special New Zealand Post Office date stamp cancelled at Scott Base. One can order the book by sending NZ\$7.50 to Book Project, New Zealand Antarctic Society, P.O. Box 2110, Wellington, New Zealand. The first-day covers bearing an attractive color illustration were selling for NZ\$3.00. This price, incidentally, also included the six current Ross Dependency stamps issued on January 20, 1983. Whether any are still available, I do not know.

The New Zealand Antarctic Society has a long and distinguished history of doing things right, and I prize my near-complete collection of their "Antarctic" news bulletin (first issue was March 1956) which is just superb. I say near-complete as I'm missing one issue (Vol. 2, No. 6, June 1960) which somehow got lost and is not available through their Society. Anyone worth their salt as an Antarcticist should be a member of the New Zealand Antarctic Society - it is only NZ\$13.00, and you get four copies of "Antarctic" per year. It's the only Society organ I know which covers the Antarctic activities of all of the nations on the great white continent. Congratulations! May their future be as bright as their past!

**U.S. GEOLOGICAL SURVEY POLAR RESEARCH SYMPOSIUM, 12-14 OCTOBER 1983.** The U.S. Geological Survey held a three-day polar symposium at the National Academy of Sciences in mid-October in which members of the Survey spoke on their polar accomplishments. It was all in celebration of the 100th anniversary of the First International Polar Year, the 50th anniversary of the Second International Polar Year, and the 25th anniversary of the International Geophysical Year. There were fifty papers on the program, almost equally divided between the Arctic and the Antarctic, and in my humble opinion it was a mighty fine symposium. Frank Press, President of the National Academy of Sciences, a scientist who was intimately involved in the US Antarctic program during the IGY, set the tone for the meeting when he spoke in his introductory comments of the importance of the polar regions to this country. He was like Knute Rockne giving a half-time pep talk, although I think all in attendance had already gotten the message that polar research was well worth the inconveniences and hardships involved in working in a less-than-favorable environment. The US Geological Survey has certainly been a scientific power in the polar regions, and listening to John Reed speak on "The Geological Survey in Polar Perspective" I felt that he must have been sitting at the bargaining table when we bought Alaska from the Russians. If he wasn't there, he must have arrived on the next mule train, as he certainly has a wealth of knowledge on the earliest USGS involvement in Alaska. One of the things which impressed me most was the appearance of the geologists who now actually own and wear suits. This was unheard of in my college days, when only the foresters were more despicable in their dress. Geologists of today almost look like normal human beings. This is sort of scary when you get right down and think about it; you wonder if they are becoming desk-bound rather than men/women living by their geology hammers. Be that as it may, it was with pride that I listened to many of our Society members (Rupe Southard, Peter Rowley, John Behrendt, Richie Williams, Jane Ferrigno, Art Ford, Pete Bermel, Charlie Morrison, Tony Meunier, and Tom Henderson) presenting updates on their Antarctic activities. There were about 200 who signed the attendance sheet, but probably about 250 attended the symposium. The USGS is to be congratulated for pulling it off with class and distinction.

**50th REUNION OF BYRD ANTARCTIC EXPEDITION II, 1933-35.** October 22, 1983 was the 50th anniversary of the departure of the JACOB RUPPERT from Newport News for the Antarctic, and twelve members of the wintering-over party, three widows of wintering-over members, and two crewmen from a sister ship, the BEAR OF OAKLAND, gathered in Washington to commemorate the occasion. There was also an assorted number of wives who accompanied their husbands to town, as well as a son and a daughter or two. All in all, it was a very sober affair, especially in light of the tales of the expedition where one would

have thought that most of the men lived by the bottle, if not with a bottle – one has to remember that this expedition preceded the advent of women into Antarctica. But the thing which impressed me most about these fellows was that they looked so great. I thought they would come staggering into town with canes and crutches like troops from the Corregidor, but instead I saw a group of healthy looking, virile men whose ages did not befit their youthful bodies. Consequently, one can only assume that all the booze they drank at Little America II must have had a healthy body preservative in it which has stood them well in their three-quarter century lives.

They came from everywhere, but it pleases me personally that so many of them came from New England. Let's start there, as Stevenson Corey, the Admiral's supply man, the instigator (I believe) of the reunion, hails from Winchester, Massachusetts. He's as handsome as a short man can be, was dressed impeccably, spoke very fluently, has a quick smile, and a new Cadillac each year. John Dyer, an MIT man on the expedition, is Mr. Music in New Hampshire (makes harpsichords and is president of the New Hampshire Music Festival), is well over six feet, ramrod straight, and has a youthful-truthful looking face befitting a choir boy. John lives in Center Sandwich, New Hampshire. Ed Moody, one of the dog team drivers, hails from Rochester, New Hampshire, and still follows the dogs (as well as being a real artisan in making dog sleds) Ed has a well manicured, handlebar mustache, and must be one of the world's greatest handlers of women as well as of dogs. He is the only man I know who invited his redheaded New Zealand girl friend to come and live with him and his wife for a month, and lived to tell the story. Now that's some man! However, his wife, who made darn sure she came to Washington with Ed, said it was better that the Kiwi stay under the same roof where she could watch the two of them than to have her stay elsewhere. A very smart woman! Charles J.V. Murphy, well known to our Society members through his writings and speeches, was down from Grafton, Vermont. I love to hear old Charlie talk about Admiral Byrd, as he knew him very well, before, during, and after the expedition, and I like to think that all the good things Charlie says about the late Admiral are true. Charlie has eye problems (an unsuccessful implant on one eye and an errant contact in the other), but he is still writing his book on Forrestal, taking care of two dogs, and weakly fighting off old maids between sips of 100 proof bourbon. Another New Englander, a very quiet, soft-spoken man, is Walter Lewisohn, former cinematographer on the expedition, who lives in Dorset, Vermont. Someone said that Walter and Ike Schlossbach were both Jewish – I wonder if they were the first Jews to winter over in Antarctica? Walter showed his silent film shot on the expedition. I had never seen it before; it's an excellent film. I was amazed at how well the vehicles ran over the snow. Although he lives in Florida now, I'm including old Bud Waite as a New Englander, because one day his ashes will be strewn in North Brookfield, Massachusetts. Bud looks great, talks great, but he says it's all a facade, that they have cut him all up and he is on borrowed time. I try to reassure Bud, telling him that only the good die young, that he is destined for a much longer life in payment for all of the sins he has committed down through the years. More on Bud later. Olin Stancliff was there from Erie, Pennsylvania. He's in great shape, has an unbelievable crop of hair on top, and spent the reunion period listening to others talk, never saying a word. However, when it came his turn to go before the mike to say a few words to the folks, he came on full throttle, and, to me, was the hit of the whole evening. This quiet man is actually a barrel of laughs waiting to be opened. He just needs a mike and a captive audience to turn him on! Another man from the east coast was our very own Dick Black of Woodbridge, Virginia. Dick was the Washington action man for the reunion, and everything had his and Aviza's artistic touches from the laying of the wreath at the Byrd Monument near the entrance to Arlington Cemetery to corsages for the ladies to the fantastic spread at the sumptuous quarters of the Society of the Cincinnati, the Anderson House. Dick was upstaged by Aviza who came all decked out in a floor-length white gown covered with penguins,

prints of penguins, that is. Whenever one or more Antarcticans gather in the presence of Dick, it's time for the Poet Laureate of the Antarctic to recite his four Antarctic poems, and these were well received by the audience, many of whom asked for copies. From the midwest came Alton Lindsay, a retired zoology professor at Purdue University who still lives in West Lafayette, Indiana. He is a very distinguished looking man - one would never take him for a university professor! He came resplendent in a three-piece suit, his wife Elizabeth wore a very attractive red dress, and they looked like they belonged to one another. Alton and the late Paul Siple were fast friends and budding scientists at Allegheny College, whose careers continued with their selection to the second Byrd Antarctic Expedition. The other five attendees came from west of the Mississippi, which is not to be held against them. Two were from Arizona - Erwin Bramhall, a physicist on the expedition, who now lives in Sun City, and William McCormick, an aviator, who lives in Scottsdale. Bramhall looks like a physicist, one who has been eating quite well; he talks slowly and softly befitting a man of distinction. McCormick is a friendly, outgoing six-footer, and appears to be a man of many words. Out there in California in Canyon City lives Joe Hill, mechanic. Joe is a big fellow, around six feet, silver crowned, and good looking. The two members on the BEAR OF OAKLAND were Gordon Fountain of Oakland, California, who creeps into Bergy Bits from time to time, and Russell Robinson, a white-goateed, garrulous gentleman from Tucson, Arizona. The three widows were our own Ruth Siple, whose statistics will not be published, plus Jane Wade and Elizabeth Junes-Taylor. Jane is a cross between the effervescent Harriet Eklund and the ultra-conservative Ruth Siple, tilting a little bit more towards Harriet than towards Ruth.

The morning of the reunion was beautiful, a delightful fall day, and they all gathered at the monument for Admiral Byrd on the Avenue of the Heroes approaching Arlington Cemetery. Supposedly the figure on top of the monument is that of Byrd, but it could be anyone - it certainly doesn't look anything like him. A funny thing happened as they were posing for official photographs that were being taken. A medium-sized bird landed squarely on top of the bare head of Byrd, and sat there for several moments. The Byrd family did not officially participate in the reunion, although certain members of the family had been invited. Senator Harry F. Byrd did a nice thing for Bud Waite. The late Admiral had had a special photograph taken of himself for his mother, and Senator Byrd had this photograph blown up, mounted with a nice border, with an inscription of appreciation below signed by the Senator, two nephews, and a niece, and attractively framed. Bud, as most of you know, is the only living member of the rescue party which went out to Advance Base in the middle of the winter and brought the Admiral back from his ordeal. I didn't think anything could break up old Bud, but he was visibly moved and almost (but not quite) speechless upon receiving it from the Master of Ceremonies after dinner, Steve Corey. I was happy for Bud, as he and I date back to 1935 or 1936 when I heard him lecture on the Antarctic in a byway of America, Thomaston, Maine.

I think the less said about the article in the Washington Post about the reunion the better. They sent a "child" to cover the event, one who was fresh out of Yale (pardons to Ambassador Daniels and Walter Sullivan) and hadn't done her homework. But then again, that newspaper has never really been a friend of Antarctica in recent years. Bring back Christine Russell!

**RONNE ANTARCTIC RESEARCH EXPEDITION REUNION, 10-11 SEPTEMBER 1983.** The following eyewitness reports on the Ronne Expedition reunion were furnished - with a few exceptions - by Jackie Ronne and Bob Dodson, with editorializing by Bergy Bits who accepts all responsibility for inaccuracies therein. Members of the 1947-48 expedition gathered for a two-day celebration of their 36th anniversary, meeting one day at the home of Nelson and Jane McClary in Middleburg, Virginia, and the follow-

ing day at the home of Harry and Jennie Darlington in Marshall, Virginia. When you go to Middleburg and to Marshall, you're not only going to some beautiful country, you're in the midst of upper-crust Virginia aristocracy, about as far removed as one can possibly get from Stonington Island in Marguerite Bay. To refresh our memories, there were twenty-three members on the Ronne Expedition - three (Finn Ronne, Bill Latady, and Andrew Thompson) have died; three (George DiGiorgio, Lawrence Kelsey, and James Robertson) have sort of disappeared; four (Ike Schlossbach, Bob Nichols, Sig Gutenko, and Jim Lassiter) are physically ailing; four (Harry and Jennie Darlington - Jennie's mother was ill in Maine, Charles Hassage, and H.C. Peterson) could not attend, and nine showed up, plus two from the nearby British Base who were on Stonington Island at the same time. Long distance travelers included Brig. General Charles Adams (USAF Ret) and Captain Donald McLean (MC, USN Ret) from California; and Walter Smith and Ernest Wood from Florida; from the northeast came Art Owen, Captain Larry Fiske (USN Ret), and Bob Dodson; Jackie Ronne of Bethesda, Maryland and Nelson McClary were Washington area attendees. The British were Dr. Richard Butson from Canada and Kevin Walton from England. And there was one more Stonington Island inhabitant, Dick Black, who was commander of East Base on the U.S. Antarctic Service Expedition, 1939-41. And, indirectly, I guess one should include Cynthia Darlington, as Cynthia was conceived in Antarctica and, but for the might of the icebreakers BURTON ISLAND and EDISTO, would have been the first born-on-the-ice Antartican. There have been quite a few children conceived on the ice in recent years, but what makes Cynthia unique is that both of her parents were married and married to one another. A bit old-fashioned, to be sure, but highly commendable... and truly acceptable in Marshall, Virginia. People who read every Antarctic book which they can get their hands on will recognize the names of Ronne, Walton, and Darlington as authors of three different books on Stonington Island, 1947-48. They have often been referred to as the Antarctic trilogy, and old-timers will find it hard to believe that a Ronne, a Walton, and a Darlington ever got together in peaceful harmony and had a great time together. I think all parties are to be congratulated for showing so much tact, tolerance, and hatchet burying, and I hope that other Antarticans will learn from it and follow suit. This wasn't the expedition's first reunion, as they met a couple of years ago in Connecticut; it won't be their last, as they are already planning their next one in Florida.

Jane and Nelson McClary treated the crowd to a grand banquet on the 10th, and Cynthia Darlington hosted a superb luncheon on the following day. Bob Dodson gave a summarization of the Ronne Expedition, which was followed by Dick Black reciting his four erudite poems describing the indescribable - i.e., the magnificent natural beauties of the earth's most pristine continent. Kevin Walton and Dick Butson both gave talks. There were cocktails, toasts, photographs, and good conversation throughout both days. A walk down nostalgia lane was relived the second day when Jackie showed the official Ronne Expedition movie film.

The following is presented without endorsement (as we haven't seen it), but the Walton family has published "a collection of fascinating and remarkable photographs which span fifty years of exploration and research in the Antarctic." It has 95 black and whites, and 90 colored shots in its 168 pages. It's a square hardback book, approximately 9" x 9". It's entitled "Portrait of Antarctica." The price is \$18 and can be obtained by sending a check for that amount to The Knell Press, 154 Belden Hill Road, Wilton, CT 06897.

One of the Ronneites put the following note on his Society form when he sent in his dues for this year: "Just returned from a reunion of R.A.R.E. and had myself a good time. I was surprised to see that everyone but myself had become old, fat, and ugly; but I enjoyed seeing them anyway." Priceless! Jackie Ronne wrote, "Thomas Wolfe was right - 'You can't go home again' - but it wasn't because we didn't try."

**SNOW BALLS.** There's-always good news and bad news. One bit of good news is that *Nolan Aughenbach* assumed a Deanship at the University of Alaska in mid-September. Way to go, Augie! He was at Ellsworth in 1957 . . . And for real bad news, *Jim Shear* died at age 64. Jim, a geographer, a bon vivant from daybreak to midnight, was Station Scientific Leader at Hallett in 1957 . . . Only *Big Bert Crary* and *George Toney* survive from the six U.S. station leaders at IGY stations, as *Carl Eklund*, *Paul Siple*, *Finn Ronne*, and now *Jim Shear* have gone on to meet their maker above . . . *Hugh Odishaw*, MR. IGY himself, has had a rough summer, and hopefully is making a strong comeback after chemotherapy for lung and liver cancer . . . *Peg Gould*, the better half of the team of *Larry* and *Peg Gould*, hasn't been up to her usual self of late, because she is suffering from a crushed veterbra since July. *Larry* has been forced into some of the domestic chores, and his cooking could just speed up *Peg's* recovery . . . *Mark Leinmiller*, the 50th anniversary Eagle Scout who had a short course in polar labor conducted by *George Denton* at the Darwin Glacier, is now in the chips, having accepted a job with Frito-Lay in Kentucky . . . Did you know that the wife of *Tom Poulter*, the scientific leader on the second Byrd Antarctic Expedition, and their three small boys were stowaways on the JACOB RUPPERT when she sailed for the Antarctic out of Norfolk? They never appeared on deck until after the pilot boat disappeared. How about that? . . . Now if you knew that one, here is one I bet you didn't know. There was a young black Boy Scout who was a stowaway on one of Byrd's ships on the 1928-30 expedition. I came across this in reading some of *Paul Siple's* papers in the National Archives. He was found on board ship several days after departing New York City. *Paul* wrote that the Scout wanted to be the first black to go to Antarctica, but asked *Paul* not to expose him as a Boy Scout for fear of disciplinary actions. *Paul* honored his request, keeping his membership a secret, but the lad got into some kind of trouble and was put off the ship in the Canal Zone. . . . *Charles Passel*, the late *Paul Siple's* collaborator on the windchill experiments on the U.S. Antarctic Service Expedition, showed up in town (from Abilene, Texas) for the Memorial Lecture. He was regaling his table with how great seal meat became, after the meat was run through the washing machine ringers to get the blood out of it, when one of his tablemates excused herself to go to the ladies' room. I don't know whether she really had to go, or, because as a lover of whales, she was afraid that *Charlie's* next story might have to do with whale meat! . . . Remember that young kid from Emmaus, Pennsylvania who joined the Society last year and wrote us, "I have always considered an Antarctic igloo as my dream house and have loved penguins since I was a young chick." Later he wrote, "I think the culture of penguins is misunderstood by myself and others. I wish to help them have more of an impact on society." This year he wrote, "I have really enjoyed the Newsletter. It has been my major source of Antarctic nutrition for my mind." *Jonathan Roland* is something else! . . . One of the really nice guys in this Society, or any Society for that matter, is that ex-Crimson football star, *Chester Pierce*, who is on the faculty of the Harvard University Medical School. He's a very busy man, but you know, he took time out last year to write that kid. *Chester* is All American in my book . . . *Vostok* came up with a new absolute minimum temperature for the world when their thermometer recorded a -89.6°C (-129.2°F) on July 21st of this year. I think we could beat them if we wanted to reopen Plateau Station and keep it in operation with the "proper" kind of met observers. However, I doubt if the Russians would let any other outside record low stand very long in the books. Remember 1957, whenever the South Pole came up with a low temperature, the Russians subsequently came forth with a lower one! . . . How about *Frank Twohy*, Assistant Curator of Birds at Sea World in San Diego, for Penguin Father of the Year? Loved ABC's segment on Frank and KAO on October 6th. KAO must be a pure delight! . . . Californians, mark your calendar for Society lecture by *Charlie Bentley* at Ternan Auditorium at Stanford on 8 December at 8 PM, preceded by dinner in the Faculty Club. Details, including directions, in next Newsletter!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 83-84

December

No. 3

**Presidents:**

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-2
- Mr. Gordon D. Cartwright, 1962-3
- RADM David M. Tyree (Ret.), 1963-4
- Mr. George R. Toney, 1964-5
- Mr. Morton J. Rubin, 1965-6
- Dr. Albert P. Crary, 1966-8
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-1
- Dr. William J. L. Sladen, 1971-3
- Mr. Peter F. Bermel, 1973-5
- Dr. Kenneth J. Bertrand, 1975-7
- Mrs. Paul A. Siple, 1977-8
- Dr. Paul C. Dalrymple, 1978-80
- Dt. Meredith F. Burrill, 1980-82
- Dr. Mort D. Turner, 1982-84

**Honorary Members:**

- Ambassador Paul C. Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard

**Memorial Lecturers:**

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Sir Peter M. Scott, 1971
- Dr. Frank T. Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980
- Dr. Robert L. Nichols, 1981
- Dr. Robert H. Rutford, 1982

- Society Finally Goes West -

THE FUTURE OF THE WEST ANTARCTIC ICE SHEET

by

Charles R. Bentley

Geophysical and Polar Research Center

University of Wisconsin

and

Chairman, Polar Research Board

National Academy of Sciences

on

Thursday, December 8, 1983

Auditorium

Terman Engineering Center

Stanford University

Palo Alto, California

(Directions-page 3)

The Society's largest single enclave of Antarcticans is in the San Francisco Bay Area, and these good folks will host the first meeting of the Society outside the Washington home base. A good turnout may make this event an annual occurrence, so all ye West Coasters, be there! Charlie Bentley first started going to Antarctica during the Little Ice Age, and has inside knowledge based on his infinite intuition as to what will happen to the West Antarctic Ice Sheet in the next century. Hopefully he will share this with us on the 8th.

\* \* \* \* \*

*Last call for Society calendars! We are accepting only prepaid orders this year, so out-of-town members who want them should send \$6 per calendar to the Society's address. Washington area members who want to pick them up at Ruth Siple's should send \$5 per calendar. Hopefully, mailings will be shortly after the middle of December. Your order MUST be in by 30 November!*

This Newsletter has three objectives - meeting the deadline for the upcoming West Coast meeting on the campus of Stanford University on December 8th; restating our intention of selling the 1984 USAKP calendar only to those who send in prepaid orders; and sending a final notice to those members who are delinquent on their 1983-84 dues. We deeply appreciate that 120 members paid for future years, particularly that thirty-five signed up for five more years. It surely helps the bookkeeping for us. There are only three weeks between our November meeting and the December meeting, so we don't have much time. The format will be a bit different, as we have one central theme - dissertations on Antarctica.

**AN EVENING WITH BENTLEY.**

This will be a real good one; not only do we have a good man on the dais, but a very educated Antarctic crowd for an audience. We imagine that Charlie may put a little levity into the program as he did when he presented our 1980 Memorial Lecture in Washington. This meeting is being advertised on the West Coast as "1st Meeting of the Tom Poulter Memorial Chapter of the Antarctic Society", and everyone sincerely hopes that his widow, Helen, will be able to attend. Tom, of course, was the scientific leader on the 2nd Byrd Antarctic Expedition, 1933-35. The flyer states that Charlie will be speaking on "Is the West Antarctic Ice Sheet Really Melting Away?" We changed the wording a bit on the front page, as Charlie told Ruth he had forgotten just what he told Art Ford, so things aren't exactly set in concrete, or should we say finalized in ice? Who are all the Californians who should be there? The driving forces setting this up are John Katsufarakis of Stanford, Art Ford of the USGS, and John Roscoe, happily unemployed retiree. Katsufarakis is a large Antarctic tern who flies south each year; it is strongly rumored that Moulton is the only American bird to have made more flights than the Stanford physicist. Art Ford is a geologist at the USGS who started going south in 1960 and has made it an irregular habit ever since. John Roscoe adds another dimension, going back to Operation High Jump and Operation Windmill. John is one of three Vice-Presidents of the American Polar Society and is rallying their California members to the meeting. Bob Helliwell, atmospheric physicist at Stanford who dates back to the IGY, has been everywhere in Antarctica, including Eights and Plateau. Rob Flint has wintered over at Byrd ('64), Plateau ('66), and Vostok ('74); summered at Siple twice, once at Vostok, and once at Dumont d'Urville. William Trabucco is another upper atmospheric physicist who has a distinguished record down south. J. M. Detwiler, a LCDR in the Navy back in the 60's, was in the Antarctic four summers. Lewis Odell Smith is an O.A.E., dating back to Operation Windmill, who, somehow, resurfaced in Operation Deepfreeze in '66-'67. And when it comes to climbing, Nicholas Clinch led the expedition to the Sentinels in '66-'67. An invertebrate physiologist, Albert Towle, was at McMurdo in the summer of '69-'70. And there are some recent Antarcticans, too, as none other than Michele Raney, the doctor who was the very first woman to winter over at the South Pole is being Stanfordized in anesthesiology - or is it anesthesiologized at Stanford? One of the first women to go to Antarctica on a ship was Susan Patla who was there in the '74-'79 era. John Guerrero, who wintered over at the South Pole with Paul Siple in 1957, lives in Chico. Rex Hanson, one of the exchange scientists at Vostok ('80), is one of the young kids. Priscilla Grew is the other half of the team of Grew and Grew. Just because Ed is teaching-researching in Germany does not mean that he can't have a San Francisco wife, as he does,

who is very gainfully employed there as a commissioner. -- *Fauno Cordes* is the woman who supplied us with her very interesting bibliography on Antarctic novels. -- *Richard Miller* is another old-timer, dating back to '58-'59 when he was leader of the Ross Sea Ichthyology Project. -- But all these folks pale in comparison to *Gordon Fountain* who was on the legendary BEAR OF OAKLAND on the 1933-35 Byrd Antarctic Expedition. Don't feel sorry for Gordon, as I just saw him within the past month and he looks just as good as old Art Ford. -- *Bob Feeney* is at Davis, and he has been an active Antarctic. -- There's a *Robert Rofen* whom I'm not certain about, but he does have research interests. -- *Walt Dabberdt* did a study on Plateau winds, although he has never been south of Las Vegas. -- *Charles Neider* is not a Society member, but I believe this writer is in the San Francisco area. -- There are a lot of good Antarcticans in southern California, including one of Admiral Byrd's daughters, one of his grandsons, one of his granddaughters, as well as *Gentleman Jim Zumberge* (who won't be too gentlemanly if the Trojans don't start winning), *Mary Goodwin*, and many others. It should be a gala evening!

**TERMAN ENGINEERING CENTER, STANFORD UNIVERSITY, WHERE ARE YOU?** Thanks to John Katsufrakis, who has engineered "An Evening with Bentley," we think we can give you the proper directions for getting there. It is my understanding that everyone in California is very familiar with the El Camino Real (California Route 82) so find your way to Palo Alto on that historic highway. You should turn in to Stanford on Palm Drive, which appears to be the main entrance. After crossing Arboretum Road, get ready to take the next right, Campus Drive, which circumscribes the Harvard of the West. Stanford does not put a scale on their campus maps, so I don't know how far one goes, but the road swings left, then comes right 90 degrees, then left 90 degrees, followed by a straight stretch. You will be taking a left off this open stretch onto Santa Teresa Street. If you find yourself going by Governor's Corner, you should come about and head back to Santa Teresa. Terman Engineering Center is across Sam Morris Way from Roble Gym, where, I presume, there are plenty of parking spaces. Those who are going to the Faculty Club (adjacent parking) for sustenance will find it within a short walking distance of Terman, being in a southerly direction on Lagunita Drive. If we have confused you, call Art Ford at the USGS in Menlo Park (323-8111, Ext. 4123). As to the gathering at the Faculty Club prior to the presentation, we will have a number problem, as there's room for only 24 in the room where some of us are dining. Art and John are handling the dinner reservations, and when they get to 24 they will close up shop.

