece and which he was able to sell for fifty cents or thereabouts, in return for a promise to take the pre-addressed covers to Little America, cancel the stamp there, and send the cover back to New Zealand aboard one of his ships after the Winter Party had been put ashore and supplied. This was a time honored way for more or less impoverished adventurers to raise funds. The difference between the cost of the stamp to them and the market price

rightfully recognized the trouble and risks they accepted.

In the beginning, I paid no attention to this side venture. I have no recollection of how many stamps were sold. The volume of covers was enough to fill quite a few mail sacks. A memory lingers of watching a sledge piled out with these sacks threading a bumpy passage through the ridges of Ver-sur-Mer Inlet, on the way from a ship in the Bay of Whales to Little America.

The task of cancelling the stamps and seeing to it that the covers went back with the last ship was assigned to the expedition clerk, a retired Navy yeoman .... In the hurry and push of reopening the camp, setting Admiral Byrd up at his Advanced Base on the Ross Shelf and emptying the two ships, the yeoman and the stamps were forgotten. He complained, I recall, that the machinery which the Post Office had provided for cancelling the stamps wasn't working very well, but members of the expedition who borrowed it to run their own covers through had no serious difficulties with it. A number of sacks went out with the ships and the assumption was that our obligations to the philatelists had been honorably met.

Hardly. Trouble came early in the Antarctic winter of 1934, after the ships were berthed in New Zealand, and the Admiral was fending for himself in his shack, the ice had closed off the Ross Sea, the darkness had driven us underground at Little America - and the philatelists in distant America, bursting with spring, were yielding to the terrible suspicion that their covers were not coming through.

Byrd had charged me with looking after various things, in consultation with my by then good and trusted friend, Dr. Thomas Poulter, the Second-in-Command. The New York office of the expedition came under increasing bombardment from stamp purchasers demanding an explanation for the failure of the covers to appear, so long after the ships had returned to New Zealand. Hell does harbor a fury equal to that of a woman scorned; it is the disillusionment of philatelists who have been shortchanged. Their wrath was compounded by the discovery that some covers did reach their destinations, and that the mail which the expedition members had stamped and cancelled on their own had completed its appointed round and was a source of pride and distinction to the recipients.

The New York office pressed me for an explanation. Complaints were being made to the Post Office in Washington and the authorities there were politely inquiring about shortfall. I called on the yeoman-clerk for an explanation. The poor soul (not the exact word used by C.J.V.M.!) at first denied any responsibility: the covers, he insisted, had all been cancelled and sent back with the ships. Then he broke down and confessed that the job had been too much for him. We had three cows with us, which Byrd had agreed to pasture under Little America's icy crust as a favor to the Guernsey cattle association, which saw in the experiment a chance to dramatize the point that the breed was a 'frugal forager.' The yeoman-clerk led me into the cowbarn. While I held a flashlight on him, he pushed aside a mound of hay. Underneath was the U.S. Mail, sacks of it, all still sealed.

I supplied the New York representative with an honest report, but as gently self-serving as I could make it, to be relayed to the Post Office. But the tumult was a long time subsiding. The bitterest complaint came from a wholly unexpected quarter - the Lydia Pinkham Company. One of

Byrd's front men had obtained a \$5,000 donation to the expedition from a chief executive of the famous company, a blood relative of the founder, a lady named (again, if memory serves) Lydia Pinkham Groves. In appreciation of the gift, the expedition bound itself to name a mountain-to-be-discovered after the founder, and to honor the donor's colleagues and friends with covers from Little America signed by Admiral Byrd himself.

The covers, alas, lay in the sacks under the hay; the mountain could not be discovered before the return of the sun, and there was no appeasing the donor's wrath. I instructed our man in New York to return the \$5,000 to the donor, with an apology, and I rather flattered myself on being able to rid the expedition of an embarrassing obligation. The only appropriate name for a modest eminence bearing some association with the rather parochial interests of the donor was Mons Veneris, and I doubted that the geographical societies of the world would look with favor on my choice.

On Byrd's return to Little America some months later, I told him what I had done. His first response was one of relief. Then he suddenly paled. "How much money did he return?" he asked. "The \$5,000," I said. "Good God," he said, "I had to pay the fellow who got the donation a finder's fee of \$1,500. We've ended up at the short end of the stick."

To close out the story, Charlie arranged for the Post Office to send down an inspector, and a bureaucrat by the name of Anderson arrived in January 1935, the sacks of mail were brought out from under the hay, the cancellation machine whirred away, and the yeoman-clerk faded gratefully into oblivion. And for Charlie it all ended on a festive note, as he threw a dinner party for members of the Winter Party when they hit Dunedin. A music hall troupe from Australia was there and Charlie invited the cast to join them. Charlie had a lot of catching up to do as he hadn't had a drink since they crossed the Antarctic Circle some 15 months previously. By that time Charlie had gotten to know the postal inspector who was "graced with a gentle witty turn of phrase", and evidently was of strong arm, too, as "he and I were of considerable help to one another that evening, getting the other safely to his room." If you want to read more Charlie Murphy, you can turn to Situation Report, a quarterly publication of the Security and Intelligence Fund (Charlie was one of its founders and is on its Board of Directors) where he has recently collaborated with Ambassador (Ret) Elbridge Durbrow on a 15-page treatise "Soviet Aims: Neither Wholly a Riddle, nor Mystery, and Even Less an Enigma." Charlie was with Fortune as a writer and editor for 34 years. A man of many talents, and let's hope that those people in Grafton, Vermont get to know and appreciate their distinguished newcomer on Pickle Street, Thanks, Charlie, for that great story about how the yeoman-clerk found a place to put the philatelists!

We are indebted to Sayed El-Sayed one more time for making an advanced copy of the BIOMASS Newsletter (Vol. 2, No. 3, December 1980) available to us with a green light for use. The big news is that FIBEX (First International BIOMASS Experiment) is underway. It is the largest multi-ship experiment ever mounted in biological oceanography. There are 18 vessels in all, representing Argentina, Australia, Chile, France, F.R.G., Japan, Poland, South Africa, U.K., U.S.A., and the U.S.S.R. Ships from Australia, France, Japan and South Africa will be working the area in the southwestern Indian Ocean (off the coast of East Antarctica between 15°E to 90°E) and eight vessels from Argentina, Chile, F.R.G., Japan, Poland, U.K., U.S.A. and the U.S.S.R. will be in the South Atlantic north and east of the Antarctic Peninsula. There is a 7-10 day krill patch study in which many of the ships will participate. It looks to me like this is a mini-GARP (Global Atmosphere Research Program), or a poor man's GARP or a biologist's GARP. But regardless of what it is, they seem to be out there doing many good things and they are publishing. And

they are super at holding symposiums and conferences, and they go to all sorts of interesting places to finalize things. I think it will pay to be a biologist during the 1980's as it is going to be exciting, productive, and American Express is going to love you, too. Twelve members of the SCAR Working Group on Biology attended the XVI SCAR Meeting in Queenstown in October. SCAR developed a Convention on the Conservation of Antarctic Marine Living Resources which is aimed at the "wise use of Antarctic marine resources." President Carter sent this treaty on Antarctic wildlife to the Senate on December 3rd. The Subcommittee on Bird Biology succeeded in putting into operation the bird-banding schemes, a bird-banding central data bank, and the International Survey of Antarctic Seabirds (ISAS). A synthesis of current information on penguin distribution and abundance should be completed by June 1981. The three priority regions for the ISAS are 1) Scotia Sea-Antarctic Peninsula, 2) Enderby and MacRobertson Lands, and 3) Ross Sea. There were three meetings in 1980, resulting in BIOMASS Report Series #14 (FIBEX Acoustic Survey Design held in Dammarie-les-Lys, France, 3-6 June), #15 (BIOMASS Data Workshop, Hamburg, F.R.G., 27-29 May) and #16 (Data, Statistics and Resource Evaluation held in Cambridge, U.K., 28 July-2 August). There are six publications in the BIOMASS Handbook Series which are:

1. Calibration of Hydro-Acoustic Instruments
2. Estimation of Population Sizes of Seals
3. Identification of Antarctic Larval Euphausiids
4. Measurements of Body Length of Euphausia Superba
5. Key for the Identification of Antarctic Euphausiids
7. Calculation of the Constants Needed to Scale the Output of an Echo Integrator

and four more are in press:

6. Studies of the Patches of Krill, Euphausia Superba Dana
8. Antarctic Fish Age Determination Methods
9. A Manual for the Measurements of Chlorophyll A, Net Phytoplankton and Nannoplankton
10. A Manual for the Measurement of Total Daily Primary Productivity

Those BIOMASSers are going to meet in Hamburg in July or August to hold a post-FIBEX Data Interaction Workshop and then there is a Technical Group meeting in Cambridge, U.K. (after the Hamburg meeting) to talk about Data, Statistics, and Resource Evaluation, which in turn will be followed in 1982 by a meeting of specialists in Japan talking about Antarctic Oceanography in Relation to Biology, plus a meeting in either Paris, Kiel, or Bremerhaven on Fish Biology. And if there is anyone staying home writing reports, there is going to be a new journal, Polar Biology to read. Information on this English language journal can be had by writing Springer-Verlag, Journal Publication Dept., P.O. Box 10 52 80, D-6900 Heidelberg, F.R.G.

El-Sayed's organ also included a book review by Deborah Shapley of Barbara Mitchell and Richard Sandbrook's The Management Of The Southern Ocean which sounds like the best Antarctic buy in a long time. For \$5.00 plus postage (IIED, 1302 18th St.N.W., Washington, D.C. 20036) you can get a copy of "a ground-breaking book... first to bring together for the layman key information about Antarctic krill, whale and population shifts, the economics of distant water fishing, comparative krill and fish products, alternative management strategies for the fisheries, the Antarctic Treaty, and the new Convention on the Conservation of Antarctic Marine Living Resources." Deborah, went on to write "this little volume is crammed with interesting, useful

information on all of the above subjects and will give the layman (as well as the specialist in some aspect of the Southern Ocean unaware of what other specialists are thinking) a grasp of the scientific and political dimensions of this important problem." Deborah Shapley is- like E.F. Hutton, when she talks, you should listen.

Walter Sullivan told the World (doesn't everyone read the New York Times?) on 16 December that Bob Helliwell had a bunch of men (people) down there at Siple Station tickling the very devil out of space, making man-made auroras above the innocents sitting at home in Roberval, Quebec. I hope it did not disturb their watching the Canadiens playing the Maple Leafs, because if it did, they might put a price on Bob's neck! Someone pushed a button at Siple on Friday the 12th that jostled the magnetic field far out in space by initiating the transmission of 10-mile long radio waves. One of the seven rockets sent up from Siple to measure the plunging showers of electrons detected emissions triggered by the radio transmission. "Electrons forming the earth--encircling radiation belt normally are trapped in paths that spiral around the magnetic field lines and reverse direction as they near the earth, at each, end of the magnetic arc. If their paths are disturbed by radio waves they fail to reverse and plunge into the atmosphere." Yes, Walter, we believe you.

Walter goes on to say that Argentina leads all countries with nine stations below 60° South, with the Soviet Union close behind with seven. With Siple closing this month (will reopen for two years in November 1981), the U.S. will be manning only McMurdo, Palmer and the South Pole this winter. The Chileans have recently built a 4,600 foot gravel runway on King George Island (Dufek's?), which also supports the Soviet base at Bellingshausen. The Chileans are offering weekly airmail service for the nearby Argentine and British stations. Argentina has also built a gravel runway near its Vicecomodoro Marambio base on Seymour Island, but it is on a plateau so high that clouds are said to make it unapproachable much of the time. That was Argentina, not Poland. There are traverses criss-crossing the interior of Antarctica by the Australians, the French, and the Soviets. The U.S.S.I traverse has Australians along. Now the question is, will the Aussies come back home as vodka drinkers or will the Russians return as beer drinkers? Walter concluded his article by saying that Ambassador Thomas Pickering of the State Department is heading up a task force looking at future U.S. involvement in Antarctica. The rapid rise in fuel costs has necessitated a sharpening of the pencils and of the minds.

We often wonder about who has been to the Antarctic the most often. In terms of total number of austral summers it has to be Ken Moulton, as he must have spent twenty summers on the beach at McMurdo. But how about the NELLA DAN? When she left Melbourne on November 17th, she was on her 59th voyage to the Antarctic for the Australian government. She first went down in 1962, and she will make her 60th trip early in 1981. This is the 34th summer for the Australian National Antarctic Research Expedition. The NELLA DAN has a new look about her, as she has been modified to the tune of \$A1,000,000 for her new role in marine sciences. Three new laboratories have been installed, and she will be taking part in an international assessment of the abundance and distribution of krill in the Southern Ocean. Incidentally, the NELLA DAN cruise of last November took 37 1981 wintering-over types for Mawson and Davis. Do you think old Gunter Weller remembers? Or do you think old Gunter would like to be going back?

The Polar Record, Vol. 20, No. 126, 1980 had an excellent summarization of tourism in Antarctica by Rosamunde J. Reich, who received her Diploma in Polar Studies at the Scott Polar Research Institute for her dissertation on this subject. The

bottom line is that approximately 31,000 people have visited the continent as paying guests, adventurers, or as guests of national scientific expeditions during the last 25 years. Up to the current austral summer, 43 flights have carried 11,045 day flight passengers. (Ed. note: I get a slightly higher figure for tourist flights, counting 14 by Air New Zealand, 31 by Qantas). She writes, "It is unlikely that more than about 19,955 people have landed in the Antarctic from tourist ships or aircrafts." Her study lists 80 cruises, seventy-two of which were to the Antarctic Peninsula, four were to the Ross Sea and four were to both the Antarctic Peninsula and the Ross Sea. She uses an estimated figure of 16,640 passengers for all the cruises, but I think she might be on the high side. She shows 193 berths for the WORLD DISCOVERER, but this figure appears to be somewhat high as they advertise 75 cabins (twin). Some of the Argentine ships have been relatively large liners - the LIBERTAD has 400 berths, the RIO TUNUYAN has 394. But the grandmother of them all is the Spanish CABO SAN ROQUE which has 841 berths. The first Lindblad Travel, Inc. cruise was in January 1966 (which was #5 worldwide), taken by the good ship LAPATAIA and they had 58 passengers. I believe at least two of our members were on her, Veryl Shults, exalted mathematician here in Washington, and Mary Goodwin, polar archivist in Los Angeles. I think you all will find this article interesting reading as it includes all the facts and figures you always were inquisitive about but were afraid to ask.

They are still trying to figure out just what happened to that Air New Zealand DC10 that crashed a year ago last November on Ross Island. The Board of Enquiry had their period of investigation extended to the end of December, but no indications as to when they will come out with their findings. They took the Board down to McMurdo this austral summer, flying the same flight path, even doing the figure eight off the coast of Ross Island which the ill-fated plane took prior to crashing. A fellow by the name of Ken Hickson has published a book on the terrible catastrophe, Flight 901 To Erebus. It is published by Whitcoulls, Ltd., in New Zealand and has been a big seller, necessitating a second printing. Bob Thomson was writing a book, although I have no word on when that will-come out.

Bob is here in the States now for five months, at the University of Northern Illinois on a Fulbright lecturing fellowship teaching "Geological Sciences in the Antarctic." Bob made his 56th visit to Scott Base in November, and will be returning home to New Zealand in June or July. He picked a real opportune time to be here in the States, as every true blue Antarctic would like to find a hiding place when those British adventurers complete their successful crossing of Antarctica on snowmobiles in late January. And I suppose DeKalb, Illinois is an excellent place for the head of the New Zealand Antarctic Research Programs to hide out.

Bad news in early December from the South African field party that was trying to get back to their station at Sanae. The party split up, with three going on ahead when they were not too far out from camp and the weather was good. A blizzard came up, they had to stop and make camp where they were, and the blizzard lasted for two full days. The other group made it to Sanae, and a rescue party came out when the others were long overdue. A member of the rescue party, a meteorologist - P.G. Bell - fell into a crevasse and lost his life. The men were found, after an eight-day ordeal, and were rescued by the veteran British Antarctic Survey pilot, Giles Kershaw who was flying support missions for the British Transglobe Expedition. Kershaw, 37 years of age, has flown some 5,000 miles in Canadian-built twin Otters, and is considered a "real hero of the British Transglobe Expedition."

(Answer: 10 overland parties have reached the Pole. List on next page.)

Overland parties reaching the Pole:

- |   |                   |  |
|---|-------------------|--|
| 1. Roald Amundsen's party               | December 15, 1911 |  |
| 2. Robert Scott's party                 | January 17, 1912  |  |
| 3. Ed Hillary's party                   | January 4, 1958   | (after traversing 1,250 miles from Scott Base) |
| 4. Vivian Fuchs' party                  | January 20, 1958  | (after 932 miles from Shackleton)              |
| 5. Sixteen Russians                     | December 29, 1959 | (after 1,670 miles)                            |
| 6. Major Antero Havola's party          | January 16, 1961  | (after 800 miles from Byrd Station)            |
| 7. Bert Crary's party (8 men)           | February 12, 1961 | (after 1,450 miles from McM in 64 days)        |
| 8. Argentine Army Expedition<br>(8 men) | December 10, 1965 | (after 825 miles from General Belgrano)        |
| 9. Japanese party (11 men)              | December 19, 1968 | (after 3,235 miles from Syd in 141 days)       |
| 10. Transglobe                          | December 15, 1981 |  |

John (BAE II) Herrmann writes that he is 88 and that his pacemaker is working fine. Carroll (Eleanor Boiling '28-30) Foster seems to be doing well in Iceland, Charles (West Base) Shirley retired from one newspaper and has gone to work as editor on a smaller one. Ed and Louise Flowers (he a Pole Sitter in '57) were in Switzerland for the month of October. Another '57 Pole Sitter, Earl Johnson, the young fellow who looked about 14, has a son who was studying towards a PhD in anthropology but has now decided to transfer to the Naval Air Academy at Pensacola. And the news from Nell Davies is not good as Frank (BAE I) is not only hospitalized but is getting progressively weaker and thinner. Al (BAE II) Lindsey made a trip to Mexico last January to check out the ruins - they are still there - and is currently writing his autobiography for a western university press. Murray (West Base) Wiener plans on retiring from banking next July. Murray and Ruth live on a golf course in Green Valley, Arizona, but it seems that retirement is going to include a lot of traveling PLUS fishing. They spent a month in Steamboat Springs, Colorado last summer and Murray caught his limit of trout every day. Sig (West Base) Gutenko is feeling better after a stomach operation and fractured hip. Sig and Lou spent the month of October in the mountains of North Carolina. Arnold (West Base) Court was president of the Association of Pacific Coast Geographers and was busy going to meetings and giving lectures all over the west. Corinne has found that recovery from her February 1979 operation for removal of half of her right lung (destroyed by a rare fungus) has been much slower than she expected. But they are planning to go to Frankfurt in July to see their son David and his bride. In the meantime the Courts sojourn to Denver periodically to enjoy two delightful grandsons. Dave (McMurdo 1956) Canham was happy to close out 1980. Dave had his whole anatomy rearranged last April when he was operated on for a type of cancer (squamas) that is impervious to radiation and relatively immune to chemotherapy. He is frequently body-scanned and otherwise tested, and remains free of cancer. He is even back on the tennis courts. Dave and Betty are either disappointed in Sacramento or are homesick for Dallas, or both, as they hope to return to Dallas by August 1982. Is Dallas big enough for both J.R. and Dave? I bet he wants to get back there so he can be closer to the Dallas Cowboys cheerleaders. Can't blame him, really.

Bergy Bits is expanding our coverage with a recipe from the ice, being Sig Gutenko's recipe for dressing for a 12-pound turkey. Sig was the cook at West Base on the Antarctic Service Expedition, and he so impressed Paul Siple with his capability

for stuffing a turkey that Paul brought his recipe to Ruth and said, "This is the way you will make our stuffings from now on." Ruth passed it along to their daughter Jane, and Jane has embellished it with some of her own additions-on. The recipe is by Gutenko, modified by Jane Siple Player, and having been tested by yours truly meets all known specifications for goodness.

24 slices white bread	about 1/2 tsp. thyme
5 strips bacon	1/4 tsp. sage
1 bunch celery	1 1/4 tsp. salt
2 or 3 onions	1/4 tsp. pepper
1 lb. mild pork sausage (bulk)	1 tsp. sugar
4 to 6 sprigs fresh parsley	5 eggs, beaten together
about 1/2 tsp. basil	1 stick butter or margarine, melted
" " marjoram	

Dry out bread overnight. Trim off crusts and dice. Cut bacon into small pieces and start to brown. Cut celery and onion fine; then add to bacon in pan and continue braising. Empty these ingredients into large mixing bowl. Brown the sausage and drain off the grease; add to ingredients in bowl. Cut parsley fine; add it, along with other herbs, salt, pepper and sugar. Add diced bread, beaten eggs and melted butter. Rub soft butter and some salt on inside of turkey - both body cavity and inside loose skin area over upper part of breast. Fill both areas with dressing (loosely). To keep dressing in, use a small skewer or two. Any extra dressing can be wrapped in foil and heated in the oven.

The friendly Washington paper, the Washington Star, ran a nice interview with the squirrely member of our Society, Vagn Flyger, who went south with Bill Sladen once upon a distant past. Vagn is a zoologist in the Animal Science Department at the University of Maryland and he is deep into squirrels. He keeps Fitz, a 9-month old fox squirrel in his living room. Fitz has a knitted fuzzy black and orange doll which he wrestles, bites, hugs, attacks, and sleeps with at night. In other words, poor Fitz thinks the doll is his wife. Vagn says if you want to make a squirrel real happy, buy him his own box of kleenex. Any self-respecting squirrel in Vagn's neighborhood has his nest lined with the latest colored kleenex tissue. Vagn has collected about 2,000 dead squirrels, which he analyzes to discover such things as the sex ratio and types of parasites. Vagn sounds like the perfect candidate to winter over. Wouldn't the psychiatrists have a great time trying to figure him out!

ARCTIC INSTITUTE OF NORTH AMERICA  
3426 NORTH WASHINGTON BOULEVARD  
ARLINGTON, VIRGINIA 22201

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Presidents:

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-2
- Mr. Gordon D. Cartwright, 1962-3
- RADM David M. Tyree (Ret.), 1963-4
- Mr. George R. Toney, 1964-5
- Mr. Morton J. Rubin, 1965-6
- Dr. Albert P. Crary, 1966-8
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-1
- Dr. William J. L. Sladen, 1971-3
- Mr. Peter F. Bermel, 1973-5
- Dr. Kenneth J. Bertrand, 1975-7
- Mrs. Paul A. Siple, 1977-8
- Dr. Paul C. Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82

Vol. 80-81 February No. 6

L A S T R E G U L A R S E A S O N L E C T U R E

Please Come, You All!

DR. LISLE A. ROSE

Polar Expert  
Ocean and Polar Affairs  
U.S. State Department

will present

ANTARCTICA FROM THE BOTTOM UP

Tuesday Evening, March 3, 1981

8 p.m.

Board Room 540  
National Science Foundation  
18th and G Streets N.W.

LET'S HAVE A FULL HOUSE FOR ONE OF OUR BOARD OF DIRECTORS,  
A YOUNG, OLD ICEBREAKER, HISTORIAN, AND AUTHOR.

\* \* \* \* \*

Honorary Members:

- Ambassador Paul C. Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard

Memorial Lecturers:

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Mr. Peter M. Scott, 1971
- Dr. Frank T. Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980

As you may recall from our last Newsletter, our distinguished president, Pete Burrill is getting married to fellow Antarctic Society member, Betty Didcoct on February 21st. For many long years I have been laboring with what turns out to be a misconception. I thought Pete was born into the Board on Geographic Names, that they were practically synonymous, being one and the same. But the other evening, when trying to catch up on some of my magazines, I found an item in the National Geographic Magazine of December 1899 that President Benjamin Harrison actually issued an order on September 4, 1890 establishing the Board on Geographic Names. Henry Gannett was the first Chairman of the Board which consisted of ten members (from the US Geological Survey, Coast S Idiotic Survey, Hydrographic Office, Corps of Engineers, the Lighthouse Board, Department of State, Post Office Department, and the Smithsonian) As long as you two are getting married, have a great honeymoon and come back to your Washington rookery as happy as a couple of penguins.

Late sad news! The Society regrets to announce the death of George D. Whitmore, 82, (Whitmore Mts. in Antarctica), former USGS Chief Topographic Engineer, on February 9<sup>th</sup>.

## B E R G Y   B I T S

Another reminder that Bergy Bits is NOT the Mouth of the Antarctic Society, but only the Single Voice of a member who is an old fuddy-duddy now outside the Antarctic mainstream. The writer is particularly cognizant of the generation gap following talks with various members of the Washington Antarctic community relative to their reactions to the Antarctic articles published by The Washington Post in early February. However, as long as I write Bergy Bits I will not compromise my feelings and will tell it as I see it, even though it may be a minority report.

President Reagan gave you the economy picture on TV on February 4th. I think it is time that we have a talk with you folks about your Society's expenditures and where we are heading. Rather than beat around the bush, we are headed straight towards an increase in dues, although we do have one recourse, cut down on the size or the number of Newsletters. Our Board of Directors, however, seems to think that Newsletters are being read, although I am not so sure about that. I do think the Newsletters serve a useful function to our out-of-town members; if you look at our membership, you will find that the pendulum has swung from essentially a Washington-based Society to a national-based Society. Our biggest financial problems are 1) xeroxing cost of our printer has gone up 35%, and 2) our corporate memberships are down. The last Newsletter was a 12-pager, and it cost the Society 53.7 cents for each one. It was our 5th Newsletter of the year. There will be two more after this one, which means about 80 pages of Newsletters this year (which translates into \$3.44 per member). This does not include mailing costs (or the annual \$40 bulk mailing permit fee), the cost of envelopes and having them printed, the cost of stationery and stamps for answering our ever increasing first class mail, the cost of cookies and coffee for our local meetings, the cost of dinner for our honorees at the annual Memorial Lecture dinner, or the "cover charge" for the summer picnic. We have a \$3.00 BAE I & II reduced membership which we don't want to increase, and we have enough kind souls like Pete Barretta, Dick Black, Eugene Campbell, Bert Crary, Tom Kellogg, George Toney, Mort Turner, and David Tyree who maintain two family memberships which means that we can send extra copies out to places like Scott Polar Research Institute, the Arctic and Antarctic Research Institute, and even do some recruiting. Overseas mailing rates went up in January. Another thing which cuts is to hear from a member a year after he/she had moved without notifying us of his/her new address, wanting the back Newsletters. As you know, bulk mailings are NOT forwarded, so will you PLEASE let us know ahead of time when and where you are moving? You Society members are fortunate in that there is a Ruth Siple, as she bought (out of her own hard-earned money at the Arctic Institute of North America) an IBM Selectric typewriter (secondhand) just to type these Newsletters. And, of course, she types them at no charge. She is also our treasurer, and handles all billings, address labels, and scoots to and from the post office in an old jalopy at no charge to the Society. Next fall, in a separate mailing, you will get a bill for 1981-82 dues. We will send out a second notice the first of November, and those who have not paid by the first of December will be automatically dropped. It is foolish and a waste of time to keep trying to collect all year long, plus we can't afford to keep sending out Newsletters to those who aren't renewing and don't tell us they aren't. We have already received dues for next year from 80 members; if any of the rest of you want to beat inflation and our upcoming dues increase, we will accept future dues at the current rate.

The Antarctic Society seems to be heading towards a "500 Club". Our membership is now at 380, with 55 new members joining since July 1980. During the past year we have done some recruiting of younger scientists, who, we feel, will be good bets to remain with the Society, but although we have tried to cover the various scientific disciplines, we haven't done too great a job. We don't envision the Society getting much larger in the immediate future, but I think there are enough good Antarcticans out there to build us up to 500 by 1983. We always lose a few members each year, and it seems apparent we will lose some this year, too. So talk your fellow colleagues into joining - make us a stronger organization.

Put a circle on your calendar for April 9th, as that will be the date of our Annual Memorial Lecture. It is a little early this time, but it was set up to coincide with the National Academy of Sciences' Polar Research Board meeting in town, which should give us a captive audience, providing the members don't all go looking for cherry blossoms that evening. Our Memorial Lecturer will be one of those who doesn't need any introduction, Bob Rutford, Acting Chancellor of the University of Nebraska, who is an authority on the natural resources of the Antarctic, and who will probably tell us all about them. Last year's Bentley-Waite production was such a smash hit on Constitution Avenue that we are going with the same hero-scientist format; Admiral Dick Black will be sharing the platform with Bob. As you all know, Dick Black wintered over with the Second Byrd Antarctic Expedition, 1933-35, and was leader of East Base on the Antarctic Service Expedition, 1939-41. The memorial program that evening will be handled by Admiral Black, and will honor the men of the Antarctic Service Expedition of 40 years ago. We don't have many members of that expedition in our Society, as many went much-too-young to their Heaven Above, but we do have the widows of Paul Siple, Al Wade, Carl Eklund, Finn Ronne and Jack Bursey as members, plus Dick Black, Murray Wiener, Clay Bailey and Walter Giles. Ken Moulton, one of the Society's cornerstones is the brother of another Antarctic Service Expedition member, Richard Moulton. Ruth Siple is a good friend of cantankerous old Arnold Court, but he steadfastly refuses to join our Society. So be it! Incidentally, this Society has legions of Harriet Eklund's fans (even some women, too), and she is coming back to the States from England this summer to live in the Detroit area.

There has been a Changing of the Guard at the corner of Pennsylvania Avenue and 21st Street, the home of the Polar Research Board. Louis DeGoes, the former football All-American - you can tell him by his bad knees - is now Assistant to the Chairman of the Polar Research Board, As I understand it, Louie has been promoted into a one-man think-tank where he is supposed to be coming up with new and exciting ideas for polar scientific research in the 1980\*s. This is all part of the Academy's master plan for development of the Arctic and Antarctic, W. Timothy Hushen, young personable left-handed skiing enthusiast who has a beautiful, tweedy girl friend who answers to Judy, has moved into the Executive Secretary position. Tim joins the long line of Michiganders (Larry Gould, Jim Zumberge, Bill Benninghoff) who have found peace, happiness, and security in the polar regions, Tim was a biology major at Alma College from which he graduated in 1965; then he turned botanist/plant ecologist at the University of Michigan where he got his M.S. in 1967. This was his introduction to the Benninghoffs, and a seed must have been planted. This qualified him for the Army, where he was a biological sciences assistant at Fort Detrick where they used to do all kinds of things with microbiological aerosols. But Tim was not a born killer, and he and the Army separated by mutual agreement in 1969. Then he joined Difco Laboratories in Detroit where they produced clinical and diagnostic reagents and bacteriological culture medium. He had a highly successful career with Difco where, under his management,

research facilities quadrupled and production increased 500% - but what we don't know is if they were operating out of someone's basement when he joined them! However, it matters not, as it was good enough to catapult him into the Polar Research Board where he became their staff officer. He has worked on the Juneau Icefield Project (1967), been a member of a scientific task force on Mt. Rainier (1972), been to the North Slope of Alaska (1975), been to the Antarctic (1976), and high adventure continues even to this day as he drives an old clunker of a car into Washington every working day. Ruth Barritt continues as the most statuesque and stylish member of the scientific staff of the Polar Research Board where she is Staff Associate, and Muriel Dodd continues as secretary, being the glue that holds the DeGoes-Hushen-Barritt triumverate together. Congratulations, all. Now we await great things with bated breath!

I wonder if Norman (BAE I) Vaughan will make the effort to come again to Washington after what happened this year. A couple of Washington's finest young punks (one 16, one 17) swiped three lead dogs from dog teams brought down from Alaska for the inauguration. Fortunately they were all recovered as the result of a Washington area alert issued for the missing dogs two days before the inauguration. One dog was said by its owner to be worth \$10,000. My heavens, they sure come expensive nowadays. I can't imagine any self-respecting lead dogs letting a couple of young city punks walk up and take them off their line and walk away with them. I was an armchair video watcher of the inauguration so missed seeing Norman in the flesh, but saw them on the tube going by the reviewing stand near the end of the parade of horses. Some of my co-workers who took it all in from street corners told me the sidewalk dog lovers were giving it pretty heavily to Norman and the other two dog drivers as it seems that 1) the wheels were up and the dogs had to pull the sled over the pavement, and 2) one of the drivers sat in the sledge and got a free ride while the dogs were busting their humps! Norman was interviewed on local TV prior to the inauguration after the dogs had been recovered and all he talked about was getting the three dogs back. Nary a word about the Antarctic. I think Norman is more sourdough than Antarctic.

It looks more and more like an Antarctic IGY Reunion extravaganza won't be until the spring of 1983. For Antarcticans, the IGY came early, with all men in place by mid-February 1957, so we could have it any time in 1982 or 1983. To tell the truth, we haven't gotten off the ground here in Washington with any reunion committees, but I have hopes of getting together with Big Bert Crary, Rudi Honkala, Dick Cameron, Bob Benson, Ned Ostenso, Ron Taylor, Johnny Dawson, George Toney, Palle Mogensen, Ruth Siple and Jackie Ronne. We all live right here in the Washington area, and constitute a large source of energy to back a real bash. Recently a group of well-known IGY VIPs met in Washington to discuss plans for a new geophysical film series honoring the 100th anniversary of the First Polar Year, the 50th anniversary of the Second Polar Year, and the 25th anniversary of the IGY. Current plans are to have WQED, a public broadcasting station in Pittsburgh who are renowned for their great National Geographic shows, plus four-a-year specials from the Kennedy Center, produce 14 geophysical films by the spring of 1983. Most of you probably remember the film series Planet Earth produced at the end of the IGY. Well, the new films will update us on all the exciting and new things that have been going on in the past 25 years. There will be 14 one-hour long films, and one will be on the polar regions. Maybe we could plan our 25th IGY Antarctic reunion around the public release of this film. I still think that our Society's Memorial Lecture in the spring of 1983 would make an ideal centerpiece for the reunion, that we could have a seminar day with invited speakers updating us on their scientific advances in Antarctica since the IGY, that we could have

a film-viewing evening, and that we could have a dinner party, a backyard bash, some individual station champagne breakfasts, and impromptu happy hours called at the discretion of two or more. But back to the films, the chairman of the committee is none other than Hugh Odishaw of "Odishaw Sends" fame, who was the Executive Director of the USNC-IGY, and on his committee are such luminaries as the immortal Larry Gould, Alan Shapley (who we are honored to have as one of our members, as we are equally honored by the membership of his niece, Deborah), James Van Allen, Walter (Quest for a Continent) Sullivan, Verner Soumi, Tom Malone, and others. I was trying to recall that song we used to sing about old Odishaw, but the years have erased it from my memory bank. Maybe Crevasse Smith still remembers it. I have an idea either he or his friend Bill Hartigan may have composed it, but then again it might have been the skulduggery of Bruce Lieske who is now in the ministry at North Pond du Lac. It is something which Bruce could have done quite easily, especially with encouragement from such characters as Ron Taylor and myself. But IGYers, THINK REUNION SPRING 1983!

How about the Hubbs Sea World Research Institute in San Diego incubating emperor penguins last fall? Nothing is sacred anymore. It marked the first time that an emperor chick has been born outside the confines of Antarctica, and three were born in one week! The parents were among 45 emperors airlifted from McMurdo Sound in 1976 and 1977. You know, penguins actually started all this ERA ruckus, and even here in the States the Old Man had to put in 64 days of incubation sitting and waiting it out. The males were kept inside a special corral during incubation and Their Holinesses remained outside until the deeds were done, after which the mothers were brought back in. The building is some 10 meters wide by 26 meters long and not only is it kept at subfreezing temperatures but some 3500 kg of flaked ice are made each day to replicate Antarctica's natural environment. The lighting is also timed to simulate Antarctic light cycles. Imagine if one of the chicks should be released back on Cape Crozier and a bunch of penguins got together when the sun was real warm and started reminiscing about their youth. The other penguins would think the American-born got hold of some bad krill if he started talking about San Diego! Sea World has 300 penguins in all, mostly Adelies. More than 100 Adelie chicks have been born at the marine park. Sea World expects to construct a polar exhibit within the next few years which should make San Diego a 'must<sup>1</sup> stop for all traveling Antarcticans. That new TV show, Those Amazing Animals, covered the emperor chick story several months ago so perhaps some of you may have been witness to it all. It would not surprise me if they started mass production by artificial insemination, but first they would have to find out who were the he's and who were the she's. Even though they may artificially impregnate the lady emperors, the good old boys will never be totally replaced as someone has to mind the store during incubation!

Transglobe is over, at least insofar as the Antarctic is concerned, and there are a lot of people breathing much better for its ending. It turned out to be rather innocuous, and was practically ignored by the press in this country. Who said the media was all bad? The crossing took 10 weeks, with their arrival at Scott Base on January 11th being some six weeks ahead of schedule. One fellow lost 16 pounds on the motorized toboggan crossing. It took only 18 days to get down from the South Pole as they averaged 64 km a day. They spent four "hair-raising days on the [Robert Scott] glacier." The leader said the glacier was "like a mine field of crevasses, a morale-destroying place in which every step could have spelt disaster." Can't you envision his book if he talks thataway? The lowest temperature on the crossing was -52°C (-62°F) and they saw sastrugi 1.5 meters high. Their only problem was a piston which broke on one of the three motor toboggans as they

were approaching Scott Base. The leader was greeted at Scott Base by his wife -as he was greeted by her at the South Pole - and their dog "Bothie." Now isn't that touching? At Scott he said, "It's a great relief to be here, to be with people who are warm and speak the same language makes an awful difference." Does this imply that the bloody Yanks at the South Pole were not warm and that they don't speak the English language? So endeth another chapter in the history of Antarctic Folly. No one will evidently come out the worse for it as Her Majesty's government has promised to replace the 9,000 liters of borrowed aviation fuel with a like amount, PLUS 23,000 liters needed to fly an aircraft from McMurdo to the South Pole. Lady Virginia was described in a Christchurch paper as a "modern Amazon, 34 years old, tall and slim with hyacinth blue eyes." How about that, fellows, adventure has sure taken a turn for the better! She is supposedly called "Ginny", but she should never be confused with good old Virginia Wade, Britain's original "Our Ginny". Evidently Sir Ranulph Twistleton-Wykeham Fiennes is called "Ron", at least by his fellow Etonians.

Terry Hughes of the University of Maine had some good news and some bad news for the scientists attending the American Association for the Advancement of Science meeting in Toronto on January 7th. The bad news is that the West Antarctic Ice Sheet might collapse within 200 years; the good news is that it would flood much of Manhattan. His computer model of marine ice sheet disintegration shows that ice streams slip off into the sea when they are no longer buttressed by a confined ice shelf, and as that slippage continues it forces the central ice divide of the ice sheet to lower and retreat. The disintegration of an ice shelf in Pine Island Bay may have caused the Thwaites and Pine Island Glaciers to surge, and their grounding lines are now retreating irreversibly into the Bentley Subglacial Trench which underlies the heart of the West Antarctic Ice Sheet. The retreat of the ice divide shrinks the Weddell and Ross Sea ice drainage basins so that the Ronne and Ross Ice Shelves, which buttress the West Antarctic Ice Sheet on the east and west, receive less West Antarctic ice. Terry says the total collapse of the West Antarctic Ice Sheet would raise the global sea levels between six and seven meters (19-22 feet). Now a man from Maine would never lie, never, so you folks out there better heed what Terry has to say. But come to think of it, the computer probably came from out-of-state, so don't sell your house on Cape Cod just yet.

Washingtonians woke up on Sunday morning, February 1st and found the Washington (antarctican) Post with a front page six-column picture spread of the South Pole Station and the first of four lengthy articles by a Margot Hornblower. Knowing the newspaper, I feared for the Antarctic, and I think my fears were well justified and became vindicated. Ms. Hornblower saw and heard and reported on things with reckless abandon. Accuracy took a back seat to sensationalism, science was treated like a malaise, taxpayers were repeatedly told the cost of supporting science, and people who wintered over were depicted as near recluses who lived with booze and dope. The surprising thing to me was not that the Post printed this, but that so many of our Antarctic family, here in Washington thought the coverage was good and brought needed attention to activities down south. It was almost like "write anything you want to about the Antarctic, but be sure to spell its name right as we need the publicity." Hear what she wrote about science, "A few experiments are conducted here [South Pole] in astronomy, atmospheric pollution, glaciology. But the presence of the United States in this bleak wilderness, like the expeditions of early explorers, has less to do with science than with international machismo." Writing about Phil Kyle, whom she did not identify as a Kiwi working in this country, she said, "Kyle and the nearly 300 American researchers who come to Antarctica each year are here as much for foreign policy reasons as for pure love of science, however." Balderdash! Guys like old John Annexstad don't even know how to spell

foreign policy, let alone define it, and they are there only because someone above scattered some meteorites or snow flakes or something else once before a time. She evidently was infatuated by a fellow at McMurdo from the University of Texas whose job was tracking satellites, and wrote that his job "involved two to five hours of work a day," But her final article on men of Antarctica made it sound like everyone who wintered over was either sleeping with Jack Daniels or was a dope addict, that the guys were all crazy or real spooky, and that one slowly dis-integrated into a helpless soul who could not think straight or act rationally. I think it's about time that Jack Renirie or whoever is responsible for picking the correspondents set up some standards of excellence. The media is bad enough anyway without letting people go there to sensationalize Antarcticans and their activities. You know you just can't put those Antarctic characters into solitary confinement when a woman reporter comes by with her pad and pencil. Women reporters are probably fair game for any story, be it fact or the wildest fiction. When I read stuff like "the primordial silence of the polar plateau engulfs the senses" I get terribly sick to my stomach. And how about this one? "Two hundred mile per hour gales whip off the polar plateau and roil the iceberg-strewn waves of the southern ocean, cutting off the continent from any ships or planes for nine months a year." Hey man, put her back in the kitchen, we don't need that kind of reporting. And she closed her third article with a paragraph about the naming of Antarctic features, and (hopefully with tongue in cheek) she wrote, "Even a New York Times science writer managed to become the eponym of Sullivan's Ridge." And rightly so, dear Margot, as some of the very best Antarctic reporting was done by Walter Sullivan, and his book "Quest for a Continent" should be required reading for all Antarctic journalists. All I can say after reading the four articles is, "Christine Russell, wherever you are, please come on back, Antarctica has need of thou." However, since Christine just had a child, why not send Charlie (BAE I) Murphy back down, as here is a topdrawer writer, and I think it would be great to read something by someone who knows something about Antarctica and who has literary talents. Or even old Wild Bill Cromie. When there are Antarcticans who are professional writers like Charlie and Bill, why not use them???

Ms. Hornblower's first article quoted Richard Cameron, "If we closed up this static [South Pole], the Russians would be here the next morning. It is a matter of prestige." Little did Poor Richard know how prophetic and clairvoyant he was in his statement. I have a scenario. It goes like this: The Russian ambassador read the article, was still in a huff over not being able to use the State Department garage and sent a two-pronged message to Moscow saying 1) that Stockman was wielding a mighty axe in Washington and that the high and mighty were falling all around town, and 2) to stand by for a possible closing of the South Pole station. The Russians got the message all fouled up, and ended up sending a wire to their flight crews in Antarctica to stand by to take over the South Pole. That wire also got garbled, and the Russians took off immediately for the South Pole. Now back to the truth! The Russians actually landed, unannounced, an IL-14 at the South Pole on February 9th.! Were they there to check out the size of beds, the supply of caviar, and things of this nature so they could send a twx back home about what they would need to make the place comfortable? Who knows. There were 12 in the plane, including five scientists. They were brought into camp, shown the place, and from all accounts a good time was had by all. Now, Dick, let's not tell the press anything more about the Russians a' Coming!

What do you do with krill? It will evidently never replace sole, as Arlen Large wrote in the Wall Street Journal on January 14, 1981 that "krill hasn't shown any sign of catching on in culinary circles, and a United Nations Food and Agriculture Organization report says that the krill supply is expected to continue

to greatly exceed the demand," The Japanese are evidently the only ones who take it straight, but wouldn't you expect that from folks who drink saki? They eat krill any way they can get it - whole, fried, or in salads. Russians make it into a paste which they mix in butter, cheese, and stuffed eggs. When the Russians have to cut it, it can't be all that great. West Germans and Poles use krill for fish fingers and fish balls. And Norwegians are told by their own scientists that krill may naturally contain too much fluoride for safe human consumption. An American fisheries expert from NOAA, William Aron of Seattle, has the best solution, "I much prefer to eat the fish that eat the krill." Meanwhile the MELVILLE is currently in Antarctic waters with 28 scientists from the U.S., Argentina, Australia, Chile, Japan, and Norway trying to ascertain how much krill can be caught for human consumption without endangering the food supply of whales, seals, and other krill eaters.

Kirby (South Pole '58) Hanson has an article, "Carbon Dioxide", in the December issue of Weatherwise. As many of you know, Kirby is the titular head of GMCC, another one of those blasted government acronyms used to confuse commoners - Geo-physical Monitoring for Climatic Change. He is also chairman of the CAS (Committee on Atmospheric Sciences) Working Group on Atmospheric Carbon Dioxide of the World Meteorological Organization, Another member of our Society, J<sub>0</sub> Murray Mitchell, told readers of the U.S. News and World Report in their February 2nd issue that "Bitter cold may subside, but not drought threat," I don't know if Murray has been talking to Terry Hughes and John Mercer lately, but it is fact that Murray has bought a considerable number of acres in Boulder, Colorado along the Front Range. Murray has a report coming out soon on the possibility of climate change in the polar regions, and then we will all get the definitive word. In the meantime, Murray, why don't you try one of our meetings? And you, too, John Mirabito. The Society may be in the hands of hard rock geologists, but they are very tolerant of meteorologists, really. And one of Karl Kuivinen's deep blue pictures of an ice coring rig set up on some Antarctic snowfield occupies a two-page spread in the February issue of Astronomy, appearing with an article about "The Missing Sunspots." I thought at first that someone had stolen some sunspots and were hiding them in their basement, but it seems that the real problem is that for many centuries there have been periods when sunspots are not all that visible.

The Oil and Gas Journal, December 29, 1980, has an article by L. F. Ivanhoe on "Antarctica - Operating Conditions and Petroleum Prospects." I think it's a pretty good article, but then again who am I to comment on the early Ordovician. One thing of general interest was "a 24-hour mean wind speed of 108 mph was recorded on the Adelie Coast in March 1951 .... winds of hurricane force were recorded on 122 days during 1952." And people think Buffalo is bad! Ivanhoe wrote, "Southern Gondwanaland is not particularly 'oily' and lacks the favorable 'A-factor' (A = for Allah, the God of oil) that has blessed the Persian Gulf with petroleum." His conclusions were, "Oil fields would have to be of supergiant size (= over 5,000 million bbl of recoverable oil) to be potentially commercial in Antarctica with known or foreseen technologies. But only 37 supergiant oil fields exist in the entire world, of which only seven are found outside the Middle East and the USSR. It is unlikely that such supergiant fields will be found in Antarctica where there are no known oil seeps and the sediments are not very attractive. The methane gas found in the few shallow DSDP/Joides deep-sea bottom cores are scientifically interesting, but are irrelevant to the commercial petroleum prospects of the continent." For references readers were invited to consult with the author at 6000 Cypress Point Drive, Bakersfield, California 93309. The Antarctic Treaty nations are going to hold formal sessions on oil exploration and development in Buenos

Aires this summer. Tucker Scully of the State Department was quoted in the Wall Street Journal, January 7, 1981, to the effect that "we may be trying to regulate an activity that may never become economically feasible." John Garrett, a Gulf Oil Corporation official, agrees that the economics look intimidating.

And how deep did they core at the South Pole this past summer? One hundred and six meters. They had to abandon their intended goal of 1,000 meters when they found out that the cable was not strong enough to snap off the core sample. The 106 meter take them back in history to about 1,000 years ago. One of the most incredible feats at the South Pole was the snow mine which Paul Siple and his men put down close to 100 feet during the first year. Some of Siple's men didn't reach the station until mid-February, many were small framed, and they all had a lot of extra work to do that first year in building the camp and establishing scientific programs. Working in that snow mine was no picnic, as it was real hard work. I arrived at the Pole early in December 1957, a fatted calf after spending the year at sea level (Little America V), and this young, wealthy Naval doctor who was to winter over with us in 1958 took me down into that snow mine and worked my butt off unmercifully. Every time I looked up he was hitting me in the gut with a block of ice to put on the ahkio for winching to the surface. I was furious, and swore to the high, heavens that after I got acclimatized to the elevation and worked myself into shape I would take this clod back down into that mine and do unto him what he had done unto me that day. But my day of revenge never came, as our winch broke down shortly thereafter and we got our snow for all of 1958 from the snow surface outside of camp. But I have a tremendous amount of respect and admiration for all that hard digging which was done by Paul Siple and his crew in 1957. It was fantastic. Twenty-four years later, after all these years of experience coring elsewhere, they were only able to go down another 70 meters. But progress is just a series of small steps, anyway, right?

Let's go to our survey of some of our more illustrious members for their top ten favorite Antarctic books. In the last Newsletter we gave you John Roscoe's and Mary Goodwin's selections which were real impressive. This time we'll start with selections from one of our Chippewa Falls members, Ned Ostenso, president of the American Polar Society, who earns his bread by being Deputy Assistant Administrator for Research and Development at NOAA's headquarters out in Rockville, Maryland. Ned prefaced his statements by saying that if the request had included both polar regions he would have headed the list with Vilhjalmur Stefansson's *Friendly Arctic*, "a true classic which I commend to everyone's attention." But he had no qualms about putting Apsley Cherry-Garrard's *Worst Journey in the World* as number one, saying "it is pretty hard to beat as a piece of literature." He went on to say, "the concluding paragraph is probably the most beautiful statement on research that has ever been written." Right on, Ned. Then he went for a work of art, *The National Antarctic Expedition, 1901-04*, an album of photographs, sketches and a box of panoramas (with the illustrations all being by Edward Wilson). And he placed Herbert Ponting's *Great White South* right behind it, "full of simply marvelous and pioneering photographs." Ned reminded us that St. Martin's Press has provided us all with a great service by republishing Ponting's and Frank Hurley's photographs in *1910-1916 Antarctic Photographs*. Ned went on to say that *Scott's Last Expedition* is "the Antarctic classic .... in the true Hardy Boys adventure tradition." An interesting comment followed, "In stylistic contrast is Amundsen's *The South Pole*; plodding professionalism vs the elan of amateurs!" Then he adds Shackleton's *The Heart of the Antarctic*, Mawson's *Home of the Blizzard*, Scott's *The Voyage of the DISCOVERY*, and South's *The Story of Shackleton's Last Expedition*. From the modern age he votes for Byrd's *Little America* and for anthologies, reviews,

and "third person" category he goes for Walter Sullivan's *Quest for a Continent*. Ned wrote, "a book, that I am sure would be on my 'top ten' list if I ever had a chance to read it, Larry Gould's *Cold*, but after years of searching I have not ever been able to locate even a loaner's copy." Ned ends his letter with a plea for the Society setting up a classified section. Besides Larry's *Cold* he is looking for a first edition of Cherry-Garrard's *Worst Journey in the World*, and a first edition of Ponting's *Great White South*. Anyone selling out?

Now let's go to Herman Friis<sup>1</sup> list. As you all know, he was The Geographer at the National Archives, and was the first head of the Center for Polar Archives. At the head of his list is Larry Gould's *Cold: The Record of an Antarctic Sledge Journey* which is "an inspiring account by the leader-scientist of a pioneering epochal geographical-geological exploration of the interior of the Antarctic continent." Then he places Paul Siple's *90 Degrees South*, "one of the best personal narrative accounts of U.S. Antarctic exploration by an objective scientist who actively participated in most of the programs and expeditions between 1928-1958. Then somewhat of a surprise to me, H.G.R. King's *The Antarctic* (Houghton Mifflin 1979), "one of the better published introductions to the geography, natural history, and exploration of Antarctica by a well qualified member of the staff of Scott Polar Research Institute," Number four was Roger Tory Peterson's *Penguins*, "a beautifully illustrated descriptive narrative account of this veteran ornithologist's scientific study in the field of penguins," Ken Bertrand's *Americans, in Antarctica, 1775-1948*, was "the most scholarly, documented history of the subject by a professionally superbly qualified scientist." Then he voted for Eliot Porter's *Antarctica*, "one of the best published photographic records of several field surveys in selected regions of Antarctica," I was beginning to wonder if this former archivist was going to vote for any of the older volumes; he ended up with four. First was Raymond Priestley<sup>1</sup>'s *Antarctic Adventure: Scott's Northern Party*, "an inspiring narrative account, which includes especially a description of the activities of Scott's ill-fated achievement of the South Pole and the scientific results of the expedition." Then Griffith Taylor's *Antarctic Adventure and Research*, "an excellent introduction to Antarctica as it was known at the dawn of modern exploration." Number 9 was Amundsen's *The South Pole: An Account of the Norwegian Antarctic Expedition, 1910-1912*, "narrative account by a truly professional explorer this volume successfully exemplifies Amundsen's philosophy of exploration," And he ends up with Mawson's classic *The Home of the Blizzard* which "provides a connected narrative of the Australian Expedition, 1911-1914 from a popular and general point of view . . . an important historical record of the initial Australian exploration of the interior of the continent." A truly interesting list.

One of our newest members is Dr. Philip Kyle from the Institute of Polar Studies at the Ohio State University via New Zealand. It looks like Phil is going to make a career out of Mt. Erebus as it seems he has a love affair going with its crater in spite of some rather belligerent counterattacks by the active volcano when he got too close to the Old Lady. Did you folks know that Erebus is one of only two volcanoes in existence with, an active lava lake? The other one is in Ethiopia. Erebus has a 60 meter lake of molten rock at 2000 degrees temperature. The surface of the lake is 200 meters below the rim of the crater, but no one, not even Phil, knows just how deep it is. From time to time small explosions spray the lava inside the crater and scatter it round the mountain. Mt. Erebus has a 105 meter deep main crater and then another inner crater of 96 meter depth. Phil has descended into the crater (by rope) several times and once it erupted when he was inside. He described the experience as "like being in front of a cannon going off." Phil is fascinated with Mt. Erebus because of that old lava lake and says it "is a window

to the magma chamber." He has recently installed two seismometers on the banks of the volcano, and a third was placed on the summit. The data is radioed to Scott Base while Phil sits back in Columbus hypothesizing about the Old Lady.

Dr. Arreed F. Barabasz, Department of Psychiatry, Harvard Medical School, presented a seminar at NSF in mid-January on his recent research "Psychological and Psychophysiological Effects of Wintering-over Isolation: Some New Discoveries," I went to hear him as I was curious to know if I were as crazy as my ex-wife suspected! It seems that there is- a certain group who have found symptoms at all stations (studied) of "intellectual inertia, impaired memory, impaired concentration, decline in alertness, and decrements in adjustment and performance." But a Russian (Ventsenostev, 1973) and a Kiwi (Gregson, 1978), thank heavens, found "improvements in cognitive function using objective experimental measures." This fellow Barabasz wintered over in Christchurch and went to Scott Base prior to the onset of winter and then again after the end of winter. I don't really think Scott Base is Antarctica any more than New York City is America. I have wintered over at a coastal station with over a hundred men (Little America V), and I have wintered over at the South Pole with less than two score. They were worlds apart. How can you stay mad or upset long at a camp like Little America V, McMurdo, or Scott where you can nearly always go for a walk to somewhere, even to the barrier edge, and there are so many other ugly faces to look at. I can't really believe these medical types who come up with crazy theories about wintering-over types. Good heavens, are all men supposed to behave like bank tellers, can't we have any individualism? Why are we immediately suspect just because we don't follow the norm set up by a bunch of bland conformists? I have found most Antarctic people real interesting individuals, the kind worth knowing anywhere. I knew one oddball at Little America V who never stepped outside the door from the time the sun went down until it came up four months later, yet was amazed to find out after we all got back that this sad guy was actually a delightful fellow here in the States. Dr. Barabasz said that he did his study on only \$5,000. I am sure there are some clinical types who may feel that this was a great bargain, but then again there are probably some good old boys who may think that this was the biggest heist since the Brinks robbery!

Charlie Murphy has been in the Wilmer Clinic, Johns Hopkins Hospital, having a second cataract peeled off and an implant made, Charlie wrote, "The operation was brilliantly successful, but the eye itself has been giving me a little trouble, and reading and writing have temporarily lost their attraction," His address, again, is Pickle Street, Grafton, Vermont 05146. Charlie was a close friend of Admiral Byrd, who had asked him to go on BAE I, but Charlie was then a fledgling young political writer having a wonderful time on The World. So he turned the Admiral down, only to go later on BAE II. I sure hope he writes his promised book on that expedition, as I think it should be a gem.

Doc Abbot, he of the star rank in military days, was kind enough to send us his 5th Annual Non-Christmas letter. He and Margaret are evidently still solvent as they will be buying twin diesel Cadillacs again this year. There really is no need to keep a car once you have dirty ash trays. Doc tried to talk an old friend, Jerry Denton, out of running for the Senate. Jerry, a retired Rear Admiral and former Vietnam POW, would not listen to Doc, so that meant the only decent thing Doc could do would be to serve as Jerry's Chief of Staff and see to it that he didn't get elected. But man's best laid plans seem to go asunder, and Jerry won in spite of Doc. Jerry then felt that Doc should come to Washington and be on his Senate staff. However, Doc has fallen in love with flying again, and then he is still delivering boats - four this past year, making a total of 22. He delivered a 46-foot to Tulsa in spite of losing the port engine four times. His friend, Jerry, called by U.S.

News and World Report "among the most outspoken conservatives," will head a newly revived subcommittee on security and terrorism.

Occasionally we throw some bait out to you folks trying to get you to nibble and send us information which we can put in the Newsletters. Usually I strike out, although sometimes I get a windfall. I sort of fell flat on my face requesting information on Society members who got degrees, although I did get some pretty impressive figures from Peter Anderson out there in 43210 zipcodeland. He wrote that the Institute of Polar Studies at the Ohio State University, which turned 20 last February, has been involved in the completion of 72 advanced degrees, with 42 of these being on Antarctic research topics (23 PhD's and 19 Masters). Now that has to be the record until some institute or center can check in with a higher figure.

Bernie Pomerantz of the University of Delaware has been playing around again in the Antarctic, this time with solar telescopes at the South Pole, studying something called supergranules which occur in the chromosphere (which just happens to be the sun's 1,500-mile-thick lower atmosphere). When they call these granules "super" they really mean super, as the darn things are 18,000 to 30,000 miles in diameter. And they still need a solar telescope to find them? Wow! The stated reasons for studying supergranules is that they may be the beginning of sunspot regions where violent eruptions called "flares" occur.

Past presidents, Gordon Cartwright and Mort Rubin, plus bridegroom Mike Kuhn of Innsbruck, were in town in January. Mort will be leaving WMO in Geneva this spring and will be living in England for a year.

Hey, you folks down below, you haven't paid for the current year, and we need your money (see page 2, 2nd paragraph). You will be automatically dropped from our files if you aren't "in" by the end of the current Society year, the end of June. So pay up now, resign, or find your name in this same spot in our next Newsletter!

MEMORIAL LECTURE

Capt. Robert Falcon Scott and His Last Expedition

by

Dr. Robert L. Nichols

Geologist and Senior Scientist,  
Ronne Antarctic Research Expedition

and

Professor Emeritus  
Tufts College

PLUS

Admiral Richard B. Black

Byrd Antarctic Expedition, 1933-35  
U.S. Antarctic Service Expedition, 1939-41

Presenting

A Memorial Tribute to Men of the U.S. Antarctic  
Service Expedition of 40 Years Ago

on

WEDNESDAY EVENING, MAY 13th

at

8 o'clock

in the Auditorium of

The National Academy of Sciences

2101 Constitution Avenue N.W.

DON'T MISS THIS GALA MEMORIAL LECTURE!

Two of the Real Live Authorities on the Good Old Days!

Nearly a Century of Polar Expertise on One Lecture Platform!

Support Your Society's Annual Big Time Extravaganza!

COME TO THE PRE-LECTURE DINNER AND FRATERNIZE!

(Form on page 12)

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Mr. Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980

B E R G Y    B I T S

Bergy Bits is not to be construed in any way as a Voice of the Antarctic Society. It is only a wandering mind of an old Antarctic who is prejudiced in his ways and thoughts, but who has a typewriter. Be kind to him, he means well.

This year's Memorial Lecturer is one of the good old boys, having wintered over at Stonington Island on the Ronne Antarctic Research Expedition, 1946-48. He spent some 154 days out in the field, and was never happier, or riper, than when he was sledging. On a later Antarctic trip, he inherited a young willowy whippersnapper field assistant who was still wet behind his ears, and taught him all there was to know about man-hauling sledges around McMurdo Sound. Bob was a good teacher; today that fellow, Bob Rutford, is Interim Chancellor at the University of Nebraska. Bob Nichols earned his bread as Chairman of the Geology Department at Tufts College, where he turned out guys like George Denton and Hal Borns. He used to flee the campus in summers to go to Greenland, in winters to go to Antarctica. Captain Scott is his hero; they had the same philosophy - if it wasn't accomplished by man-hauling sledges, it wasn't worthwhile. This is going to be a really big night, as Bob does not pull any punches. We will provide him with round-the-clock protection while he's in town, because several years ago when he addressed a coeducational Antarctic population about to go to the ice, he sent them off with the reasons he loved Antarctica, saving the best 'til last - "because of its masculinity." When you're an ex-athletic jock, are well over six feet, are still hard and lean, you can get away with anything you want to say. Don't miss this one! See form on page 12.

The U.S. Antarctic Service Expedition's 40th anniversary has gone by with little or no fanfare. It was sort of an Unsung Expedition unless you were on it, as the people in this country were more concerned with World War II than they were with scientific exploration in Antarctica. But it was a very important expedition, and many of our Society's early cornerstones were members of that expedition. Unfortunately some were taken from this earth at much too young an age, first Carl Eklund, the founder of our Society, then Paul Siple, one of our earliest presidents, followed by Al Wade several years ago, then last year Finn Ronne, and just this month, Jim McCoy. Admiral Black, who was East Base Commander on the Expedition, has graciously consented to speak to us on that expedition, and this will constitute the memorial aspects of the evening. It is rumored that in addition to eulogizing the Expedition he will tell us a bit about field exploration as experienced on a dog sledging trek. Dick Black retired from active Naval service as a Rear Admiral in 1959. But he continued to serve in various responsible positions in polar programs for several more years.

One of the worst kept secrets in town is that Mr. Antarctic Superstar, the everlasting boy out of Lacota, Michigan, the golden tongue Antarctic orator, will be getting the Cosmos Club Award on May 14, 1981. It is their biggest affair of the year, and amounts to "coronating" their Man of the Year. Somewhere along the line the Cosmos Club in a great moment of extreme benevolence towards womankind gave the award, inadvertently, I'm sure, to a woman, the First Lady of the Theatre. But things are now back in their proper perspective, and I am sure it will be a stupendous evening for all Cosmosites. Congratulations, Larry, and way to go, Cosmos Club!

We are remiss in not keeping in better touch with our most distinguished Honorary President, Ambassador Paul Clement Daniels. He has been migratory ever since 1972, living in Lakeville, Connecticut from mid-May to early November, and then spending his winters in Lafayette, Louisiana (105 Green Oaks Drive). He still reads the Newsletters "even though many of my earlier associates have passed from the scene." All Antarcticans are indeed indebted to Ambassador Daniels for the most vital role

he played in engineering the Antarctic Treaty. I hope that some day in the near future the Ambassador can be with us for a Memorial Lecture. He's a good old party boy and I am sure the pre-Lecture festivities with him there would be most enjoyable, too.

No matter what your yardstick may be, the wedding of our most honorable president, Pete Burrill, and one of our most honorable women members, Betty Didcock, turned out to be most memorable. It was the largest gathering of pure geographers to every assemble in Chevy Chase, as wall-to-wall geographers filled the Chevy Chase Presbyterian Church to see the ex-president of the Association of American Geographers (AAG) marry the ex-president of the Society of Women Geographers. It certainly was the largest non-meeting of the Mid-Atlantic Division of the AAG! Pete, also an officer in the Washington chapter of the Explorer's Club, was dressed to the gills in wedding gear and looked somewhat like an Emperor Penguin with moustache and some place to go. The day was rainy, but this didn't affect the bride as her smiling radiance permeated every inch (or centimeter) of the church. Barry (National Geographic Society) Bishop, he of Mt. Everest fame and the U.S.'s Sir Edmund Hillary, said that the wedding was one of Victorian splendor, the way weddings should be properly executed. Well, Barry didn't say it just that way; in fact, Barry may not have used any of those words, but he did say something to the effect that it was a grand reaffirmation of how weddings should be. But I sure was surprised and somewhat shocked at the ending of the ceremony. I had come under the assumption that Pete was marrying Betty, that Betty was marrying Pete, but I swear I heard the minister say, "Do you, Meredith, take thee, Betty?" and then "Do you, Betty, take thee, Meredith?" This raises a very serious question, is Pete legally married to Betty, or is Betty married to his alterego? Regardless of whether they are tied in holy matrimony, everything was perfect and it set a new geographical record - never in the history of geography in this country had so many geographers gathered in a rookery with such a commonality of love and friendship and had such a great time. When two or more geographers gather it is usually more like the Hatfields and the McCoys, yet here was a roomful of them, all having a great time feasting, drinking, talking. The reception was as great as the wedding.

Literally the last thing President Burrill did before inarching down the street to get married was to announce the slate of Officers and new Board members for confirmation by acclamation at a 60-second Business Meeting on May. Pete Burrill has another year to go as President and Pete Barretta another year as Secretary, so those two slots are closed. Charlie Morrison, a long-standing member of the Society who spent four summers in Antarctica for the USGS (64-65, 66-67, 68-69, and 71-72) and has served with great distinction as co-Bar Tender at our almost annual summer picnics, will be the new Vice-President. I, Paul Dalrymple, will be the official candidate for Treasurer, although Ruth Siple will continue to perform the duties and do all the work. This was a cosmetic maneuver to comply with our modified By-Laws. The incoming members of the Board of Directors are broadly balanced and are all faithful attendees at our local meetings. The good old explorers will be represented by Bert Crary, the first geophysicist to have plunged his instrument into both geographical Poles. His Antarctic deeds are legendary, and some could even be repeated if we had a dozen more pages. The younger heroes will be represented by Dick Neff of the USGS who wintered over at Casey Station with the Australians in 1975 when he positioned the field traverses by geocervers. The rapidly expanding philatelic section of our Society will find ASSP #1683, Charlie Burroughs of the NOAA Corps on the Board. Charlie is more Arctic than Antarctic when it comes to field experience, but his Antarctic enthusiasm is unlimited. Dr. Eugene Campbell, along with his wife Dr. Reba Campbell (also a Society member), was introduced to the Antarctic through a WORLD DISCOVERER cruise (Jan-Feb 1979) and both have been smitten

ever since. He has asked so many questions at our meetings that the only honorable thing to do was to put him on the Board. His Antarctic interests are biological, ecological and paleontological. Our new At-Large Board member will be Henry (BAE I) Harrison of Asheville, North Carolina. This meteorologist is our very best foreign correspondent and he will make an excellent Board member. All of these people can be described as "workers" and that's what's needed to make a Society go and grow.

Charlie Burroughs received the second highest award given by the National Oceanic and Atmospheric Administration, its Silver Medal, which was given to him on October 30, 1979. Secretary Krebs presented it for "contributions to the nation's Strategic Petroleum Program through his management of its Gulf of Mexico Brine Disposal Analysis Program." For you non-geographers, the Gulf of Mexico is just north of McMurdo Sound. His citation went on to say, "has built a viable and unified environmental assessment program which has served to overcome some reservations held by environmentalists and regulatory agencies ..." Charlie wants some more beach duty, as he has had enough blue water on the decks. He is currently Deputy to the head of the NOAA Corps.

J. Murray Mitchell, Memorial Lecturer 1978, recently received a \$5,000 award from NOAA for his research on climate variation in 1980. I actually think NOAA gave him the money because he was the only federal climatologist they could find who was doing any work in 1980, as all the rest were on one or more of the tens of climatic committees existing in this country who develop plans and programs. But to tell the truth, I'm not even certain about Murray, as he is either on television explaining why something didn't happen, or on the pages of U.S. News and World Report (Feb. 2, 1981) telling us about droughts, or he is in Boulder or Geneva.

In our March 1979 Newsletter we wrote about the first U.S. Antarctic humanist, Donald Finkel. Well, there is some more good news to report on this Washington University poet. In May 1980, he was awarded the Morton Dauwen Zabel Award by the American Academy and Institute of Arts and Letters. The citation read, "To Donald Finkel ... for his twin poems Endurance and Going Under. The poet, who in preparation for these works both lived in Antarctica and explored Mammoth Cave and Crystal Cave and Sand Cave, deserves praise for his courage under extreme conditions, and for his skillful assimilation of the narrative to the lyrical mode." He wrote that he was a "middling caver ... though never in Sand Cave, that dreadful pit." He feels personally indebted to Phil Smith for opening the Antarctic to persons like him, Charles Neider, Eliot Porter, and Daniel Long. Writing about the citation he said, "I suppose my true courage (tenacity?) was to persist in the face of the thunderous silence of such august institutions as the NEH." The Finkels were in town the evening of our last meeting, but had a higher command performance to attend - his wife, Constance Urdang, had a poetry reading that evening at the Library of Congress. Congratulations to both of them, may their lives continue to be poetry in motion.

Walter Sullivan just joined the Society, and I can't really tell you how pleased I am to have him aboard. My folks subscribed to the New York Times when I was in the Antarctic just to read what he was writing about the place. I once had a labor of love, reviewing his fine book Quest For A Continent for the Geographical Review. He joins a long line of well-known writers in our Society. Charlie Murphy had a best seller a year ago, The Windsors, and is writing two more books now (one on Forrestal, one on the Eisenhower administration). Bill Cromie is Executive Director of the Council for the Advancement of Science Writing, and the Nov-Dec 80 issue of NSF's Mosaic has a most interesting article by old Bill entitled "The Sky at All Wave-Lengths." The fairest of them all, Deborah Shapley, of Science magazine who was on leave last year, is writing a book on Antarctica for the Carnegie Endowment for In-

ternational Peace. We Have Arville Schaleben, who was the Executive Editor of the Milwaukee Journal and a Visiting Professor in the Medill School of Journalism. Carl Eklund's brother, Lawrence also wrote for the Milwaukee Journal, although he is now retired. Jim Sparkman of NOAA wrote for the Christian Science Monitor - it was an Antarctic assignment which made him decide to chuck it all to become a scientist. And, of course, Larry Gould wrote Cold; Lisle Rose wrote Assault on Eternity; and Robert Feeney wrote Professor On The Ice. Bert Crary is in the throes of writing at least one book on the IGY. Mort Rubin will be moving to England next month (7 Croft Lodge, Barton Road, Cambridge CBS 9LA) where he will be a Visiting Scholar at the Scott Polar Research Institute doing some historical work on the early meteorologists and meteorology in the Antarctic. Then we have journalism people like Guy Guthridge and Dick Muldoon. So with all this in-Society professionalism, why in Heaven's name am I writing Bergy Bits?

Within the past year, I have seen two pathetically poor lists of articles which have appeared in the National Geographic (and The National Geographic Magazine) on Antarctica. There were a total of 80 references, but I copied only the feature articles, skipping the news items which were popular at the turn of the century. I hope you enjoy this list, and I'm sure Antarctic Society members Edwin MacDonald, David Tyree, James Reedy, Doc Abbot, and Nicholas Clinch will be happy to see their articles in the listing. The surprising thing to me was the lack of any real articles on Amundsen's, Scott's, and Mawson's expeditions. The one by Shackleton is actually just extractions from his book of the same name. If you are ever in downtown Washington and have a couple of spare hours, why not drop into the National Geographic Society building on 16th Street and browse through some of the early issues? Just as good as going to the Zoo, and it sure smells a heck of a lot nicer. But on with the list.

1894	December	The Antarctic Continent (Geographic Notes by Cyrus C. Babb)
1901	September	The British Antarctic Expedition
1907	February	An Ice Wrapped Continent (by G.H.G.)
1909	November	The Heart of the Antarctic. By Ernest H. Shackleton
1912	March	American Discoverers of the Antarctic Continent. By Major General A. W. Greely
1922	April	South Georgia, An Outpost of the Antarctic. By Robert Cushman Murphy
1924	March	British Antarctic Expedition under Captain Robert F. Scott
1930	August	The Conquest of Antarctica by Air. By Richard Evelyn Byrd
1932	February	Antarctica's Most Interesting Citizen: The Comical Penguin is Both Romantic and Bellicose. By Worth E. Shoults
1932	October	Mapping the Antarctic from the Air: The Aerial Camera Earns Its Place as the Eyes and Memory of the Explorer. By Captain Ashley C. McKinley
1935	July	National Geographic Society Honors Byrd Antarctic Expedition
1935	October	Exploring the Ice Age in Antarctica. By Richard Evelyn Byrd
1936	July	My Flight Across Antarctica. By Lincoln Ellsworth
1939	July	My Four Antarctic Expeditions: Explorations of 1933-39 Have Stricken Vast Areas from the Realm of the Unknown. By Lincoln Ellsworth

1947	October	Our Navy Explores Antarctica. By Richard E. Byrd
1956	August	All-Out Assault on Antarctica. By Richard E. Byrd
1957	July	We Are Living at the South Pole. By Paul A. Siple
1957	July	Admiral of the Ends of the Earth (Richard E. Byrd). By Melville Bell Grosvenor
1957	September	Year of Discovery Opens in Antarctica. By David S. Boyer
1957	September	Across the Frozen Desert to Byrd Station. By Paul W. Frazier
1958	April	Man's First Winter at the South Pole (Amundsen-Scott IGY South Pole Station). By Paul A. Siple
1959	January	The Crossing of Antarctica. By Sir Vivian Fuchs
1959	October	What We've Accomplished in Antarctica. By George J. Dufek
1962	February	Exploring Antarctica's Phantom Coast. By Edwin A. McDonald
1963	February	New Era in the Loneliest Continent. By David M. Tyree
1964	March	First Flight Across the Bottom of the World. By James R. Reedy
1966	January	Stalking Seals Under Antarctic Ice. By Carleton Ray
1967	June	First Conquest of Antarctica's Highest Peaks. By Nicholas B. Clive
1967	November	Flight Into Antarctic Darkness. By J. Lloyd Abbot
1968	October	Antarctica: Icy Testing Grounds for Space. By Samuel W. Matthews
1971	November	Antarctica's Nearer Side. By Samuel W. Matthews
1973	January	This Changing Earth. By Samuel W. Matthews
1973	December	Alone to Antarctica. By David Lewis
1975	August	ICE BIRD Ends Her Lonely Odyssey. By David Lewis
1977	August	Penguins and Their Neighbors. By Roger Tory Peterson

For years people have been battering around the pros and cons of letting a ship freeze into the Arctic ice pack and become a latter-day Nansen. Wiser heads always seemed to prevail, and such plans never got beyond the paper they were written on until the Coast Guard this winter inadvertently played right into the hands of the pro-Nansenites. The Coast Guard, which has a long and most distinguished record as a rescuer of ill-fated missions, went on one of their own, making the first ever wintertime cruise to Point Barrow in one of their two biggies, the POLAR SEA. They got there okay, arriving safely with no problems on February 11th, but on the way back everything went to heck. As this is being written, on March 17th, they are rudderless, locked in multi-year ice 30 feet thick, are 155 miles west of Barrow, 90 miles off Wainwright. The Coast Guard has evacuated 50 of the crew and have even taken aboard scientists. They are desperate, and could be there for several more months, projected release date is mid-June. They are drifting about 40 miles a week. The scientists represent many different disciplines. One is a marine biologist studying the polar bear, but most are conducting ice studies or doing research on polar communications. I thought we had guys like Jay Zwally who knew where multi-year ice kept itself all of the time so that young junior officers on the bridge wouldn't make ships of opportunities out of our biggest ice breakers. I think the Coast Guard has missed a couple of golden opportunities with this "happening." Our nation has a mania about keeping up with, the Russians. What if the POLAR SEA captain had turned

his antenna on Moscow and started calling, "May Day, May Day", until one of their giant nuclear icebreakers came to their rescue. The American people would never have stood for it, and would have insisted that Congress appropriate funds for several large nuclear icebreakers for our Coast Guard. And it would have given Walter Cronkite something to talk about during his last weeks on the airways. Outside of a man-in-space launching, there was nothing that Uncle Walter loved more than a good hostage story. He could have signed off each evening with, "And that's how it is on the 37th day of the Coast Guard icebreaker POLAR SEA being held hostage in the ice pack off the coast of northern Alaska." It would have made his last month meaningful.