**AMERICAN GEOPHYSICAL UNION GOES POLAR.** If man's best laid plans do not go asunder, the American Geophysical Union will henceforth have a polar session at all future meetings, a decent and honorable step forward for the geophysicists in rightfully recognizing the importance of the polar regions. The first polar session will be at their upcoming "fall" meeting in mid-December in San Francisco. Geophysicists may not know fall from winter, but they do know how to pick a good conference city. The polar session (December 8th) will be co-chaired by Ed Todd and Bob Rutherford, and will feature Juan Roederer from the University of Alaska (The Upper Atmosphere in Polar Regions, A Window to Outer Space); Knute Aagaard of the University of Washington (The Search for Northern Sources of Deep Waters); David Elliot of The Ohio State University (Earth Sciences Research in Antarctica); Charlie Bentley of the University of Wisconsin (Antarctic Glaciological Research); Jim Zumberge of the University of Southern California (The Scientific Committee on Antarctic Research-SCAR); and R. Tucker Scully of the Department of State (Political Developments Relating to Antarctica). To stimulate a little more interest in Charlie Bentley's lecture to the Society on the 8th, we are including his abstract of what he will present earlier that day to the American Geophysical Union.

## Antarctic Glaciological Research

The objectives of Antarctic glaciological research are to determine the dynamics of the Antarctic ice masses, to ascertain their role in world climate, and to understand the record of environmental parameters stored in the layers of firn and ice. There are three principal aspects to current research: ice coring, studies of glacier dynamics, and glacial geophysical measurements.

A number of shallow, intermediate, and deep ice cores have been recovered and analyzed for a continually expanding list of isotopic, chemical, and physical properties. Interpretation of these yields detailed information on past environmental conditions and sheds light on past dynamics of the ice sheet that are crucial to the understanding of its response to climatic change. The evidence for concurrent changes in CO<sub>2</sub> content and paleotemperature is particularly dramatic. Measurements on ice cores have also yielded values of physical parameters necessary for the interpretation of remote sensing information.

Studies of ice dynamics proceed slowly because of the huge size of the ice sheet. Nevertheless, evidence is growing, from regional studies of surface mass balance combined with ice movement measurements using repeated satellite positioning, that suggest a rising and steepening of the ice-sheet surface. Numerical model studies, which play a vital role in ice dynamics, have suggested the possibility of surges of the ice sheet and have provided realistic scenarios for major post-glacial (and perhaps future) changes in the West Antarctic ice sheet.

Geophysical measurements are used for a variety of purposes – for obtaining clues to paleodynamics from various reflectors within, and at the base of, the ice sheet (radar sounding), for determining internal crystalline fabrics (seismic shooting), for calculation of englacial temperatures (electrical resistivity measurements), and for studies of isostasy and glacial history (gravity).

**AND THERE WERE TEN.** Kennard Bubier, aviation mechanic on the 1st Byrd Antarctic Expedition, 1928-30, who lived in Corona Del Mar, California, died on July 2, 1983. He had retired as a Lieutenant Colonel from the U.S. Marine Corps in 1953, and then worked another eleven years for Lockheed Aircraft. His death leaves ten living members of the 1st Byrd Antarctic Expedition—Larry Gould, Henry Harrison, Howard Mason, Norman Vaughan, Dean Smith, Eddie Goodale, Carroll Foster, Ed Roos, John Bird and Leland Barter. – Some of the fellows in NSF ran into Norman Vaughan up on the ice cap in Greenland this past summer. It seems a couple of planes (now extinct) went down on the ice cap during World War II and the downed crew decided not to wait for the rescue dogs (led by Norman) but to walk on out to civilization, which they did. The planes were left out there, and now, some forty years later, someone came up with the great idea of going back and retrieving them for some museum. So they got old Norman out of Alaska and rendezvoused in Greenland, hoping to find the planes. I understand that everyone had a lot of fun, that they told a lot of good stories; but the snow and ice were reluctant to divulge just where they were holding the planes. – Martin Ronne, who was on the '28-'30 Byrd Expedition, sired Finn, who in turn sired Karen, who in a pre-Veterans Day production on November 10th gave birth to a real bouncing boy, Michael Ronne Tupek, who checked in at 10 pounds, 9 ounces. Now it's only a question as to where Mike will play football!

**ED TODD WANTS RETIREMENT.** The Pride of Newburyport, Massachusetts has decided there is nothing more to live for now that the New Yorker has immortalized him with that cartoon of Ed walking down the street in polar garb. In one of the best known

secrets in Washington, Ed finally went through with his plan of asking NSF to search for his replacement. The announcement for applicants for Director of the Division of Polar Programs closes 25 November 1983. The whole Antarctic community waits with bated breath to find out who will ascend the throne on the 6th floor in NSF. Ed expects that his replacement will come aboard by late winter or early spring. Please disregard statement on page 3 that Ed would be co-chairman of the AGU polar session on 8 December, as Ed will be on a trip to the ice.

**ANTARCTIC DISSERTATIONS.** This has long been a subject of interest to me, because I have felt that the National Science Foundation's Division of Polar Programs was probably financing more PhDs per unit grant than any comparable office in the Foundation, which I thought was highly commendable as it seems to be consonant with the basic theme of Antarctica being a scientific laboratory. My curiosity led me to soliciting dissertation titles and authors from both The Ohio State University and the University of Wisconsin. We published the former (Vol. 81-82, December, No. 3) and looked at the latter. This year I thought it would be interesting to go to Xerox University Microfilms people in Ann Arbor (300 North Zeeb Road) to get a listing of Antarctic-type dissertations in their computer, so we did. We made up a list of key words - there is no limit to the number one can submit - and got a printout of 215 references, but only 181 were valid! We knew of ten others which did not show up on the printout, so we are working with a base of 191 dissertations. We can't list them all in a single newsletter - it would take too many pages - so we will spread them out over several issues. This Newsletter will show some special categories on pages 6-11.

**ANTARCTIC IVORY TOWERS OF LEARNING.** Our list shows that degrees have been awarded by 61 universities. There are two giants, Wisconsin and Ohio State, with 27 and 22 dissertations, respectively. Then there are nine additional schools which have produced over five dissertations: University of California at Davis, Columbia, Florida State, Johns Hopkins, Minnesota, Stanford, Texas ASM, VPI, and Washington. Here they are, with number of dissertations awarded:

Wisconsin	27	Duke	2	Louisiana State	1
Ohio State	22	George Washington	2	MIT	1
California-Davis	11	Illinois	2	Nevada-Reno	1
Columbia	9	Miami (Florida)	2	Oklahoma	1
VPI	8	Oxford (UK)	2	Oklahoma State	1
Texas ASM	7	Saint Louis	2	Perm State	1
Florida State	6	So. California	2	Princeton	1
Johns Hopkins	6	Texas Tech	2	Purdue	1
Minnesota	6	Tufts	2	Rice	1
Stanford	6	Wyoming	2	South Carolina	1
Washington	6	Arizona State	1	South Dakota	1
Maine	4	Boston	1	State Univ.-NY	1
Oregon State	4	Boston College	1	Temple	1
Calif.-San Diego	3	Case Western	1	Tennessee	1
Iowa State	3	Clark	1	Washington Univ.	1
Maryland	3	Colorado	1	William and Mary	1
Michigan	3	DePaul	1	McGill (Canada)	1
New York Univ.	3	Georgia	1	Melbourne (Aust.)	1
Rhode Island	3	Harvard	1	U.S. Internat'l U.	1
		Idaho	1	Victoria (N.Z.)	1
		Kansas	1	Witwatersrand (S.A.)	1

**BY DEPARTMENTS.** It is pretty difficult to put the studies into groupings by disciplines, as so many could be placed in two or more categories. So we have separated them by the departments in which the degrees were granted. There are a few surprises, such as a degree coming from an agriculture department, another one coming from an anatomy department, and conversely, with all that snow and ice only one from a hydrology department. So, for a continent that has no crops except snow, we have equal representation in agriculture and in hydrology!

Geology	45	Microbiology	3
Oceanography	21	Political Science	3
Zoology	17	Psychology	3
Atmospheric Sciences	15	Biochemistry	2
Geophysics	15	Limnology	2
Ecology	12	Physiology	2
Geography	10	Agriculture	1
Biology	6	Anatomy	1
Engineering	6	Environmental Sciences	1
Paleontology	6	Geochemistry	1
Biological Oceanography	4	History	1
Botany	4	Hydrology	1
Chemistry	3	Inorganic Chemistry	1
Marine Science	3		

**WOMEN OF ANTARCTICA.** According to our information, the first woman to earn a PhD on Antarctica was Mary Adamkiewicz, who back in 1950 did a dissertation in the Geography Department at Temple on "Twenty-five Years of American Antarctic Exploration, 1925-50." Wonder whatever happened to dear old Mary? Even Pete Burrill, the grandfather of American geography, has no idea. There are only four older listings: Stewart- 1933; Wade - 1937; Siple - 1939; and Warner - 1942; so she was in real good company. There wasn't another woman on the list until nineteen years later, 1969, when a real Antarctic name, Lois Jones, received her degree from The Ohio State University. All together thirteen women have received Antarctic degrees: Adamkiewicz, 1950; Jones, 1969; Katherine Green, 1975; Greta Fryxell, 1975; Cynthia Whitman, 1976; Claire Parkinson, 1977; Jennifer Kitchell, 1978; Donna Oliver, 1979; Jeannette Thomas, 1979; Ellen Mosley Thompson, 1979; Anne Douglass, 1980; Charlene Denys, 1981; Katherine Balshaw-Biddle, 1981. But there must be more, so let us know about them, please!

**A LITTLE LEVITY** (submitted by John Spletstoeser for Bergy Bits). This is the kind of Antarctic story that often has to incubate for awhile before it can be told in print. In other words, the statute of limitations should have expired by now. When I went to Antarctica in November 1961 to be part of a University of Minnesota geologic expedition in the Ellsworth Mountains, I stayed at McMurdo for several days before going on to Byrd Station. When I arrived at McMurdo from Christchurch, lodging was very tight, as it often is, and especially at that time in McMurdo's history. The usual places were filled, so I was given a place to sleep in the so-called Cryopedology Laboratory, which was a small Jamesway building dedicated to Bob Black's (University of Wisconsin, now University of Connecticut) research project on patterned ground. Bob's students, Tom Berg and Jim ("Sully") Sullivan, roomed in the lab during the 1961 winter while conducting continuing research on ground temperatures and the like. Now that summer had arrived, they had moved out into regular USAKP quarters, and I slept in the lower bunk of the double-bunk arrangement. Bob Black arrived a few days later and slept in the upper-bunk. No one else lived in the building.

I remembered Tom and "Sully" from the previous season, 1960-61, when they did some field work prior to their wintering over. The story I remember about "Sully" is his choice of spirits. In those days, alcoholic spirits were provided free by NSF at McMurdo for field parties as part of the field rations. Your allotment depended on the number of field members and the expected duration of your<sup>1</sup>- field work. Sounds like a pretty good deal, and it was, except that there were often inordinate delays in getting to the field because of bad weather, plane crashes, etc., and it was possible to consume a considerable volume of the field spirits at Byrd Station before one ever got to the field. Anyway, prior to the wintering-over at McMurdo, "Sully" was asked what kind or kinds of liquor he wanted for his winter "field" project, and he said "a case of creme de menthe." That has always stuck with me, because you would have to know "Sully" to imagine anyone actually choosing only creme de menthe when there were all kinds of other (free) choices. I expected to see him with green skin after the 1961 winter, but I guess he had sloughed it all off by the time I got there. Tom Berg is remembered by many of the 1960's Antarcticans as a good-natured guy who unfortunately was killed in a helicopter crash in one of the dry valleys in 1969. Berg Field Center at McMurdo is named for him.

However, the real reason for telling this story is still coming. The afternoon of the first day that I arrived at McMurdo in 1961, I was alone in the Cryo Lab when a number of biologists from the nearby biolab trooped in, led by Don "Curly" Wohlschlag, the Stanford Professor of Biology and mentor of several of the students he accompanied. (That biolab is now the Eklund Biolab, and the Cryopedology Lab was about where the westernmost part of the present USARP garage is.) One carried cocktail glasses, another had a cocktail pitcher, others had bottles of vermouth and olives. It was obviously time for the cocktail hour before evening dinner at the McMurdo mess hall. Tom Berg and "Sully" arrived a little later. The only commodity not apparent was gin, which someone informed me was in a box under the bunk I was sitting on, and would I "please get some out and join us." The box turned out to be a case of Beef-eater gin, and after the martinis were mixed and distributed and we had begun to get

on to serious discussions, someone asked me how I liked the martini. I said that it was very good, and then something to the effect that Beefeater is some of the best gin for the job, at which they all laughed heartily and I thought I had made friends unusually quickly with my piercing wit. Well, after a few more splashes of martinis, after which the same question was asked and much the same answer was given, followed by roars of laughter, I thought these biologists were really okay, and I started to think of some other jokes I could tell. Not so, at least the part about my jokes. What they were laughing at was the part about the Beefeater. It was sure good gin, all right, but it wasn't Beefeater, it was theirs. They made it in the biolab, having brought the ingredients, like juniper, with them, and concocting their own recipe. They simply poured their batches into Beefeater bottles and used them over and over. Sure enough, when I slid the box back under the bunk I noticed that there were no tax stamps on the caps, and all the seals were broken, even though nearly all the bottles were full.

Some of those same biologists, then graduate students but now professors, are still active in Antarctic field research, presumably escaping any mishaps associated with a moonshining operation. I left for Byrd Station a few days later, about the time my liver told me it was time to leave town.

**EMILIO PUCCI, ANTARCTICAN?** Our letterhead shows Emilio Pucci as an Honorary Member, and our new people keep asking, "How come?" Once upon a time Pucci was a dear friend of one of our members, a French correspondent, who persuaded Emilio to design an Antarctic scarf for our Society. Needless to say, they sold like hot-cakes, and, in appreciation the Society voted him an Honorary Member. I had no idea whether Pucci was alive or dead until summer before last when he surfaced in Washington for a benefit fashion show by Italian designers. That benefit evidently was not for him, as an article in the Washington Post implied that everything he touches turns to gold. The article said that the "familiar geometric prints and bright colors that have been his signature for almost 30 years . . . continue to sell around the world." And he exports wine, and also honey in an earthenware jar he designed. He is going to design another Lincoln Continental. He's evidently into men's underwear - bright pastel printed underwear. He's on the city council in Florence, Italy, where he lives, at age 69, in a huge palazzo and drives a car with bullet-proof windows. While in Washington, he showed dresses which had 8,000 hand-cut stones and which took five months to make, so the guy must have a lot of extra time on his hands. I guess he's done pretty well for himself, as he wears two wristwatches at the same time!

**PASSING THOUGHT.** Wonder if Brooke Knapp had not been a beautifully built and statuesque blond with a million-dollar smile if she would have gotten all that fuel at McMurdo from the Navy for her Pole-to-Pole globe circling. According to the Washington Post of 14 November, she wrote to the Division of Polar Programs at NSF asking for fuel at McMurdo, and Ed Todd wrote back telling her, in effect, "Heavens no! We aren't in business to support adventurers on boondoggling affairs." That fellow Todd surely is a pure scientist, but then again, he hadn't actually seen her! So Brooke reevaluated her position and decided to make some personal calls on the Navy. She found out that the Navy was real broadminded, and they said something like "Don't worry about NSF. You just meet us in McMurdo and we'll give you the whole place." Don't we have room for Brooke as an Honorary Member? Just asking!

**NEW RECORD LOW.** The Russians reset the absolute minimum temperature for this old planet, -128.6°F at Vostok on 21 July 1983. Previous record was -126.9°F, set at Vostok in 1960. Wonder when the Russians will come up with a higher world record wind speed than the 231 MPH measured atop Mt. Washington nearly 50 years ago?

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 83-84

January

No. 4

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.), 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84

*SOMETHING NEW! SOMETHING DIFFERENT! SOMETHING EXCITING!*

FULL PROTECTION FOR THE ANTARCTIC - A VIABLE GOAL?

by

James N. Barnes

Director, The Antarctic Project

Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982

Jim Barnes is an environmental lawyer and an expert on the conservation of the natural environment of Antarctica. Among his many affiliations he is a member of the State Department's Public Advisory Committee on Antarctica, and of its Public Advisory Committee on Law of the Sea; and a member of the International Union for Conservation of Nature and Natural Resources, Commission on Law and Policy. He has authored half a dozen publications on Antarctica, his most recent being "Let's Save Antarctica!" He wrote an excellent chapter on "The Emerging Convention on the Conservation of Antarctic Marine Living Resources" in "The New Nationalism and the Use of Common Spaces", published in 1981. Jim, an Okie from Tulsa, graduated from Northwestern and then went to the University of Michigan Law School. He also is capable of such mundane acts as bicycling, hiking, and photography, but not all at the same time.

*Don't miss Jim Barnes! We have never had anyone quite like him!  
In fact, there may not be another Jim Barnes, but there are a lot  
of followers in his flock!*

- - We'll have calendars ONLY for those who have already paid for them - -

We try to introduce new subjects from time to time, since history shows that variety is the spice of life. In this issue we are publishing the paper given by Gentleman Jim Zumberge, President of SCAR (Scientific Committee on Antarctic Research) at the polar session of the American Geophysical Union meeting in San Francisco on December 8th. This seems to be a logical follow-up to both Tucker Scully's Memorial Lecture on the Antarctic Treaty System (October) and Al Chapman's lecture of the State Department inspection cruise (November), and the upcoming lecture by James Barnes. We are also continuing with our publication of dissertation titles turned out by a computer search at Ann Arbor, as, hopefully, this is of interest to some of our readers. Bergy Bits will also include the personal opinions of the writer on various unrelated subjects, which should in no way be construed as anything more than personal comments,

**BAD NEWS, GOOD NEWS.** We are redlining about thirty members who have not paid their dues for 1983-84, which is the largest number of delinquents in a couple of years. However, this wasn't entirely unanticipated, as nearly all of our membership came up for renewal this year in contrast to the past several years when we had large advance-paid memberships. Those being dropped, unless they get their dues in, are Nolan Aughenbaugh - he's a newly appointed Dean at the University of Alaska but we evidently don't have his correct address; Hugh Bennett - who has a long standing reputation for holding on to his dollars; Fred Brownworth; John Bryson; Richard E. Byrd III; Bill Cooke; Steve Fazekas; Harold Fibelman; Miriam Free; Marcus Hermanson; Sam Hinerfeld; Eric Kramer - even his girl friends don't know where he's living; George McCleary; Dick Neff; Bruce Parker; Robert Rofen; Frank Salazar; Seymour Schlossberg; Bill Schoonmaker; Leland Whitmill; and Steve Wilson. There are others like John Spletts, Ed Stump, Bruce Lieske, Wild Bill Cromie, Russell Berry, and Richard Julian whom we know we'll catch up with in due time. Forty-three people signed up for five years, and we (Ruth Siple and I) can't tell you how much we appreciate that - it eliminates a lot of hassling downstream; over 140 have paid for next year - a third of our membership. Our total paid-up membership is 413. THANK YOU! THANK YOU!

**MANAGEMENT OF THE SOCIETY, IS IT OUTDATED?** I have long been a proponent that management by committee action is paramount to disaster, citing the example of a committee coming up with a camel when they were directed to produce a horse. Our Society has changed drastically in membership from its early inception when it was basically a group of Washingtonians; now it is essentially a national organization with a cluster of about a third of our members (approximately 160) living in the Washington area - half of whom have not been to a single meeting in the last six years. Our By-Laws tell us that "The Board of Directors shall consist of not less than four (4) nor more than sixteen (16), each of whom shall be a member in good standing, of full age, and at least one of whom shall be a citizen of the United States and a resident of the District of Columbia." A couple of years ago we amended the By-Laws to include the election of an out-of-Washington area member until we had three on the Board. So essentially we are managed by a President, a Vice-President, a Secretary, a Treasurer, twelve regular Board members, and three out-of-town members. We passed an amendment several years ago that people

could not be put back in office until they had sat out a few terms after leaving their position. This in turn was subsequently modified by the Siple Amendment-which said that the position of Treasurer could be more or less permanent as long as Ruth Siple was willing to fulfill the duties. I sincerely feel that the Society is overmanaged, that the Board of Directors has far too many people, that we would be much better off by reducing the number on our Board, and that we can do this without any further amendments as the By-Laws call for "not less than four." It is pretty hard to keep coining up with good Board members, especially new blood. I would like to see greater out-of-town involvement, but how do we get them into the act? I think that eventually - why not now? - a scheme should be developed whereby our out-of-town members would actually get involved in the management of the Society, that our local Board members should be reduced to two new members a year, and that our Board meetings should only be held semi-annually. After all, the Board of Directors met only once in 1982-83, and the Society flourished with only one meeting. Isn't there a message there? I imagine the Board was a great thing in the conceptual stages of the Society when it was almost an exclusive Washington fraternity, and its meetings were an excuse for having a good old boys' party. I'm not against a good party any time, but I do think that the large Board of Directors is NOT the way to run this Society. It's dangerous!

**CALIFORNIA MEETING OF THOMAS C. POULTER CHAPTER BIG SUCCESS.** The first ever out-side-Washington area meeting of the Antarctic Society was held at Stanford University the evening of 8 December 1983 when Dr. Charles Bentley, Chairman of the Polar Research Board at the National Academy of Sciences, addressed the Thomas C. Poulter Chapter of our Society on "The Future of the West Antarctic Ice Sheet." John Katsufakis of Stanford and Art Ford of the USGS, both cold-hardened Antarctic veterans of probably too many sojourns, engineered the production which was attended by approximately sixty-five people, fifty-two of whom signed a guest book, in spite of a miserable rain falling all over the area. Twenty-four members of our Society live within a stone's throw of the Bay area, which represents the largest single conclave of Antarcticans outside the Washington area. One of the many good things about this group is that they are live active Antarcticans, so we fully expect that this chapter will continue to meet periodically. The Program Chairman for the American Geophysical Union meeting was so encouraged by the large turnout for the polar session in San Francisco that he is thinking in terms of having another session next year. There are three excellent people - John Katsufakis, Art Ford, and Rob Flint -who like to work and whose enthusiasm will no doubt keep the chapter alive and active. Among the out-of-town attendees were Tahoe and Link Washburn of Seattle, Juan Roederer of Fairbanks, Mark Meier of Tacoma, David Elliot of Columbus, Tony Gow of Hanover, Tim Hushen of Bethesda, Ruth Siple of Arlington, and Paul Dalrymple of Alexandria, as well as the speaker, Charlie Bentley of Madison. However, the most honored guest, by far, was Helen Poulter, widow of Dr. Thomas C. Poulter for whom the chapter is named.

It seems appropriate at this time to reflect on some of the many achievements of Dr. Poulter, as he was truly one of the great scientific giants of Antarctica, one whose scientific curiosity was still being tweaked at his death at age 81. The late Dr. Thomas C. Poulter was the Chief Scientist on the 1933-35 Byrd Antarctic Expedition, Vice-President of the American Polar Society, 1945-78, native of Salen, Iowa (population too insignificant to count in latest census!), and graduated from Iowa Wesleyan College. He served as a submarine officer in World War I, which must have made him some sort of a pioneer in that field. As a physics professor at Iowa Wesleyan, he had a student by the name of James A. Van Allen who sort of became famous in his own right for discovering radiation belts around the earth. Van Allen

gave credit to Dr. Poulter for kindling the flame of his scientific curiosity. Prior to going to the Antarctic in 1933, Dr. Poulter participated in a large expedition seeking meteorites in the Southwest. If he had only known of the rich meteorite fields existing in the Allan Hills (Victoria Land), he would have hooked up a dog team and gone "over the hill" while at Little America II! I wonder if he ever philosophized on the possibilities of meteorites in Antarctica - I bet he must have. Dr. Poulter became Science Director of the Armour Institute Research Foundation in Chicago in 1936, and it was while there that he designed the ill-fated Snow Cruiser (which wasn't unlike the large vehicles which the Russians use successfully today in Antarctica). During World War II Dr. Poulter worked at the Navy's research station at Point Barrow, Alaska. He joined the Stanford Research Institute in 1948, becoming its Associate Director. In 1960 he became general manager of Physical and Life Sciences at the Institute and in 1963 established SRI's Bio Sonar Laboratory at Fremont for the study of biological sonar and diving mammals, including studies with blind people. He served as Director of SRI's Poulter Laboratories, named after him for his contributions in the fields of detonation and shock pulse phenomena. He held more than 75 patents on diverse inventions, many being antisubmarine devices. In his late years he was very active in marine mammal sounds. After his "paper retirement," he worked with a surgeon at SRI and at the University of California Medical School in San Francisco on experimental implants to aid the deaf. He was quite a man. The lovely house that he and Helen built in the Los Altos Hills has one of the most spectacular views in the whole Bay area. It is most appropriate that the Californians saw fit to memorialize Dr. Poulter by naming their chapter after him, as they couldn't have picked a more distinguished Antarctic scientist. Good luck to the chapter. May it flourish as did Dr. Poulter's career.