Women of polar bent, have you ever had a dream where you had a ship of your very own with over a hundred men? It could become a reality if you had the money and liked cruising in the Arctic. You can rent the POLAR STAR for only \$12,000 a day, and it's available off Greenland for two to three weeks this summer. For less than a hundred grand, you could have yourself a ball, dancing on the fan tail in the midnight sun and all. Freshly made bread never smells or tastes better than at two o'clock in the morning at sea. If that price seems a bit steep, why not consider the NORTHWIND or the WESTWIND, which also have time available, too? And the GLACIER can be had for only ten grand a day. How come the Coast Guard doesn't go into business with Lindblad or Society Expeditions? They could hire Rita Jenrette for a lecturer and she could conduct seminars on Washington government as seen from the Capitol steps and elsewhere. It would put the Coast Guard back as a paying enterprise, and just think what it would do for recruitment!

Captain Edwin MacDonald of icebreaker fame and Lindblad's first Lecturer-with-the-Mostest wrote that he has "a real collector's masterpiece, the three volumes of The South Polar Times which are reproductions (250) of the original South Polar Times as: Volume I - Winters of 1902-03 with Ernest H. Shackleton as editor and a preface by Captain Robert E. Scott; Volume II - April 1903 to August 1903; Volume III - April to October 1911. The first volume has a penned notation on the flyleaf 'To the Duke of Westminster from E. H. Shackleton, Editor & Printer, with grateful thanks for his practical help and sympathy towards the new British Expedition<sup>1</sup>.'" He wrote that Shackleton's nickname was "Parsenger", Armitage was "The Pilot", Royd simply "Our Charlie", Barne was "Mr. Frostbite", Koettlitz, the doctor was "Cutlets", Wilson was "Billy", Ferrar was "Our Junior Scientist" and Bernacchi was "A Petal of the Plum(p) Tree." Capt. MacDonald's wife ran across these valued volumes back in 1965 in London at a place called Francis Edwards, Ltd.

As our Society has a small hard-core of geologists, let's see what they are thinking about Antarctic books. We have selected Art Ford as their representative as he is a good compromise, short on years but long on Antarctic experience. He picked that best-seller by Alfred Lansing, *Endurance*, to head up his list. You know, this could very well be the very best-seller of all time by a non-practicing Antarctic; in fact, it might be the very best-seller of all Antarctic books by an American. And the guy never went south of East Saint Louis! Then Art put Walter Sullivan's *Quest For A Continent* in second place, writing it is "the best overall account of the history of Antarctic exploration up to the IGY." Then he placed Leonard Bickel's *Mawson's Will* in third place, "an outstanding modern (1977) account of Douglas Mawson<sup>1</sup> 1911-13 expedition in search of the South Magnetic Pole." A good solid choice, I'll say, as I found a lot of non-Antarctics in my office walking around reading this book when it came out in paperback. Then without comments he listed Cherry-Garrard's *The Worst Journey In The World*, Scott's *Scott's Last Expedition*, Shackleton's *The Heart Of The Antarctic*, Mawson's *The Home Of The Blizzard*, Byrd's *Alone*, and Giaever's *The White Desert*. Number 10 on his list was Edward Wilson's *Birds Of The Antarctic*, "outstanding paintings by an outstanding naturalist of the Antarctic."

Now let's hear from one of Art's contemporaries and fellow Californian, Rob Flint. He, too, had Alfred Lansing's *Endurance* at the top of his list saying, "greatest true life adventure of all time." Then he had Scott's *Voyage Of The DISCOVERY* and *Last Expedition* next. Rob wrote, "Scott is a national hero because of his pen and sense of drama. None better than Scott in those categories." And then he has Maw-son's *Home Of The Blizzard* which seems to be on everyone's most-interesting list. Rob found it "Gripping! Moments of real brilliance in his writing, too. Perhaps my favorite expedition. One senses camaraderie of Aussies compared to formality of British." Number 5 was Cherry-Garrard's *Worst Journey In The World* which was aptly described with just one word, "Classic." And then one which must be dear to his heart (and also appeared on John Roscoe's and Mary Goodwin's lists) Luc Marie Boyle's *Le Voyage De La Nouvelle Incomprise* which "is an informal story of the French 48-49 expedition, full of humor and lots of pen and water colors. Conveys the sense of camaraderie, in-jokes, irreverence which is so much a part of the small isolated groups. Wonderful." Rob xeroxed 12 pages and then very considerately provided a trot for the 12 pages! John Giaeever's *The White Desert* appeared again as "well written, well balanced account and the mixture of nationalities must have been fun." He then came up with a real beauty, Schulthess' *Antarctica*, followed by Paul Siple's *90° South*, and Finn Ronne's *Antarctic Command*. I think Rob tried to get a good crosscut of what Antarctica is really like, or can be like, in the selection of his books. Each and every book is somewhat different, and if one were to read all ten, he would get a good feeling for "the thrill of victory, the agony of defeat" associated with expedition life.

But before we dismiss Rob Flint and his book review letter, he provided us with another list, which he rather appropriately suggested might be called his "guano-kickers." He started out with H.P. Lovecraft's *To The Mountains Of Madness* which Rob described as "typical H.P. Lovecraft horror-mystery-adventure," and followed that up with *Quick Before It Melts*, which you may have seen in pictures-movies; then Pat Trese's *Penguins Have Square Eyes*; and James Follett's *Ice* (in which an Antarctic iceberg gets loose and threatens to start World War III and mow down New York City). The list follows with Kenneth Robeson's *The South Pole Terror*; David Burke's *Monday At McMurdo*; and Margery Sharp's *Miss Bianca In The Antarctic*. Miss Bianca is a mouse who goes on a Norwegian Antarctic expedition! Anatole France's social satire *Penguin Island* and Captain Ralph Bonehill's *Lost In The Land Of Ice* complete his list. The latter was published pre-Scott in 1902 and is "a boys' book, full of adventure and moral uplift, but it seems Cap'n Ralph had a trouble with facts (ex. They were now in the same latitude south that Iceland is in the north - about sixty-five degrees. 'Only thirty-five more degrees to the South Pole,' mused Bob.)" His sea was full of polar bears and giant man-carrying birds. I think if we ran a security check on Cap'n Ralph we would find out that he was actually on the staff of the Washington Post at the time. His material sounds an awful lot like what we have been reading about Antarctica in the Post. Thanks for the guano, the guano list, that is.

Records are made to be broken, and we have a new one for the greatest depth of snow and ice, one of 4776 meters at 69°50'S, 135°15'E. I don't know who takes credit for it as the analysis was done by the Scott Polar Research Institute in Cambridge, England, but the radio echo sounding was done from a U.S. plane. That makes it like five females holding hands and jumping onto the South Pole, does it not? Of that total amount, which translates into about 14,743 feet for those of you who, like myself, have not yet become meterized, it is almost evenly divided above sea level and below sea level. The elevation there is 2435 meters, bedrock is 2341 below sea level.

We understand that a sizable piece of a glacier calved off into Arthur's Harbor and created a ten-foot wave which came across the harbor and slammed into the HERO which

was tied up at Palmer Station. The spring line parted and tore up the mooring cleat on the bow. As it happened during the night hours, there were few witnesses.

Meteorites continue to make the news. It seems that Allan Hill's specimen A77283 is a diamond-bearing meteorite. And, get this, it is only the second diamond-bearing meteorite ever found - the other being from Meteor Crater in Arizona. Roy Clarke and colleagues in the Department of Mineral Sciences at the Smithsonian have postulated the diamonds in the Antarctic meteorite must have been formed before the meteoroid entered the Earth's atmosphere, as the iron meteorite landed softly, not producing enough shock to produce diamonds. In a paper submitted to Nature, Clarke et al are saying, "the most reasonable assumption is that these features (metallographic changes diamonds, and lonsdaleite) were produced in the meteoroid at the time of parent body breakup." Could it be that meteorites are a ladies' second-best friend?

Speaking of meteorites, old John (Byrd 1958) Annexstad, veteran of seven trips south, three of which were with foreign nations, writes that he breathed a great sigh of relief when he found out that Hornblower never wrote all the good stuff he told her about his feelings about women in Antarctica. She would have probably fouled it up anyway, John, so you would have been safe.

A special Antarctic Treaty Consultative Meeting in Buenos Aires in February admitted the Federal Republic of Germany as the 14th consultative member. Twelve nations originally signed the Treaty in 1959, and then Poland was admitted in 1977. There are an additional 10 nations which have acceded to the Antarctic Treaty, but they cannot send delegates to the biennial Antarctic Treaty consultative meetings, nor can they participate in deliberations modifying the Treaty.

Do you know that some skuas may live to be 40 to 50 years old? True, according to David Ainley, Point Reyes Bird Observatory, who has just completed a successful season at Cape Crozier. He found and retagged 216 skuas of known age - 10 to 19 years which is about a quarter of the total skua population at Cape Crozier. About 60% of those captured were 18-year olds. He found that "density-independent factors are critical to the age structure of their populations." Translated into commoner's talk this says that bad weather kills more skuas than lack of food. The extreme age of the birds is said to be typical of the slow growth rate of the polar species. If they really can live that long, and we have to believe that this fellow Ainley is not pulling our leg, then can you imagine what one skua might be screeching to another skua when he spots Larry Gould or Charlie Bentley showing up one more time? It could be, "Hey, Mabel, that old buzzard from Michigan (or Wisconsin) is back down here again. Let's buzz him like we did last year and the year before and the year before and ..."

How many microearthquakes are being recorded daily on Mt. Erebus by the three seismometers put in by Philip Kyle this past summer? If you said about 10 a day, you are right. Two to four events a day are caused by explosions right in the volcano, but some of the others appear tectonic. Philip says the data suggest that Antarctica is not as seismic as previously thought, at least not at magnitudes less than three.

A lake is a lake is a lake - except when in those strange dry valleys of Antarctica. It seems that no two are alike. George Simmons and Bruce Parker of Virginia Polytechnic Institute have been working on the bottom of Lake Hoare in Taylor Valley, and they are nearly ecstatic with some of their findings. At a depth of 120 feet, an area where the water contains no gaseous oxygen, they found the lake floor contained dense algae mats which appeared to be living on hydrogen sulfide instead of oxygen. They feel that the thick growth of this blue-green algae is a glimpse into what life was like 600 million years ago. Lake Hoare's water is fresh and near freezing, whereas Lake Bunny, in the same valley, is fresh on top but salty on the

bottom, which is 16 times saltier than sea water. And Lake Vanda in Wright Valley (our Allen Riordan, meteorologist of North Carolina State, spent 1969 there with the Kiwis) is salty with a temperature of 77°F at its bottom.

Cindy McFee, a 27-year old NOAA Corps commissioned officer, will be the third woman to winter over at the South Pole. She is there with Kirby Hanson's air monitoring program. She appears to be an old pro, as previously she spent a year and a half out at sea on a NOAA ship. She got interested in the Antarctic like many of us, from reading a book. But instead of Byrd or Scott or Mawson or Shackleton, hers was *Life's* "The Poles." Now what is a commissioned officer in the NOAA Corps? Is that something like a Kentucky Colonel, or does NOAA have their own little Navy?

Mike Kuhn (Plateau '57) finally got married early this past December. We don't have many particulars, as Mike just doesn't divulge much information, although he was kind enough to send along several pictures of his bride and her three children. They are evidently going to live on her spread outside of Innsbruck, and he will commute to the Institute. I never thought he would get married, as he led a pretty full life and seemed to have the best of all lives as a bon vivant in Innsbruck. The rumor is that Barbara is a childhood sweetheart who got away once, but this is strictly hearsay. Anyway, Mike inherited three beautiful children, so he doesn't have to take time out to produce and raise a family, and can keep right on skiing, hiking, teaching, researching, and washing dishes. Must have been the year for Austrians to get married, as old Norbert Untersteiner had the latest Mrs. Untersteiner on his arms at Christmastime, a beautiful, young, trim Polish model who answers to Christiana Those Austrians do all right for themselves.

Gene (Little America V, '57) Barter has joined the Society. Well, actually I think his wife Jennie, who writes a delightful, painfully truthful letter, signed him on with us. Gene was a character, sort of a married Bill Cromie. He never should have been in the Antarctic, as once upon a time he severely froze his feet after an airplane crash in the wilds of Labrador. He was instrumental in saving many lives, and was lucky to get out with only frozen feet. He wanted to go to the Antarctic so badly that when he took his physical he never took off his socks, and the doctor passed him. It must have been the same doctor who sent me back to the infantry after I got out of a German POW camp! Gene has a big Morgan horse, and Jennie sent a picture of Gene mounted on Morgan. You could tell which one was Gene - he was the one with the goatee.

Pete Barretta, our Mr. Secretary, has provided us with a most interesting article (December, The Retired Officer) about one of the most famous polar ships of all time, the revenue cutter, BEAR. She was launched in Dundee, Scotland back in 1874, being built of strong Scottish oak, Norwegian pine, Australian ironwood, Swedish iron, and other material also. Her first ten years were spent in the Newfoundland whaling and seal trade. The U.S. Navy purchased her in 1884 and sent her off in April to try and find the Greely party. They did find Lt. Adolphus Greely and there were only seven survivors of the original 25-man party which had taken off during the International Polar Year of 1881. The BEAR was transferred to the Revenue Marine Service, the forerunner of the U.S. Coast Guard, and was ordered to assume the Alaskan Patrol. The BEAR operated in Alaskan waters for four decades, and was truly a legend in her own time. She put an end to whiskey running and the captain was responsible for introducing Siberian reindeer into the Aleutian Islands and Alaska, creating a new life-style for the Eskimo. She pulled off a major rescue of eight whaling vessels locked in ice in the Bering Sea, a body of water that no vessel in history had ever crossed in winter. The BEAR did the impossible and "she and her crews were almost gods." In 1926 she received her final orders and was retired. The city of Oakland bought her and turned her into a maritime museum. She later became a Hollywood star appearing in Jack London's The Sea Wolf. When she was headed for the auction block, Admiral Byrd stepped in and

bought her early in the 1930s for a little more than a thousand dollars. She made two trips on the 1933-35 Byrd Antarctic Expedition, and went back on the Antarctic Service Expedition in 1939-40. The Navy purchased her for duty in World War II, and she was assigned to patrol Greenland. "One more footnote to her now illustrious career: she towed the first German ship captured in the war by the U.S. to America." Way to go, BEAR! Finally she was decommissioned in June 1944 and languished in mothballs in Hingham, Massachusetts for 19 years. On March 19, 1963 at 2100 hours, the BEAR gave up in a great battle against heavy seas, while being towed to Philadelphia to become a floating restaurant. Larry Baker wrote, "This ship of iron and wood avoided the undignified fate of commercialization or the scrap dealer's torch. She went to rest at sea, begrudging the end even then." This has all been immortalized by Admiral Dick Black, Poet Laureate of the Antarctic, who wrote an epic poem about the BEAR. This past year, the Coast Guard remembered - it has christened the first of thirteen medium endurance cutters the BEAR.

Here it is at long last, an up-to-date gazetteer on Antarctica, and you can buy it from your friendly Government Printing Office, Washington, D.C. 20402. The official name is Geographic Names Of The Antarctic, the Stock Number is 038-000-00471-9, the price is \$13.00, and it will be available in late April or early May. That price includes postage. If you are a good friend of some Senator or Congressman, he might send it to you, but it is our understanding that unless your name happens to be Stockman or Meese, you might as well plan on writing your check now. Next fall we will again publish a list of features named after members of our Society, as it's sort of a fun thing to compile and is one sure way of hearing from anyone whose name might have been inadvertently left out.

If you are out near the Natural Bridges National Monument in Utah this summer, drop in and say hello to Ron Thoreson who was down in the Antarctic back in 1969-70. He has apparently switched from sastrugi to sagebrush, but he is also involved with their photovoltaic energy system. He has a private pilot's license and writes that "the grandeur of this eroded scenery is a true wonder from the air."

Ingrid Malva-Gomes is a Society Loyalist, and monitors the German Tribune for us, sending us clippings. Her husband is a field man for the USGS, but if you ask me he is more like a traveling salesman with wife. It seems they moved 18 times in 1980. If he ever gets reassigned back in Reston, she has promised to bake cookies for our local meetings. Hey there, USGS, how about recalling Antonio to your head shed?

By popular demand, the Society will picnic again this summer, Saturday, July 11th, at Stronghold, that lovely old estate near Sugar Loaf Mountain. More particulars later!

The Antarctic Society is selling a book (Science, Technology And Sovereignty In The Polar Regions. Edited by Gerald S. Schatz. 1974. 215 pages) in an effort to recoup some of our losses from the Antarctic Belt Buckle deal which cost us \$300 this year. We were able to get the books at a most favorable price as the publisher wanted to sell out his supply. To be truthful, our markup is considerable -determined by committee action - but we are still offering the book at a most substantial reduction from its initial sale price of \$16. It is basically a reference type book, one for scholars and collectors, as well as the ecologically-environmentally controlled individuals. The Antarctic Treaty is there, word for word, ditto recommendations of the first six consultative meetings, plus eight chapters concerning various legal aspects of Antarctica. Help the Society - buy a book, only \$5 by mail. Use form on reverse side of this sheet.

We had a great turnout for the Lisle Rose talk. Let's keep the momentum going - come to our Memorial Lecture, and bring your friends!

Yes, I want a copy of Science, Technology And Sovereignty In The Polar Regions.  
 Please find enclosed ray check for \$5.00 made out to the ANTARCTICAN SOCIETY. Mail  
 the book to:

(SEE PG. 10, 11, 12)

# Barkentine Bear

On March 19, 1963 at 2010 GCT, a beloved old veteran of polar exploration, research, and rescue sank to the bottom of the sea off Nova Scotia. A man who knew her well describes her eventful past and final voyage.

Author Black watches as the barkentine BEAR backs away into the sea smoke, Little America, February, 1934.

By  
Richard Blackburn Black  
Rear Admiral, USNR (Ret.)  
Office of Naval Research

If wooden ships have hearts of oak,  
And I believe they do I know of one  
whose stout heart broke!  
I'll tell the tale to you:

The BEAR, an ancient barkentine  
Whose years topped eighty-nine  
Was limping southward, old and green,  
Upon a tow-tug's line

Her destination? "Shame!", she cried,  
I'm going to be a pub,  
A rest' rant!— (Chicken? Stewed or fried?)  
A gin-mill! There's the rub!"

She lay back on the cable then  
And dreamed of all her past—  
Of gales and ice and shouting men,  
Taut canvas in the blast,

The shriek of wind, the sting of sleet,  
The green seas sweeping back,  
The clinging seamen with their feet  
Braced on the foot-rope track,

With bellies pressed against the yard,  
Chilled fingers clutching sail,  
And elbow movement slowed and hard  
By wind on raincoat's tail.

She thought of evenings still and bright,  
Locked in Antarctic pack, —  
Ice-blink ahead, and blue-black night  
Behind her in her track,

When Byrd and English paced her deck  
With anxious eyes ahead,  
While Ben Johansen said, "By heck,  
Ve'll push trou or ve're dead!"

Then Crusen — (now ifs forty-one) —  
Fought through to Biscoe Isles  
To free the men on Stonington.  
One hundred forty miles

Of ice-locked sea BEAR could not break,  
So in a patched up plane  
The East Base men—a chance to take—  
All reached the ship again.

Her thoughts then flew back sixty years  
To Bering Sea Patrol,  
Her fights with poachers, British jeers,  
And heavy whale-ship toll,

Her years of aid to Barrow town  
And starving Aleuts,  
And murderers at her yard-arm  
A-hanging in their boots.

Now, back to present, and the gale  
Off Nova Scotia's shore:  
The seas run high, the tug men pale,  
"Old BEAR can't take much more!"

Old ships have souls, some sailors say,  
And some have died of shame,—  
I'll not contend this, either way,  
And I will place no blame

But tell you just what seamen saw  
Aboard that towing ship:  
The BEAR heaved back, began to yaw,—  
Her bow commenced to dip.

Then with a muffled, mighty sigh  
Her seams all opened wide,  
And with her colors gaff-tip high  
She plunged beneath the tide!

"West Over Sea," the Vikings said  
When funeral was planned,  
With chieftain lying midships, dead,  
Full armored, sword in hand.

I'll always feel, as some will voice  
Who worked that ship with me,  
That she went down by her own choice —  
The BEAR - West Over Sea!

PLEASE READ THIS PARAGRAPH!

Please note that your Society has a new official address which should be used henceforth on all correspondence. The Washington office of the Arctic Institute of North America is closing up shop at the end of June, and Ruth Siple has very graciously invited the Society to use her house as our home. For all practical purposes, #905 has been the nerve center for the Antarctic Society for the past four years, especially at editing time! Several months ago she moved us from her dining room into a spare bedroom, so we do have an excellent working area to keep the Society's files. We won't give you her telephone number, but if anyone really needs to get in touch with the Society, her number is listed in the Northern Virginia phone book. IF YOU MOVE, let us know; otherwise there is no way the Newsletters will ever reach you as the Post Office does not forward bulk mail (which we use).

The Society has had a great recruiting year, topping eighty! Fantastic! We used to go looking for members, but lately people are coming to us with their dollars. The Society should be self-perpetuating with a new crop of Antarcticans each austral summer. Last year we recruited 47 new members, the year before 72. Approximately half of our total membership are recruits gained in the last three years,, This year has been particularly gratifying as we have picked up many of the nouveau Antarctic scientists to go along with our solid base of good old boys. If we can get the practitioners into the Society, we stand a better chance of having a real solid hard core of renewals. We got rid of most of the deadwood two years ago when we dropped 71 delinquents; this year we only had to drop 17. Next year we're going to run a real tight ship, sending out individual billings in September, with only one second notice. If you don't divy up by the end of December, you will be dropped from our mailing list. It costs close to 60 cents apiece to run off and mail Newsletters, and we just can't afford to carry people on our rolls all year who do not plan on renewing. It doesn't matter who you are, as we are more interested in the color of your money than your Antarctic heritage! We have dropped such luminaries as Roger Tory Peterson, Joe Fletcher, Max Britton, Marty Pomerantz, Walter Boyd, Dietland Muller-Schwartz, William Chapman, and even a former beauty queen contestant who was once my baby-sitter when she was a Brooks Shield type. So you can see we are real ruthless. Bear this in mind when you get your bill in the fall.

The general feeling was that the Memorial Lecture was a memorable success. For the second year in a row, we had a pre-Lecture cocktail hour-dinner with over a hundred in attendance. We were blessed with a great evening, and the outside patio in the Joseph Henry Building makes for a great socializing place. We haven't gotten the timing down just right, but like Charlie Bentley, we are going to keep on going back until we get it done right! We were most happy to get such a warm response from the glaciologists who were in town for the Polar Research Board's Glaciology Workshop. In alphabetical order they were Carl Benson, John Clough, Joan Gosink, Tony Gow, Mike Herron, Karl Kuivinen, Mark Meier, Dick Moore, Bruce Parker, Troy Pewe, Ellen-Mosley Thompson, Norbert Untersteiner, and Ed Zeller. Clough, Kuivinen, Pewe and Zeller are members of our Society, and before the glaciologists left town we were into the pockets of Joan Gosink, Tony Gow and Bruce Parker for new memberships. Everyone knows Carl Benson as "the less-famous-brother" of our own Bob (South Pole '57) Benson. Not all the Poles were on strike, as Bill Sladen brought along a distinguished Polish zoologist, Professor Dobrowolski, from the University of Warsaw, and a good-looking interpreter, Lucga Swiatkowski. But the cocktail hour became supreme girl-watching time when that grizzly old Norbert Untersteiner walked in with his most beautiful young Polish

bride of six months, Christina. It was "Holy Cow, look at that beauty", followed almost immediately with "How in Heaven's name did old Norbert ever talk her into marrying HIM?" A true miracle.

Bob Nichols played it straight, because when it comes to Captain Scott he is dead serious. He tactfully avoided any mention of the storm brewing in Her Majesty's homeland as a result of the Huntford book on Amundsen and Scott. It was sort of refreshing to have a real polar authority like old Bob standing up there on the stage of the main auditorium of the National Academy of Sciences, wearing his heart on his sleeve, talking as a hero worshipper. Bob quoted extensively from Scott's diary and an American-in-attendance probably was accurate in a past lecture critique when he said, "I think Bob Nichols would have liked to have died out there in that tent with Captain Scott." I don't know about that, but Bob must be the president of the "I Love Captain Scott Society" in this country. Bob looks like he could have walked right off the stage, put on his windproofs and harnesses and man-hauled a loaded akkio up the Beardmore. Bob's chronological age is 77, but he looks and acts like a young college stud. It was good to have one of his old colleagues from the Ronne Expedition there, old Bob Dodson (who is also a member of our Society). Nichols sat next to Jackie Ronne at the dinner and announced to everyone that he had lived with Jackie for a year! Antarcticans are so truthful!

Admiral Black was as eloquent as ever, and he most ably took care of the memorial aspects for the evening. The highlight had to be his recital of three of his Antarctic poems written to his wife Aviza (who was in attendance). Dick is truly the Poet Laureate of the Antarctic, in spite of his attempts to disclaim the fact. We are including his very popular and often printed poem on the BEAR on a separate page in this Newsletter, but unfortunately it will lack the touching emotional presentation given to them by Dick. But those who could not attend the lecture will at least get an idea about the flavor of his poems. We hope to publish his other poems at a later date. It was a great evening in the growing tradition of our Memorial Lectures. I find these evenings a most fitting climax for our seasonal Lecture program, and hope that they will continue with the support of the National Academy of Sciences' Polar Research Board. We could never swing the cost of the auditorium, but with their sponsorship we get the gorgeous hall free. Our Memorial Lecturers are all top-drawer, and their presentations are most worthy of the support of the National Academy of Sciences.

The immortal Larry Gould, a legend in his own time, returned to the shores of the Potomac on his 50th wedding anniversary, May 14th, to receive the 18th Annual Cosmos Club Award. Larry was on extremely good behavior that evening, never once running his fingers through his hair and annihilating his coiffed head (as he had done in Winchester at the town's 50th anniversary celebration of Admiral Byrd's flight over the South Pole). Larry was all decked out in penguin clothes, as were many of the other men who saw fit to come in "black tie." The best way to describe the evening was "elegance." As soon as I saw the appetizer, which the Awards Dinner Menu showed as "Thunderbird Salad", I said to myself, "We won't be eating Gutenko's pemmican tonight." Thunderbird Salad, to those unsuspecting commoners like myself, turned out to be a duck-like bird carved from pineapple stuffed with crab meat. Now that is class, particularly when the head and beak were all artistically colored a la Roger Tory Peterson. That was followed by "Tournedos a la Rossini, -Perigourdine." It was the biggest piece of filet mignon my eyes had ever feasted upon. Later I was to learn from a gourmet that it had some kind of a mushroom cap. That gives you an idea about the haute cuisine of the evening. Larry prepared a formal lecture which will be printed and distributed to Cosmos Club members, although he threw away the script and talked from the hip with his ever present three by five cue cards. He showed the packed house that Antarctica is really not at the bottom

of the world, but is actually the central focus point for everything worthwhile on Planet Earth. Larry was given a very large, nicely framed certificate certifying him as the recipient of the 18th Annual Cosmos Club Award, and they have hung Larry in their Portrait Gallery of Award Winners. He was also given an envelope with some freshly minted crisp greenbacks. He may have dropped the globe on the floor, but it was noted that he carefully put that envelope deep into an inside pocket. Now that the Explorer's Club has gone coeducational, the Cosmos Club may be the last of the great all-male bastions in this country, and Larry seized upon the friendly audience to read a letter of mine of many years ago, one written to the then-chief of the Office of Polar Programs, Bert Crary, giving him hell for opening Antarctica to women. Larry protected both the writer and the receiver, giving us anonymity, although this was one audience which was probably in my camp. (I have nothing against women per se, but I had such a great time wintering over twice in Antarctica that I wanted it preserved for men, as I felt that men really needed and merited some place on earth where we could get away from women and at the same time have a ball for ourselves.) Speaking of la femme fatale, Arlene Friis had on a beautiful full-length evening gown of a lovely jade green color. Arlene gets the unofficial Bergy Bits Most Beautiful Gown Award. Vernice Anderson was especially radiant, and I was a most fortunate soul to be in the ever enjoyable company of Alice Dater, who was resplendent in dark blue. For the penguin wearers, I thought Louie DeGoes looked most Emperor like, and for the non-penguins, how can you ever top that fashion plate out of Tempe, Troy Pewe? Yesiree, it was truly an evening of elegance, one befitting our Superstar. And he carried it all off with great aplomb, naturally.

Ned Ostenso and I had breakfast with Larry the morning after the award, and he was still basking in the afterglow of the previous evening. Having breakfast with Larry Gould after he had received a most distinguished award is to an Antarctic what it must be like for a Catholic to have communion breakfast with a new Pope after his coronation. I have long harbored a feeling that the Society should use some of our limited money to video tape some of our famous members for posterity, and I think it would be just fantastic if we could get Walter Sullivan to sit down with Larry and let the camera roll. Larry's reminiscences of BAE I at Winchester really got me excited about the prospects. I presume that a great many of you have already seen and heard the three truly fantastic interviews that Trevor Lloyd taped with Vilhjalmur Stefansson for Canadian television. I thought they were great, and we should put Larry on film, too. What do you say, Walter??

Howard Mason, BAE I radio operator who lives in Seattle (5724 36th Avenue N.E., Seattle, WA 98105) has sent us a shelf of clippings on the POLAR SEA. She finally broke loose in mid-May from the 600 mile Arctic ice field off the Alaskan coast, after having been entrapped since February 20th. One would normally think that a guy would be safe if he was stuck in 20 feet of ice in the Arctic, but not so for Petty Officer Richard Barley. His fiancée married the poor soul via ham radio - the operator should have his call letters revoked! Just to make sure it stuck, there were 15 family members and, get this, some 85 reporters with the bride back in Marysville, Washington, Meanwhile, her sister ship, the POLAR STAR returned to a hero's welcome in Seattle after a record-setting voyage to the Antarctic, where the 75,000 horsepower ice-breaker accomplished in one hour what previous ice-breakers took 24 hours to do. She punched through to McMurdo in 5 hours and 20 minutes, passing the GLACIER like "she was standing still." And she did this on only two of her three propellers, Howard wrote that part of the indoctrination for his going to the Antarctic back in 1928 was to read such books as The Home of the Blizzard, The Worst Journey in the World, and The Voyage of the DISCOVERY, and after reading them "I wasn't too sure that I wanted

to go on the expedition; in fact I was pretty close to changing my mind, but of course later I was glad that I didn't." Thanks for the letter, Howard, and also for the clippings. Appreciate.

Speaking of the Arctic, old Charlie (South Pole '58) Greene wrote from Ice Station FRAM III, about 81°30'N, 5°30'E, on Saturday May 2nd, that he was there with two other Antarcticans, Allen (Byrd '63) Gill and Jay (Ross Ice Shelf Project '78) Ardai, but that he could not recruit them for our Society. Well, it takes all kinds, and you can't win 'em all. Charlie and Allen are at a two-man satellite camp doing acoustical work. Charlie wrote, "Sitting at Nord for a week waiting to come out here I wondered why I kept coming back when I'd seen 'it'<sup>1</sup> so many times. However, when I was dropped here on this floe with Allen Gill the old sentiments for this frozen ocean returned and I was glad I'd come. But don't ask me about another time." Sounds like Dick Black, eh what?!

Old Carl (Little America V '57) Wyman joined the Society recently. Carl gives us some real character, as he was not your typical Antarctic recruit. When the IGY came along, Carl, a retired Marine colonel with a grown-up family, decided that he would like to go to the Antarctic. It seems he could qualify as a backup ionosphere physicist with the National Bureau of Standards (to a young Danish scientist, Hans Bengaard, who was young enough to be his son). And how do you handle an old Marine colonel anyway? The answer is that you don't, if you want to survive the year! Carl was one of the premier rabble-rousers in camp, and tried to keep the camp honest. He also was an active ham (still using K2VAV incidentally) and set up his own rig. When he fired up for the first time, he was working the key hoping to make a stateside contact when this fellow in Pennsylvania heard him and answered. You won't believe this, but it's the truth. This very same contact had been the very first contact which Carl had had many years before when he was in Guatemala with the Marines! Carl has had emphysema and is down to 125 pounds, hating a salt-free diet. He lost his wife to the Big C, remarried in 1968, and they now live at 214 Marine Street, Beach Haven, New Jersey 08008. He would like to hear from you Little America guys, so Milan, Chappell, Taylor, Bennett, Cromie, and Crary, drop the Old Marine a line.

Louie DeGoes, former Executive Secretary of the National Academy of Sciences' Polar Research Board, has found his position abolished at the Academy, although he plans on keeping active as a polar consultant. The old All-American isn't ready to be farmed out to pasture, so the "retirement" wasn't one of his own choosing. I have known Louie since he directed the Air Force Cambridge Research Laboratories' arctic program in the 1950's, although I have not known him well enough to write his epitaph. However, it is much too early to compose a eulogy on him - one gets the feeling that he will continue to surface in polar waters. I have always enjoyed dropping in and chatting with Louie at the Academy, and he has been a veritable fountain of information and ideas about people/programs of polar bent. I have used him as a trial balloon on items for Bergy Bits and for discussions on the future direction of the Antarctic Society. I have found him to be an extremely cooperative person with exceedingly good ideas. I'm going to miss Louie, even though he has never come to one of our monthly lectures in the past four years! Anyway, Louie, happy fishing, and let's keep in touch.

There has been a Changing of the Guard at #34 Fontana in Leningrad. Professor Alexander Treshnikov is no longer Director of the Arctic and Antarctic Research Institute. He has recently become the "Head of Chair of Oceanography" in the Geography Department at Leningrad State University. Boris A. Krutskikh, former deputy to Professor Treshnikov, has become Director of AARI. It appears that

Professor Treshnikov is also president of the Soviet's Academy of Geography. Gene Bierly, chief major domo in meteorology at the National Science Foundation, supplied us with the above information on the eve of his departure for the USSR on June 11th. He has hopes of seeing Anna Minevich while in Leningrad. Anna is the Soviet's answer to Britain's Hilda Richardson and the U.S.'s Helen Gerasimou. Isn't it a miracle that the Division of Polar Programs is still alive and thriving in spite of Helen's retirement? Mother Superior of Antarctica must have trained Ed Todd and Al Fowler better than I realized.

Mark Leinmiller, the 50th Paul Siple Anniversary Boy Scout in 1978-79, who has combined a strong social life with a full academic calendar (or was it the other way around, a full social life with a strong academic calendar?) at Georgia Tech, will be the keynote speaker in Greenwich, Connecticut when their Council of Boy Scouts of America awards honors to 20 Eagle Scouts on June 22nd. When you're in Greenwich, you're in Steve Weirich's Country, the Northeast Regional Finalist for the Antarctic in 1978, and the very personable Steve of Allegheny College, Class of '81, will share the platform with the handsome, debonair, suave Leinmiller. Meanwhile, the West Coast finalist, entomologist Scott Miller, is spending his fourth summer sticking pins into bugs at the Smithsonian as he dreams of going to graduate school at Harvard University. I thought Scott was fully committed to books and bugs, and was greatly relieved when a comely geographic lassie who answers to Pam and who hails from the lovely city of Los Altos, California tracked him down here in Washington last summer. The Eagle Scouts are doing real well, it seems. Meanwhile, young Dick Chappell is fast becoming the grand Old Man of Antarctic Scouting. He holes up in Woods Hole each summer, doing all sorts of queer things with the eyes of darning needles. I always was suspicious of Dick, and my fears were well-founded!

Our last Newsletter had been finalized before we read Katherine Bouton's very fine article "A Reporter at Large, South of 60 Degrees South" in the March 23rd issue of The New Yorker. After those ---- articles by that Hornblower woman in the Washington Post last winter, Katherine's article was as refreshing as the first mail flight in at the end of winter. I just had to sit right down and write her and tell her what a great job she had done. She wrote back, "I enjoyed every minute of the research and even most of the writing. I had to leave a lot out, including an interesting interview with Larry Gould." I figure that her article has to be the longest single article ever published on the Antarctic in a weekly magazine. True? Katherine wrote that this piece was "about 20,000 words." She had old John Spletstoesser "read the piece for accuracy" which just goes to show that she has her head screwed on right. She had hoped to get down to hear old Bob Nichols, but evidently could not get out of the Concrete Jungle. We did have Ed MacDonald of ice-breaking fame and early-day LINDBLAD lecturer down again from Cape Cod for the Memorial Lecture. We appreciate old Ed getting it into gear and coming on down for our Memorial Lectures. We might have had old Bill Field, too, except his wife Mary was just recovering from a hip operation and she needed him more than he needed us.

At long last, Geographic Names of the Antarctic has been published by the Government Printing Office for the National Science Foundation. It's about the size of the Manhattan telephone directory, being close to 1,000 pages. There are some 12,000 approved names and 3,000 unapproved variant names in italics. What a cast of players! I'm sure our highly esteemed president, Pete Burrill, Mr. Geographic Names of the 40's, 50\*s, 60's, and 70's, will want to review it when he comes back from vacationing in God's country, Muscongus Bay in Maine. But in the interim the Society's fedora is off to Fred Alberts, Tom Strenger, and the others who have produced this volume. It's a bargain, a must for the night-stand beside your bed.

Remember, only \$13.00 at your friendly Government Printing Office, Washington, DC 20402. The stock number is 038-000-00471-9.

Meteorites are a hot item in Antarctica. Bill Cassidy and old John Annexstad have just as good a deal going for them with meteorites as old Charlie Bentley has with the hypothesis that the West Antarctic Ice Sheet might go sliding out to sea when no one is watching. Natural History for April 1981 has a special supplement on meteorites, and Brian Mason has an article in there on meteorites in Antarctica. The article is entitled "A Lode of Meteorites", and there is a spectacular two-page color spread of Allen Hills. And then there is a beautiful color picture of "a thin section through an achondrite shows no chondrules." I have no idea what an achondrite is, let alone a chondrule, but the article says that 87% of the Antarctic collection to date are chondrites and 5% are achondrites. Then 7% are irons and 1% are stony irons. Let's hear it for the irons!

Let's get back to people. Old Gentleman Jim Zumberge walked into a hornet's nest out there in Southern California when the NCAA found out that a goodly number of the Trojan football players weren't exactly bona fide students, having snuck in an open door left ajar in the Admission Office by, shall we say, football interested parties. But now it appears that Gentleman Jim would not have been any better off if he had stayed at Southern Methodist University as recently the NCAA found out that while Jim was President there were 29 recruiting violations in 1978-79! Jim, there is really only one place for you, get a clerical collar and go to South Bend. The NCAA never investigates Notre Dame, they are sacred.

We'll finish up the year in style presenting the favorite books of two of the good old boys, Henry (BAE I) Harrison and Bud (BAE II) Waite. Starting with Henry, the official chronologist of the First Byrd Antarctic Expedition, he pretty much voted a straight party ticket from the deep South. Five of his top ten were by members of the first two Byrd expeditions, Cold by Larry Gould, Alone by Admiral Byrd, South of the Sun by Russell Owen, Little America by Admiral Byrd, and 90 Degrees South by Paul Siple. Then he paid homage to the era of great explorers, picking Home of the Blizzard by Sir Douglas Mawson, Heart of the Antarctic by Sir Ernest Shackleton, and Scott's Last Expedition by Capt. Scott. Then he added a classic, The Worst Journey in the World by Apsley Cherry-Garrard, and then threw in a sleeper, Operation Deepfreeze by Admiral George Dufek. I don't know about old Uncle George, but you certainly can't argue with any of the rest of his selections. Now for Bud Waite, although I wish I didn't have to print his selections as his top 10 turned out to be his top 16, and he wasn't sure of some of the titles or the authors! I did narrow his list down to 14 by throwing out two arctic books, Nansen's North Pole and Andrew Freeman's The Case for Dr. Cook. His first selection was Richard Trevelyan Miller's The World Great Adventure. I think the author that Bud meant was really G. M. Trevelyan, and that the book was actually British History in the 19th Century and After (1782-1919). His second choice was J. Gordon Hayes' The Conquest of the South Pole. Then he came onto my frequency with Amundsen's The South Pole, Lansing's Endurance, Scott's Scott's Last Expedition, Cherry-Garrard's The Worst Journey in the World, Byrd's Little America, Discovery, and Alone, Pon-ting's The Great White South, Siple's 90 Degrees South, and Sullivan's Quest for a Continent. And then he ends up with Wilson of the Antarctic by Weavers (?) and Scott's Last Journey (?) by Admiral Lord Mountevans. We haven't tabulated the most popular-by-votes, as we are still waiting to hear from an intrepid explorer out in Tucson and a few others. I think one thing is rather clear, that people still love to read about the old expeditions. I bet 90% of the votes were for books written prior to World War II. No one voted for Huntford's Scott & Amundsen. Amazing. No one voted for Bunny Fuchs' book on the British Commonwealth Transant-

arctic Expedition. Sir Edmund's book drew a blank, too, ditto the late Peter Mulgrew, and more dittos on Paul-Emile Victor and Les Quartermain. It has been a popular item in Bergy Bits, and has struck a responsive chord in a lot of our members. The bottom line seems to be that the classics are still alive in our hearts, but as individuals we also have some other very personal choices that aren't necessarily well-known.

Guy Guthridge, husband of tennis playing Ruth Guthridge, and Manager of the Polar Information Program in the Division of Polar Programs at NSF, has provided us with a working man's list of Antarctic books, books which researchers would want to have on their shelves. They all have been published since 1951, and he uses all of them in his daily work, although he confesses that he hasn't read through all of them. But here is Guy's list, not in any "order of preference or utility."

1. Kenneth J. Bertrand's *Americans in Antarctica 1775-1948* (American Geographical Society, 1971) is the authoritative history for that period.
2. Walker Chapman's *Antarctic Conquest* (Bobbs-Merrill, 1965) and Charles Neider's *Antarctica* (Random House, 1972) are listed as one because they do the same thing: anthologize the well-known explorers and writers. Chapman gives 46 excerpts in 355 pages, while Neider gives 14 longer selections in 424 pages. You need both books.
3. The *Antarctic Map Folio Series* (American Geographical Society, 1964-1975) is actually 19 folders—each with a short text, numerous special maps and drawings, and lots of references. It graphically presents Antarctica's geology, ice, atmosphere, oceans, biota, and other subjects plus exploratory tracks over the centuries.
4. *Geographic Names of Antarctica* (United States Board on Geographic Names, 1956) lists the 3,400 place names then officially recognized by the U.S.A. It locates and describes features and notes why (or after whom) they were named. A revised edition (*Geographic Names of the Antarctic*) with 12,000 names has just been published by the Government Printing Office (April 1981).
5. *Frozen Future; A Prophetic Report from Antarctica*, edited by Richard S. Lewis and Philip M. Smith (Quadrangle Books, 1973), has 31 articles by Gould, Daniels, Craddock, Fletcher, Fuchs and others on science, logistics, and politics. It includes "The long look ahead," with insights as fresh today as when A. P. Crary wrote them in 1970.
- 6<sub>0</sub> *Research in the Antarctic*, edited by Louis O. Quam (AAAS, 1971) is the proceedings of a conference. It has 39 papers by top people. When I want to convince someone of the worth of antarctic science I show him/her this book.
7. The CIA's *Polar Regions Atlas* (Government Printing Office, 1978) contains 23 pages on the Antarctic. Chief attractions are the superb figures and maps, together with succinct text.
8. The *Antarctic Bibliography* (U.S. Naval Photographic Interpretation Center, 1951; reprinted 1968 by the Greenwood Press, Westport, Connecticut) is John Roscoe's indexed list of some 5,500 books and papers, covering all the expeditions from J. B. C.

Bouvet de Lozier to John Giaver and more. It is the only reasonably complete guide to pre-IGY antarctic literature.

9. Picking up where Roscoe left off, the Library of Congress Antarctic Bibliography (12 volumes, Government Printing Office, 1965- ) contains abstracts and author, subject, and geographic indexes for 1951 to the present - 28,561 titles so far.
10. Problems of Polar Research, edited by W. L. G. Joerg (American Geographical Society, 1928) is a humbling book. Its eight exclusively antarctic papers (there are 31 in all) are by Mawson, Drygalski, Taylor, Priestley, Tilley, Wright, Robert Cushman Murphy, and others. Many of the great theories regarding Antarctica's role in our planet are set out clearly and in detail on these pages. How much they knew then! And how gracefully expressed.

The Antarctic Society still has a few - would you believe a hundred - copies of Science, Technology, and Sovereignty in the Polar Regions, edited by Gerry Schatz, published in 1974, originally sold for \$20.00, which the Society is offering to you for only \$5.00. It has all you ever wanted to know about international law and natural jurisdiction in the polar regions, PLUS the Antarctic Treaty and recommendations from the first 7 Consultative Antarctic Meetings. The book will tell you such things as to where you will find the first grave in Antarctica (Cape Adare, Norwegian biologist, Nicolai Hanson, member of Borchgrevink's "Southern Cross" Expedition). Buy it now before we sell out. Own an Antarctic book without a single glossy picture, in fact, without a single picture. That shows you how scholarly it really is.

By popular demand, the almost annual Mid-Winter Picnic is back on the summer calendar, and at the ever popular Stronghold on the slopes of Sugar Loaf Mountain, two gallons of gasoline away from Washington Monument in the town of Comus, Maryland. The date has been set, Saturday, July 11th - the grounds will open at 2 o'clock, we must flee by darkness, Comus Inn will again cater, and the rub is \$16.60 (of which \$1.00 is programmed towards the admission charge of Stronghold which goes to preserve the oaks). There will be two movies in the evening, courtesy of the Australian Embassy. One is a color film of 18 minutes' duration entitled Beyond the Ice Pack, and the other is a 22 minute film, also in color, Prince Charles Mountains. The buffet dinner by Comus Inn is always outstanding, a gastronomical victory, consisting of baked ham, roast turkey, roast beef, scallops, potatoes au gratin, peas with mushrooms, tossed salad, 3-bean salad, hot rolls, dessert, and beverage (presumably coffee and milk). How can you beat that, especially when served in such a sylvan setting, after you have enjoyed a leisurely walk up to the top of Sugar Loaf Mountain and have quenched your thirst at the Charlie Morrison-Bill Cook Liquor Unlimited open cash bar? Checks should be made payable to the Antarctic Society, and must be in by July 6th. Note the Society's new address - c/o R. Siple, 905 N. Jacksonville St., Arlington, VA 22205! You people with kids - they can brown bag it, but if they should escape your clutches and go through the line, we'll have to charge you the full fare as we pay Comus by the number of bodies going through the line. There is no such thing as a rain-out, as whoever heard of rain on Mid-Winter Day Washington style? Festivities would be moved indoors in case of a downpour. Now get there! Take Route 70S off the Beltway as if you were heading north for Frederick or Camp David, depending on who your relatives

and friends may be. When you've driven 16.3 miles beyond the Rockville exit, take the Hyattsville-Comus exit, circle under the highway and follow Route 109 for 3.3 miles into Comus. Don't blink your eyes or you'll miss Comus, as it's just the Comus Inn on your right. Turn right here onto Comus Road (County Rt. 95) and go 2 1/2 miles. Proceed straight across the paved intersection (Mountain-Cross Roads), and if there is not a small lake on your left, return immediately to the Washington Monument and start all over again. A fourth of a mile beyond the intersection, turn right up the mountain through a gateway. Follow this for another 1/4 of a mile. There will be a house with four columns on the right - admire it, but don't stop there as that's not it. Go around the bend, and you will find Stronghold. You can park your car downslope from the building. It's easy.

RESERVATION FORM ON LAST PAGE!

-----

The February issue of Smithsonian has an excellent story on CRREL, the Army's Cold Regions Research Engineering Laboratory at Hanover, which is the modern day extension of SIPRE (Snow, Ice, Permafrost Research Establishment). The title of the article is "Waging war against the cold is the job of a unique Army lab", and it starts out with the best picture ever taken of our own Steve Ackley. It's not your typical centerfold. In fact, the only thing you can see is the top of Steve's nose. But there is a limit, you know, to just how much you can cover up with the fur ruff on your parka! When I first met Steve my initial reaction was that he looked somewhat like old Kaye Everett in stature and had some of his mannerisms. The Smithsonian makes him out to be very much like Kaye who is sort of a legendary character in his own right. The article says that Steve was 1) almost eaten by two polar bears - saved only by firing an emergency orange smoke flare which turned back the bears while they were choosing who was to take the first bite; 2) that he rolled off a snowmobile breaking through the ice enroute to a watery grave some 10,000 feet below; and 3) that he almost plummeted to the bottom of a bottomless crevasse on an iceberg. Now those are real Everett type stories, maybe fact, maybe fiction, but always interesting. I bet Kaye is sorry he never thought of them first. There is quite a bit in the article about Malcolm Mellor ("one of the nice things about going to Antarctica is that you get to go through all the tropical regions to get there") - and Tony Gow. Congratulations to the Smithsonian and to author Richard Wolkomir for a most interesting article. Incidentally, that full page picture of Steve shows him studying cross-polarized ice crystals from Antarctica.

I'm sure you all read in your hometown paper the comments of the judge who headed the investigation of the Air New Zealand DC-10 crash on Ross Island. The final report of the inquiry blames the airline for changing the flight plan the night before the flight without informing the crew. The new flight plan put them on a collision course with Mt. Erebus. The judge accused the airline officials of making a concerted attempt during the inquiry to conceal their mistakes. I would like to read the whole inquiry, as it seems to me from what I had read earlier in Christchurch papers that the error in the computer flight plan was detected on the previous Air New Zealand flight to McMurdo, and that this was reported to their head-shop after they returned from the trip. Regardless, it is the saddest hour in the whole history of the Antarctic. A terrible, terrible happening.

It is my personal feeling that Bergy Bits has run its course and that it's time for a change. A couple of recent events at a Board of Directors' meeting sort of confirmed this gut feeling. Change is always good for an organization and aspiring would-be writers of the Society's Newsletter should get in touch with President Pete Burrill at his home address (5204 Westwood Drive, Washington, D.C. 20016).

Writing a newsletter is a mixed bag. It can be enjoyable in that you can write nearly anything you want, subject solely to the editing of our resident typist, Ruth Siple, who evidently traces her ancestry directly back to the Puritans. But the position also catches a fair amount of flak, and this is the aspect which I don't really enjoy. It has been a labor of love for me for three years, but it has left some scars too. I was greatly upset over the turn of events with Pennie Rau over the Antarctic belt buckle, as she had become a very dear friend to both Ruth and me. She subsequently dropped out of the Society, and this hurt as she was one of our most valued members and our very first At-large Board member. Another member has repeatedly told me that I took a cheap shot at him when I was only reporting the truth. I don't mind catching hell occasionally, but it becomes like married life when it becomes repetitive. But the most recent Board of Directors' meeting convinced me that I should hang it all up. It looks good on paper to have a Board of Directors for our Society, although I think the Society could function more effectively and efficiently with just dedicated officers (President, Vice-President, Secretary, Treasurer) who work together as a team and communicate with one another. As an old infantry man who learned his lessons the hard way, I am a firm believer that people who propose things should have full responsibility for doing them. It's easy to walk into a meeting every two months or so and propose something, knowing that you won't get saddled with it. If I had my way, every suggestor who pushed through an idea, no matter how insignificant, would receive as his/her just rewards - the opportunity to label 400 envelopes, fold and stuff 400 Newsletters, and then separate them by Zip Codes!! I've done this for every single mailing except one (which Ruth did while I was on travel) for three years, and I guarantee if the "idea jokers" had to do this there would be some beautiful, quiet, short, peaceful Board meetings.

This Bergy Bits, like all of their predecessors, is only the voice of one member of the Society and in no way constitutes the position of the Society on any subject. For those of you who have read the column, I thank you - for those of you who have not, I admire and respect your great wisdom.

Antarctic name decisions. The first one, in 1947, was a landmark. For each name the Board gave all the information it had after three years of concentrated research on the nature and location of the feature and the circumstances of naming, and offered to reconsider any name if anyone could supply better information. In some cases that happened. More importantly it inaugurated the wholehearted international cooperation in name fixing that replaced bitter controversy.

The volume was put together by Fred Alberts in the Geographic Names Data Base Division at Defense Mapping Agency's Hydrographic/Topographic Center, and is published with financial support from NSF. It is for sale by the Superintendent of Documents and is a bargain at any price. (\$13.00, Stock number 038-000-00471-9, Government Printing Office, Washington, B.C. 20402.) Your President gave a talk to the Society some years ago praising the men who had done the work. A special Advisory Committee has passed on every name and in the early days did most of the research. Members of the Committee from its start till now were or are: W.L.G. Joerg, Capt. Harold E. Saunders, Lawrence Martin, Kenneth J. Bertrand, Herman R. Friis, Paul A. Siple, Albert P. Crary, Henry M. Dater, Morton J. Rubin, Kelsey B. Goodman, Walter R. Seelig, Alison Wilson, Jerome R. Pilon, William R. MacDonald, Peter F. Bermel and Luther W. Wheat - a blue ribbon crew indeed.

A rumor was going around that there was a tragic accident associated with the publication. Fred Alberts personally checked everything over and over and over and over, unwilling to release it till all was right. They finally had to take it away from him by main force, the rumor went. As the truck rolled away someone noticed blood dripping from it. Horrified, they saw in the truck Fred's right arm with the hand still clutching the manuscript. Shouts were heard and there came Fred pursuing the truck and yelling that there was one more check he wanted to make! They wouldn't stop for him. If they had, he would surely have caught the three errata (three in almost a thousand pages) that are acknowledged. But the rumor was a gross exaggeration anyway. I saw Fred after this was reported to have happened and his arm was still there. Only part of one finger was missing. Funny how rumors get started.

M.F.B.

#### B E R G Y      B I T S

I wanted out of Bergy Bits, and I still think a change would be good for the organization, but apparently no one surfaced who wanted to write this column. New blood is always good, as it brings with it a certain vitality and renewed vigor, wiping the slate clean for those who have been antagonized by the writings of my pen. I still hope that this person will come forth during the normal evolution and growth of this- organization, and trust that such will be the case. This Society is full of professional writers and people who are working in the polar arena. I don't fit in either category. What scares me about the Society is that we have a Board of Directors, and that we are bound by their decisions. I don't trust anything done by committees, as I'm one of those who feel that a donkey was made by a committee trying to make a horse.

Our Society is made up of so many different types of Antarcticans that it is difficult to cover the waterfront in each issue. As anyone who regularly reads this

column knows, I favor the good old boys, because I feel they made this all possible for those of us who followed them. I probably represent the transition Antarctic forces, being between the discoverers-explorers-scientists of the Byrd expeditions and the bisexual airborne summer-emphasis-scientists of today. I'm glad I had the opportunity to go to the ice on board a ship, and never had the temptation of living in a building with anything more feminine than a bitch (dog, that is).

Our kickoff speaker this month is an interesting character, a man I've been trying to get to speak to us for three years - old Fred Milan, known far and wide as Dr. Muckluck. A lot of Eskimos believe he is one of them, but actually he is out of the backwoods of New Hampshire. He was the really first American physiologist to winter over in the Antarctic, being at Little America V in 1957. He set up shop across from the mess hall and outside the dispensary, and his cubicle was like the corner drugstore with people - including the late Sir Hubert Wilkins when he was in camp -- always in there telling stories, or, as generally was the case, listening to old Muckluck tell stories, some of which may even have been the truth. He had supposedly lived with the Lapps several winters, but no one in camp knew anything about the Lapps, so we had to take him at face value. He loved to tell stories about Mt. Wrangell and the muscular feats of Hugo Neuberg. And there were plenty of Bucky Wilson stories, too. He talked about Lowell Thomas, and how he had skied for him in a movie. Later on I had an opportunity to query Lowell on this one, as Lowell was the dinner speaker at a symposium which my office (Quartermaster Corps Research and Development Command) ran on "Man Living in the Arctic". After the banquet, held at the Museum of Science in Boston, was over I took the liberty to ask Lowell if he really did know old Muckluck. And I be darn if he didn't, as he answered, "Freddie Milan, the greatest acrobatic skier in the country!" We just hope that Muckluck doesn't get lost in Eskimo stories, as they're really his bag now. I doubt if there's an Eskimo in Alaska who hasn't felt the coldness of one of his rectal thermometers. He has become this country's leading honcho on "circumpolar people" and headed up the U.S. Program on Circum-polar People during the International Biome Programme. Only a Milan could love Wainwright, Alaska; he and his team of circumpolarites went back there summer after summer. What Bentley is to Antarctic glaciology, Milan is to Circumpolar People. Let's hope that both of them will finally get it done right before they pass on! Fred has just come back from an international meeting on Circumpolar People in Copenhagen, and he will be hosting the next such meeting in the Institute of Arctic Biology at the University of Alaska in a couple of years. We actually changed the title of his talk from "Recent Studies on the Human Biology of Arctic Eskimos" to "Recent Studies on the Human Biology of Circumpolar People" so it would look more consonant with the title of our august organization. We trust that he will talk on the results of some of his pioneering work at Little America. At least two of us here in Washington, old Bert Crary and myself, were his test subjects. Some good stories came out of those tests. However, I have never quite forgiven old Muckluck for putting me into the group of "old indoor workers". That hurt then, and it still hurts! Muckluck went directly from Little America V to join a team of investigators studying the aborigines in and around Alice Springs in Australia. The next year he was back down south studying those exceedingly tall natives somewhere in Terra del Fuego. Later on he became an expert on how the Eskimos in Greenland contacted social diseases through their Latin American Connection. He has been in and out of sundry schools, colleges, and universities, including Copenhagen, London, Oregon, Alaska, and Wisconsin. He worked on top of Mt. Washington once upon a distant past, and has done extensive flying in Alaska. Old Muckluck has traveled all around the world, but married an anthropologist from the sidewalks of Brooklyn; together they have raised a horde of smaller anthropo-sourdoughs while living in Fairbanks. His bride of some twenty odd years accompanied old Muckluck to Europe this summer (he said the best

looking women, anthropologically speaking, that is, were in Nice), and they made the grand circuit on the continent. Muckluck sort of mumbles when he speaks, as he hasn't spent that much of his lifetime in 20th century civilization, preferring the habitats of Homo sapiens primeval. But he is an interesting cuss, and you shouldn't miss him!

**BAD NEWS:** Your Society is not making enough money for a good self-respecting, not-for-profit organization, and the Board has voted reluctantly (not really) to increase membership dues; from \$4 to \$6 for out-of-town members, from \$5 to \$7 for local members, but keeping the same rate for BAEI and BAEII members. Because of the increased cost of xeroxing our Newsletters which went up 35% this past year, we had to do something. We actually lost money on out-of-town members last year. People who joined after the first of February last year will get a "free lunch" with no assessment for 1981-82 dues. We're going to change the billing format and send out individual billings like a professional organization. The first notice will be sent in October; a second and final notice the end of November. That will be it! If we don't get a response from the second mailing, we will drop the delinquents. With the cost of Newsletters running around 60 cents an issue we can't afford to send them out for a whole year to those who aren't renewing. We have advanced payments for 1981-82 from 140 members. They will not be billed for an additional amount, but we do hope they will return the form being mailed out, as we are also asking for much needed, biographical-type information which will tell us more about the total constituency of the Society so perhaps we can better determine what kind of stories to put into Bergy Bits. We know who approximately 95% of you folks are from previous submissions, but some are just names on our roster and we want to get to know you and your likes/dislikes. And if it's any consolation to you who may not like the increased dues, remember that Ruth Siple types these Newsletters gratis on an IBM Selectric which she personally bought (secondhand) just to do the Newsletters; and there's a lot of running around, too, which never creeps into Society billings. We feel we have a great Society, are justifiably proud of our strong lecture program, have a gala dinner party-Memorial Lecture extravaganza in the spring, a Mid-winter picnic in June or July at a fabulous retreat, plus the Newsletters which hopefully strike a responsive reading chord. So count your blessings when you get the bill, and pay up!

We have over 400 paid-up members now. That's great until it comes time to stuff envelopes, and then it becomes a chore. In four years we have grown from 150 paid to 406. The best news to me is that we don't carry over deadwood, and that we don't have to send Newsletters to people who have no intentions of paying. That was a giant step forward.

It was good to go back to Stronghold for our almost-annual Mid-winter picnic, this one being held there on July 11th. The highlight had to be the appearance of our most distinguished Honorary President, Ambassador Paul Clement Daniels, who was accompanied by his better half, his very attractive and most sociable wife, Teddy. This was a real pleasant surprise. The day was one of great beauty, the Charlie Morrisons and the Mike Metzgars ran a most professional bar, and the food from Comus Inn was much better than what mother ever made. It was the kind of a day which resulted in Pete Burrill and Bert Crary grabbing a couple of gloves and going off for a game of catch. Miraculously both escaped the episode without injuries. Teddy Daniels is from Lafayette, Louisiana, home of Louisiana Lightning, the flame-throwing Ron Guidry of the New York Yankees. The day before the Ambassador had found himself in the company of some of those squares in the Division of Polar Programs at NSF who had never heard of Ron Guidry, and he began to wonder what kind of mortals worked in that office. The Ambassador is a red-hot sports fan, and plans his winter departure from Lakeville, Connecticut after his beloved

Yale football team has completed their annihilation of other teams in the Ivy League. Last year he got caught with his pants down when a snowstorm came just before the Princeton game. But what's a little old snowstorm for an Antartic Bull Dog?

The 11th Consultative Antarctic Treaty Meeting was held in Buenos Aires in July. Probably the biggest happening, at least within the meetings, was a decision to hold a special consultative meeting(s) to construct an international regime for development of Antarctic mineral resources. They also took some routine actions like urging early ratification of the convention on the Conservation of Antarctic Marine Resources (Australia, Chile, Japan, South Africa, and the USSR have ratified). They need eight nations to concur before it can be put into effect. Our position awaits action by the Senate Foreign Relations Committee. That figures, doesn't it! The 20th anniversary of the entry into force of the Antarctic Treaty on June 23, 1961 was recognized, and regrets were conveyed on the crash of the DC 10.

Hey, you BAEI and II men of steel, can you believe this one? They had a mid-winter airdrop at both McMurdo and the South Pole on June 22nd. How about that! A C141 flying out of Christchurch dropped 13,029 pounds of mail and cargo at McMurdo, and then went on to the South Pole to drop 2,760 pounds. The flight takes on added significance when you realize that they also dropped some badly needed spare parts. The aircraft had to be refueled in the air, but I guess that is old shoe nowadays.

Either the last flight of winter or the first flight of the austral summer, take your pick, called WINFLY, was made to the Antarctic during the last week in August. Price Lewis was the senior representative from the Division of Polar Programs. Meanwhile that Homing Penguin, Walt Seelig, is preparing to return with Penguinee Jo to their rookery in New Zealand for another year of hard, hard work. That's too good an assignment for old Walt - he doesn't deserve anything that good. When are you ever going to retire, Walt? George Fitzsimmons, young but veteran Antartic via Antarctic Services Corporation and Holmes & Narver, has been selected to fill the big boots of old Jerry Huffman. Can he cut the mustard like Jerry?

Although it is not the Antarctic, the groundswell might eventually affect it, Senators Murkowski, Stevens, and Jackson introduced a Senate Bill (#1562) on July 31st for "Arctic Research and Policy Act of 1981". The interesting part is Sec. 6(a)1 which states "There is established an Arctic Research Fund into which there shall be paid one per centum of all revenues received by the Federal government from disposition by sale or lease of any interest in the Outer Continental Shelf located off the coast of the North Slope of Alaska and in lands on the North Slope of Alaska." One of the reasons for this bill is to try and preserve the Navy's white elephant at Barrow, a multi-hundred unit complex called, among other things, the Naval Arctic Research Laboratory. They have been trying to kill it and bury it for half a dozen years, but like Harry's body in that early Shirley MacLaine delightful film, "The Trouble with Harry", it just refuses to roll over and play dead.

An ice core is an ice core is an ice core, or is it? Not really. Like women, some are better than others. They got a real good one at Dye 3 in Greenland this summer, an excellent core all the way through to bedrock at 2,037 meters (6,683 feet), 100 per cent recovery. This is the second longest ice core ever obtained (Byrd Station core was 127 meters longer). The core became increasingly silty after 2,009 meters and contained pebbles up to a centimeter in diameter. They think the age of the oldest ice is 130,000 years old - previously thought it would be only 100,000 years. But what is - 30,000 years when you are an ice core?

The Institute for Scientific Information in Philadelphia recently completed a survey for the Division of Polar Programs at NSF relative to who was writing about

Antarctica. Here are the top five for the period 1961-1978:

Journal Geophysical Research	7,450 citations	357 articles
Nature	2,498 citations	234 articles
Science	1,980 citations	123 articles
Antarctic Journal of U.S.	1,233 citations	498 articles
Earth and Planetary Science Letters	1,041 citations	88 articles

Mort and Rosa Rubin, he of Mirny 1958 and one of our Past Presidents, are now holed up in England for a year (7 Croft Lodge, Barton Road, Cambridge CB3 9LA) where Mort is keeping busy at the famed Scott Polar Research Institute doing background research for a paper on the meteorological and oceanographic observations of Antarctica, dating back to Cook's voyages in 1772. He and Rosa did take off for a month this summer to go to Scandinavia. Meanwhile, back in Geneva, Gordon Cartwright (Mirny 57) stands fast. We understand that he got mugged here in Washington when he came "home" last January. They thought he was a wealthy Swiss banker, I guess. Now Gordon will never leave Geneva.

We are indebted to both Richie Williams and Bob de Violini for sending us copies of the report by the New Zealand Ministry of Transport Office of Air Accidents Investigation on the crash of the DC 10 on Ross Island, November 28, 1979 which appeared in the May 11th and June 8th issues of Aviation Week and Space Technology. They place the blame for the crash "on a decision by the captain to continue the flight at low level towards a snow covered area with poor surface and horizon definition when the crew was not certain of their position." As mentioned in Bergy Bits in November 1980, the flight plan route entered into the company's base computer was changed after the crew's briefing and was a "factor that could have misled the flight crew about the aircraft's position while descending to lower altitudes." The report went on to say that "the position on the computer printout for the airfield at McMurdo was incorrect by over 2 degrees of longitude, or approximately 28 nautical miles. The error was subsequently corrected the day before the flight, but the crew was not briefed on the flight plan change the morning of the flight." Conversations among the crew from the cockpit voice recorder indicated that the crew thought they were descending some 20 nautical miles to the west of Mt. Erebus over McMurdo Sound. For those who want to read about the investigation in some detail, go to your local library and read the two issues of Aviation Week and Space Technology, May 11 and June 8, 1981. What a black day the 50th anniversary of the first flight over the South Pole turned out to be for the great White Continent!

Women of Antarctica, Arise! Your New Testament, according to the Scripture of Saint Barbara of Land, has been published by Dodd-Mead for the unheard-of-today-low cost of \$8.95. *The New Explorers, Women in Antarctica* is an easy to read book and pleasing to the eye, being profusely illustrated starting with cover jacket woman Gisela Dreschhoff, and, as they appear in the book, Christine Muller-Schwarze, Lois Jones, Eileen McSaveney, Kay Lindsay, Terry Lee Tickhill, Mary Alice McWhinnie, Charlene Denys, Julia Vickers, Irene Peden, Rosemary Askin, Yuan DeVries, Audrey Haschemeyer, Rita Mathews, Jennette Thomas, Jane Colin, Valerian Kuechle, Donna Oliver, Nan Scott, Michele Raney, Ursula Marvin, Rosili Ocampo Friedman, Katharine Cashman, Caroline Deegan, Martha Wolfe, Martha Kane and Julie Ann Sanson. And let me tell you old timers, there are some darn good looking ones in that bunch. No one in his right mind would pick a Bud Waite over a Rosemary Askin, a Dick Cameron over an Irene Peden, a Bert Crary over a Gisela Dreschhoff, or a Larry Gould over a Christine Muller-Schwarze. However, it was a mild sort of self-torture for this avowed, declared Antarctic male chauvinist to leaf through this book and realize that it's not only a new ball game today but that they (women) are here to stay. The book starts out quoting Harry Darlington telling bride Jennie, "There are some things

women don't do, they don't become Pope or President, or go down to the Antarctic." On page 221, the very last page in this small book, it quotes Jennie some thirty years after being one of the first two wintering-over women (Jackie Ronne, of course, being the other) as saying, "Taking everything into consideration, I do not think women belong in Antarctica." But the bottom line, with which the book concludes, is a quote from Sister Mary Odile Cahoon, the unknown half of the McMurdo wintering-over female twosome in 1974, as she foresaw the new role of women in Antarctica, "If women are in science - and science is there, then women need to go there as scientists." The book is essentially sixteen chapters of short, stories about prominent women of Antarctica:

- Chapter 1. Frozen Laboratory - General
- 2. At Home with 300,000 Penguins - Muller-Schwarze
- 3. Pioneer Camp: For Women Only - Jones
- 4. Seagoing Scientists - McWhinnie and Denys
- 5. Signal from Longwire - Peden
- 6. A Fragment of Gondwanaland - Askin
- 7. Nature's Antifreeze - DeVries
- 8. Fundamental Question - Haschemeyer
- 9. The Voice of the Seal - Thomas
- 10. The Longest, Coldest Night - Oliver
- 11. Too Cold for the Common Cold - Scott
- 12. Radiation Detective - Dreschhoff
- 13. Catch a Falling Star - Marvin
- 14. Martian Garden - Friedman
- 15. Fire and Ice - Cashman
- 16. Equal Partners - General

This book is only concerned with the modern era, and for all practical purposes begins with Christine Muller-Schwarze. Jackie Ronne was never interviewed which seems like a major oversight. I had hoped to find something on Davida Kellogg after having received a couple of delightful letters from her. I was also hoping that perhaps Susan Patla might be mentioned.

When we think about Antarctic meteorological observations we naturally think about good old Floyd Johnson who wintered over with Paul Siple at the South, Pole in 1957, went back to the same station for some more seasoning, and then went down with the Argentines for two more winters. Well, he actually didn't go with the Argentines for two years, but ended up staying there when they couldn't get ships in to relieve the station. The U.S. considered flying a plane across the continent to evacuate Floyd, but they never really considered it very seriously or for very long. As I recall it there were multiple women desiring that Floyd be brought back out, and our government decided for his own best welfare that he'd be better off wintering over for one more year. One wanted to divorce him, one wanted to marry him, one just wanted to play with him, and only the Lord and Floyd know why the rest wanted him back. Floyd retired from the National Weather Service in 1979, but found that retirement was not for him. He is now in charge of establishing a telemetered flood warning system for central Arizona and says it is "the most fun I've ever had." Now get off it, Floyd, we know you had more fun than that back in Christchurch in January 1957 as we were there with you. Is a flood warning system in central Arizona like establishing a blizzard alert system in the Amazon? I hesitate to give you Floyd's address as there might still be some women out there looking for him, but he's a big boy so here it is: Route 2, 608 Ironwood Drive, Buckeye, Arizona 85326. Old Leo (Byrd 57) Davis is in charge of the old Coast and Idiotic Survey station in Tucson where old Ron ( Little America 57) Viets had many illustrious and exciting years. Wonder where old Ron is? He retired about seven

years ago, but went back to work in a hurry when his mother-in-law moved in. He was so desperate that he took a job with Holmes and Narver on Johnson Island and from there went on to Korea. Now anyone who would go to those places is a real mother-in-law hater!

Arthur Knox, who describes himself as a former close colleague of old Bob Nichols in the Geology Department of Tufts College, has sent us an unsolicited but most welcome account on how the highest elevation in Antarctica was found by map makers of the U.S. Geological Survey. As you will read, the now retired Arthur Knox was right in the middle of it all when in 1960 he was the supervisory cartographer in charge of mapping the topography in the Ellsworth Mountains. But let's let Arthur tell it all to you:

Two important geographical discoveries were made in 1960 by members of the Branch of Special Maps of the U.S. Geological Survey. These discoveries are unique in that they were made largely with the use of modern photogrammetric procedures developed and used during World War II.

In 1958 William H. Chapman, a topographic engineer with the USGS, on a traverse party from Byrd Station in the Antarctic, established the heights of the principal peaks of the Sentinel Range in the Ellsworth Mountains, but because of cloud cover or because the southern part of the range was concealed by the other peaks, the height of the high unnamed mountain mass in this area was not determined.

In the following year the U.S. Geological Survey was authorized to make three topographic maps of this largely unmapped region for the first of a series of 1:250,000 scale shaded relief maps of the Antarctic. These maps were to be made by photogrammetric procedures using aerial photographs taken by the U.S. Navy from an altitude of 20,000 feet. The main geographic controls for this mapping project were the mountain peaks whose positions and heights had been established by Chapman.

In 1960, during preliminary studies of the aerial photographs for this project, Arthur S. Knox noted that the peaks on the unnamed mountain at the southern end of the range appeared to be higher than any of the others. Out of curiosity, using the Wilson Photoalidade and the control established by Chapman, he found that the highest peak on this mountain was in fact several hundred feet higher than Mount Tyree, previously established as the highest point in the range. Knox's elevation for the high point, 5,140 meters or 16,860 feet, is now shown on published maps and in current reference works. The elevation was checked by his associates, who unofficially named the feature Knox Peak. This peak was later established as the highest point on the Antarctic Continent and the mountain mass was officially named Vinson Massif in honor of Carl Vinson, the former Chairman of the House Armed Services Committee.

The elevation was first published in 1961 on the first relief model of Antarctica, and in 1962 on the Vinson Massif Quadrangle, the second of this series of shaded relief maps.

However, it was still believed by some that Mount Tyree - a nearby mountain - was the highest elevation in Antarctica until 1966, when an American mountain-climbing expedition headed by Nicholas B. Clinch first ascended the highest peaks of this mountain range (National Geographic, June 1967) and found that the highest point on Vinson Massif was indeed

several hundred feet higher than Mount Tyree.

During the preliminary mapping of the Vinson Massif Quadrangle in 1960 Knox also found, with the use of the Wilson Photoalidade, that the elevation of the glacier ice at the base of the Sentinel Range, shown as Edith Ronne Land on then existing maps, was at or near sea level, thus indicating that the Filchner Ice Shelf extended inland 200 miles south and southwest of its previously mapped location to the base of the Sentinel Mountains and the Antarctic Peninsula, then known as the Palmer Peninsula. This discovery resulted in reshaping the maps of this part of the Antarctic Continent and, according to the New York Times report of August 23, 1961, it made the Antarctic Peninsula the longest promontory in the world.

Because of this discovery the name Edith Ronne Land was no longer applicable for this shelf area, so it, as well as the name of the main ice shelf, was changed to Edith Ronne Ice Shelf and later by the U.S. Board on Geographic Names to Ronne Ice Shelf in honor of Commander Finn Ronne, who had explored the eastern part of this shelf several years previously, and also in honor of his wife Edith Ronne and his father Martin Ronne, both of whom had played prominent rolls in Antarctic exploration. The name Filchner Ice Shelf, however, was retained for a smaller ice shelf east of Berkner Island. Thus, because of the discovery of the inland extension of the ice shelf, the name Ronne Ice Shelf replaced the name Filchner Ice Shelf as the name of the second largest ice shelf in the world.

Thomas Kellogg at the University of Maine sent us last spring a three-page single-spaced treatise on his favorite polar books - which you will hear about in a subsequent Newsletter - but he wanted readers of Bergy Bits to be aware of the notable publication by two non-members of the Antarctic Society, George Denton and Terry Hughes, which could turn out to be a collector's item in spite of its cost of \$95. The book *The Last Great Ice Sheets* is published by John Wiley, and is a thick tome bound in blue heavy-duty cloth which includes about 50 fold-out maps. Tom wrote, "I might warn that this will be a classic, partly because of the large scope and wealth of information provided, partly because it introduces a large number of new and controversial concepts relating to the growth and disintegration of ice sheets, and partly because Wiley is printing only 1700 copies (and they told George that they would never reprint it). "The book" was compiled as part of the CLIMAP Project, originally to document the extent of all the ice sheets and their volumes. The book grew to include Terry's modeling of the ice sheets using his unique (and underrated) methods and concepts, and includes a discussion of just about every Late Wisconsin (or Wurm, or Weichselian) moraine on the globe. It also includes a long chapter detailing the results of George's numerous field seasons in Antarctica." Now let us turn to Science, 1.4 August 1981 where Charlie Bentley critiques the publication on pages 752-3. He is quite a bit less magnanimous in his review. In an unpunctuated 41-word sentence Charlie wrote, "Once it is recognized that the book marries a comprehensive and even-handed review of the evidence for glacial extent to an unbalanced and speculative glaciological interpretation thereof it can be embraced as an important and fascinating contribution to the literature." I think what the new chairman of the National Academy of Sciences' Polar Research Board actually said was that *The Last Great Ice Sheets* has its limitations but in a speculative science such as glacial geology it has some merit. Is that \$95 price tag a record for a current publication on Antarctica?

Sayed El-Sayed appears to be a modern day marvel with the way he has cranked up all this international enthusiasm in biomass. His Biomass Newsletters are gems. FIBEX found ten ships cavorting around the Southern Ocean last January-March (and none rammed another). There is a Post-FIBEX Data Interpretation Workshop about to convene in Hamburg (21 September - 9 October). No longer do fathers send their sons off to join the Navy to see the world, they send them to Texas A&M and tell them to become biomassers in the Department of Oceanography. I hope we can get Sayed for a speaker this year, but the problem is that he is never home - the key to a successful marriage.

Twelve or thirteen American scientists, including our own Steve Ackley of the Cold Regions. Research and Engineering Laboratory (CRREL) at Hanover, New Hampshire, will be participating this austral summer (October-November) on a joint US/USSR expedition into the Weddell Sea on the Soviet ship SOMOV to study the Weddell Polynya, an area approximately 3 x 10 km near the Greenwich Meridian and 65° S where the ice cover is often incomplete or even absent. The expedition objectives are to define the conditions of the water column to a sufficient scale to permit development of a quantitative physical model of late winter processes. The polynya supposedly has important climatic and biological impact on the Southern Ocean, primarily related to the suspected increased activity of vertical transfer processes believed associated with the polynya.

Henry Heyburn, 3918 Leland Road, Louisville, Kentucky 40207, is compiling a catalog of picture postcards of the Falkland Islands and Dependencies and of Falkland related exploring expeditions for the period 1900-1950. To date Henry has about 300 different picture postcards plus about 46 expedition cards, including de Gerlache, Charcot, Nordenskjold, and Deutschland. He would greatly appreciate photo or xerox copies of both sides of any cards which any member may have, and he will gladly reimburse any costs incurred.

Harriet is Back! That's probably the most welcome news that has happened to Ant-arcticans this year. Yes, Harriet Eklund, the popular widow of the legendary Carl Eklund, our first president, has returned to the States from England where she has been living. I had never had the privilege of knowing Harriet, but this error of omission was corrected this summer when Ruth has us both over to dinner. She sure is a firecracker, and it is easy to see why she has such a strong fixation with Antarcticans, both men and women. She seems to have equal appeal to both sexes, as everyone loves Harriet. I dare say she might be the biggest drawing card in our Society, and I hope she will be able to get to Washington occasionally from her new residence in Michigan, (we don't have her new address yet).

Welcome Aboard to the following penguins who have joined the Society in 1981:

Charles Swithinbank	Arthur DeVries	Tom McIntire
Scott Borg	John Dugger	Irwin Hirsh
Kenneth Barker	Carl Wyman	John Bryson
Robert de Violin!	Jerry Smit	Leendert Kersten
Walter Giles	Joseph Lynch	Joan Gosink
John Stagnaro	John Millard	Jennifer Thomas
Gerald Webers	Tony Gow	Katherine Bouton
Horace Porter	Sig Gutenko	Dean Freitag
Alan Parkinson	Aileen Lotz	Priscilla Grew
Walter Sullivan	Bruce Parker	Adib Barsoum
Worth Nowlin	Tahoe Washburn	Richard Reynolds
Richard Pearsall	Joan Hock	Jane D'Aguanno
Colin Bull	Jane Ferrigno	
James Kennett	Rex Hanson	

# THE ANTARCTICAN SOCIETY

c/o R. J. Siple  
905 North Jacksonville Street  
Arlington, Virginia 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Presidents:

- Dr. Carl R. Eldund, 1959-61
- Dr. Paul A. Siple, 1961-2
- Mr. Gordon D. Cartwright, 1962-3
- RADM David M. Tyree (Ret), 1963-4
- Mr. George R. Toney, 1964-5
- Mr. Morton J. Rubin, 1965-6
- Dr. Albert F. Crary, 1966-8
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-1
- Dr. William J. L. Sladen, 1971-i
- Mr. Peter F. Bermel, 1973-5
- Dr. Kenneth J. Bertrand, 1975-7
- Mrs. Paul A. Siple, 1977-8
- Dr. Paul C. Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82

---

Vol. 81-82	October	No. 2
------------	---------	-------

---

The Antarctic Society is proud to announce that  
its Centennial Lecture  
will be

"A TALE OF TWO PROJECTS: RADIOACTIVITY AND SOLAR ACTIVITY"

by

Dr. Gisela Dreschhoff

Associate Director, Radiation Physics Laboratory  
University of Kansas

and

Annual Homing Austral Summer Antarctic, 1976-1981

on

Thursday, November 12, 1981

8 p.m.

National Science Foundation  
18th & G Streets, N.W.  
Room 540

Dr. Dreschhoff will be giving the 100th professional lecture of the Antarctic Society, speaking on her extensive field work on resource and radioactivity surveys in Antarctica by airborne gamma-ray spectrometry. Come and hear the Society's Cover Girl, who also serves as the official NSF representative to the German government for coordination of US/German polar programs.

An outstanding lecture!      Please come!      Help us celebrate!

\* \* \* \* \*

The Society deeply mourns the deaths of three prominent Antarcticans: Quin Blackburn, topographer, BAE I, 1928-30 (February '81); Frank "Taffy" Davies, physicist, BAE I, 1928-30 (September '81); and Gerry Pagano, polar archivist at The National Archives (October '81).

BERGY BITS

Bergy Bits is not to be construed in any way as a voice of the Society. It is the rambling, opinionated feelings on a variety of Antarctic or near-Antarctic subjects which happen to tickle the fancy of one member who likes to see his words in print. This space is looking for a permanent author, so the opportunity is there for any of you guys or dolls to step in and take over at any time. Contact the President.

This meeting on November 12th is an historic one as it will be our 100th lecture meeting. And only seven people did encores - Paul Daniels, Larry Gould, Dick Black, Bill Sladen, Bob Thomson, Ken Bertrand and Herman Friis. The first 99 included only one woman, the late Mary Alice McWhinnie, so it is probably appropriate that the 100th lecture should be by a woman! And it might hold off a seige of the Society's officers by ERAers. We hope to upgrade our refreshments on the 12th in view of the importance of the occasion, although don't expect the Jockey Club to cater. We want a really big turnout to savor the memories of the first hundred and to drink to the next hundred. We'll have a prominent Antartican talking to us on a most timely subject, so what could be better? We have hopes that Larry Gould might put in a cameo appearance as he will be in town for the Polar Research Board meeting. Wouldn't it be great if he could bring his bride of 50 years, Peg, along, too? She's a Society Loyalist and it would be good to have her with us. And we most certainly will have the welcome mat out for all the other members of the Polar Research Board, even though they are not as glamorous or as young-at-heart as Larry. So let's make it a really great turnout. Mark the date on your calendar now!

Dr. Davida Kellogg, the other half of that great Antarctic team of Kellogg and Kellogg, writes as fine a letter as comes into our Society's mail box. I think it is rather appropriate in view of our speaker this month to pull out one of Davida's past letters and do a little quoting about Antarticans. She wrote, "... people in the Antarctic are, according to my observations, divided not so much into males and females, but into those who understand and accept the responsibilities inherent in the privilege of working in the Antarctic, and those who did not. Most of the Antarticans I knew fell well within the first class. As far as I can tell the qualities of intelligence, judgment, courage, fortitude, and cheerfulness in adversity which made them so originate within the heart and mind which, as a biologist, I am reasonably certain are situated at some distance from the region of one's primary sex characteristics." How come all these women got so smart so quick!

We finally had a SRO crowd for a meeting, as old Fred Milan, alias Dr. Muckluck, spoke to 60 odd Antarticans on September 10th. We had a little help in swelling the attendance by Dr. Chester Pierce bringing along most of his Ad Hoc Committee on Polar Biomedical Research, and how they ad hocked in the question and answer period, speaking freely, intelligently and at length on questions raised by inquisitive attendees. It made for a real lively meeting, one which we thought was the very best in audience participation. We are indebted to old Muckluck for finally showing up, for Dr. Pierce in bringing along his committee (George Bartholomew, Bill Benninghoff, Norman Chance, Mim Dixon and Joan Ryan), and for the local members giving the meeting such strong support attendance-wise. Now we have to keep the momentum going, and that should be no problem with Gisela who combines science with beauty. So if your bag is not radioactivity you can just sit back and enjoy her native good looks which help decorate the cover of Barbara Land's new book, The New Explorers, Women in Antarctica, as well as Vol. 1, No. 3, Winter 1980/81 of The Woman Engineer. The Polar Research Board of the National Academy of Sciences will be meeting here in town that week, and we have high hopes that Charlie Bentley can be as persuasive as Chester Pierce in getting members to come

to our meeting that evening. Chester is a big old football player from Harvard, and his members saw fit to follow rather than challenge! Charlie isn't so macho strong, but can be real persuasive. We like to plan as many of our meetings as possible around activities of the Polar Research Board as it is always good to have the authorities around so we get the Gospel straight.

As indicated in our last Newsletter, our dues are going up and we are changing our method of billing by sending out separate mailings. About a third of our membership has already paid this year's dues and this will be so indicated on their bills. On the bill also are some questions about your Antarctican connections, as we want to find out more about our newer members and update data on those of long-standing. Hopefully we will attempt to make this column more responsive to the masses, and the only way we can do this is to invade your Privacy Act by requesting information. We don't aim to please all individuals, but we do want to try to hit the majority. The biggest single request we get is for more information on Antarctic science programs. That side of the street is properly cared for by the Antarctic Journal of the United States (\$7.50 per year for five issues put out by the Division of Polar Programs, NSF, Washington, D.C. 20550). I feel this column should be about Antarciticans, past and present, and some of the crazy things they have done both in and out of science. We recognize that we have a lot of polar philatelists, but there is no way in which we can give them any more information than they are already getting in their own tremendous Ice Cap News. Questionnaire responses will be tabulated and seriously considered and all be put into our databank on Society members for future use. So please, you all, return the form even if you have paid your dues! It should be rather obvious why we are raising dues. The cost of xeroxing (up 35% last year) plus postal increases have necessitated it. We hope to hold the fort with the increased dues for quite a few years, as we are trying to better manage our resources and now have an account with a local money market fund which pays good interest on money in hand. With over 400 members the Society is becoming big business!

Some old IGYers have been asking when we're going to have the 25th celebration. Well, I think it should be in 1983, in the spring time, in Washington. You know it's not only our anniversary, but it's the 100th anniversary of the First International Polar Year, and the 50th anniversary of the Second International Polar Year. I suspect that we can generate some local momentum once we Washingtonians (Crary, Ostenso, Cameron, Honkala, Taylor, Mogensen, Benson, Dawson, Krank, Mirabito, Fridovich, and others) get together and start talking. I had thought about retiring this fall and devoting some efforts toward a reunion next spring, but I've had a pretty good boondoggling assignment for the past six months and am not quite ready to walk away from a full-sized paycheck every other Friday. My personal feeling was that it didn't matter too much which year we celebrate, either 1982 or 1983, as the IGY was both 1957 and 1958. And as I wrote before, if we all haven't made our pile by now, we're never going to have a pile. Besides drinking more goober beer, an important aspect of our reunion, I think we should have a scientific symposium of some sort as a centerpiece, one in which IGY scientists/pillars would speak on their disciplines, hopefully as they have developed on the ice. There aren't many Charlie Bentleys among us who have kept on going back for the sake of science. But guys like Charlie and Tony Gow, who have certainly walked out of NSF with enough dollars over the last quarter century, should have some revealing revelations. Kirby Hanson has made a pretty good living out of the South Pole, although I don't know if I'm prepared to sit through an hour's dialogue about the evils of carbon dioxide to the climate of my great grandchildren. John Annexstad could tell us how he escaped the Coast and Idiotic Survey and found fame and fortune picking up meteorites. Charlie Greene can tell how a good little old MIT

South Pole boy like himself ended up chasing whales in the Arctic. Then all of those aurora specialists from the University of Alaska must have the definitive word on auroras. And we have to have those summer scientists, too, as we need Gentleman Jim Zumberge to play the piano and to lead us singing ribald tunes of old. If we have a one-day science symposium, it could justify the college crowd coming here under the sponsorship of some grant. I think we should tie the reunion in with the Society's annual Memorial Lecture, although the Lecture should be reminiscing time with the platform being shared by such giants as Larry Gould, Bert Crary, Ned Ostenso, and Charlie Bentley. If Reaganomics haven't gotten the Academy's Polar Research Board, we could probably have a joint half-day open session with them, if we could talk them into having a simultaneous meeting. There is also a move afoot to have a series of geophysical-type movies made commemorating the 25th anniversary of the IGY. As I understand it, there won't be one on the polar regions per se, but we'll be able to find ourselves in films on the solid earth, the oceans, snow and ice, or whatnots. These films should be ready for public showing by the spring of 1983, I think. Anyway, we have allies who have key positions in establishing a national/international recognition of the IGY, and they should be able to keep us informed. Hugh Odishaw of Odishaw Sends fame, plus Alan Shapley, Line Washburn, and Pern Hart are in this thing up to their knees, and maybe we can play a tune when we get organized which will strike a responsive chord or two from them. I have a love affair with the Air Force Band and the Singing Sergeants, and perhaps we could get Senator Harry Byrd or someone with clout on the Hill to get them to come and play/sing as an introduction for the evening. I recall the Navy Band played at the Byrd shindig in Winchester two years ago. There are enough Antarcticans around town so we should be able to put up all strays coming from the boonies. There are enough party boys in town, Bert Crary, Rudy Honkala, and Dick Cameron, so that reunion aspects, would not be washed out of the picture. But in the meantime, how about writing us your thoughts? I know guys like Blackie Bennett don't own a pen or don't know how to type, but there's no excuse why their XYLS can't answer for them. After all, if we hear from the women themselves, we are really hearing from the true decision makers anyway. WRITE! WRITE NOW!

Shouldn't the Antarctic Society have its own official Antarctic bird? and what better one than the Skua, favorite bird of one of the founders, the late Carl Eklund? If memory serves me correctly, Carl did his PhD dissertation at Maryland on the skua. The skua has character, and isn't overworked like the ubiquitous penguin and Mt. Erebus. Ed and Priscilla Grew sent out a great Christmas card last year with a picture of a skua that Ed took in January 1980 when working out of the Australian National Antarctic Research Expedition's camp at Richardson Lakes. Their Christmas letter said, in part,

We picked this disreputable bird to stand in for a reindeer this year. The skua is a raucous, brazen scavenger, and it has been exterminated as a pest by some expeditions for preying on the poor penguins. But the south polar skua is also a symbol of the unity of the world and of our interdependence on the ecosystems of Antarctica. These birds, banded in Antarctica in January, have been recovered in Greenland in July and Baja California in September; they also fly to Japan and India. The fierce territorial defence by pairs of these birds keep them, according to some authorities, at a ratio of only one pair of skuas to thousands of penguins, thus preventing their penguin dinners from becoming a non-renewable resource.

So what do you think, folks, is the Catharacta maccormicki a good choice for the Antarctic Society's bird???

And now there are Seven. With the passing of Quin Blackburn and Taffy Davies, the 1928-30 Byrd Antarctic Expedition has been reduced to the Stalwart Seven: Larry Gould, Henry Harrison, Howard Mason, Eddie Goodale, Norman Vaughan, Ken Bubier and Dana Smith. There are eight others who served on ships: Leland Barter, Ed Roos, Alan Innes-Taylor and John Bird in the U.S., Carroll Foster in Iceland, and Neville Shrimpton, John Morrison, and Percy Wallis in New Zealand. There are some pretty rugged old boys in these groups. Norman Vaughan isn't going to grow old as long as they don't outlaw dog sledge teams. Larry Gould has an 18-year old twinkle in his eyes which has encapsuled him as a perpetual youth. John Bird came to one of our recent Memorial Lectures and he is as straight and as tall as a loblolly pine. Eddie Goodale is supposedly in good shape as he is an ardent sailor in the summer waters of the Gulf of Maine and the winter waters of the Caribbean. Henry Harrison is active professionally as a meteorological consultant, although he has slowed up on the base paths. Ed Roos writes us occasionally. He had a stroke several years ago that put his "starboard side out of commission", but otherwise feels well. We hear from Howard Mason, and he maintains a strong interest in the Antarctic and books on the 7th continent. Leland Barter no longer feels fit enough to go to the Antarctic, but enjoys his memories of being the Chief Engineer on the BEAR, and apparently enjoys the Society's Newsletters according to his faithful wife Mary who handles his correspondence. The next Newsletter will have tributes to both Quin Blackburn and Taffy Davies from former colleagues.

Have you seen the October issue of Inside? A free-lance writer and novelist (more the latter than the former) from Cambridge, Massachusetts by the name of David Roberts really did a hatchet job on the late Admiral Richard E. Byrd. The article is an excerpt from Roberts' forthcoming book entitled Great Exploration Hoaxes. The article in Inside has nothing new which has not been published or conjectured before. Roberts reviews all the comments by disclaimers who doubted that Byrd actually flew over the North Pole. I don't see it as any big deal one way or the other, as the North Pole has no character at all and is just more frozen ice. What's a hundred miles or so of ice when you are in a plane flying over it? Like the Dallas Cowboy cheerleaders, once you've seen one, you've seen them all! Maybe the real problem is that most of us never get to know a cheerleader or to fly over all that ice! Roberts did have a good quote from Bernt Balchen, though, which was to the effect that it didn't matter whether that little old Fokker, the JOSEPHINE FORD, actually reached the Pole, that Byrd was a great man who "dreaded a big dream." The article ended up saying 1) Amundsen, Ellsworth, Nobile, and their crew were the first to reach the North Pole, 2) that the first people to stand on the North Pole were Bert Crary and his colleagues on the Air Force C-47 flight of May 3, 1953, and 3) that Ralph Plaisted's snowmobile party (1968) was the first surface party to reach the North Pole. The more you think about people's lust today to get "inside" our public figures and national heroes, the more I am convinced that the price of glory and fame is too much for any mortal man to bear. There are those who decry the unavailability of the Byrd files to historians. Regardless of what they may or may not disclose, if I had the keys to them, I might be prone for a Latter Day Boston Harbor Tea Massacre with those files. There's a lesson to be learned from Nixon not burning the tapes. And don't we really know all that we need to know about the late Admiral? I personally think he should be allowed to lie in peace.

The October issue of Natural History (published by the American Museum of Natural History, Central Park West at 79th Street, New York, N.Y. 10024) devotes itself to "Keeping Warm, A Special Issue on Surviving Winter's Worst." If you are a real polar person, you aren't going to learn anything new out of this issue, although it is interesting. The article by John Hansen of the U.S. Army Natick

Research and Development Laboratories features a full-page picture of the "copper man" (who was a veteran when I joined that outfit back in 1954!). There is an article by Ed Kessler (Director of the National Severe Storms Laboratory in Norman, Oklahoma) on House Warming which brought back memories of when old Harry Wexler, Chief Scientist for the Antarctic during the IGY, was trying to talk certain individuals into going to Antarctica. Kessler, then a graduate student in meteorology at MIT, was one of those guys, and as I was going to Little America V in 1957 as the micrometeorologist, Harry thought the two of us should go to Washington for a week's training. So we hopped on the overnight Federal out of North Station and arrived in Washington bright and early on a Monday morning. I wasn't supposed to join Ed for the training program until afternoon, so went my own way that morning. When we met at noon Ed said, "There is no way I am going to that place. I'm catching the next train back to Boston." And he did. Wexler was a better talker than he was a judge of polar people. One fellow he talked into going to Little America V was Bill Moreland who just happened to be in Harry's Washington car pool. Never was a man more ill-fitted for the Antarctic than old Bill, who ended up as head of Weather Central which he ran like a stateside operation. He never went outside a single time during the four-month sunless period, although he would listen intently when you walked in and spoke of the glories of an ongoing aurora. He never even went outside for the lowering of the flag at the end of daylight, saying "I never put it up." One of my biggest shocks (outside of marriage) was that this same guy, who was truly a miserable soul in the Antarctic, was really a delightful guy back here in the States. I ran into him at a meeting in Berkeley and had a great time with him. He could often be found (at meetings) sitting alone drinking in the cocktail lounge, and I often wondered if he were still brewing over letting old Harry Wexler talk him into going to the ice. One more Harry Wexler story. The Weather Bureau sent down this technician from Portland, Maine by the name of Chet Twombly to run the radiosonde tracking equipment at Little America V in 1956 (prior to the IGY). When we arrived at Little America V, Chet had his bags already packed and was at the door as we walked in. Wexler said to him, "Chet, I'd like to have you check out Sam Wilson on the GMD." Chet didn't bat an eye and said, "It has been a damn long winter, Harry, and I sure don't want to miss that ship", and he picked up his bag and headed for the chopper to the CURTISS! Antarcticans are such delightful characters, and that Sam Wilson was one of the biggest. He was a last-minute replacement when the "head shrink" threw out someone. Sam was found in some midwestern bar, and probably is back in that same bar today. He hated the Antarctic so bad that on the way home he paid for his own passage from Honolulu to the States (rather than wait an extra day for a free trip) just to put more distance between himself and the Antarctic! Would love to see old Sam, as he sure had some great stories.

U.S. News and World Report, September 21, 1981, had a pictorial article on Transglobe. They are supposed to be in Alert now, where they will spend a month in canvas and wood huts. They are scheduled to start across the Arctic ice in February with an April North Pole due date. Charles Burton, speaking of their Antarctic crossing last year, said, "The journey was nobody's idea of pleasant. Our complaints included raw backs, swollen knees, split fingers and noses, frost nip, cracked lips and severe windburn blisters." What did he expect, a walk on his tip toes through a tulip patch? The leader, Sir Ranulph Twisleton-Wykeham-Fiennes is complaining, too. He said, "Financially it's been a personal failure. I've used 10 years of my life when normally I'd be climbing the ladder of a company." Transglobe must have been something like a marriage - you enter full of all kinds of hope and joyful anticipation of all the excitements ahead and then you get into it and realize it is full of crevasses, sastrugi, and pressure ridges, with some frigid days and some boilermakers, too. But aren't we all a bit responsible for whatever fate has bestowed upon us?

A copy of an interesting letter from George Bernard Shaw to Apsley Cherry-Garrard, written on April 26, 1922, has recently been brought to my attention. Reading the letter, and then going back to *The Worst Journey in the World*, I feel pretty certain that the letter had to be about Chapter XIX, *Never Again*. It seems that Cherry had expressed some concern that the discrepancy in style in the chapter was so noticeable that the public would be suspicious of Shaw's collaboration, so GBS (as he signed the letter) made some changes and in this letter tried to reassure Cherry that everything would be all right! Shaw wrote, "The chapter is all right now: the discrepancy of style is no longer noticeable, as you have got the middle of it, which is the part that tells, quite characteristic." Later on in the letter he wrote, "You need not be at all uneasy as to the integrity of your authorship. All books that deal with facts and public controversies are modified by consultation, mostly to a much greater extent than this one." I think Cherry-Garrard was smart as a fox in going straight to Mecca to get help on his book. In today's world, he would have gone to Larry Gould, America's gifted man of words about the polar regions. I reread Larry's *Cold* this summer, and I think this book is one of the world's best kept secrets; it has suffered from its limited publication (the publisher went bankrupt during the depression). But *Cold* is truly an outstanding book, and the chapter about how they lost that little Fokker out there in the Rockefeller Mountains is most interesting. I hope Charlie Murphy upgrades his priority on his planned book on the 1933-35 expedition, as I can't wait to read that one. Charlie writes us from time to time and all of his letters are masterpieces, whether they are about the women of Vermont or the men of Antarctica.

Michele (South Pole '78) Raney finds Antarcticans facing her everywhere she turns. While dressed up in a 16th-17th century costume at a Renaissance fair, she was confronted by three "Antarctic" shirts heading towards her. Later an unknown intern asked her in an emergency room, "Is Dr. Muchmore still drawing blood?" And finally she met a well-known limnologist (Charles Goldman) who submerged a thousand feet in a submarine in Lake Tahoe, who said that his real claim to fame was making beer in McMurdo. Michele is off to Nepal in November, not to find more strange Antarcticans, but to attend a medical seminar. She met one of the biggest medical characters in Antarctic history last August when she ran across old Capt. Hedblom at an Operation Deep Freeze Medical Conference. I thought he was buried in the permafrost in Brunswick, Maine but he must have escaped. Meeting with all these Antarcticans stimulated a skull session with Dr. Braggett, the current Fleet Medical Officer, and has resulted in Michele wanting to compile Antarctic medical happenings/stories from past polar physicians and patients. So if someone did an appendectomy on you when you had tonsillitis, write Michele (125 North Las Palmas Avenue, Los Angeles, CA 90004) and tell her, the first South Pole Woman of the Long Night, all about it.

Antarcticans are a funny lot. They either hate to stay home or have a tremendous thirst for travel, and hopefully their other halves never find out which is the predominating force. Ruth recently received a card from Nick Clinch from Lhasa where he wrote, "Old climbers never die, just start leading treks." He wrote the card prior to departing the next day for Everest base camp. Then we had a card from Sayed El-Sayed from Hamburg where he was participating in a FIBEX Workshop which he described as, naturally, "a very successful meeting." Do you think Sayed is ever on campus? I doubt it very seriously. He says he could come to Washington and tell us all about FIBEX and SIBEX and TIBEX and ad infinitum if we could pay his way. We don't pay speakers nothing as we aren't rich little kids, but we do hope to get him on a "bootleg" when he is in town for a polar meeting. But first, you can be assured that he won't be here as long as there's some ship afloat in the Southern Ocean with a spare bunk, or a Southern Ocean workshop going on in some exotic foreign city. Gad, am I jealous of oceanographers. They really lead the

good life in the fast lane. I, myself, will never forget the exhilarating feeling, thirty years ago, of entering the port of Plymouth, England, after being knocked about in the North Atlantic for a month on a relatively small oceanographic research ship operated by the Woods Hole Oceanographic Institution. And to think these oceanographers get that kind of a high every time they enter a port. It's too good for them!

The end of an era came recently when the USNS ELTANIN was released to the Navy. She was the only ice-strengthened deep-sea research ship in our inventory, and this 266-footer now goes into ready reserve at Portsmouth, Virginia. Her record speaks for itself, having logged 521,000 nautical miles on some 3,722 days at sea between 1962 and 1979. She went on 66 research cruises, and completed what amounts to a circumnavigation survey of Antarctica. Her list of chief scientists reads like a Who Who's in the Southern Ocean, including the late beloved Mary Alice McWhinnie. The ELTANIN left her marks in physical oceanography, marine biology, geology and geophysics, paleontology, meteorology, and mal de mer. They are still totalling on the computer the number of bottles of Dramamine consumed on board.

Some Antarctic ships aren't so lucky as the ELTANIN and end up on the hot end of acetylene torches. The old icebreaker BURTON ISLAND, after over 30 years of polar service, was sold for scrap last year for a measly \$261,000. She was the first American icebreaker to enter McMurdo Sound (February 1947). The following year she was the flagship of Operation Windmill. She was the first American ship to visit Mirny in 1958. All together she made 14 Antarctic voyages. Then the Argentine icebreaker SAN MARTIN was sold for more scrap last year. And the old supply ship, the PRIVATE JOHN R. TOWLE, bit the torch last year after supplying both U.S. and New Zealand bases nearly every summer for 'some 25 years. But when we think of ships dying, you have to admire the way the BEAR took her own life at sea in a heroic act defying man's ignominious fate awaiting her at the end of her journey. I have the idea that the BEAR's record will never be duplicated, that she will remain a true legend in the annals of polar ships.

The South Pole is a great place for sun watchers as they have so much fair weather in mid-summer, there is little moisture in the atmosphere, and the pollution is just camp-produced. So it's no wonder that U.S., French, and Swedish astronomers have been converging on the South Pole in the past two austral summers to take observations of the oscillations of the sun. And they tell us they have found out as much information concerning the sun's interior as has been determined by astronomers in thousands of years. That's pretty impressive, I think, although I'm not quite sure in my own mind how useful it is to me to know that the region between the thin outer layer and the core has been found to extend to within 0.3 solar radii of the center, as opposed to 0.86 radii predicted by the prevailing model. They also tell us that the sun's chemical composition is now known to be much the same as that of other stars (earlier models had predicted a different chemical makeup). I'm glad there were Americans and Swedes with the Frenchmen, because after serving on the front lines with the F.F.I, during W.W. II there is no way I would believe what a Frenchman told me - unless it was where you could find a woman or get a bottle of either cognac or calvados.

Antarctica is a great place for scientists. Your chances of being funded down south are probably better than doing an investigation in Nebraska or New Hampshire. Remember when someone by the name of Jimmy was living on Pennsylvania Avenue and his Georgian teammates looked at the NSF funding being spent in the Peach State and the whole darn lot of them had apoplexy. Well, the USARP season is well underway for another year, with six round-trip flights inaugurating the season in late August. They took down 70,060 pounds of cargo and 194 scientists and support personnel.

Washington note of Antarctic interest: To the immediate north of our nation's Capital, there is a green park-like area which is a mid-summer delight with trees, a lovely fountain, and some of Washington's finest. Also there is a mounted plaque which tells us that someone by the name of George Washington bought this parcel of land on October 3, 1798 and that he subsequently built two brick buildings on the lot. (Perhaps he had visions of an early Holiday Inn, or perhaps he built them as a tax hedge.) Be that as it may, in due course this parcel of land and buildings fell into the hands of the famous Antarctic explorer, Admiral Charles Wilkes. He tore down the two buildings and built a larger single unit, and it was here on this glorious piece of Washington real estate, perhaps the choicest in town, that Wilkes lived within sight of Union Station and the Teamsters Union! A little bit of Washington trivia for you folks.

The autumn 1981 issue of The Wilson Quarterly, a publication of the Woodrow Wilson International Center for Scholars, has two articles on Antarctica, one by our own Peter Anderson of the Institute of Polar Studies at The Ohio State University entitled "How The South Was Won", and the other by a British-born beauty, Barbara Mitchell, "Cracks In The Ice". The titles are quite engaging, and breed excitement, but the texts are really for those scholars who are not true-blue Antarcticans. Peter's article is a history of how: Antarctica was discovered, and the most interesting part is a table of Antarctic firsts. Barbara's article treats everything which does not put on some form of a pant in the morning, namely, krill, oil, and those kinds of things which complicate treaties. Somehow or other Barbara snuck in a page about the South Pole Station which doesn't tie into anything else in the article. She didn't do her research too well, as she took the easy way out and said that the sun sets on March 22nd and rises on September 22nd. She never read Bergy Bits or she would have known better.

Congratulations to our Lee Winslow Court, who has 15 paintings in the Polar Collection at the National Archives, and must be the Society's Court artist, as he recently walked off (actually was awarded) with the John Singleton Copley Medal at a recent art show. It was the fourth bestowed in the last century. That's pretty good for a kid from Canton, Massachusetts. Lee was one of the founding fathers of "The Great Double Cross Corporation of Antarctica". He felt my double cross credentials were so outstanding that he swore me in as a new member last year. On a recent trip to Washington he called a local meeting of the XX at the Mellon Gallery where I had the pleasure of meeting his favorite penguin, who answers to Ruby. Lee spotted her in a rookery while on an early day Lindblad cruise, and thought that she would fit in real well with the decor in his homes in West Townshend, Vermont and Monhegan Island, Maine, so he propositioned this penguin and she accepted right then and there. Love Boat, Antarctica! Lee sold a baker's dozen of his landscapes to a, shall we say, prominent local law firm. So if you should happen to see an Antarctic scene in a local attorney office, it could be Lee Winslow Court's, husband of Penguin Ruby.

Last year we solicited lists of favorite Antarctic books from various members of our Society, and most of them appeared in Bergy Bits last year. Davida Kellogg, mother of Griffith Taylor Kellogg - isn't that neat! - has a pregnant (she said it was "large and growing", so it must be pregnant) library of polar books. Shackleton's South tops her list, and you can see she has a love affair with that expedition as she writes that "Shackleton's account is complimented and amplified by Worsley's" Endurance, Hurley's Argonauts of the South, and Lansing's Endurance. She ranks Scott's Voyage of the Discovery and Scott's Last Expedition as "all-time great narratives of Antarctic literature." Then she adds "another all-time great account", Cherry-Garrard's The Worst Journey in the World, followed by Maw-son's Home of the Blizzard, Nordenskjold's Antarctic, Gould's Cold, Ponting's

The Great White South, and Shackleton's Heart of the Antarctic. She also spoke of the high literary quality of Alone. She wrote that Otto Nordenskjold's book on wintering over on the Antarctic Peninsula in 1901-1903 is "a fascinating account" and has been translated into English (Archon Books, The Shoe String Press, Hamden, Conn. 1977). Davida gave us a bonus in her letter, she listed her top ten on the Arctic. But we are running out of space, so will just list them by author and title: Amundsen, Gjoa Expedition; Andree, Story of his polar flight in 1897; Bartlett & Hale, The Last Voyage of the Karluk; DeLong, The Voyage of the Jeanette (see also Ellsberg's Hell on Ice); Fiala, Fighting the Polar Ice; Greely, Three Years of Arctic Service; Kane, Arctic Explorations; M'Clintock, The Voyage of the 'Fox' in the Arctic Seas; McKinlay, Karluk; Melville, In the Lena Delta; Nansen, Farthest North; Peary, Nearest the Pole and North Pole; Worsley, Under Sail in the Frozen North (this is the same Worsley who sailed with Shackleton on ENDURANCE). She says for Arctic humor one should read Walter E. Traprock's My Northern Exposure: The Kawa at the Pole, And for North Pole controversy, she recommends Wright's The Big Nail. Incidentally, Davida is looking for first editions of Cherry-Garrard, Priestley, Armitage, Bernacchi, Borchgrevink, and Sir James Clark Ross. Anyone selling contact her at the Institute for Quaternary Studies, University of Maine-Orono, Orono, Maine 04469.

Herman R. Friis, former Director of the Center for Polar Archives, has graciously consented to write the following obituary on the late Gerald Pagano, beloved friend of all Antarcticans:

Gerald (Gerry) Pagano, 68, died in his sleep early Saturday morning, October 17, 1981, in Washington, D.C. He was born January 22, 1913.

He was in the U.S. Army 1935-36, and 1940 - Feb. 1965, much of the time as Chief Warrant Officer. His services with polar programs included Public Information Officer and Adjutant of the U.S. Military Base, Thule, Greenland 1955-56; Military Assistant to the Scientific Advisor of the Army Research Office, Office of the Chief, Research and Development, 1956-59; Technical Information Officer, U.S. Antarctic Projects Office, 1959-60; Assistant Plans & Operations Officer, U.S. Naval Support Force, Antarctica, 1960-65; staff of the Research Analysis Corp., 1965-72; Center for Polar Archives, The National Archives, Washington, D.C., 1972-81.

Gerry had a passion for research for which he was especially well qualified by \* temperament and intellect. With these commendable traits Gerry was a valuable source of knowledge, particularly about the polar regions. He generously shared that knowledge with colleagues and other interested parties alike. Gerry's, nearly thirty years of intimate association with agencies of the Federal Government responsible for our country's polar regions gave him a wealth of information in the subject field. His close association with Dr. Paul A. Siple during the 1950 \*s and 1960's gave him an opportunity to become well versed in the history of polar exploration. Gerry's enthusiasm was infectious and spirited. He has left an imprint of his competence on the optimum preservation of the papers of many notable polar specialists that are in The National Archives.

The U.S. Advisory Committee on Antarctic Names recognized Gerry's contributions to United States science and logistics in Antarctica by naming Pagano Nunatak in Thiel Mountains, Antarctica in his honor.

His membership in professional organizations included The Antarctic Society (Treasurer 1966-67, Board of Directors 1969-71), The Society for The History of Discoveries, The Association of American Geographers, and the American Polar Society.

The Antarctic Society extends its deepest sympathy to his wife, Gladys, and their sons, Tom, Terry and Tim.

Caution! This column may be detrimental to your health, so sensitive people should use it judiciously, taking it in small doses early in the morning, never before retiring at night. It has been said to include offensive material and, Heaven forbid, sexist rhetoric, so you are hereby forewarned. To the offended, there is good news. It would be much, much worse were it not for the cutting knife of your censor and our Society's doer, Ruth Siple. But Bergy Bits is not, never has been, and never will be the Voice of the Society, and is nothing more than what one member feels constitutes interesting items for our broad Society membership. When a new person surfaces who wants to take this over, it is all theirs. In the interim I am prone to say that a tiger does not change its spots overnight and that the style of Bergy Bits will remain essentially as it has been the past four years.

**REQUIRED READING.** As this is being written in mid-December, we have membership returns from about half of you, and have collected this year's dues from over 300 members. A second notice is going out with this Newsletter to those who have not replied, both for the dues and for the membership information data bank. Unlike previous years, we are not going to carry delinquents through the year, so if your form has a "Second Notice - Dues Not Paid", please pay or let us know that you are dropping out of the Society. The cost of running off Newsletters and mailing them prohibits us from keeping delinquents on our rolls. And, please, if you move or have a new zip code (which many of you in the Washington area have), will you advise the Society because no bulk mailings are forwarded and you will never get the Newsletters.

**SOCIETY CHANGES.** First, you will notice that we are using subject headings for the first time. This was a suggestion of the old biomasser, Sayed El-Sayed, seconded by Gordon Cartwright, and a compromise to those members who say the Newsletters are too long. This way they can pick and choose their reading material and have a Newsletter of their own choice in length. We categorically rejected as an awful time-wasting endeavor Hal Vogel's annual request for an index. The Newsletter results from two persons (Paul Dalrymple, the writer, and Ruth Siple, the typist) taking their own personal time putting it together, including labeling envelopes, stuffing envelopes, sorting by zip codes, and mailing. Any free time left over is spent answering Society mail which at times is appreciable. Indexing, nyet. We are introducing with this issue a classified section, which we plan to keep small and interesting. We hope that it will be popular.

**FISCAL CHANGES.** We have divorced ourselves from Riggs National Bank as they initiated all kinds of service charges which were detrimental to a Society like ours which handles about five hundred small checks a year. Our checking account is now with the Metropolitan Federal Savings and Loan in Bethesda where we not only get interest on our holdings but where we do not get stuck with service charges. And it's much more delightful dealing with personable comely lassies than with those three-piece-suited preppy types at the other place. Our non-operating holdings are in a money market fund (First Variable Rate) in Washington which deals primarily with U.S. Treasury Notes and Bills. Now this may sound like we're going big time, but we aren't. We are, hopefully, going to better manage your Society's meager holdings and hope that our interest gains will keep up with inflation and thus keep us from raising membership dues.

**SUGGESTION FOLLOW-UP.** Albert Armstrong, an old Navy type from Bureau of Yards and Docks who evidently was in on the design and construction of many of our

buildings in Antarctica, bemoans the lack of information in Bergy Bits on the physical picture of Antarctica from the viewpoint of "an engineer and/or architect". I brought this up with our Program. Chairman, Mort Turner, who has been involved with Antarctic matters- since time immemorial, and he suggested that the Society might be able to go through NST slide files and select outstanding shots, have transparency sets made up on different subjects, such as camp buildings; penguins, seals, skuas; shipboard scenes, aircraft operations; scientists at work; Erebus and other scenic wonders; and offer them for sale to our members. What do you folks think about this? Let us know, pro or con, as we don't want to develop this idea until we get a strong pulse reading from you all.

**AUTHOR OF BERGY BITS.** First, several have asked who in Heaven's name was writing Bergy Bits. The answer to that is quite simple, as I believe I do know my own name, Paul Dalrymple. My Antarctic connection is rather ancient and corroded by time, as I am an employee of the Corps of Engineers and regretfully am not involved now in any Antarctic activity. I was in Antarctica during the IGY, and if I achieved any notoriety at all it was the fact that I was the only married man to spend both IGY years on the ice (Bert was between marriages, Charlie was still single and had not yet met Marybelle, and the other "two-time loser", Mario, was still actively pursuing - with quite a bit of success - all the women in Latin America with marriage never entering his head). I was involved in the micrometeorological program at Plateau in the late 1960's, but my men went there while I wintered over in Natick, Massachusetts. So I have to rely on my old contacts plus people like Guy Guthridge and Tim Hushen to provide me with items for Bergy Bits.

**MEMBERS CLAMOR FOR SCIENCE NEWS.** This is prelude to the biggest demand of you folks, more science news. Again, the Division of Polar Programs at NSF puts out the Antarctic Journal which is the official organ for Antarctic science. We can't compete with it and we don't intend to, but it is available for those who want to subscribe to it (\$7.50 per year for five issues, one of which is a giant annual review of several hundred pages reviewing progress on all Antarctic research). If you want more information on it, contact Guy Guthridge in the Division of Polar Programs at NSF, Washington, DC 20550, or telephone him at 202-357-7817. I have thought of asking Dr. Todd if perhaps someone like Guy could write a couple of pages on late science news for each Newsletter, but maybe it's better to stick with freelancing of information as it gives more journalistic freedom of the press! If you want more information on foreign activities, there is nothing finer than the news bulletin of the New Zealand Antarctic Society, Antarctic. Jim Caffin does a truly fantastic job. The overseas rate to us is NZ\$8.00 (Secretary, NZAS, P.O. Box 1223, Christchurch, New Zealand).

**SCIENCE IS BLONDE AND IS SPELLED GISELA.** We had a near capacity crowd for Gisela Dreschhoff's lecture on "A Tale of Two Projects: Radioactivity and Solar Activity" on November 12th, but it took strong support from scientists in town attending the Polar Research Board's fall meeting to fill up the room. For the second meeting in a row, Bill Benninghoff of the University of Michigan was in attendance. Others from the Polar Research Board were Vera Alexander, Director of the Institute of Marine Sciences at the University of Alaska, Art Lachenbruch of the USGS in Menlo Park, E. Fred Roots of the Department of Fisheries and Environment in Ottawa, Bob Rutherford who is still Vice Chancellor for Research and Graduate Studies at the University of Nebraska, and J. Murray Mitchell of NOAA's Laboratory for Environmental Data Research. That good looking young girl with Murray was his athletic daughter, Kathy, from the Cathedral School in Washington. Fortunately for her, Kathy inherited both her mother's good looks and her athletic talents. The eminent American glaciologist, Mark Meier of the USGS in Tacoma, also attending the Polar Research Board meeting, came to our meeting. Kay Sterrett, Acting Director

of the Army's Cold Regions Research and Engineering Laboratory at Hanover, New Hampshire, and Ed Todd, Director of the Division of Polar Programs at NSF, helped to swell the ranks with more notoriety. The recently retired Executive Secretary of the National Science Board, Vernice Anderson, was also there. We certainly appreciate the attendance of out-of-town polar scientists as we strive to build our Society. We are justly proud of our strong lecture program, which we feel is just outstanding and on the very frontier edge of what is going on in Antarctica. Our aim is to make the lecture program most responsive to today's Antarctic science and to slant our Newsletters toward the happenings of the men and women who have made and are making science news in Antarctica. Our meeting attendance leaves something to be desired, so I hope you locals will make more effort to get out to hear the great speakers which are on our program. Gisela was certainly most outstanding, and a real pro in her delivery. I was amazed that this Little Woman (actually a good-looking doll) had done so much in Antarctica, as I doubt if she could push the Fairbanks above 125 pounds, even wearing full polar garb. Good things come in small packages.

**LARRY GOULD, HOW DO YOU STAY SO YOUNG!** The Immortal-In-His-Own-Time Larry Gould was in town for the recent Polar Research Board meeting. He is still drinking from that Fountain of Eternal Youth, and gets his daily exercise early each morning when his miniature schnauzer, Gray, comes around and puts a leash on Larry and takes him for a two- or three-mile walk out into the desert. Larry enjoys being taken for a walk by Gray, and presumably Gray enjoys having Larry along. Both are trained to stay out of neighbors' yards, but Gray has a hard time restraining from chasing wildlife in the desert. It's always great sport getting together with Larry, and how I love to hear him talk about the men and ships of the Byrd Antarctic Expedition of 1928-30. He talks about that expedition as if it just ended last week - he's been on an emotional high from it for over fifty years. He never had a need for drugs, as the Antarctic, plus his bride of fifty years - Peg, turn him on full power. We almost pulled off a coup of major proportions when we had that great Antarctic reporter-science writer-historian from the New York Times, Walter Sullivan, all lined up to videotape an interview with Larry for posterity, but alas, Walter was held up at Edwards AFB awaiting the delayed shuttle flight landing and couldn't get back to Washington while Larry was here. We live by propositioning people (some times you even make out), and when we propositioned Walter to tape Larry, Walter came back with an affirmative. So we called Larry and he said, "Let the cameras roll." Well, he didn't exactly use those words, but he was enthusiastic about his good friend Walter sitting down and taping him. For one week it was pretty exciting talking with Tim Hushen, and Pembroke Hart, who in turn was talking with Hugh Odishaw who in turn was talking with WQED. We even talked with WETA and also a private producer, and then NSF surfaced with a great offer to do it all for us - free! Everything was looking too great to be true, and it turned out that way when those darn NASA people never changed their Fram filter, and we American taxpayers ended up paying over another million for the delayed space shuttle, which cost us Walter who had to remain in California for the eventual landing. Damn, damn, damn. We have hopes that this has just been delayed, put on temporary hold, and that Walter and Larry can soon sit down together and do the taping. If you ever heard the Canadian Film Board tapes (five in number) where Trevor Lloyd, the eminent Canadian geographer who once taught at Carleton College (where have I heard of that place before?), interviewed the Friendly Arctican, Vilhjalmur Stefansson, you know how great it will be when Walter does sit down and wrap up Larry in video tape.

**AND THERE WAS A WEDDING, WITH ANTARCTICA RIGHT BEHIND.** Ruth Siple is a woman of many loves (a collector of bells, friends, and casserole recipes, but not

necessarily in that order), and she also loves her college sorority, so it was no surprise last spring when she turned her back on our Society Memorial Lecture and high-tailed it back to Allegheny College "to go to her 100th anniversary. This created a mini-crisis as there's always money to be collected at the door, name tags to be handed out, plus last minute walk-ins who upset the whole apple cart. But she has a daughter Jane in town, and she agreed to fill in, although the night before she threatened to cancel out because she felt ill. Meantime I tried half a dozen times the afternoon of the lecture to reach old Hugh DeWitt at the Smithsonian because he had indicated previously that he wanted to come and we hadn't received his reservation nor his MONEY! He finally completed his noon-time jogging about 3:30 that afternoon and indeed did want to come to the Lecture but didn't have a car. I told him I had a beautiful 1962 Fairlane that rode like a charm and had room for another passenger. So Hugh met Jane, Jane met Hugh, and neither one of them remembered the next day who the speaker was the previous evening. To make a long story short, there were wedding bells in Washington in mid-November, and they walked out of the church, grabbed their sea bags, hopped onto a plane to Rio de Janeiro where Hugh literally carried Jane across the gangplank of the WORLD DISCOVERER as the ship pulled out for its first winter cruise to the Antarctic. Hugh was one of the lecturers on the cruise, and I guess you'd have to say it was Jane's maiden cruise as she had never been on anything bigger than a Potomac cruise boat. Needless to say, a fine time was had by all, the honeymooners as well as the honeymoon watchers. They returned from South America to Washington in mid-December, and Hugh immediately came down with a severe attack of Montezuma's Revenge. You see, his new mother-in-law forgot to tell him "don't drink the water" when he got to Arlington. However, he recovered in due time and they were off almost immediately for a big snowstorm in Orono, Maine where Hugh is a professor in the Zoology Department of the University of Maine. Naturally Hugh spoke ahead of time to Ruth about how honorable his intentions were with Jane, at which time I tried unsuccessfully to get Ruth to run a security check on his background. I was somewhat suspicious as I knew he was one of those Southern Ocean biomassers, but that he was different than the rest of that cult, because he was hosting his workshop this summer at Orono in the height of the black fly season. Not only are all the other biomass workshops in exotic foreign cities, they are also in their best seasons. But Ruth liked Hugh from the very beginning because he always came to her house with a lumberman's appetite, and she thought it was just great that Jane had found a man of such fine tastes. Bob Nichols, were you waxing romantic words in your Memorial Lecture?

**RONNE EXPEDITION MEMBERS REUNIONIZE.**

Almost a third of the still-living members of the 1947-48 Ronne Expedition assembled in a simulated Antarctic setting in an old raftered barn in Wilton, Connecticut in late October. The hosts were Bob and Robbie Dodson, and answering the roll call around a crackling fire in an immense fireplace were the old professor Bob Nichols, Walt Smith, Art Owen, Nelson McClary, Larry Fiske, and Richard Butson, a British renegade from their nearby base on Stonington Island. They evidently had one heck of a good time, one that was described as a "warmly evocative event for all present." They departed with pledges to meet again next year in the spring of 1983 at the Middleburg, Virginia home of Nelson McClary, whose spouse is authoress Jane McIlvaine McClary. Dodson, Nichols and Fiske (a Navy man) made a 90-day geological sledging trip by dog team along the coast of Marguerite Bay and the approaches to George VI Sound back in 1947. Nichols hasn't been the same since then, as this Scott-like man is never happier than when he is miserable on the trail. Smith and Owen constituted half of the four-man joint U.S.-British main southern sledge party that penetrated by dog team into previously unexplored territory on the lower east coast of the Antarctic Peninsula. Butson is a medical doctor and was also a "dogsboddy" in the British

11-man Falkland Islands Dependency Survey camp. He played an important part in the mid-winter rescue of Pete Peterson from one of the deepest crevasse falls on record. I didn't realize it, but these two camps in each other's back yards were the only camps occupied in Antarctica during the southern winter of 1947-48.

**ANTARCTIC LOVER HAS BOOK SHOP.** Jay Platt, a naval architect turned antiquarian, runs a used and rare book shop in Ann Arbor, Michigan, specializing in Antarctic books. Ron Taylor, who found him when he was on one of his frequent book-hunting sojourns, told me about him. I recently bought half a dozen Antarctic books from him, and not only were they in excellent shape, but his prices were reasonable. He caught the Antarctic bug when he read Lansing's *Endurance*, although he says the closest he has come to Antarctica is Texas. I thought many of you might be interested in contacting him about some particular book or perhaps in getting his list of books. His address is West Side Book Shop, 113 W. Liberty, Ann Arbor, MI 48103 (313-995-1891). Incidentally, he recently became our 415th member, so Welcome Aboard, Jay.

**DRUGS IN ANTARCTICA, SO WHAT ELSE IS NEW?** I suppose most of you have heard one way or another about those dogs in New Zealand sniffing out drugs bound for the Antarctic. Robert Reinhold of the New York Times had an article in the November 30th edition, and we will quote from his article rather than from numerous ones published in Christchurch newspapers this summer. For the first time ever, New Zealand custom officials have interdicted, opened, and confiscated quantities of U.S. mail bound for the ice. Sniffer dogs had detected "26 parcels containing marijuana and other illicit drugs" by late November. It's hard to tell just what will happen now, but presumably New Zealand officials want to interview the addressees when they return from the continent, with a view to prosecuting them. And it appears from Reinhold's column that the Americans involved will have no rights under law to refuse to answer questions. Penalties upon conviction will vary depending upon the amounts; importation of large quantities of illegal drugs for distribution can bring up to ten year's imprisonment. Looks like some people could miss being home for Christmas .... in the 1980's! It looked like a bad summer all around, because about the same time the Navy garage at McMurdo burned down flat one evening. And guess what vehicle was caught inside and totally extinguished? You're right, a fire engine.

**TO BE LOVED IS TO BE CHINESE.** Dr. Chang-Hua Tsao became the first person from the People's Republic of China (PRC) to work with a USARP at the South Pole. He has been there this summer working with Marty Pomerantz of the Bartol Research Foundation on solar studies. The PRC, according to a 12 October text issued by the official Xinhua Agency, "is planning on sending a scientific expedition to the South Pole (sic) and wishes to establish a permanent base in the Antarctic as soon as possible." Move over, penguins, the Chinese are coming!

**ANTARCTIC DEGREES, THE OHIO STATE UNIVERSITY.** I have often wondered how many degrees have come out of the Antarctic, feeling that hundreds of PhDs must have been spawned there in the past quarter century. It has been a true bonanza for many a graduate student, with NSF helping to finance most of them. These degrees should be asterisked, indicating "This degree was obtained through the courtesy of the National Science Foundation which had both the great wisdom and the far-end-of-the-tunnel foresight to sponsor my Antarctic field work and analyses." I thought we'd kick off this college report with a list of those Ohio State University students who have obtained degrees since the inception of the Institute of Polar Studies. Thanks go to Peter Anderson for providing us with this listing.

## **ANTARCTIC PH.D'S ---- OHIO STATE UNIVERSITY**

1963. Parker E. Calkin. 'Geomorphology and Glacial Geology of the Victoria Valley System, Southern Victoria Land, Antarctica,' (Goldthwait, advisor, Geology)
1963. Richard L. Cameron, 'Glaciological Studies at Uilkes Station. Budd Coast. Antarctica,' (Goldthwait, advisor, Geology)
1964. William R. Long. 'Stratigraphy of the Ohio Range. Horlick Mountains. Antarctica,' (Goldthwait, advisor, Geology)
1967. Velon H. Hinshew. 'Geology of the Scott Glacier and Wisconsin Range Areas, Central Transantarctic Mountains, Antarctica,' (Summerson, advisor, Geology)
1968. Caspar Cronk, 'Glaciological Investigations Near the Ice Sheet Margin, Wilkes Station, Antarctica,' (Bull, advisor, Geology)
1968. Peter J. Barrett, 'The Post-Glacial Permian and Triassic Beacon Rocks in the Beardmore Glacier Area, Central Transantarctic Mountains, Antarctica,' (Summerson, advisor, Geology)
1968. John F. Lindsay, 'Stratigraphy and Sedimentation of Lower Beacon Rocks of the Queen Alexandra, Queen Elizabeth, and Holland Ranges, Antarctica, with Emphasis on Paleozoic Glaciation,' (Summerson, advisor, Geology)
1969. Gerald Holdsworth, 'Mode of Flow of Meserve Glacier, Wright Valley, Antarctica,' (Bull, advisor, Geology)
1969. Lois M. Jones. 'The Application of Strontium Isotopes as Natural Tracers: The Origin of the Salts in Lakes and the Soils of Southern Victoria Land, Antarctica,' (Faure, advisor, Geology)
1969. Wayne L. Hamilton, 'Microparticle Deposition on Polar Ice Sheets,' (Bull, advisor, Geology)
1970. R. Eastin. 'Geochronology of the Basement Rocks of the Central Trans-Antarctic Mountains, Antarctica,' (Faure, advisor, Geology)
1971. Robert E. Behling, 'Pedological Development on Moraines of the Meserve Glacier, Antarctica,' (Goldthwait, advisor, Geology)
1971. John D. Gunner, 'Age and Origin of the Nimrod Group and the Granite Harbour Intrusives, Beardmore Glacier Region, Antarctica,' (Faure, advisor, Geology)
1972. Olav Orheim, 'A 200-Year Record of Glacier Mass Balance at Deception Island, Southwest Atlantic Ocean, and its Bearing on Models of Global Climatic Change,' (Bull, advisor, Geology)
1972. Edmund A. Schofield, 'Field and Laboratory Studies on the Ecology and Physiology of Selected Algae, Mosses, and Lichens from Antarctica,' (Rudolph, advisor, Botany)
1973. Paul Mayewski, 'Glacial Geology in the Late Cenozoic History of the Trans antarctic Mountains, Antarctica,' (Goldthwait, advisor, Geology)
1975. Ian M. Whillans. 'Mass Balance in Ice Flow Along the Byrd Station Strain Network, Antarctica,' (Bull, advisor, Geology)
1976. Lennie G. Thompson, 'Microparticles, Ice Sheets and Climate,' (Bull, advisor, Geology)
1976. Edmund Stump, 'On the Late Precambrian-Early Paleozoic Metavolcanic and Metasedimentary Rocks of the Queen Maud Mountains, Antarctica, and a Comparison with Rocks of a Similar Age from Southern Africa,' (Corbato, advisor, Geology)
1978. Claire L. Parkenson, 'A Numerical Simulation of the Annual Cycle of Sea Ice in the Arctic and Antarctic,' (Rayner, advisor, Geography)
1979. Ellen Mosley-Thompson, '911 Years of Microparticle Deposition at the South Pole—A Climatic Interpretation,' (Rayner, advisor, Geography)

Peter writes that there are currently two fledglings working on PhDs from Antarctic field work - Julie Plais in glaciology and Chuck Vavra in geology. Julie came to Columbus via the University of New Hampshire. Next issue, the University of Wisconsin at Madison.

**LARRY GOULD AND HENRY HARRISON WRITE ABOUT TAFFY DAVIES AND QUIN BLACKBURN.** Two of the stalwarts of the first Byrd Antarctic Expedition, 1928-30, died during the past year, and we thought Society members would like to read the words of two of their closest comrades on the expedition, Larry Gould and Henry Harrison. As Larry was second-in-command to the late Admiral we will start off with his comments.

"Within the past weeks my Antarctic world has grown smaller as the number of survivors from the first Byrd Antarctic Expedition, who wintered over in Little America, has shrunk from 42 to 7 with the deaths of Quin Blackburn and Taffy Davies.

Due to the failure of our good ship Eleanor Boiling to get through the pack ice on a second trip from New Zealand to Little America with additional housing 42 men lived in quarters designed for 25. Under such 'contagious' conditions it is not the big things but little ones such as the way a man butters his bread or parts his hair or eats his soup that drives his companions up the wall.

It is a core of men of great strength and integrity who keep things in balance. Quin and Taffy were a part of that core. Quin for his quiet infflappable way and concern for others. Quin built an igloo where he slept to ease the crowding. Nobody was more beloved than Taffy with his bonhomie, his buoyant and infectious good humor and his delightful Welsh accent."

Now let's hear from Henry Harrison, meteorologist and the unofficial official historian/chronicler for BAE I. First, about Quin Blackburn.

"Quin A. Blackburn [age 81] died at Boise, Idaho on February 8, 1981, leaving wife Jessie and sons Tom and Bob. Quin was one of a select group that served under Admiral Richard E. Byrd on both BAE I and BAE II. In August 1928 Quin signed on board the Bark "City of New York" and served as a seaman-before-the mast on the Bark from Hoboken to Little America and back. As a member of the ice party at Little America he was assigned variously as dogteam driver and topographer; also came to be known as something of a recluse when he carved out his own private house out of the ice next to the radio shack. Quin lived alone through the winter. On BAE II Quin distinguished himself by leading a three-man field party on a 1,500 mile geologic and geographic trek by dog sled. This feat drew world-wide attention. On his retirement from the Bureau of Land Management on June 30, 1969 Quin received one of the highest awards issued by the Department of the Interior, the Meritorious Service Award for excellent service rendered during his 35 years as a government employee. In addition, Quin was cited by Interior Secretary Walter Hickel for his expert dealing with mineral reserves.

Blackburn was noted for his literal speech. At Christmas 1973 he wrote, "Mainly because of my adverse physical status, I am currently beset with inertia in respect to the prospect of journeying relatively far from home." Translated, Quin was saying, "I can't travel." Mt. Blackburn at 86°17'S and 147°16'W was discovered by Quin in December 1934."

Henry wrote that Taffy was a prolific letter writer and that a book could be written from the letters which he had received from him over the past 18 years and which he recently returned to his widow Nell with the suggestion that they be passed along to the Center for. Polar and Scientific Archives at the National Archives.

We are drawing upon material from Henry as well as an obituary written by Jeff (Maudheim) Hattersley-Smith which appeared in the 14 October 1981 London Times for a resume of Taffy's illustrious career. He was born 77 years ago in Merthyr Tydfil, Wales, and he graduated from the University College of Aberystwyth (lo-

cated on Cardigan Bay in Wales). He then became a lecturer in physics at the University of Saskatchewan, and later on moved to McGill University, which he left to join the first Byrd Antarctic Expedition, being the only British member of the wintering-over party. He worked his way to the Antarctic as a seaman on the Bark CITY OF NEW YORK. (Incidentally, only Eddie Roos in Cocoa Beach and Henry Harrison in Asheville remain as survivors of the crew that sailed out of Hoboken on August 25, 1928.) Taffy's specialized work at Little America was in geomagnetism. His genial personality, keen sense of humor and great physical strength made him not only a valuable camp asset but one of its most popular men. Upon his return from the south, he joined the Carnegie Institute in Washington where he continued his research in geomagnetism, which led to his becoming the Director of the Carnegie Geophysical Observatory in Huancayo, Peru from 1936 to 1939. While with the Carnegie, he took leave in 1932 to lead the Canadian Arctic Expedition to Chesterfield, NWT during the Second Polar Year, 1932-34. World War II saw him return from Peru to Canada where he served in naval intelligence in both South America and in Ottawa and, in a series of senior appointments, played an important part in fostering Arctic research, making many short trips to the Canadian Arctic in the 40's, 50's, and 60's to such places as North Ellesmere, North Greenland, Baffin Island, and Alaska. He was instrumental in the engineering of the highly successful Alouette satellite in 1962 (the only non-US-USSR satellite in orbit at the time). Taffy built and operated the Defence Research Telecommunications Establishment, from which he retired as Director-General in 1969. He was a Fellow of the Royal Society of Canada, and a charter member and past president of the Arctic Circle Club of Ottawa. He also was a member of our Society and presented the Memorial Lecture in 1972. The U.S. Advisory Committee on Antarctic Names named an ice-covered cape at the NE end of Hughes Peninsula, Thurston Island, Cape Davies (71°46'S, 100°23'W). Following a severe and paralyzing stroke in 1980, he fought on for another year before he died on September 23, 1981. He is survived by his wife of 50 years, Nell, and their two daughters, Jane and Marian.

**JACK DYMAND, CREWMAN ON JACOB RUPPERT, 1933-35, DIES IN NEW ZEALAND.** Jack Dymand, who signed on with the JACOB RUPPERT on the second Byrd Antarctic Expedition as a cook and as a dog handler, died in Christchurch on September 22, 1981. Jack, whose first name was actually Percy, was born in Seattle but settled in Dunedin, New Zealand where he got into the restaurant business. He moved on to Christchurch 12 years ago, and probably a lot of you Antarcticans are familiar with the Dymand Steak House on Colombo Street. His American heritage showed up in his being a founding member of the Otago Softball Association in the 1930's, and his adaptability to local games resulted in his becoming Secretary of the New Zealand Darts Council. Now anyone who cooks steaks, handles dogs, plays darts, and loves Softball must have been a good guy. He also was a member of our Society. Jack was seriously injured in an automobile accident five years ago, and his wife Eila wrote that he never really recovered from that accident. He developed cancer of the lung about a year ago, but "thanks to our wonderful doctor, he had a very peaceful death. He had no pain, but developed pneumonia." Our sympathies go out to the family.

**HARRY VON ZELL DIES.** There must be some people out there besides Larry Gould and Henry Harrison who remember the old radio announcer, Harry Von Zell, who recently passed away. I can remember him on the George Burns and Gracie Allen Show, but I didn't realize that he got his first big break when he anchored the "March of Time" program during which he delivered the commentary of Admiral Byrd's broadcasts from Little America.

**RECENT RETIREES.** Good luck to Milton Johnson, John "Lefty" Mirabito, and Jim O'Neal who took the plunge and left the Federal bureaucracy.

**GERMAN SHIP GOTLUND II ALLES KAPUT.** The West German Antarctic Research Expedition, GANOVEX, suffered a crippling blow in mid-December when its chartered ship, GOTLUND II, a 93-meter, 4400-ton, ice-strengthened hull, challenged the sea ice off Yule Bay near Cape Adare and came out a real loser, in fact, they were "overcome." It all began on December 17th when the ice-beset ship started taking on water and began listing. The U.S. flew out a C-130 from McMurdo and two pumps were dropped to aid in the pumping. But it soon appeared that all was going to be in vain, so at 0230 hours on the 18th, the captain ordered the remaining four members aboard to abandon ship. Later that day she went to Davey Jones' locker at approximately 70°21'S, 167°31'E. GOTLUND II had five choppers aboard, and they were able to get all 41 crewmen and scientists to an emergency shore station, from which they were flown to the U.S. camp site for the North Victoria Land summer field program. As this is being typed on December 22nd, some of the men have already been evacuated to McMurdo Sound, whence they will be flown to Christchurch, New Zealand.

**AUSTRALIA, UK, AND INDIA THINKING ANTARCTICA.** Australia's Parliamentary Standing Committee on Public Works says the country's three largest Antarctic stations must be rebuilt immediately at a cost of \$58M if Australia is to continue scientific research and maintain an effective presence on the continent. This year's budget contains \$1M to start the work. The report also recommends a fourth station, an airstrip, and a new research/cargo ship. A Sydney newspaper reported in September that "Australian Antarctic scientists believe the nation will lose much of its Antarctic territory to the Russians if it does not spend more than \$100M as soon as possible to reaffirm its claim." Dr. Pat Quilty, Deputy Director of the Antarctic Division, said "it is scientific performance which counts. That's where we're being swamped by the Russians. They're doing good work and a lot of it, and they are getting it all published." Meanwhile the British have announced that they will relocate Halley Bay (the station, that is) in 1983 at a cost of 1M pounds. The station, located on the Brunt Ice Shelf off Coates Land, has been an active year-round station since 1956 and has "sunk" 10 meters into the ice. Another 3M pounds will be spent for new buildings over the next three years. Bids have been solicited for a new polar research ship to cost an estimated 4M pounds. India has leased Norway's M/V POLARSIRKEL for an Antarctic cruise that hopefully will reach the coast.

**CLASSIFIED:**

Wanted. Mawson's Home of the Blizzard and first edition of Ponting's Great White South. Ned Ostenso, 2871 Audubon Terrace N.W., Washington, DC 20008.

Wanted. U.S. edition of Huntford's Scott & Amundsen, G. P. Putnam's Sons. Constance Swan, 11 Granite St., Rockport, MA 01966. (Her copy was stolen!)

Wanted. Larry Gould's Cold. Guy Guthridge, 6519 Hitt Ave., McLean, VA 22101.

Wanted. Chances for travel and adventure - non-military. Mark Leinmiller, 1383 Shadowood Drive N.E., Marietta, GA 30066. (Mark is the 50th Siple Anniversary Eagle Scout to Antarctica, 1978-79. Experience includes baptism by Denton at Darwin Glacier. Current Yellowjacket at Georgia Tech mastering mechanical engineering with yearn to climb Mt. McKinley.)

Wanted. Just one more chance to go to the Antarctic by former Antarctic Treaty desk officer in the Department of State. Call collect! Robert D. Yoder, RFD 1, Box 533, Springfield, VT 05156.

Bergy Bits is the unexpurgated candid comment of a single member of the Society and should not in any way be construed as representing the voice or the position of the staid, reverent Society or its illustrious membership.

**MEMBERS ARE HEARD: BERGY BITS SEXIST, VERBOSE, OPINIONATED, RAMBLING, ETC.**

Colin Bull at Ohio State effectively uses surveys to show that they are doing things right in Columbus; I am using our survey to look for arenas for improvement. To date we have heard from about two-thirds of the membership, although 20% of the responders made no comments at all about liking or disliking Bergy Bits. Perhaps some were hesitant to voice disapproval because their names were already on the form, or maybe they didn't want to knock a Ma and Pa operation. Three strong voices, two females, one male, claimed Bergy Bits was sexist. One female who joined after coming off a cruise ship, was pretty hot under the collar and wrote, "Bergy Bits is all I receive. As a professional woman I resent the constant chauvinist remarks. The tone makes the Society sound like a high school fraternity, not an organization of professionals which I was led to believe that it was." Our Society is really not a professional society; its charter says that we were "incorporated as a non-profit educational and cultural organization." The educational part comes mainly from our fine lecture series, and the cultural part comes in small doses from guys like Bert Crary! We have offered to refund her money, as we certainly don't want members who feel they were recruited under false pretenses, do we? The woman indexer for that superb publication Ice Cap News wrote, "Remarks about women are offensive. I doubt if comparable remarks about black people would be considered acceptable in the Newsletter." One fellow who was in the Antarctic during the IGY and still goes back (although not Charlie Bentley, Dick Cameron or John Annexstad) wrote, "I find the sexist rhetoric offensive." Well, that's the way it goes; you can't please 'em all! But only three voices against Bergy Bits' sexism is a victory! We don't intentionally mean to antagonize anyone, so we might possibly (but no promises, now) let up just a bit.

The biggest complaint about Bergy Bits has been about its wordiness. Some of the comments "usually too long, usually too opinionated....verbose....too folksy.... bit too gassy....too long....rambling....bit wordy.... verbose (again)....another comment on folksy style....slightly wordy....sometimes too long, too personal.... Well, look at the good side - since Mike Kuhn told me last year not to write more than ten pages, ten pages it has been. Now we have subject headings so you can pick your poison, and don't have to take the whole dose at one time. Sure it's personal, but I do try to work in everything that's sent to me by members and whatever I can pick up at NSF or the National Academy of Sciences. In an effort to depersonalize the Newsletters, I did run the series on members' favorite Antarctic books last year! We're trying!

One member, my old roommate at Little America V, Ron Taylor, made his annual plea to "improve the English." Trouble with Ron is, he has spent too much of his life with the Literary Digest, Harper's, New Yorker, and their ilk! There was a request for Navy news, and one for more on DF operations. The Navy situation sort of bugs me, too. Since their base of operations is now on the West Coast, there isn't much Navy Antarctic news here in Washington. Maybe we should have a field correspondent from Point Mugu. We'll have to look into it. One responder felt I was discourteous. Well, I grant that I give the needle to an awful lot of people, but don't I give it to nearly everyone? Those who get it the most are those I know the best. When I

wrote that Fred Milan "mumbles," I wasn't really slaughtering old Fred, I was just being truthful. I've known Fred for ages, and he is one of my most favorite people, a real great guy - but he still mumbles. Bill Schoonmaker asked if my soliciting comments "could ... be a step towards recognition that something worthwhile could have happened after BAE II." Well, I've been looking for something significant after BAE II, Bill, but just can't seem to find anything. Probably it's hidden in some crevasse. Ken Moulton feels I avoid, like the plague, the great things done by the austral summer scientists. I look upon our Washington lecture series as state-of-the-art presentations by our country's top Antarctic scientists, who are austral summerites, and upon Bergy Bits as news about members and programs over all of the past 50 years.