**THE SCIENTIFIC COMMITTEE ON ANTARCTIC RESEARCH (SCAR) - James H. Zumberge.**

SCAR and the Antarctic Treaty are legacies of the IGY (International Geophysical Year). By the time the IGY ended on December 31, 1958, both SCAR and the Treaty were born. SCAR was formed by the International Council of Scientific Unions (ICSU), and the Treaty came into force in 1961 after extended negotiations that were rooted in pre-IGY days.

The purpose of SCAR is to coordinate research in Antarctica, sometimes initiate new research programs, respond to recommendations from the Treaty Nations, sponsor symposia and workshops, and to maintain open lines of communication between the scientists of the member nations.

Most of the scientific matters of SCAR are handled in nine of ten working groups: Biology, Geodesy and Cartography, Geology, Glaciology, Human Biology and Medicine, Meteorology, Oceanography, Solid Earth Geophysics, and Upper Atmospheric Physics. The tenth working group, Logistics, is an exception to the generality that SCAR deals only in scientific matters,

When other matters arise that do not fall neatly within the purview of the working groups, groups of specialists are organized. Currently, five such groups exist: Antarctic Climate Research, Seals, Southern Ocean Ecosystems and their Living Resources, Antarctic Sea Ice, and Antarctic Environmental Implications of Possible Mineral Exploration and Exploitation.

\* [Editor note: SCAR dates back to September 1957; the Antarctic Treaty was signed 1 December 1959, but Informal Working Group on Antarctic meetings date back to 13 June 1958]

This last-named group has particular significance because it reflects a shift in SCAR activities from those that are purely scientific to those that have a broader context. It also serves as an example of how SCAR responds to formal requests from the Treaty Nations.

From the beginning, SCAR maintained a rigid distinction between science and politics. This separation remains until this day, but the line between the two has become more finely drawn, and SCAR must exercise constant vigilance to avoid matters and policies that, while they may relate to scientific activities, are the business of the Consultative Parties who administer the affairs of the Antarctic Treaty. SCAR and the Treaty Nations normally communicate through their respective National Committees.

The question of Antarctic mineral resources had never been raised within SCAR until 1976. That year, SCAR met in Mendoza, Argentina and tabled a recommendation from the Eighth Antarctic Treaty Consultative Meeting held the previous year in Oslo. That recommendation asked SCAR to identify the most-likely areas in Antarctica where mineral exploration and exploitation might occur, the extent to which such activities might affect the marine and terrestrial environments in general and ecosystems in particular, and the kinds of monitoring programs that should be developed prior to the commencement of any mineral activities.

SCAR was apprehensive about its response lest someone infer that by taking on the assignment, SCAR was tacitly endorsing a move toward exploitation of mineral resources in Antarctica. Keep in mind that the OPEC quadrupling of the world price of crude oil in 1973 and 1974, caused oil importing nations of the free world to begin thinking about alternative sources of this commodity. Both SCAR and the Treaty Nations had avoided the minerals issue until it was forced on their agendas by international events beyond their control.

Without belaboring the reasons why both SCAR and the Treaty Powers finally addressed the question of mineral resources, suffice to say that SCAR organized a group of specialists to deal with the request from the Eighth Treaty Meeting. The study made by the group was conveyed to the Consultative Parties in time for their Ninth Meeting in London in October 1977, and a published version appeared in 1979.

The story does not end there, and indeed is still unfolding. The present SCAR Group of Specialists on Antarctic Environmental Implications of Possible Mineral Exploration and Exploitation is an outgrowth of its predecessor who first addressed the question in 1976. The Consultative Parties are now working towards an agreement on a minerals regime for Antarctica which will govern the way in which minerals, including offshore hydrocarbons, could be exploited within the framework of the Treaty,, Since the Treaty itself is silent on the question of resource development, the Consultative Parties are trying to forge a separate convention to handle this problem,, They have turned to SCAR for answers to scientific questions that arise during the course of negotiations, but SCAR's Working Group has no say in the design of the concord toward which the Treaty Nations are working.

SCAR's spectrum of activities will be further broadened in 1985 when it joins with the International Union for the Conservation of Nature (IUCN) in sponsorship of a symposium on "The Scientific Requirements for Antarctic Conservation." ICUN's view of the future of Antarctica has political connotations that include the possibility of making Antarctica into a World Park with all the ramifications that status implies. SCAR, however, has no official position on that question, and believes that matters such as these lie in the realm of inter-

national diplomacy, not international science.

From time to time, other groups have tried to entice SCAR into taking an official stand on one policy or another that bears on the future of the Continent. The most recent of these came from a New Zealand based group that wanted SCAR to intervene with the French who are planning to construct an airstrip to improve the logistic support of their scientific base in Terre Adelie. The group protested that the building of this landing field would have undesirable environmental consequences on the local ecosystem, and that the facility should not be built. SCAR referred the matter to its Working Group on Biology, but SCAR does not have the authority to tell the French Government what to do in cases like this, nor does it have the inclination to take an official position on whether the strip should or should not be built. Our role is to determine to the best of our ability what the environmental consequences will be and provide that information to those who want to refer to it in making the decision,,

Unfortunately, many will deduce from SCAR's refusal to make official pronouncements on matters such as the proposed French airstrip that SCAR has no position on conservation in Antarctica. Nothing is further from the truth because since the early days of their existence, both SCAR and the Consultative governments have been conscious of the fragility of the Antarctic ecosystem and the need for protective measures. Indeed, in 1964 on recommendations formulated by SCAR, the Treaty Nations adopted guidelines for the conservation of Antarctic flora and fauna and designated a number of Specially Protected Areas. These measures became effective in 1966. They have since been expanded, and in 1972 the Consultative governments adopted SCAR's advice on another concept of Sites of Special Scientific Interest. Several of these have now been established and SCAR is compiling an annotated Atlas of Antarctic Protected Areas and is preparing specific recommendations for the establishment of new sites.

SCAR even published a small booklet to advise visitors and tourists on proper environmental behavior when in Antarctica to insure that conservation and preservation of the environment is practiced by all who enter the Treaty area. Those who would charge SCAR of indifference or negligence on conservation matters in Antarctica have no basis in fact for doing so.

Over the twenty-five years that SCAR has been in existence, it has enjoyed remarkable stability in carrying out its mission of fostering and guiding research. This work has continued unabated in spite of international events that have posited some of its member nations in opposing stances. Neither the cold war of the late fifties and early sixties, nor the war over the Falkland/Malvinas Islands, nor any of the other international incidents and conflicts of the last quarter-century have had any impact on the regular and ongoing activities of SCAR. This has been due in no small measure to SCAR's determination to maintain its apolitical posture in all that it does.

Some of the SCAR delegates and members of SCAR Working Groups and Groups of Specialists act as advisors to their governments during meetings of the Consultative Parties, but they do so as scientific representatives of their respective countries and not as emissaries from SCAR.

SCAR's membership is open to any nation that establishes an ongoing scientific program in Antarctica. The original twelve have grown to fifteen [Editor note: sixteen have now ratified the Treaty], and at least three other members will apply for membership status soon. At the Seventeenth Meeting of SCAR in Leningrad in 1982, observers from Brazil, Peoples Republic of China, India, Italy, and the Netherlands were present because their respective countries had indicated inten-

tions to establish scientific research programs in Antarctica. Uruguay has been invited to send an observer to the Eighteenth Meeting of SCAR in Hamburg next year. It is not impossible that SCAR could have twenty members by the end of this decade.

**OPEN SEASON ON ANTARCTICA: UNITED NATIONS GETTING INTO THE ACT.** The United Nations evidently does not believe in the old axiom that if it isn't broken, leave it alone, because in late November a resolution was passed, adopted by consensus, that asks General Javier Perez de Cuellar (wonder if he's related to Mike Cuellar, the superstitious pitcher of yesteryear for the Baltimore Orioles, or, could he be one and the same person?) to "prepare a comprehensive factual and objective study on all aspects of Antarctica, taking fully into account the Antarctic Treaty system and other relevant factors." The "other relevant factors" seem to be the Third World countries who feel/fear that they will miss out on the subdivision of Antarctic goodies at some future date. The report won't be completed for a year, and then will start "the real controversy" - as written by Michael Berlin in the Washington Post on 1 December 1983. The General Assembly's Political Committee did find some good things during their three days of discussions on Antarctica: unanimous praise for the Treaty's effectiveness in isolating the continent from the arms race, safeguarding its environment, and fostering cooperative scientific research. Berlin wrote that "the Treaty powers have recognized the emerging pressures and are eager to be responsive enough to satisfy the moderates in the Third World without relinquishing control." One American official was quoted as saying, "The Treaty keeps the territorial claimants at bay. The Third World says it doesn't want to destroy the Treaty, but if there's some assertion of the 'common heritage' concept, some call for international control, some proprietary right for resource revenues, that means there is no national jurisdiction, no sovereignty possible. That's what Washington fears most. It would trigger the claimants' action, - force them to reassert their claims, and they would blow the Treaty apart. And we would have lost its tremendous disarmament aspects." The article went on to say that "Negotiations among Treaty parties have included proposals that a portion of resource revenues be set aside for international purposes, such as administering Antarctica. And commercial exploitation, under these proposals, would be open to private or state syndicates of countries that are not parties to the Treaty." It seems to this innocent bystander that the United Nations should have more world-pressing problems in this troubled world than Antarctica which appears to me to be doing just fine with its Antarctic Treaty plus SCAR.

#### **ADDENDA TO LAST ISSUE LISTINGS OF DISSERTATIONS.**

Under Atmospheric Sciences add:

Kuhn, Michael. Measurements and analysis of the spectral transparency of the East Antarctic atmosphere. University of Innsbruck.

Vergeiner, I. Mixing layer concept and Richardson number in stable stratification, based on an analysis of wind and temperature profiles of the South Pole Station, 1958. University of Innsbruck.

Weller, Gunter. The heat budget and heat transfer processes in natural ice bodies. 1968. University of Melbourne.

Under Women of Antarctica add:

Kellogg, Davida<sub>0</sub> Microevolutionary mechanisms in the evolution of Miocene to recent radiolaria from Pacific deep-sea cores. 1973. Columbia University. (Davida writes that "about a third of the work involved rads from south of the Antarctic convergence.")

I should have remembered that guy Vergeiner, as he took my data and beat me to it working up a doctoral dissertation. I felt an obligation to get the scientific data out into the community as early as possible, so I did, not suspecting that lurking somewhere in the Alps was a frustrated meteorologist looking for some data to analyze! He never contacted me about what he was doing, nor did his thesis advisor who was an Antarctic colleague of mine; I never found out about it until a couple of years afterward - from a third party. It didn't hurt me professionally as I was working up my data through Lettau the Elder, who was tops in the world in micrometeorology. But I did learn a lesson - don't be a nice guy when you have some original data, as there's always some out there waiting to do you in.

**EVERYTHING IS NOT WHITE OR BLACK.** The print-out of dissertations was listed by years, not disciplines, not by departments; then Bergy Bits broke them down according to some unknown mythical formula (probably the time elapsed since the last cup of coffee). We can't always tell from the department designated in the print-out whether a study is really geography, geology, glaciology, geophysics, or whatever, as so many cross boundaries when they do their dissertation. Now take the last one above, the one by Vickers; it doesn't belong under geophysics, and we probably wouldn't have even included old Bill if it hadn't been for one of the nice guys (Dick Goldthwait) writing us from Florida, asking how come Bill's dissertation wasn't listed under meteorology. According to the computer Bill got his degree in the Geography Department at McGill; Dick writes that he got it under Svenn Orvig. And since we had no grouping for geography, we spread titles around a bit and Bill came out in geophysics. It's actually much better than he deserved, based on how strong he came on when he arrived at Little America V in the austral summer of '57-'58. There were quite a few people who wouldn't have been the least bit hesitant to pushing him headlong into Crevasse Valley. The real miracle here is that Vickers shows up at all, not that he is out of place!

**NSF'S DIVISION OF POLAR PROGRAMS ADVISORY COMMITTEE.** The newly restructured Division of Polar Programs Advisory Committee met for the first time at the National Science Foundation in Washington, D.C. on 15-16 September 1983. The Advisory Committee, which the Foundation originally established on 1 October 1977, provides

"advice, recommendations, and oversight concerning support for research and research-related activities in the polar regions area." Previously, the Committee had been comprised of six subcommittees that focused on specific science disciplines and logistics. The present Committee is an interdisciplinary group with one to three members representing each of the five broad scientific disciplines in which the Division supports research. These are biology and medicine, ocean sciences, earth sciences, atmospheric sciences, and glaciology. The Committee will provide general oversight of management and program balance for the Division's arctic and antarctic programs. Relevant committee members also will review in depth each disciplinary program at least once every three years; two or three other scientists who are experts in the discipline under review will help the committee members with these reviews. The Committee will meet two or three times each year, and members will ordinarily serve 3-year terms. However, six of the current group will serve only two years to ensure an orderly rotation of the committee's membership. The present 12-member committee will be expanded to include three specialists in polar logistics and other related areas. The current members are:

Ian Dalziel, Lamont-Doherty Geological Observatory, Columbia University;  
James R. Heirtzler, Department of Geology and Geophysics, Woods Hole Oceanographic Institution;  
William W. Kellogg, National Center for Atmospheric Research;  
Louis J. Lanzerotti, Bell Laboratories;  
Ursula B. Marvin, Smithsonian Astrophysical Observatory;  
James McCarthy, Department of Biology, Harvard University;  
Gifford H. Miller, Institute for Arctic and Alpine Research;  
Christopher Mooers, U.S. Naval Post Graduate School;  
Ellen S. Mosley-Thompson, Institute of Polar Studies, Ohio State University;  
Stephen C. Porter, Department of Geological Sciences, University of Washington;  
Elmer Robinson, Department of Chemical Engineering, Washington State University;  
Clayton White, Department of Zoology, Brigham Young University.

**HAPPY NEW YEAR TO THE WESTWIND, TOO.** The daily sitrep from the USCGC WESTWIND on 1 January 1984 seemed innocuous enough, in fact, upbeat, reporting that a helo flight taking scientists to the Jason Peninsula had resulted in significant findings, with the icebreaker navigating through heavy second/multiyear ice. And the message ended with "best wishes for a Happy New Year from WESTWIND." The next message, some seven hours later brought bad tidings - at 6 PM (Greenwich) the icebreaker had run afoul the 100-foot sheer ice cliff on the Larsen Ice Shelf when the multiyear heavy brash field shifted, resulting in more than a 30-foot gash six feet above the water line, and the ship was listing 8.5 degrees. What a great way to celebrate New Year's Day! Two compartments had been flooded, but by 8 PM (Greenwich) the ship had worked clear of the shelf and dewatered the flooded compartments. Before the day was over, they had maneuvered into an open lead. It was a harrowing experience shared by our Society's president, Dr. Mort Turner, who was aboard the WESTWIND at the time. As this is being typed (January 4th) everything appears to be under control; plans are being made to cruise back to South America; and the scientists are saying they'd prefer a flight to a cruise. C'est la vie!

**WHO'S ON FIRST! WHAT'S ON SECOND!** The guessing game in Washington is centered on who will replace the Squire of Newburyport, Ed Todd, as Director of the Division of Polar Programs. The drama intensified considerably when NSF relented under some pressure and opened the recruitment to academia (previously one had to be a government bureaucrat). We have heard various and sundry names being batted around, some from within the Foundation, some from other government offices, some from university circles. Bergy Bits has heard some pretty impressive names, and let's hope that when the selection committee gets together they can pick a winner.

**DON'T FORGET US ON BAE I** (Henry Harrison to Bergy Bits on 18 November 1983). We at Little America I also built up a reputation for imbibing the right stuff. Our serious drinking was done during the last month or two after practically all of the work program had been completed. True, we did find many excuses during the year to justify special party drinking - 4th of July, return of the sun, South Pole Flight and others. Some of those turned out to be barnburners featuring a football game outside on the Barrier in one case and a smashed mess table inside in another. The sky was the limit on these parties on that day but the following day was always back to normal operations.

The illegal drinking started long after the South Pole Flight when many of the 42 winterites were more or less waiting for the CITY to come get us and take us home. I recall the ringleaders as being Joe Rucker (Paramount News), Blackie (storekeeper) and Jim Feury (snowmobile). One of them would show up at my bunk after taps and say, "P-s-s-t, party just getting going in the Norwegian House!" Doc Coman's alcohol keg held out to the bitter end to provide fuel for the parties. Those in the know referred to these midnight sessions as "Meetings of the Bay-of-Whales Harbor Board." They were strictly verboten, of course, but we had a most unusual thrill one night around two o'clock when in walked THE COMMANDER, saying "Could I join the party?" And he did!

**MAIL BAG.** Here's a kicker, that staid and true son of New England, *Bob Nichols* has moved to Seminole, Florida - totally disregarding my admonitions. However, he wrote "my heart will stay in Massachusetts and New Hampshire." His ancestors didn't cross the North Atlantic until 1630, which makes him sort of a late arrival in Boston. Bob is too young to be moving to a retirement community, but you can't tell darn geologists anything anyway. - - - The *Zumberges* were interviewed in the Los Angeles Times on December 26th. He broke my heart when they said that his favorite photo (among many hanging on the wall) was one showing him standing between a couple of millionaires, O.J. Simpson and Marcus Allen. I bet neither one of them ever graduated from college. I thought his favorite picture would be one of him with Bert Crary and Larry Gould, not of those two! Marilyn Zumberge comes across as a very gracious and lovely lady. I guess she does the whole ball of wax at home, as she said, "Jim hardly knows where the grocery store is." - - - One of *Priscilla Grew's* current responsibilities as one of the Commissioners of Public Utilities in California is establishing the new phone rates following the breakup of Ma Bell. I had never met Priscilla until recently; she is a wonderful person, a pure delight to talk to. Ed has to be out of his mind to have an ocean and a continent between them! - - - I think *Winnie Reuning* has done just an excellent job since she became editor of the Antarctic Journal. - - - Enjoyed a couple of evenings drinking beer with *Mike (South Pole 78) Pavlak* in Las Cruces. He is still with Holmes and Narver, and is married to a beautiful blonde with an engaging personality who has a cat. Mike has one more year of work at White Sands, during which time his bride will finish her degree work in computer sciences at New Mexico State. They are nice folks. - - - *Red Jacket (South Pole 58) Jorgensen* is now president of AGA. As those old guys on the corner say in the IBM commercial, "You can't be talking about our Red Jacket?"

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Presidents:

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-2
- Mr. Gordon D. Cartwright, 1962-3
- RADM David M. Tyree (Ret.), 1963-4
- Mr. George R. Toney, 1964-5
- Mr. Morton J. Rubin, 1965-6
- Dr. Albert P. Crary, 1966-8
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-1
- Dr. William J. L. Sladen, 1971-3
- Mr. Peter F. Bermel, 1973-5
- Dr. Kenneth J. Bertrand, 1975-7
- Mrs. Paul A. Siple, 1977-8
- Dr. Paul C Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82
- Dr. Mort D. Turner, 1982-84

Honorary Members:

- Ambassador Paul C. Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard

Memorial Lecturers:

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Sir Peter M. Scott, 1971
- Dr. Frank T. Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr. 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980
- Dr. Robert L. Nichols, 1981
- Dr. Robert H. Rutford, 1982

WELCOME SPRING

with

WHALE WATCHING IN THE ANTARCTIC

by

Dr. William E. Evans

Director

Hubbs-Sea World Research Institute  
San Diego, California

on

Tuesday, 20 March 1984

8 PM

National Science Foundation  
18th and G Streets NW  
Room 543

- Light Refreshments -

Dr. William Evans is dedicated to understanding the interaction of man and the marine environment. The White House announced on 15 November 1983 the intention of the President to nominate Dr. Evans to be a member of the Marine Mammals Commission and to designate him Chairman. He is a member of the technical advisory group for the University of Guelph, studying the potential effects of oil spills on marine mammals. One of his many research programs involved the study of Gigi, the only Gray whale studied in a controlled environment. It is expected that Dr. Evans will devote part of his lecture time to tourism in Antarctica. For more on Dr. Evans, see page 2.

\* \* \* \* \*

*EXTRA ATTRACTION!* An exhibit of 24 color photographs of the polar regions by Mr. Erick Chiang, USARP Field Project Manager, DPP, NSF, will be on display at the meeting. Mr. Chiang has worked in both Greenland and Antarctica, having traveled to Antarctica numerous times since 1976. Come early and enjoy this superb collection of fine photographs.

*Don't miss Dr. William Evans!* It should be a most interesting evening - an excellent follow-up to James Barnes's presentation in January on protecting Antarctica!

SEE YOU ALL THERE!

Writing this column is a mixed bag, as it isn't always easy to get information. There are some very considerate people in our membership, mostly out-of-towners, who send us clippings when they see something of potential interest. But it's hard sometimes to find out just what is going on in Washington. This can be frustrating. The Antarctic Project seems to do a pretty good job of monitoring things which we can't hope to do, so from time to time, we will quote, as we will in this issue, from ECO, a publication with which they are allied. Again, anything in Bergy Bits is strictly unofficial relative to the Antarctic Society. Someone has to write it, and I prefer reading my own material to that of someone else who has prejudices that don't agree with mine.

**UPCOMING LECTURER DISTINGUISHED NOISE SCIENTIST.** Dr. William E. Evans, the Director of the Hubbs/Sea World Research Institute, is a Hoosier who found his way to the sea at a relatively young age when he was a research assistant at the Ohio State University Research Foundation conducting research on visual and voice communication, intelligibility studies, and biophysics of hearing for the U.S. Navy Voice Communications Laboratory at Pensacola, Florida. He evidently enjoyed listening to loud noises, and shortly thereafter found himself an artillery officer at Fort Knox. Then in civilian life he worked for Douglas Aircraft (1956-59) in bio-acoustics communication, noise control, and physiological effects of prolonged exposure to high level noise. In June 1960 he took his noise expertise to Lockheed Aircraft where he was Projects Leader of their Bio-acoustic group. The Navy beckoned in June 1964, and for the next fourteen years he was a civilian scientist with them studying the ability of certain marine mammals to navigate by sonar and aided in the development of aerial survey techniques. He also pioneered the use of radio telemetry in the study of whales and dolphins. Through the use of the Sea See, an underwater vehicle developed with his assistance in 1967, he initiated studies on the behavior of wild populations of pelagic (.open ocean) vertebrates.

He went to Hubbs/Sea World Research Institute in January 1977, where, as director, he is responsible for the organization of the Institute, procurement of endowments and generation of an aggressive grant procurement program, supervision of five scientists and 55 research associates, and spreading the Gospel about the Hubbs/Sea World Research Institute. He is the author of more than 60 published technical papers with topics on cetacean communication, dolphin echolocation, effects of noise on marine organisms, animal tracking and vocalization among marine mammals. He sounds, sic, to me like another Tom Poulter! Don't miss his lecture on the 20th! Let's have a full house, but please keep the noise level down!

**CONDOLENCES TO THE JIM CAFFINS.** David Caffin, son of Jim Caffin who is editor of Antarctic, the super publication of the New Zealand Antarctic Society, died a week before Christmas. Although Jim and his wife knew that David had only six months to live after a cancer operation, they didn't expect the end to come quite so soon. Many of our members knew David from his days in the New Zealand Embassy, 1968-72, when he was concerned with Antarctic affairs. In one way or another David's father has touched the lives of most Antarcticans who have gone through New Zealand, as he has been involved with covering Antarctic happenings since the IGY, I remember quite clearly a picture in one of those Deep Freeze yearbooks of Jim and Dave Canham

taken back in 1956 when Dave was the Navy commander at McMurdo, and both of them looked like fairly young kids. How the years roll on! The Society extends deepest sympathies to the Caffins in their tragic loss. Jim's address is 35 Chepstow Avenue, Christchurch 5, New Zealand.

**MEMBERSHIP.** We have 429 paid members for this year, and with this issue we are cutting off all free-loaders. Quite a few of you are sending in unsolicited checks, saying you got no bill and don't want to be delinquent. If you don't get a bill, you are paid up; if you send in an extra check, it is credited towards an extension of your membership.

**EAGLE SCOUTS, HERE'S YOUR OPPORTUNITY.** The Boy Scouts of America, the National Science Foundation, and the good old U.S. Coast Guard have joined together to make it possible for some Eagle Scout between 17 and 19 years of age (as of 1 June 1984), who has three years' membership in the Boy Scouts of America, to go to Antarctica during the next austral summer. Applications must be in by 1 April 1984 to Activities Service, Boy Scouts of America, 1325 Walnut Hill Lane, Irving, Texas 75062-1296. I imagine that all Scouts know about this opportunity, but if there is an interested, qualified candidate whom you know who hasn't heard about it, he should probably call (not collect) Zach Hirsch immediately at (214)659-2000 in Irving to get the necessary forms. The final group of nominees will gather in Salt Lake City on 21-23 May at the Biennial Meeting of the Boy Scouts of America. Dick Chappell, the IGY Boy Scout, will head up the selection committee. My advice to all finalists - you had jolly well convince Dick that the opportunity to go to Antarctica is the biggest and most exciting thing you have ever dreamed about. - - - Mark Leinmiller, the last Eagle Scout to go, 1978-79, has announced his intentions to go for that most difficult of life's merit badges, husbandry. I've been forewarning Mark that this can be perilous and even detrimental to one's human enjoyment of life, but in spite of my forewarnings he got engaged to Pamela over the holidays. He will ease into marriage, waiting until Frit-O-Lay reassigns him to a more permanent slot, which may give him a year for deep thinking. One of the runner-ups to Mark in 1978 was Scott Miller. Ruth and I got to know him pretty well, as he used to spend his summers at the Smithsonian. I thought he was completely dedicated to bugs, totally oblivious to girls. Then all of a sudden this lovely Santa Barbara creature with two legs showed up in Washington and they got married shortly thereafter. Mrs. Scott Miller is also a Pamela, so maybe there's something in the name which attracts Eagle Scouts. Scott and Pam have been all over the globe running down insects, and it won't be long before he gets his PhD in entomology at Harvard. I would like to do a six-years-after story on the Eagle Scouts who were finalists in 1978, as they were a group of excellent young men. And I'm sure this year's finalists will be equally impressive. Any principal investigator who might get the chosen lad as a field assistant should consider himself lucky. - - - Maybe I have written this before, but even if I have, it bears repeating. When the late Dr. Paul Siple went south as the first Eagle Scout, there was another Boy Scout aboard-- as a stowaway! (I found this out one day when I was at the National Archives perusing some of Paul's papers.) The Scout, discovered after they had been to sea several days, wanted to be the first black to go to Antarctica. Although he was a Boy Scout, he asked Paul not to tell anyone for fear they would throw him off the ship, since Paul was the official Boy Scout. But he never made it because he got into some sort of trouble on board, and was put off the ship in the Canal Zone.