I would, however, like to share the comments of Arville Schaleben, whom I've never had the pleasure of meeting, but whose comments have inadvertently been my Bergy Bits beacon, Arville was formerly editor/reporter/photographer for the Milwaukee Journal, and visited the Antarctic with an inspection team back in the early 1960's. He wrote, "I like it - informative, but breezy; opinionated, but okay; important often, pleasantly gossipy often. Keeps me both abreast and entertained." Basically, I would say those are my objectives for Bergy Bits.

So the Society will have a useful file on who we are, could you folks (120) who haven't returned the form please do so to help us get to know you?

**STEVE ACKLEY, LEGENDARY CRRELITE TALKS ABOUT US-USSR WEDDELL SEA CRUISE ON SOMOV.**

The evening of January 19th separated the intrepid explorers from the rank and file membership as 22 hardy, foolhardy souls braved ice slick highways to slide into the Board Room at NSF to hear Steve Ackley, a sea ice expert at the Cold Regions Research and Engineering Laboratory (CRREL) at Hanover, New Hampshire tell us all about the seven weeks' cruise of the SOMOV last October and November into the Weddell Sea. It was another interesting lecture on a most timely subject by a speaker who had hardly shaken his sea legs. We heard about a marriage of Russian logistics and American technology combining to make a most satisfying cruise. The food was hardly edible, though, and a seal (crab eater^ perhaps?) must have been put on the vodka locker while the Americans were aboard, as it was a "dry cruise." There were 26 scientists, evenly divided - 13 Americans, 13 Russians. Steve said they were paired off with their counterparts, so there was an American and a Russian in each room. He didn't say whether this applied to the two American female scientists, but since we presumably don't discriminate against women or men and neither want special favors, we must assume that the women were paired off with their Russian men counterparts! We Americans are so broad-minded, it's just great. Steve said it was very humanizing to have women aboard, that he actually prefers having women scientists along on cruises to just being with men scientists. Glaciologists have told me the same thing, that it's better with women. It was truly an interdisciplinary cruise, with programs in physical oceanography, air-sea-ice interactions, sea ice dynamics, marine biology, and marine chemistry. Steve commented on the fact that the cargo ship was large but underpowered, which meant they couldn't really crack their way through ice over a meter thick. They had daily Russian satellite photos and knew that the polynya was not there this year, although it appeared from the photos that there was an area of ice weakness with expanding and contracting leads which were in the general area of where the polynya might have been. Steve showed a nice series of slides of ice conditions as the ship entered the ice pack. The water near the edge of the ice pack is very rich in nutrients, and this was easily detectable in the coloring of the, shall we say, bergy bits. One of the most interesting things to me was something which Arnold Gordon had discovered on an earlier trip into the Weddell Sea, and that was the existence of chimneys of near isothermal water. Equally intriguing was a suggested

life cycle path of krill. They don't do it the easy way - all that travelling about just to be gobbled up by some big-mouthed whale. This whole expedition makes one wonder about the future; in the current financial atmosphere, our Coast Guard icebreakers have priced themselves right out of science. What happened this past austral summer could become a blueprint with the Russians most happily providing platforms for our scientists in exchange for our' much more advanced scientific technology. There were excellent on-ship laboratories for doing analyses, so much of the analytical work was done right on board shortly after marine or atmospheric samples were taken. All data were exchanged among scientists at the end of the cruise, and there will be a post-cruise analysis workshop in this country, followed up later by a final one in Leningrad. This was our first lecture ever by a CRRELite; we are far overdue in tapping their sources of expertise. You can always tell a man from CRREL - they don't wear neckties. In fact, if the CRREL Personnel Office finds out that a prospective candidate even owns a necktie, it's legitimate grounds for immediately "dropping that person from further consideration. Steve was anxious to speak to our Society now, as he felt he would be too old to stand up by the time we'd get around to ask him to give a Memorial Lecture. And so it was that the first lecture in the second century of Society lectures was given by a tieless, bearded, slightly balding, not-too-skinny scientist (in spite of the fact he had lost 20 pounds on the cruise) who only a year ago was a near center-fold spectacular in the February Smithsonian.

**THE U.S. POSTAL SERVICE, THE ULTIMATE IN INCOMPETENCE.** If it weren't for the UPS, there would never be a Christmas in this country because the Postal Service would foul it up beyond recall. It's doing a real job on the Antarctic Society! Our last two Newsletters have been mailed at least three weeks prior to the announced meeting, and in some states the last one still hasn't been delivered (as of 23 January). The Newsletters are sorted by zip codes and by states with 10 or more for any one state going in one bundle. You might think this is good, that larger groupings would be expedited, but it works in reverse in keeping with the Post Office's creed to really foul up anything designed to speed up delivery and which might put mailmen out of work. I used to think lawyers were bad, and they are, but the Postal Service has them beat. If you live in Massachusetts, Heaven help you, as the post offices there are the worst offenders in getting our mail delivered. Also a loud boo to the Postal Service in California and in Colorado - they are almost equally incompetent. And to compound my unhappiness, the Postal Service has increased our mailing rates (starting with this issue) by practically doubling the cost. What a bunch of bandits!

**WHERE DO WE COME FROM?** Joseph Warburton asked us to do a "state by state" involvement story, so we're taking him up on his idea. Bergy Bits for October 1980 showed the names and addresses of all our California members, which incidentally has continued to grow in size in spite of several members moving out of state (Dave Canham, Larry Flint, David Coles) and one (Pennie Rau) resigning. This is how your Stateside membership now looks:

Virginia	75	Florida	9	Kansas	4	North Carolina	2
Maryland	59	Pennsylvania	8	Missouri	4	Utah	2
California	38	Illinois	7	Rhode Island	4	Wyoming	2
D. C.	36	New Jersey	7	Vermont	4	Hawaii	1
Massachusetts	14	Alaska	6	Wisconsin	4	Indiana	1
Colorado	13	Maine	6	Connecticut	3	Louisiana	1
Texas	13	Nebraska	6	Kentucky	3	Montana	1
Arizona	12	New Hampshire	6	Minnesota	3	New Mexico	1
New York	10	Michigan	5	Georgia	2	Tennessee	1
Ohio	10	Oklahoma	4	Nevada	2	West Virginia	1
Washington	9						

The biggest change in membership in the past five years is that we have gone more national, with less than 40% of our membership now in the Washington area (it was over 60% a few years ago). We now have over 122 members west of the Mississippi. We are particularly happy with the support we are getting from the Institute of Polar Studies at Ohio State (we now have eight members from there, whereas several years ago we had only Emanuel Rudolph and Peter Anderson), and from those who have joined from other polar citadels at Lincoln, Tempe, Boulder, Orono, and Fairbanks.

One interesting thing is that polar people seem to retire to the Sun Belt states (Florida, Texas, Arizona, and California) where we have 72 members. I can't believe that grizzly old warriors like Bud Waite (Happy 80th Birthday on February 14th, Bud - 3248 Valencia Drive, South Venice, Florida 33595), Larry Gould, Ken Bubier, Ed Roos, Walter Giles, Clay Bailey, Murray Wiener, John Herrmann, and others prefer being warm and comfortable in the sun to living in the northern tier of states suffering from bone-chilling cold and knee-deep snow. But I take heart that there are still some rugged individuals from the old days such as Leland Barter, Charlie Murphy, Howard Mason, Bob Nichols, Bob Dodson, John Dyer, John Cadwalader, and a few others who still stand toe-to-toe and challenge old man winter to turn it on.

Let's salute the state of West Virginia with this issue, which has one member, Pam Dailer. She represents the new Antarctic regime, the young and the beautiful, the austral summer type, who thoroughly enjoyed her summer at Siple Station several years ago. I understand from a most reliable source that she has circled in red all sexist remarks in Bergy Bits in recent years and will be returning them to me in due time, probably in a wheelbarrow. To make her work easier, I encircled the most blatant sexist remarks in her copy of the last issue! So I salute West Virginia and Pam Dailer in this issue. West Virginia, Almost Heaven!

**SOCIETY MEMBERS IN GEOGRAPHIC NAMES OF THE ANTARCTIC.** We went through the latest volume of the Geographic Names of the Antarctic to list the Society members who had Antarctic features named (and approved) for them by the U.S. Board on Geographic Names. We also visited the Defense Mapping Agency to get the recent approvals which were not in the April 1981 publication - there were only six, although two of the six (Ellis Ridge and Mt. Meunier) showed in our last listing published in September 1979. There are 195 Society members so honored, approximately half of our membership. As for the other 50%, you can 1) pray that someone might propose a feature in your honor and then pray some more that it will get approved, 2) get yourself onto the Advisory Committee on Antarctic Names - a foolproof way of getting a feature named for you, or 3) get a job at the USGS in Reston which is concerned with mapping Antarctica. Once it paid off to go to the Antarctic for a year, but this isn't necessarily so any more. Ask new member Richard Urbanak who wintered over at Byrd in 1960 and then again at the Pole in 1971. Two more South Polers who never made it are Charlie Jenkins (1974) and Kenneth Barker (1977). And apparently it doesn't work automatically if you go down with a foreign country. Ask Allen Riordan who was meteorologist at Vanda with the Kiwis in 1969 or Dick Neff who wintered over with the Aussies at Casey in 1975. Nor does it help to be Director of the Division of Polar Programs at NSF or the Executive Secretary of the Polar Research Board at the National Academy of Sciences, as both Ed Todd and Tim Hushen are waiting to be recognized. On the other hand, the most recent list shows second features being approved for Fred Alberts (ex-Secretary to the Advisory Committee on Antarctic Names, 1949-1979), also for Rupe Southard (Chief of the Office of International Activities at the USGS, Reston), and one for Luther Wheat (who is on the Advisory Committee)! I rather like the namings done by some of our British friends, such as "Toadstool Rocks 68°50'S, 69°25'W, named in association with Mushroom Island and Puffball

Island." And how about Port Circumcision, 65°11'S, 64°10'W, a cove on the south-east side of Petermann Island discovered on January 1, 1909 by Charcot and named "for the Holy Day on which it was first sighted." Port Circumcision, Petermann Island, ah those Frenchmen!

We have one of Admiral Byrd's daughters (Katharine Breyer) and one of his grandsons (Richard E. Byrd III) as Society members, and they probably know that nine features have been named after the Admiral or immediate family members. Our British member, Charles Swithinbank, has four approved features (a range, a glacier, some slope, and some old glacial moraine). Then we have four families, each with three features, Larry Gould, Ed MacDonald, and the widows of Paul Siple and Finn Ronne. Paul actually named a mountain, Mt. Ruth Siple and it appeared that way for many years until that coup came along which purged non-influential women names from the face of Antarctic maps. Ed has switched to his native Scottish spelling of MacDonald, although his name appears Irish style on maps. Quite a few members have two features named after them: Clay Bailey of BAE II and the USAS expeditions, Sig Gutenko of the USAS and the Ronne expeditions, Eddie Goodale of BAE I, John Cadwalader of Task Force 43 fame, Bert (Mr. IGY) Crary, the ever-going Charlie Bentley, our British lend-leaser, Colin Bull, our politico success, Phil Smith, the debonair Troy Pew&, our Lebanese hero, George Doumani, famed historian Harry Dater, whose widow remains a Society stalwart, and the aforementioned Fred Alberts and Rupe Southard. So all together we have 19 members/families with more than one feature. A list of all Society members who have geographical features named after them or their late husbands:

Abbot, J. Lloyd	Cartwright, Gordon	Espenschied, Peter
Alberts, Fred	Chappell, Richard	Everett, Kaye
Allen, Robert	Clarke, Dorothy (widow)	Everett, William
Anderson, Peter	Clough, John	
Annexstad, John	Collins, Henry	Feeney, Robert
Aughenbaugh, Nolan	Collinson, James	Field, William
	Craddock, Campbell	Flint, Robert
Bailey, Clay	Crary, Albert	Flowers, Edwin
Barnett, Donald	Cromie, William	Ford, Arthur
Baulch, DeeWitt		Fowler, Alfred
Barter, Leland	Dale, Robert	Fridovich, Bernard
Behrendt, John	Dalrymple, Paul	Friis, Herman
Bennett, Hugh	Daniels, Paul	Frostman, Thomas
Benson, Robert	Dater, Alice (widow)	
Bentley, Charles	Dawson, John	Giles, Walter
Bermel, Peter	Dawson, Merle	Goldthwait, Richard

Meserve, William	Shapley, Alan	
Meunier, Anthony	Shults, Roy	Barsourn, Adib (new
Milan, Frederick	Shurley, Jay	Twiss, John (members)

**MASTER ANTARCTIC BUILDER, ALBERT ARMSTRONG.** In the last Newsletter we mentioned that Albert Armstrong was interested in Antarctic construction. Albert is 87, going on 27, being one of the most enthusiastic Antarcticans in our Society. The guy has been all over the globe designing and building structures, but he left his heart in the Antarctic. He got a finger caught in a taxi door in Christchurch, and had to have it treated at McMurdo. He felt the facilities at McMurdo left a lot to be desired, so when he came back to CONUS he took up a successful personal crusade for the 10-bed dispensary for the station, not only the building but its medical equipment (in duplicate). He introduced the "light green" color to McMurdo, also the first stand-up bar, telephone booth, and closed circuit television at the Primary Building, PM-3A Power plant. In fact, he was involved, either by design or construction, in a long list of buildings at McMurdo (PM-3A electric power plant, 1500 KW stand-by electric power plant, water treatment plant, primary

and secondary auxiliary pump house, condenser plant, aircraft terminal building, CC>2 service tank stations, mess hall, storage warehouses, and personnel quarters). And he was also involved with Eights Station, the air-portable scientific laboratory consisting of eleven units, each completely furnished and weighing 30,000 pounds. He's quite a fellow, a sheer delight to talk to, and he talks about his Antarctic involvement in the early 1960's as if they had happened this current austral summer.

**FIRST HEBREW PRAYERS AT SOUTH POLE?** One of our Society members, Roy Millenson, a former aide to Senator Javits, went to the South Pole with a Congressional delegation early in January 1974, at which time he placed in a three-foot deep hole at the South Pole the phylacteries his parents had given him at his Bar Mitzva some forty years earlier. The Chicago Tribune for 17 January 1974 quoted Roy as saying "the phylacteries have become worn over the years and my rabbi said that the proper way to dispose of them was by burial. Then the Antarctic trip came along and I took them with me. I said two prayers - the 'shehehiyanu' and the 'shma' - and covered them with snow. As far as I know, mine were the first Hebrew prayers ever said at the South Pole. The phylacteries were placed in a paper bag bearing the date January 3, 1974 and were buried at -14°F." Does anyone know of any earlier Hebrew prayers at the Pole?

**POLAR PHILATELISTS.** Let's take a look at our expanding philatelists - an enthusiastic corps nurtured by their award-winning Ice Cap News. I'm amazed at what these people will collect. They'll gobble up anything with a polar cachet or cancellation. Most of the philatelists in our Society are real biggies; nearly all came via the stamp community, although people like Bud Waite, Mort Turner, Bert Crary, and in a restricted sense, myself, came via our polar activities. We have a real philatelic heavyweight in our secretary, Pete Barretta, one of the most loved members of our Society, who is currently recovering from another bleeding ulcer. We are especially happy to include in our membership the president (Bob de Violini), the editor (Bernie Coyne), and the art editor (Joseph Lynch) of the American Society of Polar Philatelists. The members of our Society who have come out of the closet and confessed they are first, last, and always practicing polar philatelists are the aforementioned Pete Barretta, Liselotte Beach, Charlie Burroughs, Ronald Chaikin, Anne Cope, Bernie Coyne, Bob de Violini, Carl Fisher, Hal Helfrich, John Herguth, Sam Hinerfeld, Joe Hogan, Richard Julian, Bill Littlewood, Joseph Lynch, Seymour Schlossberg, Douglas Shelton and Hal Vogel.

**LINDBLAD AND WORLD DISCOVERER MEMBERS.** We probably have at least 20 members who discovered Antarctica via one of the two cruise ships. As a group, these members are about the easiest members of our Society to please, as they appreciate any kind of information on the Antarctic, true or not so true. One of my favorite Society members is Mary Goodwin out in Los Angeles. By profession she's a medical illustrator married to a professor of urology. She confesses to probably being the national champion of drawing a certain organ pertinent to her husband's livelihood. But she also has a most extensive Antarctic library, has written several articles on the Antarctic, and has splendid deep New England roots. Dotte Larsen has gone on three Lindblad cruises, proving that she'll go to the end of the world in search of whales. Her fame as a whale spotteress is well-known, and she has authored "Guide to Whales and Dolphins of the Southern Hemisphere." Another one of my favorite travelers is Vernon Cooper, who lives in a coal mining community of 7,000 in eastern Kentucky, which is a very strong incentive in itself to getting out of town and seeing the world. He's in South America now, this past summer he climbed many of the most beautiful peaks in Switzerland, and last year he went to Greenland. One of our Board members, Eugene Campbell, is a real delightful gentleman, who

along with his lovely wife Reba (both of them are doctors) , went to the Antarctic a couple of years ago on the WORLD DISCOVERER. The old icebreaker himself, Edwin MacDonald, lectured on the LINDBLAD for some seven years. George Llano has headed up the lecture program on the WORLD DISCOVERER for the past three years. And other members of our Society, such as the late Ken Bertrand, John Cadwalader, Hugh DeWitt, and Mike Kuhn have lectured at various times on one of the ships. My files show, in alphabetical order, the following "tourist" members:

<u>Name</u>	<u>Home Port</u>	<u>Year/Cruise Ship</u>	<u>Notations</u>
Elmer Babin	Cleveland, Ohio	1969 AQUILES (Lindblad) 1977 LINDBLAD EXPLORER 1981 LINDBLAD EXPLORER	Wrote "Experience; World Wide Travel Vantage Press
Dorothy Brown	Boston, Mass.	1969 LINDBLAD EXPLORER	Excellent Society Member
Eugene Campbell Reba Campbell	Chevy Chase, Md.	1979 WORLD DISCOVERER 1980 WORLD DISCOVERER	They are both super
Vernon Cooper	Hazard, Ky.	1976-7 LINDBLAD EXPLORER	Bon Vivant
Lee Winslow Court	Monhegan Is., Me.	LINDBLAD cruise	Met his future wife Ruby
Mary Goodwin	Los Angeles, Calif.	1966 LAPATAIA(Lindblad)	First Tourist ship
Henry Heyburn	Louisville, Ky.	1969 AQUILES Lindblad) 1970 LINDBLAD EXPLORER	Publishing catalog Falkland Is. post cards in 1982
Irwin Hirsh	Chicago, Ill.	1980 WORLD DISCOVERER	Most memorable trip of his life
Dotte Larsen	Pittsford, N.Y.	1976 LINDBLAD EXPLORER 1979 LINDBLAD EXPLORER 1981 LINDBLAD EXPLORER	She's a great one tremendous photos. Can't help loving her!
Aileen Lotz	So. Miami, Fl.	1981 WORLD DISCOVERER	My severest critic
Laura Murphy	Silver Spring, Md.	1979 AIR NEW ZEALAND	Flight before fatal one!
Luella Murri	Springfield, Va.	1980 WORLD DISCOVERER	Multipurpose action lady
Mayme Neel	Columbia, Mo.	1969 AQUILES (Lindblad)	An appreciative member
Katherine Petrin	Virginia Beach, Va.	1969 LINDBLAD 1971 LINDBLAD	World traveler who used to live here we miss her
Ruth Rogers	Glen Ellyn, Ill.	LINDBLAD cruise	Pays her dues or
Veryl Schult	Washington, D.C.	1966 LAPATAIA (Lindblad)	Mathematicians & travel
Constance Swan	Rockport, Mass.	1979 LINDBLAD	Society Loyalist good things come in small packages

Now if I've left anyone off the list, it wasn't intentional. Let me know. I notice there are a lot more women than men. Are the cruises thataway????

The following three paragraphs were provided by Guy Guthridge, erstwhile carpenter who is Manager of Polar Information in the Division of Polar Programs, NSF:

**WHERE THE USARPS ARE.** This is the height of the summer in Antarctica. Here's where U.S. folks were at 2 in the afternoon on 16 January 1982: McMurdo, 662 people. Williams Field (the McMurdo airport), 122. Amundsen-Scott South Pole, 37. Siple, 17. Byrd, 18. Northern Victoria Land, 7. Palmer, 28. Dome C, 16. Various field parties, 26. Total U.S. population in Antarctica, 933, comprising 115 scientists, 168 contractor personnel, 86 United States Navy officers, 499 enlisted persons, 47 New Zealand personnel under contract to the Navy for food services, 12 National Science Foundation staff, and 6 visitors. These figures don't include ships' crews.

**COAST GUARD BREAKS THE ICE (AGAIN).** The United Coast Guard Cutter Polar Sea, one of our nation's two newest and most powerful icebreakers, broke ice and records in McMurdo Sound on 14 and 15 January. Starting at the ice edge just south of Cape Royds, the ship cut through to Hut Point, 20 nautical miles, in 9 hours, clearing the way for the annual resupply of McMurdo Station. In the good old days this job took two of the smaller Wind-class breakers, working side by side in the "railroad track" method, several days to a week of backing and ramming. Polar Sea and her sister, Polar Star, live in Seattle when not in the high latitudes.

**GLOBAL WARMING?** In 1976 Paul Damon and Steven Kunen of the universities of Arizona and Utah wrote in Science that, "If the CO<sub>2</sub> greenhouse effect causes a global warming trend, it will most probably become apparent first in Antarctica." Shortly after, J. Murray Mitchell of the National Oceanic and Atmospheric Administration lectured to our society on this topic, noting that warming could prevent the next ice age and even send West Antarctica to sea. Now, George Kukla and Joyce Gavin of Lamont-Doherty Geological Observatory think they may have detected a decrease in the extent of antarctic pack ice in the 1970s compared to the 1930s—by about 35 percent. But they report in the 30 October 1981 Science that the link to any CO<sub>2</sub>-induced global warming "must, at present, remain highly tentative." Other scientists are unconvinced that the pack ice area decreased. Feeling the other leg, Robert Etkins and Edward Epstein of NOAA write in the 15 January 1982 Science that the observed rise in sea level over the last 40 years cannot have been caused only by thermal expansion of the water: "Significant discharges of polar ice must also be occurring."

**ICE CHIPS.** Thank's, Guy, please come back in the next Newsletter. // Ron McGregor, former Commander, Antarctic Support Activities, 1961-63, retired from the Office of Naval Research on January 8th after some 41 years and 6 months of government service (26 1/2 of which was with the Navy). His last position was Director of ONR's Arctic Atmospheric and Ionospheric Division. // An early Memorial Lecture this spring, at the peak of the Cherry Blossoms - April 1st! It promises to be a real barn burner with the old Minnesota halfback, Bob Rutford, currently Vice-Chancellor of the University of Nebraska giving the Lecture. Sharing the platform with Bob, giving the memorial aspects, will be the venerable, honorable Charles J.V. Murphy of BAE II fame. More good news - the price of the pre-Lecture dinner will be only \$15 this year. Mark your calendar! Come to Washington! // No classified section as we ran out of space. One man wrote and told me to take it and shove it, but one woman wrote that she liked the idea. // Fifty-one members are delinquent as we go to press. If you got a separate sheet marked "FINAL NOTICE, DUES NOT PAID", you had better believe it, as there will be no more free lunches unless you send some green. If you got a form stamped "YOU HAVE PAID THIS YEAR'S DUES", please return that form filled out so you will be in our data base. // See you on February 16th! Let's pack the place!

# THE ANTARCTICAN SOCIETY

c/o R. J. Siple  
905 North Jacksonville Street  
Arlington, Virginia 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

President!:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.), 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bernel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82

Vol. 81-82

March

No. 5

The Antarctic Society and the National Academy of Sciences'  
Polar Research Board are happy to co-sponsor  
the Society's 18th Annual Memorial Lecture

"Antarctica in the National and International Context"

by

Dr. Robert H. Rutford

Former Director, Division of Polar Programs, NSF  
Current Vice-Chancellor for Research and Graduate Studies  
University of Nebraska at Lincoln

and

Newly-elected President of the University of Texas at Dallas

PLUS

Mr. Charles J. V. Murphy  
Byrd Antarctic Expedition II, 1933-35

who will give the memorial aspects of the program

Thursday evening, April 1

at 8:15 p.m.

in the Auditorium of  
The National Academy of Sciences  
2101 Constitution Avenue, N.W.  
Washington, D.C.

Honorary Members:

Ambassador Paul C Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Bladwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Mr. Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980

Dr. Rutford, an Antarctic Glacial Geologist, currently is head of the U.S. delegation to the SCAR Sub-Group on the Environmental Implications of Possible Mineral Exploration and Exploitation in Antarctica. - - - Charlie Murphy, a very close personal friend of the late Admiral Richard E. Byrd, is a well-known biographer and political historian.

You are cordially invited to the Annual Pre-Lecture Dinner in Adams Rib Restaurant (Joseph Henry Building, 21st & Pennsylvania) at 6 o'clock, preceded by cocktails at 5 o'clock in the outdoor court on the 2nd floor, weather permitting. PLEASE fill out the reservation form on page 10 - NOW! and mail with your check to the Society's office. DON'T DELAY!

Bergy Bits is NOT the Voice of the Society, just the prejudiced, volunteer meanderings of a single member. If you can do better, this space and all of its attendant accoutrements can be yours for the asking.

**SURVEY IS OVER AND DONE WITH.** Our thanks to the 351 who returned the forms with background information and your feelings about what should be in the Newsletters (even though some of you like old Bert Crary, Crevasse Smith, Mort Turner and others just sent the form back without adding a single thing, not even an address!) To the other 80 who threw theirs in the waste basket, you haven't made our job any easier, I assure you. Some good ideas surfaced from the forms. We'll certainly keep paragraph headings, as there were a lot of favorable comments on them; we'll also strive to have more news on current events, although there has been a surprising amount of current news in Bergy Bits during the past several years. Starting with this issue we'll add a section on upcoming events. Then we'll try to have a paragraph on the last Society lecture for the benefit of out-of-towners, and a paragraph in each issue - maybe - about some state and its members. With this letter I'll initiate a paragraph on my favorite Society member of the month (MOM), which will invariably be a walk down memory lane with a non-active Antarctic whose heart was left in Antarctica when the body was delivered back to the States. We'll run a classified section in an effort to get answers to people's questions and needs. We hope Guy Guthridge will be a permanent guest artist writing at least a page of Guyisms. During the next year, if I am still writing, you can expect an overdose of material on Washington's plans for celebrating the 100th Anniversary of the First Polar Year, the 50th Anniversary of the Second Polar Year, and, particularly, reams on an IGY Antarctic reunion in Washington - all to be in either April or May 1983. The style of Bergy Bits won't change, as the negatives didn't seem to constitute a valid protest when weighed against the favorable comments. You people constitute a difficult constituency as you represent over 50-odd years of varied, active Antarctic participation; I am working off a narrow base of a couple of years out of the middle, having seen the ice last in December 1958. Changes since then have been phenomenal. But, believe me, we'll still try to cover the barrier front from 1928 to 1982.

**PRESIDENT REAGAN, JACK ANDERSON AND TIME.** In the New Federalism, or whatever, one never knows for sure, does one? But one thing came through loud and clear this winter - Washington has a love affair going with Antarctica. Never before has the old continent been so revered by the high and mighty along the Potomac. We seem to feel that this popularity high will continue through the next Antarctic Treaty or until some firm and binding decisions have been made on the natural resources of Antarctica. Most of you have probably not seen President Reagan's memorandum of 5 February relative to the U.S. Antarctic Policy and Programs, so here in its entirety is the good news for all Antarcticans in this country. (We understand there were some omissions, among them the inclusion of Siple Station, along with South Pole, Palmer, and McMurdo.)

SUBJECT: United States Antarctic Policy and Programs

I have reviewed the Antarctic Policy Group's study of United States interests in Antarctica and related policy and program considerations, as forwarded by the Department of State on November 13, 1981, and have decided that:

- o The United States Antarctic Program shall be maintained at a level providing an active and influential presence in Antarctica designed to support the range of U.S. Antarctic interests.
- o This presence shall include the conduct of scientific activities in major disciplines; year-round occupation of the South Pole and two coastal stations; and availability of related necessary logistics support.
- o Every effort shall be made to manage the program in a manner that maximizes cost effectiveness and return on investment.

I have also decided that the National Science Foundation shall continue to:

- o budget for and manage the entire United States national program in Antarctica, including logistic support activities so that the program may be managed as a single package;
- o fund university research and federal agency programs related to Antarctica;
- o draw upon logistic support capabilities of government agencies on a cost reimbursable basis; and
- o use commercial support and management facilities where these are determined to be cost effective and will not, in the view of the Group, be detrimental to the national interest.

Other agencies may, however, fund and undertake directed short-term programs of scientific activity related to Antarctica upon the recommendation of the Antarctic Policy Group and subject to the budgetary review process. Such activities shall be coordinated within the framework of the National Science Foundation logistics support.

The expenditures and commitment of resources necessary to maintain an active and influential presence in Antarctica, including the scientific activities and stations in the Antarctic, shall be reviewed and determined as part of the normal budget process. To ensure that the United States Antarctic program is not funded at the expense of other National Science Foundation programs, the OMB will provide specific budgetary guidance for the Antarctic program.

To ensure that the United States has the necessary flexibility and operational reach in the area, the Departments of Defense and Transportation shall continue to provide, on a reimbursable basis, the logistic support requested by the National Science Foundation and to develop, in collaboration with the Foundation, logistic arrangements and cost structure required for effective and responsive program support at minimum cost.

With respect to the upcoming negotiations on a regime covering Antarctic mineral resources, the Antarctic Policy Group shall prepare a detailed U.S. position and instructions. These should be forwarded for ray consideration by May 15, 1982.

(signed) Ronald Reagan

And did you read all the good things Jack Anderson wrote in late January? Fantastic! One of his associates, Dale Van Atta (who must have come from the School of See No Evil, Hear No Evil, Speak No Evil) told Jack, who told the world, that the only thing wrong with Antarctica is a shortage of funds. I have a sneaking feeling that Van Atta never went to the ice, that there was some sort of collusion between him and Guthridge with Dale actually spending those two months in Tahiti while Guy sat in Washington writing the material which Dale later (when he got back from Tahiti) turned over to Jack Anderson. How else can you account for five favorable articles from Anderson, who isn't normally disposed to being kind to anyone? Ed Todd, though, is still sitting in the Director's chair of the Division of Polar Programs at NSF wondering where Van Atta saw "top secret CIA and National Security Agency reports on Antarctica." Ed has never seen one since he's been on the job! The Time magazine article (February 22, 1982) was sort of anti-climatic after the President's memorandum and Jack Anderson's column. One might say, Déjà vu, n'est-ce pas?

**HOPALONG CASSIDY TELLS ALL ABOUT METEORITES.** Dr. William Cassidy was enjoying the serenity of a peaceful afternoon working in his laboratory at the University of Pittsburgh on February 16th when the quietude and his concentration were broken by a call from Ken Moulton of NSF who was just checking with Bill's office to see what time he would be arriving in Washington to give the evening lecture to the Antarctic Society. Imagine Ken's surprise to find that Bill was still at the University. But that was nothing compared to Bill's horror when he found out he was supposed to be lecturing in Washington in 5 1/2 hours! Disdaining the airlines, he hopped into his Audi and sped through the countryside like a modern-day Paul Revere, driving madward, onward towards the Washington Monument. Four hours after departing his laboratory, Hopalong pulled up in front of the National Science Foundation, having successfully outrun all cops along the 250 miles from Pittsburgh to Washington. He established another Antarctic Society "first" by arranging his slides in a tray in the men's room while a crowd of 45 people assembled in the Board Room to hear his lecture. It was our Society's first lecture on meteorites, in spite of the fact they have been a part of the Antarctic scene since Sir Douglas Mawson's expedition to Adelie Land picked one up in 1912. Today approximately 5,000 specimens have been found by the U.S. and the Japanese. Bill had just returned from the Antarctic where the U.S. had its greatest year in finding meteorites, a record 373 specimens. If my notes are correct, the biggest ever found was an iron, consisting of over 30 pieces, weighing 898 pounds, with the largest fragment being over 300 pounds. Bill not only has a nose for meteorites, but he appears to be a Scotsman masquerading under an Irish name. All of his fellow meteorite hunters are paid by their home offices; the only one paid by Hopalong is John Schutt (a Society member), and he doesn't get paid until the season is over. John is a modern-day Crevasse Smith, as he is sent out ahead in the lead snowmobile to see if he falls into anything. If he survives, all the rest hop into their snowmobiles and pile after him like penguins following the leader. There are a couple of women meteorite hunters on the squad, supposedly not there just hoping to find another meteorite with diamonds. Finding a meteorite evidently is cause for much back-slapping, which I find most refreshing after watching all those high fives in the end zones this past football season. When Bill Cassidy (and Ed Olson) first went searching for meteorites back in 1976 at the foot of the Wright Upper Glacier, they found two in the first half hour, and then not another one for six weeks. Altogether they now have around 1,100 specimens from Allan Hills (which may represent something like 100 falls), which is a goodly number in a search area only about 150 square kilometers. Statistically, over a period of a million years, there should only be one meteorite on each square kilometer. Bill Cassidy and his space cadets in snowmobiles must feel they have truly found the Happy Hunting Ground in the

Allan Hills. At the lecture a six-year old youngster in the front row was sketching meteorites, and even asked a question of the speaker (another Society "first", youngest person to ever ask a question). He has good lineage, his Dad being Dr. Robert (South Pole 57) Benson of NASA and his uncle the Alaskan snowman/glaciologist, Dr. Carl Benson. Last seen, Bill was headed towards some Chinese food, and then was driving straight back to Pittsburgh in the rain, fog, and darkness of night in order to meet with his class the following morning. Our Hopalong Cassidy may not be an Ail-American football player, but he truly is on our All-Antarctican team with an asterisk indicating he is also MR. NICE GUY!

**COLORADO, FOURTEEN MEMBERS, FOURTEEN PENGUINS.** There are a lot of important Ant-arcticans in Colorado, and many are members of our Society. One who was a wheel even before the IGY is Alan Shapley of Boulder. He has been to the Antarctic twice, the first time in January 1959 when he went on a VIP Post-IGY visit with the likes of the late Lloyd Berkner and Harry Wexler, plus J. Tuzo Wilson. Another Boulder-ite is meteorologist Ed Flowers who wintered over twice at the South Pole (1957 and 1960), and then went back later for two more summers. Ed heads up a bag of worms, the National Weather Service's solar radiation program. But he's used to bad deals, because before the IGY he had to answer all the crank mail about busted weather forecasts. Ed is really going to enjoy retirement, believe you me. And living in a Boulder canyon, in a mansion built by himself and his lovely bride Lisa, is Kirby Hanson, meteorologist at the South Pole in 1958, and until recently in charge of NOAA's Geophysical Monitoring for Climatic Change program (which included the South Pole Station in its network). Kirby is sort of an independent free-lancing senior scientist with NOAA who is concerned with CO2 warming. Another 1958 South Pole meteorologist, DeeWitt Baulch, lives in nearby Golden. Dee who works for EPA actually started out as a geographer and may still be one. Also living in Boulder are a couple of good old boys from Eights Station, Lorne Matheson (class of 1963) and Joseph Hirman who was station scientific leader in 1965. Presumably they were both upper atmospheric types. Lorne writes that he has recently worked on computer programming for the new digital ionosonde put in at Halley Bay by the British Antarctic Survey. Still another Boulderite, F. Michael Maish, was with the Soviet Antarctic Expedition in 1969, wintering over with the Russians (a la Cartwright, Rubin, Dewart, Flint, and Rex Hanson), at Vostok. Not all Antarcticans in Boulder are old fossils, though, as Richard Reynolds, a geologist with the USGS, went to the Pensacola Mountains in 1978-79 to study the Defect Intrusion. But Reynolds is no kid, either, as he was down there in 1970-71 studying the Lassiter Coast (Jim Lassiter is a new member) as well as the Latady, Button, Playfair, Guettard, and Werner mountains. Another old timer, in the Charlie Bentley tradition, is John Behrendt of the USGS in Denver. John wintered over at Ellsworth in 1957 and has gone back repeatedly (in 1958-59 on the EDISTO to Ellsworth, in 1960-61 to West Antarctica (airborne geophysics), in 1961-62 on an Antarctic Peninsula traverse as well as to Byrd (geophysics), in 1965-66 to McMurdo and the Pensacola Mountains (geophysics), and again in 1978-79 when he went to the Forrestal Mountains). Another Denverite is new member Peter Rowley. I don't seem to have a form on him, but I know that he's an active practicing Antarcticans who has worked on the geology of the Orville Coast and eastern Ellsworth Land, and apparently also on the geology of the Lassiter Coast and southern Black Coast. Still another geologist in Denver, John Ege, was involved in the mapping of the Pensacola Mountains in 1963-64. And wherever Broomfield may be hidden, we have yet another South Pole man, Bob Grass, who wintered over in 1964 as physicist in charge of the ozone program. Evidently he likes ozone, as he has supervised the Antarctic ozone program ever since 1965. What a rut! Elsewhere in this issue, we have written about Capt. Marion Morris of Colorado Springs who is our first MOM (Man of the Month). Way down south in Durango is Tom (Plateau 68) Frostman. Tom is one of my favorite

people and one of the top two or three persons who have worked for me. When he was micrometeorologist at Plateau he almost became a statistic. He was alone in the garage, cooking steaks over a wood fire (the generators had all broken down), when he passed out from carbon monoxide poisoning. It took the camp personnel about three hours to bring him around. Unfortunately Tom has bailed out of Antarctic activities and now is director of one of the top ten summer camps in the whole country. So if you have any youngsters you'd like to farm out for the summer, unload them on Tom and you can be sure your worries will be in good hands. So there you are - fourteen Antarcticans in Colorado, and every one of them is a bona fide penguin who's been there!

**CAPT. MARION E. MORRIS, U.S. NAVY (RET.), BERGY BITS MAN OF THE MONTH.** We are initiating this MOM series with a salute to Capt. Marion Morris, a former pilot and VX-6 commander, who now lives at 2242 Glenwood Circle, Colorado Springs, CO 80909. We've never had the pleasure nor the honor of meeting this gentleman, let alone fly with him, but we feel we know a little bit about him from his beautiful prose when he writes about his past associations on the ice. Like many, he is living for that day when a call might come asking him to go back to Antarctica. He wrote, "I know my chances of returning to the ice are practically nil, but someday...SOMEDAY...I pray to return and breathe the air of peace and feel the chill of purity. Meanwhile I'll just feel sorry for the millions of fellow humans who have never had that opportunity. I was part of its recent heritage and I am most proud of the continuing program. Maybe the best is not yet to come; I suspect the best is past. But Antarctica will emerge as a new force on this planet...if we don't screw it up." But we're getting ahead of ourselves, so let's backtrack and let Capt. Morris introduce himself.

.... I served with VX-6 (now VXE-6, of course) during DEEP FREEZE 64, 65, and 66. Like so many others I sort of "popped" into the program and then, after a few years, "popped" out of it, not leaving much imprint. However, I did leave with a feeling of having materially advanced the relationship of "Navy" and "USARP"s and have the fondest memories of strong friendships (albeit brief) with many of the red-parka gang ....

My final year with the squadron was spent as skipper and that enabled me to invoke the ancient RHIP custom of military life and I selected some of the better flights for myself, much to the chagrin of some of the younger macho-types. I was privileged to make the first flight to establish Plateau Station and still feel the little butterflies that were shooting touch-and-goes in my stomach as I climbed out of the airplane and saw the skis some 18 inches down in the softest snow I'd ever encountered. It took thirteen takeoff attempts to get off the plateau that day; but our mistakes uncovered the correct procedures and subsequent flights made it without a hitch.

My tour also saw the phasing out of the ancient C-47 "Goons" and the then-neglected "Otters"...good riddance, in retrospect. They had served their purpose and the effort was just getting too demanding for their marginal performance. .... What a great place to fly! And what an opportunity to do it to my heart's content. Of course, there were those moments of "stark terror" which punctuate the aviator's "long hours of boredom!" But that was all part of it, and I was too enthusiastic to let a little thing like ground blizzards and rock-hard sastrugi spoil my fun.....

.... I have never been prouder of any of my achievements (perhaps a

somewhat presumptive word...) than I am of my brief participation in the ongoing effort in Antarctica. I certainly am a Johnny-come-lately when one considers the heroic figures and herculean effort that preceded my involvement. But, if one can be "guilty by association;" why not "proud by association?" A particular source of my satisfaction is the realization that, as a professional military man, I was involved for all too short a while in an endeavor of peace; an endeavor which taxed my ability as strenuously as any of the times of combat .....

Naturally he reads Bergy Bits, writing that it "takes me back to a pleasant time in my life when men were men; and chocolate was Brown Swiss; and penguins were brothers; and flights through crisp, unpolluted skies were an everyday joy; and evenings in weather-created Jamesway prisons were full of overdone steaks, frozen beer, and hearty associations; and sleep was so sound." Old Antarcticans never really die, do they? Nor do their memories ever fade away. Antarctica is something like your first real love, you just can't forget those fond, warm memories. Maybe they should build an Old Antarctic Retirement Home on McMurdo Sound for guys like Marion Morris...and me...and you... and you... and also you.

**PRISCILLA GREW, JUST ANOTHER WIFE OF A TYPICAL ANTARCTICAN!** The Edward Grews could be the most fascinating couple in our Society, as they have combined successful careers and a happy marriage while living hundreds of miles apart, sometimes thousands of miles apart (e.g. when Ed is in Antarctica, India, or one of his other favorite environs). But you get the feeling that their successful marriage is not directly in proportion to miles of separation, that it would still prosper even if they had to live with one another. Governor Jerry Brown appointed Priscilla to a six-year term on the California Public Utilities Commission in San Francisco. Her nomination resulted in the Governor getting some flak from politicians who advocated a traditional appointment more to the liking of the Chamber of Commerce, but when the confirmation votes were tallied, Priscilla won in still another Californian landslide, 25 to 2. Needless to say, Priscilla is a strong backer of Governor Brown, has been for some five years. She finds the Governor a courageous and consistent advocate of those causes in which she believes: "nuclear nonproliferation, ethical government, conservation and alternative energy, affirmative action for the disadvantaged, and environmental stewardship." I wonder if Priscilla also likes Linda Ronstad! Priscilla has been appointed by Interior Secretary Watt (who, one might suspect, would be at opposite poles to her beliefs) to a second term on the Earthquake Studies Advisory Panel of the USGS. And she is also on the Committee on Geology and Public Policy of the Geological Society of America. The National Science Foundation offered her the job as Director of Earth Sciences which she turned down. Why, when only one block from the Executive Office Building and the White House? I wonder what it must be like to be married to such a professional success. It must mean you don't talk about Roger Staubach and the Dallas Cowboys at the dinner table, that you don't talk about the daily weather or your neighbors, and that conversation pretty much follows the headlines of the New York Times and the Wall Street Journal.

**AUSTRAL SUMMER ENDS PEACEFULLY, SOMEWHAT HILARIOUSLY.** When you see old Walt Seelig walking along 18th Street N.W., then you know all the penguins are back in their rookeries, and so it was on March 1. This year was a mixed bag, although it turned out much better than it appeared it would when, at one point, it was thought that most of our helicopters might be grounded because stress fractures were detected on one. There was bad news with the sinking of the German ship GOTLUND II, and more bad news when one of the Navy enlisted men

lost his life in an off-loading accident at McMurdo. Then a near-panic situation arose in New Zealand when authorities didn't like the smell of some mail going to the ice. And a good family newspaper like the New York Times lowered themselves to write a somewhat meaningless expose-type article about what happens when one winters over in Antarctica. But now everyone is home, including those questioned by the New Zealand authorities about the contents of their mail, the net result of which was that several Navy men and contractor personnel ended up paying token fines and having to leave New Zealand on the first available transportation. One probably couldn't have wished for a quicker or better settlement, and, hopefully, there is a lesson to be learned from it all. And tourists on both the LINDBLAD EXPLORER and the WORLD DISCOVERER found out how rough it can be at sea, as both ships got caught in a severe storm between McMurdo and New Zealand, which they will never forget. Nothing like a little realism, eh what! In a "believe it or not"-type incident, the curtain really came down on the summer season when one of our ships, the SOUTHERN CROSS, was arrested - yes, arrested, when it arrived in New Zealand. The ship wasn't misbehaving, but it was carrying the helicopters flown off the GOTLUND II before she went down, including one flown off by a Kiwi hired to go on the German expedition. He felt the ship was derelict at the time he flew the helicopter off and therefore it rightfully belonged to him. So he had the ship arrested in an attempt to get possession of his very own chopper! He lost his case, naturally, and it ended up with the U.S. having to pay \$23,000 per day for two days' port charges. Antarctica can be fun and games - win some, lose some - but it is never dull.

**TERRA NOVA, CENTER STAGE, BALTIMORE, MARCH 23-APRIL 25.** After several aborted attempts at the Kennedy Center, the TERRA NOVA is finally coming to town, sailing into Baltimore Harbor and anchoring on the Center Stage, 700 North Calvert Street, Baltimore, Maryland 21202 (Box Office, 301-332-0033) for a five-week stay in March and April. Tickets for this stage play are reasonably priced, with a top price of \$14.00 (Friday and Saturday evenings, center orchestra and mezzanine) and a minimum price of \$7.50 (side seats for Saturday and Sunday matinees). No matter where you sit, you'll feel like you're hauling Captain Scott's sled - no seat is farther than 35 feet from the stage. Two of the matinees will be followed by panel discussions on the stage about the pros and cons of Scott and Amundsen and their infinite wisdom and/or bad luck. Wouldn't you love to see Bob Nichols up there on the stage, wearing his ever-present braces, extolling the virtues of Captain Scott and shooting down any young upstart who might want to challenge Scott's decisions! However, I have a sneaking suspicion, based on phone conversations with sweet-sounding Sally Livingston of Center Stage, that perhaps one or two of our Society members may be invited to be panelists. If there is enough local interest in going to Baltimore for a show, it may be possible to get a small discount for Society members. If you're interested, get in touch with Ruth Siple (522-2905) and perhaps something can be set up.

**HELP PETER ANDERSON, HE'S IN NEED.** Peter needs something bad, and it isn't a trip to Florida, but help on a book on aviation in Antarctica which he is currently trying to finish. He pleads "would love to hear from members who have photographs I could borrow, copy and return, memories of their Antarctic work, and stories to tell." He said his work right now is restricted to mail (poor soul!), but that interviews might be a possibility downstream. Peter's address is Institute of Polar Studies, The Ohio State University, 125 South Oval Mall, Columbus, OH 43210.

**A NEW KID ON THE STREETS - FIPS.** The Institute of Polar Studies has a new off-spring, FIPS (Friends of the Institute of Polar Studies), which appeared on the

DO WE HAVE YOUR CORRECT  
ZIP CODE??

scene in January 1982. FIPS is actually a newsletter which is dedicated to extolling the virtues of those intrepid explorers/scientists (both past and present) who grace the halls of the IPS. FIPS is available for \$5.00 per year (FIPS, OSU Institute of Polar Studies, 103 Mendenhall, 125 South Oval Mall, Columbus, Ohio 43210). Good luck, Ann!

**KIWIS RUN IN SMALL CIRCLES.** Jim Caffin wants us to point out that two Kiwis, Gerald Holdsworth and Tony Gow, came in one-two in the 10km three-times-around-the-world race at the South Pole (summer 81082). Hey, Jim, they've been gone from New Zealand so long that you can't be serious and still claim them as yours, can you? Also, isn't New Zealand actually one of our States, or hasn't Capitol Hill gotten around to ratifying that one, either? Anyway, we didn't have our first team at the South Pole; they were detained elsewhere in the interest of science.

**FATHER OF ANTARCTICAN RECEIVES HIGH AWARD.** Dr. Jacob P. Den Hartog, father of Stephen (Little America V '58) Den Hartog, received the Founders Award of the National Academy of Engineering on November 4, 1981, for "outstanding accomplishments in developing the theory and advancing the art of vibrational effects in mechanical design, extensive government and industrial contributions, and inspired teaching of two generations of engineers."

**QUESTION/ANSWER.** Who was the first Hispanic at the South Pole? Celia Ramirez-Heil, Division of Polar Programs, NSF, during austral summer 1980-81.

**FROM THE DESK OF GUY GUTHRIDGE.** McMurdo, South Pole, and Siple begin winter. On February 10 the last planes of the season left Siple and South Pole stations, and on February 20 the last planes departed McMurdo, leaving these three U.S. stations to their own devices until October or November. At the South Pole, 7 science personnel and 11 support personnel are monitoring the passage of satellites, recording fluctuations in gravity, making seismic observations, photographing auroras, measuring cosmic rays, collecting air samples to monitor global atmospheric changes, and observing the weather. At Siple the emphasis is on the upper atmosphere, with 3 science and 5 support personnel monitoring very low frequency signals. McMurdo, primarily a logistics center, has 7 science and 85 support personnel performing-projects in meteorology and upper atmosphere physics.

Palmer Station continues its summer activities until the end of March, when HERO, the 125-ft wood research ship, leaves 2 science and 6 support personnel to monitor the upper atmosphere and collect meteorological data.

Banana Belt attracts summer science. The austral summer now winding up has witnessed more U.S. science at Palmer and along the Antarctic Peninsula than ever before. Of the approximately 81 U.S. antarctic research projects this year, 23 center on the Peninsula-up from 10 last year. Most of the work is biology, taking advantage of the diverse (for Antarctica) biota, the availability of HERO, and the biological laboratory at the station. Also, the icebreaker GLACIER is supporting geology in the James Ross Island area (near the tip of the Peninsula) and will collect piston cores along the western side of the Peninsula before calling at Palmer in mid-March and heading home.

New source of ultra low frequency waves. Data from Siple Station have revealed a previously unknown source of ultra low frequency (ulf) waves in the upper atmosphere. According to a National Science Foundation release, physicists at the University of Maryland and Bell Laboratories found that "ulf waves are generated in the ionosphere when the conductivity of that region increases significantly due to increased ionization caused by ultraviolet light and x-rays from solar flares." Previously, it was thought that natural ulf waves were generated only when the solar wind hit the earth's magnetic field or during magnetic storms.

CALENDAR OF UPCOMING EVENTS.

Major Importance;

1 April 1982. Antarctic Society's 18th Memorial Lecture, Dr. Robert H. Rutherford. Memorializing, Charles J.V. Murphy.

11 May 1982. Antarctic Society's last lecture of 1981-82 season. Dr. Edward P. Todd, Director of Division of Polar Programs, NSF, will speak on U.S. Antarctic programs.

10 July 1982. Antarctic Society's Mid-Winter Picnic, Stronghold.

Others;

23 March-25 April 1982. Terra Nova (play), Center Stage, Baltimore (see p. 8)

March-April 1982. Live TV coverage of under-ice exploration efforts on wreckage of H.M.S. BREADALBANE (sunk in 1853 in 330 feet of water off Beckley Island, 600 miles north of Arctic Circle, within 100 miles of North Magnetic Pole), Explorers Hall, National Geographic Society, Washington, D.C.

1-3 April 1982. National Academy of Sciences, Polar Research Board meeting, Washington, D.C.

5-8 April 1982. 3rd Session of Executive Committee, Working Group on Antarctic Meteorology, WMO Secretariat, Geneva, Switzerland. Gordon D. Cartwright represents U.S.

24-26 May 1982. SCOR/SCAR Workshop on Enhancement of Interaction Between Physical, Chemical and Biological Oceanographers, Tokyo, Japan.

27-28 May 1982. BIOMASS Colloquium, Tokyo.

30 May-4 June 1982. SCAR Group of Specialists on Southern Ocean Ecosystems and Their Living Resources, Nikko, Japan.

7-10 June 1982. Fish Age Determination Workshop, University of Maine, Orono.

June 1982. Antarctic Treaty, Mineral Resources, Wellington, New Zealand.

28 June-9 July 1982. 17th Meeting of SCAR, Leningrad, USSR. (Also meetings of Working Groups on Biology, Logistics, Upper Atmosphere Physics)

16-20 August 1982. 4th International Symposium on Antarctic Earth Sciences, University of Adelaide, South Australia.

The Antarctic Society  
proudly presents  
an old-time favorite

THE UNITED STATES RESEARCH PROGRAM IN ANTARCTICA

by

Dr. Edward P. Todd  
Director  
Division of Polar Programs  
National Science  
Foundation

Wednesday evening, May 12

at 8 p.m.

Board Room (Room 540)  
National Science Foundation  
18th and G Streets NW

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Mr. Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979

Dr. Todd is a northeaster from Newburyport who came to Washington to seek fame and fortune in the sacred rooms of the National Science Foundation. Then one day he found himself the Director of this nation's most perilous and also most exciting program, the United States Antarctic Research Program (USARP). Dr. Todd goes to the ice each year to escape 18th & G Streets and to see firsthand what kind of an operation he is running there. Be sure and come on the 12th to hear him tell it as he sees it from The Director's Chair.

Good News! No Bergy Bits! We had to go to press early with this Newsletter as both Ruth and I have mid- to late April involvements with members of our respective families. Bob Rutford's 1982 Memorial Lecture was not ready for printing, but Charlie Murphy's memorial comments were, so-we are using Charlie's now and will use Bob's in June.

The May 12th meeting will also be our annual business meeting. One amendment coming up for vote - making the treasurer's position semi-permanent so in the future Ruth Siple can legally succeed herself. Anyone with a face like Ruth's has to be honest. Slate of officers (President, Secretary and five Board members) will be presented for election by acclamation. Come to vote "yes" so that we can get on with the meeting. Light refreshments and coffee for those who vote the party line. P.C.D.

412 Paid Members as of April 6

WE THANK YOU!

Charlie Murphy, seventy-seven years old, has not lived by the sword, but by the pen and he has done quite well, thank you. When you look at Charlie you see a hulk of Boston Irish, a throwback to John L. Sullivan, although his kind face with the map of Ireland immediately lets you know he's a man of passion and words, far from ever being a stevedore. He was brought up in Newton Center, somewhat removed from the Irish stronghold in South Boston, and he did something very un-Irish - he went to Harvard rather than Boston College. After a couple of years, he decided he had to start his life's pursuit in journalism. He went to the Big Apple where he latched on to the Associated Press, then went to the Evening Post, and from there to the World. Charlie was the CBS man with Byrd on the 1933-35 expedition, and it is strongly rumored that you can detect the fingers of Charlie in the writing of Byrd's Alone. After BAE II Charlie was associated with Time, Inc. for thirty-four years, covering politics and national strategy for both Fortune and Life magazines. He has been very active in the Security and Intelligence Fund here in Washington. In his speech he makes several references to James Angleton, which should be a familiar name to most of you, as Mr. Angleton was formerly head of counterintelligence for the CIA. We were pleased that Mr. Angleton could come to our dinner and lecture, as did another one of Charlie's delightful local friends, retired Air Force Colonel Vincent Ford (who had also come to an earlier Memorial Lecture). Charlie's speech was a sheer delight, especially when you realize that he put it all together in a couple of days. When he finished he received a resounding, continuing applause for several minutes. Those of you who know the present-day Charlie Murphy, who never passes a bar without paying his due respects, will be particularly enthralled by his great story about the Golden Stalactite. Charlie now lives on Pickle Street, Grafton, Vermont 05146.

#### SOME VAGRANT RECOLLECTIONS OF AN ELDERLY ANTARCTICIST

- Charles J.V. Murphy

When the Antarctic Society asked me to dip into a dimming memory for a recollection or two of the Second Byrd Antarctic Expedition, 1933-35, my response was, "Why me?" That experience was over and done with half a century ago, and in all the years since I've never had occasion to render such an account before strangers, and, for that matter, and no doubt for excellent reasons, I can't recall ever being invited to do so.

People learn to be wary of polar travelers. Isolation tends to make windbags of us all. I remember meeting the dean of American Antarcticists, Dr. Laurence M. Gould, when Admiral Byrd was assembling his first Antarctic party in 1928, the last year of the Calvin Coolidge presidency. Gould impressed me at the time as a reserved, laconic, professorial fellow, and I judged his reticence to be the professional armoring of a geologist - a scholar who communes with rocks. When next I encountered him, in this same company, he was reverently and irretrievably launched on an autobiographical pilgrimage disguised as a history of Antarctic geological research which took him the better part of two hours to complete.

Paul Dalrymple dissipated any apprehensions with the assurance that the intellectual contribution this evening would be supplied by Dr. Robert Rutford. All that was expected of me, I was told, were a few nostalgic reminiscences about life at Little America, now gone with Nineveh and Tyre, at a time before most of the practicing generation of Antarcticists had been born. In other words, I was to present myself as a survivor of an endangered species. When Byrd mustered the winter party in the vicinity of 78 degrees South latitude, we numbered 56. Now we are down to 25, and a third of those are geriatrics.

I trust I am not trespassing on the privacy of the distinguished Dr. Rutford if I claim a certain remote kinship with him. The evening's program identifies him as President-elect of the University of Texas at Dallas, currently a Vice-Chancellor at the University of Nebraska. Perhaps the most conspicuous honor bestowed upon me in recognition of my stay in Antarctica came from the state of Nebraska. The Governor made me an Admiral of the Nebraskan Navy, an institution wholly bereft of annals for want of a sea to sail on and an enemy to fight. It tells something of the intellectual gulf which separates Dr. Rutford's generation of Antarcticists from mine that the subject of his discourse will be the emerging significance, in both, a national and international context, of that no longer distant continent.

When the gallant Admiral Byrd took us there, in the first year of Franklin D. Roosevelt's first administration, it never occurred to any of us, I suspect, that a place consisting entirely of ice, snow, cold, wind, rock, and a vast emptiness could be fitted into a context of any kind. Even the choice of a name for our hamlet on the Ross Ice Shelf betrayed a certain provincialism - Little America. I read the other day that the Soviet Union maintains no less than eight permanent stations on the continent and the United States has four. The Chileans, the Australians, the Argentines, and the New Zealanders all dispatch expeditions there on a fairly regular basis, and visitors from Communist China, Japan, West Germany, France, and even Poland swell the tourists into the region. In 1933, we were the only people there, and on more than one occasion, as time drifted on, I found myself wishing that I was somewhere else.

Even more instructive are the contrasts between what might be called the standard of living available to an Antarctic resident nowadays and what constituted our lot in the little shanty town of Little America above the Bay of Whales. Today, I am told, a private room, hot baths and showers, hi-fi sets, toilets that flush, a clinic, beds with a change of sheets, reading lamps, rugs on the floor, a bar open around the clock, electric washing machines, snack bars, and mess halls offering menus superior to those served up at the flag officers' mess at the Pentagon are among the standard creature comforts accorded an Antarcticist berthed at McMurdo Sound. With these come, of course, regular flight schedules to and from New Zealand, carrying mail and fresh stores through the months of daylight and generous allotments of time for radio telephone conversations with family and friends at home. When we were there, the ships came and went once in the season and that was that. I dwell on these amenities not from a tardy surge of envy, but rather out of a simple recognition of the realities of class differences from the point of view, say, of a survivor of the Donner Party reading in his old age of the mansions and social doings of the Railroad Barons who had followed him through the Pass into San Francisco.

The winter party of the Second Byrd Expedition subsisted at what might fairly be described as the Tobacco Road, or Third World or Have-Not standard of existence. In terms of what we had to do with, we were closer to Scott, Amundsen, and Peary than we were to those who come and go today. In fact, the austerities imposed upon us by circumstances were in some respect hardly more congenial than those accepted by the whalers out of New Bedford and Salem. For one thing, we were not financed out of the Federal Treasury. Richard Byrd was the last of the successful entrepreneurial explorers-, and the expedition was, I believe, the last major polar expedition to be organized, financed and directed as a private enterprise. Byrd raised the money he needed by cadging donations from rich individuals and organizations, by lecture tours, by selling to marketing firms the right to claim the honor of being the expedition's chosen supplier, and by scavenging the storage dumps and depots of the government and private companies for surplus equipment that would be useful to him.

Our principal vessel was a single-screw, single-hull cargo ship that had rusted in mothballs since World War I. The Navy leased it to Byrd for \$1 a year. It was hardly a bargain even at that price. A New York beer merchant, Jacob Ruppert, made a handsome donation in cash for the privilege of having the aging ship renamed after him. The hard times that compelled Byrd to press on with the money-raising, at best a humbling experience even in the best of times, through the darkest of the depression years, led inevitably to several painful, even embarrassing compromises. The JACOB RUPPERT lacked standard ballast, and Byrd had no money to buy it. He ballasted the ship with soft coal offered to him free by a coal merchant in Norfolk, and he used the surplus for heating the shacks at Little America. The most unpleasant memory I carry from life underground was the agonizing difficulty of trying to start a fire in the morning chill under a layer of frozen soft coal and the puff of choking black soot that would explode in one's face when a fresh shovelful was tossed on the fire. A welcome gift of cash was raised in a wholly unexpected and potentially embarrassing quarter. The Lydia Pinkham Company, makers of the famous vegetable compound for women, gave \$5,000 with the understanding that a mountain, or an equally impressive topographical feature, be named after the lady founder. A comedy of errors, too complicated to explain here, later led to a quarrel with the executives of the company. To the relief of most of us, if not to Admiral Byrd, who had to pay back not just the \$5,000, but also had to absorb a commission of \$1,500 pocketed by the professional money-raiser, the commitment did not have to be met.

It was the same with people. Byrd had no money for salaries. The military services seconded a handful of pilots, mechanics and ship's officers; the universities a few scientists; and the Weather Bureau the meteorologists. The Norwegian government generously detached an experienced ice pilot to take our ships through the pack ice; otherwise our company consisted of volunteers. The volunteers in the ice party - those, that is, who wintered at Little America - drew no pay at all. The ship's crews berthed in Dunedin on the South Island of New Zealand, were doled out \$5 a week per man for pocket money - hardly enough to pay for the bus ride into the city and a few beers.

A drawback with volunteers is that a leader has no real control over a troublemaker. On the eve of the departure of the second ship from the Bay of Whales, the physician who had volunteered to serve the Winter Party, decided that the prospect had lost its attraction for him and he announced his determination to desert the expedition and leave for home with the vessel. It was touch and go whether a sea relay worked out with the New Zealand government would enable us to bring another doctor down to Little America and leave time for the old barkentine, the BEAR OF OAKLAND, to complete a second passage of the Ross Sea before the ice closed in. The New Zealander, a fine doctor, was part Maori. His bedside manner was hardly soothing, though. I all but severed my forefinger one morning while chopping wood and I telephoned the doctor across the camp to say that I needed help to stanch the flow of blood. "Bad luck," Dr. Potaka acknowledged. "Get the fire started. Heat up some water. Call me when it's boiling and I'll come over."

In New Zealand, the ship's companies managed one way or another to make ends meet, even on their meager remittances. One fellow, a hunchback Australian beachcomber and confidence man named Creagh whom Byrd had signed on in Panama, on the way south, as a ship's cook proved exceptionally ingenious. Well into the winter night, a signal from the Navy Captain in command of the ships at dock in Dunedin reported to us in Little America that Creagh had been arrested as an imposter and would I authorize him to take him back on parole. The charge was that Creagh had booked himself into a number of provincial theatres for a lecture on "The Last Hours of Mati Hari," and he was advertising himself as "Lieutenant Creagh, in charge of the firing squad." My answer was, yes, take him back by all means. A man of Creagh's imagination and brass was too invaluable to lose.

As I suggested at the start, the ambitions of the Second Byrd Antarctic Expedition, in keeping with its means, were fairly simple, even primitive, I read in the New York Times the other day that the National Science Foundation, which directs and supports the United States' activities in the Antarctic, has in motion for the current year a program calling for the deployment of some 287 scientists - quite enough to staff the scientific faculties of at least two colleges - and their investigations are to take them into some fourscore different fields of esoteric interest. A scientific program of such splendor and magnitude was, of course, beyond even the wildest imaginings of the early Byrd men. To be sure, a solemn emphasis was laid upon the scientific aims of the expedition, such as they were. Even at that early stage some of the glamour was off exploration for its own sake. It was no longer enough for a professional explorer to answer, as the Englishman Mallory did, when asked why he was obsessed with the desire to scale Mt. Everest, that he had to do it "because it is there." People were beginning to argue that whatever was there, beyond the horizon, had to promise something of practical or abstract worth.

So Byrd took south with him two fine physicists, a geophysicist, two biologists, a geologist or two, and two meteorologists. For his second-in-command, Byrd chose the senior physicist, Dr. Thomas Poulter of the Armour Institute, whose forte was low-temperature physics - a first class human being, physically strong, marvelously competent, and ingenious in the practical skills of the artisan, brief in speech but long in moral strength. A dear man, in every respect. Even so, the scientific component - to use the jargon of the day - constituted only a small but highly self-disciplined and purposeful nuclei of the population of Little America. They represented a fig leaf, so to speak, for imparting an intellectual sanction to Byrd's central purpose, which still was physical discovery in its most elementary aspect - finding lands, mountains, glaciers and seas never seen before.

Fifty years ago there still was a fine harvest to be had here, and our vehicles - a two-engine Condor biplane, long obsolescent, a single-engine monoplane, and a newfangled helicopter - were assembled primarily for that fairly simple-minded mission. We also had some 150 Siberian huskies for sledging parties to far-off sectors. They served as the last surviving relics of turn-of-the-century polar travel. And with a view to mechanizing surface travel and mitigating its drudgery, Byrd also introduced the first belt-driven tractors. Unfortunately, the only vehicles within the means of his shrunken purse were three grossly underpowered machines built by the Citroen people of France for an expedition into the Sahara Desert. Beggars not being choosers, Byrd accepted them anyway, and though the mechanics who had to keep the machines running learned to curse them as nothing ever invented by man has been so cursed, they performed quite creditably and were the means of saving Byrd's life.

All the same, Byrd was shrewd enough to perceive that if his work was ever to catch wide public attention - if it was to produce book sales and lecture fees that would enable him to pay off his mountainous debts - he would have to inject something wholly novel into his agenda. He had, after all, bagged the last remaining prize in sheer adventure with his spectacular flight to the South Pole only four years earlier. The idea that he latched on to at the last minute, was to winter alone on the Ross Ice Barrier, at what we came to call the Advance Base. What happened to him there - his close call with death, and the gallant relief journey taken by Poulter and four companions - is a fairly familiar story. I shall limit my comments on the event to two general observations - my knowledge of Byrd's display of character under pressure and the phenomenon of discord and divisiveness which Byrd's predicament generated in the shacks of Little America, by then long buried under snow.

The years since have witnessed one or two misguided, ill-intentioned and even dastardly attempts to blacken Byrd's reputation. The most mischievous assault was made by one of Byrd's own principal lieutenants - Bernt Balchen, a flyer who accompanied Byrd on both the quite desperate trans-Atlantic crossing in 1927 and the hardly less hazardous flight to the South Pole two years later. Balchen, late in middle age and having held his fire until after Byrd's death in 1957, branded Byrd a faker. His leadership in the Antarctic, according to Balchen, was incompetent and haphazard, and his claim to having flown to the North Pole with Floyd Bennett was fraudulent. By Balchen's calculations, their little plane - little, that is, by present standards - was incapable at its designed speed of completing the round trip to the Pole and back to its take-off point on Spitsbergen, above Norway, within the time cited by Byrd in his navigational accounting. What Byrd did, Balchen argued, was to order Floyd Bennett, a Navy warrant officer junior to Byrd in rank and social station, to fly around in idle circles over the empty northern sea once they were out of sight of Spitsbergen, and stay out no longer than was necessary to validate the navigational reckoning - a reckoning flawed, so the charge went, by Byrd's error in over-estimating the plane's speed by a full hour. In support of this monstrous libel, Balchen insisted that Bennett had himself made to him a death-bed confession of the fraud.

Here is a point that I can refute from personal experience. I was with Balchen and Bennett on the flight that ended in Bennett's death. It was in 1928. We were flying to Labrador to retrieve the crew of the German monoplane Bremen that had been forced down off the coast there, in a snow squall, after completing the first air-crossing of the North Atlantic east to west. We were in a drafty Ford tri-motor, a species of aircraft long extinct. En route, Bennett came down with a raging case of pneumonia. He had been terribly hurt the year before in the crash of an airplane he and Byrd were testing for the trans-Atlantic crossing. He collapsed at the controls directly after the take-off from Detroit and thereafter dozed fitfully in his seat, coming to only long enough to take over the controls for a landing on the ice of a lake near Quebec, where we were to refuel and shift from wheels to skis, before going on to Labrador.

Once on the ground, I summoned a doctor and together we took Bennett to a small hospital. Balchen and I went on to Labrador. Bennett died while we were gone. There was no deathbed confession. The din inside the pilot's compartment of a Ford trimotor hardly encouraged confession during the long flight. Moreover, it would have been wholly outside the character of either Byrd or Bennett, and unthinkable in terms of their relationship, that they could have brought themselves to indulge in such a conspiracy. Byrd and Bennett had shared a risky apprenticeship in polar flying off Greenland two years before the polar flight. Men who had perpetrated a fraud of the magnitude imagined by Balchen would hardly have trusted each other to bear the high risks attaching to the flights already in Byrd's plans for the Atlantic and the Antarctic. Even more convincing was an analysis of the flight made by one of Byrd's men, the late Pete Demas, an aeronautical engineer. It was a garbled transmission of a news dispatch to the New York Times from Spitsbergen that misled Balchen. The dispatch when received fixed the departure time an hour later than it actually was.

Byrd was a romanticist, a Virginian of the most aristocratic lineage in the American genealogy. When the notion of the Advance Base was first conceived, the hope was to plant a shack on the rim of the polar plateau, some five or six hundred miles south of Little America. Three men would man the station. They would measure the earth's fiercest winds and deepest cold, contemplate stars visible through an atmosphere of the most serene clarity and in an intellectual as well as physiological way contemplate a man's capacity to endure isolation. The scheme foundered because

the difficulties encountered in re-establishing the expedition at Little America delayed the departure of the trail parties. With the summer light drawing short, it became evident that the farthest point within our reach was only 120 miles or so out and that the work of the station would consist of little more than simple meteorological measurements.

Byrd decided to assign to himself the duty of station master. I suspect the idea was in the back of his mind from the beginning. A year or two before we left the United States an absorbing narrative had been written by a British explorer, an amateur, who through a failed connection had been compelled to pass a winter night alone on the Greenland ice cap. His account fascinated Byrd. He kept going back to the psychological and spiritual ingredients of the experience. No doubt he wished to test himself in the same situation. It was a rash enterprise. It was a mistake. Byrd was not mechanically minded. He couldn't fix things. He had never looked after 'himself. Advance Base was in place by March, as the winter darkness came on, and Byrd cheerfully took up his experience in being alone as the tractor party withdrew.

By June, he was in desperate straits. For communicating with, us at Little America, he depended upon a transmitter powered by a gasoline-driven generator set on a ledge in a tunnel outside his shack. From Little America, I talked to him two or three times a week over our voice transmitter. He responded in code. At the end of one of our schedules, without our knowing it, carbon monoxide fumes seeping into the shack felled him. He barely recovered consciousness and when he did the poisoning had left him weak and wretched. Thereafter, not daring to risk the fumes again, he was obliged to resort to a hand-cranked generator. Before leaving us, John Dyer, an M.I.T. graduate who was in charge of the broadcasting equipment, had given him quick instruction in Morse code. Byrd's inexperience with the code, combined with his physical weakness, made his messages difficult to decipher, and, what became increasingly ominous, he began to miss schedules.

At first, we put down the lapses to uncertain magnetic phenomena and the garbles to clumsiness. Dyer was the first to suspect that something was seriously wrong with Byrd himself. As he studied the messages and gauged the blurred and tardy responses, he became convinced that Byrd had suffered a physical failure or accident of a serious nature. I was some time extracting from Byrd, on the Barrier 120 miles south of us, an admission that fumes had poisoned him and that he remained quite weak. He insisted, though, that he could and would manage to last out the stay and was in no need of help.

But the conviction took hold that he was verging on helplessness and it was our duty to go out to him. The risk of attempting his relief was heightened by the circumstances that the crisis had risen halfway through the winter darkness, with temperatures down to 80 degrees below zero and razor-sharp winds prevailing on the Barrier. There was no certainty that a party navigating in darkness and blizzard could find the flags marking the trail to Advance Base, and evade the crevasses on the way. Sledging there was out of the question. Dogs would have perished in the cold. That left only the tractors, unreliable machines at best and extremely vulnerable, because of their weight, to crevasses.

So grave were the risks that the most experienced men of the winter party drew up an estimate in which they calculated that the chances of our ever reaching Byrd with tractors were one in twenty-five, and the attempt should not be made unless Byrd himself called for help. Poulter and I ruled to the contrary. Byrd, after all, was not only the leader of the expedition but an Admiral of the United States Navy. He could hardly be expected to ask five men to risk their lives in the face of such odds to save him alone. It was equally unthinkable that his own people should consider presenting him with such a choice.

The controversy over what should be done and how it should be done raged through the camp. It divided us for days. Poulter resolved the dilemma by announcing that he would lead the expedition himself and call for volunteers. The justification that was presented to Byrd over the radio was that Poulter was anxious to make the trip in order to conduct certain celestial observations at the higher latitude. I doubt that Byrd was ever taken in by the gentle deception. Indeed, he seemed to welcome the proposition.

Poulter had no difficulty in enlisting volunteers. He set out in weather fearsomely cold, depending for navigation upon a tricky combination of sextants and candles and flashlights mounted in cairns. He finally made it to Advance Base on the third try, in July, and none too soon. Byrd was on the surface when they drew near, and his appearance was shocking. He could not have withstood the punishment of the tractor journey back to Little America, and Poulter and his party stayed with him for three months, until the return of daylight allowed us to send out a plane to bring him back in.

There never was any question of Byrd's courage, his fortitude, his concern for others, even his modesty. He was a gallant man. My friendship with him was among the firmest I have known. And my admiration for Tom Poulter, for his tenacity and perseverance, for his gentle spirit, is hardly less.

At Little America, I shared another enterprise with Poulter that was quite as risky in an intramural context, but perhaps not so creditable in an historical sense, yet one which involves perhaps the most precious secret still to be unlocked on the continent. That secret involves the whereabouts and condition of what my friend James Angleton likes to call the Golden Stalactite of Antarctica.

A recent press release from McMurdo Sound announced that the interest of scientists in the Antarctic is fast shifting from the accumulation of pure knowledge for the enrichment of theory into the practical exploitation of tangible resources - the minerals, oil, the fish in the sea, and the like. The author of that confident dispatch was ignorant of the existence of a store of value equal to the treasure of the Incas, the hoards of the Pharaohs. That treasure has lain for half a century, undisturbed, sleeping the sleep of a fine wine in its cask, under whatever remains of the observation shack in the center of Little America through the dome of which Doc Poulter used to track the wheeling constellations before he set out for Advance Base.

The Golden Stalactite is a spike of frozen amber-colored liquid of uncertain length. It is formed of approximately equal parts of 100-proof, pre-World War I Golden Wedding bourbon and rye poured through a hole bored in the floor of the shack by Poulter and the senior biologist, Dr. Perkins of Rutgers, during the month of April 1934. One can be certain the whiskey froze almost instantly as it descended into the ice and no doubt the top of the spike rests directly under the floor.

We had a drinking problem at Little America. Accounts of the contemporary social regime at the South Pole and McMurdo Sound stations hold that the supply of alcohol is ample and marijuana is imported by those who favor the weed over the traditional products of corn and rye. When our expedition sailed from Norfolk, prohibition was still in force in the United States. Byrd saw no harm in taking along whiskey for medicinal purposes and festive occasions. An executive of Schenley distilleries, New York's famous official greeter, Grover Whalen, who had welcomed Byrd back from his several celebrated flights, demonstrated his appreciation of the hardships in store for Byrd and his men by contributing sixty cases of whiskey from Schenley's finest reserve stock.

Trouble was, after we settled in at Little America, there was no place to store the

liquor under a measure of reasonable control. Travel among the shacks in the compound was by way of tunnels created by stacking crates of supplies in parallel files on the surface, roofing them with tarpaulin, and letting the drifting snow cover them. Whenever the cook, the carpenter, or a mechanic ran short of anything, he simply rooted around in the underground galleries for the crate holding whatever he needed. The side of the crate would be ripped open, the contents removed, and the box left in place, to support the walls of the tunnels. The cases of bourbon and rye similarly entered the life-support systems in a very real sense. When a man had emptied the bottle in his foot locker, all he had to do was to repair to the right tunnel and replenish his supply.

No one gave much thought to the amount of drinking until after Byrd had been established at Advance Base. The effort had quite exhausted the winter party. It had also delayed the process of bringing under cover a goodly fraction of the essential stores from the staging depots set up between the camp and the Bay of Whales as the ships were being unloaded. Darkness was coming on; the days were growing shorter, the cold turned sharper, and it became increasingly difficult to muster working parties for the unfinished task. While a handful of workers labored on the surface, their shipmates gathered around the stoves in the shacks below were raising their voices in convivial song or snoozing in the bunks.

There were several close calls. While crossing camp on the surface, it was easy to lose one's way in the blizzards that swept up without warning. A man who had had too much to drink could easily wander off across the Barrier in the darkness or fall through the covering of a tunnel. More than one man did and death would have come quickly had a companion not come upon them in time.

What made the situation particularly delicate was that the announcement in the press that Byrd had gone off by himself brought a flurry of anxious wireless messages from the parents of younger members who feared their sons had been left to fend for themselves. An accidental death from drunkenness, quite apart from the necessity of restoring discipline in the camp itself, was a disgrace the expedition could hardly risk, in Byrd's absence. Or so I reasoned. It was I who persuaded Poulter, himself a teetotaler, that the liquor had to be destroyed. If our people could not draw on the stock sensibly, then let's get rid of the stock. It was, I came to realize afterwards, a silly decision, perhaps the most deplorable in a long catalogue of misjudgments. Yet even then I had the wit to realize that if the men caught us in the act of wanton destruction, they might kill us in our tracks.

So the foul deed was accomplished covertly, by stealth. While the camp slept, Poulter and Perkins emptied the cases in the tunnel, one after another, over a period of several weeks, and carried the bottles to Poulter's shack. Poulter bore a hole in the floor of his shack and the glorious fluid was poured through it, bottle after precious bottle. We had failed to anticipate that disposing of the empty bottles would present a problem. That was resolved by smashing the bottles inside gunny sacks and scattering the splinters over the snow on the edge of the camp.

The drinkers were slow to awaken to the drought setting in. Many of them had accumulated small reserve stocks of their own. The assumption was that Poulter and his scientists had simply moved the whiskey- into secret caches and a systematic search, would in good time bring it all back to hand. Indeed, as days- wore on and the reserve stocks were depleted, men who had not braved the cold of the open Barrier for weeks emerged from the tunnels, armed themselves with, long brass sounding rods and formed little parties to probe the depths of the snow for the lost whiskey.

Quite rightly, they concluded that the stuff had to be under or close to Poulter<sup>1</sup>s shack. The searchlight of Poulter's tractor had hardly disappeared below the horizon as he set out on his dangerous winter journey before half a dozen of his com-

panions were hacking away at the ice around his shack. They were certainly close, but not close enough. What those parched souls never imagined was that the prize they sought was no longer in bottles. Instead it had been transformed into a Golden Stalactite pendant from the floor of the shack.

In their desperation, the drinkers turned to moonshining. First the compasses were emptied of alcohol; then the biologists discovered that their supply of alcohol for preserving specimens was being pilfered. Our Maori physician invented a still. While the ships were refitting in Wellington, on their way south, a friendly merchant had presented the expedition with half a dozen cases of a patent medicine called Dr. Baxter's Lung Preserver. It had a phenomenally high alcoholic content. Dr. Potaka ran the stuff through his little still. He never succeeded in ridding it of a tarry gummy residue, but he was never without a customer.

Even now my blood runs cold when I ponder the puritanical reasoning that led me into promoting that egregious profligacy. However, this is not to say that it was necessarily a mistake beyond redemption. My friend Angleton upbraided me for not having the foresight to arrange with Poulter and Perkins to have a strong hook frozen into the inverted bottom of the spike. The Saudi Arabians, he reminded me, are considering towing from the Antarctic oceans into the Arabian Sea whole block-long icebergs to be melted down for drinking water. It would be no trick, my friend went on, for a hovering helicopter of the power developed in the Vietnam war, to hoist the Golden Stalactite from its frozen scabbard and transport it to a safe vat in New Zealand. My only response was an enigmatic smile. The secret of whether a hook was attached to that delicious amber stream and the whereabouts of the map on which Poulter fixed its precise location in the camp is one that remains with me and strengthens my intention to live a lot longer.

So that was how it was with us. We Byrd men went without whiskey. And again in contrast with the Antarcticists of the hour we went without women. I dare not say in this company that we were better off without either one. The shrewish sniping aimed at the chivalrous Paul Dalrymple for his light-hearted skepticism of the value of a woman's work in the polar regions leaves me gun-shy. Permit me to note merely that a woman in polar haberdashery is hardly an inviting object. Historical oversight may not in itself explain the failure of the Eskimo culture, ancient as it is, to produce a Joan of Arc, a Cleopatra, a Helen of Troy, a Clare Boothe Luce, even a cover girl or a Vogue model. Cold does not foster a flowering of womanly graces. Byrd, when in a speculative mood, used to discourse on the pleasure of finding beyond the last mountain range a lush, tropical valley, nourished by thermal streams and populated by Amazons comely in appearance and of an amiable cast of mind. The vision was one I found pleasing. The Garden of Eden - serpent, apple and all - seems a far more appropriate setting for woman than an Antarctic godown.

With women or without, we Antarcticists constitute a fairly special fellowship. We are rather like shipwrecked mariners in some respects. Leaving aside such distinctions as technical and academic pursuits, the experience we share is made up of a long passage in isolation, loneliness, deprivation, perhaps even a considerable emotional strain, even the occasional brush of danger.

The recollection of hardship and unhappiness, like the memory of pain, is the most ephemeral of memories. For myself, I shall say that I soon forgot the squalor and dirt of Little America, the hunger for privacy, the pettiness of the little quarrels. What I came to remember was the extraordinary beauty of the skies, the majesty of the auroral displays, the beauty of the ice when the moon shone on it, the pervading stillness, and, above all else, the kindness, the thoughtfulness, the decency of good men. Best of all, in that setting and in their company, I came to terms with myself.

Forgive me for rambling on so long. I warned you in the beginning that the Antarctic makes windbags of us all. Thank you.

# THE ANTARCTICAN SOCIETY

905 North Jacksonville Street  
Arlington, Virginia 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.), 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82

Vol. 81-82

June

No. 7

SOCIETY BOOK AUCTION TO BE HELD ON JULY 10th (see p. 10)

SPECIAL SUPPLEMENT TO NEWSLETTER ON CELEBRATING ANNIVERSARY OF POLAR YEARS, WITH COMMENTS ON HOPED-FOR REUNIONS. READ IT! SEND COMMENTS! PLEASE!

OLD TIME FAVORITE

(at old time prices!)

\$8.50

ANNUAL MID-WINTER PICNIC EXTRAVAGANZA

at

STRONGHOLD

Comus, Maryland

Saturday, July 10th 2 p.m. to sundown

Honorary Members:

Ambassador Paul C Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Mr. Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980

Charlie Morrison and Mike Metzgar, tried and true "baristers," will once again set up shop under the oaks and provide cool, refreshing libations at most nominal prices for all thirsty penguins and friends of penguins. Bill Cooke, ancient and honorable bartender, will serve as official Society taster, making sure that all beverages meet his highest professional standards.

Comus Inn will once again cater. This year we have chosen the luncheon. For \$8.50 per plate (goes by plate used, not by head count) one gets baked ham, roast turkey, chicken salad, coleslaw, 3-bean salad, potatoes au gratin, hot rolls, beverage, and ice cream. Fantastic price!

And a movie (to be selected) on snow and ice. Bring your youngsters. Let them climb Sugar Loaf Mountain alone. Good possibility you might even lose one or two!

Stronghold is impossible to reach, but Antarcticans do the impossible. So get off the Beltway onto Rrnte 270 North and head towards Frederick. After you go past the Clarksburg exit, slow down, as 4.3 miles farther down the road will be the exit for "Hyattstown-Comus." Circle under 1-270, follow Route 109 for 3.3 miles to Comus. Turn right on Route 95 and go 2.5 miles. When you come to intersection, cross over, and 1/4 of a mile farther you will find a road turning off to the right, going upslope. Go up this road, pass the first house, and turn into the parking lot below the next house - Stronghold. Take your lawn chairs out, and join the party.

*Send your check to Ruth at the Society's address. THIS WILL BE YOUH RESERVATION!*

*DO IT NOW!*

Talk given by Dr. Robert H. Rutford to the Antarctic Society, Washington, D. C.  
April 1, 1982

ANTARCTICA: U. S. ACTIVITIES IN THE NATIONAL AND  
INTERNATIONAL CONTEXT

"Antarctica, the continent lying concentrically about the South Pole. The land mass, almost wholly obscured by a continental ice sheet, lacks an indigenous population and is without an economic base, but it is important as an area of large scale international cooperation in scientific research, conservation, and logistic operations."

Those words, from the Encyclopaedia Britannica, repeated as the introduction to the award winning film highlighting the science activities of the United States in Antarctica, describe a part of the world which, for most of us gathered here tonight, occupies a special place in our hearts and minds. It is a place of extremes. As the environment of that continent is extreme so are the attitudes of those who have been there; it is a place one either loves or hates. For me it is a part of the world that has held my interest for many years. It has provided an opportunity for me to meet people, to do research, to lead people, and most of all, it, Antarctica, and all of the people involved in the activities there, regardless of nationality, have been good to me, my family, and my professional career.

It is indeed a special honor for me to stand before you this evening to present the Memorial Lecture for 1982, to join the special few who have been invited by the Antarctic Society to deliver a message to this elite group in our nation's capitol. I am humbled by the shadow of those who have been here before me, especially my friends and colleagues Cam Craddock, Joe Fletcher, Bob Nichols, and the Dean of U. S. Antarctic scientists, Larry McKinley Gould.

As most of you are well aware, I have had a continuing involvement with the U. S. activities in Antarctica, one that to my knowledge is unique. My initial contact with the program began in Greenland in 1955-56 when, as a U.S. Army lieutenant, I first met the Seabees from the U. S. Navy, who later would make the trip from Little America to Byrd Station along with Phil Smith and others. (We had in Greenland the large LGP D-8's for testing and operation. Tractors like these went to Antarctica and still are in operation there.)

In 1959 I first went to Antarctica as a graduate student, worked with several different groups including a New Zealand party in Victoria Valley. In 1960 I returned as Deputy Leader of a Minnesota party headed for the Ellsworth Mountains, a trip that ended in the Jones Mountains where we became the first field party put into the field by LC-130 aircraft. I can still remember that we landed at least 15 miles from the closest rock! We then taxied in close and we explored this area in the tradition of the two Roberts-Scott and Nichols-by man-hauling! Fifty years of progress in Antarctic transportation!

In 1963 I returned to lead a helicopter supported geologic mapping party in the Ellsworth Mountains and had the fantastic experience of discovering the first Glossopteris in West Antarctica in the northern Sentinel Range. The work from that season became the basis of a Ph.D. dissertation completed some years later.

A second visit to the Jones Mountains in 1968 led to a decision to never return to Antarctica. This was then followed by trips in 1973-74, 1974-75, 1975-76, 1976-77, and 1979-80, the first two as Director of the Ross Ice Shelf Project, the next two as Director of the Division of Polar Programs at NSF. The most recent trip was as a field assistant to George Denton in the Ellsworth Mountains. My participation in Antarctic affairs continues through my activities as a member of the Polar Research Board, Convenor of the SCAR Group of Specialists on the Antarctic Environmental Implications of Mineral Exploration and Exploitation, and as a member of the U.S. delegation to the past two Treaty meetings.

Thus, it may be that my involvement with this program has allowed me to wear more hats than almost anyone else. My involvement now covers over 25 years, and it is with this background that I suggest to you this evening that we take a hard and critical look at the U.S. involvement in Antarctica from both a national and international point of view.

The U.S. program in Antarctica-USARP or USAP, is currently operated and funded through the Division of Polar Programs of the National Science Foundation. The Division of Polar Programs had its beginning during the IGY, when the U.S. National Committee for the IGY worked with NSF to fund Antarctic research.

Dr. Tom Jones was appointed Antarctic Program Director in 1958, and by 1960 the staff had grown to seven. Two members of that staff continue with DPP today.

In the early 1960's Dr. Jones reported to the Director's Office. The staff was growing. A ship, the Eltanin, was to become part of the operation, and by early 1963 the Office of Antarctic Programs (OAP) was made a part of the International Activities Division. As the Foundation underwent reorganization, the administrative home of OAP changed also to the Division of Mathematical Physical and Engineering Sciences, then the Division of Environmental Sciences, and by early 1970 it joined the National and International Programs Directorate. The addition of Arctic duties in 1970 saw a name change to Office of Polar Programs.

In 1976 following another reorganization, the Office became the Division of Polar Programs in the Directorate for Astronomical, Atmospheric, Earth, and Ocean Sciences, and it remains with that Directorate today.

In addition to these organizational changes, the role of the Division has undergone considerable change. From a very humble beginning in IGY, the Office grew in size but the role of operational leadership in Antarctica continued to be provided by the U. S. Navy as it had been during the IGY. During the 1960's this dual role continued with NSF responsible for Science, the Navy for operations, and while the system worked, it was my view that it often worked in spite of itself.

In 1970 an Antarctic Policy Group (really a three agency troika of Department of State, Department of Defense, and National Science Foundation) led to the recommendation that the funding for Antarctic programs be consolidated, and in 1971 OMB Circular A-51 (.Revised) was issued. This document spelled out quite specifically the responsibilities of NSF, the Department of Defense, the Department of State, and the Department of Transportation, for the Antarctic Program. The consolidation of the Antarctic budget into a single budget line,

and the transfer of budget elements from other agencies to NSF began, with the "culmination" of that effort reached in 1976. Thus, the budget for DPP grew during this period to reach about \$30 million in 1976, actually closer to \$50 million if we include funds for purchase of two LC-130s.

The management of NSF was never too comfortable with this growth, and it also found itself continually defending the budget for the Antarctic program both from without and within. The other divisions and many members of the National Science Board failed to comprehend that this growth was a result of the transfer of function as well as budget, and the DPP budget soon became the target for many suggestions that a reduction "here" could result in a budget boost "there".

During the early to mid '70's, the Antarctic Program was impacted by the buzz words "Environment" and "Resources", and the budget for DPP began to show these subdivisions in the request budget. It was during this time that the decision was made to tie up the Eltanin, and the Antarctic program budget became more difficult to maintain at a satisfactory level.

In 1975 a second Antarctic Policy Group review of the program management and budget was conducted. Involvement within the Federal Government was still largely limited to NSF, DOD, and DOS although others signed off on the final document. It was, however, the beginning of a significant change in the internal decision making process within the Executive Branch of the government, as the APG was now expanded by the Carter administration to include all agencies who might have some interest in the Antarctic. The Living Resource and Mineral Resource issues suddenly found people from other agencies becoming Antarctic "experts" overnight; some of those "experts" still cannot spell Antarctica, try as they may; others have and continue to provide excellent input into the APG process and the Treaty activities.

It was somewhat shocking for some to see these new kids on the block elbow their way to the table, and to get involved in determining national policy for the conduct of Antarctic affairs. The influence and leadership of NSF in consort with DOD and DOS was reduced at this time; the procedural changes combined with personnel changes resulted in a very different mix in the cast of characters dealing with both domestic and international U.S. Antarctic affairs.

All of this occurred at the same time that the final decisions regarding management of the U.S. program were being implemented; decisions which once and for all established NSF as the single point manager for planning, budgeting and managing the U.S. Antarctic Program.

It is my perception that the change in APG policy, the changes in key personnel, and the move to single point management, while potentially of great benefit to the program, all came at the same time and were a bit too much to handle. The opportunity to establish NSF as the leader was not fully realized by NSF leadership at that time. In my personal view this was the time for NSF to move into the driver's seat and to become the "Lead Agency" in a manner and style that it deserved.

NSF had been handed the management of a national program—one that had lots of appeal to the citizens of the U.S.—a program that was increasingly becoming part of the international scene.

While I am well aware that the lead agency for the Antarctic Policy Group is DOS, it is clear that the influence exercised by NSF on that group has been diluted, just by the fact that there are more players in the game.

The most recent review of the U.S. Antarctic Policy and Programs has only recently been completed and a presidential memorandum forwarded. This unclassified document reconfirms the level of activity and the single point of management previously discussed. It further provides for separate budgetary guidance from OMB for the Antarctic Program to ensure that it is not funded at the expense of other NSF Programs. Finally, it allows other agencies to fund and undertake directed short-term programs of scientific activity upon the recommendation of the Antarctic Policy Group and subject to the budgetary review process.

This latter clause allows, for the first time in more than a decade, other agencies to launch "private" programs in Antarctica. This is a victory for several special interest groups within agencies of the federal government who have sought this foothold in previous years, but who were unwilling to support the NSF request for funding in their special interest areas.

Many people aware of this last APG review, were extremely pleased with the presidential memorandum. In my view, however, it weakens NSF's leadership of the program. It is somewhat like allowing a federal agency other than DOD, to fight a private war after getting approval of the National Security Council. The logic of this all escapes me, I must admit. It cannot, to quote from the Presidential memo, "maximize cost effectiveness and return on investment."

One final comment on the single point management system that has developed. As a participant of the system, let me assure you that the efficiencies that have been achieved are many. I think I speak for all members of the user community when I commend the DPP for the fine tuning of a system that in my view is the best in Antarctica. The support of science in Antarctica has never been better.

Let me turn now to some of the international aspects of the U.S. activities in the Antarctic.

It is of great personal interest to me that the first leader of the university that I will soon join, Dr. Lloyd Berkner, was the man who is often given credit for suggesting the Third International Polar Year (1957-58), an event we know as the International Geophysical Year. Out of the planning for this activity grew an ad hoc committee that met in 1957 to look at the possibilities of doing additional research in Antarctica. A Special Committee on Antarctic Research was established by ICSU, the International Council for Scientific Unions, and met in 1958. In 1961 the SCAR acronym was retained when the group became the Scientific Committee on Antarctic Research.

The names of Laclavere, Panzarini, Gould, Robin, Gjelsvik, and now Knox, recite a history of the growth of SCAR to meet the increasing demands placed upon the scientific community by those external to that group.

SCAR has been a leader and has been involved heavily in the support of international symposia, has provided input and recommendations to the Antarctic

Treaty group, has provided a forum where scientific activities have been discussed openly with no fear of political reprisal, and through the SCAR mechanism, the international aspects of scientific research in Antarctica have been continued since the IGY.

Personally, I remember especially a 1972 meeting in Canberra at an afternoon session of the SCAR Group of Specialists on Ice Shelf Drilling, in which all SCAR nations participated in the development of drill site selection criteria for a hole through the Ross Ice Shelf. This was my first real experience with a SCAR meeting, other than a symposia, and I came away with a feeling that RISP could at any time call upon the expertise of twelve nations to assist in its efforts. And, in fact, we did!

SCAR operates independent of the Treaty, although there is continual dialogue between SCAR and the treaty nations. Many of the recommendations adopted by the Treaty Consultative Meetings had their origin in SCAR, and SCAR has served well as a Scientific Committee.

This discussion of SCAR may seem somewhat out of place, but it should not. The U.S. has continually been a leader in the SCAR arena. If we are to look critically at U.S. activities in Antarctica we must also look critically at our involvement with SCAR.

It has been my experience that the forum provided by SCAR is invaluable for the exchange of both scientific and often informal political views in a low risk environment. I am aware that by definition SCAR is a scientific not political body, but the very fact it brings together representatives who later gather together as the scientific advisors to the Treaty Consultative Meetings is a useful exercise.

The evolution of SCAR during its 20 year plus existence is of some interest, and the changing role of SCAR has not been without problems. SCAR traditionally has suggested scientific needs, has provided scientific advice but has not attempted to operate programs.

The development of BIOMASS in the past six years has changed this somewhat, although there is a continuing debate as to just how the BIOMASS/SCAR relationship should be interpreted. It was interesting to me to hear today from a third party as to his view of BIOMASS history and intent, and it might be well for all of us who are currently engaged in the debate to review the history of how BIOMASS came to be.

As most of you are aware, the U.S. participation in SCAR occurs through a U.S. National Committee organized through the national organization adhering to the International Council of Scientific Committees. In the U.S. this is the Polar Research Board of the National Academy of Sciences.

The U.S. organization of the National Committee is somewhat unique in that there is total separation between the operating organization, DPP, and the National Committee. U.S. federal agencies are represented in the SCAR arena only in the areas of Logistics and Mapping.

It is my impression that during the early years of SCAR few problems arose as a result of this organization, and it was not until the era of large

multi-national programs, often proposed in the SCAR arena, that problems began to develop. The communication problems between SCAR, SCAR Working Groups and Groups of Specialists on the one hand and the operating organizations on the other have increased in recent years.

This apparent disconnect is good in many ways, but it requires a dialogue both before and after SCAR meetings between the individuals representing the National Committee of SCAR bodies and the operating unit, DPP in this case, that too often has not occurred. The result of this communication break-down has been the gradual development of what appears to be an adversary relationship that is not beneficial to either the National Committee or the operating organization.

The fact that the National Committee is dependent on funding for its activities from the operating organization can cause real problems if the relationship between these two groups becomes too polarized.

At times such as we face right now, with tight budgets and continuing inflation, it is natural to suggest that support of advisory groups such as the PRB be greatly reduced, and that, as the National Committee, its SCAR activities be reduced. This is not to suggest that the PRB should not be required to justify its activities or defend its budget. Rather, it is to caution against application of across the board cuts that may have serious long-range impacts.

It is my personal belief that the U.S. has a great deal more to lose than to gain through a decreased involvement in SCAR. The decade ahead is one in which international activity and involvement should and will increase, and it is disturbing to me to hear arguments for a reduction of U.S. activity at the international level through SCAR.

If the SCAR activity is worth doing at all, then I suggest that it is worth doing well. We must provide the support necessary to ensure a continued leadership role for the U.S. in SCAR. In my view it would not serve the scientific interests of this country well if we were to reduce our international involvement and become an inactive or passive member of SCAR.

We are entering a decade that will see great changes in the role of Antarctica on the international scene. Already another nation, India, has sent a party to the continent, and Brazil continues her attempt to field a group. The number of nations who have acceded to the treaty now numbers over 20.

The Living Resources Convention has been ratified by eight signators and that regime will soon hold its organizing meeting and the provision of the Convention will enter into force. This will bring a third international body into existence that will deal with Antarctic issues outside of the traditional two bodies (SCAR and the Treaty).

We heard today at the opening meeting of the Polar Research Board that comment that the Recommendation from the last Treaty Meeting concerning the Mineral Resources question is at about the same stage as the Living Resources question was following the IXth Consultative Meeting of the Treaty nations in London five years ago. I doubt that anyone would have speculated at

that time that a Convention would be coming into force in 1982. We also heard differences of opinion as to the pace that the development of a convention for Mineral Resources will take, but it almost certainly will occupy the attention of the Treaty Nations for a major part of this decade, and almost certainly SCAR will be called upon by the Consultative parties to provide some scientific and/or technological input into their deliberations. The U.S. has been an active participant in this SCAR input to date, and I would hope that it will continue to do so.

Another part of the total U.S. activity in Antarctica, although it takes place on other continents, is the participation in the Treaty process. As most of you know, the Treaty document itself is unique and it is not my intent to discuss it here.

Rather, I would simply say that as a participant in parts of the last three meetings of the Consultative parties to that treaty, I have come away with a feeling of pride in the role that the U.S. has played. It is not possible for me to detail much of what goes on at the Treaty Meetings because of the restrictions placed on those who do participate, but the work of the Antarctic Policy Group in providing meaningful position papers, in providing delegation members, and delegation leaders and spokespersons has been excellent.

This is not to say that mistakes have not been made, but I think it is fair to say that the U.S. has played a major role in the Living Resources agreements.

Currently within the APG there is a discussion of a position paper for use by the U.S. delegation to the Special Consultative Meeting on minerals that will be held in New Zealand in June. The Presidential memorandum referred to earlier calls for that paper to be forwarded from the APG by May 15. I would further note that through the Antarctic Advisory Group to the Department of State there has been the opportunity for input from non-governmental representatives including several of the people here tonight.

My review of the total U.S. activity as it relates to the Antarctic has only briefly touched on the participation of other Federal agencies. For the past decade this has been largely through the Antarctic Policy Group and through programs funded by NSF. There have been some other activities but these have apparently, and unfortunately, been quite independent of the DPP management. What will happen in the future as the result of the recent memorandum we can only guess at. I sincerely hope that some mechanism other than the APG is formed to coordinate these potential activities.

By now many of you are wondering what it is that this talk is all about. For sometime, as I have been involved with the Antarctic program I have worried about the ups and downs of the program. I have given serious thought to the management structure and have expressed my views in private correspondence and internal documents. I have watched with pride the development of a system that provides excellent support for the majority of science efforts.

A year ago I was to deliver this lecture but had to withdraw. In the ensuing twelve months much has happened, and what I had planned to say at that time has now been overcome by events.

Let me now make some comments for us all to consider.

I do-not quite know what the word I want to use here is, but for the sake of not finding a better one, let me use the word "excitement". I am concerned that the excitement of the Antarctic Program seems to be gone. Certainly there is excellent science being done, and the contribution to our understanding of the world around us continues to grow through Antarctic research. What I am talking about is the unusual, the idea that brings together scientists and logistics support in an effort that is synergistic for all involved.

Have we all become so bureaucratic that we worry more about form than substance? Has the U.S. activity reached such a stage in its evolution that the stagnation point has been reached?

It strikes me that the Division of Polar Programs may be buried so deep in the NSF bureaucracy that it is all but ignored if things go well. About the only time it surfaces is when the annual VIP visitors list must be put together or when there is a financial crisis.

The new Presidential Directive, through its statement concerning separate budgetary guidance, provides a rationale for establishing the Division of Polar Programs as a separate entity, reporting directly to the Director of the National Science Foundation. This realignment would focus more attention on the activities in the Antarctic, and would provide greater exposure for the program both within NSF and within the Executive Branch of government.

Should the whole structure of the Polar Research Board and the National Committee be re-examined? It is my perception that the Polar Research Board attempted to differentiate functions at one time through the establishment of the Committee on Polar International Relations. It is also clear to me that this effort was not clearly explained and was never fully understood by the Antarctic community.

Should there be a careful review of the philosophy and policy concerning scientific research in the Antarctic? The new policy statement nowhere mentions a "balanced program". What is a balanced program?

What about Bert Crary's recommendation in his article in the December, 1970, issue of the Bulletin of Atomic Scientists? While one of his proposals would have eliminated many of us from our continued direct involvement in Antarctic field activities, I suggest to you all that the article is still well worth reading a dozen years after it was published. Bert presented some thought-provoking ideas then and in most cases they remain valid today.

How should we react to the points about management of scientific programs and international cooperation so clearly stated by Phil Smith in that same issue of the Bulletin of Atomic Scientists and re-emphasized in his paper contained in the Dry Valley Drilling Project volume of the AGU Antarctic Series. Again, I suggest that you all re-read those two contributions.

The recent initiative by the Division of Polar Programs to raise some of these questions with the Polar Research Board is to be commended. I urge my colleagues on the Board to take this task seriously. By the same token, I hope that the Division of Polar Programs and the National Science Foundation will take the resulting response from the Board seriously also!

It is my impression that a dialogue has begun in recent months that will, hopefully, address many of the issues that heretofore have only been discussed privately. We will not all agree and consensus will never be reached, but I sincerely hope that the differences of opinion can be aired openly, in a low stress environment, without fear of any retribution.

This group gathered here tonight represents a very special minority among the citizens of this country. Most of you have been involved in the United States activities in the Antarctic in one way or another. My charge to you tonight is to use your special expertise along with your strong interests to work to strengthen the U. S. Antarctic activities in whatever way you can.

All of us have unique skills, and the opportunity to utilize those skills to aid the U.S. Program will certainly be available to you in the months and years ahead. Let us all take advantage of those opportunities. Let us all work together to strengthen all aspects of the U.S. Antarctic activity, as we move into the challenging decade ahead. Thank you.

AUCTION. Commander Kelsey Goodman, USN (Ret), has graciously given the Society two of his historic polar books for auctioning off as a fund-raising effort at our Mid-Winter Picnic at Stronghold on July 10th. BUT you don't necessarily have to be there. You can send in your bids, which must be received by July 8th, to the Society at our Arlington address, marking the envelope "Book Bid." You will be duly represented at the auction by one of our most honorable non-bidding members who will act on your behalf, bidding up to the authorized amount specified in your submitted bid. The books to be auctioned are:

- 1). Dr. Frederick A. Cook: My Attainment of the Pole. N.Y. Polar Publishing Co., 1911 (2nd Edition) 604 pages, Quarto, Original brown cloth, numerous illustrations and sketches, water stains. Signed "Dr. W. A. Applegate, Chief Surgeon, Southern RR, with regards from Frederick A. Cook." Minimum bid: \$25.
- 2) Lt. Adolphus W. Greely: The International Polar Expedition Report on The Proceedings of the U.S. Expedition to Lady Franklin Bay, Grinnell Land. One of 4500 copies. Two volumes, 545 pp plus 738 pp, Quarto, several foldout maps, numerous other maps, charts, photographs, and sketches. With 17 scientific appendices, including mammals, birds, botany, molluscs, tides. Both volumes have been repaired. Vol. 1 lacks backstrip. Minimum bid: \$55.

Remember, money is only monetary - you can't take it with you. Books are immortal, and classics are forever.

President Pete Burrill had a few words for you folks as he's about to step down after two highly successful building years for the Society, but we ran out of space. So Pete is being put "on hold" until the August Newsletter. ... Think Swithinbank! He will be our speaker on *August 31st* at NSF. How timely and clairvoyant we are in having a Brit at this time!

SPECIAL SUPPLEMENT ON CELEBRATIONS/REUNIONS RELATIVE TO POLAR YEARS, SPRING '83

The time has come to see what enthusiasm exists in the hinterlands among Antarcticans for a Spring '83 reunion in Washington. There are all kinds of reasons for having a Gathering of The Clan, it being the 100th anniversary of the First Polar Year (only Larry Gould, Bud Waite, and a handful of others are still alive from that one), the 50th anniversary of the Second Polar Year, and the 25th anniversary of the IGY. If you are IGY or older, you presumably have made your pile and will never get any wealthier - just a bit more decrepit - so it behooves all of us in that category who want to break bread and drink wine with our peers to plan on Washington in May 1983. We want to know how you all feel about a reunion, so we have a few questions we would appreciate your answering (see reverse side). If we get a strong enough show of hands' to warrant celebrating, we will try to establish a program of interest for the majority.

The idea, as I see it, is to come up with something which will (1) make it worthwhile, (2) make it interesting, (3) make it provocative, (4) make it historic, and (5) make it memorable. The key to the future is presumably the past, and presumably the key to a successful polar reunion will be getting as many of the good old boys to Washington as is humanly possible. The Antarctic Society has shown in recent years that people like Larry Gould, Bud Waite, Dick Black, Bob Nichols, and Charlie Murphy are ageless, that they are good for all ages, that their recollections resemble a good wine, better with aging.

The IGY is represented by Bert Crary, Ned Ostenso, Dick Cameron, Ron Taylor, Rudi Honkala, Bob Benson, Johnny Dawson, George Toney, Joe Krank, John Mirabito and Mort Rubin, plus Ruth of the House of Siple. Most are members of our Society, some are not, and a few are workers. -I think the core is there to provide the spade work, and I am pretty sure there are enough recent vintage Antarcticans in the Washington area who would be willing to work on a reunion.

It appears to me that it might be best to have an all-purpose type reunion, one of interest to the majority, but with individual days designated for special programs. Some pipedream possibilities would include polar exhibits in some of the government/private buildings commemorating the various polar anniversaries, such as history of polar cartography (USGS), polar exploration (National Geographic Society), polar philately (anyone but the Postal Service), Antarctic Treaty (State Department), polar literature (Library of Congress), etc. Commemorative days could be set aside for talks pertinent to the various commemorative periods, presuming we could find some host who would be willing to provide us with a lecture hall. We could have one general all-purpose type dinner/banquet; we could have the Antarctic Society Annual Memorial Lecture; and we would have individual camp luncheons and evening donneybrooks by expeditions/eras. Whatever we do will have to be built around the IGY, as BAE II will be holding their own special reunion later on in the year (October 22, 1982 in Washington). And, time is fleeting, as the list of members from the IGY (close to 150) has seen deep inroads from the Great Reaper. From the wintering-over folks in '57-'58, Carl Eklund, Gerald Fierle, Ben Harlin, Norbert Helfert, Herfried Hoinkes, Bob Johns, Finn Ronne, Paul Siple and Ed Thiel are gone.

There is no "best time" to please everyone. Washington is a delightful city in the spring, and from mid-April to mid-May it is beautiful - decked out in a profusion of lovely dogwoods, azaleas, tulips and magnolias. April is a big tourist month, with the DARs swarming over the city in late April. In mid-May someone

upstairs always pulls the switch marked "Washington-high humidity" which begins four miserable months when only the British are happy here in Washington. So tentatively, unless we hear a loud dissent, we are thinking about the window following the DARs and preceding the humidity. And for those who don't have a Washington connection, there are probably more rooms available in early May than in late April.

Please complete this questionnaire and return to: Paul C. Dalrymple  
Antarctican Society c/o  
R. J. Siple 905 N.

Arlington, VA 22205

1. The idea of an Antarctic reunion:

- / / Sounds interesting; am undecided, keep me on mailing list
- / / Certainly am interested; probably would come
- / / Will come
- / / Not interested; please do not contact me again

2. If I come to the reunion, I would like a:

- / / One-day reunion
- / / Two-day reunion
- / / Three-day reunion
- / / Four-day reunion
- / / Five-day reunion

3. These are my ideas about what I would like to have for a reunion:

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET

ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 82-83

August

No. 1

**Presidents:**

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-2
- Mr. Gordon D. Cartwright, 1962-3
- RADM David M. Tyree (Ret.), 1963-4
- Mr. George R. Toney, 1964-5
- Mr. Morton J. Rubin, 1965-6
- Dr. Albert P. Crary, 1966-8
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-1
- Dr. William J. L. Sladen, 1971-3
- Mr. Peter F. Bermel, 1973-5
- Dr. Kenneth J. Bertrand, 1975-7
- Mrs. Paul A. Siple, 1977-8
- Dr. Paul C. Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82
- Dr. Mort D. Turner, 1982-84

*COME YE! HEAR YE! A PREMIER SPEAKER LAUNCHES OUR 24th YEAR!*

## NATIONALISM AND INTERNATIONALISM IN THE ANTARCTIC

One man's perspective - 1949-82

by

Dr. Charles Swithinbank

Head of the Earth Sciences Division  
British Antarctic Survey Scott Polar  
Research Institute Cambridge, England

on

Tuesday, August 31st, 1982 8 p.m.

National Science Foundation  
18th and G Streets  
Room 540

**Honorary Members:**

- Ambassador Paul C Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard

**Memorial Lecturers:**

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Franke, 1968
- Dr. Henry M. Dater, 1970
- Sir Peter M. Scott, 1971
- Dr. Frank T. Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975-
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980
- Dr. Robert L. Nichols, 1981
- Dr. Robert H. Rutford, 1982

*Society Selling Outstanding Antarctic Book - see page 9*

### OFFICERS 1982-83

- President - Dr. Mort D. Turner  
Division of Polar Programs, National Science Foundation
- Vice-President - Mr. Charles Morrison  
National Mapping Center, U.S. Geological Survey
- Secretary - Mrs. Ruth J. Siple  
Polar Research Board, National Academy of Sciences
- Treasurer - Dr. Paul C. Dalrymple  
Engineer Topographic Laboratories, Ft. Belvoir

### BOARD OF DIRECTORS

Through 1983

- Robert J. Allen E.
- Vernice Anderson J.
- Michael Metzgar
- Joanne C. Turner

Through 1984

- Charles A. Burroughs
- Eugene P. Campbell
- Peter Barretta, Jr.
- Richard J. Neff
- Henry T. Harrison

Through 1985

- Guy G. Guthridge
- William J. Kosco
- William H. Littlewood
- Walter R. Seelig
- Dotte Larsen

It's hard to believe, with 90° temperatures and 70% humidity, that the 1982-83 season is upon us, but the calendar shows that our first speaker will appear in a few short weeks! Bergy Bits will be essentially the same this year as in the past four years, although we hope to have more input from members of our Society. We trust that Guy Guthridge, Manager, Polar Information Program, Division of Polar Programs, NSF, will have something to say in each issue about the latest news from the ice. This edition has a timely write-up by our own Pete Barretta on "philatelling around the Falklands in the spring of 1982." Our outgoing president, Pete Burrill, writes of his two-year term. Our new president, Mort Turner, given the option of introducing himself in this column or leaving it to me, took the only wise choice - he wrote his own bio! We deeply appreciated both Charlie Murphy and Bob Rutford making available their talks before our Society last spring for publishing in separate issues of the Newsletters (April '82 and June '82). A most welcome change-of-pace in the Newsletters.

We try to tailor our inputs to cover all sectors of interests expressed by our members. However, this year's Newsletters will stress the historical as we are in the midst of celebrating the 100th anniversary of the 1st Polar Year, the 50th anniversary of the 2nd Polar Year, and the 25th anniversary of the IGY. We are also driving towards some sort of a mass gathering of the clan next spring here in Washington, and, hopefully, Bergy Bits will be one of the organs stirring up interest and passing information to interested celebrants.

Bergy Bits is NOT the Voice of the Society. Take nothing in it too seriously. If anyone gets offended, that's the way the cookie crumbles at times.

**PETE BURRILL'S SWAN SONG.** Our outgoing President, Pete Burrill, had a most successful two-year term highlighted, presumably, by a most daring mood, getting married to another member of the Antarctic Society. Both his marriage and his presidency have been highly successful, although somewhat tiring, as much of his time in the past two years has been spent in the company of or acting out the part of a carpenter. Pete and Betty were back for the Mid-Winter picnic, returning from their Maine retreat where Pete re-shingled the family homestead at non-union wages. Betty, Maine, and hard work must agree with Pete, as he looked like a young colt. Pete wrote one last Growler for our last Newsletter, but we didn't have space for it, so with belated apologies, here's Pete's Growler #4.

As another Society year nears its close, our affairs are in excellent shape. The new officers and directors are fully prepared to join those whose terms are continuing. While many have contributed to this happy state of affairs, the principal credit must go to Paul, Ruth, and Mort. In my first Growler, July 1980, I announced those three as the starters. They have done most of the work. In this last one of my Growlers I congratulate them on their performances beyond the call of duty. All my fellow officers and directors have been conscientious, cooperative and wise (most of the time). The Society has pursued its course with a few adaptations to new opportunities and in response to suggestions from members. We face the new year with continued optimism.

**HERE'S MORT.** We are real happy to have Mort Turner sitting in the president's chair. Somehow or other he has hitherto sneaked by being a Society member with-

out serving as an officer or a member of our Board of Directors (his wife Joanne is now serving her second term on our Board!). Nearly everyone knows Mort, as no one, with the exception of Ken Moulton, has been on the job longer in the polar office at NSF than Mort. Unfortunately he will miss our first meeting as he will be participating in WINFLY, the first flight at the end of winter to Antarctica.

Mort D. Turner. Born 1920 in Greeley, Colorado, Mort received a B.S. degree in geological engineering at the University of California, Berkeley and studied metallurgical engineering at Virginia Polytechnic Institute. He spent three years in the Army during World War II, primarily operating high-speed movie cameras in rocket development. Mort married Laura Perez y Mendez of Puerto Rico and they had two girls and a boy. When the war was over they returned to California where Mort returned to his alma mater and earned an M.S. in geology. He was immediately hired by the California State Division of Mines and spent six years as an industrial-minerals specialist. Next followed an opportunity to set up a geological survey for the Commonwealth of Puerto Rico, and to become its first State Geologist, a position he held for 5 years. It was an exciting experience to design this government agency, and satisfying to have the governor approve into law so many of his recommendations for Puerto Rican mineral development. His venture as an independent consultant in the West Indies was just starting when he was offered a position with the Office of Antarctic Programs at the National Science Foundation, as an assistant to Dr. T. O. Jones. This world of ice and snow promised new and interesting scientific challenges, and so he began work with the Antarctic and Arctic. While not an OAE, he- has been with the Antarctic Research Program since June 1959, shortly after the end of the IGY. He has been with the Antarctic Program through its evolution to the Office of Polar Programs and then the Division of Polar Programs, except for the years from 1961-1965 when he went to the University of Kansas to study for his doctorate in geology. While there, Laura (his wife) died in an auto accident. After Mort's return to Washington and NSF, he married Joanne C. Dort. With her son, the combined family now had 4 children and has since added 3 grandchildren. Mort continues to enjoy the constantly changing challenges of helping to put together the Arctic and Antarctic research programs at NSF. Keeping up with developments in economic and engineering geology is made more meaningful by the fact that he is a faculty member in the Geology Department at George Washington University and teaches one or more courses each year. He enjoys the contact with the students and finds it a good balance for his administrative work at the Foundation. Other interests include collecting maps, stamps, books on exploration, an abiding interest in science fiction, and occasional investigation into the evidence for early (pre-12,000 years BP) man in the Americas. Mort and Joanne enjoy travel, photography, anthropology, and folklore together. With the children grown and out on their own, these interests are satisfied by traveling to out-of-the way places whenever possible.

**HAPPY NEW YEAR - BILL FOLLOWS!** Yes, this is a new year, and this is the first issue of the Newsletter for the 1982-83 season. Usually we don't kick off the new season until the fall, but last year we got going in September and this year we're opening up with our first ever August meeting. When you catch a guy like Charles Swithinbank on this side of the Atlantic, you better take advantage of it and have a meeting even though it may still be hot and humid. The Society, in as good shape memberwise and financially as it has ever been, is starting off this season with 425 paid-up members; and our treasury is now in order with a small nest egg in a money market fund and our petty cash in a checking account paying

interest and not charging for services. Last year some people didn't recognize our bills as bills, but this year there will be no problem - it will say so right on top! About a third of our members have already paid for 1982-83; they will not get a bill. There is no increase in dues; we're staying at \$7 per year for all local members (within 50 miles of Washington) and \$6 for out-of-town members. Overseas members, exclusive of New Zealand which we recognize as a colony, will be charged \$10 because of the increased cost of overseas mailing. Initiation dues are being dropped, as most new members weren't reading the fine print, and it was too embarrassing trying to collect an extra two dollars. We no longer carry delinquents on our records beyond January, although we make every effort to keep all members active in our Society. Last year we dropped three members of the 1933-35 Byrd Antarctic Expedition, but only after repeated efforts to see if they enjoyed the Newsletters - never heard from any of them. All together, we dropped 15 last year. Our biggest problem is one of zip codes and changes in addresses. The military people are no problem, they always let us know changes in addresses, but I can't say as much for you roaming civilians. All of our stateside mailings are by bulk mail, and they can NOT be forwarded if you move, can NOT be delivered with no zip code, and are NOT returned to the Society. So if you move, PLEASE send your new address to Ruth. Also PLEASE check your zip code to be sure it's correct. Your Society isn't a profit-making outfit on dues; our Newsletters cost slightly over 60 cents an issue (with 7 or 8 published a year); and we have the cost of a bulk mailing permit plus charges for each mailing, refreshments at local meetings, stamps for first-class correspondence, annual donation to Stronghold (where we hold the annual Mid-Winter picnic in June or July), plus guest tickets for our Memorial Lecture dinner. We still plan to operate for several more years without raising dues. Our corporation memberships and our sales program both help our treasury, so support our sales of books and calendars.

**MID-WINTER PICNIC.** About 70 Antarcticans and would-be Antarcticans gathered under the oaks at Stronghold on July 10th for our annual Mid-Winter picnic. When it comes to a party, there are no better party boys than those geologists and mappers out at the USGS in Reston. Charlie Morrison and Mike Metzgar run the best darn bar in town. You can see they've had a lot of experience on both sides of a bar, and their untiring efforts to make our Mid-Winter picnic an unqualified success is greatly appreciated by all attendees. Comus Inn catered again, and they always do an excellent job. A popular innovation this year was an auction which preceded the meal. The day concluded with a showing of the famous Hillary-Tenzing film "The Conquest of Everest."

**TERRA NOVA, A SMASH HIT IN BALTIMORE.** Ted Tally's play, Terra Nova, had a real successful run this past spring at Baltimore's Center Stage where it played from March 19th through April 25th. They did an excellent job of promotion - at a press conference Bill Sladen was introduced as an Antarctic authority, and later a Baltimore paper interviewed Bert Crary. Bill almost became a cast member, going to the play frequently and becoming a close personal friend of members of the cast. Two of the Sunday matinees were followed by "post-game highlights" discussions from the stage. Bert Crary and I shared the platform with a drama professor and the moderator on Easter Sunday afternoon. The highlight of the question and answer period was the last question when some unsuspecting man asked of Bert, "We have just seen a play here on this stage where men found themselves in perilous situations from time to time. You must have been in some perilous situations yourself during some of the many traverses in Antarctica. Could you please tell us about one or two such instances?" Well, Bert mulled that over like he mulls over all

questions, and then said very dryly, "Yes, as a matter of fact, we did experience some real perilous situations- - they happened every time we ran low on beer." What a beautiful way to wrap up that session! The last matinee featured Guy Guthridge of NSF, Jackie Ronne, and Bill Sladen on the platform. Guy played the straight man, speaking first, then Jackie came on strong for Amundsen, and Bill wrapped it up with his unequivocal support of Capt. Scott. I was burning the highway from Maine to Virginia that day, so I missed what everyone said was a real great entertaining show. When it came Bill's turn to talk, he had a bag of goodies at his side, and as soon as Jackie got through, Bill reached into his bag, brought out a Union Jack, waved it at the crowd, and then put it in his lapel. A lot of our members took in the play (we were given a good discount), and they all thought it was most interesting; the only one who didn't like it was Ruth Siple. I think the amazing thing is how Antarcticans can love a play which plays so loosely with facts. Almost like say anything you want, but be sure to spell Scott and Amundsen's names correctly. What surprised me most was that the play was so much Huntsford. It made Teddy Evans a terrible burden to Scott's party long before they reached the South Pole, but Scott's journal shows that he pulled his load up until his last days on Beardmore. Scott's journal also shows that Birdie Bowers was ailing for a considerable period, yet the play has Birdie in relatively good shape. And as for the ending, I doubt if most historians would be as kind to Scott as Ted Tally was in the play. Many of us read the script and wondered how effective the play would actually be, but it came off amazingly well. If it ever plays in your area (it has already played in quite a few cities here, in England, and in New Zealand), you should take it in, particularly if it's a rainy afternoon.

**REORGANIZATION AT THE NATIONAL ARCHIVES.** I asked Dr. Franklin Burch of The National Archives if he would write a paragraph for Bergy Bits on the current status of what was once its Center for Polar Archives, which subsequently became the Center for Scientific and Polar Archives. He didn't wish to write about recent developments, although he graciously consented to answer questions about what has happened there in recent months. However, Dr. Burch wanted me to be aware that whatever happened to the old Center for Polar Archives had nothing to do with Reagonomics, that certain decisions had been made a long time ago, in fact, when Herman Friis retired. There has been a tightening up of the organization and many of the senior people who have retired have not been replaced. With reorganization at The National Archives, the Center for Scientific and Polar Archives has become the Scientific, Economic and Natural Resources Branch. Dr. Burch is in charge of this Branch, which has 25 people, including Alison Wilson who has been polarized for over 25 years, being a Bert Crary hire back in the Eisenhower administration. And with the purging of "polar" from the title of an individual unit, so has disappeared their ardent desires to actively pursue soliciting polar papers. Dr. Burch didn't say so, but I have the feeling that this probably happened when Gerry Pagano was called from Above. There are 3,000 cubic feet of polar papers in The National Archives, but this is small potatoes in the Scientific, Economic and Natural Resources Branch whose holdings total 130,000 cubic feet. I asked Dr. Burch how safe the polar holdings now resting there were. The answer was that any small holdings might be in jeopardy should a higher priority need for space arise within The National Archives. I sort of have a sickening feeling of insecurity about the polar holdings, but then I'm a worrier. This really points up to me the need for a national polar museum like the Kiwis have in Christchurch and the Soviets have in Leningrad. There is some good news - Dr. Burch has agreed to do all he can to help out in any anniversary celebrations relative to the polar years, and told me that he would be most happy to have old polar films shown during the reunion period in the theater at The National Archives.

**CIRCA ADMIRAL RICHARD E. BYRD.** There was a story in the Christian Science Monitor of April 13, 1982 about a cache of some 43 trunks and boxes of the late Admiral Richard E. Byrd's that were found when a demolition team was knocking down an old warehouse in one of Boston's ugliest suburbs, Somerville. However, the contents were mostly clothing and other odds and ends. There are "more than 50 four-drawer file cabinets bulging with memorabilia...stored at a regional center of The National Archives...in Waltham, Massachusetts," but they are not available at this time for polar historians and scholars to study. The Admiral's famous home (9 Brimmer Street) has been sold to a private individual, and the CSM's article said that the Foundation would use the proceeds of the sale "in part to acquire for public use certain of the Admiral's papers and other memorabilia now in private hands." I was under the impression that nearly all of the Admiral's papers were in the hands of the Byrd family, and that it was just a matter of their consenting to make these valuable papers available to the public. The article quoted James B. Ames, a trustee of the Admiral Richard E. Byrd Foundation, to the effect "if there are other valuable Byrd documents elsewhere (than in Waltham), the trustees would want to acquire those, too, so that all could be presented as a gift to some appropriate public library or government agency." Wouldn't it be just great if such could come about while some of the late Admiral's colleagues were still around to share in the rejoicing! To show you that things go wrong in even the best of families, the Christian Science Monitor published a picture of the late Admiral with the late Dr. Paul Siple, Murray Wiener, and Eddie Goodale taken at Little America in December 1955 with the caption "the Admiral himself at South Pole, 1929." How about that for a major guffaw! Although he flew over the South Pole several times, the late Admiral never lived to actually set foot on the South Pole. - - - We understand from a most impeccable source that a tremendous baby, 8 lbs. 13 oz. was born to Janice and Richard E. Byrd III on July 1, 1982. This early firecracker was named Lucy Bradley Byrd. There must be a very strong family desire to produce very healthy children, as Lucy's cousin Cameron checked in at 9 lbs. 4 1/2 oz. (see Bergy Bits for May 1980). Lucy's sister Alice was the very first great grandchild of the Admiral's. Now it's time for a Richard E. Byrd IV.

**REUNION - LET'S GO FOR IT.** We have heard from over 40 people relative to having a reunion. I was sure hoping for a much larger response. Our Honorary President, Ambassador Daniels votes for a two-day reunion, and that seems to be the preference. Both Dick Black and Bud Waite of BAE II said they would come, the Good Lord willing. Charles Adams and Bob Nichols of the Ronne Antarctic Research Expedition are interested. The thespians from Little America V, 1957 (Wild Bill Cromie, Boy Scout Dick Chappell, and Gene Harter) are all anxious to put on another Happy Hour skit. Now the question is whether the rest of are ready for it. Cromie added a special request, "lots of beer - cold beer", showing that his likes haven't changed one iota in 25 years. Vern Anderson, Charlie Bentley, Dick Cameron, Bert Crary, Steve Fazekas, Ed Flowers, John Guerrero, Ned Ostenso, and myself are other IGYers looking forward to a reunion. Dick Goldthwait voted for a "Photographic Smorgasbord" where any participant could "show and tell" 10 to 20 slides. Marion Morris voted for a thorough briefing on Antarctica today. Hugh DeWitt said that he would very much enjoy a comparison of the objectives, equipment and success in achieving the goals of the Polar years and the polar aspects of the IGY. Dave Canham wanted many things, mostly of an audio-visual nature, but he asked specifically for "no pemmican hors d'oeuvres." Roy Shults wants a lecture or two followed by a cocktail party with dinner "with the usual wild speeches." Bert and Mildred Crary sort of cancelled one another out, showing they are a typical husband-wife team. Mildred voted for "slides, films, someone taking oral histories, address exchange, party, program for children." The other half wrote "I would not be particularly interested

either in long, serious professional talks, or endless amateurish slide shows or movies," although he added that "I would relax the rules for the older expeditions and let them talk a little longer." Bert added, "I would like to hear the IGYers give impressions of little-known IGY events - short and informal but by as many as have something special that most of us don't know about. I would like to hear the anecdotes of people like Wexler, Siple, Eklund, Dufek, Ronne, etc. by anyone who has something interesting to tell. These should not be detrimental but again should be short tales not commonly known." Herman Friis had a plethora of ideas; a session on the history of the Office of Polar Programs' contribution to science in the polar regions, international response to the call for the First Polar Year, US's scientific contribution to the First Polar Year, and a history of the first IGY as reflected in the resources in The National Archives. Doc Abbot and Tom Frostman, one an admiral, the other a USARP, want, and rightly so, Navy involvement. Jerry Huffman outlined a three-day program. Louie Quam suggested a symposium on the influence of the Polar Areas on World Climates, especially as recorded in ice sheet drilling. That master driller, B. Lyle Hansen, wants a picnic on one of the days where one can just circulate and visit informally. George Doumani wants no more cluster bombs dropped on Lebanon, and thinks the idea of a reunion is a "good idea." Paul Humphrey wants to do it all in one day, including a dinner with "outstanding speaker (brief)"! Ned Ostenso wants one day devoted to a special symposium of selected speakers summarizing what we know about Antarctic geology, glaciology, biology, meteorology/ climatology, etc., vs. what we knew in 1957, with Larry Gould or Walter Sullivan emceeding it. Bob Nichols had the best thought - "all my Antarctic friends present." I think there is probably enough interest to assure that some sort of a reunion will be held next spring at the time of our Memorial Lecture. I already have verbal assurance from Dr. Burch at. The National Archives they they would show old polar films on one of the days designated, as a reunion day, and we have high hopes that the US Geological Survey will come up with some sort of a polar cartographic historical display. And I think we can count on Iceberg #3 - The Paul A. Siple Chapter of the American Society of Polar Philatelists to come up with an outstanding exhibit of polar philately pertaining to the Polar years. If some of the rest of you meant to write us but didn't, why don't you get off your tail and send in your ideas? We need a show of hands if we're going to convince people that this idea is really worth pursuing. We know there are guys like Hugh Bennett who would rather shoot themselves in the foot than write, but perhaps those guys could get their wife, girl friend, or whatever, to do it.

**THE FALKLAND ISLANDS CRISIS - PHILATELICALLY.** Col. Peter Barretta (USAF Ret), a member of our Board of Directors and a long-standing member of the American Society of Polar Philatelists (ASPP) kindly consented to write a short article on the effects of the war in the Falklands on philatelists.

As a result of the recent Falklands crisis a side effect has been an upsurge in interest among philatelists for stamps and covers from the Falkland Islands. Stamp dealers and philatelic collectors began making the most of the political situation in the Islands. Rumors abounded among philatelists as to what actions the Argentinians would take with the Islands' stamps at Port Stanley or whether they would issue their own stamps. The latest Falklands stamps featuring the wedding of Prince Charles and Lady Diana were declared invalid as one of the first actions of the Argentinian military governor. In addition, speculation started among collectors on the new Falklands stamp that was to be issued by Britain. There was information that the Royal Research Ship BRANSFIELD was carrying, in late March 1982, a few days before the April 2 invasion, the initial mint supplies of stamps and first day covers honoring the 21st birthday of the

Princess- of Wales which were being delivered to the various island stations in the Falklands, South Georgia and the British Antarctic Territory; and that the bulk supply of these stamps were immediately locked in the vaults at the post office in Stanley. Information now states that these stamps were issued on July 1, 1982, as planned, and that new Falkland Islands stamps will be issued with the date 1982 on them.

Through- the overwhelming coordinated efforts of a fellow Antarctic Society member and polar philatelic specialist, Lt. Col. Joe Hogan of Fort Hood, Texas, the names- of military and naval personnel, units, and both naval and civilian vessels forming the Falkland Islands Defence Fleet/Battle Group were researched through a number of sources. Covers to ships and units were sent to the British Fleet Post Office, the firms of the chartered and requisitioned civilian vessels (i.e., luxury liner CANBERRA), Her Majesty's Ships (HMS) and the Royal Fleet Auxiliary (RFA). Covers were also sent to reporters of the BBC, ITN, British newspapers, the Argentinian general and postmaster at Puerto Argentine (Port Stanley), and to several Argentinian naval vessels. From mailings to approximately 90 British naval ships and civilian vessels, covers have been returned from 39 ships as of July 17, 1982. The covers have the name or insignia of the ships as cachets (hand rubber stamps); and in some cases are autographed by the Master or Commanding Officer, including the flagship HMS HERMES, an aircraft carrier; and the commanding officer of a frigate forwarded a rather intense and patriotic letter stating the historical background of the Falkland Islands claim problem with Argentina. The letter, in part, states, "They may only be little islands but nobody has the right to simply walk in with a gun and explain that they are now colonized.... I do hope the world will understand our point of view and that of the unfortunate islanders. We do not intend to hand the people there over to gunmen and have a slightly stubborn streak on that point." A naval flight cover from the HMS INVINCIBLE, another carrier, relates the combat air patrol sortie of a Sea Harrier's engagement with an Argentinian Mirage III during which air missiles were fired but no kills were made as the Mirage retreated. The pilot notes that he was trained in the Harrier aircraft by the U.S. Marine Corps while on an exchange tour. A cover was received from the RFA SIR GALAHAD, an assault landing ship, and has an oval hand rubber stamp cachet from its Master dated April 28, 1982. At a beach-head at Fitzroy near Stanley on June 8, 1982, the SIR GALAHAD was sunk with a number of casualties. The HMS FEARLESS, an amphibious assault ship forwarded a cover that was cancelled at Stanley on June 23, 1982, about a week after the Argentinian surrender, probably among the first British postal cancellations at Stanley since the April 2, 1982 invasion. An interesting cover was received by Col. Hogan from the deputy Post-Master of the South Georgia Island, who apologized for the delay in transmission of the cover. It was carried in hand luggage while he was a prisoner of Argentina following the attack on the island on April 3, 1982, and later was repatriated to England. (The island was recaptured by the British on April 25, 1982). The Falkland Islands Dependencies stamp on the cover is cancelled by the signature of the deputy Post-Master. The envelope transmitting the cover is cancelled at Cambridge, England with a special penguin pictorial cancel of the British Antarctic Survey.

The Argentinian covers were obtained from a long-time hobby exchange correspondent in Buenos Aires. The extensive Argentina cover collection has many indications through the years that reflect their claim to the "Islas Malvinas," including map stamps that depict their claim over that part of Argentinian Antarctica that is also claimed by Britain,, From a map stamp issue in 1935 the

theme was endlessly repeated in other map stamps in 1954, 1960, and 1964 claiming not only the Falkland Islands, but also the British Antarctic Territory, the Falkland Islands Dependencies, South Georgia Island, South Shetland Island, South Orkney and the South Sandwich Islands, and often showed the Argentinian flag flying over the islands. Two large colorful souvenir sheets were issued in 1980 to reinforce its claim to the Falklands. As a result of the invasion of the Falklands, a 1700 peso stamp was overprinted "Las Malvinas son Argentinas." Covers were forwarded by my correspondent with printed cachets showing the three island groups, the Falklands, South Georgia and the South Sandwich Islands as the national territory of Argentina. A special pictorial flag cancel also used the same slogan on the overprinted stamp. Argentina recently also has issued a new set of two 5000 peso stamps with one showing the creation of the Argentinian political and military command of the Falklands area starting in 1829 and the map stamp clearly shows the claims of Argentina, and the other stamp features the first commander of the Malvinas area. Because of the heightened interest, stamp dealers are offering the 1700 peso overprint and are taking orders for the new set of the 5000 peso stamps.

**MAWSON'S WILL - A TREMENDOUS BOOK, A GREAT BUY.** We were able to buy a hundred copies of Lennard Bickel's excellent book "Mawson's Will," from a book dealer at a most favorable price, and are offering them to Society members at approximately half the retail price. The books are all in mint condition. Ed Hillary wrote the foreword describing "probably the greatest story of lone survival in Polar exploration." You may think you have read it all in Mawson's "The Home of the Blizzard," but such is not the case. Mawson's account, hitherto the only writing on the epic (Mawson-Ninnis-Mertz) trek, was a "tightly controlled narrative that precluded heroics," written by a most modest man. Bickel, an Australian, did a lot of research uncovering evidence which brings fresher light on Mawson's ordeal on the ice. He found copies of the Swiss Dr. Mertz\* journal in German, and also found a lot of material in Mawson's sledging diary which had never before been printed. It's most unfortunate that today's culture precludes our youngsters having real heroes; if they have a hero, it's likely some punk rock musician strung out on drugs who doesn't have the common sense to get a decent haircut or buy a suit of clothes. Mawson would be hard to beat as a true Antarctic hero, ranking right up there with Shackleton. I have to confess to some prejudice, as I used to work with Sir Hubert Wilkins and was influenced by his great admiration for both Mawson and Shackleton. Mawson was a giant of a man, a rangy six-footer, who weighed about 210 pounds at the age of 30 when he led the Australasian Antarctic Expedition of 1911-13. When he finally staggered back into his main camp at Commonwealth Bay in early February 1913 he was an "emaciated wretch" weighing about a hundred pounds, unrecognizable to his own men who greeted him with "My God, which one are you?" If this book doesn't touch the cockles of your heart, you are plain heartless. It would be a great book for either your own personal library or to give to a loved one or a friend. We are happy to offer this book to Society members at what we feel is an exceptionally good price. *The book will be for sale at Society meetings for \$5.00. If you are ordering by mail, it will be \$6.80. Please make your check payable to ANTARCTICAN SOCIETY, and send us the mailing address.* It's a great book - you'll like it!

**MID-WINTER AIRDROPS.** The mid-winter airdropping of 11 tons of material, including mail and fresh vegetables, went off without any real problems on June 22nd. Forty containers equipped with parachutes were dropped from the Starlifter over McMurdo in 8.5 seconds, surface temperature - minus 80°F! Then on to the Pole, where drops were made on three passes; surface temperature there was minus 112°F, ideal for airdropping! Polesters/Polesterettes reported that "it was a beautiful sight - the C141

backlighted by a brilliant aurora zooming over the dome." Six out of seven drops at the Pole were perfect, but a "few freshies were lost in the seventh - still, an unqualified success." They arrived back in Christchurch at 8:30 PM, some 15 1/2 hours after takeoff. Imagine sitting in a pub later that evening and having some bloke ask you what you did that day - you could answer blandly, "Not much, went for a little flight, refueled in mid-air, decided to fly by McMurdo and the South Pole to see how things were, and then came on home in time for some mutton stew before coming over here for a yard of ale."

**GENTLEMAN JIM PLAYS WELL IN LENINGRAD.** The XVII Meeting of SCAR (Scientific Committee on Antarctic Research) met in Leningrad, USSR from 28 June through 11 July. Gentleman Jim Zumberge, President of the University of Southern California, was elected president of this august group, succeeding Professor G. A. Knox of New Zealand. Jim will no doubt find this presidency dealing with fourteen different nations (Argentina, Australia, Chile, France, Federal Republic of Germany, German Democratic Republic, Japan, New Zealand, Norway, Poland, South Africa, United Kingdom, United States, and the USSR), a cakewalk after dealing with the law enforcement component of the NCAA which has imposed severe penalties on his university for a little harmless hanky-panky by overly zealous alumni who over the years have gotten used to seeing to it that their Trojans are one of the best college football teams that money can buy. I understand that Jim was an unqualified success in Leningrad (as he was in Moscow in 1958), and that he topped it all off by giving part of his acceptance speech in Russian. Is this what they mean by gamesmanship or is it one-upmanship? Quite a contingency represented the United States. Besides Gentleman Jim, there was Charlie Bentley, Bill Benninghoff, Cam Craddock, Colin Bull, Sayed El-Sayed, Al Fowler, Tim Hushen, Uwe Radok, Bob Rutherford, and Fred Williamson. With the exception of old Uwe and Williamson, all are Society members in excellent standing. Space and time and laziness on my part prohibit me from getting together any information as to what went on scientifically in Leningrad, assuming that something scientific must have happened in two weeks, especially with all those wheels there.

**SNOWFLAKES.** Records are made to be broken, and so it was at the South Pole on 23 June when a new all-time min was set for the station - minus 117.4°F (some four degrees lower than its previous min). The world's record min is minus 126.9°F set by the Russians at Vostok many years ago. -- Condolences to Bud and Betty Waite who lost their only son and two granddaughters in a terrible automobile accident near St. Louis in June. -- Condolences also to Brian Mason, meteorite at Smithsonian, who lost his college-age son last spring in a climbing accident out west. -- Apologies for leaving no room for Guy Guthridge, although he supplied facts (among the fiction) used in this Newsletter.

#### **SCHEDULE OF UPCOMING MEETINGS/SYMPOSIA.**

Fourth Symposium on Antarctic Earth Sciences, Adelaide, Australia, 16-20 August 1982.

Dr. Charles Swithinbank, SPRI, will address the Society, Room 540 - NSF, 8 PM, on August 31st (see cover sheet of Newsletter).

Dr. Philip Kyle, New Mexico Tech, will address the Society, "A Walk Around the Crater of Mt. Erebus," Room 338 - NSF, 8 PM, on September 15th.

Division of Polar Programs Annual USARP Orientation, Marriott Twin Bridges, 14-16 September, 1982.

Krill Biology Symposium, Institute for Marine Biomedical Research, University of North Carolina, Wilmington, North Carolina, 16-18 October 1982.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

President!:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.), 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84

Vol. 82-83 October No. 2

The Antarctic Society and the Polar Research Board, NRG  
Co-sponsor Fall Spectacular  
Honoring 25th Anniversary of the IGY

THE INTERNATIONAL GEOPHYSICAL YEAR: ANTARCTICA REDISCOVERED

by

Walter S. Sullivan  
Science Editor, New York Times

Introducing Walter will be our own Larry Gould  
Honorary Member of SCAR

on

Thursday, November 11, 1982

8 PM

NAS Auditorium  
National Academy of Sciences  
2100 Block of C Street NW, South Side  
Washington, DC

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Franke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982

Walter Sullivan should be right at home in the National Academy of Sciences, for among his many honors is their Public Welfare Medal awarded in 1980. He has also received the Distinguished Public Service Award from the National Science Foundation. The American Association for the Advancement of Science, in conjunction with the Westinghouse Educational Foundation, has presented him thrice - the statutory limit - their Annual Award for Outstanding Newspaper Writing on the Natural Sciences. He has participated in four Antarctic expeditions, and from 1956 to 1959 was in charge of the special Times coverage of the IGY.

GALA DINNER PARTY

There will be a pre-Lecture dinner at the National Academy of Sciences, starting with cocktails at 5 PM (open bar) in the Great Hall, after which dinner will be served in the Refectory (downstairs). Dinner will consist of Fresh Fruit Cup, Salad Maison, Chicken Breast Francaise, and Chocolate Swirl Cheesecake. The cost will be \$19.00 per person, which includes all your drinks and taxes and gratuities. This is a once-in-a-lifetime Society opportunity to drink, eat, and listen with only one car stop. There should be plenty of street parking because of the holiday. LET'S HAVE A REALLY BIG TURNOUT FOR WALTER AND LARRY!

We will have to formalize arrangements early. So PLEASE! Reservations and checks (we don't want cash payment at the door) should be in our mail box no later than November 6th.

B E R G Y     B I T S

Bergy Bits, as it was in the beginning and will be for at least this year, is the Non-Voice of the Antarctic Society, put together by a member of the Society who strives to make the column an interesting potpourri of some facts - some fiction - some anecdotes about people and events related to the Antarctic. We try not to let truth get in the way of a good story. We do seem to have quite a few non-member critics who somehow find time to read the Newsletter and fault us - to them may I raise the salute which Nelson Rockefeller so aptly gave a bunch of young harassers when he was giving a political speech. I wonder how effective these guys are in their public service, non-paying, extracurricular activities.

**ARE WE EVER EXCITED - YOU BET WE ARE.** I am continually amazed at the calibre of our fine lecture series, and our next meeting promises to be real fantastic. Your Society had been thinking of who we could get to give us a lecture on one of the triple anniversaries (100th of 1st Polar Year, 50th of 2nd Polar Year, and 25th of the IGY). The Washingtonian who has been trying to stir up interest in the bureaucracy relative to these anniversaries is Pem Hart, Executive Secretary of the Geophysics Research Board at the National Academy of Sciences, who was a pseudo-Antarctician of sorts in bygone years. One day recently we were mulling over names of potential speakers, and he proposed trying to get Walter Sullivan. We had previously been in contact with Walter, and knew if the circumstances were right, he could be enticed. So Walter will be giving our Society's 107th Lecture, the very first one ever presented by a member of the media. It is most appropriate that it should be Walter, as there is no better known or more knowledgeable Antarctic science writer. He was synonymous with IGY and Antarctica, where he spent much time befriending both the scientists and the military support personnel. His many articles in the New York Times during the IGY were written with great depth and much wisdom, with clarity and understanding. My late father subscribed to the Times then just to read Walter's articles on the Antarctic, because reading Walter was the next best thing to being there. He has written many books - Quest For A Continent and White Land of Adventure in 1957; Assault On The Unknown in 1961; We Are Not Alone in 1964; Continent In Motion in 1974; and Black Holes, The Edge Of Space, The End Of Time in 1979. His Quest For A Continent and Assault On The Unknown are two of the very finest books ever written on the IGY. Walter is a Yale man. We mention this because our popular and beloved Honorary President, Ambassador Paul C. Daniels, is also a Yalie, and very proud of it. We hope that the good Ambassador and his charming wife Teddy will be able to be here for the lecture. They were scheduled to be on the road to Lafayette, Louisiana during the first week in November, but the presence of "two of my best friends, Larry Gould and Walter Sullivan" may be enough of an attraction to get the Ambassador to change his plans. It would really be a Triumvirate having the Ambassador and Larry and Walter. A memorable evening that none of us will want to miss, so we're looking forward to a great turnout.

**MORE GOOD NEWS! WALTER SULLIVAN WILL INTERVIEW LARRY GOULD.** I don't know how many of you had the privilege of seeing/hearing those wonderful interviews by the well-known Arctic geographer Trevor Lloyd of the late, famed Arctic explorer, Vilhjalmur Stefansson, which were shown on Canadian television. There were several half-hour shows which I thought were fantastic. I have longed for someone to do such interviews with our own Larry Gould who knows all that's needed to be known about Antarctica. Several years ago while visiting with John Sater, then of the Arctic Institute of North America's Washington office, I told him I wished our Society could get someone to tape Larry for posterity. John suggested we contact Walter

Sullivan, which we did. Everything looked like it was coming up roses. Walter wanted to tape Larry; Larry wanted Walter to tape him. It was all scheduled last year, but alas, things went awry when Walter had to remain an extra week on the west coast to cover the delayed space shuttle landing. But now it's all on the front burner again, scheduled to be done the afternoon of November 11th at the National Science Foundation. This will be just great - vintage Gould is about as good as we common folk will ever hear. Walter's interview of Larry will serve as another manifestation of our Society's recognition of the polar anniversaries. Larry had made a name for himself in the polar regions (both Greenland and Antarctica) prior to the 2nd Polar Year and, of course, was Mr. Antarctic IGY. To the best of my knowledge, he had no active role, either as a planner or a scientist, in the 1st Polar Year, but then again, he's a man of great accomplishments, so maybe he did.

**SWITHINBANK BREAKS RECORD.** Charles Swithinbank evidently broke all Society attendance records for a non-Memorial Lecture when he spoke to our Society on August 31st. Eighty-four people were in attendance, including a late-arriving, scraggly-bearded soul who sat in the foyer outside the packed room. There were eight past presidents (Mort Rubin, Bert Crary, George Doumani, Bill Sladen, Pete Bermel, Ruth Siple, Paul Dalrymple, and Pete Burrill), as well as someone from the Japanese Embassy and another from the Russian Embassy. Charlie picked the title of his talk, "Nationalism and Internationalism in the Antarctic", in mid-April during the height of the Falkland Islands crisis. Much of his presentation on the 31st, though, was centered on his fond memories of his many Antarctic sojourns and experiences which several in the audience had shared with him on the ice. The Norwegian-British-Swedish Expedition to Maudheim has always fascinated me, and it was great to hear firsthand from one of their many famous scientists (which also included Valter Schytt, Gordon Robin, Gosta Liljequist, Fred Roots, and others). He also spoke of his year with the Russians at Mirny in 1964. Charlie was the first British scientist to ever winter over with the Russians; he is also the last Brit to winter over with the Russians. I don't know just what inference we can draw from this, but one can surmise that he either didn't drink his fair share of vodka or else he drank more than his fair share! I wonder how many members of our Society have wintered over with the Russians besides Charlie, Gordon Cartwright in 1957, Mort Rubin in 1958, Gil Dewart in 1961, Michael Maish in 1969, Rob Flint in 1974, and Rex Hanson in 1980. Are there more? It sounded like Charlie thoroughly enjoyed his year at Mirny; in fact, it sounded like Charlie thoroughly enjoyed every trip he ever made to Antarctica, irrespective of expedition, camp sites, or colleagues. He told the crowd how he found the immortal Larry Gould's geology hammer on Mt. Nansen - some thirty years after Larry had left it there - and had brought it back to Larry. You know glaciologists never die, they just keep on going back to their same old haunts. Three years ago Charlie accompanied Terry Hughes back to Byrd Glacier, a glacier which Charlie had studied some 19 years before. The XYL of one of our Board members told Charlie at the conclusion of the evening that he was a double for Tom Landry, the coach of that ex-Dallas football team that used to have all those gorgeous cheerleaders! We got a little too over-enthusiastic on the mock-up of the cover sheet for the last Newsletter - Charlie has asked for space to clearly identify his British connection.