**IF YOU HAVE CLASS AND ARE DISCRIMINATING, WE HAVE A SUGGESTION FOR YOU.** There is some really beautiful origami penguin note paper available for direct purchase from

a lady in White Stone, Virginia. There are two penguins walking across the note paper, with a body of blue water behind and in the distance something which could be assumed to be Mt. Erebus. These are available in the Smithsonian at \$1.10 each, but Motoko Williams, P.O. Box 87, White Stone, Virginia 22578 (telephone 804-435-2211) will sell packages of six to members of our Society for \$6.00, which includes mailing to you. We, the Society, get no kick-backs or any freebies. This is strictly something I thought you all would be interested in knowing about and procuring.

**PENGUINS GALORE.** If you like penguins, your attention is directed to two recent publications, National Wildlife Federation's Ranger Rick for February 1984 and National Geographic's World, March 1984. Just because they are kids' magazines, don't turn your back, on them, as there should be enough, kid in each of us to thoroughly enjoy these issues. The whole issue of Ranger Rick is on Antarctica, and a lot of it is on penguins. Its centerfold is not the usual 20th century centerfold, but a great shot of about 30 Adelies lined up on a hunk of snow at the water's edge jumping into the sea. Fantastic! The National Geographic World has two Emperor chicks on its- cover, the first two to be hatched at Sea World in San Diego. If you don't like that photo, you probably don't like your mother, baseball, or vanilla ice cream either. There are six pages devoted to Sea World's Penguin Encounter. If you don't have these magazines, the National Geographic Society is at 17th and M Streets N.W., Washington, D.C. 20036 - send \$1.15 for a single issue of World if you live in the States, \$1.70 if outside the States; one is supposed to be a member of Ranger Rick's Nature Club to get Ranger Rick, a membership costs \$10.50. Their address is National Wildlife Federation, 8925 Leesburg Pike, Vienna, Virginia 22180.

**NEW ANTARCTIC ARRIVALS.** (article by Frank Todd in Hubbs/Sea World Research Institute's Currents, No. 28, January 1984)

During November/December 1983, Scott Dreischman, Frank Twohy, and Frank Todd of Sea World, and Dr. Braulio Araya of the University of Valparaiso collected eggs of several species of Antarctic avifauna. Franz and Lydia Lazi of Stuttgart, Germany, accompanied them to film a TV special of the project, which was a joint venture between Sea World, Hubbs/Sea World Research Institute, Chilean Antarctic Institute (INACH), the University of Chile and the Chilean Air Force (FACH). Headquarters were at the Chilean Marsh Base on King George Island in the South Shetland Island group, located along the north coast of the Antarctic Peninsula. The Chilean Air Force has constructed an airstrip at the Base and C-130s fly in regularly. A field camp was established on Nelson Island, with logistic support from the helicopter squadron based at Marsh.

During their stay on Nelson Island the TV documentary was completed and much natural history data was compiled. A large amount of data on Weddell seals, which may form the foundation for a future H-SWRI project, was also collected. Of particular interest was a total albino Weddell pup, complete with pink skin, white fur and red eyes.

Their primary objective was to collect fertile eggs of Antarctic birds and transport them back to San Diego in portable self-contained field incubators. Ultimately 450 eggs of nine species were acquired - chinstrap and gentoo penguins, giant and painted petrels, kelp gulls, Antarctic terns, brown skuas, blue-eyed shags and sheathbills. Of these, as far as they know, only the gentoo penguin has ever been seen alive in North America.

The logistic problems involved in moving live birds which, require subfreezing temperatures are enormous, but transporting delicate eggs by-ship through some of the roughest waters on the planet had not been considered realistic. However, with their success in artificial hatching and subsequent handrearing of penguin eggs in San Diego in the past few years, and with aircraft support now available, the concept was felt to be feasible. If successful, transportation of live birds from the Antarctic could become obsolete.

Timing was important because there is only a very short period when the laying schedule of all species sought overlap. Indeed, the shags were hatching just as the sheathbills and skuas commenced laying (and some chicks hatched enroute). To acquire the eggs, a great deal of helicopter support was required. The skill and professionalism of the pilots they worked with, was superb and they repeatedly went out of their way to assist them with their work. In fact, the interest and help the field team received from all the base personnel was far beyond their expectation.

The eggs were successfully transported to San Diego in a Chilean Air Force 707. Since eggs are considered birds, the old penguin research, freezer at San Diego has been converted into a IKS. Department of Agriculture-approved quarantine facility. The chicks hatched en route or since arrival are being cared for by the Sea World Aviculture staff, H-SWRI volunteers and bird personnel from other zoological institutions. As of the first of this year 150 penguins - gentoos and chinstraps - have hatched and skuas were beginning to emerge from their shells. It is too early to tell at this point how successful the project will be, but the early indications are very positive. (Postscript. All the birds are fledglings now, and are being acclimated to the environment of the Penguin Encounter. Frank Todd, 1 March 1984)

**GOOD NEWS AND BAD NEWS IN TUCSON.** The Voice of the Antarctic, Larry Gould, tells us in his letter of February 20th that things are going better for his Peg. She had cancer of the liver, but it was highly localized and they were able to operate. A tiny patch of bone cancer was eliminated by radiation, and all of her doctors have assured Larry that she will be alright again. But there remains one small problem - Larry's cooking, which leaves something to be desired. Not only has Peg lost 25 pounds, but Larry has lost 10 pounds. However, wasn't Larry carrying around a little surplus anyway? We have heard a rumor from an impeccable source that a publisher may be reissuing Larry's famous book Cold which should please a lot of you folks who have been trying to locate a copy of this limited edition book. - - - The real bad news is that things are worsening for Hugh Odishaw of IGY fame. He not only has cancer of the lungs and liver, but a very recent bone scan showed that his bones have it too. Life can be so beautiful, yet at times it can be ever so difficult. I don't think any of us fully appreciate what we have when we are young and healthy, and able to go to a place such as Antarctica.

**METEOROLOGISTS NEVER DIE.** A couple of years ago we told you that a group of meteorologists in Washington thought they had finally retired Gordon (Mirny 57) Cartwright, only to have him return to Geneva and go back to work. This action confirmed an earlier Bergy Bits viewpoint that the only way to get Gordon out of Geneva would be to burn the place down. But there's another Antarctic meteorologist who makes Gordon look like a neophyte - he's Henry (BAE I) Harrison who has devoted over 60 years to meteorology. A lot of people in our midwest who experienced the Siberian Express in December probably think that Henry's years haven't done much to improve their lives, but the American Meteorological Society isn't of that bent. On 20 December 1983, they announced that Henry would receive their Special Award for 1984. These awards are made to individuals or organizations who have made important contributions to the

science or practice of meteorology or to the Society. Henry will receive his award "for his distinguished service over 60 years, from Kite Station observer to leader in the evolution of aeronautical meteorology, and his key role in founding the Society's Certified Consulting Meteorologists program, being CCM Number One. His many contributions to aviation safety and operating efficiency include research that advanced the widespread and effective use of airborne weather avoidance radar."

Henry hasn't exactly been an unsung hero for all these years, as he was the recipient of the American Institute of Aeronautics and Astronautics' Losey Award (1935), the American Meteorological Society's Award for Applied Meteorology (1960), the Flight Safety Award (1960), the Front Range Squadron Award, the W. A. Patterson Award (by United Airlines) in 1966, the Edgar S. Correll Award of the Air Transport Association (1972), and the University Recognition Medal by the University of Colorado (1958). And, naturally, he received the Congressional Medal for Polar Exploration for being on the Byrd Antarctic Expedition, 1928-30.

Henry's career began with the U.S. Weather Bureau (USWB) as an observer at the USWB Kite Station in Due West, South Carolina. In 1928 he became an Airway Forecaster at the New York Air Mail Terminal at Hadley Field, New Jersey. After being on the Byrd Antarctic Expedition to Little America in 1928-30 he returned to the U.S. to serve as an Airway Forecaster for the USWB in Cleveland. In 1935 Henry joined United Airlines as a flight dispatcher. During World War II, serving in the USAF, he handled such important assignments as Chief of Staff Weather Officer for the Yalta Conference and head of the Far East Air Force Weather Service. Returning to United Airlines after the war, he was named Manager of Weather Service (1948) and Director of Meteorology in 1956.

In his 33 years with United Airlines, Mr. Harrison's contributions to aviation meteorology are widely acknowledged in the field. He wrote many papers and developed research on such subjects as prefrontal squall lines, upper air phenomena and multiple route flying, which paved the way for successful operation of commercial jet aircraft. He did work in developing airborne weather radar and forecasting of hail storms. He became the recognized authority on mountain wave effect, which causes turbulence near mountains; he has done important research into clear air turbulence and its relation to the high altitude jet stream. His study of fog dispersal through aerial seeding has also commanded much attention. (He enjoys a well merited reputation as a keen student of the game of our National Pastime, baseball. Ed. note)

**JOHN ANNEXSTAD FINALLY MAKES IT.** It took old John Annexstad only twenty-five years after his IGY wintering-over experiences at Byrd in 1958 to come up with his PhD union card. However, his study on meteorites was the very first Antarctic meteorite doctoral dissertation (Meteorite Concentrations and Glaciological Parameters in the Allan Hills Icefield, Victoria Land, Antarctica) ever done. His major professor was Ludolf Schultz of the Max Planck Institute fur Chemie at the University of Mainz, a veteran of three Antarctic meteorite sojourns. John himself spent five field seasons tracking down the elusive specimens, so it's obvious that meteorite degrees come at a cost. On the other hand, John had a pretty good deal going, and one shouldn't kill a golden goose before its day. After all, hasn't Phil Kyle sort of demonstrated that Mt. Erebus is-Forever? John wrote that he thought he would never finish the degree, and lived in constant fear that he'd end up being the oldest person to ever finish a degree. But he discovered that our illustrious president, Mort Turner, didn't get his degree until he was 52, and this gave John impetus to finish it before he became that old, which he did. John's academic degrees are really polarized, as his master's earned at the University of Alaska (under Antarctic Bucky Wilson) was on upper atmospheric physics (Macquarie Island and Kotzebue) and conjugate point

micropulsations. Thank, heavens old John got his PhD degree; otherwise, he might have been reduced to being just the answer to another trivia question – who was the first grizzly old American Antarctic to take his daughter to the ice as a field assistant? That daughter, Kris, is presently serving a one-year preceptor-ship as the junior-junior member of a Philadelphia architectural firm called "Friday." I presume by its name they work only on Friday, doing one week's work on that day. Anyway, work doesn't seem to interfere too much with Kris's athletic pursuits where she still excels in everything she does. Readers of this column may recall that she had an athletic scholarship at Rice, having been fortunate enough to have inherited her mother's athletic abilities. Had it been the other way around, she might have been a tenured graduate student!

**ANTARCTICA CAN BE BOUGHT.** If you've got the money, you can get there. That was proven when eight business men/adventurers, members of the Seven Summits organization, chartered a modified DC-3 to transport them to Antarctica so they could climb Vinson Massif, the 16,864' erection standing in the Sentinel Ranges. These guys must coin money, as they attempted to climb the highest mountains on all seven continents in 1983 (McKinley, 20,320', North America; Elbrus, 18,510', Europe; Kilimanjaro, 19,340', Africa; Aconcagua, 23,081', South America; Kosciusko, 7,328', Australia; and Everest, 29,028', Asia were the other six). I think it was poetic justice that Everest rebuked them some 3,000 feet from its summit. They chartered the plane from the Polar Research Laboratory in Santa Barbara. Manor Buck of PRL said their plane was the only one that could get their number of people and equipment to the mountain. The plane is equipped with three turboprop engines, giving it much more power than the original DC-3, has a fuel capacity of 1,900 gallons, and a range of 1,700 miles. Piloting the plane was veteran polar pilot Giles Kershaw, whose name sort of rings a Trans-Globe bell. They had to have a sponsor, and found one in Chile! The Chilean air force supplied the fuel and a base of operations at Punta Arenas. They were able to land on a glacier about three miles from Vinson Massif. Having some extra pocket change left after chartering the plane and its crew, they hired Yuichiro Miura, the Japanese photographer who skied down Everest and lived to tell about it in a movie. There will be a heart-rendering movie film produced on their great adventure, which probably will be released in Japan. Let's hope it stays there! I think the Navy should dust off Que Sera Sera and bring her back, as she was a good old DC-3 who did her all for science. But if millionaires who don't know what to do with their time can buy their way there, won't Antarctica soon become the playground of the ultra-wealthy jet set????

**THE BRITONS ARE AT IT AGAIN.** Nine British servicemen and scientists are going to winter over on Brabant Island off the Antarctic Peninsula. This isn't news in itself, but they want to do it the hard way, the British way, camping out with only tents and snow huts. It really won't be that big a deal, as the island is north of the Antarctic Circle, and haven't Eskimos and the Lapps been doing the same thing for centuries in a colder environment? The men represent the Royal Air Force, Navy, and Marines, and I imagine it will be a lot safer there than in Lebanon. They plan to survive on wild game, and supplies that arrive by plane (which could make it all quite palatable). The island is a good size, being 50 miles long, and planes have landed there. However, it's a virginal island with no record of either exploration or settlement. The British seem to get an inordinate amount of pleasure out of doing things the hard way, something which must have been instinctively willed by Scott to all future U.K. Antarcticans.

**SHACKLETON STAGES A COMEBACK – OF SORTS.** Sir Ernest Shackleton had always enjoyed the enviable reputation of being the best man to go south with, and presumably

he merited being The People's Choice. I used to hear a little bit about Sir Ernest from a former colleague of mine, the late Sir Hubert Wilkins, who, you may recall, was going south, with Shackleton as his scientific leader when Sir Ernest died in South Georgia in 1922. Now our British friends have come up with a four-part, four-hour documentary on Shackleton. It was shown on TV in Canada in November, and received great reviews. Someone by the name of David Schofield plays Shackleton, and the Toronto Star said he gave a compelling performance, whatever a compelling performance may be. The documentary writer, Christopher Railing, was given credit for converting Shackleton's past into "an appealing blend of self-delusion and hard reality." The review said, in part, "we are treated to the sight of several artfully selected warts. For example, Scott comes in for a revisionist overhaul, portrayed here as an envious and mean-spirited glory-seeker. Headed by a bunch of shuffling pettifoggers, the Royal Geographical Society fares no better. Accurate or not, these charges gain a certain conviction solely on the strength of the visual surroundings. Indeed, from Siberian ponies dying in the harness to pocked foreheads burnished by the cold, each episode is a veritable motherlode of vivid period detail." I hope this series eventually makes it on our PBS.

**FOREIGN AID PROGRAM STILL WORKING.** The Soviet's fishing trawler, MYS DALNIY, came into McMurdo Sound on 20 February with a 33 year old woman suffering from internal bleeding. They stayed offshore two miles, sending ashore a tender with a party of three. The weather had reduced visibility to a half mile, so they didn't want to bring the trawler into dock's side (or could it have been the catch they had in their holds?). Doctors at McMurdo provided minor surgical assistance which was successful, and shortly thereafter the MYS DALNIY steamed out of McMurdo Sound. (Courtesy of Guy Guthridge)

**U. S. ANTARCTIC BED COUNT.** McMurdo and the South Pole are already in their wintertime posture. There are 81 souls at McMurdo (four scientists, twelve civilian support, and 65 Navy support personnel). The South Pole totals 19 (seven scientists, twelve civilian support). Siple is closed for 1984-85, but will reopen in late 1985. The HERO leaves Palmer in early April, leaving behind two scientists, seven supporting civilians and a lone Navy person. (Courtesy of Guy)

**CHRISTCHURCH'S DISPLAY DAY BIG HIT.** Christchurch International Airport, on the South Island of New Zealand, drew an estimated 25,000 to 35,000 visitors on Sunday, the 19th of February for a "display day" that featured U.S. and New Zealand exhibits from Antarctica. The major drawing card was a USAF C-5B Galaxy, a big airplane which is not used in the Antarctic. Thousands of people were attracted to the U.S. Antarctic Program's ski-equipped LC-130 airplanes and a UH-1N helicopter freshly arrived from McMurdo Station. Three 40- x 120-foot white nylon tents, rented for the occasion, contained displays of U.S. and N.Z. Antarctic logistics, weather forecasting, stations, ships, land transportation, tent camps, snowcraft, and research results. At peak periods during the day, visitors stood three and four deep viewing the exhibits and the tents. The mayor of Christchurch said the event enjoyed one of the largest turnouts in the city's history. The special day commemorated U.S. and N.Z. cooperation in Antarctica and both countries' extensive use of the airport as an Antarctic gateway. (Courtesy of Guy) (Ed. note. We understand there is some consideration being given to the possibility of a mini-display like the one in Christchurch being put together for a U.S. tour.)

**WIND CHILL - MUCH ABUSED, POORLY UNDERSTOOD, WIDELY MISUSED.** Andy Rooney should stick to Christinas necktie stories, as his syndicated column in early January on

"The Wind Chill Factor" was a bomb. It epitomized the public lack of knowledge about the derivation of wind chill. He quoted a National Weather Service employee in New York City as saying, "It was invented by Admiral Peary at the North Pole years ago." Former national TV weather forecaster, Gordon Barnes, told his Washington audience last year that it was a product of a doctor in the U.K. Typical Barnes. But the real professional meteorologists are well aware that it was conceived in Antarctica and was the offspring of the late Dr. Paul A. Siple, a former president of our Society, and Charles Passel, current member of our Society. Their field testing was conducted on the U.S. Antarctic Service Expedition, 1939-41, when they carried out eighty-nine experiments on the rate of freezing water in plastic containers (15 cm long, 6 cm diameter). They fitted their data to an empirical equation which yielded a value of heat loss expressed as kilogram calories per square meter per hour, and the results of their work appeared in the Proceedings of the American Philosophical Society in 1945. Dr. Siple was the Army's foremost authority on cold weather clothing, patented many items, and was involved in the design and development of the vapor barrier boot which many of you have worn in the Antarctic. Siple's work on clothing zones which appeared in military almanacs was a practical application of the utilization of wind chill. Global maps have been produced by the military showing isopleths of wind chill in kilogram calories per square meter per hour.

But that is all history. Nowadays wind chill has evolved into a wind chill equivalent temperature (WCET), still utilizing the equations of Siple-Passel. Its popularity is based on its "catchiness" and its simplicity - computations require only current ambient air temperature and wind speed. For some peculiar reason, people seem to get an inordinate amount of pleasure in knowing how cold it is or how hot it is, probably because it gives them an excuse for doing less work and a topic which they can discuss with their nearest neighbor - inside of each of us is a little bit of forecasting skill which we all like to practice. When it's -20°F with a 25 knot wind, the WCET is -75°F. Now that's much better to talk about than just a temperature of -20°F! So I say unto you all, wind chill for evermore will be an equivalent temperature, not a value of heat loss per se.

Thanks to Paul F. Krause, geographer at the Engineer Topographic Laboratories at Ft. Belvoir, who has done some remarkable things on the computer relative to environmental effects, we are presenting a new nomogram (based on the Siple-Passel equation) which you can use to find out how cold you will feel when the next Siberian Express goes through your neighborhood (see page 10). The wind chill equivalent temperatures are across the bottom, the wind speeds are on the left, and the air temperatures are the heavier, darker curved lines. Follow your wind speed over to the temperature curve, then drop on down to the X-ordinate, and there's your WCET. We haven't seen a nomogram just like this one, although there are variations showing the wind chill in kilogram calories per square meter per hour. One thing quite obvious is that the WCET is very sensitive to increases in low winds, whereas there is little change after wind speeds reach 40 knots.

Unless you were in Eastern Siberia (or had your head buried in the sand) in December, you know that our midwestern states had a real blast of Arctic air just prior to Christmas. We computed hourly WCETs for 17 U.S. stations, including three Alaskan stations, for an 11-day period, 16-25 December 1983. Here are the minimum WCET values obtained:

Williston, N.D.	-89.3°F	Glasgow, Mont.	-76.4°F	Milwaukee, Wis.	-70.2
Bismarck, N.D.	-79.9	Scottsbluff, Neb.	-75.0	Chicago (Midway)	-70.2
Miles City, Mont.	-79.9	Norfolk, Neb.	-73.0	Casper, Wy.	-65.2
Chicago (O'Hare)	-79.4	Fargo, N.D.	-72.0	Internat'l Falls,	-61.8
Minneapolis/St. Paul	-76.3	Duluth, Minn.	-71.4	Minn.	

Now let' go to Alaska:

Barrow	-52.4°F	(but only -28.8°F for 9-day period, 18-26 December).
Fairbanks	-40.5	( " " -11.0 " " " " )
Anchorage	-9.9	( " " + 4.2 " " " " )

On 23-24 December, when the wind chill equivalent temperatures were the lowest in the lower 48 states, the minimum WCET values for the three Alaskan stations were Barrow, -13.8°F; Fairbanks, -11.0°F; Anchorage, +5.0°F - 60 to 70 degrees warmer WCETs in Alaska! Wow!

We don't have hourly data from the Antarctic yet, although we hope to get them later, but we do know that Doc Abbot, the old Deep Freeze commander who lives in Mobile, was shivering at a -21.2°F WCET on the day before Christmas when he was trying to start one of his Cadillacs, while McMurdo, on the same day, had a +20.2°F WCET. How about that!

If anyone is still reading, here are some other stats which might surprise you. Williston, North Dakota, had ten consecutive hours with an average WCET of -84.6°F; had a 24-hour period when the WCET averaged -75.1°F; had two consecutive days when their WCET was -70.0°F or below. We hear a lot about International Falls, but all they have is a better Chamber of Commerce. The really bad place is actually Williston, but no one knows where Williston is, so they never mention it. Bronko Nagurski put International Falls on the map fifty years ago, so everyone knows about it. Another terrible place is Duluth, and according to US News & World Report, a lot of people who enjoy feeling miserable go there in midwinter. There were four cities with 10-day averages (16-25 December) which had mean WCETs of -40.0°F or below: Williston the coldest, -45.8°F; Duluth the next coldest, -41.4°F, and Glasgow, Montana and Bismarck, North Dakota. Chicago gets a lot of publicity because a lot of TV cameramen there like to go down to the waterfront and get shots of surf pounding over the road, but it isn't all bad there - 10-day average WCET of only -27.5°F. The moral of this whole story is to stay out of Williston, even if you could find it. Has anyone actually been there in winter?

**SUMMARY REPORT ON THE ANTARCTIC MINERALS MEETING, WASHINGTON DC, 18-27 JANUARY 1984.**  
(From 6 February 1984 report by ASOC - Antarctic and Southern Ocean Coalition - on Antarctic Minerals Meeting).

The sixteen Antarctic Treaty Consultative Parties (ATCPs) met in Washington DC, 18-27 January to continue their formal negotiations for an Antarctic minerals regime. They had previously met three times in this series of negotiations, in Wellington, New Zealand (June 1982 and January 1983) and Bonn, Federal Republic of Germany (July 1983). At the earlier sessions only 14 nations were represented. The two additions were Brazil and India, who became full "Consultative" members of the Treaty at the XII Consultative Meeting held in Canberra, September 1983.

The governments completed a "second reading" of the draft minerals treaty prepared last year by Chris Beeby, head of the New Zealand delegation. Beeby continued to chair the "Working Group" (as the governments call their mineral meetings). But not enough progress was made to allow a new draft to be prepared. Many new proposals were put forward both in draft treaty language and in the form of "non-papers" (which do not contain the usual numbering system for official documents in an international negotiation and apparently have no "official" status). It is expected that Beeby will prepare a comprehensive "Chairman's Report" which covers all significant proposals for modifications to the draft regime. This will not be a public document.

The sixteen ATCP governments will probably meet again in Tokyo from May 21-31, 1984. The twelve "acceding" members of the Antarctic Treaty (those whose scientific programs are not sufficient to give them full voting status) will be invited for the first time to send representatives to a minerals meeting, although they will not be allowed to participate as "observers". The important Environmental Contact Group (chaired by Dr. John Heap of the UK) will be convened in Tokyo.

It is expected that Beeby will prepare a new draft minerals treaty at the conclusion of the Tokyo meeting. A further negotiating session is set tentatively for Brazil in January 1985.

Non-governmental environmental organizations monitored the minerals negotiation, as they have for the last several years. Like all previous Antarctic minerals negotiations the Washington minerals meeting was held behind closed doors. NGOs thus had to use "informal" methods of learning what was happening in the meeting.

**SOME INTERESTING OBSERVATIONS BY A BIOLOGIST.** Charlie (South Pole 58) Greene has incorporated himself into Greeneridge Sciences, Inc. out there in Santa Barbara. Evidently he will be doing the same things: he did at the Polar Research Laboratory, but will have more dollar bills pass through, his hands. When we wintered over together, I had sort of picked him out as one who would become a college professor, not one to get all wrapped up in sounds of Arctic watered whales. Recently he sent us an interesting clipping out of the PIO of the University of Southern California at Santa Barbara about some observations of Bruce Robison of their Marine Science Institute who does biological research at Palmer. One was relative to how clear the atmosphere was at Palmer - when they had good weather - saying it was "like walking around with binoculars on." And he went on to comment on the sunlight filtering through the icebergs producing a glowing blue which had no match in the color chart, calling it "ethereal blue." - - - I'm rather ignorant about most things in life, so it doesn't take much to amaze me, but I never realized before that krill come in such numbers that research vessels are forced to turn on their echo sounders to avoid hitting their massed layers with nets. It seems they occur in such numbers that they can burst trawl nets, leaving the biologists with an all-day mending job in freezing weather on a heaving deck. How about this! Robison determines the age of krill by counting the annual rings in its earbone! And I like this quote from Robison, although I think I have heard it somewhere before - "If I knew I would never see Antarctica again, I would be very disappointed." This fellow Robison either has a way with words or else he has a great public information officer in Bob English!

**WHO HAS SEEN REAL WIND CHILL?** Elsewhere in this Newsletter there are a couple of paragraphs on wind chill. There are no stats on which, meteorological station in the world holds the record for the lowest wind chill equivalent temperature (WCET). And if there were stats, they would be non-representative because a peculiar thing happens, when winds are greater than 50 knots - the wind chill values start to increase (get warmer). So there is no valid way to come up with realistic values for a place like Mt. Washington, New Hampshire where winds over 50 knots are experienced frequently in winter. That station was established during the 2nd Polar Year, and the first winter they had a temperature of -50°F with a wind speed of 100 knots. That must be about as bad as it comes. Certainly far worse than at Vostok, even with their extremely low minimum temperatures, because temperatures below -125°F can only occur with calm conditions, so their WCETs would be the same as their ambient temperatures. It is quite possible to have a temperature at the South Pole of -80°F with a wind speed of 20 knots, resulting in a WCET of -155.6°F. If I were to make a guesstimation of how low a WCET could go, I would say about -190°F - a temperature of -90°F with a wind speed of 30 knots would result in a value of -186.2°F Possible??? We have a couple of expert armchair meteorologists in our group, NOAA's J. Murray Mitchell (with polar experience in the Arctic when he was in the service), and NCAR's Will Kellogg; it would be interesting to get their comments, on this possibility. Rudi Honkala has experienced more wind chill than anyone in our Society, as he spent five winters on top of Mt. Washington, one winter on windy St. Lawrence Island in the Bering Sea, and three Antarctic winters, two on Wilkes Coast which experiences some pretty strong katabatic winds. If anyone knows how miserable it can get, Rudi is the person. I guess those of us who haven't crawled on our hands and

knees across the tundra of Home Stretch on Mt. Washington in midwinter haven't really lived. Until someone can convince me otherwise, I would vote for Mt. Washington as the station with the worst wind chill.

**MOUNT SIPLE.** As the Newsletter was being prepared, word was received that the POLAR SEA had reached Mt. Siple. Volcanologists, petrologists, glacial geologists, geodesists, and geophysicists were put ashore or flown in the vicinity by helicopter from the POLAR SEA. Dr. Wesley LeMasurier, University of Colorado at Denver, is a volcanologist/petrologist, who will determine whether Mt. Siple is a volcano, as has been assumed since its discovery. Dr. LeMasurier will search, for evidence of volcanic rocks that show evidence of having been erupted under water. Volcanic rocks of this type may help indicate periods of volcanic activity at times of higher glacial levels. He will also be interested in (1) whether it is active or not, (2) the ages of exposed rocks, and (3) whether it is part of the Mt. Erebus volcanic province or part of the Marie Byrd Land volcanic province. Dr. Philip Kyle has two graduate students aboard who will take rock samples for detailed geochemical analyses, including isotopic ratios of critical elements. Dr. George Denton, University of Maine, and a soils specialist who is working with him, will determine if higher-level glaciations have affected Mt. Siple in the past. Drs. Zeller and Dreschhoff, University of Kansas, are prepared to fly with a scintillation counter that will detect and record the relative amounts of uranium, thorium, and potassium in the exposed rocks of the area. These data will be combined with data from prior surveys in other parts of Marie Byrd Land, to map broad trends in the presence of these elements in Marie Byrd Land. The U.S. Geological Survey has two topographic engineers on the POLAR SEA who placed geoceivers on terrestrial points that are recognizable on aerial photos. The geoceivers determine location by latitude, longitude, and elevation to within a few meters by readings on passing navigation satellites. Preliminary location determinations by this group indicated that Mt. Siple is over 60 kilometers from its position on existing maps.

Messages received in the Division of Polar Programs, NSF, on 1 March verified that Mt. Siple is a volcano. Scientists were on Mt. Siple for four days. An ornithologist found a colony of Adelie penguins, approximately 2,000 pairs, on Lovill Bluff. Mt. Siple, on maps, is 15 miles north, 13 miles east of the actual position, it was determined. A writer/historian, Mr. Parfit, is recording the expedition's trip which will be published later on.

This is the first time that Mt. Siple has ever been visited by anyone. The results of even such a short investigation are expected to add significantly to our scientific knowledge of a major part of Marie Byrd Land.

**SECOND SEYMOUR ISLAND (JAMES ROSS ISLAND BASIN) EXPEDITION.** The second Seymour Island Expedition, again planned and organized by Dr. William Zinsmeister (now of Purdue University), was put in and supported by the U.S. Coast Guard Icebreaker WESTWIND. The WESTWIND left Punta Arenas, Chile, on 10 December 1983 with 14 scientists on board. Mort Turner was assigned by the National Science Foundation to be Chief Scientist and National Science Foundation Representative. The WESTWIND had a smooth crossing of the Drake Passage. The scientists and their field camps were placed on Seymour Island by 17 December. Three tent camps were established. The main camp, Buckeye, with the Kent State University group, emphasized fossil mollusks, echinoids, crustaceans, mammals, and birds of both Cretaceous and Tertiary ages. Another camp, Albatross, with the Ohio State University and Colorado School of Mines scientists, studied Cretaceous-age microfossils, ammonites, and plant spores. The third camp, Calcutta, was for the Texas Tech scientists, who were collecting Cretaceous-age marine reptiles and birds.

Late on 27 December, the WESTWIND started south for purposes of personnel training and science reconnaissance if the opportunities became available. An extensive survey of the stratigraphy and collection of fossil pollens from Cretaceous sediments was carried out on the east end of Robertson Island by the Colorado School of Mines group and the NSF Representative. On 30 December the ship went south of the Antarctic Circle and then returned northward, through heavy sea ice, to the Jason Peninsula. There a very brief helicopter reconnaissance did not find reported Cretaceous sediments, but did identify a large volcanic collapse caldera. After leaving the Jason Peninsula, the WESTWIND continued to follow discontinuous leads northward through heavy pack ice, generally keeping several kilometers off the Larsen Ice Shelf.

Shortly after noon on New Years Day the WESTWIND was beset while it was between 1 and 2 kilometers from the face of the Larsen Ice Shelf. The ice holding the ship began to move rapidly westward, toward the shelf. By 4 p.m. the WESTWIND was immediately adjacent to the vertical face of the shelf, with the pack ice pushing hard against the ship and the shelf. The ship was heeling to starboard about 17°. The crew, with all available hoses, was lubricating the sides of the ship with sea water to attempt to bring it back to trim. The WESTWIND, riding in a mass of brash ice, shifted until it listed about 5° to port. In this position it was dragged forward along the front of the ice shelf, where a minor projection broke ship frames and ruptured the hull for 40 meters. Because of the port list, the ruptures were all above the water line. All the crew went into life jackets. Crew not on duty and passengers were assembled on the boat deck with survival gear. There was no panic in the crew and the entire emergency was very well handled.

About half an hour after the damage started, the direction of movement of the ice changed and the WESTWIND was carried away from the shelf, and ice pressure let up somewhat. For three and a half days after the accident, the ship pushed very slowly through, nearly-solid, thick ice, further hampered by the loss of much of a blade from one propeller and by having the rudder stuck to one side. The WESTWIND broke out into relatively open water .on the afternoon of 4 January and was again in contact with the scientists on Seymour Island by helicopter on 5 and 6 January. The field camps were backloaded to the WESTWIND, and all field research ended about noon on the 6th. By the early morning of 8 January the ship was at anchor in the harbor at the west end of King George Island, off the Chilean Frei and Marsh Bases and the Soviet Bellingshausen Station.

Two U.S. Coast Guard C-130s- arrived at Punta Arenas, Chile, on 10 January with heavy loads of steel plates and rubber matting for patching the WESTWIND. These were relayed to Marsh Base by the C-130s in several flights, starting on 11 January. All of the U.S. scientists of the second Seymour Island Expedition were taken north to Punta Arenas by the first return C-130's flight.

Patching the ship went remarkably rapidly, with the WESTWIND leaving for Punta Arenas on 19 January, and headed ultimately for its home port of Mobile, Alabama, and a lengthy yard period for permanent repair.

Despite problems with helicopters, weather, and ice damage, the scientists of the Seymour Island Expedition accomplished a great deal. Announcements of specific discoveries will have to wait for the arrival of samples presently on the WESTWIND, and laboratory study of the fossils. However, the findings of the first expedition and preliminary statements on the fossils recovered during the second expedition, indicate that Seymour Island and surrounding areas of the James Ross Sedimentary Basin will be a world-class paleontological resource, worthy of many seasons of future field research.

**BILL FIELD.** Father of Alaskan Glaciers Termini, whose great-great grandfather was Commodore Cornelius Vanderbilt, turned 80 in October. He's surging!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 83-84

April

No. 6

**Presidents:**

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-2
- Mr. Gordon D. Cartwright, 1962-3
- RADM David M. Tyree (Ret.), 1963-4
- Mr. George R. Toney, 1964-5
- Mr. Morton J. Rubin, 1965-6
- Dr. Albert P. Crary, 1966-8
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-1
- Dr. William J. L. Sladen, 1971-3
- Mr. Peter F. Bermel, 1973-5
- Dr. Kenneth J. Bertrand, 1975-7
- Mrs. Paul A. Siple, 1977-8
- Dr. Paul C Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82
- Dr. Mort D. Turner, 1982-84

**Honorary Members:**

- Ambassador Paul C. Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard

**Memorial Lecturers:**

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Sir Peter M. Scott, 1971
- Dr. Frank T. Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980
- Dr. Robert L. Nichols, 1981
- Dr. Robert H. Rufford, 1982

The Antarctic Society and the National Academy of Sciences' Polar Research Board are most happy to co-sponsor the Society's 20th Annual Memorial Lecture

50 YEARS UNDERNEATH GLACIERS

by

Dr. Richard P. Goldthwait  
Professor Emeritus  
The Ohio State University

on

*Friday evening, 18 May 1984*

*8 PM*

in the Lecture Room  
The National Academy of Sciences  
2101 Constitution Avenue N.W.  
Washington, D.C.

Dr. Richard P. Goldthwait is a glacial geologist who has a long and most distinguished career as a teacher, researcher, and administrator. As founder and first Director of the Institute of Polar Studies at The Ohio State University, Dr. Goldthwait is directly or indirectly responsible for hundreds of scientists going to Antarctica, many of whom received advanced degrees based on their research. He has encouraged and fostered the multidisciplinary approach to environmental studies. His broad field experience and extensive research give him a wealth of material to draw upon when he tells us what is beneath glaciers. (More on pages 15 and 16)

\* \* \* \* \*

Cocktails and Dinner precede the Memorial Lecture, all in the main building of the National Academy of Sciences (see address above). The Open Bar opens at 5:30 PM, and dinner follows in the Refectory at 6:45 PM. The menu is breast of chicken Marengo, miniature antipasto with bread sticks, rice pilaf, toasted French bread Parmesan, wine, chocolate mousse with butter cookies, and coffee or tea. Reservations at \$21.00 per person must be made with the Antarctic Society prior to sunset 15 May! NO reservations accepted by phone – by mail ONLY! Checks should be mailed to the Antarctic Society, 905 N. Jacksonville St., Arlington, VA 22205.

Bergy Bits is a non-denominational, highly prejudiced column written (unless otherwise noted) by an older Antarctic who marches to his own drummer. It should in no way be construed as the Voice of the Society, only as a supplement to the cover announcing the next meeting. If you are sensitive about Antarctica, you should avoid reading it; if you have a sense of humor and don't mind the stretched truth, this column may be for you; if you can do a better job, let our President know and you'll probably have yourself another job without compensation. Our aim is to have at least one paragraph of interest to all of our members, remembering that you folks are of all ages and have multiple interests.

**ALMIRANTE BROWN STATION BURNS.** (Guy Guthridge). The Argentine station Almirante Brown, at 65° S latitude on the west coast of the Antarctic Peninsula, burned to the ground 12 April 1984. Six of the seven station residents were unharmed in the early morning fire; the seventh, Dr. Sanchez, sustained minor burns and smoke inhalation. The station consisted of three small interconnected buildings made of wood. An emergency camp, 200 yards from these buildings, remains. On Paradise Bay, the site is one of the most picturesque in Antarctica and is a familiar sight to passengers of tourist ships that visit the region. At the request of the Argentine Antarctic Institute, which owned and operated the station, the U.S. National Science Foundation sent its research ship HERO to evacuate the seven men. Arriving at 5:17 PM on the 12th from the U.S. Palmer Station (about 40 miles west of Brown), HERO picked up the men and was on the way back to Palmer within 20 minutes. HERO was to deliver the Argentines to their station Jubany, on King George Island, during its final trip out of Antarctica for this season scheduled to begin on 16 April.

**NEW ANTARCTIC FOSSILS.** (NSF News Release). Dr. William Zinsmeister, Ohio State University, led an expedition to Seymour Island this past austral summer which discovered the fossil remains of eleven species of invertebrate marine animals, some of which were found for the first time; others were known to exist only at mid-latitudes. The unexpected findings were made on the steep slopes of badlands topography which makes up most of Seymour Island, an ice-free, 15-mile long island at the northeastern tip of the Antarctic Peninsula. The first fossil finds were of a certain class of starfish, crabs and crinoids.

Dr. Zinsmeister said that "recent discoveries in the polar regions will modify ideas about evolution. It's apparent that evolution has indeed been taking place in the polar regions and that these regions may have been a source for many groups of animals and plants. . . . Evidence shows that these animals evolved over millions of years in the high latitudes - above 60° latitude - under conditions that allowed them to move northward."

The work of the researchers appears to have solved, a mystery that has baffled scientists for over a century - the abrupt appearance of new groups of invertebrates that has been found in the fossil records of the southern continents. The evidence now suggests that these animal groups have had a long period of evolutionary development around Antarctica before moving northward. Dr. Zinsmeister and Dr. Rodney Feldman of Kent State University have written an account of the findings which will appear in Science. It has now been published in the April 20th issue.

**FILMMAKERS TO VISIT USARP.** (Guy Guthridge). A filmic highlight of the 1957-1958 International Geophysical Year was the Planet Earth series—half a dozen films on the state of knowledge in geophysics. Now WQED, the Pittsburgh public television station, is doing a followup: *Geos: the Rediscovery of Planet Earth*. Both the new series and the original one a quarter century ago were planned by the National Academy of Sciences, which this time established a special Geophysics Film Committee to steer the effort. The late Dr. Hugh Odishaw chaired this committee and figured heavily in both series. One of his last works before his death on 4 March 1984 was a 21 February letter to the National Science Foundation conveying the detailed plans for the film group's coming work in Antarctica.

As guests of the National Science Foundation, a four-person WQED film crew will visit McMurdo-accessible parts of Antarctica for five weeks or so during the 1984-1985 season. They will film activities of scientists in the United States Antarctic Research Program. Series Producer and Director, Gregory Andorfer says, "We will interweave their [Antarctic investigators'] stories into the larger mosaic context of our seven-hour television series on the earth sciences." The Antarctic components will comprise 30 to 35 minutes of the series.

**FRAM: THE JOURNAL OF POLAR STUDIES.** The first issue of Stephen Carter Jackson's journal on polar lands has been published. Originally it was going to be *The Journal of Polar History*, but it has been changed to *FRAM: The Journal of Polar Studies*. I'm not quite certain what FRAM is doing in the title; it's the only word appearing on the cover so I presume Steve wants it known as FRAM, I think Bergy Bits will refer to it as JPS so as not to confuse it with the old ship. JPS is a very professional-looking volume, being 364 pages in length. There are twelve major papers and then a potpourri of other things ranging from translations to notes and correspondence. There should be something for everyone interested in polar history; it's for the serious reader, not to read for comic relief. I presume the first volume of JPS is a trial balloon, that we won't really have a true feel for it until after its shakedown cruise through 1984-85. Right now there is one very serious problem, a tremendous need for some creditable editing. I have read several articles and Ruth is going through the whole volume; for a professional journal it is overloaded with misspelled words, including names of explorers and even uncomplicated polar words. Errors are monumental, such as misspelling of Stefansson on page 193 — the inaugural edition was dedicated to him, too! And one of the Advisory Board, Francis Auburn, wrote a major article whose title appears in bold print on page 201 as "Antarctic Minerals and the Third Word." Oh my, oh my! There are literally, sic, over a hundred errors of one kind or another. But these can be reduced if Steve picks up a good editor, which he badly needs. The price of \$50 per year is reasonable, although I might want to wait to see subsequent issues before committing myself. If you would like to order a sample copy, you can get one for \$30 from Polaris Publications, P. O. Box 8089, Bangor, Maine 04401. We wish Steve luck with JPS, as it will be good to have a reputable journal on polar history and polar studies.

**BILL SLADEN COMMITS HIMSELF.** Our only two-timing Memorial Lecturer, Bill Sladen, sort of disappeared from sight last year, and we wondered if he had migrated with some of his best friends to their Siberian feeding grounds. It seems that not only is he alive and doing well at Johns Hopkins, but he has also taken unto himself a permanent playmate who is neither bird nor mammal — something very difficult to believe until you see his selection. To prove that all men are mere mortals, he married the lovely Minnesotan, Dolores Ulman of Arlington, Virginia on 29 April 1983. This is "sort of" cast in permanency as the marriage has been blessed and sanctified in England (Saint Mary Magdalene Church, Westerfield, Suffolk — 21 May 1983), so Bill is truly committed. But as long as one is dedicated to the insti-

tution of marriage, I can think of no one finer to share that dedication with than Dolores. She's tall, streamlined, attractive, sexy, gracious, pleasant, elegant, eloquent, educated, and nice, also young. Come to think of it, why did she marry Bill?

**ALICE DATER TAKES A BATH.** If you happen to read Bergy Bits you know that we are partial to Alice Dater, widow of the well-known Antarctic historian who was such a driving force in the activities of this Society in the 1970s. She went to Antarctica this past austral summer, being on Lindblad's terminal cruise of the EXPLORER. Alice likes to do things with a flair, and she created a little bit of Antarctic history in McMurdo Sound when she became an official member of the Bert Crary Antarctic Swimming Club. Alice was in a zodiac going ashore somewhere in McMurdo when an unfriendly wave goosed the zodiac and tossed Alice and a compatriot into the sea. Now this isn't such a great a feeling when (1) you are overdressed in polar clothing, (2) you don't have a life jacket, (3) the water is icy cold, (4) you're a woman, (5) you're a septuagenarian, and (6) you can't swim even in your own bathtub. So Alice went down, became a human submersible. She thought she was a goner, and all the bad actions in her life flashed through her mind, terrifying her. She opened her eyes to see the pearly gates, but saw only someone's leg in the water. It turned out she was in real shallow water, and wasn't about to die. They took her back to her stateroom and her eyes were dancing with thoughts of receiving copious quantities of hot buttered rum. But instead all they gave her was tea. Then the ship's doctor came down and jabbed her in the chest to check her reactions. He found out they were darn good, so he then told her to go up to the wardroom and get a drink for herself. So for this Olympic year, we toast our own McMurdo Sound breaststroke, non-swimming champion, Alice Dater!

**FUEL DRUMS, MOUNTAINS, SMOKED SALMON, AND OAE'S.** (Charles Swithinbank). I have just spent a couple of months in Antarctica, three weeks as copilot of one of our Twin Otters. We provided an air taxi service for a joint USARP/BAS assault on the geology of the Thiel Mountains led by Ian Dalziel of Lamont. As it turned out, the geologists got in trips to Haag Nunataks, Ellsworth Mountains, Martin Hills, Pirrit Hills, Nash Hills, Hart Hills, Stewart Hills, Whitmore Mountains, Patuxent Range, and just about everything in the Thiel Mountains ... None of this would have been possible but for fuel caches left in various places by VXE-6 the year before. We flew three times to the South Pole, being overwhelmed each time by the friendly reception and super-efficient refuelling services which allowed us to geologize more outcrops than any of us had dreamed of. [We took off] on 28 December ... to fly the 1000 km to Halley. As [our pilot, Garry Studd] trimmed the aircraft ... he assured me that we were heading true north. Since northward lay the Atlantic, the Pacific, and the Indian oceans, I was not sure how to respond. But 3 1/2 hours later Whichaway Nunataks appeared right on the nose as we had planned, and we landed amongst them to pump fuel. Now four empty drums bear witness to our passing. Onward over Recovery Glacier (daunting), Shackleton Range (very beautiful), and Slessor Glacier (terrifying), we landed at Halley after 6 hours 50 minutes in the air. From there we flew to Druzhnaya, passing the Soviet ships KAPITAN GOTSKY and PIONEER ESTONIA working ice along the coast. Refuelling at Druzhnaya (by prior arrangement) we were invited in for a meal of smoked salmon, salami, chocolate, bread, butter, and deicing fluid (ethyl alcohol). From there, onward to Fossil Bluff, Rothera, and the Chilean station Marsh, where we saw the unfortunate USCGC WESTWIND and a USCG C-130 that was bringing bits to repair her. HERO was also in harbor. After a day trip to Arctowski we were airlifted to Punta Arenas by C-130, courtesy Fuerza Aerea de Chile. The airport at Punta Arenas was overflowing with USARPs, including Mort Turner southbound with Joanne carrying his hammer. Jim Zumberge and

George Llano were cruising in WORLD DISCOVERER; we missed them by one day at Marsh. We were not the only OAEs just past the first flush of youth: the HAS ship JOHN BISCOE was at the time southbound with Colin Bertram and Alfred Stephenson, both of whom wintered in the Antarctic Peninsula in the nineteen-thirties. Some uncouth geologists referred to it as "the geriatric cruise" ... (Ed note: if the shoe fits ....!)

**REPORT OF INTERNATIONAL BIOMEDICAL EXPEDITION TO THE ANTARCTIC (IBEA).** The 6th International Symposium on Circumpolar Health, Anchorage, Alaska, 13-18 May 1984, will devote one day to a special session on the International Biomedical Expedition to the Antarctic. After four years of planning and organization by the Scientific Committee for Antarctic Research (SCAR) Working Group on Human Biology and Medicine, the IBEA was successfully carried out in 1980-81. To view man as a whole, the IBEA was multidisciplinary with projects in physiology, biochemistry, microbiology, immunology, psychology, sleep and epidemiology. This is the first time such a presentation will have been made. A 100-minute TV documentary will be shown. The core sessions of the Symposium will be on (1) cold injury, physiology and adaptations, (2) infectious diseases, (3) cancer and other chronic diseases, (4) genetics, anthropology and demography, (5) nutrition, (6) environmental and occupational health planning and engineering, (7) social environment, mental health, alcohol and drug abuse, (8) maternal and child health, (9) dental health, and (10) health care delivery and information systems. Our own Fred "Muckluck" Milan is president of the National Organizing Committee on Circumpolar Health, and Secretary Margaret Heckler, Department of Health and Human Services, will be the keynote speaker for the Symposium. Now there is a most unlikely twosome.

**THE DEPLORABLE EXPEDITION.** Several years ago the Society was given a delightful lecture on the Wilkes Expedition by Dr. Herman Viola, Director of the National Anthropology Archives at the Smithsonian Institution. Recently he had another occasion to give the same talk, and afterwards we absconded with his text for possible use in a Newsletter. No one knows more about Charles Wilkes than Dr. Viola, and his presentation is full of wonderful little anecdotes about the Expedition which are probably not known to many of you. Wilkes is staging a comeback and his renaissance will reach a climax late in 1985 when the Smithsonian will have a Wilkes exhibit. The Smithsonian is looking for a co-sponsor, also for the road through to the right person to get a postage stamp issued on Wilkes. Dr. Viola's account has everything except sex - a dramatic account of how science won out in spite of the frailties of the expedition leader, a scenario which has been repeated and which will no doubt be repeated in the future. This is great history - please be sure to read it in its entirety.

**THE UNITED STATES SOUTH SEAS EXPLORING EXPEDITION, 1838-1842.** (Excerpted from talk by Dr. Herman Viola, presented at Smithsonian Institution on 12 January 1984.) The story of the Wilkes Exploring Expedition began in the early 19th century with a man named John Clive Simms, who believed that the world was hollow and that the entrances to the inner world could be found by sailing to the South Pole, the "Holes in the Poles Theory." New England merchants, anxious to find new sealing and whaling grounds, allied themselves with Simms and his friends to encourage Congress to sponsor a South Seas exploring expedition. The United States Navy liked the idea because it offered the opportunity to learn more about this little-known region and to intimidate the South Pacific natives who had killed many American seamen over the years and who had not been punished for it. Thanks to these various interests and the encouragement of President John Quincy Adams, Congress in 1828 passed a resolution requesting

the President to send one of the public ships to the Pacific to examine coasts, islands, harbors, shoals and reefs, if it could be done without a special appropriation. Despite this resolution, it was ten years before the expedition set sail for the South Seas. Officially known as the United States South Seas Exploring Expedition it also enjoyed several other names, such as the Wilkes Expedition, and, perhaps most accurately, the Deplorable Expedition. The newspapers gave it this name because of the endless delays and confusion. It seemed that everything about the expedition was controversial. There were fights over the number and types of ships, the choice of the commander, the scope of his authority, and the size and background of the scientific staff, to mention just a few of the problems. The general feeling of the American public about the venture was nicely summed up in 1837 by John Quincy Adams who was then serving as a representative in Congress from Massachusetts. All he wanted to hear about the Exploring Expedition, he said, was that it had sailed.