Many thanks for a delightful evening with more old friends than I ever expected to see gathered together in one place. I wish we lived a bit closer so that such happy occasions could happen more often.

There was one small mistake that you inserted into the August Bergy Bits. My address was given as British Antarctic Survey, Scott Polar Research Institute, Cambridge. While I am a lifelong friend and admirer of the Scott

Polar Research Institute, the fact is that *I* left the place six years ago. Rolling the two institutions into one is a common and forgivable mistake but here is the difference. The Scott Polar Research Institute was founded in 1920, belongs to the University of Cambridge, has a fine building in Lensfield Road, Cambridge, and a staff numbering about a dozen that is often outnumbered by visitors and research students. The British Antarctic Survey was founded (under another name) in 1943, belongs to the taxpayer, has an uninspiring building in Madingley Road, Cambridge (2 miles from the SPRI), and a staff numbering over 300. What we have in common is dedication to the pursuit of excellence in polar research and a healthy record of staff migration in both directions. Long may both institutions prosper!

**INSIDE EREBUS.** Phil Kyle, a native son of Wellington, New Zealand, who now works out of some cactus patch in the desert called Socorro, New Mexico, spoke to the Society on September 15th on Mt. Erebus. Phil, who is now a professor in the Department of Geoscience at New Mexico Tech, has a never-ending Antarctic lifetime dream studying old Erebus. He actually has a better deal than the meteorite picker-uppers, as his party camps on the outer rim of Erebus above and beyond the visitation of tourists. And when it comes to cooking a turkey or a chicken, all they have to do up there is wrap it in aluminum foil, bury it in the hot soil, and come back later! Phil had fantastic pictures of Erebus, including some beautiful shots of hot magma in the inner crater. It all looked rather masculine to me, so I thought I was safe in asking if this was an all-male operation. Imagine my chagrin to find out that some of those people wearing parkas whom I thought were men were actually women. You certainly can't detect sex in parkas. But I understand there is still one Antarctic bastion where women have never trod, or at least have never wintered over. I imagine that Professor Thomas David, Sir Douglas Mawson, Alistair Mackay, Jameson Adams, Eric Stewart, and Sir Philip Brocklehurst, who made the first ascent of Erebus 55 years ago next March, would all be flipping in their graves if they knew women were cavorting on the crater of Erebus while living on lobster tails. This coming summer will be Phil's 11th working out of Scott Base and McMurdo, and what a high he must experience living and working around the craters of Erebus. He must hate to leave, especially knowing that he has to go back to Socorro. Phil told a near capacity audience that there are probably ten active volcanoes in Antarctica, and one gets the feeling that his destiny will be etched on slopes of many of those volcanoes.

**KEEP THOSE CHECKS COMING.** We entered this 1982-3 season with 105 paid-up members, approximately 25% of our total membership. We got real good response from our first billing, picking up dues from another 241. But we are still after the other 81. They are getting (with this Newsletter) a second notice. Then those who don't respond to this second notice will find their names published in the third Newsletter of the year. There will be no freebies after the third issue, as we'll assume that those who haven't paid by then have found better places to put their dollar bills. We dropped 16 members last year and 2 members resigned, but we came out ahead because we picked up 42 new members last year (vs 79 new members in 1980-81, 47 in 1979-80, and 72 in 1978-79). Ruth and I surely appreciate it when you all pay rightaway, as this is a "Ma-Pa" operation and it's a veritable pain (for me, anyway) when people hold out paying their dues.

**ADOPT A PENGUIN** - [PLEASE Read This Paragraph]. It happens every so often that some character writes an article about Antarctica, and ends it with our address for further information. This results in a flood of unwanted mail, much of which I confess goes directly into the circular file. An ecumenical-type publication called Campus Life recently (July/August) stirred up a lot of interest in our Society among junior

high school kids. I never saw the article, but it must have been a beaut. Randy Prum in Sheboygan wrote us for information on the "Adopt-A-Penguin Program"; Mark May out in Gig Harbor, Washington wanted "info about a T-shirt"; Beverly Reese in Fayetteville, Georgia wrote "some day when I can make it on my own, this club will darn well see me in anarctica"; Heidi Hofer in Carpenter, South Dakota wanted to know "any possible way for me to acquire and keep a penguin as a pet?"; Eric Baker at Elmendorf AFB is a doubting Thomas as "I read about your Society in a magazine and although I really doubt it exists, just in case ...". But the best letter of all came from Jonathan Roland of 790 Spruce Street in Emmaus, Pennsylvania, who wrote "Dear fellow Antarctica lovers, I have always considered an Antarctican igloo as my dream house and have loved Penguins since I was a young chick. Antarctica doesn't have much pollution or political problems. I was overjoyed when I discovered your society in Campus Life Magazine. Please send me any information that you could send me. Thank you very much! In honor of Antarctica", and then he signed his name upside down, signifying, I presume, that he was already at the bottom of the world. Well, we have some good news for you hardened old Antarcticans; young Jonathan is now one of your co-members, as he joined right up. On his application form he wrote "I think the culture of penguins is misunderstood by myself and others. I wish to help them have more of an impact on society." Maybe some of you folks can write Jonathan and welcome him into our Society, and reassure him that penguins are alive and doing quite well for themselves under the Antarctic Treaty. As for the Society, we are looking forward to additional communications from Jonathan, and we hope that he may enjoy our Society down through the years.

**NEWS FROM GUY GUTHRIDGE** (Manager, Polar Information Program, Division of Polar Programs, National Science Foundation). Guy has provided us with the following three items of interest. Enjoy!

Antarctic budget for fiscal 1983 approved. As in some former years, this summer's Congressional deliberations on the Antarctic budget had antarcticans on the edge of their seats. The process began in February, when the President issued a memorandum directing continuation of the United States Antarctic Research Program and included \$86.4-million in the National Science Foundation budget request for this purpose. The House approved the President's figure, but on 18 August the Senate Appropriations Committee recommended a shift of \$15.3-million from the antarctic logistics budget to another part of the Foundation. This move if sustained would have gutted the 1982-1983 season in Antarctica, forcing 60 to 70 percent of the researchers to stay home. In September the House and Senate committees jointly recommended an antarctic budget of \$82.4-million—\$4-million lower than the President's request. This figure was passed in the HUD-Independent Agencies appropriations bill and was signed by the President in early October. The budget as passed will require flight reductions and deferral of needed construction, but the 84 science projects involving some 270 researchers can be carried out as planned.

It's hard to be a penguin! G. L. Kooyman and others of the Scripps Institution of Oceanography and the British Antarctic Survey have further evidence that it's hard to be a penguin. Using an on-bird recorder, they measured the diving depths- of king penguins near South Georgia. The birds frequently dove deeper than 100 meters, rarely more than 240 meters. They averaged 144 dives a day—most of them 5 to 50 meters in depth. These dives are not jaunts: food is the objective, for parent and chick. On the basis of estimated masses of squid consumed, only about 10 percent of the dives result in prey capture. Kooyman figures the cost of foraging is over twice as great as the energy content of the food delivered to the chick. During one trip at sea, lasting 4 to 8 days and averaging 865 dives, some 50 to 90 squid have to be caught

to sustain the adult and feed the chick. The 20 August Science has more.

Antarctic fish may save farmers millions. It seems farfetched, but studies of the glycoproteins that keep antarctic fishes from freezing have resulted in a synthetic substance that may pave the way for farmers to save millions of dollars annually be decreasing crop damage due to frost. Robert E. Feeney and Arthur L. DeVries, both biochemists, did the years of basic research at McMurdo that led to this development, but our heroine is Elizabeth Allegretto, who has never been to Antarctica. Ms. Allegretto, then an undergraduate at Northern Arizona University, prepared polymers that could inhibit ice nucleation by duplicating the antifreeze properties of the fish in a much simpler system. These long-chain molecules could be used as a spray to inhibit ice formation in plants. Crops showing the greatest promise for treatment are in places like Florida with occasional light frost at 25 to 30 degrees Fahrenheit. Don't head for the feed store just yet. "We've done this in a laboratory," says Ms. Allegretto's faculty advisor, "but I want to stress that we have yet to begin trials with actual plants in the field."

**HUGH DEWITT TELLS ALL.** Worth Nowlin down there in Texas wants us to come up with some news on oceanographers, past and present, and what they are up to. That sounds like a most legitimate request, but the problem is getting items of interest into my hands. I am no longer involved in polar work, so am dependent on people supplying me with information. Ruth's newest son-in-law, Hugh DeWitt, is an oceanographer-ichthyologist-zoologist, and we told him if he expected second servings over Christmas that he had better give us some copy for this Newsletter. So, Worth Nowlin, here is what has been happening lately to one oceanographer, told in his own words:

A second workshop (sponsored by the SCAR/SCOR/IABO/ACMRR BIOMASS Program) on the Ageing of Antarctic Fishes was held at the University of Maine, Orono, during 7-10 June 1982. Eleven participants from the U.S., England, West Germany and France spent the four days listening to and discussing presented papers, discussing current research and examining otoliths and scales of several fish species. The main conclusions of the meeting were that the methods agreed upon during the first workshop had proved successful and had enabled workers to communicate more effectively about their research. There were problems with some of the large species because growth becomes slow with increasing size, but some new methods of analysis using scanning electron microscopes and electron probes might eventually solve them. Additional presentations on the potential uses of SEM and electron probes, and on methods of resolving scale annuli were made and discussed.

The first meeting of the BIOMASS Working Party on Fish Ecology was held in Hamburg, West Germany, during 20-25 September, concurrently with the Fourth Congress of European Ichthyologists. The terms of reference for the group are 1) to keep under review the progress made in investigations on the biology of Antarctic fish and to suggest priority topics for study, and 2) to collect information and recommend studies on the population dynamics of major fish stocks.

In addition, the Working Party was requested to assess the current rate of exploitation of Antarctic fish stocks and predict the effects of possible future patterns of exploitation until such time as the Scientific Committee of the Convention for the Conservation of Antarctic Marine Living Resources comes into force. The Chairman of the Working Party, Dr. D. Sahrhage of the Institute fur Seefischerei in Hamburg, has also been appointed as Chairman of the Scientific Committee, although the committee itself has not been formed.

There were requests from ornithologists that the Working Party prepare a handbook for the identification of fish remains commonly encountered in the stomachs of predators such as birds and seals. Such information is important in describing food habits and the ecology of predators, and in quantifying the trophic energetics of a species. The Working Party agreed to prepare an identification guide and H. DeWitt was asked to coordinate the effort. Dr. Hecht of the J.L.B. Smith Institute in South Africa agreed to prepare a key to fish otoliths, one of the most commonly encountered remains, since he was already engaged in such a study.

Acting on a request from Dr. W. Fischer of FAO, the Working Party agreed to prepare identification sheets of the commercially important and common species of Antarctic fishes. Dr. J. C. Hureau of the Paris Museum will act as coordinator of this effort, with the bulk of the work divided between DeWitt, Hureau, Tomo (Argentina) and White (England).

Recommendations were also made for fish research during SIBEX (Second International BIOMASS Experiment), planned for the 1983-84 and 1984-85 southern summer seasons. Details of participation will be worked out in meetings during the next months. One of the potentially most useful results of SIBEX may be the pooling of data by the participating nations working in different regions of the Antarctic (Western Scotia and Eastern Bellingshausen Seas; Prydz Bay; and the Pacific Ocean in about 160°E) which can then be analyzed by computer methods. The Working Party recommended that a fish data analysis workshop be held sometime in early 1986 in Hamburg where the computer facilities of the Inst. f. Seefischerei can be made available. All data should be stored on tape in a BASIC compatible format and sent to Hamburg before the workshop. Questions and models to be used in analysis need to be submitted at least a year before the workshop so that appropriate programming can be completed. Such a workshop also offers the potential of using older, pre-BIOMASS data.

I should add that all of the participants in both the Workshop and Working Party have had Antarctic experience. The two Britishers, North and White, were also affected by the Falklands war. North was stranded in the field on South Georgia for six weeks when the Argentines occupied it. He thought the small party he was with would be captured, but the Argentines either did not know where they were or decided to leave them alone. White was delayed on Signy Island for a couple of months when the ship on which he was to return to the U.K. was commandeered for the attacking British fleet. It was one of the ships sunk, containing the samples of that year's biological program at the South Orkney Islands. The delays of North and White also meant that they did not have time (two weeks!) to prepare for the fish ageing workshop in June.

**SURFACE ICE 600,000 YEARS OLD . . . PERHAPS.** Last winter when Bill Cassidy of the University of Pittsburgh was speaking to the Society he mentioned to us that he was finally able to get a geologist to join his team - Ian Whillans of The Ohio State University (Ed. note - the same university that used to play winning football). Well, Ian has conjectured that evidence gathered in the Allen Hills region points to the possibility that deeper, older ice has been pushed up to the surface, especially forced upwards against the Transantarctic Mountains. It appears that the oldest ice might be as old as 600,000 years. When you realize that the oldest dated ice is only about 125,000 years old (the bottom of the 6,700 foot core drilled in Greenland in 1980), the conjectured figure for the Allen Hills ice represents a gigantic leap back into climatic history. More good news is that it's just lying there on the surface, "almost like a vertical core." Ian was quoted

as saying, "If this is true, it is a stupendous new discovery." I would like to be able to share in his happiness, but I'm afraid I am much more interested in knowing whether this is going to be a cold winter in Washington than in what happened, say, 450,000 years ago in Antarctica. However, good luck to Ian in his investigations.

**BILL DUNLOP UPSTAGES SIR RANULPH TWISTLETON-WYCKENHAM FIENNES.** What a beautiful day August 29th was for the common man. Just fantastic to think that a 41 year-old former truck driver from Mechanic Falls, Maine should have the good fortune to sail his 9 feet 1 inch long boat into Falmouth Harbor, England, on the same day that the \$17.5 million doliar-financed Transglobe Expedition should chug into Greenwich on their 32-crewed good ship BENJAMIN BOWRING. And you know who got all the publicity in this country? Good old Bill Dunlop, who established a new record for sailing the smallest boat ever across the Atlantic from west to east. Sometimes when you don't believe in things, poetic justice reaffirms itself and all of a sudden you are a believer again. I love it, I love it, I love it! James Lardner wrote in the Washington Post, "By an inspiring fluke of timing, Sir Ranulph came into port amidst a sudden flowering of other heroic journeys -Bill Dunlop traversing the Atlantic in a 9-foot sailboat, Lon Haldeman bicycling across the U.S. in less than 10 days, and 65 year-old Ashby Harper and 54 year-old Ionthe Rhodes swimming the English Channel and Chesapeake Bay, respectively." Lardner went on to say that "if you set out to define the ground rules of this mission (Transglobe), you would end up with more caveats than there are in all the collected speeches of Alexander Haig." He pointed out that the expedition "frequently detoured thousands of miles from the Greenwich meridian to camp in such rugged outposts as Paris and Hollywood, where the travellers rested and set up shops as salespeople for the latest in British-made exploring gadgets" and he pointed out that during their "lonely journey across the Arctic, the expedition's Twin Otter supply plane made food and fuel drops every five or six days and provided no fewer than half a dozen replacement snowmobiles." Captain Scott was just born too early, but on the other hand Scott is immortalized and Fiennes will soon be forgotten. Lardner said that Fiennes' companion, Charles Burton, was "clearly a selfless man, for what other kind would enter such a wisp of a name into partnership with 10-syllabled nobility." But good on Bill Dunlop for truly making this past August 29th a memorable day.

**CARL WYMAN SUCCUMBS.** Carl Wyman's name is not one of those well-known Antarctic names, but if anyone were to publish a book on Antarctic characters, he should certainly note this ex-Marine colonel who was the assistant ionosphere scientist at Little America V in 1957 and who died on September 17th, 1982. Carl had always had a certain amount of fascination for Antarctica, and when the IGY came along he looked for ways of getting south. He had retired from the Marine Corps, his children had been educated and were as safely married as marriage can be, and he filed an application with the National Bureau of Standards to go south with them. He was sent to Little America V to assist a young, bona fide Danish polar ionospheric scientist by the name of Hans Benggaard. Carl's first love was amateur radio, he brought his own gear to Little America, and even before he had his long handles unpacked, he was up on the air working the key. His very first contact at Little America V happened to be this guy in Pennsylvania, who turned out to be the very same fellow who was his first radio contact many, many long years before when he was in Guatemala with the Marines. But it didn't take Carl very long to develop a side interest, which he pursued diligently and most faithfully throughout the long winter night, and that was proclaiming himself a one-man task force to keep the Navy, VX-6, and the Seabees honest. He took great delight in harassing all of them, and as a good retired Marine colonel, he was most effective in

this self-appointed role. The doctor at Little America V used to dispense those small two-ounce bottles of medicinal brandy once a week, one to a customer. Most people gulped them down immediately, but some hoarded them until they had enough to make it worthwhile. Somehow or other, Carl and the Navy Chief Photographer, a fellow by the name of Larsen, accumulated enough of those tiny bottles to be able to have their own little party, and it resulted in one of the few interesting events to occur during the whole winter. The Navy leader, Willie Dickey, a captain-seeking-admiral-which-was-never-to-be, got quite upset and called in Serf Cray, Scientific leader at the camp, and told Bert he was bringing Larsen up before the mast and wanted to know what Bert was going to do to punish this grand-fatherly old Marine colonel. Bert, an astute old codger himself, realized he was overmatched when it came to Wyman, and besides, no one loved or appreciated a happening better than old Bert. So when Bert answered Willie with "Hell! I'm not going to do anything!" that ended the whole episode. I ran into Carl's Danish supervisor in Copenhagen about eight years ago, and the first thing he said to me was, "I always wondered what I did to warrant having Colonel Wyman assigned to me." Carl was really looking forward to our reunion next spring, and we're sure going to miss him. Just before he died, he wrote me that he knew both Ken Bubier and Walt Giles, both O.A.E.'s. In fact, he had enclosed a xerox copy of a letter that Mrs. Bubier had written him on February 4th, 1930 in which she thanked him for forwarding one of her husband's radiograms from Little America. Carl lost his first wife to the Big C, and had remarried successfully in 1968. He had emphysema and presumably that's what got him at the end. I know people like Bert Cray, Mukluk Milan, Boy Scout Chappell, Ron Taylor, Blackie Bennett, Wild Bill Cromie, Gene Harter, Mier Bruce Lieske, and others will miss him even though we haven't seen him lately. But at least we know what he's doing up there in Heaven - he's policing the activities of guys like George Dufek, trying to keep them honest!

**AND THE TORCH IS CARRIED FORWARD.** When you look at the roster of folks going to Antarctica these days, you find more and more family teams, and it appears that a couple of old IGYers (Bucky Wilson, Little America V, 1958, and John Annexstad, Byrd, 1958) are each taking down an offspring this austral summer as a field assistant. I'm getting a personal kick out of old John taking down his daughter Kristine, as it seems to me in my files somewhere is a relatively recent letter from him stating how great Antarctica was before the advent of women. John must have converted as he saw the Light. Cam Craddock had his son with him in the field for several seasons, and Dick Cameron's son Andy spent a summer at McMurdo plus a year at the Pole. I recall that Harry Ayres (Ed Hillary's mountaineering tutor) of Scott Base, 1957, had a son down there several years ago on a summer project. There have been quite a few husband and wife teams in the Antarctic, with another such team apparently going to Palmer this year. This makes me wonder if any of our husband and wife teams had ever conceived on the ice. So I asked this question of Tom and Davida Kellogg when they were here in Washington in September, as they have a son named Griffith Taylor Kellogg - with a name like that I thought he might have been Made in Antarctica. But they disclaimed any Antarctic origin, and said they knew of no other childbirth from a husband-wife team outside of the offspring of Jennie and Harry Darlington. Do you mean to tell me that the Darlingtons did something 35 years ago that no other U.S. married couple has been able to successfully duplicate in all these ensuing years? I can't believe it.

**BOARD OF DIRECTOR ANDERSON CANONIZED.** Here is some really good news. E. Vernice Anderson was presented the National Science Board's Special Award for Exceptional Service on May 19, 1982 in the beautiful Diplomatic Functions Area on the eighth floor of the Department of State. The certificate with its generous and well-

deserved citation had the names of all Board members, past and present, and was signed by the Chairman and the Director. Vernice was also presented a set of miniature Thomas Jefferson mugs and a tray with the signatures of the Board Chairmen and Directors. The Society would like to add their belated "Well done!" to Vernice.

**EXPLORERS RAISE MONEY FOR RONNE MEMORIAL FUND.** A Finn Ronne Memorial Fund for Antarctic Research has been established and will benefit from a gala black tie banquet being held by the Explorers Club at their meeting on 3 November when their 50-year members will be honored. Jackie Ronne is going to narrate a short film of the Ronnes' last trip to Antarctica. One of the members being honored is our own William O. Field, Medalist 1929. If you like explorers and black ties and wild, crazy, exotic near-edibles and the Big Apple, then you should be there - but you need a valid invitation.

**KENTUCKY COMMITTEE FOR THE FALKLAND ISLANDS.** Kentucky, the state with beautiful horses and fast women, (or is it the other way around? I never was quite certain), has something called the "Kentucky Committee for the Falkland Islands," the chairman of which is a member of our Society, Henry R. Heyburn. He has raised over \$3,000 for organizations which directly assist the Kelpers. Donations have been sent to the Falkland Islands Office in London, the International Red Cross in Geneva, King Edward Memorial Hospital in Stanley, three churches in Stanley (Christ Church Cathedral, St. Mary's Catholic, and The Tabernacle), and to the Senior School in Stanley. Henry absorbs all of the overhead, so all donations hopefully end up helping the people in the Falklands. If any of you folks feel so inclined, Henry is still accepting contributions. The address is: Kentucky Committee for the Falkland Islands, 3918 Leland Road, Louisville, Kentucky 40207.

S O M E     C L A S S I F I E D S

**METZGAR ENTERPRISES, P.P.P.P. (PREPAID PEWTERIZED PENGUIN PRODUCTS).** Mike (South Pole 78) Metzgar has a Syracuse Connection (Good Lad Products, Ltd.) who makes hand-made pewter and pewter alloy products. Among the items are a 12-ounce mug of an alloy of pewter and aluminum (approved by the American Medical Association for drinking purposes) with a 1 7/8" penguin silverplated to the mug; a circular solid pewter belt buckle, 2 1/2" in diameter, with same superimposed 1 7/8" penguin; and the same penguin alone as a pin. All three items have a solid look about them; the mug is quite handsome, looking like pewter even though an alloy. Mike has personally field-tested two of the items, the mug for ice-cold beer, and the belt buckle (united with a belt) for holding up his trousers over a substantial sunken chest. The pin probably has some utility for those who can't get enough penguinmania to wear. If anyone wants any of the items, deal directly with Mike, making checks payable to: J. Michael Metzgar, Jr.

send to: 1012 North Paxton Street  
Alexandria, Virginia 22304

The costs, including handling and shipping are:

12-ounce penguin mug	\$25.00
penguin belt buckle	16.00
penguin pin	11.50

Any item sent to Alaska or Hawaii will cost \$1.00 EXTRA!

If you have had your fill of penguins, all three items also come with a polar bear (instead of a penguin), same prices. A small part of the total cost will find its way into the treasury of the Antarctic Society.

**SOME GREAT ANTARCTIC BUYS FROM BARNES AND NOBLE.** Barnes & Noble has several Antarctic books for sale, and in case you missed their holiday book sale, here they are:

- 1084417      Antarctica by Eliot Porter (with Foreword by Walter Sullivan).  
              Includes 87 stunning four-colored photographs. Published for  
              \$35.00, being sold for \$17.95.
- 1056508      Scott & Amundsen by Roland Huntford. A superb dual  
              biography on two of the best known Antarcticans of all  
              time. Published for \$19.95, being sold for only \$6.95.
- 1012814      Shackleton's Boat Journey by F.A. Worsley. The author was  
              captain of the ENDURANCE, and this is another book on one of  
              the great survival stories of all time. Published for \$8.95,  
              being sold at \$2.98.
- 0067223      The Voyage of the DISCOVERY by Capt. Robert F. Scott. Includes 260  
              illustrations by Dr. Wilson and other members of the 1902  
              expedition, 12 color plates in facsimile from Wilson's sketches,  
              panorama and maps. 2 vols, 1,064 pp., N.Y. 1969 reproduction of  
              1905 edition. Published for \$57.00, the two volumes now only \$19.95.

The address is: Barnes & Noble, Sale Annex, 126 Fifth Ave., New York, NY 10111.  
You have to give the item number, the title, the quantity desired, and the cost.  
Then you add \$2.25 to the bill for cost of postage and insurance (a one-time  
charge, regardless of how many books you may buy).

Your Society decided not to get into reselling these books, as it's just too hazard-  
our guessing how many of them our members might already have. Both Porter's book  
and Huntford's book have been highly recommended in past issues of our Newsletters,  
so we felt that most of you who wanted them probably have them by now. We sold out  
the supply (100 copies) of Mawson's Will - it was a great sale, as we got back  
many favorable comments from happy purchasers. Our next sale, hopefully, will be  
the 1983 Antarctic calendars - news about their availability will be passed along  
as soon as we get the information from Walt Seelig in Christchurch.

**GARAGE SALE OF JOURNALS BY STEPHEN WILSON.** Stephen Wilson, Operations Officer on  
the GLACIER in 1955-57, wants to unload some of his polar journals. He is willing  
to sell (presumably at a nominal cost) the Journal of Glaciology, 1955-75; Ice,  
1958-77; Arctic, 1956-79 - two numbers missing; Antarctic News, 1963-72; Bulletin  
of the New Zealand Antarctic Society, 1963-1972 - four issues missing; Polar Record,  
1955-72. His address is USEPA, Acid Deposition Research Staff, RD 767, 401 M St.  
SW, Washington, DC 20460.

END OF CLASSIFIEDS

**APOLOGIES TO TOM STRENGER.** Last February's Newsletter had a couple of pages about  
the publication Geographic Names of the Antarctic, although most of it was just a  
listing of the 200 members of our Society whose names appear in the publication.  
The current Executive Secretary of the Advisory Committee on Antarctic Names, Tom  
Strenger, has taken exception to some of my loose comments in that write-up. I  
would like to publically say that Tom and his group have done and are doing a fan-  
tastic job. I have been given access to their files and have some knowledge of how  
competent they are in their field. One of my errors was reporting that a multi-  
year Antarctic name by the name of Richard Urbanak did not have a feature named for  
him. He does have a feature - Urbanak Peak, 84°38' S, 115°55' W; I just missed it  
when I was going through the book for members' names. I also commented on finding

no feature for one American who wintered over with the Kiwis at Vanda; he wrote me, after getting that Newsletter, that he chose not to have a feature named after him because he felt the naming of features might some day be used by nations trying to establish political claims. I guess this fellow strongly favors the current international scientific laboratory-continent. Incidentally, Tom pointed out in his letter to me that the Defense Mapping Agency serves as the staff for the Board on Geographic Names, and that's why the files reside there.

**ANTARCTIC SATELLITE OBSERVES ANNIVERSARY.** The Mt. Washington, N.H. Observatory, which has spawned many an Antarctic, celebrated its 50th Anniversary this past summer on June 18th and 19th. The Observatory, noted for holding the world record for highest measured wind speed - 231 mph, was established under the guise of the 2nd Polar Year. And if there is anyone who doesn't think the top of Mt. Washington isn't polar, he hasn't been on the top of Mt. Misery. The Antarctic with the most time on Mt. Washington is old Rudy Honkala who spent five years at the Observatory in the 1940's and 1950's. Another multi-year Antarctic, Luis Aldaz, spent time on the mountain. Fred Milan and Rodger Brown (Little America V, 1957 and 1958, respectively), plus Bob Eisner, a McMurdo Sound crabber in the late 1960's, were bona fide Mt. Washington types. I worked on the mountain one summer, back in 1949, although Honkala rightfully refuses to grant me membership in the inner sanctum sanctorum reserved for their wintering types. There always was a lot of hanky-panky going on around Mt. Washington, and both Honkala and Eisner met their future and still current wives while working there. The head man in Weather Modification for NOAA sent his regrets that he couldn't make the reunion, saying the mountain would always be dear to him as his older daughter was conceived on the top of Mt. Washington (hopefully not on government time). Eisner got the prize for coming the farthest, all the way from Fairbanks. Milan had his airline ticket to come from Fairbanks, but Old Mukluk got fouled up in an airline strike and never made it. Dick (Ohio State) Goldthwait and his wife were there for the dinner meeting. For the Mt. Washington Innocents, Dick is Mr. Geology when it comes to the Presidential Range, especially Mt. Washington. The committee did a good job running the reunion, in spite of the sub-par meals now being served at the Appalachian Mountain Club Lodge at Pinkham Notch. Tributes were paid to Dr. Charles Franklin Brooks, Director of the Harvard University Blue Hills Observatory in Milton, Massachusetts, and to Joe Dodge, who not only was a member of the first crew at the Observatory, but who ran the Observatory from Pinkham Notch for so many years that his name is synonymous with the Mt. Washington Observatory. There never were two people more different than Dr. Brooks and Joe Dodge. They recognized each other's merits and together formed a great team. Dr. Brooks, founding father of the American Meteorological Society and past president of the Association of American Geographers, was a scholar-teacher-scientist, a religious man of extreme kindness, understanding, and humility. He was responsible for the science and funding for the Mt. Washington Observatory. As for Joe, if he didn't actually invent swearing, he certainly perfected it to pinacles never before reached in this country. Swearing was truly an art which he openly shared with one and all, with age and sex not being serious deterrents. Joe worked on the philosophy that nothing was too good for his boys on the mountain, and they got the very best, even if it meant that he had to steal for them. I don't think Antarctica ever had a counterpart to Joe Dodge, although Admiral Mike Bernkert was close. It was a great reunion!

**BAD NEWS.** Condolences to Con Eklund, brother of the late Carl Eklund, whose wife Ethel died in Washington on October 17th. John Herguth, faithful philatelic member of our Society, died on September 18th. The mother of Dick Chappell (Boy Scout, Little America 57) was killed in an automobile accident in early August. The Society offers its sympathy.

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 82-83

January

No. 3

**Presidents:**

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-2
- Mr. Gordon D. Cartwright, 1962-3
- RADM David M. Tyree (Ret.), 1963-4
- Mr. George R. Toney, 1964-5
- Mr. Morton J. Rubin, 1965-6
- Dr. Albert P. Crary, 1966-8
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-1
- Dr. William J. L. Sladen, 1971-3
- Mr. Peter F. Bermel, 1973-5
- Dr. Kenneth J. Bertrand, 1975-7
- Mrs. Paul A. Siple, 1977-8
- Dr. Paul C Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82
- Dr. Mort D. Turner, 1982-84

*DOUBLEHEADER!*

PREMIER SHOWING OF UNEDITED WALTER SULLIVAN VIDEOTAPE  
INTERVIEW WITH DR. LAURENCE MCKINLEY GOULD

*Taped 11 November 1982 by Pat Olmert, National Science Foundation (p. 3)*

*PLUS*

President Mort Turner will show a few slides he  
took on the recent WINFLY in August 1982.

**Honorary Members:**

- Ambassador Paul C Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard

On  
Tuesday, 18 January, 1982  
8 PM  
National Science Foundation  
18<sup>th</sup> and G Streets  
Room 540

**Memorial Lecturers:**

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Sir Peter M. Scott, 1971
- Dr. Frank T. Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980
- Dr. Robert L. Nichols, 1981
- Dr. Robert H. Rutford, 1982

\* \* \* \* \*

*1983 Antarctic Calendars will be for sale at the meeting (\$5.00 each),  
and mail orders (\$6.00 each) are now being filled. We have only 150  
this year, so order NOW - first come, first served! It's a good  
calendar, with many excellent pictures.*

Something new this year - a set of four color postcards of Antarctic  
scenes (Emperor Penguins at Cape Royds, Wright Valley, Scott's 1910 Hut  
at Cape Evans, and Scott Base). These were made available to us at cost  
by the New Zealand Antarctic Society. They are \$1.00 locally (at the  
meeting or at 905 N. Jacksonville Street) and \$1.25 by mail. We have less  
than 100 sets, so order NOW.

And if you haven't ordered your P.P. (penguin products) from Mike Metzgar  
(J. Michael Metzgar, Jr., 1012 N. Paxton Street, Alexandria, VA 22304),  
you can still do so. Prices again (including handling and shipping) are:

12-ounce Penguin mug	\$25.00	
Penguin belt buckle	16.00	(to Alaska or Hawaii -
Penguin pin	11.50	\$1.00 extra)

All three items also available with a polar bear - please indicate your  
choice when you order. Make checks payable to J. Michael Metzgar, Jr.

\* \* \* \* \*

Board of Directors Meeting at 6:45 PM on the 18th

Bergy Bits is NOT the voice of the Society, and in no way should it be taken as anything more the ramblings of one of its members. The aim is to include something of interest to all segments of the Society. We try to get facts, but we also don't let truthfulness get in the way of a good story. This particular issue has quite a bit of material relative to BAE I, but a little history won't hurt any of us, so you rookies keep quiet and don't scream at me.

**WALTER SULLIVAN RECALLS THE IGY.** Our meeting on November 11th was epic in many ways. For the first time in the history of the Society we had (1) a member of the media addressing the congregation, a mediaite of great repute, in fact, the Dean of American Antarctic Mediaites, Walter Sullivan, Science Editor of the august New York Times; (2) all past directors of the Division of Environmental Sciences/ Office of Antarctic Programs/Office of Polar Programs/Division of Polar Programs in attendance (Tom Jones, Joe Fletcher, Bob Rutford, Ed Todd); (3) our Honorary President, Ambassador Paul Clement Daniels (with Teddie), and our Perpetual Superstar, Larry Gould (without Peg), both in attendance. It was the first time ever that we had all functions (cocktails, dinner, and lecture) under one roof, and what a delight that was to have a one-stop affair, especially when that stop was the main building of the National Academy of Sciences. It is surely nice to go first-class occasionally. Walter spoke to us in the beautifully redecorated lecture room, where wall-to-wall people heard Walter give his autobiographical account of the Antarctic International Geophysical Year. Walter had been an eyewitness to a lot of pre-game ceremonies associated with the establishment of the Antarctic IGY program, having been privy to attend an international planning session in Paris, to have gone on the ATKA's 1954-55 Antarctic reconnaissance cruise, and to have been there during the IGY. All Antarcticans seem to be smitten by the many attractions of the continent, and Walter is no exception. He talked fondly about the Antarctic -it must have truly been a labor of love. We have his talk on a cassette which we'll loan to out-of-town members - first come, first served - but please get it right back to us so that others can enjoy hearing Walter.

There were many distinguished attendees, but none more radiant than Vernice Anderson, who lights up like a Christmas tree in the presence of Larry Gould. Alice Dater, widow of the well-known Antarctic historian who was such a force in the maturation of the Antarctic Society, was bouncing around all aglow about her upcoming trip to New Zealand and Tahiti. And Dotte Larsen, Whale Spotteress Supreme, was down from Pittsford, New York and didn't seem to be crying at all about her husband's recent defeat for a Congressional seat. There were also some men there, such as that handsome Texan with the personality, Grover Murray, and the ex-Harvard football great, Chester Pierce. You knew it had to be a big event when John Mirabito walked in, as this ex-Navy aerologist from McMurdo Sound (circa early Pleistocene) hasn't been to a Society function in years. Mort and Rosa Rubin, and Bill and Bente Littlewood, former jet-setters in Geneva and Djakarta, respectively, were there. And for distinguished and handsomest, how can you beat Admiral Dick and Aviza Black - no way. Double Memorial Lecturer Bill Sladen came with that elongated beauty from Minnesota with the great personality, Dolores Ulman. Jackie Ronne and her daughter, Karen Tupek, were there, along with a couple of close friends. I was personally disappointed that we didn't have enough people to warrant using the Main Auditorium, but a lot of people were on travel or otherwise committed. Bill Field, one of the real nice guys, sent his regrets from Great Barrington, Massachusetts where he is finishing his life's work "before I get called to the Great Beyond." Capt. John Cadwalader, USN Ret (120 Norristown Road, Blue Bell, PA 19422) wanted to come, but he's an officer

in the Philadelphia Wilderness Club and had to go to their annual meeting. Dick Chappell wanted to come badly but had a previous appointment at Japan's National Institute for Basic Biology in Okazaki where he and a colleague, Ken Naka, were going to continue their research on the retina of the dragon fly - Eagle Scouts get into the darnedest life pursuits. Paul Humphrey is landlocked in North Carolina (617 West Aycock Street, Raleigh 27608) and couldn't leave his aging mother - but he wants to know if anyone has an extra copy of the report prepared for NSF on the voyage of the AlKA which he made with Walter Sullivan, George Toney and others, and if so, he'd like to procure it. Ned Ostenso was travelling in China and Bangladesh, presumably fleeing from all those RIFs he executed in NOAA. Don Wiesnet was in Africa - how sweet it is to be a bureaucrat and see the world, sure beats joining the Navy. John Roscoe (20 Holden Court, Portola Valley, CA 94025) is still recovering from a 5-way bypass heart operation and sent his regrets. Bud Waite (3248 Valencia Drive, South Venice, FL 33595) wanted to be here in the worst way, but he has countless things wrong with him and was just trying to gain enough strength to re-enter the hospital for another hip operation. Harriet Eklund, everyone's sweetheart, was living it up (again, still) in Italy, and I'll bet she never spilt a drop of wine. Deborah Shapley wanted to come to hear Walter, but she was locked in to some embassy function. Bert Cray had to take Frank to a karate lesson. And so it went.

**LARRY GOULD GETS TAPED.** The Walter Sullivan videotaping of Antarctic Superstar Larry Gould went off on schedule on the morning of November 11th. The interview lasted for fifty-six minutes, and seemed to get better as it went along. It came off more as a firesideless chat than it did an interview, as both men were very much at ease with each other and both seemed to be enjoying the opportunity of sitting down and reminiscing. Even though I was privy to being at the taping, I was amazed, when I first saw/heard the videotape, at the wide range of subjects brought up in such a short time. There was quite a bit on the pre-Antarctic Gould, and it was interesting to learn about Larry's geological research in the La Sal Mountains in Utah and how he had found something contrary to the teaching of his mentor, Professor Hobbs. The parts of the tape I liked best were when Larry reminisced about being on the trail, and when he started to talk about Scott, Amundsen, Shackleton, and Mawson. I'm a born hero-worshipper, and love it when someone stands up and says he is a Mawson man. The world is full of a bunch of mealymouthed characters, but Larry is certainly not one of them. Walter credited Larry with being an adept woodsman, citing references in Little America to his being called Chips. Larry said he only wished it were so, but Chips Gould was another man in camp! Then Larry was blindsided by a question about the relationship of Fridtjof Nansen and Katherine Scott, but Larry deftly and swiftly parried off the surprising question while recalling meeting Lady Scott and saying what a delightful lady she was in person. Carleton College came up several times in the interview, and much to Larry's surprise, Walter said that one of his daughters had once applied to Carleton. I was a bit surprised that Larry never got around to talk about one of his favorite Carletonites and Antarcticans, Carl Eklund. This is purely my own thought, but I have a feeling that perhaps Carl was Larry's alter ego during the IGY, that he looked upon Carl almost as if he were his son. Larry says he is not 86 years old, he is 86 years of age. How very true! He is still all boy, and his eyes fairly twinkle when a good story is being told. When you get Walter Sullivan and Larry Gould together, you have a couple of good-looking men. Walter is distinguished looking - like a movie matinee idol; Larry is rugged and looks like a geologist.

**A WALK DOWN MEMORY LANE WITH HOWARD F. MASON, RADIO OPERATOR, BAE I.** From time to time we like to print something from one of the good old boys, because we shouldn't forget our heritage and what got us to where we are today. It seems most appropriate to put something in this issue from Howard Mason (5724 36th Avenue N.E., Seattle

WA 98105) as he was with Larry at Little America I, and like Walter Sullivan, he worked for the New York Times. I might add that he serves one of the many non-salaried official Society's positions, that of Seattle correspondent monitoring the various polar icebreakers, their many successes and their frequent failures. This past October he addressed the Jack Binns Chapter of the Society of Wireless Pioneers on "Radio Communication on the First Byrd Antarctic Expedition, 1928-30," and without Howard's permission we are including parts of it for your enjoyment.

One of our ships was the old, wooden barque rigged ship SAMSON, 167 feet long, which we renamed the CITY OF NEW YORK. The other was the small steel steamer CHATHAM renamed ELEANOR BOLLING after Byrd's mother. It had a forward hatch large enough to take the huge crate enclosing the fuselage of the trimotored Ford aircraft, which was scheduled to make the pole flight.

Besides the 42 men and the 80 dogs, the ships carried food, fuel, dog food, photo and scientific gear, radio equipment, plenty of snow shovels, and a thousand other items.

The New York Times had made a large monetary contribution and was awarded exclusive news rights. They also furnished all radio communication equipment and operators. The Times furnished a reporter as a member of the expedition who sent back daily reports direct to the Times in New York for publication in papers of the North American Newspaper Alliance thruout the country and the world.

Short waves had only been in use for a few years. Not too much was known about their reliability over long distances, especially on rather low power. The distance from New York to Little America is about 8900 miles.

For several years the Times operated a transmitter on the 14th floor of their building in mid-Manhattan, with the call letters WHD, sending daily press schedules to ships at sea. Reports received indicated that they were getting pretty fair coverage over a considerable part of the globe.

It was thought if the Antarctic base had a transmitter similar to WHD that comparable results should be obtained. So three transmitters were built, for the base and the ships. Shop space was loaned by the Lighthouse Service Shops on Staten Island. For each a maple frame was built, supporting a smaller frame to carry two UV-204A one-quarter kilowatt tubes, to be operated as self oscillators in a tuned grid-tuned plate circuit, self rectified. Malcolm Hanson, the expedition radio engineer, sent up copper strip coils, blocking condensers, and other parts from Washington. These were appropriately mounted. Plate supply was furnished by a one-kilowatt Crocker-Wheeler 500 cycle a-c motor generator obtained from a surplus store on the East Side. Transmitters like this have a good note that cuts through interference and carries well, though illegal now. Primary station power was from one or the other of two standard Kohler 2 kw. farm lighting plants for the base transmitter.

RCA installed converted P-8 transmitters on each of the two ships for 600 meter use. A 500-watt Bureau of Lighthouses beacon transmitter was taken along so we could rig a four-course A/N beacon at the base, should the weather close in on the pole flight as the aircraft returned from the pole. It was not needed, however. This transmitter normally was set up on 600 meters.

The short wave receivers for the base and for the two ships were Gen. Elec. AR-1496B using low drain tubes and plug-in coils in a four tube con-

figuration. For medium and long waves the Navy loaned low serial numbers of a new type of receiver. Both ships carried the old large type Kolster direction finder. The CITY OF NEW YORK carried a depth finder for deep ocean depths.

While at Staten Island we obtained and partly assembled parts for three lightweight sets to be used on the trail. They were completed and tested in the Antarctic during the winter when there was more time. The transmitters used<sup>1</sup> one 7.5 watt tube crystal oscillator, keyed directly into the antenna and powered by an English Evershed hand generator furnishing both filament and plate power. The receivers used four tubes in an r-f, detector and 2 audio configuration, operating entirely from Burgess dry batteries.

..... Out in the Pacific WHD started to have difficulty in reading the ships due to the high level of man-made interference in mid-town Manhattan. This caused considerable concern as it jeopardized the whole communication plan.

Mr. Iverson, the Times chief operator, put a receiver in his car and went out on Long Island until he found a place relatively free of any interference. There he put up a shack and installed a receiver and a special type of long wire antenna, directional south. Two telephone lines were leased to the Times office, one for a signal line, the other for an order line. This completely remedied the problem and receiving was through this remote station for the rest of the time it was needed.

The remainder of the trip to Dunedin, New Zealand was made without incident except that I learned what the Times meant by "exclusive news rights." One day I was working an amateur and engaged in a little of what is called amongst operators "chewing the fat." I mentioned that we had a pretty strong wind, that the ship listed quite a bit as we sailed along causing quite a bit of water to come on deck. Nothing wrong with this. But he gave it to his local paper apparently, enlarging it a little, and the local editor passed it on, with further enlargements, to the-Hearst News who printed it thruout the United States. The New York Times hit the ceiling the next morning when the Hearst papers came out with a story that the CITY OF NEW YORK had encountered a terrific storm, had acquired a bad list and was taking on large quantities of water and was in a bad way. We heard from the Times the next day. Definitely nothing was to be given out that could be construed as being of a newsworthy nature until-the Times got it first.

..... On arrival [Bay of Whales] two houses were put up, then three sixty-foot steel windmill towers and antennas of several kinds. Later a Beverage wire about 800 feet long was put up, supported on bamboo poles, pointed a little East of North, towards New York. Within a few weeks the houses were almost covered completely by drifted snow.

The first house to be erected measured about 24' x 36' inside. A place about eight feet square was walled off with heavy insulating blankets as the radio room. Along the wall to the left of the entrance was the radio table, with, receivers on shelves above. At the operator's left was the short wave transmitter. On the opposite wall high up was a shelf for a Kolster TRF broadcast receiver, and below that a calendar. Along the blanket wall opposite the receivers were two tiered bunks for Pete and I. Carl Peterson was a radio operator on Norwegian passenger ships and for a time was stationed at Kings Bay, Spitzbergen before becoming an American citizen. He was an excellent operator and had a fine personality. Pete and I shared equally

in the operating. The remainder of this building was occupied by a large galley-type coal range, workspace and a table for the cook, a large dining table seating about 22 down the center, a large sink and dish, shelves, two-tiered bunks sleeping about 20, a wall clock and a telephone to the other house.

..... Now about radio. After trying various times of day and various frequencies we settled on the top edge of the 36 meter marine band, and found that signals usually started coming in from New York about the time darkness started to creep across the U.S. This was our afternoon, due to the longitude difference. Later midwest and west coast signals could be received. The "Little America" assigned call letters were WFA. The ships were WFAT and WFBT. ... When we returned to the states one of the Times men told me that one day our signals were so loud that he laid the phones on the table and could read us in the next room. He would tell the others in the editorial office, "Hear that? That's Byrd in the Antarctic." On the other hand, some people don't believe you if you say you can read weak signals better if you shut your eyes, open your mouth, and hold your breath. It's true.

Our usual schedule was to send our press and expedition messages to WHD first, then receive from him before handling personal messages. After that we would shift our transmitter to the edge of the 40 meter amateur band and clear Ronne Martin at the San Francisco Examiner. (Personal messages only) Then a brief CQ and it seemed that every amateur in the U.S. answered. Several amateurs were there night after night and took many personal messages. Others would report our signals good until we tried to send a message, then it was "Sorry OM, you faded." I suspect they only wanted the contact. Every expedition member who wished sent a message home and got an answer back about once every two weeks. This was genuinely appreciated. It is difficult to realize the effect on some.

..... Some rather unusual things happened. I had been told that the Navy had all of their stations monitoring our transmissions, but I didn't think any more about it until one day, right after time tick when we held a message for the Navy, I got a hunch and gave NAA a brief call. He came right back. So I gave him the message. The next day we were notified through WHD that what we had done was "highly irregular" and should not be repeated! In the future all messages for the Navy Department had to be routed thru NPU in Samoa, a station we had never heard.

On another occasion I was trying to work WHD and something seemed to be wrong at the New York end. Then the downtown operator called and "please tell the operator on Long Island to hang up his phone so I can call him." How's that for relaying through the nearest station, 8900 miles down and 8900 miles back to send a message 40 miles?

..... When word reached New York that the pole flight had been successfully flown, we were swamped for many days. Congratulatory messages came from everywhere. WHD sent the bulk of them, but Ronne Martin at KUP, the San Francisco Examiner had a stack; those filed with WU came via KPG; Fred Roebuck at Mussel Rock gave a stack to Don Harris on one of the Pres. boats in the W. Pacific; and every amateur we could hear had messages. When it was over we had received nearly 800 messages that month. Ordinarily our monthly total was about 150, sent and received. For the whole time in the Antarctic, some 22,00 words of press were sent.

**JOHN N. DYER, BAE IT, AN UNUSUAL MAN.** While talking about Antarctic communications let's shift our attention to the 2nd Byrd Antarctic Expedition and to one of their radio operators, John N. Dyer, who now lives in Center Sandwich, New Hampshire 03227. John's misfortune (graduating from college in the middle of the depression) turned into his fortune (signing on with the 2nd Byrd Antarctic Expedition as a radio operator, paid by CBS and sponsored by General Foods). John and his fellow radiomen put together weekly radio reports back to the states and "take it away, John Dyer" were commonly heard words. His post-Antarctic life was spent in private industry with the Airborne Instrument Lab on Long Island. He must have done quite a respectable job. as he eventually became its president. But he had the good sense to retire in New Hampshire where he had the opportunity to enhance his appreciation of fine music. John comes from a musically inclined family, as his father played the flute and the clarinet, and his sister and mother played the piano. As for John, he started out on the drums but soon became interested in the piano. He said he never played well, but he thoroughly enjoyed coming home from work and playing, and he played a lot. John has been serving as President of the New Hampshire Music Festival, and was recently renominated for another term. He told THE (Meredith, N.H.) NEWS, a lively popular paper which nearly every loyal New Hampshire son reads, that "Music is like all the arts, the more you know, the better you like it." John may love tickling the ivory, but he can still find time to get back on the rig weekly and chew the fat with, his old Antarctic buddy, Bud Waite, Radio W22K, in South Venice, Florida. Those old BAE radio operators are a hearty lot, be they in Seattle, Center Sandwich, or South Venice.

**ROYALTY SITS ON THRONE AT SOUTH POLE.** The South Pole attracts one and all, they seem to come from all walks of life, but it wasn't until December 11th that royalty actually walked around the South Pole. In one of the best kept secrets - even the polar philatelists didn't know - Prince Edward Windsor, 18-year old son of the Queen of England, was in Antarctica from 8 December through 15 December as guest of the Kiwis at Scott Base. While on the ice, friendly allied forces from the United States flew him to the South Pole in one of their C-130's, and they also flew him in a chopper to Dry Valley where he was given the opportunity to visit the New Zealand station, Vanda. The prince came back from McMurdo in the C-141 Air Force Starlifter which was bringing back the former prince of the Tonight Show, Hugh Downs. Prince Edward was accompanied on the ice by Bob Thomson, head of the New Zealand Antarctic programs who has found time between countless Antarctic trips to address our Society twice in past years. So add the name of Prince Edward to the names of other celebrities like Cardinal Spellman, Barry Goldwater and Admiral Stockdale who have visited the South Pole!

**WHEN IS A RECORD NOT A RECORD, AND JUST WHO ARE YOU, DAVID S. PORTER?** The answer to the first is when it appears in the Guinness Book of Records; the answer to the second is unknown to me. But it seems that the Guinness Book of Records tells one and all that the first American to have stood at both the North and South poles is this nondescript fellow by the name of David S. Porter, who presumably was at the South Pole on December 14, 1970 and at the North Pole on April 9, 1979. Now I'm sure this fellow David is well-known to his mother and was probably a standout in his junior high school, but just who is he? But as Bergy Bits pointed out last year, old Bert Crary was actually the first scientist of any kind to have worked at both the North and South poles (North Pole, May 3, 1952 - South Pole, February 12, 1961). And another fellow who left his footprints on both poles was tennis star Tracy Austin's godfather, climatewise Joe Fletcher. Actually Joe beat the slow-footed Bert Crary out of the plane when it landed on the North Pole back in 1952, but then he was just a lowly colonel scientific administrator - and he never did beat Bert to the South Pole. (P.S. A telephone call to the indefatigable Guy Guthridge revealed that he was a prominent ham radio operator who visited Antarctica.

**20/20 ANTARCTIC VISION.** We presume that most of you folks are aware of the fact that ABC has a bi-weekly program called 20/20. Well, 20/20 has been to the Antarctic this austral summer, and returned from the ice in mid-December. According to the office of Jack Renirie at NSF, we can expect to see it on national TV in late January or early February. In Washington, 20/20 comes on every other Thursday night at 10 PM, and, presumably is shown nationwide in the same time frame. Hugh Downs is the moderator. Some of you may remember that it was he who did the quasi-intellectual documentary on the former residence of the late Admiral Richard E. Byrd's home at 9 Brimmer Street in Boston which was shown on TV several years ago. So Hugh has had some exposure to polar people. We feel that with the help of all the USARPs and Renirie while on the ice this will be a great show. So keep on the lookout for 20/20.

**ANTARCTIC CALENDAR IS BEAUTIFUL, BUT ...** We wouldn't want you to believe everything which is printed on the calendar. Take the shot for June 1983 of the mid-winter airdrop at the South Pole. The caption says the temperature at the doorway is  $-200^{\circ}$  F. If you believe that, you'll believe anything. I checked upper air soundings from the South Pole station for several years, and never found temperatures any colder than about  $-135^{\circ}$  F, and these were up around the 50 millibar level. The airdrop was being made from 13,000 feet (about 4,000 feet off the surface) and with the stable air mass over the South Polar Plateau in winter with an almost constant steep temperature inversion, the actual true air temperature outside the door of the aircraft was probably many degrees warmer (or in this case, less cold) than the surface temperature was at the time. But I grant you, with the plane's speed and all, it probably felt like  $-200^{\circ}$  F (whatever  $-200^{\circ}$  F feels like). The "South Pole Hero" pictured for December is Phil Kazanjian. Even a veteran Antarctic photographer like Phil got carried away, as he wrote me, "Carl Benschmidt took the photo in November 1979 with the temperature nearly  $100^{\circ}$  F minus." So I had to check the records for myself, as my recollection, having lived there for one year, was that November wasn't half bad. And I found out that the lowest temperature actually recorded that month occurred on November 4th and was  $-61.7^{\circ}$  F! However, the calendar is the best of its kind, and if you didn't get Sports Illustrated's first annual swim suit calendar for Christmas, you must get the Antarctic calendar being offered in this Newsletter.

**MEMBERSHIP RESPONDS WELL TO NEW BILLING SYSTEM.** Over 93% of our membership responded to our billing of dues, and we thank you. But there is still a handful of delinquents and their names are listed below. In keeping with our announced policy of dropping members who do not send in their dues following two billings and the listing of their names in the mid-winter Newsletter, the following members will not be bugged (but dropped) before the next Newsletter if they don't pay up!

Steve Ackley	Martin Halpern	Donald Siniff
Duwayne Anderson	Rex Hanson	Jerry Smit
Ruth Barritt	Joe Hirman	William Smythe
Hugh Bennett	Alan Parkinson	Rupe Southard
Craig Berg	Susan Patla	Jim Sparkman
Bill Consley	Bruce Poulton	Jerry Taylor
Ottar Dahl	Robert Rofen	Jay Zwally
Margaret Edwards	Lisle Rose	
Peter Espenschied	Bill Schoonmaker	

**MARTIAN AND LUNAR METEORITES (FROM DESK OF GUY GUTHRIDGE).** Evidence is growing that two meteorites found in Antarctica came from Mars and the moon. Other meteorites are thought to be from the asteroid belt, so these ones, if confirmed, will be especially valuable for understanding the solar system. William A. Cassidy, University of Pitts-

burgh, who headed the team that found the samples, says "we have to begin thinking of the antarctic ice sheet as a place that collects and preserves not only fragments of asteroids but also fragments of other solar system bodies."

The suspected Martian rock weighs 17.5 pounds and is grayish brown with yellow and dark tan flecks and streaks of dark, glassy material formed by the shock that knocked it from the parent body. It crystallized 1.3 billion years ago, making it far younger than virtually all other meteorites, which are 4.5 billion years old. Noble gases trapped in the rock are close to atmospheric measurements made by the two spacecraft that landed on Mars in the 1970s, according to data obtained by Donald D. Bogard of the Houston center. Micheal D.B. Duke, chief of the Planetary and Earth Sciences Division, says he is "convinced that this sample came from Mars."

Some people had thought it was not possible for a piece of a planet to escape from itself. But Viking orbiter photos show craters where large bodies made oblique impacts on Mars. The arriving bodies, traveling at 6.2 miles a second, could have accelerated ejecta well above the 3.1 miles a second required to escape Mars's gravity.

The suspected moon meteorite has a light green crust; it is the size of a 1-inch cube and weighs about an ounce. Brian Mason of the Smithsonian Institution examined a thin section and found it to be anorthositic breccia composed primarily of plagioclase feldspar in a glassy matrix. He said some of the fragments resemble moon rocks.

Both meteorites were found in southern Victoria Land. The National Science Foundation supports this poor man's space probe as part of the United States Antarctic Research Program. NASA, the Smithsonian, and the Foundation allocate the samples to scientists for study.

**A POLE APART (BOOK REVIEW BY GUY).** A new book deserves the attention of Antarcticans. It is A Pole Apart; The Emerging Issue of Antarctica, by Philip W. Quigg (McGraw-Hill, 299 p.). The book is a scholarly discussion of Antarctica's place in the world today and its probable place tomorrow, with chapters on history, science, resources, territorial claims, the treaty, outside interests, and what to do next. The excellent notes, including annotated references to most of the best current literature on Antarctica, occupy 45 pages. The author was managing editor of Foreign Affairs and spent more than 2 years, full time, writing the book, supported by a grant from the Twentieth Century Fund.

What I like about this book is that it gathers all the important issues into one place. Mr. Quigg also responsibly suggests answers to current questions. For example, he says the Antarctic Treaty is the only workable system for solving the problems of ownership and sharing of Antarctica's wealth, whatever that may turn out to be.

The book concludes with this beginning: "If the (Antarctic Treaty) consultative parties are realistic and avoid seeking narrow advantage in the continued exercise of their trusteeship, an era of expanding benefits is possible. If they are heedless or inflexible, then the good so far accomplished by the Antarctic Treaty may be lost forever."

**MORE ON QUIGG.** Quigg's book reviewed above by Guy Guthridge will interest a lot of Antarcticans if for no other reason than their names are in its pages. The book is a name dropper's paradise, starting with over sixty people being acknowledged for their contributions! But one gets somewhat suspicious when the first sentence in the acknowledgments thanks Lawrence J. Baack for reviewing the book! One might say that there are two books in this volume, with the first 218 pages being impersonal, then

after an interlude of two appendices (Antarctic Treaty and Convention on Conservation of Antarctic Marine Living Resources) comes the best part of the whole book, 46 pages of notes where Quigg, at times, let's it all hang out to dry. Ruth Siple likes a well-edited book - this one is not, and has frequent errors. If you should want to check on references about Admiral Byrd, you will find Byrd in the index between Bruce and Burdick. But what can you expect nowadays for \$19.95? The last real bargain at that price was Huntford. But for the average non-critical reader, this book has a lot to offer and I think most of you will like it.

**THE NEW NATIONALISM AND THE USE OF COMMON SPACES.** Another recent book (edited by Jonathan Charney) explores the issues in marine pollution (four chapters) and the exploitation of Antarctica (five chapters). It was published by Allanheld, Osmun under the auspices of The American Society of International Law. About the only familiar name Antarcticans will find in its pages is Jim Zumberge, as he wrote the introductory chapter on the Antarctic on "Potential Mineral Resource Availability and Possible Environment Problems in Antarctica." Most of the chapters are written by lawyers or experts in law. Deborah Shapley told me that she thought this was probably a very good book, and when Deborah talks, I listen. I wouldn't want to take this book to bed with me, or to the mountains or seashore, but I think it probably has a lot of utility as a reference book. The man who should review this book is old Mike Benkert, the ex-Coast Guard admiral who was in charge of marine pollution (.cleaning it up, not creating it) before retirement, and who made several Antarctic cruises as skipper of icebreakers, including one circumnavigation cruise where they inspected foreign-stations. Mike, who is president of the American Institute of Merchant Shipping (AIMS) told me he'd get a copy of the book and read it. Then I'll get together with Mike for lunch at some local watering hole so he can pass along his comments to me to give to you in a forthcoming Newsletter. I'm prejudiced against all lawyers whom I've grown to mistrust, but Mike is above that and will give it to us straight. In the meantime, I think you folks will have to make a decision if you want to buy Quigg, buy Charney, or put your dollars aside for Deborah Shapley's Seventh Continent which might be published one of these upcoming years (sometime in 1983). All of these books will presumably touch upon factors which are being discussed by the various nations involved in the next (?) Antarctic Treaty.

**OTHER PUBLICATIONS ON ANTARCTICA OR NEW ZEALAND.** Deborah Shapley had an article in Science 82's November issue entitled "Antarctica: Up For Grabs" which is good reading. She wrote that Moscow is 600 miles farther north than Caribou, Maine. I didn't know that any place in the world was farther north than Caribou - I was sure Caribou was the end of the world. Deborah's bottom line was "Hammering out a consensus on resources while keeping the territorial question at bay is a task of mammoth dimensions; the lure of exploitation is great, and it climbs with every discovery of Antarctic wealth." Deborah also had the lead article (and cover) of the New York Times Sunday Magazine, November 28th, "The Army's New Doctrine." I had done a little reading of my own on this subject, and I think Deborah's synthesis on AirLand Battle is just excellent.

New Scientist for 16 September 1982 had a very good article by the outgoing director of the Scott Polar Research Institute, Gordon de Q. Robin, on "Curtain Up On Polar Research." It's sort of a review article commemorating research activities that came about through international cooperation in the polar regions during the first International Polar Year, the Second International Polar Year, and the International Geophysical Year. It is a pretty nice article, highly recommended reading.

Science for 20 August 1982 had a fantastic picture of a King penguin and its chick on the cover. Inside, on pages 726-727, there is an article by Gerald L. Kooyman,

R. W. Davis, J. P. Croxall, and D. P. Costa on "Diving Depths and Energy Requirements of King Penguins." Recently developed depth histogram recorders were clamped to the feathers between the scapulae of three adult King penguins which weighed between 12 and 14 kg. The study was done back in 1980 near a breeding colony on South Georgia. During 18 days at sea, 2,595 dives were recorded, an average of 144 dives per day. The birds' depth frequently exceeded 100 m, but the penguins rarely dived deeper than 240 m. It seems that their fishing success leaves something to be desired, as it was reported that only about 10 percent of the dives resulted in prey capture. About 50 to 90 squid need to be caught on each trip to sustain the adult and feed the chick..

Science for 28 May 1982 had an article by Richard A. Kerr on "New Evidence Fuels Antarctic Ice Debates" in which he presents various opinions of the age of ice in Antarctica. Ed Stump and his colleagues at Arizona State suggest that their data from the upper Scott Glacier indicates the presence of the East Antarctic ice sheet in that area is pre-Larry Gould, Early Miocene - 16 to 22.5 million years ago. It seems that oceanographers favor an age of about 14 million years, and that some continental geologists suspect that a good deal of ice existed millions of years earlier. The latest evidence from the continent comes from the ice-free Dry Valleys where George Denton, Michael Prentice, Davida Kellogg, and Tom Kellogg used the Trans-antarctic Mountains as "dipsticks" to measure the changing thickness of ice during the past 20 million years. It's rather hard for me to understand how a bunch of grown-up people can get all excited about whether ice is 9 to 15 millions years old or 27 million years-old (as Wesley Le Masurier and David Rex determined from three volcanoes).

Science for 26 February 1982 had an article by E. Imre Friedmann on "Endolithic Microorganisms in the Antarctic Cold Desert." It seems that a variety of microorganisms live under the "surface of rocks in the Dry Valleys, colonizing extended areas, and producing considerable biomass. If you like cryptoendolithic lichens, this is probably a very exciting article. Cryptoendolithic microorganisms of the Antarctic cold desert "survive in an inhospitable environment without actually adapting to its extremes." It seems to me this has its counterpart in today's society in the institution of marriage.

Cuisine, November 1982, has something useful for all personkind, a long article on "New Zealand" by Arline Inge, with photographs by George Silk (three of which are gorgeous). There are twelve New Zealand recipes, with such delicacies as (1) smoked eel with horseradish cream, (2) roast loin of lamb with kumara seasoning, (3) Canterbury lamb with honey, (4) venison steaks with cranberry-port sauce, (5) champagne Kiwi sorbet, (6) salmon trout with lemon butter, and (7) the piece de resistance, Australia and New Zealand's famous pavlova - the magazine's centerfold. Incidentally none of the twelve recipes was from a restaurant in Christchurch. Is this indicative of meals in Chch?

**CRYSTAL BALLING SPRING OF '83.** Some things are coming into focus, some things are hazy. Let's start with what we do know. President Mort Turner has us all set up for a presentation on March 24th by Bill Zinsmeister of the Institute of Polar Studies and the Department of Geology, The Ohio State University, on the recently discovered marsupials found in some 40-million-year-old rocks on Seymour Island (see Science, 15 October 1982). This meeting will be unique in the annals of our Society, as it will be sort of an official-unofficial bilateral meeting with the Education Department of the Smithsonian held on their grounds. This year's Memorial Lecture will presumably be held in conjunction with the spring meeting of the National Academy of Sciences Polar Research Board, April 22-24. We are in the discussion stage with Gentleman Jim Zumberge, President of SCAR and prestigious President of the University

of Southern California, about being our Memorial Lecturer. You can always find Jim's name on the sports page, as he does such things as promote his football coach (who got his university put on probation by the NCAA) into a position as one of his chief deputies! This brings up our reunion prospects. We really have three choices: (1) doing something at the time of the Memorial Lecture - first gut reaction is that this is too early in the summer; (2) having an almost purely social gathering mid-May, perhaps with an early mid-winter picnic affair at Stronghold; or (3) scrubbing the whole idea. To be truthful, the responses have been somewhat less than overwhelming. We lost out on a hoped-for centerpiece attraction of a polar symposium when PRB voted "no", and, to be downright frank, I haven't seen much enthusiasm locally in the resident IGYers. But it will all be resolved by the next Newsletter which should follow this one in four to six weeks.

**U.S. GEOLOGICAL SURVEY PLANS TO COMMEMORATE THE POLAR-GEOPHYSICAL TRIPLE ANNIVERSARY.**

The U.S.G.S. has tentative plans to prepare a traveling exhibit that highlights the contributions of Survey personnel to polar research. The exhibit might be assembled by early 1983 and will be shown in U.S.G.S. centers in Reston, Denver, Rolla, Menlo Park and at the National Academy of Sciences. A 2-3 day symposium will probably take place in mid-October at the National Center in Reston, Virginia and will be open to the public. It will present a series of technical papers and discussions focusing on past and present accomplishments of the U.S.G.S. in both North and South polar regions. It is anticipated that the results will be published as part of the U.S.G.S. Professional Papers series.

**PAUL NOONAN, NAVY PHOTOGRAPHER AT WILKES 57 DOING JUST FINE.** When Harriet Eklund was encamped in Washington this past spring for about six weeks, Rudi Honkala, Wilkes 57, thought he'd get some of her late husband's colleagues together for some goodies and to look at some old films. Paul Noonan lives just outside Washington and Rudi asked him to come along. Although Paul had never shot movies in his life, he shot movies at Wilkes. He had to turn most of them into the Naval Pictorial Archives (or whatever) , but he managed to save bits and pieces and put them together for a home movie - which he brought along. It is just an excellent film. This became a springboard for Paul, as his Washington Navy duty saw him getting calls from 1600 Pennsylvania Avenue to come and help out. In fact, if you saw the official film of the JFK funeral, much of it was shot by Paul, including all the sequences in the Catholic cathedral in Washington. Later he became the official White House photographer whose duties were to follow LBJ everywhere (within common sense, that is) and shoot him for posterity. So Paul went everywhere the Johnson family went, and traveled a little bit higher on the hog than when he was with Eklund, Honkala, and Cameron. Paul stayed a short time in the White House with Richard Nixon, but found it sort of anticlimactic. Paul is now a civilian with the National Institutes of Health here in Washington, and, according to his effervescent wife, is really shooting some fantastic things.

**RUTH SIPLE'S BROTHER SETS WORLD RECORD.** Charles Johannesmeyer, 64-year old retired industrial engineer now of Hilton Head Island, brother of Ruth Siple and father of Alan "Sack" Johannesmeyer (a Naval career officer who spent several summers at McMurdo as part of the nuclear power team), set a new world record in the pentathlon for 64-year-old men when he amassed 1,654 points in an event held on May 7th of this year. But it took him two weeks to find out that he was a world champion; only when word came back from some national center did he realize how well he had done. Congratulations, Chuck, you're really something! It's just too bad that Ruth never inherited any of that Johannesmeyer athletic ability.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 82-83

March

No. 4

Presidents:

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-2
- Mr. Gordon D. Cartwright, 1962-3
- RADM David M. Tyree (Ret), 1963-4
- Mr. George R. Toney, 1964-5
- Mr. Morton J. Rubin, 1965-6
- Dr. Albert P. Crary, 1966-8
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-1
- Dr. William J. L. Sladen, 1971-3
- Mr. Peter F. Bermel, 1973-5
- Dr. Kenneth J. Bertrand, 1975-7
- Mrs. Paul A. Siple, 1977-8
- Dr. Paul C. Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82
- Dr. Mort D. Turner, 1982-84

Honorary Members:

- Ambassador Paul C. Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard

Memorial Lecturers:

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Sir Peter M. Scott, 1971
- Dr. Frank T. Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980
- Dr. Robert L. Nichols, 1981
- Dr. Robert H. Rutford, 1982

Another Exciting Society First — We Go To The Smithsonian !

THE ANTARCTICAN SOCIETY AND THE SMITHSONIAN INSTITUTION

Co-sponsor Two Lectures by

Dr. William Zinsmeister  
 Invertebrate Paleontologist  
 Institute of Polar Studies  
 The Ohio State University

DISCOVERY OF LAND MAMMALS IN ANTARCTICA  
 1982 Seymour Island Expedition

March 24, 1983

8 PM

Baird Auditorium  
 National Museum of Natural History  
 Smithsonian Institution  
 Constitution Avenue at 10th Street N.W.

PLUS

LATE CRETACEOUS, EARLY TERTIARY BIOGEOGRAPHY OF ANTARCTICA  
 AND THE SOUTHERN CIRCUM-PACIFIC

March 25

12 Noon

Baird Auditorium

On Thursday evening Dr. Zinsmeister will emphasize the logistics, geography, and broad significance of the finds, and on Friday he will go into somewhat more detail on the fossils themselves.

*Both lectures are open to the public at no cost.*

Thursday evening parking behind the Museum in Staff parking area (enter off Constitution Avenue, west end of building). Enter Museum through Constitution Avenue doors - Baird Auditorium is on the ground floor.

\* \* \* \* \*

Approximately 15 calendars left for some lucky buyers. Clearance Sale at \$4 if picked up at Ruth's or \$5 if mailed out.

\* \* \* \* \*

Happy 39th Birthday to Harriet Eklund on February 13th!  
Happy 81st Birthday to Bud Waite on February 14th!

Bergy Bits is a potpourri of stories about Antarctica and Antarcticans that one person has assembled to meet the requirements for a Newsletter for the upcoming meeting. It is NOT the voice of the Society, nor are all of the articles altogether truthful. The aim is only to make the input of possible interest to some segment of our Society of over 400 members, representing various expeditions and disciplines in Antarctica since 1928.

**ZINSMEISTER SPEAKS ONCE, SPEAKS TWICE.** Dr. William Zinsmeister is a Research Scientist at the Institute of Polar Studies, Ohio State University in Columbus, Ohio. Dr. Zinsmeister received all of his higher education in Southern California and was granted his Ph.D. in geology at the University of California at Riverside in 1974. He immediately went to OSU as a post-doctoral fellow and has been on their staff continuously since then. Dr. Zinsmeister was first exposed to polar research in 1971 when he did field work on upper Paleozoic sediments in the western Brooks Range, Alaska, for the Mobil Oil Company. His first field research in Antarctica was part of an OSU reconnaissance expedition to Seymour Island in 1974-75. This has been followed by a continuous round of field expeditions to southern South America, New Zealand, Tasmania, the McMurdo area of Antarctica, and finally, in 1982, as leader of an extremely successful expedition to Seymour Island. Between field trips he has managed to do the extensive, and sometimes tedious, laboratory research on the fossils he has collected. He has published nearly half-a-hundred papers and abstracts on them.

Dr. Zinsmeister specializes in mega-invertebrates of Cretaceous and Early Tertiary age. However, he has organized expeditions that include geologists and paleontologists who have a wide variety of interests. His latest, the Antarctic project he will describe on Thursday evening and Friday noon, made major new finds in fossil invertebrates, plants, large marine reptiles, and land reptiles. These would have been enough to have excited the scientific community, but late in their limited time on Seymour Island the first discovery of a land mammal was made. It was a part of the jaw of a marsupial, very small in size but one of the great fossil discoveries of recent decades.

The problems of reaching Seymour Island, the fossils and how they were formed, and some of the significance to understanding the geologic and tectonic history of South America, Antarctica, and Australia, will all be part of Dr. Zinsmeister's two presentations to the Antarctic Society and the Smithsonian Institution.

(The above information was furnished by our President, Dr. Mort Turner.)

**MEMBERSHIP STABILIZES AT 418.** We really haven't gone out recruiting this year, nor turned over any rocks in any rookeries looking for new members, but have just taken in those who have found us. So we have picked up only 19 new members since June. Our losses have been the same, 19 (2 deaths, 17 drops). We have taken a hard stand against delinquents; everyone who owed got a bill, then a second notice, followed by a final notice, which in turned was followed by a printing of those delinquent. So officially we have dropped Ruth Barritt, Craig Berg, Bill Consley, Ottar Dahl, Pam Dailer, Margaret Edwards, Peter Espenschied, Martin Halpern, Celia Heil, Helen Hickland, Bernie Lettau, Admiral Mandarich, Bruce Poulton, Lisle Rose, Jerry Smit, Jerry Taylor, and Jay Zwally. Newsletters cost more now, and postal rates went up again at the beginning of this year, so I think we're

justified in being hardnosed. Besides, past records have shown that it's a losing cause tracking down delinquents in the spring; if any want us, they know where to find us.