Six ships finally sailed from Hampton Roads, Virginia on August 18, 1838, under the command of Lt. Charles Wilkes. Before the explorers reached home four years and two presidents later, they had sailed 87,000 miles and established Antarctica as a continent. They had surveyed 280 islands as well as much of America's northwest coast, had prepared 200 new nautical charts, had crossed the Pacific Ocean three times, and had circled the globe. A throwback to an earlier age, it was the last major exploring expedition to depend entirely on sail, yet it was also a harbinger of the future, for it placed the natural sciences in the United States on a professional basis. The scientists it employed were outstanding young scholars in their fields, not the wealthy amateurs who had previously dominated the natural sciences. It also was directly responsible for turning the Smithsonian Institution into a museum as well as a research institution.

Wilkes was not the Navy's first choice to lead the squadron. Of forty lieutenants in the service, thirty-eight had had more sea duty. However, he had the vision, determination and energy to do the job. He was not a professional scientist, yet he displayed superior expertise in surveying, chart-making, astronomy, and all the studies related to the naval profession. He was a strict disciplinarian and often in conflict with his officers and men. Very little humor emerges from the pages of his five-volume narrative of the expedition. He cast himself in the role of lonely hero of the venture with such single-mindedness that he failed to confide in any of his fellow officers. He kept his orders secret, revealing only what would justify his actions. Some say Herman Melville put a good bit of the secretive and aloof Wilkes into his characterization of Captain Ahab in *Moby Dick*.

The civilian scientific corps, cut from a projected 25 members to 9, came from a generation for whom science was a profession rather than an avocation. Their average age was 32. The geologist was James L. Dwight Dana, who once said that "to the naturalist, collections were better than books." Already the author of a major work on mineralogy, he went on to enjoy a long and productive career "as one of the greatest American leaders of science."

Horatio Hale, the linguist and ethnologist, was only 21 in 1838. He nearly missed out on the expedition because Wilkes believed that any of his men could "pick up languages well enough to make vocabularies."

Titian R. Peale, a native of Philadelphia, was a zoologist and artist, and a veteran of a previous exploring expedition to the west. He sometimes managed his father's museum in Philadelphia where a five-legged, six-footed, two-tailed cow giving milk to a two-headed calf was used to lure visitors to the scholarly exhibits.

The botanists were William Rich and William D. Brackenridge. Brackenridge was a Scot who Wilkes felt robbed the expedition of its one hundred percent American flavor. Nevertheless, the seeds Brackenridge brought home formed the nucleus of the Botanical Gardens in Washington. He later became Superintendent of the United States Capitol grounds, and he laid out the grounds for the Smithsonian Institution.

Charles Pickering was the zoologist. Pickering, who later became one of the finalists for the first Secretary of the Smithsonian Institution, did a little of everything - physical anthropology, botany, as well as zoology.

One of the scientists had such a heated confrontation with Wilkes that he did not complete the cruise. He was Joseph P. Couthouy, the conchologist. Couthouy had been so anxious to accompany the expedition that he applied in person to President Andrew Jackson. He told Jackson that if he could not go as a scientist, he would sign on as an ordinary seaman. When Couthouy refused to turn over his notes and drawings to Wilkes, he was ordered home "for disobedience of orders." Couthouy became captain of his own ship during the Civil War and was killed by a Confederate sharpshooter.

Two artists accompanied the expedition, Alfred T. Agate and Joseph Drayton. Drayton at 42 was the oldest of the scientists. Several of his drawings done during the expedition have survived in the Smithsonian collections, including one of a fish caught in the Fiji Islands.

The goals set out by the Act of Congress and transmitted to Wilkes by the Secretary of the Navy were many and explicit, but like the Commandments, two were the greatest of all. The expedition was to promote "the great interests of commerce and navigation", and when compatible with that, to "extend the bounds of science and promote the acquisition of knowledge."

Wilkes commanded the sloop-of-war VINCENNES, which was the largest vessel of the squadron. She was 127 feet long, 35 feet wide, and carried a crew of 190. Second in command of the expedition was Lt. William L. Hudson, on the sister sloop, the PEACOCK. Hudson, at 44, was four years older than Wilkes, and the oldest officer on the expedition. He was the best seaman among the officers and the best liked.

The other ships were the brig-of-war PORPOISE, a supply ship named THE RELIEF, and two identical schooners, the FLYING FISH and the SEA GULL. Modifications had been made on most of the ships to accommodate the civilians and to make room for the non-military, scientific nature of the expedition. Even so, the scientists complained of inadequate room and facilities to pursue their duties, while the officers and seamen often resented what little space they did use. Writing home to his daughter, Peale described his cabin as "just about as large as your mother's bed. In it I have a little bed, over and under which are packed clothes, furs, guns, books, and boxes without number, all of which have to be tied fast to keep them from tumbling about and off the floor which is sometimes covered with water."

Wilkes ordered all officers to keep daily journals which were to become the property of the government and to be used for writing the history of the expedition. Twenty-three are now in the National Archives. The diaries were the source of much complainings. One officer wrote in his that "keeping a diary is a damned bore." Some of the officers ripped out pages when they were asked to give them to Wilkes for periodic review. One officer kept two diaries - one to give Wilkes and one to keep for himself. Not all the diaries are useful for research because some of the officers did little more than copy the entries from the ships' logs.

Wilkes was a rigid disciplinarian and he quickly became disliked by most of his officers and crews. For example, although the Navy in 1838 allowed only a dozen lashes as a maximum punishment, Wilkes frequently gave more than that, sometimes as many as forty lashes. Needless to say, desertion was a serious problem during the four-year voyage, in fact over 120 of the 500 men who served deserted along the way. Wilkes also lost many men whose enlistments ran out during the voyage. Even by offering bonuses and extra shore leave, he could not get many of them to re-enlist – he lost 48 men in Hawaii alone. Wilkes was so angry he imprisoned three marines who tried to leave, and had them flogged every other day for a week until they agreed to re-enlist. He was later court-martialed for this.

Charles Erskine had sailed before under Wilkes and had been flogged, he claimed, unjustly. Soon after leaving the United States, Erskine decided to kill Wilkes. Just as he was about to drop an iron spike on Wilkes' head, however, he saw a vision of his mother and stopped. He told this story in his book, *Twenty Years Before the Mast*, which he wrote in 1890. Ironically, Erskine learned to read and write while on the expedition.

Those were cruel times, and Wilkes was probably no worse than many. For example, when the ships were in Sydney, Australia three British sailors stowed away on one of the American ships. One of the stowaways was a twelve-year old drummer boy who became a mascot to the American sailors. When Wilkes returned to Sydney, he gave the stowaways back to the British authorities. The drummer boy's punishment was 110 lashes. Of these the boy received 97, the last five posthumously.

The first important stop for the Wilkes Expedition was Orange Harbor at Tierra del Fuego, which the ships reached in February 1840 after spending Christmas in Rio de Janeiro. Wilkes used Orange Harbor as a base while he tried to explore the waters around the South Pole. He took four ships and left two and most of the scientists behind to survey the harbor and coast and to collect scientific data. There were only a few natives and the area was not of much interest to the scientists. Moreover, the weather was so bad that little work could be done while the scientists were there. One cabin boy used his time to give Couthouy's quarters a thorough cleaning which included throwing away all the seashells he found lying loose in the cabin. Meanwhile, Wilkes was not having much better luck. The weather was so bad the four ships could not sail in company and most of them turned back without accomplishing anything. Nevertheless, some land was found that did not appear on charts and which encouraged Wilkes to make another attempt the next year.

Wilkes had planned for the squadron to reunite at Valparaiso, Chile, but only five made it. The SEA GULL had 'disappeared somewhere between Orange Harbor and Valparaiso; it was never heard from again. Wilkes evidently planned to rename Orange Harbor, Sea Gull Harbor, and he submitted it to the Navy Department that way after his return. However, when the map was engraved, the original name Orange Harbor was retained.

After waiting several weeks for the SEA GULL the expedition travelled up the South American coast to Lima, Peru, their final stop before heading across the Pacific. Thus far, the scientists were generally unhappy because no new or unexplored places had been visited. Wilkes was unhappy because he thought many of his officers and crew were plotting against him. To get rid of the supposed troublemakers, he assigned all the officers and men with whom he had had arguments to the supply ship RELIEF, and sent it back home. His official reason for doing this was that the ship was too slow and delaying his squadron.

Finally, in August 1839 after almost a year at sea the squadron reached the first Pacific island. This was the Tuamotu group. Unfortunately they had a

fight with the first natives they met. To make matters worse from a scientific point of view Wilkes began surveying the islands from aboard his ship and did not want to stop long enough to let the scientists go ashore. At most, he would allow them ashore for an hour or so each day, and he told them that if they did not come back when ordered, he would not let them go again. Couthouy later grumbled that the scientists had gotten 50,000 specimens in Rio, but the collections they got from the first five unexplored islands they saw would not fill a cigar box.

The scientists soon became convinced that Wilkes did not want them to accomplish anything important because he was afraid they would overshadow his own accomplishments. Even some of the younger officers, who were at first very enthusiastic about aiding the scientists, became disenchanted, and the scientists had to endure considerable sarcasm. The sailors called them "clam diggers" and "bug catchers." One lieutenant on Peale's ship ordered its rowboat to load ten water bags, two buckets, one shovel and two scientists. Another officer sent a rowboat to an island to bring back yams, pigs and scientists.

Part of the problem may have been the fact that Wilkes told the crew and officers that all souvenirs they collected had to be turned over at the end of the voyage because they were the property of the government. The crew thought that the scientists had ordered this. Actually it was part of the orders Wilkes had received. The scientists wanted the officers and the crew to help collect things because the more they collected the more complete the collections would be. But they had planned to pay the crew members for any items considered important enough to keep.

To make morale problems even worse, the explorers found, when they got to the exotic places like Tahiti and Samoa, that the missionaries had gotten there first and spoiled all the good times they were planning to have. They were especially disappointed to find that the girls for the most part were now Christian and not as free with their sexual favors as they once had been to previous explorers.

Wilkes and some of his officers were quite pleased at this because they felt desertion would not be as much of a problem. But the missionaries had not been completely successful. At one island the first native they met could speak fluent English, which pleased them very much. But the first thing the native asked for was a bottle of rum. The officers were quite shocked and said to him, "Didn't the missionary on this island teach you better than that?" The native laughed and said, "I am the missionary."

From Samoa, the squadron went to Sydney to prepare for the second Antarctic exploration. After a month's stay in civilization, three of the ships headed south into the polar waters. Their goal was to find land and thus ensure their fame as explorers. The scientists went to New Zealand where the entire expedition was to rendezvous in April, 1840.

Aboard the PEACOCK, on January 16, 1840, Lt. Reynolds and another officer were high up in the rigging and saw what they thought was land. For reasons never really explained, Capt. Hudson failed to log their report. The two officers spotted land again on the 19th and recorded it in the ship's log, only to find Hudson again harboring doubts of its authenticity. But it was well that they logged it, and recorded it in their diaries as well, because a French expedition had sighted land later that same day and came close to depriving the expedition of even this bit of glory. There was enough changing and erasing of reports on this subject for some doubt still to exist on the precise date of discovery. Soon after these discoveries, the PEACOCK collided with an iceberg and had to leave for New Zealand. The two other ships remained in the polar waters and made many sightings of land and charted the coast just outside the ice barrier for over 1,500 miles.

Regardless of doubts and inconsistencies, the expedition can claim to be the first to establish the continental proportions of Antarctica. New charts superimposed on those of Wilkes a century later show his work to be quite accurate. His accomplishments are especially remarkable considering that all the surveying work had to be made from ships standing out from the shore. As early as 1841, a German map labeled this landmass Wilkes Land, a name it still bears.

Meanwhile, the scientists were languishing in New Zealand, where they quickly exhausted all its flora and fauna. Melville was indebted to them again for a sketch they made of a Maori chief, who became the prototype of Queequeg in *Moby Dick*.

The next big surveying job involved the Fiji Islands, Wilkes had with him a deposition concerning the murder in 1834 of ten crew members on an American ship. All information pointed to Vendovi, a Fiji chief, as the person responsible. Wilkes went to elaborate lengths to capture Vendovi. The officers made friends with Vendovi's family, and then invited his relatives to a feast on board one of the ships. When they came on board, the officers told them they would be kept hostage until Vendovi surrendered. Vendovi came right away, and to everyone's amazement he turned out to be a pilot they had hired a few days earlier to get the ships through some narrow channels.

Wilkes then told Vendovi's relatives that he was taking the chief to America with him where he would be educated and civilized; he would then be returned as an example to his people of the blessings of civilized life. Evidently there was a failure to communicate because Vendovi's brother told one of the officers that he would also like to go to America, and wanted to know if all he had to do to get there was to kill a white man.

The crew found evidences of cannibalism which they tended to regard scientifically as long as "Fijians ate only Fijians." In fact they gathered some cooked remains for their collections.

Native hostility hit very close to Wilkes. His nineteen-year old nephew, Wilkes Henry, the only child of his widowed sister, was murdered by Fijians on Malolo Island. Lt. Joseph Underwood was also killed in the same attack. Wilkes got his revenge by attacking the island. About 20 natives were killed and a large village was destroyed. The two young men were buried on a secluded cay which Wilkes named Henry's Island, and the island of which the cay was a part, the Underwood group.

The expedition remained in the Fiji Islands for three months. Despite the violence, the explorers were proudest of the work done there. They corrected a vast number of errors on existing charts. Brackenridge listed 600 new plant species collected and preserved. Dana's coral collection was nearly unprecedented, and is the heart of what is now the world's largest coral collection. Because of the hostile nature of the islanders, however, most of the collecting was done on a grab-and-run basis, and no collecting was possible in the dangerous interior of the islands.

The next destination was the Sandwich or Hawaiian Islands where the squadron enjoyed a brief holiday in Honolulu. Honolulu was then a town of about 9,000, consisting of four streets, two hotels, seven bowling alleys, several taverns, and many prostitutes. Wilkes and the *VINCENNES* stayed in Hawaii several months, establishing an observation post on top of Mauna Loa which he called Pendulum Peak. He sent the other ships back into the Pacific where they surveyed and explored the Drummond and Marshall Island groups. In the Drummond Islands the squadron had another fight with natives after one of the crewmen was killed.

The squadron was reunited once again at the mouth of the Columbia River off the northwest coast of America. But catastrophe struck again as THE PEACOCK hit a sandbar and was lost. Although all hands and the scientific papers were saved, a great many scientific specimens were lost, including Peale's entire butterfly collection. After visiting California for a while, and adding another ship to replace THE PEACOCK, the exploring expedition crossed the Pacific for the third and last time. Wilkes sold the FLYING FISH in the Philippines because he thought it was no longer seaworthy. Then everyone headed home.

The last tragedy was the death of Vendovi. He had been confined on THE VINCENNES for more than two years and his health finally failed. He lived just long enough to reach New York and died about two hours after he got there. The resourceful scientists were disappointed at losing their living artifact. But they kept his skull anyway for research purposes, and it too is now part of the Smithsonian Institution's collections.

Wilkes was disappointed, because no bands welcomed the explorers. Instead, charges, counter-charges, and court-martials abounded. Something like three months were spent in court-martial hearings. Nothing more serious than a few reprimands and suspensions came of them. And they probably can be charged to the almost incomprehensible rigors of a four-year journey, beset by nearly all the hardships that can trouble the human mind and body.

The story would not be complete without telling what happened to the collections. Although Wilkes had not seemed entirely keen about the scientific aspects of the expedition during the voyage, he arranged to have himself placed in charge of the collections and the various reports that were to be published upon his return. He personally wrote the official history of the expedition in five volumes.

The United States, however, was unprepared to cope with the tons of specimens the expedition generated. And a good deal of the material was lost before things were put under systematic control. Congressmen, amateur scientists, and collectors in general helped themselves as things were unpacked. Peale was eventually hired to serve as a curator. He was shocked at the mess he found. He said bird skeletons--male and female--were jumbled together, the legs of one being put on another body. Hundreds of fine insects, he said, were put into families without localities, although they came from all parts of the world. Bows were in one end of a room, arrows in another with their ends sawed off to make them fit into fancy stands.

The collections were first placed in the care of the recently founded National Institute for the Promotion of Science, and were displayed in the Great Hall of the Patent Office Building. The upper room which was 265 feet long, was filled with natural history specimens and drew crowds of visitors. But even there the collections were in danger. One unnamed commissioner, is supposed to have sent the government collection of vertebrate fossils to a bone mill in Georgetown, where the bones were ground into commercial fertilizer. Someone else at the Patent Office noticed that the metal tags on Couthouy's shell specimens were discoloring the alcohol, so he took them all out and put them into one jar, thus destroying the documentation for the seashell specimens.

Meanwhile, Joseph Henry, first Secretary of the Smithsonian, made it clear that he did not consider the Institution a museum and he did not want the Wilkes material to ever come there. Since he did not care much for the Smithsonian building itself, he offered the building to the government and suggested that the Smithsonian Institution be moved to another site. He urged Congress to buy the Castle Building, pay for the display cases and grant an annual appropriation for maintaining the Wilkes Collection and other museum items. To his utter

amazement, and chagrin, the government agreed to the idea except it wanted the Smithsonian to stay there as well. Henry had no choice but to accept, and the Wilkes material was delivered in 1857. A sign was hung over the display hall reading, "National Museum of the United States", and the Smithsonian Institution, as we know it today, took off from there. While all this was taking place the scientific community was eager to see the reports ready for publication. That the reports finally appeared was something of a miracle in view of the meager appropriation, bureaucratic indifference, lack of research facilities, and the independent nature of the young scientists. More than thirty years were spent on the reports, and even then some were never completed.

Nevertheless the expedition left a priceless legacy for future research. Dana's work on corals, for instance, described hundreds of new types and corrected many existing errors. It became a standard work, and connected the expedition fully and forever with the systematic study of zoophytes. Of 483 coral specimens that he collected, for example, 229 were unknown to science. - - - Fifty thousand plant specimens formed the basis for the United States National Herbarium, which is now administered by the Smithsonian's Department of Botany. Brackenridge almost lost his appropriation for refusing to give free samples to Congressional wives. Today, there are about three million specimens in the Botany collection. - - - The 1,128 fish collected represented over 500 species. In one report on 588 specimens, 195 were unknown or undescribed when the expedition returned. - - - Peale was more of an artist and collector than a systematic scientist. His stuffed birds and mammals are remarkable, but his report on mammalogy and ornithology was completed by someone else. - - - The vocabularies and grammars Horatio Hale collected were never superseded, and many are still being used today.

Wilkes remained irascible to the end of his life. You may recall he was the Navy captain who seized THE TRENT during the Civil War and almost inspired the British to declare war on the United States. Perhaps it took that kind of leader to accomplish what he did on the Exploring Expedition. Dana, who had had his share of battles with Wilkes, gave him the accolade he probably deserved. "Wilkes," he said, "although overbearing and conceited, exhibited through the whole cruise a wonderful degree of energy and was bold even to rashness in his explorations .... I much doubt if, with any other commander that could have been selected, we should have fared better or lived together more harmoniously, and I am confident that the Navy does not contain a more daring or driving officer."

**POLAR STAR MAKES IT TO THE BIG TIME.** Lincoln Ellsworth's Northrop Gamma POLAR STAR is part of the new show on The Golden Age of Flight which opened at the Smithsonian Institution's Air and Space Museum on April 5th. This sleek, silver bird made the first so-called Transantarctic flight in November-December 1935. Herbert Hollick-Kenyon, British-born Canadian from British Columbia, was Ellsworth's pilot on the 13-day trip which covered a distance of 2,200 miles, 1,200 of which was over unexplored territory. The POLAR STAR was an all-metal, cantilever, low-wing monoplane powered by a Wasp 600 horsepower engine, giving a top speed of 230 miles per hour. Equipped with wing flaps which reduced landing speed, it could land at 42 miles per hour. With a full load of gasoline, the POLAR STAR had a cruising range of 7,000 miles. The low wing was advantageous for landing in snow, as two men could scoop out trenches for the skis which would result in the wing resting on the snow surface.

**AND THEN THERE WAS ONE.** The Society Expeditions Cruises, Inc. of Seattle, Washington acquired the Lindblad EXPLORER on 1 February 1984, and will be using the ship on their Antarctic cruises starting in the 1984-85 austral summer. The WORLD DISCOVERER, the Society Expeditions' former Antarctic ship will not be making any more

Antarctic cruises, although she will be sailing in the South Pacific. We understand that the WORLD DISCOVERER will be painted blue and white, which would surprise a lot of whales and seals and penguins who have gotten used to seeing its beautiful red hull in Antarctic waters. Our Society has a lot of Lindblad alumni in its membership, close to 20, and their loyalty to Lindblad has been truly strong and steadfast. People like Dotte Larsen have made so many cruises on the EXPLORER that they almost qualified for crew pay. It is good to know that the EXPLORER will remain in service, flying under the flag of T. C. Swartz's Society Expeditions. Society Expeditions is currently preparing their brochure for their 1984-85 Antarctic cruises. Long live the EXPLORER! George Llano will stay on as lead lecturer.

**BAD NEWS! GOOD NEWS!** As you noted on the front page, the price of food and drink on the evening of the 18th is \$21, which is rather rough on those whose lips never touch alcoholic beverages. The Academy does not allow cash bars, so, as long as we eat at the Academy, we must go along with an open bar. The good news is that we can all find free parking on the streets, have a one-stop evening (drinks-dinner-lecture), be in the elegant rotunda where there is plenty of room, and sit free in a nice auditorium for a learned Memorial Lecture. With the Polar Research Board meeting in session, we can be assured of nearly all their members being in attendance, which makes our group more legitimate and distinguished, while filling more seats in the auditorium. Even though it's a bit costly, once a year shouldn't hurt too many of us, and if you drink, you have a cheap evening.

**METEORITES MORE PREVALENT AND LARGER.** According to the Minutes of the Meteorite Working Group meeting held, at the Lunar and Planetary Institute in Houston on 6-8 April 1984, it was another great field season for Bill Cassidy and friends. They found a total of about 360 meteorites, but 100 may be one carbonaceous-chondrite found on a slope near Allan Hills. Bill credited this year's success to the extensive exposure of ice and the clear hard firn. The average specimen size was much larger this year. Two weeks were spent near Elephant Moraine where they found 200 specimens, including two irons, one broken, the other a piece of iron shale. The team that traversed towards Allan Hills were tent-bound by a storm for seven days, and towards the end experienced a tent fire. Paul Sipiara suffered second-degree burns, but they were able to evacuate him by helo within three hours.

**MORE ON WIND CHILL.** In the last issue we speculated on extreme wind chill equivalent temperatures (WCET), conjecturing that the minimum might be about  $-190^{\circ}\text{F}$  in Antarctica and that Mt. Washington, N. H. was in all likelihood the most miserable spot in the world. Let's discuss Mt. Washington first, as we have some hard data for Mt. Misery. As you may recall from the last Bergy Bits, Williston, North Dakota had a WCET of  $-89.3^{\circ}\text{F}$  on 24 December 1983, probably the lowest in the mid-west for the 24-25 December 1983 Siberian Express. When we received the Mt. Washington, N.H. December data from Staff Meteorologist Greg Gordon we discovered that our assumption was true, that the mountain was the worst spot on 24-25 December 1983. They had a WCET of  $-111.4^{\circ}\text{F}$ , resulting from a temperature of  $-37^{\circ}\text{F}$  with a wind of 75 kts. I admit that I took Bergy Bits' Liberty and did not penalize Mt. Washington for its excessive wind, treating 75 knots like it was 50 knots (the wind chill equation reverses at 50 knots, resulting in warmer values).

Gordon is one of those freaks who delights in challenging the mountain's worst weather on a one-on-one basis. He said that the worst he had ever experienced was on 8 January 1968 when it got down to  $-46.2^{\circ}\text{F}$  with wind gusting to 130 mph, a WCET of  $-125.9^{\circ}\text{F}$ . Mt. Washington had one other real miserable day, 29 January 1934, when the temperature got down to  $-46.5^{\circ}\text{F}$  with a 100 mph wind, WCET of  $-126.4^{\circ}\text{F}$  with Bergy Bits Liberty.

I propose that this is the all-time record low for the U.S., although I assume that some other mountain top like Mt. McKinley might have had lower values, but they had no instrumentation/observers.

Hourly data for Antarctica are hard to come by, but once upon a time I did copy hourly temperature and wind speed data for the South Pole for 1957 and 1958, so I checked them to see what I could find. The worst condition during the first two years of the Siple-built-station was on 19 June 1958 when the temperature at 1900 hours was -95.1°F and the wind was blowing 20 knots, giving a true WCET of -177.3°F.

To those of you who wrote in with your impressions of your most miserable day, we thank you. The Chamber of Commerce in Williston wrote Bergy Bits a great letter, asking for a public apology for all the nasty things we wrote about their miserable December weather. We're happy to apologize to good guys. You know, they had a population increase of 17% from 1980 to 1982, and we put that into a computer and found that if their growth rate continued at that pace, in forty years Williston would be the fourth largest city in the United States with a population of 2,564,871. Then people like me would know where Williston is located!