**HELLO! I'M ED TODD.** Will the real Ed Todd please stand up? The New Yorker magazine for January 17th ran a caricature of some beady-eyed person bundled up in down coat, galoshes, long scarf, ear muffs and visored cap, walking with his attache case along a snow-clogged street in a snowstorm. This individual had a sign draped around his neck which read "Hello! I'm Ed Todd." The cartoonist claimed he never heard of NSF's own Ed Todd, but had pulled the name out of a snow-filled sky and stuck it on the guy. I know it couldn't have been in Washington as there were two cars in the background (no one moves in Washington when it snows), the streets had been plowed (they never plow in Washington during a storm - they pray for warm weather), and the sidewalk looked shoveled (another Washington impossibility). Ed was down south when the cartoon appeared, so his office found out the cartoonist had his price (don't we all?),' took up a collection, and bought the original for him. Never should have done it - I can see this becoming an annual feature with next year Al Fowler, the following year Mort Turner, ad infinitum...until they get to John Splettstoesser, and there they will draw the line.

**PEORIA, NSF IS ALIVE AND DOING VERY WELL - AT PRESS TIME.** President Reagan's budget to Congress harbors good tidings for NSF, and especially for the Antarctic. The new budget assigns NSF the largest increase in R&D funding among the civilian agencies, up \$195 million or 18 percent from the current fiscal year. If the inflation factor is the estimated 5 percent, the increase in real terms would be 13 percent. But Antarctica fared still better. Their 1984 budget is currently \$102.1 million (up from \$83.2 million), an increase of 22.7 percent. But only about 21.6 percent of the Antarctic monies are, shall we say, scientific dollars, as the rest all goes for support in one form or another. Ten million dollars in FY1984 will be direct support to scientists (up from \$9 million this year), and \$12.1 million will be direct scientific support (up from \$10.1 million). No one made out better than the Antarcticans in the table "NSF Obligations by Budget Activity, FY1983-84" on page 749 of Science's issue of 11 February 1983. Someone must be doing something right in Antarctica. Congratulations, you all!

**MANAGEMENT IN ANTARCTIC TREATY ACTIVITIES** - R. Tucker Scully, Director, Office of Oceans and Polar Affairs, U.S. Department of State. (Sea Technology Magazine has kindly given us permission to copy this fine article from their January 1983 issue.) The past year was an important one in the evolution of the system of cooperative international relations established under the Antarctic Treaty of 1959. Largely through an imaginative formulation which permits its parties to agree to disagree over the existence of territorial sovereignty in Antarctica, the Antarctic Treaty reserves Antarctica exclusively for peaceful purposes and guarantees freedom of scientific research there. Over the past few years, the nations active in Antarctica under the Treaty have also begun to come to grips with possible resource activities on and around the southernmost continent.

During 1982 several important developments took place in this process. A new treaty--the Convention on the Conservation of Antarctic Marine Living Resources (CCAMLR) entered into force in April. (The U.S. had ratified it in February.) The Convention has as its objective application of an ecosystem approach to the management and regulation of fishing activities in the waters surrounding Antarctica. "The Convention establishes a commission and scientific committee to give effect to this objective, and the first meetings of those bodies took place in Hobart, Tasmania, Australia, May 24-June 14, 1982.

At these meetings, the eleven members of the Commission considered and agreed upon measures—primarily of an administrative and financial nature—to ensure the effective start-up of the CCAMLR.

The meetings on Antarctic marine living resources were followed by the first session of the Special Consultative Meeting on Antarctic Mineral Resources held in Wellington, New Zealand during the latter half of June. At that meeting the fourteen Antarctic Treaty Consultative Parties—Argentina; Australia; Belgium; Chile; France; Federal Republic of Germany; Japan; New Zealand; Norway; Poland; South Africa; U.K.; U.S.; and U.S.S.R.—began the process of elaborating a regime of Antarctic mineral resources. The fourteen had previously reached consensus that such a regime should be concluded as a matter of urgency and identified a number of principles and elements which should be reflected in it. The regime would have as a basic objective determination of the acceptability of possible mineral resource activities in Antarctica and the governing of any such activities determined to be acceptable. The meetings made a good start to converting these principles and elements into concrete provisions. Much work, however, remains to be done.

The U.S. played an active part in the conclusion of the CCAMLR and in the discussions of the regime for Antarctic mineral resources. U.S. leadership in international activities within the Antarctic Treaty system is related to U.S. leadership in scientific activities in Antarctica itself. The importance of the United States Antarctic Program (which is administered by the National Science Foundation) was recognized in a directive issued by President Reagan in February, 1982. The President decided that the United States Antarctic Program should "be maintained at a level providing an active and influential presence in Antarctica designed to support the range of U.S. Antarctic interests."

Antarctic activities during 1983, if anything, will intensify. The Commission on the Conservation of Antarctic Marine Living Resources and its Scientific Committee will hold their second meetings, probably in mid-1983. The second formal round of discussions on the regime for Antarctic mineral resources will be held in the Federal Republic of Germany in July, 1983, with informal discussions planned on the regime in January and possibly in April.

At the same time as this, the Consultative Parties will hold one of their regular biennial meetings—the Twelfth Antarctic Treaty Consultative Meeting—in September. In all, it will be a particularly busy year on the international front as the U.S. and the other Antarctic Treaty Consultative Parties work to see the Antarctic Treaty system evolve to meet the changing world of the 1980s.

**STATE DEPARTMENT DECISION ON ANTARCTIC MINERALS (FROM THE DESK OF GUY GUTHRIDGE).**

The Department of State has issued a document that establishes the U.S. negotiating position for an international regime for antarctic mineral resources. Titled Final Environmental Impact Statement on the Negotiation for an International Regime for Antarctic Mineral Resources, the report considers seven actions ranging from no action to negotiation of a permanent moratorium on mineral resource activities in the Antarctic.

The selected federal action is, in fact, to negotiate a regime covering both exploration for and exploitation of minerals on the continent and offshore. The action "is designed to protect the full range of United States interests, including nondiscriminatory access for United States nationals and firms to engage in any permitted mineral resource activities. It would offer a stable international basis for necessary economic, as well as environmental, decisions." A cornerstone

of the U.S. position is to allow minerals exploration and exploitation only if environmentally acceptable on the basis of adequate scientific information.

The 250-page report documenting the decision was completed in August 1982. A 2-page summary, or "record of decision," appeared in the 8 November 1982 Federal Register, pages 50598-50599. And the negotiations are under way: the most recent was an Antarctic Treaty meeting in Wellington, New Zealand, in January and February 1983.

**A CLASSY ANTARCTIC COLLECTOR ITEM.** The New York Times has a set of seven paperweights featuring the front page of an historic edition, with one being the issue following Commander Byrd's flight to the South Pole, its headline reading "Byrd Safely Flies to South Pole and Back, Looking Over Almost Limitless Plateau, Drops Food, Lightens Ship on Perilous Flight." A miniature reproduction of that front page made in steel is mounted on the side of a beautiful piece of green marble (3"x2"x2"). And on top of the small block is a circular medallion showing the Ford Tri-Motor with "Byrd Antarctic Expedition" on the side of the craft, with the date of the flight (November 29, 1929) shown below the craft. I think it's one of the classiest looking mementoes of Antarctica I have ever seen -- one of the few available without the ubiquitous penguins -- with apologies to Bill Sladen. The price is \$20 which includes shipping and sales tax. If you want one, send check or money order payable to the New York Times to Paperweights, Dept. TPO, Box 234, New Hyde Park, New York 11040. Your Society has absolutely nothing to do with this endeavor -- I only saw the one that Ruth Siple received as a gift -- but we think old Tri-Motor men like Bob Baron and members of the Byrd expeditions might love to have one. In fact, I think most Antarcticans would like to have one, as it's really nice.

**U.S. NEWS & WORLD REPORT VISITS ANTARCTICA** (January 24, 1983 issue). Stan Wellborn, science editor of the U.S. News & World Report, said that his two-week trip to Antarctica was the best, most rewarding reporting experience he had ever had. His five-page report was the typical stereotype article which one has gotten used to seeing in such publications as Time, Newsweek, and other weekly pictorial news organs, although I do think the pictures get better each year. I enjoyed his quotations from George Simmons, an aquatic ecologist from Virginia Polytechnic Institute. He believes the lakes in the Dry Valleys constitute an "evolutionary backwater" that largely disappeared on earth 600 million years ago but survive in Antarctica. "We can decode our biological past with these organisms," asserted Simmons, who also believes the hardy species will outlive mankind. "I can guarantee you that when the human race is dead and gone, these little critters will be chugging along just as they have been for 3 1/2 billion years." And I also found Dr. Warren Zapol's study most interesting. He evidently feels that there may be clues in the "dive reflex" of seals that can be related to crib death, feeling that the pronounced slowdown in the metabolism of diving seals also occurs in humans when their faces are splashed with water. Dr. Zapol suspects that infants who spit up liquid at night experience a metabolic drop-off and die before their bodies can return to normal. And I'm beginning to think that Dick Cameron's annual comment on the Russians taking over the Pole (should we pull out) is the second most popular quotation ever made at the South Pole.

**INDIA GOES TO ANTARCTICA, SILENTLY.** Probably no country's entry into Antarctica has been cloaked with less fanfare than that of India. As one who was a very minor participant in the International Indian Ocean Expedition, I am flabbergasted that they could muster the wherewithal to pull it all off with such secrecy. But on

January 9, 1982, after a 33-day voyage from Goa, they landed on the continent near the Japanese base of Syowa, and set up the station of Dakshin Gangotri at 70°3' S, 40°7' E. They spent ten days on the ice doing the routine (collecting ice samples, collecting rock samples, studying radiation, monitoring the climate, measuring magnetic fields, etc.). The expedition was organized by their Department of Ocean Development, and their stated aim was to initiate scientific studies that have relevance to their homeland in scientific and economic terms. How did they get there and back? They chartered the 600-ton POLAR CIRCLE from Norway, that's how.

India manned (or personned) a 28-member team this year which sailed on 2 December 1982, again on the POLAR CIRCLE. The most important task for this year's expedition is to find a suitable site for a permanent research station. The expedition's leader is glaciologist V. K. Raina of their Geological Survey. Their hope is to be on the ice for 60 days, and eventually to have a permanent base operating by 1985. They have ambitions of either building or buying their own research ship. India has not signed the Antarctic Treaty. It seems that "India is taking part in discussions with other developing countries about joint efforts to explore and exploit Antarctica." India has turned down offers of help from the Soviet Union for the use of their airstrips and buildings on the ice cap. (This information was obtained from the 23-30 December 1982 issue of Nature.)

**CHINESE ENTER WONDERFUL WORLD OF EL-SAYED.** Sayed El-Sayed, oceanographer and supreme BIOMASS salesperson, visited China last summer to enlighten them about studies on the Antarctic ecosystem. He made it all sound so good and exciting that they asked him to write up a proposal (when he got back home) whereby they could get into the act. Towards, this end, they sent Mao Xinghua, head of the Marine Biology Laboratory at the First Institute of Oceanography in Qingdao, and Zhang Kuncheng, a senior staff member, to Texas A&M in mid-November for a 3-month familiarization course. As soon as they checked in, they checked out on the Texas ASM research vessel GYRE for a little old cruise in the Gulf of Mexico. Officials in the Chinese community want ideas on what a cooperative project should cover, and how much equipment and human resources would be needed. What about money? - not mentioned! Bureaucracy also reigns in China, as Zhang said the proposal would be forwarded from (1) First Institute of Oceanography to (2) National Bureau of Oceanography to (3) National Commission of Science and Technology; they would all review it, naturally. If approved, the program could begin as early as next summer and would capitalize on four other Chinese oceanographers engaged in research at Texas A&M. The Chinese want to boost marine research as a way to increase harvests of food from the sea. They already know how to fish, it seems, as they rank third in the world in annual catches of fish - 4.2 metric tons. How many striped bass in a metric ton, anyone know? Anyway, you've got to hand it to old Sayed, he would walk the whole China Wall to recruit half a dozen BIOMASSers.

**THE GREWS ARE AT IT AGAIN.** Ed Grew had a great 1982, publishing five papers, having four in press, and three more waiting to be submitted. He has left UCLA, evidently for good. Ed has been awarded a year's fellowship by the Alexander von Humboldt-Stiftung for work in Germany at the Ruhr-Universität at Bochum, under the sponsorship of Professor Werner Schreyer ... Meanwhile back in San Francisco, Priscilla (Grew) is trying to overcome the personal grief associated with the defeat of her long-time mentor. Governor Jerry Brown, who gave her 11 years of jobs. She is locked in as a Commissioner on the California Public Utilities Commission through 1986, which is a nice little legacy. She also serves, under the auspices of the National Academy of Sciences - National Research Council, on the Board on Mineral and Energy Resources and the Committee Advisory to the USGS. She was named to the

Advisory Council of the Gas Research- Institute and the Natural Gas Committee of the National Association of Regulatory Utility Commissioners. In addition, Priscilla was elected to the Board of Trustees of the National Parks and Conservation Association. But it was sort of self-satisfying to this humble being that she actually found time during 1982 to do something as mundane as climb little old Mt. Monadnock in New Hampshire. Now if she had climbed Mt. McKinley I would not have been half as surprised!

**ANOTHER ANTARCTIC METEORITE FIELD (FROM THE DESK OF GUY GUTHRIDGE).** U.S. scientists this season have found another field of meteorites in Antarctica. The collection is at Pecora Escarpment (85°38'S 68°42'W) at the southern end of the Pensacola Mountains. The find supplements earlier finds made at Allan Hills in southern Victoria Land over the last several years. The new find, 31 meteorites so far, includes one carbonaceous chondrite, a rare type of meteorite that contains carbon molecules. Meteorites tend to accumulate in Antarctica on fields of glacial ice whose movement is blocked by mountains. The Pecora Escarpment site was selected as a likely such area through review of maps and glacial flow characteristics. John Schutt headed a team organized under William A. Cassidy, University of Pittsburgh, that flew out from McMurdo Station in C-130s to make the search. Further work at the site is likely in future years.

**TONY (SOUTH POLE 74) MEUNIER RETURNS TO ICE.** It has been seven long years since Tony Meunier walked the streets of McMurdo, and he made some interesting observations. First, he felt that USARPs were better treated now than before - he equated this with more civilians in the support group at McMurdo. And second, he said that McMurdo was like walking through Tysons Corner (one of Washington's largest shopping malls), with a great number of women. Back in 1974 women turned heads, but now are so common that no one pays any attention (Ed. note - what a sad state of affairs!). Tony spent 40 days out in the field with Bill Cassidy, a Dane, and a Kiwi on the Far Western Blue Ice Field. He lost something like 16 pounds while out there, but when you start from a base of 255 pounds (Tony claims an insignificant 235 pounds), he wasn't exactly skin and bones when he came out. Can't you imagine what Betsy's father must be thinking to have a strong, six-foot six-inch son-in-law who runs off to the ice over the holidays just to run a snowmobile around fifty square miles picking up some rocks from God knows where and treating them like they were the family jewels?

**ANNEXSTAD AND ANNEXSTAD, AS IN JOHN AND KRIS.** Once upon a not-so-distant past there was one of the good old boys who looked upon the advent of women onto the ice with jaundiced eyes, if not downright skepticism, and who answered to the name of John Annexstad (Byrd Station 58). But as his daughter Kris got older, he started to look at her in a different light, as a possible field assistant. After all, she was born in Minnesota, reared in Alaska, and, through no fault of her own, schooled in Texas. She was strong, she was capable, she was qualified, she was literate, and she was a surveyor, all attributes which John felt were basic to doing his work, pardon me, assisting him in the field running down meteorites. She excelled in high school, being both an honor student and athlete of the year as a senior (champion track and volleyball star). She was so great at volleyball that Rice University gave her a scholarship and she was a starter for four years. She made the Dean's List for academics, architecture). She was/is a woman of the outdoors, camping and backpacking all over the place. Old John is rather proud of young Kris and wrote " ... terribly pleased to have the opportunity to share with someone from my family a life and experience that means so much to me. It really is the chance of a lifetime and a dream come true." This was John's eighth trip south, but I

dare say the most meaningful, one that he will cherish in old age when he sits in front of the fireplace and thinks back on the past field season in the Allan Hills when he, a former master male chauvinist, and his daughter became the first U.S. father and daughter scientific team to ever work in Antarctica. You're a »lucky stiff, John.

**MIKE BENKERT SAYS ...** As indicated in the last issue, we were asking old Mike Benkert, the ex-Coast Guard admiral who is currently president of the American Institute of Merchant Shipping (AIMS), if he would look over Jonathan Charney's *The New Nationalism and the Use of Common Spaces*. On the marine pollution side – you may remember that Mike was once in charge of the Coast Guard's marine pollution program – he said it was good, with nothing radically wrong from the environmental point of view. He said the references were quite good for those of us not knowledgeable in the field. He disclaimed the book was for the lay reader, as it claimed, saying it's for the professional student. The ordinary person would find it heavy reading, he said, and after two pages would put it back on the shelf. He called it pretty "strong stuff," having an environmentally oriented bias. Now those of you who have had the pleasure of sailing with Mike or know him personally know that his comments were attractively dressed with more colorful and descriptive verbiage, but we wouldn't want to use that kind of language in this fine family newsletter.

**HUNTFORD IS AT IT AGAIN.** Roland Huntford is now writing a book on Sir Ernest Shackleton. I bet Sir Ernest is lying uneasy in his grave over that. I was privy to seeing a letter that Huntford wrote last December in which he said that Shackleton "was not an easy character to grasp. He was as ill-prepared as Scott, but considerably more intelligent, and determined to survive." The only Antarctic heroes to survive are going to be those who were too dull for a biographer to uncloak. Speaking of Shackleton, I once worked with the late Sir Hubert Wilkins who was Shackleton's Chief Scientist on his last expedition. I probably knew Sir Hubert better than I knew any other well-known polar scientist. Lowell Thomas wrote a truly fascinating biography on Sir Hubert, but for all practical purposes it only included the first half of his life. Sir Hubert would have been a hard man to defrock, as he was a man of tremendous accomplishments all over the world. And a very humble man. They threw the mold away after they made Sir Hubert.

**MIRIAM MACMILLAN, FIRST LADY OF THE ARCTIC.** Fortunately for us Maineciaks, not all of you people have the good fortune to live in Maine or to spend your summers there, but there is a lady in Owl's Head, Maine (a suburb of Rockland - my birthplace!) who has led a most fascinating polar life and was recently honored by the Explorers Club. She's Miriam MacMillan, widow of the old admiral who died in 1970 at the age of 96. Now if you don't know Miriam, she isn't as old as you might imagine; she is the daughter of one of Mac's best friends, and as a child Mac once bounced her on his knees. They were married in 1935, and in 1938 she made her first trip to the Arctic, followed by eight more on the good schooner BOWDOIN, the last one being in 1954. Miriam got to go back to Labrador when the natives in Maine took up a collection to bring her there for the celebration of the 200th anniversary of the landing of the Moravian missionaries. A lot has been published about Miriam and the BOWDOIN in the past year (*The Courier-Gazette*, Rockland, Maine, September 23, 1982; *The Boston Globe*, September 28, 1982; and a wonderful article in *Yankee* magazine, October 1982), as there is a big drive on to raise \$200,000 to refit the 61-year old BOWDOIN (originally costing only \$29,000) which has made 26 trips to the Arctic, logged over 300,000 miles, penetrated to the farthest reaches of Kane Basin, far north of Thule, even to the Humboldt Glacier. When she is refitted

(we're still talking about the BOWDOIN) she will be a seagoing classroom for teaching sailing, seamanship, meteorology, oceanography, and marine ecology. And her first trip will be her 27th trip to the Arctic! Wouldn't you love to be aboard? I bet old Bud Waite would throw away his crutches and hobble aboard for just one more shot at the polar regions.

**ZUMBERGE, PRETTY CAGEY FOR A PRESIDENT.** Gentleman Jim Zumberge, occasionally on campus President of the University of Southern California and august President of SCAR, continues to amaze me. I read the sport pages pretty regularly, and for a backyard pool swimmer, he gets better coverage than many a sports celebrity. He got excellent mileage out of his criticism of the NCAA putting Southern Cal on suspension. But then he pulled a real coup – he kicked upstairs this football coach (a fellow named Johnny Robinson), making him one of his key assistants, a vice-president. This was the sheer stroke of a genius, as not only did he remove the coach who got him into trouble with some sleight of hand recruiting, but he put him to work in his outer office where he could use his personality, name, and pressing of the flesh to bring in megabucks for the non-athletic part of the university. A tremendous move! Best move by a college president since Ike left Columbia for Pennsylvania Avenue. But, alas, the story has a sorry ending. Gentleman Jim didn't sign him to an ironclad contract, and out there in tinsel and make-believe country are many tigers. And among the prettiest and most voluptuous of all tigers in Los Angeles is the beautiful six-time married blonde bombshell, Georgia Frontiere, who owns the hapless Los Angeles-Anaheim Rams. She batted a few eyelashes, or whatever, at the poor old country boy-football coach-vice-president, and Johnny walked out the door, leaving Gentleman Jim in the lurch. I tell you one thing, Jim, you lost to a real pro in that thar Georgia. You got nothing to be ashamed of! Now why don't you hire Georgia to replace Johnny and keep it all in the family!

**A LEGEND BY THE NAME OF ALAN INNES-TAYLOR DIES ... OFFICIALLY.** A couple of years ago, based upon what we thought was a reliable source, we reported that Alan Innes-Taylor of BAE I and BAE II had died. Much to our chagrin we had to write Alan to explain our happiness over finding out that his demise was greatly exaggerated. But he did indeed succumb in January, and with his passing went one of the truly great polar experts. A lot of people have written us Innes-Taylor stories; one of his great admirers is old Fred "Muckluck" Milan of Little America V rectal thermocouple fame, who wrote us on 21 May 1979:

Alan was born in 1900 in Berkhamstead, England, and came with his parents to the U.S. in 1906. He was the nephew of a former Prime Minister to New Zealand. He had been a pilot in the dying days of World War I and had come to Canada to be a constable in the Royal Canadian Mounted Police. Hired by Admiral Byrd to select and bring down dogs for sledging, he served in the Antarctic in 1928-30 and again in 1933-35. He was the recipient of the Congressional Medal (gold) 1928-30 and the Congressional Medal (First Class) 1933-35. He was also awarded the Carnegie Hero Medal (1937) for jumping off a ferry boat to save an old lady who had fallen overboard. He served in the USA Air Force (up to Lt. Col.) and then served as a consultant to SAS, KLM, and Air France when they first established the Polar Air Route. He has served in the Air Force as a survival expert, and according to an old sergeant, had commanded serially all of the Air Force's survival schools.

Before you guys jump all over me about the reference to Innes-Taylor serving in the Antarctic in 1928-30, one must remember that Commander-Byrd-had indeed contacted his New York Office for an additional 20 dogs and that Alan did take them from Alaska to New Zealand, hoping to get there in time to catch the second voyage of

the ELEANOR BOLLING to the Bay of Whales. But he missed her and had to subject himself to the terrible ordeal and hardship of wintering over in New Zealand. He and his dogs finally left Dunedin on the CITY OF NEW YORK on January 5, 1930 (along with Ed Roos and John Bird of our Society), but they didn't reach the Bay of Whales until the evening of February 18th, after a miserable trip south during which they encountered terrible weather. Commander Byrd immediately loaded the ship, and she set sail the next morning, less than 14 hours after arriving. But Byrd gives Innes-Taylor and his dogs credit for helping in the rush of loading. I imagine those dogs must hold the record for the least time spent on the ice by a team of huskies. Alan went down on the Second Byrd Antarctic Expedition as chief of trail operations and performed most admirably (see Byrd's Discovery).

Philip Marshall, a periglacial geologist disciple of Line Washburn with some Antarctic experience, who is now with Dave Hickok in the University of Alaska's Arctic Environmental Information and Data Center in Anchorage, was hoping to write a biography of Innes-Taylor (letter to us of November 22, 1982) and indicated that he "would like to interview Innes-Taylor no later than spring 1983." Let's hope he moved it up. Philip wrote us:

Innes-Taylor learned dog-mushing as a constable with the Northwest Mounted Police in the Yukon and British Columbia from 1921-1926. He managed the Lederle Laboratories in western Canada studying animal diseases. In 1948 he was in charge of the joint U.S.-Canadian weather station at Isachsen Island. Innes-Taylor made the transition from dogsled and windjammer to tractor and icebreaker. He was one of Canada's pioneer aviators (FAI Pilot License 434), trained in bi-planes without instruments during the First World War. By special act of the U.S. Congress, he was commissioned in the U.S. Army during the Second World War and commanded special operations training mountain troops and commandoes in Greenland, Canada, and the U.S. He was instrumental in developing field survival techniques in the Arctic for the U.S. Army, Air Force, and many commercial airlines. He was awarded the Carnegie Hero Medal, two U.S. Congressional Medals, the Yukon Territory Commissioner's Medal, and the highest civilian decoration in Canada, the Order of Canada.

His last paragraph included this gem, "Beaver farmer for Patagonia, dogsled and canoe freighter, steamboat purser, where else could such a colorful independent story be found?" True! I don't know how Philip made out trying to get funding to do this bio on Innes-Taylor, but if any of you know of any untapped sources of funds which might be available for the asking, please contact Philip directly.

**MAIL CALL.** *Michele Raney*, first woman to ever winter over at the South Pole, has just begun a two-year residency at Stanford in anesthesiology. Her new address is 20990 Valley Green Drive, Apt. 677, Cupertino 95014. Michele reports that "I'm actually enjoying the return to formal training, despite the long hours and studying." Michele will be saddened by the following news, if she reads these things, that concerns the death of another polar medical person, old *Captain Hedblom* who died last November 27th, presumably at his home in Brunswick, Maine, after a two-day illness. (Brunswick, home of Bowdoin College and the Peary-MacMillan Museum) Anyone who ever saw Captain Hedblom will never forget him, as he was a giant of a physical specimen, and it seems to me that his uniform of the day was always tent-size overalls with a big red cross on the back. Palle (South Pole 58) Mogensen gave us this sad news, recalling how Captain Hedblom served on the Advisory Board of AINA where he was influential in many ways, such as the development of polar clothing....*David Kellogg* wrote that they had a "short but productive season" in Taylor Valley with Don Elston and cohorts; said the weather was so spectacularly

good that they had to import a Dry Ice maker and tanks of CO<sub>2</sub> in order to keep their ice cores from melting. The Kelloggs are looking forward to another 15 years when their 3-year old son, Griff (for Griffith Taylor) will be big enough to be their field assistant!...Haven't heard lately from the old icebreaker, *Captain Edwin MacDonald*, He went to China last spring on a Naval Academy Alumni cruise. He contracted chronic lymphatic leukemia, but reported last March that "chemotherapy appears to be gaining the upper hand"...*Charlie (South Pole 58) Greene* is going to be stripped of his Antarctic campaign ribbon if he keeps on with his Arctic affairs. In 1982 he made five field trips above the Arctic Circle (3 to Prudhoe Bay, 1 to Tuk, and 1 to Arctic Bay). How come a nice little old MIT boy could get so wrapped up in noise measurements and the responses of marine mammals (ringed seals, bowhead whales and narwhals), I'll never know. And Charlie had such promise when he was a young, budding scientist running the C3 ionosphere sounder!...That darn *Art Ford* out there in Menlo Park really one-upmanshipped me good. I put a personal note on his Newsletter about the fabulous performance of my favorite Ford, a 1962 Fairlane which has clocked 206,000 miles and doesn't want to quit. Art came back with the fact that he not only owns a 1930 Model A Ford, but that he drives it to work every day. He bought his for \$100 back in 1950; I bought mine for \$275 when it had only 28,000 miles. His speedometer has turned over several times that he knows of, so I have to get down on my knees and admit that A. Ford (his license plate) has me beat. But I still love my Fairlane!...*Don Wiesnet* of hydrological fame retired from the National Earth Satellite Service last October after some 32 years of federal service, some of which were probably enjoyable. Had some difficulties holding jobs (14 years with the USGS, 4 years with the Coastal Oceanography Branch of the Naval Oceanographic Office, 10 years with NOAA, and, more recently, senior research hydrologist and Chief of the Land Sciences Branch of NESS), and is just beginning a new career as a private consultant in remote sensing, environmental science, and hydrology. Sounds awful - he should just go home, put his feet up and enjoy watching the little woman do housework...*Jim and Jan Sparkman* have a mountain retreat in Afton, Virginia - right up on the Blue Ridge Parkway - and he appears to be enjoying teaching at the University of Virginia and also working for Simpson Weather Associates. He doesn't miss NOAA at all!...Remember I wrote once about this fellow *Albert Armstrong* who designed a lot of the good buildings at McMurdo and who is about as old as Methuselah? We sell him five calendars every year, which we mail out for him to five different women. He just repeated the order for those postcards with "it is necessary for me to have several sets, as you know how it is to keep all of the girls in a jolly and convivial mood in order to keep the old boy in operable amusing condition." I just hope some jealous husband doesn't catch wind of all of Albert's shenanigans and unload a shotgun on the "old boy," as that could totally destroy his operable condition. He tells me they are all relatives, but that's the same song and dance we get from other multiple buyers... *Arville Sohaleben* wrote that the hurricane which hit Hawaii in January "knocked the smithereens out of both our Kanai places." He should have built on Ross Island...*Larry Gould* wrote that the only reason Howard Mason wasn't operated on for appendicitis at Little America was that Howard got well amazingly fast when he found out that Larry was going to be the anesthetist. Dr. Coman had evidently already started preparation for the operation. They performed an appendectomy on a Navy man at Little America V when I was there which may have set a record for number of hours on the operating table. It was a comedy of errors; the dentist who was supposedly assisting the station doctor couldn't take it and had to be replaced by old Fred "Muckluck" Milan. Somehow or other, the patient actually survived, much to everyone's surprise. The health record in camp improved radically thereafter...What do you think of old *Dick (Wilkes 57) Cameron* marrying that young Sally Barnett? Understand they got married ten minutes after midnight on New Year's Eve, which I suppose is as good

a time as any to do the deed. At least all bystanders should have been in a good mood by then....Another New Hampshireite, *Rudy (Wilkes 57, Wilkes 59, Palmer 67) Honkala*, has pulled out of Washington and moved to a little town named Kilmamock in Virginia. It's about 160 miles from Washington, which Rudy feels is still much too close, but he is on an inlet of the Chesapeake Bay and is looking forward to spending a lot of time out on- the water....*Bill Tobin*, ex-Office of Polar Programs, has been plagued with bad back problems, and has just escaped from a local hospital. Let's play tennis, Bill!....USA TODAY, in its health column on 17 February 83, had the following paragraph: "One newcomer to the cold war is jokingly called 'killer hankies.' The iodine-saturated tissues help prevent the spread of cold viruses. Researcher *Elliot C. Dick*, of the University of Wisconsin, tested them on servicemen at McMurdo Station in Antarctica and found that they cut the spread of colds by 40 percent." There was other good news in the article, such as, kissing doesn't spread colds, wet feet and chills don't cause colds, children catch the most colds, and non-smokers get over their colds faster. The bottom line was "Treating a cold will stop it in seven days; otherwise it lasts a week."....*Mort (Mirny 58) Rubin* has written a couple of excellent articles in the Polar Record on some of the scientific programs on pre-Larry Gould expeditions. Vol. 21, No. 130, 1982, has one on pages 33-49 entitled "James Cook's Scientific Programme in the Southern Ocean, 1772-75," and Vol. 21, No. 132, 1982 has another on pages 215-229 on Thaddeus Bellingshausen's Scientific Programme in the Southern Ocean, 1818-21." And I believe Mort has another article which is about to be published....*March Vaucher* of the Marine Policy and Ocean Management Program at the Woods Hole Oceanographic Institution has recently published "Prospective Maritime Jurisdictions in the Polar Sea." It is Technical Report, WHOI-83-1 and sells for \$5. In actuality it's not so much a report as it is two maps of the polar regions with some jargon at the bottom. Weddell as in Weddell Sea is spelled incorrectly on the map, and I'm not certain why some islands (like the Falklands and Kerguelen) are pink, and other islands (such as Heard, Prince Edward, and Crozet) are not. I think these maps are for the affluent polar collector who doesn't want to miss any item.

**ANTARCTIC AMBASSADOR, DOROTHY IRVING BELL, 86-YEAR OLD LASSIE IN BRISTOL, ENGLAND.**

Gordon (BAE II) Fountain, seaman on the queen of all Antarctic ships, the BEAR, introduced us through the mail to a delightful lady in England, Dorothy Irving Bell, whose nickname is Squibbs. We sent her a complimentary copy of the Newsletter just to see if we could interest her in joining our ranks. She wrote us a great letter telling about hearing Shackleton and Amundsen lecture, and about being a great friend of James Marr (the Scout whom Shackleton took south on the QUEST). She told a tale about how, at her late husband's request, she went to this home for, shall we say, wayward youths and spoke about Antarctica. But let's let Squibbs tell you as it really was:

I was faced by an audience of keen looking lads and in spite of having done naughty things they probably had no encouragement at home to be decently behaved and interested in anything worthwhile so I went headlong into a talk and said how I had become so keen on Antarctic exploration and after all they, if they wanted to badly enough, might well go on an expedition one day. They were a fine bunch of lads and listened to every word and asked questions at the end. A few days later my husband came in and said I could not talk to the Remand Home boys again as next day three of them had absconded and were caught looking for a ship to take them to Antarctica! I told him it was the best compliment I had ever had.

Squibbs must be something. Wouldn't you just love to meet her? I know I would. She ended up sending "Every good wish to your Society." Maybe some of you folks might want to write her - her address is 5A Oakfield Road, Bristol BS8-2AJ.

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET

ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 82-83

April

No. 5

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.), 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982

OFFSHORE OIL DEVELOPMENT IN POLAR REGIONS  
APPLICABILITY OF ARCTIC EXPERIENCE TO THE ANTARCTIC

by

F. Geoffrey Larminie, OBE

Director, Environmental Control Center  
British Petroleum Company  
London, England

on

Thursday, April 21, 1983

8 PM

National Academy of Sciences  
Joseph Henry Building, Room 451  
corner of 21st and Pennsylvania Avenue N.W.

*(Please note where we are meeting - we have never been there before.  
Same building as Adams Rib Restaurant. Parking at a cost in garage  
under building - entrance on I Street.)*

Geoff Larminie, petroleum geologist, and a current member of the National Academy of Sciences' Polar Research Board, received the Order of the British Empire from the Queen back in 1971 for his good deeds and many accomplishments while serving in the Expedition Department of the British Petroleum Company in such fine polar places as Sudan, Greece, Libya, Thailand, Kuwait, Canada, and the USA (Alaska, California and New York City). He formerly was a lecturer in geology at the University of Glasgow and the University of Sydney, and was also past president of the Alaska Geology Society. Presentation will be given in the best of Queen's English. Translators not required.

This Newsletter is divided into two parts, the first being more or less the official part, and the second will be BERGY BITS, the unofficial part. We'll start this out with an article by Celia Heil of the Division of Polar Programs, who at the request of our President, Mort Turner, summarized published material from various sources on Latin American activities/interests in Antarctica.

**ANTARCTICA AND THE LATIN AMERICAN NATIONS** (by Celia Heil, DPP, NSF).

Two Latin American republics, Argentina and Chile, are consultative parties to the Antarctic Treaty. Brazil, Uruguay and Peru have joined the acceding nations but are not yet consultative parties. The most recent, Peru, acceded to the Treaty on 10 April 1981. Argentina and Chile each maintain several stations and active research programs on the antarctic continent. Argentina and Chile have overlapping claims in Antarctica and in turn these claims are both overlapped by a claim of the United Kingdom. Members of the Antarctic Treaty are both claimant and non-claimant nations and there is no broad recognition of the territorial claims.

Chile, Argentina, Peru, and Uruguay, claim to be direct and legitimate successors to the Spanish sovereignty over land and sea that included portions of the antarctic regions in direct geographic line of the South American continent. These claims are based on a historic event that took place at the end of the 15th century when the Iberic kingdoms of Castille and Aragon established their title over the "Terra Australis Incognita" through the Papal Bull of Discovery of the New World. Under the same Papal declaration, Portugal was granted new lands in the other half of the world, presumably also including corresponding portions of Antarctica. Brazil traces similar claims through succession from former Portuguese sovereignty.

Argentina's antarctic program is under the administration of the Institute Antartico Argentine (Argentine Antarctic Institute) established on 17 April 1951, a branch of the Direccio'n Nacional del Antartico (National Directorate of the Antarctic). Support and supply operations for Argentina's eight stations are provided by the three branches of the armed forces. Argentina has had the longest continuous operation of an antarctic scientific station of any nation. This dates from the occupation of Estacion Orcadas in 1904, after it was turned over to Argentina by the Scottish National Antarctic Expedition. On 13 December 1947, Admiral Gregorio A. Portillo crossed the South Pole in a Douglas C-54 plane, thus Argentina became the second nation in the world to fly across the South Pole. Since 1968, Argentina has been conducting scheduled tourist voyages to the Antarctic Peninsula during the austral summer. The first two such voyages took place during January/February 1958 and January 1959.

Chile's activities in her four antarctic stations are coordinated by two institutions, Comite' Antartico Chileno (Chilean Antarctic Committee) and Institute Antartico Chileno (INACH) administered by the Ministry of Foreign Affairs. These institutions plan and coordinate the technical and scientific activities on the antarctic continent. Logistic support is provided by Chile's armed forces. Chile's first antarctic expedition and the establishment of her first station, Base Prat, took place in 1947. On 29 May 1981, Chile celebrated the 17th anniversary of the establishment of INACH. Extensive scientific research is supported by LC-130 (Hercules), Twin Otter, and helicopter aircraft throughout the Antarctic Peninsula region. Chile has expressed her intentions to establish a scientific base close to the geographic South Pole, and plans are being considered to circumnavigate the ice continent to have a better understanding of Antarctica.

This austral season (1982/83), 40 scientists from the Federal Republic of Germany, China, Peru, and Uruguay, were participants of Chile's Antarctic Expedition. The expedition focused its research in the Drake Sea, Antarctic Peninsula, and adjacent archipelagos. The Chinese scientists are members of the National Oceanographic Institute of China. Scientists from Peru and Uruguay are members of their respective antarctic institutes.

According to a Latin American newspaper report the objectives of the Chilean expedition were to study the possible use of penguins for food consumption, to undertake basic biological, geological, and atmospheric research, to study the volcanic activity of Deception Island and the occurrences of iron and copper, and to search for indications of past human habitation. The German scientists members of the Universities of Hannover and Kiel, were interested in lichenology and glaciology.

The Instituto Brasileiro do Estudos Antarticos (Brazilian Institute of Antarctic Studies) was established in September 1972. It is supported by the Government and forms part of the Comisi6n Interministerial do Recursos do Mar-(Interministerial Commission of Marine Resources) who provides the logistic support. This year Brazil is conducting its first antarctic expedition with three adequately equipped ships. The lead ship was acquired from the Lauritzen Shipping Company in Copenhagen and is the former ANARE expedition icebreaker "Thala Dan", purchased by Brazil and renamed "Barao de Tefe". The ship is carrying 67 scientists and members of the crew; a second ship, "Wladimir Bernard" of the Oceanographic Institute of the State University of Sao Paulo, has 52 members. This vessel, equipped for oceanographic research, will remain in the southern seas until March 1983.

This expedition, assisted by Chile and Argentina, is Brazil's formal application to consultative membership to the Antarctic Treaty. One objective of the expedition is to establish a base on the antarctic continent. This base is to be located outside of Argentina and Chile's claimed territories, somewhere on the Weddell Sea coast, for the purpose of exploration and exploitation of oil reserves and krill. The expedition sailed from Rio de Janeiro, with a scheduled stop in Porto Rio Grande on 26 December 1982. The University there has provided an area for storage of supplies and other material bound for the antarctic continent for this and future expeditions. The University at Porto Rio Grande will serve as a point of departure and logistic support for the Brazilian antarctic program and for personnel training. The center at the University will have facilities to process sea products harvested from the antarctic seas. British and German scientists have expressed their interest in participating in Brazil's antarctic program at the University. During the two years of preparation the expeditionary group was in close contact with the Scott Polar Institute in Cambridge, England, and Chile's Antarctic Institute and received scientific and technical advice from the United States.

At the First National Antarctic Convention in 1970, Uruguay gave official status to the Instituto Antartico Uruguayo (IAU) (Uruguayan Antarctic Institute) and was officially incorporated to the Ministry of Defense in 1975. Uruguay acceded to the Antarctic Treaty on 11 January 1980. The IAU is the liaison agency with the international scientific community. Although Uruguay has established an antarctic institute and has ratified the Antarctic Treaty, no antarctic field research has been undertaken. Uruguay does not yet have a coordinated and viable program of specialized scientists and trained personnel nor the logistic support needed. However, several scientists and representatives of IAU have participated in antarctic

scientific research and expeditions through programs of other nations such as Argentina, Chile, England, and the United States.

This austral season has been witness to another first. Spain acceded to the Antarctic Treaty on 31 March 1981, and this year, on the last week of December the first Spanish antarctic expedition departed from the Port of Gijon, Asturias. The vessel, the "Idus de Marzo" (Ides of March) with 23 crew members was due to stop in Brazil on its first port of call on 15 January 1983, then proceed to Argentina, where nine Spanish scientists from the Oceanographic Institute of Spain were to join the expedition. The vessel was also scheduled to stop in Uruguay and Punta Arenas, Chile, before the expected arrival in Antarctica in early February.

Brazil's and Spain's antarctic expeditions are of great significance to the Latin American nations already involved in antarctic work. Argentina and Chile have given their support to these expeditions and it seems that the Latin American nations interested in the scientific and diplomatic participation in Antarctica are working together in this common effort.

(Information for this article was obtained from several Latin American newspaper articles; Argentina and Chile's Antarctic Research Bulletins; and from a previous article by the author, "Antarctica: Life at the End of the Earth", AMERICAS, NOV/DEC, 1981, VOL. 33, NO. 11-12, Washington, D.C.)

**POLAR BOOK AUCTION.** At the last Board meeting of the Society, the subject of having a polar book auction was raised, and a committee consisting of Charlie Burroughs, chairman, Bill Littlewood and Guy Guthridge was appointed to look into the feasibility of an auction. The Committee is supposed to present its plan of action at the next Board meeting, date to be set by the President. Essentially the game plan worked out by the Committee is that Society members would offer books for sale at an auction, presumably at our annual Mid-Winter picnic at Stronghold, with 20% of the sales going to the Society, 80% to the donor. Anyone wishing to participate in this venture should contact Charlie Burroughs at 686 College Parkway, Rockville, Maryland 20850. The Committee is interested in knowing who wants to submit what, who wants to participate in the auction, who wants the auction list, et cetera.

#### B E R G Y      B I T S

This is the unofficial section of your Newsletter, mostly about people and happenings. The Society's membership, now over 420, includes members from all American expeditions to Antarctica. We strive to find some items of interest for each group, but only so much can be covered in Bergy Bits. It's essentially a potpourri of material either sent to us or given to us. We are more than willing to include more material on ongoing activities, but you guys and dolls have to get the stuff in to us if you want it to appear in our Newsletter.

**ZINSMEISTER PLAYS TO OVER 200, BUT ...** Bill Zinsmeister spoke to what well may have been the largest audience in the history of our Society on March 24th and 25th when over 200 people heard him tell all about the amazing discoveries on Seymour Island in the austral summer of 1982-83. That was the good news; the bad news was that the show of Society members was poor, especially in view of the fact that the discovery of the jawbone of a marsupial on this expedition was probably the most exciting scientific thing to happen in Antarctica in this century, although

"meteoritators" might challenge this opinion. I grant you that our Society is fast becoming a broad-based society (63% of our membership is outside the Washington area), but we still have 154 local members, the largest group of which is from the US Geological Survey, and as the Survey goes, so goes our attendance at the lectures. For this lecture, we had only one member from the USGS. I was hoping our Society would turn out en masse, and that a joint Antarctic Society-Smithsonian Institution conclave might become an annual event. But we may have blown it. Maybe it was because of a phobia suburbanites of Washington have about going downtown at night; maybe it was due to the fact that Bill also spoke at the National Science Foundation and siphoned off some of our listeners there; or maybe it was because we never got on the phone and jacked up people to turn out. Those who missed one of the presentations - there were three - missed out on a thrilling story. Seymour Island is evidently about as un-Antarctic as you can get, with real badlands that would thrill only pigs and paleontologists. Zinsmeister said his idea of Heaven would be to be laid away in such an area resplendent with fossils. It is quite evident to me that he's never been to the beaches of Ft. Lauderdale during the college spring recess. Bill is going back next year, with twice as many people (20) and for a much longer period (1981-82 season was only 19 days long). Listening to Bill's enthusiasm for it all, I had the feeling that Seymour Island will become to him what Mt. Erebus became to Phil Kyle. Bill made a prediction that he will find dinosaur bones on Seymour. Now if NSF were clairvoyant, they would borrow some bones from a museum and have the Argentines fly them down ahead of the Americans next year so they'd be waiting for Bill's discovery. This way NSF wouldn't have to keep funding additional expeditions for the next decade to Seymour. After all, icebreakers are real expensive.

**1983 MEMORIAL LECTURE WILL BE PART OF ANTARCTIC OCTOBERFEST.** There will be a lot of polarites in Washington town in mid-October with the US Geological Survey holding a three-day polar symposium at the National Academy of Sciences and the National Academy of Sciences' Polar Research Board meeting at the same time. So the Society is going to take advantage of the influx of penguins and polar bears and hold its 1983 Memorial Lecture during that week. October is a good month in Washington, the heat and humidity of summer are passe, and it's just a great time of the year. We hope this will be a period when IGY personnel may see fit to come to Washington to reunite themselves. At least with the polar symposium, there is a scientific excuse for the professorial types to leave their halls of learning and come to town for a sprinkling of libation and whatever.... Our Society got off to an early start in 1982-83 with a late summer lecture by Dr. Swithinbank, our first-ever summer lecture, so there is no reason why we can't close our current lecture season with our April meeting, our sixth of the year. In all likelihood the Society will again hold the annual Mid-Winter picnic sometime in June or July at Stronghold, which will officially end our activities for this season. A Newsletter in late May or early June will alert you folks on the details.

**PENGUINS LIVE IN MULTIMILLION DOLLAR LUXURY IN SAN DIEGO.** Thanks to Barbara Duffy Heffernan, Director, Government Affairs, Sea World, in Washington, we have a wealth of material on Sea World's Penguin Encounter which will open in San Diego in early summer, hopefully on Memorial Day, presenting fantastic exhibits of Antarctic penguins, temperate penguins, and alcids. The polar exhibit, built at a cost of seven million dollars, occupies a 28,000 square foot building in the San Diego marine park. A mini-Antarctic environment has been created within a 5,000 square foot exhibit area where the temperature will be maintained at 28°F. There is a 3,000 square foot viewing space (presumably so penguins can also watch homo sapiens), including a moving sidewalk directly in front of the viewing panels and an upper level viewing area with a bank of 12 television monitors. So one can watch emperors, Adelies, kings,

rockhoppers, macaronis, and gentoos through a 100-foot wide window (made up of 13 panels joined together with silicon) while on the moving sidewalk. There is also a 2,000 square foot outdoor exhibit area where you can watch a Humboldt penguin colony; conversely the Humboldts have a 1,000 square foot viewing area to watch us watching them. Puffins and murrelets, both members of the alcid family of birds, made out quite well, too, as they will have a 1,200 square foot exhibit area.

Twelve thousand pounds of snow will be produced each day. Artificial ice will simulate the edge of the polar ice shelf and fresh crushed ice will be blown over this each day to provide a realistic substrate for the birds. The ice shelf juts out over a 7 1/2 foot deep pool of water, maintained at 45°F. For the very first time in a major exhibit, guests will be able to view penguins as they swim underwater. In an upper level viewing area guests may relax on benches for extended periods of viewing, or take advantage of a bank of 12 television monitors with video presentations on various aspects of penguin biology. In addition, the video system has the capability of going live and viewing ongoing penguin research. Sea World has thirty other educational exhibits and six aquatic shows, and must be one of the truly great bargains in existence. Ms. Heffernan has indicated there is a good possibility that they could present a lecture to our Society sometime next fall, but in the meantime all roads lead to San Diego. And if you see any penguins that look like Bill Sladen or Larry Gould, please keep it to yourself!

**SEA WORLD PENGUIN PROPAGATION PROJECT** (Copied from Sea World News release of 9/82).

Purpose: To establish and maintain a self-perpetuating colony of high Antarctic penguins available year-round for research purposes. ... Population: Seven of the 17 species of penguins are represented, including king, Adelie, emperor, macaroni, Humboldt, rockhopper and gentoo. Description of polar species: Emperor penguins; Height: 3-4 feet. Weight: from 50-100 pounds. Long, slender body with patches of orange-yellow at sides of head. Largest of the living penguins. Range: Antarctica. Hubbs-Sea World Research Institute and Sea World aviculturists made history on Sept. 16, 1980, with the hatching of the first emperor penguin chick ever to occur outside the Antarctic continent. This was soon followed with the hatching of two more emperors on Sept. 20, 1980. In succeeding years, additional hatchings have taken place. Adelie penguins; Height: 2-2 1/2 feet. Weight: from 9-14 pounds. Black-throated. Range: Antarctica. More than 120 Adelie chicks have been hatched and reared in the penguin propagation facility since 1976. Hatchings of this magnitude are unprecedented outside the Antarctic. Adelies lay two eggs - one is hatched in an incubator and the other is left with the adults. Sea World aviculturists hand fed chicks which were hatched in an incubator and later transferred to a brooder, thus allowing the collection of valuable behavioral data. A food formula was devised by the staff. This diet consists of ground fish, crustaceans and vitamin/mineral supplements. King penguins; Height: 3 feet. Weight: from 25-40 pounds. Bright yellow coloration around head and neck. Range: Subantarctic. The fifteen king penguins maintained in the facility are much like emperors but are more active and "aggressive" than their larger counterparts. Being sub-antarctic in origin, these penguins prefer ice-free areas, particularly when breeding. Several eggs have been laid by the kings in the unit, but no chicks have been successfully reared by the adults. However, in 1982, two chicks were hatched in the incubator and subsequently hand reared. Prior to this no king penguin had been artificially hatched and reared. Macaroni penguins; Height: 2-2 1/2 feet. Weight: 10-12 pounds. Orange plumes on top of head extending backwards. Range: Sub-antarctic. For some time Sea World has had three elderly macaroni penguins that are managed in the same manner as the Adelies. Although the mated pair has laid several eggs, none of these has been fertile, a condition attributed to the age of these penguins. A fourth macaroni stranded in New Jersey in August, 1981,

has been rehabilitated and introduced into the unit. Rockhopper penguins: Height: 2 feet. Weight: 5-7 pounds. Red eyes, drooping yellow crest. Range: Sub-antarctic. Nine specimens of rockhopper penguins are maintained in the San Diego park. Three of the older penguins have produced eggs. An infertile egg was once substituted with a fertile foster Adelie egg from an incubator. This egg was hatched by a pair of rock-hoppers. The foster parents attempted to rear the chick but apparently were unable to supply a sufficient quantity of food. Gentoo penguins: Height: 2 1/2 feet. Weight: 9-13 pounds. Conspicuous white marks on top of head; white band extends from eye to eye across a slate black head. Range: Antarctic and Sub-antarctic. Sea World maintains one gentoo on loan from the San Diego Zoo. It has exhibited breeding behavior with the Adelies, assisting a pair in nest building and attempting to incubate abandoned Adelie eggs. Humboldt penguins; Height: 2-2 1/2 feet. Weight: 8-10 pounds. Narrow white superciliary stripe passing well above the eye. Long, heavy bill. Range: West coast of Chile and Peru. Because this species inhabits tropical and subtropical climatic zones, the Humboldt penguins are maintained outdoors at ambient temperatures. Total world population may be less than 5,000 individuals, and it is considered an endangered species. Sea World maintains 50 of these penguins. The Humboldt is one of the most familiar "zoo penguins" because of its ability to survive in warmer climates. This species typically nests in burrows. Up until 1977, the Sea World Humboldt colony was quite productive with 10-13 young being reared a year. In the next three seasons, heavy rains flooded the burrows, resulting in the loss of numerous eggs and chicks. Since that time by utilizing techniques involving artificial incubation and hand feeding similar to that used for the Adelies, Sea World aviculturists have successfully reared Humboldts in a controlled environment.

**RAISING PENGUINS AT HUBBS-SEA WORLD RESEARCH INSTITUTE, SAN DIEGO** (Copied from the Institute's Currents, January 1983).... . . Dr. George Bartholomew of the University of California at Los Angeles and his associates continue to study penguin egg metabolism, and Adelie penguins have again successfully produced chicks; more than 50 were hatched last year. As Adelies usually only rear one chick, as in previous years, one egg has been removed from each two-egg clutch and placed in the incubator. When hatched, these, like more than half of the Adelies that have been raised in the Facility, will be hand-reared.

Last February two king penguin eggs were laid in the research freezer. As the care they were being given by their parents was inadequate, they were taken from the adults and hatched in the incubator. Raising the two chicks to fledgling stage has not been an easy task. King penguins in the wild inhabit subantarctic regions where they are not subjected to the climatic extremes of the Antarctic. Therefore they can take a longer time to fledge their young than species that live closer to the pole; king chicks may take up to 13 months to fledge. In the case of the two chicks, however, fledging took only seven months, undoubtedly because they were fed daily, whereas chicks in the wild may go without food for weeks at a time during the winter while the adults are at sea.

Raising these king chicks is a first-time-ever event and a major breakthrough. "We had no knowledge at all of what was required to hand-rear the larger penguins," Todd (Frank Todd, Research Fellow and Corporate Curator of Birds for Sea World) says, "and we were particularly anxious to succeed with these as we knew that we would probably have to raise an emperor by hand sooner or later. Caring for these king chicks enabled us to develop guidelines and obtain data that could be used when that day came."

The day arrived this fall. In September two pairs of emperors each produced a chick. At six weeks of age, one chick was significantly smaller than the other, and it was decided to remove it from its parents and rear it by hand. Initially the little

emperor, affectionately known as "E.P.", had a large stuffed Snoopy doll for a companion. Emperor chicks are brooded on the feet of their parents and covered with a fold of abdominal skin. The young penguin was able to nestle under the toy dog, which served as a surrogate parent and afforded the chick a degree of security. The experience gained with the king penguin chicks did, as expected, prove to be invaluable in raising the emperor. By mid-December it weighed 7776 grams, a gain of 6380 grams while under human care.

The large body of data on incubation and hand-rearing of penguins that has been amassed in the Polar Research Facility will prove inestimably valuable in the future, as live birds will no longer be imported from the Antarctic; only eggs will be brought back.....

**PAUL A. SIPLE, POLAR CLOTHING EXPERT.** The second president of our Society, the late Dr. Paul A. Siple, was well-known for his many polar achievements, but probably none overshadowed his interests in the health and welfare of men in the polar regions which manifested itself by his development of the windchill equation resulting from experiments he conducted while serving as leader of West Base on the Antarctic Service Expedition, 1939-41. During World War II there was an interesting exchange of messages between Admiral Richard E. Byrd and General Dwight Eisenhower which involved Dr. Siple. If you have read Alfred Chandler's *The Papers of Dwight David Eisenhower; The War Years*, you may recall that Byrd wrote Eisenhower on 2 February 1945 that he had been in contact with General Handy and had arranged to have Major Siple sent to the European Theatre of Operations to assist in cold weather problems. The Admiral wrote, "I can say without hesitation that he is the greatest living expert on cold and wet weather clothing." And General Eisenhower's message (#2279) to Admiral Byrd said, "Dear Admiral Byrd. Thank you for your note about Major Siple. I will see to it that his work here is facilitated."

I (pcd) hadn't known how many trench foot casualties were experienced by our troops in Europe, but there were 11,000 cases in November 1944 (L'Hollier and Park's *Sealed Insulated Military Boots*, Natick Laboratories, 1967); and going through Paul's papers in the National Archives I found a statement that there were 50,000 trench foot casualties in Europe in World War II. Paul, along with a physiologist at the University of Pennsylvania, the late H. C. Bazett, conceived the principle of a double vapor barrier boot - the precursor of the insulated boot - and constructed some footgear utilizing the double-barrier principle in March 1944 which were field-tested by a group of Canadian soldiers. Paul proposed the four layers of footgear used in the early studies be integrated into the wall of a waterproof boot. He and Bazett received and transferred to the Army Quartermaster Corps a patent on an insulated boot designed with an inner layer of fleece, a layer of rubber, a layer of fleece and an outer shell of rubber - all laminated together into a single boot wall. L'Hollier, then a development manager for Hood Rubber Company, carried the principle of insulation by air one step further than Siple. He devised a way to trap an air chamber within the boot wall, while keeping the insulating material dry between two impermeable layers. The standard black boot came into its own during the Korean War, while the white insulated boot was formally adopted by the Army in 1959 for military personnel. We used "formally adopted", as IGY personnel will recall that the white rubber insulated boot was available for them to wear in the Antarctic in 1957. I thought this little bit of history wouldn't hurt any of you - one should always be mindful of one's heritage. After all, aren't all Antarcticans indebted to the late Dr. Siple for the white rubber insulated boot, as I don't believe, in spite of Murray Hamlett's awful pictures, that any American has ever had trench foot in the Antarctic?

**BED COUNT.** Here is the winter-time census for US Antarctic stations: McMurdo 85, South Pole 20, Palmer 10, and Siple 8.

**ROCK APPEARS TO BE FIRST KNOWN VISITOR FROM MARS.** This headline screamed across the top of the Science section of the New York Times for Tuesday March 15, 1983. A long, excellent article by John Noble Wilford started out, "A greyish-brown chunk of rock, a meteorite found on the ice of Antarctica four years ago, has sent a shock wave of excitement through the laboratories of planetary scientists. Its drab appearance belies its apparently exotic provenance. The rock very likely comes from Mars." The 17.5 pound rock, eight inches in diameter, was picked up in 1979 at the Elephant Moraine near McMurdo Sound. It is young as meteorites go, being only 1.3 billion years old, according to radioactive dating. It was said that meteorites almost invariably date back to the beginning of the solar system 4.6 billion years ago. Since the rock appeared to be volcanic, it had to come from a body that had been geologically active as recently as 1.3 billion years ago. Scientists have found some of the so-called noble gases - neon, argon, krypton, and xeron - trapped in the glass, strikingly similar in abundance to those of the Martian atmosphere as determined by Viking missions to Mars in 1976. However, definite proofs that it came from Mars may have to await the return of Martian samples by spacecraft. At this time, the United States has no plans for such an undertaking.

Meanwhile, as evidence becomes more and more persuasive, it could be that the meteorite is the first known object from another planet to reach the Earth. Dr. Robert O. Pepin, a University of Minnesota physicist, has been doing analyses on the gases trapped in the meteorite and said "the results are ambiguously positive." They were "positive" because the spectrometer detected 15 percent more nitrogen-15 than would be found in a sample from the Earth's atmosphere; they were "ambiguous" because he needed a measurement close to 60 percent to match the Viking data from Mars. Dr. Pepin said the problem might be some contamination from ordinary nitrogen which the rock had absorbed during processing in the laboratory, while a colleague of his, Dr. Alfred O. Nier, suggested that the Martian atmosphere was different 180 million years ago when the glass trapped the gas. But Dr. Pepin put it all into its proper scientific perspective when he remarked, "That rock just smells like Mars."

**MORE ON METEORITES.** The Bulletin of the American Meteorological Society, one of its more prominent organs, had a rather long article on "Antarctic Meteorites from Mars" in its News and Notes section of the March 1983 issue. Robert Huguenin of the Depts. of Physics and Astronomy at the University of Massachusetts has come up with compelling evidence to support the belief that two of the meteorites found in Antarctica were once part of Mars.

His studies involve examination of the Martian surface through remote sensing, as well as through studies of the mineralogy and chemistry of Viking-obtained soil samples. He has also participated in numerous earth-based observations of Mars via telescope.

Through the use of spectrophotometry—the measuring of a surface's light reflectance and absorbance—Huguenin and his associates have been able to probe portions of Mars's surface the size of New England .....

Striking similarities are revealed when reflectance spectra of areas of Mars are compared to the reflectance spectra of some of the Antarctica meteorites. They indicate that the meteorites are similar in major mineral makeup to broad expanses of exposed rocks on Mars .....

Another important piece of evidence is the similarity of derived "parent magmas." ....

Huguenin also notes that the meteorites under study are, geologically speaking, unusually young. By measuring radiogenic decay, a process similar to dating fossils through measurement of the radioactive decay of carbon isotopes, scientists are able to determine the rate of decay of elements such as uranium, argon, and strontium—isotopes of which are found

in many meteorites. Such dating methods revealed the age of the suspected Martian meteorites to be from 500 million to 1.3 billion years old - considerably younger than the 4.6 billion year old meteorites originating

from asteroids at about the time the earth cooled ....

Despite the evidence to the contrary, there are scientists who find it difficult to believe that meteorites would be able to escape Mars's strong gravitational field to intersect Earth's orbit, in the manner of asteroids. However, a research team at the Carnegie Institute of Washington, led by George W. Wetherill, calculated that such an escape was possible if the permafrost believed to pervade the Martian soil vaporized on impact, therefore creating such extremes in gas pressure, that surface material could be boosted into space and enter the Earth's orbit. He devised a permafrost model to demonstrate his explanation.

Huguenin likens the Martian climate to that of Antarctica, with temperature falling to as low as -50 to -100C during the night. . . .

Huguenin must be a master of the understatement as he said, "It's very exciting."

**MAIL CALL.** We have it from a most reliable source that Eddie Goodale, one of the old Harvard dog team drivers on the Byrd '28-30 expedition who continued his Antarctic activities with the Office of Polar Programs at NSF (serving occasionally as their rep at Christchurch for several years, an early-day version of Walt Seelig), was back south this winter in Mobile, but that he is feeling his age. Supposedly he does quite well physically, although this will probably be the last year he'll be able to go south (from Maine) for the winter . . . Dick Conger recently joined the Society. Dick lives here in the Washington area. He was the head Navy photographer in the Antarctic for many years - on High Jump in 1946-47, on Windmill in 1947-48, on the staff of Deep Freeze from 1954-59 (I, II, III, and part of IV), and was also up in the Arctic three times. Dick was recently out in Missouri, and he looked up Father John Condit who was the first Catholic priest at McMurdo Sound in 1956. Father Condit, as I recall, had quite a pugilistic reputation, and there weren't many fights that winter in which the good priest did not become actively involved. Now he has a parish in Taos, Missouri, which, Dick tells me, is about 45 miles from Columbia, Missouri . . . Jerry Huffman tells me that the former Antarctic Navy commander who later worked in the Office of Polar Programs at NSF, Captain Eugene Doering, died very suddenly in the past month. No details. He was particularly interested in the energy part of NSF.... While we are writing about the military, it's always good to get a copy of Doc Abbot's Christmas letter. The former Deep Freeze admiral lives the good life down on the Gulf where he still delivers Bertrams (#26 and #27 in 1983) to buyers, trades in Cadillacs, does a lot of traveling (highlight of '82 was a trip to Western Europe with 81 souls, of which 33 were Naval Academy '39 classmates, another 33 were wives or wives-equivalents and the other 15 were friendly forces). Doc says he has four jobs, all non-salaried. His Christmas "annual non-Christmas card" is just great, having a most original format which is innocuous and a pleasure to read - even though I have never had the pleasure of meeting him! .... We understand from another source that a representative of TEMCOR in Torrance, California, the good folks who built the geodesic dome at the South Pole, recently visited the station and came away with a warm feeling that the dome was doing just great, and that it would last for at least another ten years. Now that's what you'd call good news . . . Gordon Cartwright, the first lend-lease exchange scientist whom the U.S. sent to Mirny in 1957, is being retired to pasture over there in Geneva, Switzerland. He had a real good deal going for himself, and there were only two ways they could move him - one was burning down Geneva, a somewhat drastic deed; the other was abolishing his job. So it finally came down to the latter, and his job will be wiped out at the end of this June. But is he coming home? No siree, Gordon is going to keep on living right there in Geneva. He is only 74 and feels he

has a lot of skiing left in his legs, and then there is summertime sailing on Lake Geneva. He came back to the states in mid-March when the Department of Commerce threw a big bash for him and Bob White gave him a 50-year pin. He actually joined the old Weather Bureau back in 1929. Old meteorologists like Gordon and Henry Harrison just never quit Dick Black, our poet laureate, can be found in Washington papers in all sorts of outfits. We have long been accustomed to seeing him dressed up as some Shakespearian character at a Folger theatre party, but the Alexandria Gazette of February 16, 1983 showed him dressed as Admiral John Paul Jones. He looked about as much like Admiral Jones as the two next to him looked like George and Martha Washington, a couple of local Alexandria citizens of yesteryears. Last summer (June 18, 1982) the Smithsonian Air and Space Museum sponsored a public symposium on Amelia Earhart, commemorating the 50th anniversary of her solo flight across the Atlantic, the first time a woman had flown across. Six individuals whose lives were touched by Earhart took part in the commemorative program, and Dick Black was one of the six. Dick recounted how he was on the US Coast Guard Cutter ITASCA cruising near Rowland Island, awaiting Earhart and her navigator to arrive on the one-by-three mile Pacific atoll for refueling before going on to Honolulu. But, she never reached there, and to this day no one is certain just what happened . . . . We hear from another source that Big John Stagnaro, the itinerant ham radio operator who has done such yeoman work running phone patches for the men and women on the ice, has had some health problems of late. I'm sure all Antarcticans wish Big John a speedy recovery. . . . The Antarctic Superstar, Larry Gould is going home in mid-April. Yes, he's going back to Northfield, Minnesota on a mercy trip to Carleton College where he will take part in a geology symposium, April 12-16, commemorating his establishment of their Geology Department 50 years ago. Now that should be a fun trip, even though the immortal Satchel Paige once cracked, "Never look back, someone might be gaining on you." However, Larry has the same love of living and achieving inherent in most graduate students, so they will never catch him - no way! If one needed proof that Larry was really indestructible, it was confirmed this winter when he totalled his Volvo and he walked away undaunted with a few bruises . . . . The old ice breaker, Ed MacDonald, writes that his 15-month siege of leukemia is now in remission. He's off this month for a cruise to the Holy Land, Greece, Greek islands, Istanbul, Cairo and other interesting ports. Last year while on a trip to China, his wife Jessie Bell volunteered Ed for an acupuncture demonstration in a Nanking commune of 17,000 people. It seems that Ed had arthritis in his right hip from too many rolls on icebreakers, so he went along with it. He said he felt no pain, just a mild tingling sensation. After five minutes of treatment, he felt like a new man, able to "run and leap like a mountain goat." Jessie Bell must have wondered what kind of a monster she had created by volunteering Ed! But the beneficial effects lasted only about 12 hours, and he ended up by having his second total hip replacement operation (in ten years) after he got back home . . . . John Roscoe was in town recently and attended his first ever Antarctic Society meeting. I haven't seen him in decades, and after his five-way bypass heart surgery year before last, I thought he might have aged, but he has a crew cut, looks in great shape, and walks very sprightly. John was photo-grammetrist on Operation High Jump and also Windmill, plus serving as scientific and political advisor to Admiral Byrd from 1949 to 1957. John is a fascinating person to talk to, real interesting, and I hope the Society can get him to talk on tape sometime about his relationships with Antarcticans. We talked for over an hour, and he is truly a gold mine of information about people and events. John wants to rally the Society members living in northern California for a meeting or conclave. I think it's a great idea! I'm trying to talk Frank Eden at NSF into having an all-day polar session during the December meeting of the American Geophysical Union in San Francisco. Frank is the Program Chairman for that meeting. I have an idea it won't fly, but if people like Gentleman Jim Zumberge, Bob Rutford,

Larry Gould, Bob Helliwell, Grover Murray, and other wheels would second the idea in letters to Frank, it might. After all, there really hasn't been any professional society recognition of the polar centennials, and San Francisco would be a good place to have one. And then John could stage a local gathering of Society members at the same time . . . . Mike (Plateau 67) Kuhn of the University of Innsbruck is off to Kathmandu in the Himalayas, presumably with his faithful Linke Fuessner actinometer and other associated pyranometers. He duly noted before his departure that his wife is with child - nothing like leaving a little reminder at home! Mike will be here in the states for the Evanston meeting in late June (see below) . . . . More woes for Elizabeth Innes-Taylor, widow of Alan. Her eldest daughter Catherine lost a baby girl in childbirth - she would have been the first grandchild in the Innes-Taylor family. There are three Innes-Taylor children, Catherine, an Associate Professor at the University of Alaska in Anchorage; Rollie, a free-lance writer living in Japan; and a daughter Kristin who lives in Whitehorse, . . . . John Cadwalader, an old Navy captain, says he feels old reading Bergy Bits until he sees Bud Waite's name and then he doesn't feel quite so old!

#### **UPCOMING MEETINGS.**

"The Last Deglaciation: Timing and Mechanism," Airlie House, Virginia, 2-6 May 1983.  
"Symposium on Ice and Climate Modelling," Northwestern University, Evanston, Illinois,  
27 June-1 July 1983.  
"Fourth International Conference on Permafrost," University of Alaska, Fairbanks,  
18-22 July 1983.

A very interesting 5-day workshop, funded by NATO, NSF, and others (?), coming up on 2 May will bring together leading earth scientists from around the world. The first three days will focus on data relevant to the deglaciation; the fourth day will be devoted to planning the Quaternary volume of the Decade of North American Geology series; and the last day will be a summation and analysis of the timing and mechanism of the deglaciation. The major sessions are on (1) Timing of Deglaciation: View from the Ocean, (2) Timing of Deglaciation: Ice-Sheet Areal Extent, (3) Geochemical Evidence of Existing Glaciers: Ice Elevation, (4) Climatological Evidence South of the Ice Sheets, and (5) Climatological Overview/Evaluation. Ninety people have been invited to attend, and they virtually constitute a list of who's who in glaciology and climatology. It should be a great workshop.

The International Glaciological Society and the American Meteorological Society are hosting an interdisciplinary symposium on ice and climate modelling which will be concerned with the following topics: (1) Ice Data for the Present Climate: Continental and Marine Ice Sheets, Sea Ice and Snow Cover, (2) Modelling of the Present Climate (Atmospheric climate models, Oceanic climate models, Ice models, and Coupled models), (3) Ice and Climate Data for the Pleistocene and the Holocene, (4) Climate Modelling of the Pleistocene and the Holocene. A hundred and twenty dollars will get you into this symposium.

The National Academy of Sciences' Polar Research Board and the State of Alaska are the organizers of the Fourth International Conference on Permafrost, with the University of Alaska being the host and local organizer. Six themes have been identified as being particularly timely: (1) Pipeline construction, (2) Climatic change and geothermal regime, (3) Deep foundations and embankments, (4) Permafrost terrain and environmental protection, (5) Frost heave and ice segregation, and (6) Subsea permafrost. These will be reviewed by panels of experts. In addition there will be 350 contributed papers, including 53 Russian and 40 Chinese. If pingos and ice wedges turn you on, then you have to be in Fairbanks in July. But bring money, real money and lots of money. For a starter, registration is \$225.

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 82-83

July

No. 6

**Presidents:**

Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982

Comus Inn will again cater our picnic. This year it will be baked ham, roast turkey, chicken salad, coleslaw, 3-bean salad, potatoes au gratin, hot rolls, beverage, and carrot cake. How can you beat that for a ten spot, especially when comely lassies come across meadows and vales, and deliver it to you with a smile as you enjoy the cool mountain breezes on the slopes of Sugar Loaf!

Charlie Morrison (minus Mike Metzgar who has given up peace and happiness to go for the big bucks in the corporate world in his Dad's golf manufacturing business in California) and a bartender-to-be-named will again serve intoxicating and nontoxicating beverages at nominal prices under the sign of the Penguin in the tent pavilion under the oaks. Evening entertainment-to-be-determined, but undoubtedly a movie with some ice and snow. Sugar Loaf is only 8,924.13 miles from the South Pole, so it's just like home. Bring the kids, encourage them to get lost on the mountain, and remind them to keep their plate if they want seconds (so we won't get charged for another meal).

**DO NOT MAIL YOUR CHECK AND RESERVATION TO THE SOCIETY ADDRESS — RUTH WILL BE OUT OF TOWN!**

Take 270S past Rockville, Shady Grove, Gaithersburg, AEC, Clarksburg Exits, Turn off at HYATTSTOWN-COMUS Exit, circle under 270S, and go 3.3 miles on Route 109 to Comus. Turn right on Route 95. Drive 2 1/2 miles, proceed across paved intersection, drive short distance (1/4 mile) and turn up mountain road on your right. After another 1/4 mile, you should be close to Stronghold. First house with four white columns is NOT it, but house around the bend IS it! Parking lot this side of house in mowed area. Take your lawn chairs out of your trunk and proceed to backyard for an afternoon of revelry.

**PLEASE MAIL YOUR CHECK TO MORRISON NOW! AND PLEASE, NO UNANNOUNCED WALK-INS THIS YEAR!**

Bergy Bits is an assemblage of bits of information, some of which may actually be true, which has been gathered and given by this writer to Ruth Siple for typing for the Newsletter. We try to make things timely; we try to select items which will be of interest to various segments of our Society; and we openly solicit contributions (from people besides such faithfuls as Sayed El-Sayed, Bob Nichols, and Bud Waite), especially from those of you who are current Antarctic Activists in the field. Bergy Bits is NOT the Voice of the Society, but we hope some of you enjoy it.

**WE'RE LATE.** People have been calling, wondering what happened to their Mid-Winter picnic. Well, we checked the moon and tides and found out that Mid-Winter was coming on late this year - August 6th. Actually, we ran a very low-key Society this year, and by the time we got around to requesting a reservation at Stronghold, they had sold out June and July. We had only one Board of Directors' meeting all year, which I call a blessing, being skeptical of management by committee actions. We are late in presenting you with a slate of candidates for the new Board members and officers' for the 1983-84 season. Somewhere along the way we will have to hold our overdue annual business meeting, but the president, secretary, and treasurer being out of town at the time of the picnic, it can't be before our first meeting in the fall. But we assure you that the long absence in not sending out a Newsletter has been deeply appreciated by at least two of us, Ruth Siple and me, Paul Dalrymple. It is fun to do non-Antarctican Society things! Incidentally, your treasury is in good shape, dues will remain the same, and you can look forward to receiving your bill for 1983-84 some time around Labor Day.

**SOCIETY TOPS OFF 1982-83 WITH 434 MEMBERS.** Our membership continues to grow in spite of the fact we had no concerted recruiting campaign in the past year. However, 33 new members did find us during the year, which was certainly a plus. But we also lost 20, 18 who failed to come up with the greenbacks or resigned (Ruth Barritt, Craig Berg, Bill Consley, Ottar Dahl, Pam Dailer, Margaret Edwards, Martin Halpern, Celia Heil, Helen Hickland, Bernie Lettau, Admiral Mandarich, Bruce Poulton, Lisle Rose, Jerry Smit, Jerry Taylor, Dick Victory, Drew Victory, and Jay Zwally), and two who passed away (Carl Wyman and John Herguth). Our policy has been to separately bill everyone early in the year (hopefully bills will go out this August), and then we light candles and pray that people will respond to that first billing. We do mail out second notices plus final notices with Newsletters to those who don't come up with the bucks. If people haven't found the wherewithal to pay then, we drop them from the rolls, as we feel in this all-volunteer Society that we should not have to get down on our knees and beg anyone to stay, in the ranks.

**RONNE ANTARCTIC EXPEDITION MEMBERS PREPARE FOR GALA REUNION.** Thirteen members of the 1947-48 Ronne Antarctic Expedition are going to "reunionize" in Virginia on September 10th and 11th. In attendance will be Charles Adams, Harry and Jennie Darlington, Bob Dodson, Larry Fiske, Jim Lassiter, Nelson McClary, Donald McLean, Bob Nichols, Art Owen, Jackie Ronne, Walter Smith, and Ernest Wood. They will meet on the 10th at Nelson McClary's home in Middleburg, and then move on to the Darlingtons in Marshall on the 11th. They must be making Dick Black an honorary member of the Ronne Expedition, because the Antarctic Poet Laureate will be the keynote speaker on the 10th.

**BAE II WILL ALSO "REUNIONIZE" - OCTOBER 22, 1983.** Members of the Second Byrd Antarctic Expedition will celebrate the 50th anniversary of their departure from Newport News on the JACOB RUPPERT when thirteen members and two widows of BAE II assemble in Washington, D.C. on the 22nd of October, 1983. The moving forces behind the reunion have been Stevenson Corey and Dick Black, and they have aroused a lot of interest in their

fellow expedition men. Those being "reunionized," in alphabetical order, are Dick Black, Erwin Bramhall, Stevenson Corey, John Dyer, Joe Hill, Guy Hutcheson, Walter Lewisohn, Alton Lindsey, William McCormick, Edward Moody, Charles J.V. Murphy, Olin Stancliff, and Bud Waite. The widows are those of Alan Innes-Taylor and Paul Siple. They plan to muster at the entrance to Arlington National Cemetery at 10:30 that morning when they will lay a wreath at the monument of their late leader, Admiral Richard E. Byrd. That evening they will have a blast at a fine establishment in the District. Stevenson Corey will be their Master of Ceremonies and Charlie Murphy will present a talk memorializing the late Admiral. It's going to be a night to be long remembered as the Gallant Knights of the Golden Stalactite gather to raise their glasses one more time.

**GEOLOGICAL SOCIETY OF AMERICA RECOGNIZES POLAR CENTENNIALS ON OCTOBER 19th.** The Geological Society of America has seen the light, and will celebrate the triple anniversaries (100th of 1st Polar Year, 50th of 2nd Polar Year, and 25th of the IGY) at their 95th annual meeting in the Superdome, New Orleans, October 18-21. A symposium on "The Geology of the Ellsworth Mountains, Antarctica" has been organized by Cam Craddock, Gerald Webers, John Spletstoeser, and Mort Turner. One thing you can be sure of, it will be an artistic success if speakers select representative slides of that beautiful area. It will be a four-hour session, followed by two full hours of drinking, which would lead one to think that there is going to be a happy bunch of geologists when they shut down the bar at 7 PM. There are fourteen papers in the symposium, with only one 5-minute coffee break - how terrible! Some of the paper titles look real deadly, on such things as Cambrian mollusca, breccia bodies, and depositional environments. If anyone is still there at 4:35, they will hear "Pumpellyite-Actinolite Facies Metamorphism in the Heritage Range of the Ellsworth Mountains, West Antarctica." Geologists get turned on by the darnedest things, but if pumpellyite-actinolite facies excite them, all the more power to them and their search for more pumpellyite-actinolite facies. Our immediate past President, Pete Burrill, has been to 58 consecutive annual meetings of the Association of American Geographers. I doubt if Larry Gould can top that for the Geological Society of America.

**AN INTERNATIONAL GEOSPHERE-BIOSPHERE PROGRAM (IGBP), NOT "AN IMPOSSIBLE DREAM."**

Some of this country's most distinguished, elitist scientists have been thinking that the time is NOW for coming up with another global international program, and Dr. Herbert Friedman presented some of the current thinking on the IGBP in his presentation, "The Legacy of the IGY - One Hundred Years of International Cooperation in Geophysics and Looking Ahead," at the National Academy of Sciences' 120th Annual Meeting in Washington in April 1983. Thanks to Pern Hart of the Academy, we have a copy of Friedman's unedited presentation, and will present herein the Summary. Many of you have already heard it or have read it, but for those of you who haven't, this is how the thinking was at 9 AM on April 27th.

"The success of the International Geophysical Year (IGY) has prompted contemporary geoscientists to consider the possibility of a second generation IGY, to which we have tentatively given the name International Geosphere-Biosphere Program (IGBP). Biosphere studies were essentially neglected during the IGY but concern for the environment has heightened our awareness of the need for scientific understanding of atmospheric pollutants and biogeochemical cycles, and of the links between geophysical and biological processes.

IGBP is still an unstructured concept. It is essential that the programs planned be global in character to derive substantial benefits from international cooperation. The science involved must have strong cross-disciplinary content to connect the diversity of scientific subdisciplines that constitute the whole of geoscience.

It is possible to frame scientific programs of a global character with well

defined emphases in several major categories, i.e., solar-terrestrial relationships, lithospheric dynamics, oceans and atmosphere, and the biosphere. Within each of these major blocks of geoscience the value or organized international cooperation is unquestioned. In each major block many special projects are already planned or under serious discussion. The question we raise is whether a general umbrella plan for all of these major blocks of geoscience can be formulated to enhance the cross-disciplinary exchange of ideas in such a way that the totality of scientific progress will be greater than the sum of the constituent parts.

If we search for cross-disciplinary connections they turn out to be more common than uncommon. Let me offer some examples, using such widely separated elements as the sun and the earth.

- o We learn about the interior of the earth from seismology. In the past decade, solar physicists have taken their cue from seismologists and used observations of solar vibrations to learn about the interior of the sun.
- o NASA has on the drawing board a project called "Starprobe" which will approach within four solar radii in a highly eccentric orbit and measure the mass distribution of the solar interior just as geosatellites have done for the earth and lunar orbiters for the moon.
- o Solar magnetism is related to its internal spin and convection much as we believe terrestrial magnetism derives from rotation and convection in the earth's liquid core. Solar magnetism reverses every 22 years, terrestrial magnetism every million years. The similarities, in principle, of the physical processes are impressive.

Unlike the IGY, which was planned to run less than two years, the IGBP must be designed to cover one or two decades because many of the natural geosphere-biosphere cycles are that long or longer.

IGY contributed greatly to international understanding, but the stimulus for international cooperation has been wearing thin over the years. I believe we should try to revive it again."

**OUR ALICE IN WONDERLAND OR EVERY DATER HAS HER DAY.** Alice Dater, whose late husband, Harry, was Mr. Antarctic Society for many, many years, as well as being an outstanding Antarctic historian, has hung it all up at Sidwell Friends School after some thirty-nine years and three months of teaching sixth-graders. It wasn't Alice's idea to retire - she feels she was just getting warmed up and had many more useful years. The school - not Alice - is celebrating its 100th anniversary this year, and where Alice is a cornerstone at Sidwell, they established Dater Day on April 29th. The kids were told that Alice would like to see them all dressed up in coat and ties, and dresses, although this proclamation was issued without Alice's signature. At noon someone suggested to Alice they go to the cafeteria for lunch. She vetoed that idea, saying it was always too noisy there for enjoyment. Her veto was overridden, however, and Alice walked in to a large reception which included her younger brother from Maine, her son and daughter-in-law from New Hampshire, and an endless sea of sixth-graders. They had a quartet playing-18th-century music, although Alice vehemently denies she was alive during that historic period in our history - we'll check on this later. Then that evening Alice had a dinner engagement with a friend for some Chinese food, and lo and behold, she walked into another reception. A hundred people were there, including her brother, Elliot from Columbus, Ohio (who just happens to be a Society member). As if this wasn't enough, they had a third reception on June 7th, just to be sure that Alice realized she was really supposed to retire. They gave her all sorts of goodies, and when we last talked to Alice she was knee-deep answering letters from across the country. What is she going to do? Well, for one thing she's going to the Antarctic this winter on the WORLD DISCOVERER, and this will help eliminate

the heartburns over losing all of those sixth-graders. People on the WORLD DISCOVERER are going to enjoy Alice, too, as she is a sweetheart.'

**SEX IS HERE TO STAY, AT LEAST AT THE SOUTH POLE.** Parade Magazine's Michael Satchell told Sunday readers on June 5th that four out of five wintering-over women had "sexual relationships with one partner for the year." I dare say that's a higher batting average than for a comparable group working in my area at Ft. Belvoir! I don't believe anyone ever wrote that coldness or darkness numbed one's feelings, and to the best of my knowledge, sex has never really killed anyone. It is probably as good an outlet as any to make time pass. But I wonder how the other seventeen red-blooded guys must have felt and how it must have affected morale? My ex-roommate at the South Pole was the very virile Mario. Giovinetto, and if he had been there with women and among the outside group he would have slashed his throat or torn down the camp. Even without women, he used to punch holes through walls! It's no great secret that the South Pole hasn't been the same since women came to stay, and that there have been some pretty serious personnel problems there in the past five years. I advocated in Bergy Bits back in November 1978 that the whole camp be of women, writing, "If one woman can have fun there, think of all the fun that 18 of them can have there with no men to bother them from February to November." Dick Cameron has since echoed this feeling in interviews to various reporters. I still think it's a great idea. I also still think that most men would prefer to be in an all-male camp than in a bisexual camp; life is so much easier when you are with birds of the same feathers, whether you are at the South Pole or out on the golf course. Satchell quoted Kathy Covert as saying that "I feel there's a certain wistfulness on the part of some older veterans. For them, it's the closing of an era." She could have been quoting me as the title of my piece about women in Antarctica back in 1978 was "The End of an (Great) Era." But at least I admitted defeat, that women were here to stay, and that those chosen were undoubtedly the best qualified. However, that still doesn't mean that I think it's a good policy at the South Pole where there isn't any real outlet when you want to get away from your troubles. At the coastal stations, I see no great problem, whether women are there or not, because one can nearly always get outside of camp and go for a walk when you are upset. I don't have much knowledge about what goes on at the South Pole, but I do have a few connections outside of DPP who tell me about the trials and tribulations, enough to know that not everything in that article about women at the South Pole was the gospel truth. And as for George Denton and Lyle McGinnis, hang in there - at least you both knew it "when"!

**"LIFE WITH FATHER" PLAYS WELL ON THE ICE.** Old John Annexstad, a tried and true male chauvinist who believed in Antarctica for men, found himself caught between his old convictions and changing his way of thinking about Antarctica when his daughter, Kristine, began asking questions about what he really did in Antarctica. The light at the end of John's Antarctic tunnel turned out to be Kris, and they went south this past austral summer to extend the triangulation line which John had set up west of the Allan Hills in 1978. Kris, the athlete in the family, had a great time and wrote us, "I fell in love with the Antarctic and I do want to return, but I can never return without my father because since the day I was born the Antarctic has been him as much as he being the Antarctic. Now, this is even more so because the Antarctic, to me, was an expedition with my dad and seeing the Antarctic through his eyes." Well, that is just great, Kris, but one should never say "never." Besides, your old man is getting older and you don't want to cut off your bridges behind you! Kris wrote all about it in April's Sallyport (what is a Sallyport?), Rice University's Alumni newspaper. She found that she was a cause celebre wherever she went, even being interviewed by Hugh Downs of 20/20. Kris and John didn't have great weather while in the field, being able to work on only 10 of the 30 days. They did extend John's triangulation network by an additional 25 stations, and Kris did fulfill a long-time dream of having a White Christmas. She also saw four-foot-high sastrugi. Which makes me ask just how high do

sastrugi grow? Ed Hillary told us after arriving at the Pole in 1957 that they had come across some six-foot high, but I wasn't certain whether this was after or before their daily allotment of grog. Kris ended her article in Sallyport with the following two paragraphs which seem to say, show me the way, I want to go back, with or without the old man!

"In retrospect, my close calls with frostbite, the days when the sleeping bag would not get warm, the endless reading, and the never-setting sun adding to the monotony and frustration of having only one other person to talk to sum up the bulk of my expedition. But when I recall my appreciation of the small pleasures, like returning to New Zealand, stepping off the C-130 plane to moisture in the air, the color of life, the gardens and warmth of Christ Church, I would work in the Antarctic all over again.

When I remember how, after we had been cooped up in the tent so long, the wind ceased, allowing us to take a 'walk around the block' going nowhere in particular, I would go again. When I remember coming into the tent after ten hours of wind, snow, and sun to a small Svea stove and hot boiled chicken, or our enthusiasm over hearing a voice on the sideband twice a day for survival check-in and forming a radio camaraderie, I would go again. Finally, when I recall my heartbreak as our plane landed in Houston and my tears walking up the ramp arm-in-arm with Dad, realizing the expedition was over and it was no longer just the two of us, I know I would go again."

Kris will forever remain the answer to at least two Antarctic trivia questions, (1) who was the first daughter of a US scientist to accompany her father out into the field?, and (2) who was the first female volleyball star to attempt to read The Rise and Fall of the Roman Empire while driving a snowmobile and triangulating at Allan Hills?

**POLAR SURVIVAL - THE HARD WAY.** Theodore Shabad, one of the New York Times correspondents who served in Antarctica, revealed to the public on April 26, 1983 that 20 men survived for 227 days after a fire destroyed the power plant at Vostok. I have it from a reliable source that the United States knew about the fire shortly after it had occurred and were standing by ready to make an emergency flight to Vostok with another generator. But the Russians never asked for help, wanting to tough it out, and tough it out they did. The 20 men doubled up on bunks in three small rooms, with the only heat being supplied by a small kerosene heater. A worn-out diesel engine used on an ice core drilling project was used to send out faint communication messages. A scrapped diesel unit was repaired in the next two months, but there still remained a shortage of power. Some heat was provided by candle-like devices consisting of wicks dipped in diesel fuel. Faces of the men were said to be lined with carbon particles embedded in the skin. The fire occurred early on the morning of April 12, 1982, when, a mechanic smelled smoke at 4 AM. The temperature outside was -75°F, and there was a strong wind. Fire extinguishers did not function in the cold and they had no smoke masks. One engineer was killed in a vain attempt to save the diesel units. They lost their three main diesel generators, and also the standby generators. It must have brought back sad memories of when the Russians lost eight meteorologists on August 3, 1960 when the Met building at Mirny caught fire. Fire is certainly Public Enemy Number 1 in the Antarctic.

**WHOSE IS THE "JOURNAL OF POLAR HISTORY"?** We wanted to find out who the new kid on the block was, so we wrote them (Polaris Publications, P.O. Box 8089, Bangor, Maine 04401) and asked them, "Who are you, anyway?" Well, this has stimulated an exchange of correspondence with Stephen Carter Jackson, who is the editor of this forthcoming journal. Steve is really an arctic man, an adventurer who has spent considerable time since 1975 backpacking and exploring the Canadian Northwest Territories. In

his younger days, he was with, the Park Service. He seems to have a lot of enthusiasm, has a very international approach, to the scope of the journal, and is somewhat wary of Antarcticans whom he feels are sort of a club set unto themselves. I have tried to convince Steve that Antarcticans are actually human beings and that we have a place in society, even to the extent of being useful in helping him get his new publication off to a great start. I hope that Steve has actually contacted some of you about serving on his Board of Directors/Governors/Whatever, and I also hope that some of you have agreed to serve in some sort of an advisory capacity. The Journal will be standard 6"x9" book size, running 400-416 pages, will be profusely illustrated with all original photos and art work, and will be printed on archival 60lb paper. He plans to start with printing 3000 copies. The first issue is shaping up pretty well, and I think pure historians will be interested in its contents. When I first wrote Steve back in April, he had not really been in touch with the Antarctic community in the United States, but he does plan on meeting with certain members of the Washington crowd late this summer or fall. This (Journal of Polar History) is a tremendous undertaking and I think Steve is smart enough to realize that he can use all the help he can get. We wish his Journal well, and I hope he takes advantage of the polar scientific man-woman power within our Society. The semi-annual publication is selling for \$50, a lot of clams, and let's hope it justifies those bucks and has a long and distinguished career.

**GONE BUT NOT FORGOTTEN - A NEW BEAR HITS THE WAVES.** The US Coast Guard, which has a long record of knowing how to do things right, commissioned the Cutter BEAR on February 4th of this year in Seattle. She was named for the famous polar steam barkentine BEAR which was built in Dundee, Scotland in 1874 and purchased in 1884 by the US Government to rescue survivors of the Greely Expedition. The original BEAR was 199 feet overall in length, of heavy oak construction, and powered by a compound reciprocating steam engine which produced 300 horsepower. In 1886 the BEAR was transferred to the Treasury Department for use in the US Revenue Marine's Alaskan Patrol, where she served with great distinction for the next forty-one years. She was legend in the lusty, brawling, new territory of Alaska, and it was from her decks that reindeer were introduced into Alaska. The BEAR's most dramatic rescue was the Overland Expedition which was launched in the winter of 1897 to bring relief to the Alaskan whalers frozen in the ice off Point Barrow. They put ashore a party of men who made an epic dog sled trek over 1600 miles of frozen Arctic wilderness, arriving in Point Barrow in time to save the survivors of eight trapped vessels from almost certain starvation, providing shelter and medical attention until the BEAR was able to break through the ice and lead them out. She later served with distinction on the Second Byrd Antarctic Expedition, making trips to the Bay of Whales in both 1933 and 1935. Leland Barter, Ed Roos, and Gordon Fountain of our Society all served on the BEAR. Gordon was one of three former members of the BEAR - the only Antarctic - present for the commissioning of the new 270-foot Medium Endurance Cutter BEAR. He wrote that "it was a very moving ceremony, and the speakers duly impressed all hands with the fact that they had a great responsibility to live up to the good name and deeds of the old ship." The new BEAR has a cruising range of 3850 nautical miles at maximum speed, or 6370 NM at 15 knots, and can carry a crew of 109 officers and enlisted personnel. She was christened with two bottles, the first being one containing water from the Bering Sea, and the other the traditional bubbly. She is the first of four look-alikes being built by the Tacoma Boatbuilding Company, and then there will be nine more built for delivery by 1987 by Robert Derektor Company of Middletown, Rhode Island. The BEAR is powered by two 3500 horsepower diesel engines driving controllable pitch propellers. She is based out of Portsmouth, Virginia, where she is involved in policing and interception of drug trafficking from the Caribbean.

**A TRIBUTE TO NESTOR BOTTINO (1925-1983).** Sayed El-Sayed sent us a very touching eulogy on Nestor Bottino which we felt should be included in total:

"It was in the late '60s that I first met Nestor Bottino. At that time a group of us at ASM were trying to put together an integrated program to study the Antarctic marine ecosystem. When we realized that we needed someone to do a lipid study of fauna (particularly the crustacean, krill) and flora, Dr. Raymond Reiser of the Biochemistry Department suggested that I get in touch with Nestor, who was interested in this field of research.

Nestor accompanied us on three cruises to the Antarctic. I have extremely fond memories of those cruises, of the veteran members of those scientific trips and, in particular, Nestor. He added a lot to those cruises with his joviality and exuberance. During the often dreary nights, while the ship was plying the waters of the Southern Ocean, Nestor introduced an element of culture on the ship'. Instead of the triple-X rated movies that were the sole entertainment on the Navy ship, Nestor provided the ship's scientific party with some relaxation in the form of poetry, guitar music (he was an accomplished guitarist) or Gregorian chants. I well remember his staying up at night, working in his uncomfortably located lab near the bow of the ship, with one of his graduate students, while listening to classical music or Italian opera. Being the gregarious type - he was fond of people from all walks of life as a result - he particularly liked a line from "La Boheme:" "La compagna esta stupenda." This line became the motto of the cruise, as it described his fond attachment to the people surrounding him. For years after the cruise, this phrase was a constant refrain in our conversation, and when he was in an exuberant mood he would change it slightly, using the Italian superlative, "La compagna esta stupendissima!"

Nestor, a man steeped in the knowledge of many cultures, made valiant attempts during these Antarctic cruises to learn a few Arabic sentences so he could converse a little with his numerous Arab friends. Long after the cruises were over, and until two weeks ago at the International Food Festival on the ASM campus, Nestor always greeted his Arab friends with the two Arabic words he was fond of saying: "Ya Habibi! Ya Habibi!" (Oh, my loved one! Oh, my loved one!). Given his enthusiasm, it is not surprising that some of his Arab friends tried to convince him that his ancestors must have come from somewhere in the Middle East, since the name Bottino is close to the Arabic name Abou-Tina (salt-of-the-earth).

In Nestor's death, the scientific community in general, and the Antarctic one in particular, lost a first-rate scientist, a well-respected educator and a highly dedicated, professional teacher. We will truly miss his sense of humor, his exuberance, his joie-de-vivre and all those warm personal traits that endeared him to his many, many friends. Our Habibi was truly the "salt of the earth."

**A LITTLE BIT OF SCIENCE.** From 22 April 1983, "Behavior of Antarctic Krill, *Euphausia superba*: Chemoreception, Feeding, Schooling, and Molting," by William Hamner, Peggy Hamner, Steven Strand, and Ronald Gilmer. Abstract. Krill do not feed by passive, continuous filtration but use area-intensive searching and various rapid feeding behaviors to exploit local high food concentrations. Chemicals alone at low concentrations, not particles, trigger feeding. Krill form dense schools that move rapidly and migrate primarily horizontally. Abrupt disruption of a school can trigger mass molting, and molts may act as decoys. From 3 June 1983, "Variability of Antarctic Sea Ice and Changes in Carbon Dioxide," by H. Jay Zwally, C.L. Parkinson, J.C. Comiso. Summary. A definitive long-term decrease in the extent of antarctic sea ice is not detectable from 9 years (1973 to 1981) of year-round satellite observations and limited prior data. Regional interannual variability is large, with sea ice decreasing in some regions while increasing in others. A significant decrease in overall ice extent during the mid-1970's, previously suggested to reflect warming induced by

carbon dioxide, has not been maintained. In particular, the extent of ice in the Weddell Sea region has rebounded after a large decrease concurrent with, a major oceanographic anomaly, the Weddell polynya. Over the 9 years, the trends are nearly the same in all seasons, but for periods of 3 to 5 years, greater winter ice maxima are associated with lesser summer ice minima. The decrease of the mid-1970 's was preceded by an increase in ice extent from 1966 to 1972, further indicating the presence of cyclical components of variation that obscure any long-term trends that might be caused by a warming induced by carbon dioxide.

**PEOPLE WILL BUY ANYTHING.** The New York Times Book Review section, under "And Bear in Mind" lists "The Birth of the People's Republic of Antarctica" by John Calvin Batchelor, a Dial Press publication of this spring which is selling for \$16.95. According to the Times Book Review of May 29, 1983, "The book begins in the known world. Grim Fiddle (the Swedish-American narrator and hero) is the bastard fruit of an apparently random encounter in 1973, at a Stockholm bar called The Mickey Mouse Club, between an American draft evader and a local girl who seduced him in a phone booth." And the book goes downhill from there, until Grim "sails ever southward to new reunions and losses and the bloody achievement of power in Antarctica, where he wins a kingdom and a dangerous bride and almost loses his soul." I guess the reason a book such as this sells can be found in the quality of the television shows being offered to the public. Shackleton must be turning in his South Georgia Island grave over this book which uses that same island for part of its setting. The author was born in Bryn Mawr, which probably explains everything, as good common folks aren't really from Bryn Mawr, are they?

**JAMES N. BARNES, PUBLIC INTEREST ANTARCTIC LAWYER, THE ANTARCTIC PROJECT.** We wrote The Antarctic Project (624 9th Street, N.W., 5th Floor, Washington, DC 20001) and asked them to give us information on who they were and what they were up to, and we got a very nice letter back from Jim Barnes, who is The Antarctic Project, along with a copy of an outstanding publication, resplendent with glorious colored prints by Eliot Porter, Let's Save Antarctica, published in 1982 by Greenhouse Publications in Victoria, Australia. Jim has been a public interest lawyer in Washington for the past twelve years, working mainly on environmental issues. He worked, starting in 1977, at the Center for Law and Social Policy, a non-profit outfit supported by the Ford and Rockefeller Foundations, specializing in the international environment. In that position he represented environmental and conservation organizations before Congress and various government agencies, and was also a public member of numerous State Department negotiating teams on treaties, including several Antarctic delegations. He helped negotiate the Convention on the Conservation of Antarctic Marine Living Resources. In 1978 he helped set up a coalition of organizations from all over the world to focus attention on the developing "rush for riches" in the Antarctic. This is called the Antarctic and Southern Ocean Coalition (ASOC) and has 130 members in 23 countries. One of their goals is to work for protected status for the region, often called a World Park, Preserve, or Heritage Monument (for which petitions are available). Jim has also worked closely with the International Union for the Conservation of Nature and Natural Resources (IUCN) and the World Wildlife Fund (WWF) during the last few years, serving as a member of the IUCN's Law Commission. Jim and his associates have tried to attend each major resource-oriented conference of the Treaty Parties during the last five years, to lobby delegates about protection of the environment and to prepare a newsletter called ECO. But unlike all the other international negotiations that deal with the environment, Antarctica meetings are closed to the public and to the observers from conservation and environmental organizations. However, Jim hopes that policy will eventually be reversed.

**USGS PRESENTS PUBLIC SYMPOSIUM ON POLAR RESEARCH, WASHINGTON, D.C., 12-14 OCTOBER 1983.** The US Geological Survey is celebrating the triple anniversaries (100th of 1st Polar

Year, 50th of the 2nd Polar Year, 25th of IGY) this fall with a three-day public symposium on polar research conducted by their people. This will take place in the Auditorium of the National Academy of Sciences at 2101 Constitution Avenue, 12-14 October. The first day and a half will be devoted to the Antarctic - 28 papers; the afternoon session on the 13th and the sessions on the 14th will be on the Arctic - 24 papers. The National Academy of Sciences Polar Research Board is also going to meet here in Washington that week, 10-11 October, and we expect that our Society will take advantage of the great influx of polar types by holding a meeting with a speaker of interest to geologists. It could be that an effort will be made to get Antarctic IGYers in to town that week to see how many are still speaking to one another. We're in the process of investigating this.

**BUD WAITE, AN INDESTRUCTIBLE OLD WARRIOR.** Amory H. "Bud" Waite (3248 Valencia Drive, South Venice, Florida 33595) was in the hospital last month. They took the top off old Bud's bladder, and with it "the complete tumor so that all repeat all cancer has been removed." He is on simple antibiotics, down ten pounds, and looking forward to raising a little hell at the 50th anniversary of the Second Byrd Antarctic Expedition. Bud is a real fascinating guy to talk to, but almost impossible to follow on paper as his brain is so far ahead of his typing speed. He probably comes closer to being an unsung hero than anyone I know, as his pioneering research in radio echo sounding opened the way for taking airborne, measurements of the depths of snow and ice. However, Bud is probably more proud of being a member of the rescue teams, all three of them, which were formed to go out to Advance Base to get the Admiral back in 1934.

**ERRATA, AN EYEWITNESS ACCOUNT OF HAIRY APPENDECTOMY AT LITTLE AMERICA V.** In one of our last Newsletters, we did a little reminiscing about an appendectomy at Little America V which was sort of a comedy of errors, even though the patient, a man of great intestinal fortitude, somehow overcame the frailties of those involved in the operation and actually lived to tell about it. Now my friend, Dr. Muckluck Milan of the Institute of Biology at the University of Alaska has written me the true story - enjoy it!

"The dentist served well throughout the entire 4-hour procedure as the anesthesiologist. Initially, the patient was given a shot and the incision was made. But that material had been frozen and thawed so many times that it didn't work. So the Doc then used an ether drip. The patient had come out of the first anesthesia and was experiencing mania as he was put down through the various planes of anesthesia to get him unconscious again. I was called in to act as the 'Dirty Scrub Nurse'. Of course, all heat had been shut off in the fear of an explosion. My only job was to start a drip going in the foot and to pick up dropped tools, etc. I remember that one of the Navy medics was experiencing problems. The patient's guts were boiling out of the incision during his struggling, making the operative field very clouded. Meanwhile, the dentist called off the time since the beginning of the operation, 'It is now three hours, Doctor!' And the dentist did a good job."

**AMERICAN GEOPHYSICAL UNION THINKING POLAR.** Frank Eden, National Science Foundation, who is also serving for the next two years as chairman for AGU meetings, is considering having polar sessions at their biannual meetings. He hopes to inaugurate this idea at the December meeting this year in San Francisco, having a Union session of invited papers on polar research. This should be of interest to our many members in the Bay Area, as there are more Antarcticans per hectare around Palo Alto than anywhere else (except the Greater Washington area). If this session becomes a reality, perhaps a west coast Antarctic Society meeting should be held in the same time period. Why not?

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET

ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 83-84

August

No. 1

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.), 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84

*Orientation Week Special*

*ANTARCTICA AND ITS RELATION TO THE GLOBAL ICE AGE*

by

Dr. George H. Denton  
Department of Geological Sciences  
University of Maine  
Orono, Maine

Wednesday, September 14, 1983

8 PM

National Science Foundation or National Academy of Sciences  
Washington, D. C.

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982

Dr. Denton is one of Antarctica's Good Old Boys, who has worked in Antarctica sixteen different summers. One of his former professors, Bob Nichols, introduced him to the Antarctic by making him "earn it the old-fashioned way" -by manhauling sledges. He is considered one of the world's leading glacial geologists on Antarctica. Dr. Denton, formerly on the staff at Yale University, has found peace and happiness at the University of Maine. Don't miss this lecture! It will be a great one!

*The Annual Memorial Lecture for 1983 will be presented by R. Tucker Scully of the Department of State on October 12, 1983 in the Main Auditorium of the National Academy of Sciences, 2101 Constitution Avenue NW, Washington, D.C. The title of the Lecture is "The Future of the Antarctic Treaty System." We are hoping for a record attendance with the Polar Research Board and the USGS polar geologists in town that week. Mark it on your calendar NOW!*

IGY Antarctic 25th Reunion, October 14-15, Washington, D.C. (see p. 7-8)

This Newsletter is going to be short, as time is fleeting and we have to get something out tout de suite announcing our upcoming meeting on September 14th. At press time we do not have a hall, but by mailing time we will have confirmation for our Washington area residents. This issue is sort of a special one, being devoted to something new, for us - a bibliography of Antarctic fiction. We are deeply indebted to one of our Society members, Fauno Cordes of 355 Arballo Drive, San Francisco, California 94132, for making her bibliography available to us all. I wondered why she liked Antarctic fiction until I learned where she worked - Mt. Zion Hospital Nuclear Medicine. She really needs fiction, a lot of it! Once upon a time, April 1981 to be exact, we ran a listing of Rob Flint's favorite books, which included some fictional choices. These are being repeated following Fauno's in order to have them all in one Newsletter.

**FROM FAUNO CORDES.** April 12, 1983. "I would be thrilled to have my bibliography printed in the Newsletter. I have read all the books except for James Fenimore Cooper (excerpts only) and D.C. Poyer. / I have all but six in my own library. I found one of the six in the library of the University of Arizona with Laurence Gould's bookplate in it! / I can honestly say that some of the books on the list are the worst that I ever have read. A couple of them are excellent. Most are mediocre. I don't know of any other continent that has been so abused. / I have been amazed that there is no Jack London or even Alistair MacLean of the South. I have spent my whole life with MDs and PhDs, and learned early that scientists have an artistic side. It seems strange that none of the Antarcticans has taken up pen in the tradition of Isaac Asimov or Fred Hoyle. It is even stranger when you consider that most of their autobiographical books are well written. / I do hope that my list will inspire someone to take up a pen and write the great Antarctic novel. The public needs some good information."

August 2, 1983. "A Fall printing sounds great .... The interesting news is [that] Charles Neider just finished the Antarctic novel he has been working on for eight years. I hope I get some additional items from the membership."

August 7, 1983. "I just finished reading the July Newsletter and I would like to comment on the review of 'The Birth of the People's Republic of Antarctica.<sup>1</sup> / It is one of the latest additions to my bibliography of Antarctic fiction. I hate to tell you this, but it is one of the better books on my list. Aside from the coordinates of the map on page 174, the factual information, which then becomes fictionalized, is fairly accurate. / A good well-written novel on the Antarctic will stir public opinion far more than 'Let's Save Antarctica.' Since the current treaty is about to expire, it may be important to stir the public. Meanwhile, until Charles Neider's novel is published, John Calvin Batchelor is the best Antarctic novelist around. / For a really bad recent Antarctic novel, I would like to recommend 'Fire Below Zero<sup>1</sup> by Nico Mastorakis and Barnaby Conrad. If that is not available, try 'Down To A Sunless Sea<sup>1</sup> by David Graham. After you read any of the above, I think you will agree that the Antarcticans should demand better representation in the literary field."

*The Emerging Face of a Continent - A Bibliography of Antarctic Fiction*

Antarctica is the last continent to have been discovered. It took about 150 years of exploration for the true image to emerge from the mists and

mirages. Charts of the coast were made, disputed, and resurveyed. The inland areas were photographed from the air with special cameras.

During this time, fiction writers grasped what few facts and quotes were available. They wove tales of fact and fantasy for child and adult. Many of them hoped desperately for a warm, inhabited Antarctica. The resulting stories fall into these categories; fantastic high adventures, and stories based on historic expeditions.

This bibliography does not include autobiographical poetry, historical novels, and children's penguin stories.

I would be grateful for any additional titles or information.

PRE-SCOTT: Most of the stories written before the Scott Expedition of 1902 are fantastic high adventures.

- 1829 (revised) *The Rime of the Ancient Mariner* by Samuel Taylor Coleridge. A ship sailing in the Southern Ocean is cursed when a mariner kills an albatross, a pious bird of good omen.
- 1837 *The Narrative of Arthur Gordon Pym of Nantucket* by Edgar Allan Poe. The survivors of a sailing ship mutiny drift southward beyond Bennett's Island (82°50'S, 42°20'W). They discover that the warm polar, islands are inhabited by a black people.
- 1849 *The Sea Lions* by James Fenimore Cooper. Two rival schooners named "Sea Lion" search for a mysterious sealing ground in the Antarctic Ocean.
- 1869 *Twenty Thousand Leagues Under the Sea* by Jules Verne. Captain Nemo, using the submarine "Nautilus" as an icebreaker, cuts the polar circle at the 55th meridian. He sails for the South Pole, an island separated from a continent by a canal. Poe's Narrative is mentioned.
- 1888 *A Strange Manuscript Found in a Copper Cylinder* by James de Mille (published posthumously). The poles of the earth are flattened and nearer to the hot core than the lower latitudes. The south polar lands, and vast inland sea are therefore warm. A marooned seaman discovers and lives with a group of Troglodytes, one of several native polar peoples.
- 1894 *Centuries Apart* by Edward T. Bouve. A 19th century U.S. Army expedition is blown south of Africa. They discover a warm current which flows south into an open polar sea. A large colony of 16th century Englishmen is found living on a large polar island.
- 1899 *The Wreck of the South Pole* by Charles Curtz Hahn. A shipwrecked mariner discovers a warm South Pole and inland sea inhabited by a telepathic civilization. A sudden precession of the poles causes a world-wide catastrophe.
- 1901 *Beyond the Great South Wall* by Frank Savile. A British Lord inherits several 16th century Mayan artifacts which lead him to undertake an expedition to an active volcanic Antarctica. There, in an area south of Bovet's Island, he discovers mummified Mayans, gold utensils, and a live Bronto-saurus excelsus. The title page etching depicts a walrus. Borchgrevink is mentioned.
- 1901 *The Great White Way* by Albert Bigelow Paine. The central heat of the Earth is brought to the surface by oblation of the poles. A civilization, similar to the Incas, lives in a warm central Antarctica. The story is based on Borchgrevink<sup>1</sup>'s report of a warm current below 71°S flowing from the direction of the South Pole.

1906 *Au Pole Sud A Bicyclette* by Emilio Salgari. [This story possibly was published in 1909 under the name "Una Sfida Al Polo."] An American and English expedition to the South Pole starts from Baltimore to settle a gentlemanly wager. A bicycle team pedals from the base of the peninsula to the pole. A great deal of factual, historical, and fanciful polar information is presented and is augmented by interesting engravings.

POST-SCOTT: Stories based on incidents during historic expeditions and whaling adventures begin to appear.

1928 *Over the Polar Ice* (Andy Lane series) by Eustace L. Adams. A teenage aviator flies from New York to the South Pole and back.

1930 *Lost at the South Pole* (Ted Scott Flying series) by Franklin W. Dixon. A young aviator is involved in a race to become the first to fly over the South Pole. Base camp is presumably near to where the Queen Maud Range is joined by Carmen Land. The hero is attacked by a great auk.

1931 *South of Zero* by M. I. Ross. A boy stows away on an expedition ship bound for Ross Island. Most of his adventures are based on incidents of historic expeditions.

1931 *Bird Life at the Pole* by Wolcott Gibbs. Mr. Herbst, a newspaper publisher sends Commander Robin, a Junior League girl, and ship "Lizzie Borden" to Antarctica.

1933 *Unthinkable* by Francis Sibson. The South African Antarctic Expedition is marooned in Antarctica. Their struggles for survival are based on the exploits of Shackleton and Campbell. The theme is anti-airplane.

1934 *Whalers of the Midnight Sun* by Alan Villiers. A Tasmanian boy stows away on a whaler bound for Antarctica. The Captains discovers a passage at the foot of Graham Land, proving that it is an island.

1935 *Dian of the Lost Land* by Edison Marshall. Scientists find tribes of Cro-Magnons and Neanderthal living in a warm Antarctica. The continent had been connected still to South America and Africa at the end of the Pleistocene. Inspired by a Byrd quote.

1938 *Last Port of Call* by Heinrich Mauser. A married man leaves his family in Germany, boards one of the last sailing ships in Copenhagen, and sails for Australia via the Southern Ocean.

1946 *The Man Who Missed the War* by Dennis Wheatley. An engineer, who designs trans-Atlantic shipping rafts, and a stowaway drift to Antarctica. Landing at 67°30'S, 77°10'E, they discover a warm valley inhabited by Leprechauns and Atlanteans who are influencing the outcome of World War II.

1949 *White City* by Paralee Sweeten Sutton» A young couple, lost in a small airplane, discovers a luxurious<sup>1</sup>, centuries old, civilization in Antarctica. The inhabitants live by a lake kept ice-free by hot springs. They use thought transference and universal communication.

1949 *The Survivors (The White South, Calling the Southern Cross)* by Hammond Innes, The whaling factory ship "Southern Cross" is beset by ice and a ruthless killer in the Weddell Sea. Based on Shackleton's 1914 expedition.

POST-IGY; The "warm Antarctica" story disappears and the world-wide catastrophe story increases.

1956 *We Were There With Byrd at the South Pole* by Charles S. Strong. A boy goes

- south on the whaler "Larsen" and joins the Byrd expedition at Little America.
- 1960 *Antarctic Raider* by W.R.D. McLaughlin. A German warship sails to the Antarctic to seize Norwegian and British, factory ships. These are found at approximately 60°S and within two time zones west of the Greenwich meridian.
- 1962 *The Disappearing Island (A Grue of Ice)* by Geoffrey Jenkins. The former commander of the British Naval forces based on Deception Island is taken aboard the factory ship "Antarctica." He is the key to unravelling wartime mysteries involving Bouvet and Thompson Islands.
- 1963 *Secret Under Antarctica* by G. R. Dickson. A boy goes to Antarctica as an assistant to his scientist father. Under the ice, he discovers a submarine yacht which houses the Tropic movement to reassemble Gondwanaland.
- 1964 *Quick, Before It Melts* by Philip Benjamin. A journalist from Sage Magazine is sent to the Antarctic to report on the IGY. Wending his way through raucous adventures, he engineers a spectacular "scoop."
- 1965 *Forbush and the Penguins* by Graham Billing. A scientist lives alone in an historic hut to study penguins.
- 1967 *My Boy John Went to Sea* by James Marshall. A boy ships out on his father's whalecatcher. The catcher crew tries to tow a blue whale during a fierce storm.
- 1970 *The Survivor* by Thomas Keneally. The survivor of an Antarctic expedition returns after a grave is found. It contains the remains of the man he abandoned forty years before.
- 1970 *Cape of Storms* by John Gordon Davis. A nurse and a marine biologist ship out from Capetown aboard the All England Whaling Company factory ship "Icehammer" and catches "Fourteen." Racial violence plagues the voyage and return to Africa.
- 1971 *The Ice People (La Nuit Des Temps)* by Rene Barjavelo. A French Antarctic expedition finds the remains of a 900,000 year old civilization under the south polar ice cap. A woman, Elea, is awakened.
- 1971 *Miss Bianca In the Antarctic* by Margery Sharp. Two mice go to the Antarctic to rescue a Norwegian poet. They are imprisoned by a polar bear cub on an exchange visit and, in turn, are rescued by Adelie penguins, an Emperor penguin, and a helicopter.
- 1975 *The White Ship* by Ian Cameron. In 1819, the brig "San Delmar" was wrecked on Candlemas Island, an active volcanic island in the South Sandwich archipelago. In 1974, a young graduate historian is possessed by one of the passengers of "San Delmar." She induces the British Antarctic Survey to send an expedition to the island.
- 1976 *Leviathan* by John Gordon Davis. The director of Magnus Oceanics takes his ship and crew to the Antarctic to blow up the Russian factory ship "Slava."
- 1978 *Victim of the Aurora* by Thomas Keneally. The news media member of the New British South Polar Expedition is murdered. The episodes are patterned after the saga of Scott's last expedition.
- 1979 *Icequake* by Crawford Kallian. Solar flares in 1985 cause loss of Earth's magnetic field. The Antarctic icecap surges and scientists try to escape the breakup.
- 1979 *The Better Angels* by Charles McCarry. A President of the United States orders the assassination of Ibn Awad of Hagreb. As an aside, the children

of President Lockwood's right-hand man tour the Antarctic aboard their stepfather's yacht.

- 1980 *Storehouses of the Snow* by Edwin Woodard and Heather Bischoff. The south polar icecap is breaking up following a sudden increase in the tilt of the Earth's axis. Volcanic eruptions occur at Deception Island, trapping the research vessel "Quest." The cruise ship "Sinbad" is beset by ice in the Lemaire Channel. Palmer Station is destroyed by earthquakes.
- 1981 *Down to a Sunless Sea* by David Graham. The Earth is in a state of chaos and nuclear war. The planet's axis is tilting and Antarctica will become warm. Two plane loads of refugees flee to McMurdo Station.
- 1981 *White Continent* by D. C. Poyer. I have been unable to locate a copy of this book.
- 1981 *Fire Below Zero* by Nico Mastorakis and Barnaby Conrad. An industrialist, born of eight parents, discovers the fatal flaw in the U.S.-U.S.S.R. Project Nova. He arrives at the laboratory base in Enderby Land in time to prevent the destruction of Earth.
- 1982 *Winter of the White Seal* by Marie Herbert. A young 19th century whaler is marooned on Livingston Island and finds companionship with a baby white seal.
- 1982 *Sur* by Ursula K. Le Guin. Using "Yelcho" as an expedition ship, a group of South American women travel to the South Pole in 1909-10.
- 1982 *The Aquarius Transfer* by Robert Joseph. A devastating drought has dried California. An iceberg is towed to Point Mugu by a converted supertanker.
- 1983 *The Birth of the People's Republic of Antarctica* by John Calvin Batchelor. Skullagrim Fiddle, driven from Sweden, the Falklands, and South Georgia during the Age of Exile, becomes the warlord of Anvers Island. His final flight is to Elephant Island where he is a prisoner for twenty-nine years.

"By the way, in case someone wants to read any of the books, I have written them up in such a way as to leave some surprises. I have tried not to reveal the endings - that would be mean."

**FROM ROB FLINT.** 5 January 1981. *To the Mountains of Madness* by H.P. Lovecraft. Typical H. P. Lovecraft horror-mystery-adventure.

*Quick, Before It Melts* (soon was made into a Minor Motion Picture).

SpooF. My favorite exchange: Reporter: "Why do all you Scientists wear red-checked shirts?" Chief Scientist: "Because we don't want to be conformists, like the Navy."

*Penguins Have Square Eyes.* SpooF. Don't remember much about it.

*Ice* by James Follett. I read it on way to ice last year. Pretty bad. Giant iceberg gets loose from Antarctic and threatens to start World War III and mow down New York. Hmmm.

*The South Pole Terror* by Kenneth Robeson. A Doc Savage adventure. First published in 1936.

*Monday at McMurdo* by David Burke (1967). Interesting in that it is an Australian's view of McMurdo politics and operations (carried to dramatic exaggeration, of course).

*Miss Bianca in the Antarctic* by Margery Sharp. Kid's book. Miss Bianca,

the mouse, goes on a Norwegian Antarctic expedition. She knows the polar bears she meets are at the wrong pole, but they explain that they are on an exchange visit.

*Penguin Island* by Anatole France. This social satire should qualify, but somehow his penguins live in the north rather than in the south. (?)

Finally there is the treasure that I was given for Christmas, *Lost in the Land of Ice* by Captain Ralph Bonehill (published in 1902, i.e. before Scott's first!). It is a "boys' book", like Tom Swift or the Hardy boys, full of adventure and moral uplift. Cap'n Ralph has got a few problems with his facts, however. "They were now in the same latitude South that Iceland is in the north - about sixty-five degrees. Only thirty-five degrees more to the South Pole," mused Bob. They sail on to the South Pole, finding open water beyond Palmer Land. The sea is full of polar bears and giant man-carrying birds. They have a terrible time with the magnetism there, which makes their rowboats spin about uncontrollably. But eventually they do retrieve all the gold and platinum and all ends well! There are penguins on the book's cover design, but none in the text.

**ANTARCTIC IGY REUNION.** Reunions seem to be in order this fall with the Ronne forces and the 2nd Byrd Antarctic Expedition members gathering here in town, so IGYers are going for it on October 14-15. There is no perfect time, so we might as well set a date and see what happens. Dr. Ned Ostenso, the Chippewa Falls kid who was at Byrd in 1957, has graciously volunteered his place, plus his liquor cabinet, for a bash on the evening of October 14th. There are 22 IGY people in the Washington area:

Bob Benson, South Pole 57	Rudy Honkala, Wilkes 57
Walter Boyd, Little America V 57	Joe Krank, Little America V 57
Dick Cameron, Wilkes 57	Len Le Shack, Byrd 58
Richard Conger, Everywhere 57-58	Palle Mogensen, South Pole 58
Bert Crary, Little America 57-58	Paul Noonan, Wilkes 57
Paul Dalrymple, LA 57; South Pole 58	Ned Ostenso, Byrd 57
Johnny Dawson, South Pole 58	Nicholas Ropar, Little America V 57
Skip Dawson, Byrd Trail 57	Mort Rubin, Mirny 58
Fred Fopay, Little America V 58	Phil Smith, Crevasses 57-58
Bernie Fridovich, McMurdo 57	Ron Taylor, Little America V 57
Tom Gray, Little America V 58	George Toney, Byrd 57

This constitutes a hard core, and hopefully we can build upon these men to attract a goodly gathering. If one needed a good reason for not postponing a reunion, here it is - the death list of those who wintered over in 1957 (and this is no doubt incomplete): Carl Eklund, Gerry Fierle, Ben Harlin, Nornt Helfert, Herfried Hoinkes, Bob Johns, Wes Morris, Finn Ronne, Paul Siple, Ed Thiel, and Carl Wyman (roughly 10% of the wintering-over scientists).

The USGS 3-day symposium on polar research being held in Washington at the National Academy of Sciences, 12-14 October, might attract the IGY university types to putting in orders for Washington, staying over for some socializing Friday night and all day Saturday. The Antarctic Society's 1983 Memorial Lecture will also be given in that time frame, the evening of October 12th at the National Academy of Sciences. Tucker Scully of the State Department is going to talk about the future of the Antarctic Treaty, which should be of great interest to everyone. No one is more involved in the State Department (or Washington, for that matter) than Tucker in the annual consultative talks that have been going relative to the Antarctic Treaty. How long the

reunion lasts will depend on how many people show up, and that's why we are asking IGYers to contact Dalrymple (3336 Lockheed Blvd. #204, Alexandria, Virginia 22306) ASAP with their reply - affirmative, negative, undecided! He, in turn, will then get back to the interested souls.

**RAYMOND HEER, JR. (1920-1983).** Ray Heer, the former Atmospheric Physics Program Manager in the Office of Polar Programs at NSF, died from a massive heart attack at the age of 63 on the 14th green of a golf club in Annapolis on 16 August. Golf was his favorite outdoor sport. If Ray had to die, he couldn't have picked more favorable conditions for himself. He had just shot a brilliant - for him - 44 on the front nine; his beloved Baltimore Orioles were in first place in the American League East; his beleaguered Baltimore Colts through some magic potion were still undefeated in their pre-season schedule; his three children were still married to their first encounters; he was grandfather to five boys and one girl; and last, but by no means least, he was still married to a lovely Kentuckian, Melva. The previous week the family had been in Kentucky attending memorial services for Mel's father, and one of Ray's sons told me that he had never been playing better golf than he had that week.

Ray was an interesting devil. When I first met him, seeking money for a grant, he said, "I'm an R.C., what are you?" I knew I was in trouble as my Protestant background included two ministers. So I answered, "My religion is baseball, I'm a Detroit Tiger fan." Ray was a sports fan, and he could understand, I think, baseball as a religion much better than he could my being a Protestant. But Ray had a short memory, and the next two times we met, he started it all over again, "I'm an R.C., what are you?" Ray always followed up the religion question with a comment, "There is no good research done in the government, it's all done in universities." But I knew at the time that our office had something universities did not have, Ray recognized the fact in spite of his prejudices, and we eventually had a successful "marriage" for about ten years of research. He was a good man to do business with; everything was up front; you could trust him. His blackboard listed all his grantees with the amount of dollars they were getting, so you knew how you stacked up against other grantees. And you never submitted a blind proposal, because he would tell you in its preliminary stages the ballpark range which probably would be acceptable. He never led me astray.

We had a common interest in sports and down through the years we both had developed a fine appreciation for lovely women, so our bond lasted until he retired from NSF. We had one great night in Boston, attending a Red Sox-Oriole game on free ducats from Oriole catcher Clay Dalrymple, and then spending the waning hours after the game drinking with most of the Orioles in a downtown Boston watering hole.

Ray had a lot of enthusiasm, and he was very versatile. I don't think he failed at many things. True, he couldn't grow a beard worthy of the name, and his goatee would have ranked no higher than a three on a scale of 1 to 10. However, he was a master candle maker; he designed and made rugs - beautiful rugs; he bought a Heath kit and put his own color TV set together. At the same time he was a docent at the Smithsonian, he was delivering the Yellow Pages for Ma Bell, and both were equally exciting to him! In retirement he was a part-time science teacher, and he loved it. It was while he was teaching and Mel was out of the house that their home in Annapolis caught fire and burned to the ground. The Heers turned this adversity into triumph by building a beautiful new home on the same site, one which reflects the originality of Ray and the charm and grace of Mel. It's a shame that this loving twosome could not have enjoyed it together for many more years.

## 1983 MEMORIAL LECTURE

"FUTURE OF THE ANTARCTIC TREATY SYSTEM"

by

R. Tucker Scully, Director

Office of Oceans and Polar Affairs

Department of State

Wednesday, 12 October

8 PM

Main Auditorium

National Academy of Sciences  
2101 Constitution Avenue, N.W.  
Washington, D.C.

The Memorial Lecture will be preceded by a cocktail hour (5 PM) and dinner (6PM) — limited to 200 people. The Lecture is being held in conjunction with the USGS Polar Research Symposium at the National Academy, October 12-14, with the cocktails-dinner (London broil) being open to all attendees, at a cost of \$20 per person. If you want to be there when they break ice and cut bread, get your money in immediately, as we expect a big crowd, a sell-out. If you want to phone in your reservation, call Ruth at (703)522-2905, on or after Monday, the 26th.

If you want to make a day and a half of it, Antarctica will be the subject of papers all day on the 12th and the morning of the 13th. And there's no law saying Antarcticans can't stay the other day and a half to hear about the Arctic - not as exciting, of course.

As you read this, Tucker Scully is in Australia attending the current Consultative Meeting on the Antarctic Treaty. So, not only will we all be hearing from the top U.S. man on the Treaty, but he'll be bringing us the latest red-hot news. It will be another gala Memorial Lecture on a timely subject by a well-known authority. Best deal in town!

Those who have sent in dues checks, thanks! Those who are putting it off, get on the stick, please! Multi-year payments are appreciated. As we go to press, 38% have paid. We now have 434 members - best ever!

Mary P. Goodwin

\* \* \* \* \*

First ever West Coast Meeting! Charlie Bentley, Chairman, National Academy of Sciences' Polar Research Board, will speak at Stanford University on December 8th. Be there!

Bergy Bits is an assemblage of unrelated bits of information and trivia which may or may not be of interest to a small segment of the Society. It is NOT the official voice of the Society, which is speechless. Bergy Bits does, however, fill a requirement for printed material to go along with announcements of meetings. Its text may vary from issue to issue, e.g., the next Newsletter will contain a listing of doctoral dissertations obtained from Xerox University Microfilms in Ann Arbor, Michigan.

**NEW OFFICERS AND BOARD MEMBERS.**

Listed at the bottom of the first page are the officers and Board members, including the newly elected. Mort Turner has another year to serve as President and he will be ably assisted this year by the indomitable Pete Barretta. Pete, a polar aircraft philatelist, is a dedicated Society member who never misses a meeting. Ruth Siple is back as treasurer, and where could we find a more honest person to handle our megabucks? Ken Moulton is moving in as secretary, which is sort of a titular position with no real responsibilities. Ken, an Antarctic veteran dating back decades, should do well in this position. On the Board of Directors for the next three years are Alice Dater, widow of the late Harry Dater, well-known Antarctic historian who served as the backbone of our Society throughout the 1960s; George Doumani, one of our ex-presidents, is Lebanese born who once received the Order of the Cedars from his native government; Jane Ferrigno, a young Antarctic at the US Geological Survey who is working on their satellite image atlas of glaciers of the world; and Donald Weisnet, hydrologist and also a remote sensing specialist who discovered a self-fulfilling personal reward for his expertise in remote sensing when he found himself on a topless beach in Copenhagen this past summer while he was desperately trying to serve this country in a military manner as a high ranking Naval reserve officer on a two-week tour of duty at our embassy in Copenhagen. Our newest At-Large Board member will be our west coast archivist, Mary Goodwin of Los Angeles. Mary doesn't yet know she is on the Board; this position is sort of a self-volunteering job because we automatically put those who write us frequently on the Board! I think it is an outstanding group of distinguished people. Great to have them working for us.

**GET THOSE MEMBERSHIP DUES IN, PLEASE!**

We had a great first-time-around response to our first billing for 1983-84 membership dues, having 75 percent of our total membership (444) in the bank by the end of October. Those who haven't paid their dues will get a second notice with this Newsletter, and we hope this will move the rest to make it 100 percent. Those who don't pay by the end of this calendar year will be dropped from our 1984 mailings. We are playing hardball because we find that those who don't pay up by January usually don't pay later, so why carry them on the rolls, adding to the cost of printing and mailing Newsletters? We are VERY pleased that so many sent in multi-year dues; that surely helps with the bookkeeping and also financial planning. Thank you! Thank you! Thank you!

**R. TUCKER SCULLY GIVES MEMORIAL LECTURE BEFORE LARGE AUDIENCE.**

The 1983 Memorial Lecture was scheduled so that it would coincide with the fall meeting of the National Academy of Sciences' Polar Research Board and the US Geological Survey's Polar Symposium in hopes of attracting a large turnout. Then we signed up an expert on the Antarctic Treaty at the State Department, R. Tucker Scully, to speak on the Antarctic

Treaty System which was and is a subject of great interest to all polar people. With the support of the Academy through their Polar Research Board, it was all dressed up with an accompanying cocktail-dinner in the main building of the Academy. There were 133 for dinner, and presumably about 175 attended the lecture. It marked the fifth consecutive Memorial Lecture which has been held in the Main Auditorium of the National Academy of Sciences, all of which have been preceded by a dinner party. In addition, we held a regular cocktail-dinner-speaker program at the Academy last year when Walter Sullivan of the New York Times was our speaker on the polar centennials. The Society is deeply appreciative of the support given by the Polar Research Board, as it is only through them that we can take advantage of such beautiful surroundings. And the price is right, too!

**AL CHAPMAN SEES ALL, TELLS ALL.** There is no better way to visit multiple Antarctic stations than to be a member of the State Department's inspection team which periodically goes around the continent and drops in on those coastal stations which they can readily reach by helicopter. The inspection team sees more per unit time in Antarctica than any other group. Probably the luckiest member was a military officer who is a munitions expert - imagine being a munitions expert and being asked to go on a beautiful cruise where munitions have been banned by a treaty which has been in effect for over 20 years! I did something similar once - I was a cloud observer at an observatory sitting high on a mountain top which was always in the soup! Al Chapman headed up the corps of observers, and will come before us on November 16th to tell us about his visits to 14 stations, showing us pictures of those stations and some of their ongoing activities. It is most appropriate that Al speaks to us now, as not only was the cruise conducted this year, but his presentation follows our annual Memorial Lecture by R. Tucker Scully on the Antarctic Treaty System. As an appetizer to get people to attend the lecture, we are printing herein some of Al's notes on his cruise so that we all will be ready for his presentation. Come on out and hear Al - it will be our last Washington meeting for this calendar year!

#### ANTARCTIC OBSERVER MISSION.

Every couple of years or so, the United States Government sends a team of official observers to Antarctica. I was fortunate to lead the most recent U.S. Antarctic observer team. We circumnavigated two-thirds of Antarctica and visited fourteen foreign research stations--about twice as many as usual.

The "inspection," as it is sometimes called, derives from the Antarctic Treaty of 1959. Any of the Consultative Parties of the Treaty can appoint official observers, inform the other Parties, and send them south to look around and report on findings. Although some of the other Consultative Parties have from time to time done this, the United States has been most steadfast in exercising this right. We feel that conducting inspections in Antarctica is important both to us and to the Treaty system as a whole. The observers have access at any time to any place south of 60 degrees south latitude, the outer limit of the Treaty area. They are able to obtain first-hand evidence that all nations active in Antarctica are observing the provisions of the Treaty. Essentially, these provisions prohibit military activities, the explosion of nuclear devices, or the deposition of radioactive waste, and they encourage scientific cooperation on the continent. In addition, observers note whether measures to preserve the antarctic environment, which have been adopted subsequent to activation of the Treaty, are being implemented. Finally, such on-site inspections provide a useful precedent for peacekeeping agreements we may wish to promote elsewhere in the world.

Our observer team was composed of four U.S. Government officials chosen to provide expertise on a range of subjects including antarctic affairs, diplomatic usage, modern weaponry, high-latitude science, and the foreign languages of the stations we were planning to visit. Ronald A. Gaiduk and I were the Foreign Service officers. Ron is a language wizard whose fluent Russian, German, French, and Japanese were of incalculable value. Navy Commander Maria Kazanowska is an oceanographer of considerable polar experience, including service on a previous observer team, who has an expertise in Russian and Polish. Col. John A. Raymond, U.S. Army, was our weapons expert from the U.S. Arms Control and Disarmament Agency.

We flew by LC-130 from Christchurch to McMurdo Station on January 17, 1983. We were met by Dr. Ed Todd of NSF and Capt. Brian Shoemaker of the U.S. Naval Support Force Antarctica. They had arranged a three-day orientation which included a visit to Amundsen-Scott Station at the South Pole, a helicopter tour of the magnificently scenic Dry Valleys on the west side of McMurdo Sound, and briefings at McMurdo Station and New Zealand's Scott Base.

Our Antarctic circumnavigation got under way on January 21 when we boarded the U.S. Coast Guard Cutter POLAR STAR, one of our most powerful icebreakers, which had just completed the annual task of breaking the channel through the pack ice into McMurdo Station for U.S. Navy supply ships. For the remainder of its Antarctic tour, the POLAR STAR—400 feet long and weighing 13,000 tons—was dedicated to putting our observer team within helicopter distance of foreign research stations around the coast of Antarctica. Much of it had not been effectively visited by an observer team since 1967.

The thirteen USARP scientists aboard were restricted largely to work they could accomplish along the cruise track dictated by our mission. However, the circumnavigation westward from McMurdo to Palmer Station did provide an opportunity for them to make observations enroute and to take samples from offshore waters seldom visited by American scientists. I had the pleasure of sharing a cabin with Chief Scientist Ozzie Holm-Hansen of the Scripps Institution of Oceanography, from whom I gained many knowledgeable insights into antarctic marine sciences.

Leningradskaya (USSR), January 25—Leningradskaya is a collection of a dozen or so buildings clinging to a crystalline outcrop several kilometers from the coast and completely surrounded by the great continental ice sheet. The Coast Guard pilots put two helicopters down in the only possible place, a sloping area of compacted snow recently scraped by a bulldozer. We later learned the Soviets were preparing for a visit by helicopters from their supply ship.

Our Soviet hosts, who had tumbled out of their quarters upon hearing the noise of our approach, greeted us affably and invited us inside. They were relieved to discover that two of our team could converse easily in Russian and charmed that one of these was an attractive woman, the first ever, they said, to visit the station.

Kazanowska explained that our visit was being made under Article VII of the Antarctic Treaty and that we would like to observe their station activities. She added that we would appreciate an explanation of their equipment and scientific program and a tour of the premises. The Soviet leader, Valeriy Sergeievich Ippolitov, an ice expert, seemed genuinely pleased to have us there and led us through practically every building and room at the station. In the 15-man complement were a physician, a surgeon, a meteorologist, an atmospheric physicist, a satellite engineer, a radio operator, plus support

personnel. They were busy with a variety of scientific observations of which meteorology seemed the most important. Each had his own tastefully decorated room in their dormitory.

At the close of the station tour we were treated to a light meal of various kinds of sardines, herring, olives, Russian rye bread, and home-grown (i.e., antarctic) cucumbers, accompanied by genuine Russian vodka. The inevitable toasts were exchanged, and we presented the commander with a handsome brass plaque for the station. Also, we presented the station personnel with special shoulder patches to commemorate our visit. After a picture-taking session outside, we departed amidst a rousing sendoff.

Dumont d'Urville (France), January 28—Situating on one of a series of rocky offshore islands, Dumont d'Urville shares its site with an Adelie penguin rookery. The odor was not as bad as one might think, and man and bird seemed to live agreeably together. Work had begun on levelling and joining a string of five nearby islands to create an all-year runway. This is intended to provide Dumont d'Urville with more reliable connections with the outside world. Environmentalists the world over are up in arms about the resulting displacement of penguins, and this illustrates the intense competition for the limited ice-free space on the continent.

Casey (Australia), January 31—This was the only station we approached close enough to reach by small boat rather than by helicopter. Like the other two Australian stations which we visited subsequently, Casey is in the midst of a major program of construction which will replace the original facilities with carefully planned new ones. The various types of buildings are of standard design and are color coded, but the layout of the three stations is different and suited to the specific site characteristics of each. The functional specialty of Casey is glaciological surveys using tractor trains which penetrate far into the interior of the continent, even in the dark of winter.

Mirny (Soviet Union), February 2—Formerly the Soviet Antarctic headquarters, Mirny still supports a big operation with important logistic functions, particularly with respect to Vostok Station, 1,420 kilometers to the south, which is supplied by sled train and by airplane. New buildings raised on steel struts above rock exposures to supposedly prevent snow drift and eventual burial, have been built at Mirny. We covered the considerable distance between buildings in a noisy but serviceable tracked vehicle. The station leader, Valery Serdukov, proudly showed us the large gilt key, his symbol of office, which is ceremoniously passed from one leader to the next.

Davis (Australia), February 4—Davis is situated in the Vestfold Hills, one of the largest ice-free areas in Antarctica. It is also adjacent to Prydz Bay, a biologically rich region of offshore Antarctica. Biological studies carried out close offshore and in the many nearby saline lakes are a primary scientific activity at Davis. On the lighter side, we delighted in the opportunity to approach closely and photograph a group of huge, sleepy elephant seals lying on the beach. Gaiduk got close enough to one open-mouthed young male to testify that the great gaping beast had an incredible case of halitosis.

Mawson (Australia), February 7—The buildings of Mawson, Australia's oldest station, are clustered around the head of a small bay. When the new base is complete, all but the most historic old buildings will be removed. Like

many of the stations in Antarctica, Mawson has a strong upper atmospheric physics program, but its cosmic ray laboratory is, so far as I know, unique. Three of the latter's seven meson telescopes are situated at the bottom of a 40-foot pit blasted out of bedrock. Thus they are screened from all but the most energetic particles. Mawson is one of two Antarctic stations (New Zealand's Scott is the other) which retains dog teams for local transportation. The crew at Mawson states in their defense that, in contrast to snowmobiles, the dogs are dependable and require little fuel.

Molodezhnaya (Soviet Union), February 9--This is the McMurdo of the USSR and headquarters of the Soviet effort in Antarctica. Although less advantageously located in some respects, it does have the advantage of a much more open site than McMurdo. The many buildings are widely spread on a series of low, rocky ridges running at right angles to the nearby coast. Dr. Rurik M. Galkin, Chief of the 27th Soviet Antarctic Expedition Wintering Party, was in command at the time. He remembered fondly the winter he had spent a few years previously with the U.S. at the South Pole. We saw as much as we could of this large base in a full day ashore, including a computer center and a scientific rocket assembly and launching complex. Some of our party also went off to inspect a new snow/ice runway nearby on which Soviet IL-18s from Maputo in Africa are able to make wheeled landings during the austral spring and fall.

Showa (Japan), February 10--Dr. Shinji Mae and his wintering party of 35 men all turned out to greet us at Showa. We just missed the FUJI, their supply/research vessel, which had departed two days earlier for their return journey to Japan. The Japanese have a broad scientific program underway at Showa, and at a small year-round outpost for meteorological and glaciological research at Mizuho, 150 miles to the southeast and high up on the polar ice sheet. Several new laboratory buildings packed with the latest electronic gear have been added in recent years. Even in the Antarctic frontier the Japanese retain a unique cultural elegance which was evident in their courtly hospitality.

Novolazarevskaya (Soviet Union), February 13--The 55-mile flight south over the great ice shelf separating the Schirmacher Hills from the open sea stretched the capabilities of our helicopters to their limit. We knew that some East German scientists would be there, but we were surprised to discover that East Germany was operating an adjacent but separate base at Novolazarevskaya. The East Germans have their own quarters and laboratories and also their own scientific programs. The six-man East German team that normally winters over at Novolazarevskaya is, however, dependent upon the Soviets for logistical support, medical care, and one main meal per day. The normal Soviet wintering complement is 37. We noted that this was the only Antarctic station we visited that was making use of propeller-driven generators to capture the wind power of Antarctica. They said that three of these windmills provided enough electricity to heat the Soviet buildings during the winter. Novolazarevskaya, too, has a snow/ice airstrip where large aircraft can land on wheels in case the runway at Molodezhnaya is closed.

SANAE (South Africa), February 15--This was our first visit to a station built on an ice shelf, and we were surprised how little there was to see from the air, just a series of ventilator shafts spaced out over the flat snow surface and a few instrument shelters further removed in several directions. In fact, after we landed, we spent ten minutes or so looking for a place to enter.

Suddenly, several smiling heads popped out of a trap door on top of one of the shafts and we were invited into their snug quarters several flights down. There, a series of interconnected steel tubes shelter insulated quarters and laboratories. Arnold Vermooten, a young M.D., led the friendly group of scientists that greeted us. It was interesting to note that all fifteen young men shared equally the housekeeping duties (cooking, cleaning, and servicing the snow melter). Risk of fire, the nemesis of life in Antarctica, is minimized by an advanced system of warning and control.

Georg von Neumayer (West Germany), February 16--Georg von Neumayer was one of the smallest stations we visited--and one of the newest. With the Filchner Summer Station at the head of the Weddell Sea and the polar research vessel, POLARSTERN, it forms part of a remarkable antarctic research capability. We were impressed with the planning and foresight which had produced such progress in a few short years. Another ice shelf station, it is built in the form of an H. It has an ice-resistant oval outer shell which encloses boxy insulated living and working spaces. Halley Station of Great Britain introduced this concept in Antarctica, and it was further perfected by the South Africans at SANAE. The West Germans have installed state-of-the-art equipment and have emphasized energy-saving measures. Being a year or two younger than SANAE, the structure had accumulated less snow and was closer to the surface.

Halley (Great Britain), February 18--I have no intent to belittle British scientific activity at Halley, for there was ample evidence that serious work in meteorology and upper atmospheric physics was being done. However, what impressed our team was the effort which was being put into the new base to replace the old one, now near the end of its useful life. Halley, too, is an ice shelf station, far from any windswept rock to keep it above snow accumulation. Bearded "Big Al" Smith, designer and project superintendent of the new base, gave us an insightful tour of the large, H-shaped wooden structure, a further evolution of the insulated box-in-tube concept. Construction began on January 2, 1983, and it was anticipated that it would be sufficiently completed by February 27 to house a winter work force of twelve men, who would be able to finish the interior for an early 1984 occupancy. Such success, of course, was owing to highly organized planning and preparation, as well as exceptional good fortune with the weather.

General Belgrano II (Argentina), February 19--The site is rather awesome, a small, rounded outcrop of shattered, red rock terminated by a cliff on one side and by glacial icefalls on two others. Only inland can snowmobiles make their way out onto the polar icecap. We had not anticipated visiting any Spanish-speaking stations in Antarctica, so we borrowed Seaman Silva from the POLAR STAR crew to interpret for us. A high point of the visit was discovery of a beautiful chapel formed by one arm of the storage cave carved into a neighboring glacier. It is occupied only by a statue of the Virgin bathed in ethereal blue light.

Vicecomodoro Marambio (Argentina), March 3--Before visiting Marambio our ship made a detour around the South Orkney Islands for the benefit of our scientific colleagues. Thus, by the time we got back southwest to the vicinity of the Antarctic Peninsula, winter was on its way. We found Marambio to be an airstrip laid out on the flat top of Seymour Island with associated hangar and numerous red station buildings. A cold wind was blowing snow across the flat mountaintop, but the Argentine Air Force warmed us up with cups of coffee.

Marambio is the logistics center for extensive scientific work in the vicinity during the austral summer.

Miscellaneous Significant Events. Second Indian Antarctic Expedition, February 13—It was the Soviets at Novolazarevskaya who informed us that the Indians had established a base camp near the Soviet transshipment "port" for Novolazarevskaya. We found the small ship POLAR CIRCLE, leased by the Indians to transport their expedition, nosed into shorefast ice in a bay where an easy gradient led up onto the coastal ice shelf. Dr. R.K. Raina, several members of his group, and some of the ship's officers came aboard the POLAR STAR for a chat, and the seriousness of India's effort to establish a program of antarctic research was manifest.

POLARSTERN—Near the southern shore of the Weddell Sea, the German polar research vessel POLARSTERN rendezvoused with the POLAR STAR in mid-February in a thick ice floe, and personnel of the two ships exchanged visits across the ice. Our scientists were envious of their German colleagues, for the POLARSTERN represents the latest in the design and outfitting of a vessel for a wide variety of research in ice-covered waters. Although the POLAR STAR can crunch much thicker ice, little space or thought had evidently been given in its designing to optimize conditions for research. In all fairness, it must be admitted that from the outset the POLAR STAR and its -sister ship, the POLAR SEA, were primarily built for general rough duty in ice-infested waters.

Palmer (USA), March 6—Our last port of call was at Palmer Station. There we had an opportunity to compare a small American station with emphasis on biological research with the fourteen foreign stations we had visited over the preceding weeks. I am happy to say that Palmer stands up well in the comparison, both in equipment to carry out research, but more important, in the will to facilitate as far as possible each scientist's reasonable requirements for support. I am also happy to say that our tour convinced us that all of the foreign research stations we visited exhibit compliance with the Antarctic Treaty. The "spirit of Antarctica" is a wonderful and salutatory cooperative product which should be carefully nurtured as an example of what is possible in this troubled world.

**NEW ZEALAND ANTARCTIC SOCIETY CELEBRATES GOLDEN.** Our brethren in Kiwiland, the New Zealand Antarctic Society, celebrated their 50th anniversary from 29 October through 5 November. Australia's most distinguished present-day Antarctic explorer and scientist, Dr. Phillip Law, was the principal speaker at the fiftieth anniversary celebrations of the New Zealand Antarctic Society in Christchurch. He gave an illustrated lecture in the Ngaio Marsh Theatre on November 2, the date on which the society was established in 1933, and also spoke at the official dinner on November 5. In addition to Dr. Law's visit, the Canterbury branch, which is now 28 years old, has organized an exhibition of Antarctic art since 1901. The exhibition includes the work of British, New Zealand, Australian, and American artists. One of the exhibitors is Mrs. Nel Law, who accompanied her husband on an expedition south in the summer of 1960-61. She spent three months in Antarctica and on Macquarie Island, and was the first British woman to visit the Antarctic, and the first of her sex to visit Adelie Land, the French sector of Antarctica. A painting by the Australian painter, Sidney Nolan, who is considered to be the most imaginative and eminent of all the artists who have been to Antarctica since Cook's day is also in the exhibition. (above copied in part from The Christchurch Press, October 11, 1983)

They celebrated with class by publishing "Looking South," an illustrated history of its activities since 1933, and by issuing a limited first-day cover which carries a