**ANTARCTIC BRIEFINGS.** Jim Barnes, environmental lawyer who is the Antarctica Project, is putting out a series of Antarctic briefing papers which should be of interest to many of you. Four have been published to date:

- |                 |  |
|-----------------|--|
| No. 1 - 3 April | Status of Antarctic Minerals Negotiations.       |
| No. 2 - 9 April | A Non-commercial Approach to Antarctic Minerals. |
| No. 3 -16 April | An Antarctic Environmental Protection Agency.    |
| No. 4 -23 April | Protected Areas in the Antarctic.                |

These briefing papers were prepared for distribution to media-type people, but individuals can obtain them for \$2.00 from James N. Barnes, Executive Director, The Antarctica Project, 624 Ninth Street, N.W., Washington, D.C. 20001 (202-737-3600). I think they are excellent write-ups on subjects which a layman like myself doesn't get a chance to hear about very often. Another set of four briefings will be published in the near future, and these can be had for an additional two dollars. Following the Tokyo meetings in late May on minerals, ECO will publish in early July a series of articles on what they think transpired in Tokyo. These can be had for \$5.00 from The Antarctica Project (address above). Good buys, all.

**ED TODD SWEEPSTAKES.** As we go to press, speculation reigneth supreme in Washington as to who will replace Ed Todd as Director of the Division of Polar Programs at NSF. We understand that twenty-five people filed their candidacies. Then we heard that some committee had picked out the five highest qualified. And the last rumor we picked up was that one name has been forwarded to higher levels for consideration and anointment. The Washington betting fraternity seems to think they know who that person is, but I would not count on anyone in this era where you don't have to pick the best qualified, only someone from the top echelon.

**THANK HEAVENS ROBERT PEARY NEVER WENT TO THE ANTARCTIC.** I imagine that nearly all of you folks saw the documentary in December on Cook and Peary, but probably not many of you know about an article in the Washington Post of 10 April 1976 by Joel Dreyfuss entitled "On Top of the World." It's a very interesting article, as the author interviewed at length a fellow by the name of Herbert L. Frisby in Baltimore who had dedicated a large part of his life to the cause of Matthew Henson. Frisby had made 25 trips inside the Arctic Circle, and frequently visited Henson in Harlem. According to Dreyfuss, Peary abandoned Henson after the North Pole, in spite of

having a long-time association, including a trip to Nicaragua and numerous trips to the Arctic. Presumably Peary's alienation developed after Henson became the first to reach what they were going to call the North Pole. Apparently Peary arrived some 45 minutes later. According to the article, Henson had somehow calculated the position as being the North Pole, which Peary confirmed after his arrival. Henson, so the article goes, extended his hand to congratulate Peary; Peary refused it. Henson became so wary of Peary that he removed all the cartridges from his gun and from Peary's because he was afraid that Peary would kill him! Peary never spoke to Henson on the return trip except to give him direct orders. Henson was bound by a promise to Peary that he would not lecture or write about the trip. He kept the vow for 12 years, but because of financial problems finally broke it, adding to Peary's hostility toward him. Henson was made a life-time member of the Explorer's Club in 1937, and Congress awarded him a special medal in 1945. President Eisenhower received him in the White House in 1954 shortly before his death in 1955. I doubt if there are very many people around who would be willing to bet the family jewels on whether either Cook or Peary reached the North Pole. But if it had not been for Peary supposedly reaching the North Pole, Amundsen would never have turned south and Captain Scott would have been the first to the South Pole. How history would have changed!

**IVY LEAGUE PREPPIE GIVES 1984 MEMORIAL LECTURE.** Dr. Richard P. Goldthwait, class of 1933 at Dartmouth, turned down Admiral Byrd's request to go on BAE II as a geologist. Our Society is very magnanimous, very broad-minded, and to show that we can overlook errors of judgment, we invited Dr. Goldthwait to present the 1984 Memorial Lecture. The title of his lecture may show why he didn't want to go to Little America II; he was really more interested in what lay at the bottom of glaciers than what glaciers looked like on the surface. However, to show he had no personal animosity towards the Byrd family, he later taught geology to the Admiral's son at Harvard! Dr. Goldthwait is one of three Ivy League Golden Ice Axes, glacial geologists with 50 years of experience who have made a comfortable living with their ice axes, namely, Bill Field, Link Washburn, and Dick Goldthwait. I think it is remarkable that these men overcame their Ivy League training, which should have normally led them into finance or big business, and ended up being men of snow and ice. And they have all achieved so much while remaining so humble, so kind, so thoughtful, and so dedicated. It is truly great having one of them as our Memorial Lecturer.

As a New Englander, I must point out with pride that Dr. Goldthwait is a good old Mt. Washington man, loyal to its core, and is, without a doubt, this nation's foremost authority on the geology of the White Mountains and the Presidential Range. He has worked nearly everywhere that it snows, with the exception of the Soviet Union. His name is synonymous with Glacier Bay where he conducted a 20-year program involving 25 field parties. Later on this summer, 23-30 August, he will be a special lecturer on a cruise to Glacier Bay when they will honor William Skinner Cooper, the founder of Glacier Bay National Park. Dr. Goldthwait worked on the Crillon Glacier in Alaska with Link Washburn, has done extensive work on Baffin Island, and, naturally, has been to Antarctica many times ('57-'58, '60, '63, '66, '70, and '73).

He left Brown University to go to The Ohio State University in 1946, and he did many great things in Columbus, although he isn't as well-known nationally as Woody Hayes. He was President of the Ohio Academy of Sciences; was a Governor of the Arctic Institute of North America; founded and directed the cradle of polar scientists - the Institute of Polar Studies; was chairman of the Geology Department; was Acting Dean of the College of Mathematics and Physical Sciences; and I believe he sang vociferously and sometimes on key in one of the local church choirs. The Ohio State University awarded him their Distinguished Service Medal. He was with the U.S. Army Air Force in 1942-46, and a recent communique from Dr. Goldthwait revealed to me

that he had done some work on wind chill when at Wright-Patterson Field during the war. We understand that he was involved in a post-World War II aborted trip to the Himalayas where they were going to find the highest mountain, but the Chinese said whatever they say when they mean "no", and they all had to come home. Maybe this was Dr. Goldthwait's only life failure, as his successes as a scholar, a teacher, an administrator, and a researcher carried over into his family life. We understand from an impeccable source that his most personable bride of all these years was most helpful when he was doing his doctoral dissertation - it seems that Kay did a lot of the mapping and drafting. A man with great foresight in picking his life partner! However, the Goldthwaits weren't forever in the field, as they produced one son and three daughters.

The National Park Service gave him their Service Award in 1983 for showing how the succession of climates and the progression of life development in the wake of retreating glaciers give clues to why some glaciers advance, others retreat. He has a majestic mountain of 3815 meters lying 2.5 miles south of Mt. Dalrymple in the Sentinel Range. It doesn't bother me much that his mountain is 215 meters higher than mine; in fact, I stopped crying about it way back in 1983. But I tell you, it's truly an honor to lie in the shadow of Mt. Goldthwait; also to be so close to nearby Mt. Washburn. What great company! He's an honorary member of the Hilda Richardson Society, known in a few circles as the International Glaciological Society. And he serves on the International Quaternary Association's Commission on Quaternary Glacial Deposits - presumably an august and honorable group.

There appears to be only one flaw in Dr. Goldthwait's armor, and that is, what is this glacial geologist doing living in Anna Maria where the only ice to be found is in highballs? He admits to being a part-time beachcomber, going out each day to check sea level. He wants to be the first one in Anna Maria to know when that great ice mass in Antarctica starts to melt. However, like a good homing bird, Dr. Goldthwait does return each summer to his native state of New Hampshire. I presume he goes back there to see glaciated things and to get a fix to carry him through the long winter in Florida. He spends half of each day finishing up research studies which he never completed when he was doing such mundane things as being a dean, a chairman, a director. The price of fame and glory doesn't come cheaply!

Let's fill the lecture hall on the 18th! Dr. Goldthwait deserves a full house! A lot of us owe so much to him, so be there to join in the applause!

#### **UPCOMING MEETINGS.**

International Symposium on Circumpolar Health. Anchorage, Alaska. 13-18 May 1984.

National Academy of Sciences' Polar Research Board. Washington, D.C. 17-19 May.

PRB's Committee on Polar Biomedical Research. Washington, D.C. 31 May-1 June.

17th Antarctic Treaty Consultative Parties Meeting (Minerals Regime). Tokyo. 21-23 May.

Antarctic Politics and Marine Resources: Critical Choice for the 1980s.

University of Rhode Island. 17-20 June.

Post-FIBEX Workshop on Data Interpretation. University of Hamburg. July 1984.

18th Meeting of SCAR. Bremerhaven, F.R. 24 September-5 October 1984.

\*\*\*\*\*

Be sure to see the May 1984 National Geographic. Article by UCLA biologist, William N. Hamner entitled "Krill - Untapped Bounty From The Sea." Excellent photographs, particularly one of chin-strap penguins on an iceberg.

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 84-85

September

No. 1

**Presidents:**

- Dr. Carl R. Ekiund, 1959-61
- Dr. Paul A. Siple, 1961-2
- Mr. Gordon D. Cartwright, 1962-3
- RADM David M. Tyree (Ret.) 1963-4
- Mr. George R. Toney, 1964-5
- Mr. Morton J. Rubin, 1965-6
- Dr. Albert P. Crary, 1966-8
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-1
- Dr. William J. L. Sladen, 1971-3
- Mr. Peter F. Bermel, 1973-5
- Dr. Kenneth J. Bertrand, 1975-7
- Mrs. Paul A. Siple, 1977-8
- Dr. Paul C. Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82
- Dr. Mort D. Turner, 1982-84
- Dr. Edward P. Todd, 1984-86

## *Orientation Week Special*

EXPLORATION OF THE QUEEN MAUD MOUNTAINS:  
The Reach to the Southernmost Rocks

by

Dr. Edmund Stump  
Department of Geology  
Arizona State University  
Tempe, Arizona

on

Wednesday, 12 September

1984 8 PM

National Science Foundation  
18th and G Streets NW  
Room 543

- *Light Refreshments* -

**Honorary Members:**

- Ambassador Paul C. Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard

**Memorial Lecturers:**

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Franke, 1968
- Dr. Henry M. Dater, 1970
- Sir Peter M. Scott, 1971
- Dr. Frank T. Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr. 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980
- Dr. Robert L. Nichols, 1981
- Dr. Robert H. Rufford, 1982
- Mr. R. Tucker Scully, 1983
- Dr. Richard P. Goldthwait, 1984

Ed Stump is one-half of a well-known husband and wife Antarctic scientific team. He is a PhD out of The Ohio State University, and for the past fifteen years has been a frequent researcher in Antarctica. In 1970 he went to the McGregor and Amundsen Glaciers, in 1974 to the Duncan Mountains, and in 1977-78-79-80-81 to the Scott and Leverett Glaciers. He was the Chief Scientist on the North Victoria Land Project in 1981-82. In 1982-83 he and his wife, Harriet Maccracken, worked in the McMurdo Sound area. He joined the faculty at Arizona State University in the fall of 1976, and was on sabbatical leave in 1983-84 at Victoria University in Wellington, New Zealand. An outcrop by the name of Simon was born to Ed and Harriet on 28 March 1984, — no doubt another budding Antarctic geologist.

*Let's get the year off to a great start! Support our fine Lecture Series!*

**BONUS** — Dr. Stephen J. Boyer, former medical officer at the South Pole, will speak at the 1984 USARP Orientation on "Antarctic Environmental Hazards" at the Twin Bridges Marriott on Tuesday evening, 11 September at 7:30 PM. Come, y'all, and learn about hazards beyond the Beltway.

\* \* \* \* \*

*The Philosophical Society of Washington has invited our Society to come to the John Wesley Powell Auditorium, Cosmos Club (entrance 2170 Florida Avenue NW) at 8:15 PM on Friday, 14 September 1984 to hear Dr. Arnold Gordon, Lamont-Doherty Geological Observatory, speak on "Ocean-Atmosphere Exchange Processes in the Southern Ocean."*

Late tragic news - Admiral Tyree died 25 August (see page 6)

Here we go again, another year of some facts, some half-truths, and some fiction. It's up to you as astute Antarcticans to decide which is which. We only try to make it readably enjoyable. For example, last spring when we said that septuagenarian Alice Dater, who was dumped by LINDBLAD into McMurdo Sound, couldn't swim, dear Alice came back with validation (Red Cross Lifesaving Course, Quinibeck, Ely, Vermont) that she had passed some dog-paddling test as an infant. Well, Bergy Bits' version was much more interesting and exciting - we didn't let the truth get in the way of a better story. This same good old-boy philosophy will be continued this year. Just remember that what you read here is not the Voice of the Antarctic Society, it is just the ramblings of an old Antarctic who takes the time and effort to put something together for members to read, and then he sits comatose for a weekend stuffing newsletters into envelopes.

**WE'RE HEALTHY, WE'RE GROWING.** Our membership reached a new all-time high of 461 this past summer, and it is expected we will hit 500 within two years. Local members (within 50 miles of Washington) constitute only a third of our total membership; this is a radical change from seven years ago when it was close to two-thirds. In numbers, though, local membership has remained steady at about 150. It's just that our out-of-town membership growth has been fantastic. We will be sending dues notices in a couple of weeks. Over a hundred members have already paid for this year, so if you don't get a bill, you are in good standing. Dues will remain the same as they have been for the past several years - \$7 local and \$6 out-of-town. The treasury is in good shape, so we hope to keep the same dues for many more years.

**DR. EDWARD PAYSON TODD ASSUMES PRESIDENCY OF THE SOCIETY.** We had hoped to find a stouthearted son from the Pine Tree State to replace Mort Turner as President, but no luck. However, we did find a close approximation in Ed Todd who hails from nearby Newburyport, Massachusetts and has sailed extensively in Maine waters. It seems that he was almost unemployed, being a gentleman carpenter, gardener, errand boy, and prospective consultant living in nearby Falls Church, Virginia. Another plus in his selection is his most personable wife, a Mt. Holyoke College graduate. I have a well-founded fixation about Mt. Holyoke girls dating back to the late 40's. So there was no question about Dr. Todd's personal credentials. Then we looked at his professional credentials. He was a graduate of M.I.T. where he received his B.S. in physics in 1942, and as far as we could find out M.I.T. is an creditable institution located down Massachusetts Avenue from the august, prestigious Harvard University. It seems that some sort of an international period of ill will was going on at the time Ed graduated from M.I.T., so he spent the next four years as a commissioned officer in the Signal Corps. Then he returned to the Bay State to accept a position as research physicist with the United Shoe Machinery Corporation in Beverly. Ed then did something unusual for a provincial New Englander - he forsook the Citadel of Advanced Learning in Cambridge to go to the University of Colorado where he obtained his PhD in physics in 1954. But he did come "home" in 1954 when he accepted a position of Supervisor of Applied Research with Pitney-Bowes in Stamford, Connecticut. However, he must have missed that Rocky Mountain High, as he headed back to the University of Colorado in 1957 to take over as Technical Director of their laboratory for Atmospheric and Space Physics. Ed stayed there until 1960 when he went to Washington to seek peace, happiness, and great wealth from the

National Science Foundation. He served in many positions at NSF, including Associate Program Director for Atmospheric Sciences and as Acting Assistant Director for Astronomical, Atmospheric, Earth, and Ocean Sciences. Dr. Robert Rutford was Director of the Division of Polar Programs at NSF in 1977 when an academic offer came which was too good for Bob to turn down - at least in Bob's opinion. Dr. Todd volunteered for the position, assuming command on 19 August 1977. He never regretted it in spite of all the work involved, saying it was the most exciting job in all of NSF. It became obvious during the winter of 1982-83 that NSF had the right name with the right job when the New Yorker showed a cartoon of a parka-clad explorer trodding down a city street in a snowstorm. Around his neck was a placard reading "Ed Todd." There was no greater fame Ed could achieve after being immortalized for life by the cartoonist, so he sought out retirement papers. He told his peers at a brown-bag lunch at NSF - over a year ago - that they should start looking for his replacement. Dr. Todd was retired regally in late June, while folks at NSF wonder if they ever will find his replacement.

**BRAVO'S MASTER, JACK TUCK, DIES MUCH TOO YOUNG.** Jack Tuck, probably the first American to winter over two consecutive years in Antarctica, and the only U.S. Naval officer to winter over two consecutive years, died at age 51 on 14 August 1984 after a gun accident at his home three days earlier. Jack was cleaning a family collection of rifles and pistols, prior to disposing of the collection, working under the assumption that none were loaded since the ammunition supply had been disposed of many years ago. However, one pistol had a bullet in it, and it discharged. He put up a good fight for two days after surgery in the University of Massachusetts Hospital in Worcester, but then died from a massive stroke.

Jack was one of the best known Antarcticans during the IGY, and accompanied the late Dr. Paul Siple to the South Pole in 1956, remaining at the station as the Navy commander in 1957. Both were geographers and a strong bond grew between the two during that year. It was anything but normal, as it was the first year the U.S. was at the South Pole. There was a tremendous amount of work to be done after the construction party left camp, and no one really knew what kind of weather could be expected during the winter. If you could have read Siple's diary in the National Archives, you would know that Jack arrived at the South Pole pretty much "Defectized." However, Tuck was enough of a man to realize that it was a golden opportunity for him to be at the Pole with Siple, and soon they became united in purpose and in dedication. One well-documented incident that helped seal their relationship was when no one informed either Siple or Tuck that VIPs at McMurdo had dedicated the South Pole station. They were not told until several weeks later when the last of the wintering-over scientists were flown to the Pole. The Siple-Tuck relationship remained a strong one after the IGY. Tuck's son, Jonathan, was given the middle name of Paul and became Paul's godson. In fact, Jonathan spent several days with Ruth earlier this summer.

Jack was in charge of dogs at McMurdo during 1956, and in '57 took Bravo with him to the Pole. Bravo was an ill-tempered character, but at least he fulfilled some sort of a role as camp mascot. He was pictured in the National Geographic and in newspapers with Jack. Bravo was Jack's dog, that is, until they all got back to the States. Through some quirk of ill fortune Bravo ended up with the Siples - until it became overbearingly evident that Bravo was never meant to be a Virginia squire, and he was sent to kennels in New Hampshire.

Jack came back from the South Pole with ideas of continuing his geography training, having received his bachelor's degree from Dartmouth College. He went to the University of Wisconsin at Madison, which then was considered the top geography school in the nation, where he earned his master's degree; then went to Cambridge, England to further his education and to be near the Scott Polar Research Institute. Upon returning to the States, he followed his Wisconsin advisor, Dr. Kirk Stone, to the University of Georgia at Athens. But Jack must have decided that geography was less

exciting in Georgia than it was at the South Pole, so he moved to Massachusetts, and lived there the rest of his life. He became sort of a professional do-gooder, devoting most of his time to volunteer efforts with the Deerfield Rescue Squad and the Deerfield Volunteer Fire Department. He also worked as an educational consultant, as an investment manager, and was on the Board of Trustees at Hoosac School in New York.

Jack is survived by his wife, Margaret (Peg), a daughter, Kathleen (Kathy) who is a freshman at Denison University in Ohio, and son, Jonathan who is a senior at Bates College in Lewiston, Maine. Deerfield Academy plans on establishing a lecture series in Jack's honor, with the first speaker to be a geographer. Jack had signed a living will to donate his eyes and his kidneys, so within hours after his death, he was again helping people. Our condolences to Peg, Jonathan and Kathy. (Mrs. John Tuck, Jr., "Overhill", Lower Road, Deerfield, Massachusetts 01342.

**ED ROOS SUCCUMBS AT AGE 76 (ON 15 MAY 1984).** Sven Edward Roos, seaman on the CITY OF NEW YORK, BAE I, and chief of oceanographic surveyors on the BEAR OF OAKLAND, BAE II, was born in Guthenberg, Sweden on 19 August 1907. He was only 18 when he enlisted as a seaman on the First Byrd Antarctic Expedition. After returning from the two Antarctic trips, he joined the Merchant Marines, and in 1938 went to work for Standard Oil on its oil tankers. During World War II, Captain Roos was on two oil tankers torpedoed by Nazi submarines, but escaped without any injuries. He became a naturalized American citizen in 1943. One of the highlights of his career was being presented the Tradition of the Sea Award for his heroics in 1956 when his ship, the S.S. MOORE-MCCORMACK ELM saved the crew members of a Brazilian fishing boat that had broken up in a severe storm. Ed retired in 1970 and had been living in Cocoa Beach, Florida. He is survived by his wife, Anne and his son, David. We used to hear from Ed occasionally, and apparently his health was such that he didn't do much travelling. Bud Waite knew him quite well, and according to Bud the two of them took soundings every five minutes for four months in 1933 when they were on their way to the Antarctic. Our condolences to the family. (Mrs. Anne Roos, 4700 Ocean Beach Blvd., #220, Cocoa Beach, Florida 32931.)

**MORE BAD NEWS - ED O'CONNOR IS DEAD.** The National Science Foundation learned on 27 August that a young Antarctic who has been to the continent several times in recent years lost his life at sea off the coast of California. It's ironical that a person who spent the last austral summer diving with John Oliver in the McMurdo area would lose his life to the sea.

**SOMETHING NEW - PLEASE READ.** I have always been a big admirer of the New Zealand Antarctic calendar - the pictures are fantastic, the paper of high quality, and it is clean (without historical or geographical facts/trivia). We are going to try to sell some this year, although we'll also be selling the Navy-USARP calendar. We expect to have the New Zealand calendar some time in November, ready for your Christmas giving,, We think there must be a few of you who might welcome a calendar without a Hercules sitting on the runway at McMurdo; the New Zealand calendar is a good one for those more interested in artistic beauty than in Antarctic trivia. We mark calendars up one dollar, as it is our only money-making effort for the whole year. The price on the limited edition of the New Zealand calendar will be \$5 local pickup and \$6 for mailing.

**FRAM: THE JOURNAL OF POLAR STUDIES.** We are anxiously awaiting the second issue of JPS, although we seriously doubt if the editor, Stephen Carter Jackson, will send us a complimentary copy this time. It is unfortunate that Jackson appears to be a very headstrong man who does not easily take suggestions or recommendations. I don't think there's anyone in the polar community who wouldn't like to see his publication flourish. He came onto the scene at a very advantageous time.

I encouraged him early on to come to Washington to meet some of the people he didn't know and whom he distrusted. But he never did, even though these were the people who could have helped him in many ways. Jackson entered into publishing JPS as a virtual unknown in this country. I made extensive inquiries throughout the polar community to find out who he was, and the only person who had ever even heard of him was Ron McGregor, and he knew very little about him. So I wrote Jackson and we did carry on a correspondence last year, one that I had hoped would be beneficial to both of us. I highly recommended the establishment of an editorial board, suggested some names, and am glad to see that one of them, Peter Anderson of The Ohio State University, is on the Advisory Board - although to date Peter has served more or less in a perfunctory role, and has not yet been consulted.

Ruth Siple read every word in the first issue of JPS, and even went to the Library of Congress and the National Geographic Society Library to research index material. I dare say that no one else has done that. One reviewer in another newsletter admitted that he had read only three of the articles before he wrote his "review"! Ruth found close to 500 mistakes in the first issue, and had doubts about many more. These were typed out and sent to Jackson, as well as to two members of the Advisory Board. If anyone knows anything at all about Ruth Siple, they know she is the kindest soul on earth with not one drop of vindictiveness in her system. She wants JPS to be a great success, and she felt that pointing out the vast number of errors would convince Jackson that he badly needed an editor. I feel the same way, except more strongly, as I am of Scotch ancestry and couldn't let go of fifty greenbacks a year to get two issues of an error-filled journal. Jackson has blamed Ruth and me for three papers being withdrawn, and for thirty anti-letters from Society members. I seriously question the latter, as I pretty well know our membership, and I doubt there are thirty people in our Society who would bother to write a letter to him. I wish Jackson would learn from Ruth's efforts, take it from there and come forth with, something which the polar community would want to read. We would then be most happy to lead the cheering and advocate our members subscribing.

**CAN YOU BELIEVE THIS? I CAN'T.** The Arlington Journal had a story in its 19 July 1984 issue which I could not believe. Peary High School in Rockville, Maryland had a very large U.S. flag and a dogsled which Admiral Robert E. Peary had with him on his trek to the North Pole. These items were on loan from the Peary family, and had to be returned when the school closed this past spring. The Admiral's grandson, Edward Stafford, got in touch with an auctioneer (Richard Opfer) and both items were sold for only \$3,190 to an antique dealer, George Theofiles of New Freedom, Pennsylvania. What kind of a grandson would sell such precious memorabilia?

**READ ABOUT THE NEWEST BOY SCOUT - HE WALKS ON WATER (I THINK).** The Boy Scouts of America asked us if we knew of a good man to be one of the judges to help select the 1984-85 Boy Scout to go to Antarctica. We recommended one of my favorite Ant-arcticans of all time, one of my ex-employees, Tom Frostman, who was considerate enough of his family and me not to die when he was unconscious for several hours at Plateau Station in 1967, overcome by carbon monoxide poisoning. He now is director of an outstanding summer camp in Durango, Colorado, and we would like to share parts of his letter to us about his feelings about the Eagle Scouts.

I am grateful indeed to both of you for submitting my name to serve on the panel of judges to choose the Eagle Scout who'll get to go to the Antarctic later this year. It was truly enlightening to be with such a great bunch of young men (ages 17-19) each of whom had accomplished more to date than most adults I know... Presidential scholars, EMT's, paramedics, founders of clubs and periodicals, nationally ranked chess players . . . and more important, well-mannered, articulate and personable people.

The winner is Doug Barnhart, a nineteen-year old Eagle Scout from McMurray, PA

(the Allegheny Trails Council). He's a certified EMT and paramedic, is an assistant chief of the Johns Hopkins First Aid Squad, an active member of the Presbyterian Church, a member of the National Honor Society, a musician, a freshman at Johns Hopkins (chemistry major), has attended the Pennsylvania Governor's School for the Sciences, a potential MD down the road.

The decision was really a tough one, and it took several rounds of balloting and several hours of discussion to come up with the "winner." The hard part was that they were all winners, and they became good friends instantly. And I think because they realized that they were in competition WITH each other instead of AGAINST each other, that as "losers" they could still take pride and joy in one of their brother scouts winning ... and the winner sensed a greater degree of humility knowing that the others were equally qualified and deserving.

In the long run, it was we, the judges, who truly benefited from having shared some really quality time with some of our nation's finest young ambassadors.

Five of the six judges, by the way, had been to the Antarctic and represented some five decades of research and exploration on the continent. Capt. David Gershowitz, USCG (Ret) was part of Operation Highjump with Adm. Byrd in 1946-47; Dr. Richard Chappell (chairman of the committee) had the honor of wintering over with BERGY BITS in the 50s; Frosty was there in the 60s; Mark Leinmiller (the last Eagle Scout to be chosen under this program) was there in the 70s; and CMDR David Humphreys, USCG, is still active with the Antarctic programs and may be on the POLAR STAR with Doug later this year.

The other finalists were: Eric Jensen, Mercer Island, WA; Steven Sherrod, Anchorage, AK; Vince Hougo, Los Angeles, CA; Nathaniel (Bucky) Trumbull, Woods Hole, MA; and Bryce Quayle, Bethesda, MD.

And deserving much credit for putting all this together, Mr. Ilmar Pleer, Associate National Director of Activities, Boy Scouts of America National Office, Irving, Texas.

**ICE CHIPS.** There is a new and exciting map of the McMurdo Sound area being completed this fall by *Dee Molenaar*. It will be 24" x 36" in size, and will provide a full color, oblique-view pictorial rendition of the area (about 30,000 sq. mi.) including Ross Island, parts of the Ross Ice Shelf, a segment of the Transantarctic Mountains (between Cape Teall on the south and the Fry Glacier on the north) and the eastern part of the Polar Plateau. The perspective chosen is obliquely to the south, looking into the continent. As we go to press, we are in communication with Dee, and hope to be able to offer it to Society members by mid-November. We have seen some of Dee's other map products, and they are beautiful. Tentatively we hope to be able to offer it at \$5 local, \$6 mailed. . . .*Jim Caffin*, nonpareil editor of *Antarctic*, the outstanding quarterly news bulletin of the New Zealand Antarctic Society, recently received high and exalted recognition for his work from the Queen of England. Our congratulations to Jim for this richly deserved honor!

*Rear Admiral David Merrill Tyree*, former commander of the Naval Support Force, Antarctica, 1959-1962, died on 25 August at age 80 in the Portsmouth Naval Hospital, Virginia. Admiral Tyree was the fourth president of our Society. An obituary on Admiral Tyree, one of the most popular of all Antarctic commanders, will be in our next Newsletter. He is survived by his wife, Eleanor, of Port Haywood, Virginia, and son, David of Islip, New York. Interment was to be in Annapolis on 29 August.

The remaining pages are devoted to the first-ever listing of Society members and addresses. We did it by states and zip codes, so you can invite your nearest Antarctic neighbor to your next pemmican meal.

..... Next meeting - 18 October .....

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 84-85

October

No. 2

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.) 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.) 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984

## A Stellar Fall Classic

PRELIMINARY RESULTS OF THE ANTARCTIC MARINE  
ECOSYSTEM RESEARCH AT THE ICE EDGE ZONE

by

Dr. Cornelius W. Sullivan Department of  
Biological Sciences University of  
Southern California Los Angeles

on

*Thursday, 18 October 1984 8 PM*

National Academy of Sciences  
*Joseph Henry Building (corner of 21st and  
Pennsylvania NW)*

Room 450

Washington, D.C.

This meeting, to be held in one of the lecture rooms of the National Academy of Sciences, is being cosponsored by their Polar Research Board which will be holding its fall meeting in Washington at the time. Dr. Sullivan is a member of the Polar Research Board as well as being an Associate Professor at Jim Zumberge's University. He is a graduate of Penn State University, Class of 1965, and also has his M.S. from Penn State. His PhD in marine biology was obtained from the University of California at San Diego in 1971. He had a Postdoctoral Fellowship at Scripps Institution of Oceanography from 1971 to 1974. Since 1974 he has been on the faculty at the University of Southern California. He visited Antarctica in 1981 and has written extensively on microbiological communities within the Antarctic sea ice. He is extremely well qualified to speak on the Antarctic marine ecosystem at the ice edge — his talk should be of special interest to all Antarcticans, including landlubbers.

*WE'RE SELLING! New Zealand and USARP Antarctic calendars and  
Molenaar's pictorial map of McMurdo Sound area, (see page 10)*

**THE PRESIDENT'S COLUMN - Dr. Edward P. Todd.**

END OF AN ERA. Word has been received that one of the key figures in U.S. Antarctic activities has retired after a quarter of a century of active involvement. Mr. Price Lewis, Jr., chief-of-operations of the Division of Polar Programs at NSF, hung it up at the end of September to turn his attention to other pursuits.

Price Lewis's Antarctic career has been truly remarkable and began when he was in the U.S. Navy. He became skipper of the wind-class icebreaker, STATEN ISLAND, and took his ship to Antarctica on several occasions. Following his tour as skipper he spent several years as the ship operations officer of the Naval Support Force Antarctica, spending a great deal of time at McMurdo. In those days much of the cargo movement was earlier in the season than at present and took place at the ice edge some miles north of McMurdo and Winterquarters Bay. The cargo was offloaded from ships to sleds which were towed by tractors to McMurdo. During these operations Mr. Lewis pioneered the use of D-8 tractors as mooring posts for cargo ships. After this tour he spent some time in Washington as Interagency Coordinator of Antarctic matters for the Department of Defense.

Following his Navy career, Captain Lewis joined the National Science Foundation in 1972 to contribute his expertise and experience in polar operations to the Division of Polar Programs which, at that time, was just beginning to assume an ever increasing share of the total planning, operational, and funding responsibility for United States activities in Antarctica. At NSF he proved, again and again, that he was an able and firm manager and negotiator in his dealings with the Navy, Coast Guard and contractors.

In the international sphere his negotiating talents have shone, not only in liaison activities with agencies and officials of the New Zealand government, affecting the greater part of the U.S. Program, but especially in planning and coordinating with agencies in Argentina and Chile. His efforts there were, in a major way, responsible for the smooth and steady support of Palmer Station and its research operations as well as for the year-round operation, as well as frequent repair, of the research trawler HERO.

Price's steady hand and vast experience from 25 or 26 years of continuous involvement in the USARP will be sorely missed, but the loss will be alleviated by the fact that he leaves behind a cadre of well-trained, but younger, managers in DPP Operations. On behalf of the Antarctic Society we wish Price Lewis Godspeed and success in his next, retirement career.

**B E R G Y      B I T S**

A collection of assembled items of possible interest to some segment of our membership, if not to you. Personal interpretations are those of the writer, and do not necessarily represent the voice of the Society.

**HEY WASHINGTON! WHAT DO WE HAVE TO DO?** We had only twenty-five people for a great lecture with beautiful slides by Ed Stump last month. Outside of the night that Steve Ackley spoke, when Washington was in the throes of a bad ice storm, this was our poorest attendance in the past five years. I don't know what you guys (male and female) want, but you are missing some fine lectures by Antarcticans who are doing great things on the cutting edge of their science. Our

lecture series is fantastic, we meet only seven times a year in nice quarters in an excellent section of town, and yet half of our local members have never attended a single lecture. I think I know whereof I am writing as I have attended the last 41 lectures dating back to 29 March 1977. C'mon, folks, get off your duffs and come on down and hear some first-rate presentations. We should have wall-to-wall people for every meeting.

**TIME FOR MEMBERSHIP DUES.** If you have not paid your dues for the current year, you will receive with this Newsletter a second notice. We started out with a good base, with about a third of our members having paid in advance. As we go to press, over a third still has not paid. We are trying to encourage people to renew for multiple years, as this is strictly a labor of love for Ruth and me, and it's no fun sending out bills, bills, bills. So if you haven't paid yet, how about renewing for multiple years? And if you aren't renewing, that's okay too - just please let us know. We will close the books at the end of the calendar year, so if you aren't in then, don't expect any more Newsletters. Those of you who move or have new zip codes, please remember to let us know. Our Newsletters go out by bulk mail, so they cannot be forwarded.

**MEET DR. PETER E. WILKNISS, THE NEW DIRECTOR FOR DIVISION OF POLAR PROGRAMS, NSF.** The National Science Foundation announced on 20 September 1984 that Dr. Peter E. Wilkniss, Deputy Assistant Director, Scientific, Technological and International Affairs Directorate, NSF, was the new Division Director for Polar Programs, effective 1 October 1984. I think this announcement caught most of the polar community by surprise, as the new Director of NSF didn't come aboard until 1 September 1984. The feeling seemed to be, that after the long and fruitless deliberations of the selection committee last spring and summer in choosing Dr. Todd's replacement, everything would revert back to ground base zero and that the selection might take some time. However, we understand that Dr. Wilkniss was selected on 17 September and the members of the Division of Polar Programs were told on the morning of 20 September. We understood there were 25 applicants for this position, although our sources sometimes left much to be desired. But we do know for a fact that some of the candidates were members of our Society, so there has been an inordinate amount of interest in just who would get the position. I thought I could write down two names, and one of them would be the winner, but when no selection was made last spring, I figured that a dark horse might emerge from the "hung jury" - not a dark horse in the sense of qualifications, but in the sense of the Antarctic. After we learned that Dr. Wilkniss was to be the new Director, Bergy Bits wrote him asking for his bio and comments, plus inviting him to join our Society at the full rate of \$7. We are happy to report that he promptly obliged most willingly on all scores. His credentials are indeed impressive.

Peter Wilkniss was born in Berlin, Germany on September 28, 1934 and was educated in Germany, receiving his M.S. in chemistry from Technical University in Munich in 1958 and his PhD in radio- and nuclear chemistry from the same university in 1961. He came to the States in 1961 to accept a position with the U.S. Naval Ordnance Station as a research chemist and its radiological protection officer (J.961-1964). Then he became head of their Nuclear Chemistry Branch in 1964. He transferred to the Naval Research Laboratory in 1966, taking a position there as research oceanographer. In 1970 he became head of their Geochemistry Branch and added another branch head in 1971, that of its Chemical Oceanography Branch. He served as chief scientist on a variety of oceanographic research cruises and research flights, including several to polar regions. Dr. Wilkniss joined the staff of the National Science Foundation in June 1975, and has served the Foundation very well in several capacities. In Astronomical, Atmosphere, Earth, and Ocean Sciences, they included Project Manager for the National Carter for Atmospheric Research Program, Program Manager for the Ocean Sediment Coring Program, and

Division Director for Ocean Drilling Program. In addition, he has served as the Senior Science Associate to the Director/NSF, and most recently as the Deputy Assistant Director for Scientific, Technological, and International Affairs Directorate.

Dr. Wilkniss has authored fifty-three articles in scientific and technical journals, prepared nine U.S. Navy reports, made eighty-six formal presentations at national or international scientific conferences, and participated in thirteen national/international workshops.

Relative to his polar interests and hopes, he wrote Bergy Bits on 26 September 1984:

My interests and research in the polar regions include meteorology, oceanography, and air/sea/ice interactions. I believe to have been among the first to measure man-made chlorofluorocarbons in the Antarctic atmosphere and to use Nimbus satellite images to construct air mass trajectories to the Antarctic in 1972. In the Arctic, in summer cruises and winter and spring flights, I have also conducted trace gas and aerosol measurements and used satellite images and conventional meteorological information to reconstruct meteorological data in the years 1971-1975. My research has been published in refereed journals.

What am I looking forward to? First and foremost, to help sustain the U.S. preeminence in high quality polar research. To this end I hope to enlist even more than at present the active participation of the scientific community in supporting the best research. Finally, I was distressed by the sparse attendance at special polar symposia during some recent major national and international scientific conferences. I believe that the interest and participation of the research community, especially of young investigators in polar research, needs to be encouraged.

Relative to "up front and personal," Dr. Wilkniss is a U.S. citizen, is married, and has two children. His hobbies are soccer, swimming, and coaching youth teams.

We understand that Dr. Wilkniss is going to make every possible effort to be at Dr. Sullivan's lecture on the evening of 18 October, and I know that I am eagerly looking forward to meeting him.

**COLDEST GETS COLDER.** We read in the newspapers last year that the Russians had experienced a new minimum low at Vostok on 21 July 1983 of  $-89.2^{\circ}\text{C}$  ( $-128.56^{\circ}\text{F}$ ). But we couldn't find any other reference to it, and the Division of Polar Programs' efforts to confirm it fell upon deaf ears. So I wrote Anna Minevich at the Arctic and Antarctic Research Institute in Leningrad to see if she could help out. I'm happy to report that this very popular person with all Antarcticans replied on 10 September that "an article about it will be published in the Information Bulletin of the Soviet Antarctic Expedition No. 105 (in press)." She ended the letter with "Give my best regards to those who remember me." We used to send our Newsletters to Anna, but haven't in recent years with overseas postage going up, but after some kind words about the Newsletters, I think we'll have to reconsider our mercenary viewpoint!

**MUSHERS HONOR MOULTON THE ELDER.** The International Sled Dog Racing Association honored Dick {Antarctic Service Expedition, 1939-41) Moulton in Philadelphia at their 19th annual meeting, 5-7 October 1984. After five decades of sled dog racing, Dick hung up his harness following his final trek on the 1984 race circuit which led him to Alaska. In 1975, Dick was given the Association's bronze medal, one of his prized possessions. Dick lives in Meredith, New Hampshire, and is a local hero

in that area after winning five times the annual World Championship Sled Dog Derby in Laconia, New Hampshire. In contrast, his kid brother Ken's only claim to notoriety was in 1943 when he swished through a two-handed winning set shot against nationally unranked, unknown Enfield, N.H. High School, in the closing seconds I Dick may be an internationally renowned musher, but old Bob Nichols remembers him as the guy who in 1947 locked him in a boxcar loaded with huskies in New Hampshire, destination Beaumont, Texas. But knowing Bob, I'm sure that he would love to have been in the Barclay Hotel the night of the 7th to lead the cheering for Dick.

**BYRD'S LOG HOUSE IN MAINE RAZED BY FIRE.** The late Admiral Byrd had a vacation estate, *Wickyup*, somewhere in Maine near Sullivan (which is in the Bar Harbor area). It seems that some man and his dog were at the cottage, and one of them knocked over a kerosene lamp causing the fire.

**NATIONAL ARCHIVES 50th INCLUDES ANTARCTICA.** The National Archives is celebrating their 50th anniversary this year, and have exhibits for each of the years in the semi-circular exhibit hall off the main lobby. The very first exhibit, for the year 1933, features the Second Byrd Antarctic Exhibition. Stevenson-Corey's diary is open to Thanksgiving Day 1933; there is a sketch map of the Bay of Whales done by Dick Black from the Siple Family Collection; and there is a small panorama of Little America II from photos by Tom Poulter. Later on, for 1957, there is a photo of the ring of fuel drums and the U.S. flag at the South Pole. Herman Viola, the scholar of Charles Wilkes, whose lecture on the Wilkes Expedition we ran in Bergy Bits last year, has authored a large volume on The National Archives, highlighting its fifty years. It has a golden price tag on it, and probably is of great interest to those who are archivists or fans of The National Archives. But it is deadly serious, and not at all like Herman at the lecture podium.

**AL LINDSEY, NATURALIST AT LARGE.** Al (BAE II) Lindsey overcame his natural heritage, son and grandson of ministers in the Methodist Church, to become a great naturalist! A college friend of the late Dr. Paul A. Siple, Al went with Paul on the Second Byrd Antarctic Expedition, 1933-35, as a botanist. After that expedition he obtained his PhD at Cornell University in botany, ornithology, and insect ecology. He has taught at several universities, but since 1947 has been with the Department of Biology at Purdue University - Professor Emeritus since 1973. He has published some seventy technical papers in scientific journals. Currently he is under contract to the Indiana University Press for a volume commemorating the 200th anniversary of the birth of artist-naturalist John James Audubon in 1985. The Ecological Society of America presented Al with its Eminent Ecologist Award of 1976. This past spring his alma mater, Allegheny College awarded Al its Gold Citation in appreciation and recognition of honor reflected on Allegheny by virtue of his outstanding achievements. Al has written a book, *Naturalist On Watch*, which is a series of short chapters, 40 in all, dealing with various aspects of his exciting life, including Antarctica. It's a fascinating little book, great reading, and it's amazing the people he has known and the places he has been. One chapter is about an ex-Ohio State University Antarctic and his Kiwi wife, James and Nancy Barlow, who live in the boonies near Denali. Anyone who loves the natural environment and believes in conservation should get this book, available only from The Merry Lea Environmental Learning Center, Goshen College, Goshen, Indiana 46526. Hardback is \$11 - softback is \$5.75, both prices include handling charges,

**WHO IS WRITING WHAT?** Carleton College has reissued Larry Gould's fantastic *Cold*, which has become all but impossible to find. The new printing also includes Larry's presentation before the Cosmos Club in 1979 when he was their Man of the Year. And there are additional pictures beyond those published in its first edition. I have no idea how many copies have been printed by Carleton College or its price, but if you can get one, consider yourself lucky.

One book a lot of us have been looking forward to is Deborah Shapley's *The Seventh Continent: Antarctica in a Resource Age*, which will be coming out in December or January. It will be an oversized book with many pictures and maps, published by Resources for the Future, Inc. contracting with the Johns Hopkins University Press.

The Smithsonian Institution is publishing a 224-page illustrated field guide to eighty-seven species of whales, porpoises and dolphins entitled *The World's Whales*. It will have over 200 photos, over a dozen full-color paintings. Looks like a must!

Last year we found out that quite a few of you folks are into Antarctic novels. Well, there is a new one coming out shortly, this one by Charles Neider, who has written several Antarctic books of note. The title of this, his fourth novel, will be *Overflight*. It concerns a lone survivor of two crashes (a DC-10 and a helicopter) on Mt. Erebus and "his massive will to endure against great odds, his guilt because he survived, his love for a Navy doctor (Ed. note- thank Heaven the doctor is a woman), his acute awareness of Robert Falcon Scott, and finally his overpowering obsession with the mysterious, seemingly cunning, deadly white mountain."

Bert Crary tells me that he has finished a draft of his experiences in both the Arctic and the Antarctic. Now he is looking for a publisher. I wonder which book Big Bert actually wrote. Did he write the unexpurgated version consisting of those true-to-life tales of a scientist-at-large which he used to tell us all about at Little America V, or did he write a dull tome about seismic shots and glaciological pits? The first one could easily get itself banned in Boston and make Bert a wealthy man; the other one would sell only to libraries and next of kin.

Gil (Wilkes '56, Mirny '61) Dewart told me last year that he had finished a book on the Antarctic which was about to be published, but I haven't heard anything more about it.

Mo Morris, he who used to fly planes all over Antarctica, is a novelist looking for the right person (editor/publisher/agent). He has just finished a spy thriller, *The Alpha Bug*, and has another, *The Third Day*, underway. His Antarctic novel, *The Icemen*, is still looking for a publisher.

Charlie Murphy is my favorite Antarctic writer, and I love to see letters from him come into the Nerve Center. If Larry Gould is the Golden Throat of the Antarctic, which he is, then Charlie must be the Golden Pen. Several years ago he co-authored a book on the Windsors which was a best seller. Right now he is working on a book about Forrestal. Early in 1984 he visited London and then went to the Bahamas, and his letter of 9 March to- this corner had some advice which came too late in my life to be of benefit to me but which could be useful to many of you young Antarcticans. Speaking of his trip he wrote, "There I savored the flower-laden scents of the trade winds and the comforts of the Very Rich. Those of us who failed to accumulate a large fortune have been shortsighted, I must say. Isolated as I more or less am in the now wholly glaciated valley of Grafton - (Vermont), I've come to appreciate keenly the advantages accruing to money in large amounts."

**ADMIRAL DAVID MERRILL TYREE.** Admiral David Tyree died on 25 August at the Naval Hospital, Portsmouth, Virginia. Pneumonia was the immediate cause of death, but there had been serious complications over several months and he had been hospitalized for some time. The only burial service was a graveside one at the Naval Academy Cemetery on 29 August which was attended by his immediate family, several Classmates, wives and widows, and by a few others. Admiral Tyree, who was an Army brat, son of Major and Mrs. Amos Tyree, had graduated from old Central High School in Washington (DC) in 1921. He was appointed to the Naval Academy from the state of Kentucky. As a Midshipman he was a member of the varsity track team, and as an officer was a surface type who became one of the leading members of the "Gun Club," serving aboard several ships in World War II as a gunnery officer. He attended postgraduate school in Annapolis and later the University of Michigan where he was awarded an

M.S. degree in chemical engineering. He had several tours in the Bureau of Ordnance in Washington. Later he had command of NEW JERSEY, and was superintendent of the Naval Gun Factory. His last command before retirement in 1963 was that of the Naval Support Force during Operation Deep Freeze. A quiet, soft-spoken type of man, he was an extremely knowledgeable and effective naval officer who served his country, his Navy and his family well; an outstanding all-around person. His citations included two Legion of Merit awards, the Bronze Star Medal, and the Order of the Orange of Nassau with Sword from the government of the Netherlands. He is survived by his widow Eleanor, who is known as Sally, Box 117, Port Haywood, Virginia 23138; a son, Cdr. David M. Tyree Jr. USN (Ret.), of Islip, New York; a daughter, Mary Lee Deering of Middleburg, Virginia; eleven grandchildren and four great-grandchildren.

Admiral James Reedy, who succeeded Admiral Tyree as Commander of Operation Deep Freeze in 1962, wrote Bergy Bits:

My orders as ComTaskForce 43 (more generally known as OPERATION DEEPFREEZE) were unexpected, to say the least, as I had no particular qualification for the job. Actually I knew little of what the job entailed. Dave Tyree I knew only by his reputation as a sound battleship sailor of general competence, some eight years my senior. Our paths had never crossed, so I was faced with taking over a job unlike any other in the Navy from a man I didn't know. But Dave Tyree in his wisdom saw to it that there was a generous overlap during which I could familiarize myself with the methods necessary to administer this command so that, when I took over in the ceremony on a 57 degree below zero day at the South Pole in November, 1962, his quiet, skilful guidance had eliminated most of the pitfalls there might have been had I to undertake learning to direct effectively this unique operation on a trial and error basis.

One facet of DeepFreeze at that time was that it was, for good reasons, semi-diplomatic. Dave and Sally had made the necessary calls on the right people such as the Mayor of Christchurch, the Governor General, the Prime Minister, and, of course, our U.S. Ambassador in Wellington, and clued us on these procedures. They had made many personal friends in their three-year incumbency, and Jean and I inherited a coterie of wonderful New Zealanders. I became Admiral-in-Residence for a certain bit of beach on Lake Coleridge, called Admiral's Cove by Dave's close fishing friends. It was arranged that we would take over the house they had rented on Wairarapa Terrace in Christchurch, complete with the gardener, Old Percy, and friendly neighbors. Our contacts with the Tyrees after that period were too few but always pleasant. I felt I was his friend - and I knew he was mine. He leaves us with a lasting appreciation of one who was truly an officer and a gentleman.

**IKE, A MULTI-FACETED ANTARCTIC CHARACTER, DIES AT AGE 93.** Antarctica has always attracted adventurers looking for challenges and excitement, but I doubt if any of them could approach Isaac Schlossbach whose life ended peacefully in his sleep on August 20, 1984, in Wall Township, New Jersey. A Naval Academy graduate, Class of 1915, who went to the first submarine school in New London in 1916 and in 1921 switched to naval aviation, became an Antarctic in 1933 when he went south on the Second Byrd Antarctic Expedition. He went back on the U.S. Antarctic Service Expedition, 1939-41, and was second-in-command on the Ronne Antarctic Research Expedition, 1946-48. He was a summertime participant on three Deep Freezes, the last one at age 70 in 1960-61. He went south with the Australians during the 1955 austral summer. He also was "arcticized," first when he served as Navigator and Senior Watch Officer on the submarine NAUTILUS on the Wilkins/Hearst Nautilus

Expedition to the Arctic in 1931. The submarine's problems were innumerable, but it did go under the ice at 82°N, traveling 32 miles under the ice. Ike's military career ended in 1930 when he lost his left eye. According to his obituary in the Asbury Park Press on 24 August 1984, this came about "after being punched by a jealous suitor who thought he was moving in on a girl friend." Ike never did get married as he wanted to be free to leave on a moment's notice should an opportunity come along to do something exciting, rewarding, and worthwhile. He was involved in many crazy happenings, and according to an excellent booklet by Peggy Goodrich, *Ike's Travels* (published by the Township of Neptune, Neptune Municipal Complex, 25 Neptune Blvd., Neptune, New Jersey 07753), he came close to looping a submarine when trying to avoid hitting another ship. He fell out of an open cockpit plane after executing a flip, but hung onto a strap as he teetered precariously 8000 feet above the ground. Ike said, "I had learned that if your plane is upside down it will eventually learn to right itself if you don't do anything. It worked and I was fine. When I landed, the commander told me that the mayor of Norfolk (Virginia) had watched the whole thing." There appear to be multiple stories associated with every aspect of Ike's life, as nothing was simple and direct. Even getting into the Academy, he was a third alternate who made it because the first alternate failed the mental test, the second failed his physical. Only someone who was in World War II could understand how he and his left glass eye returned to active duty. One could falsely assume that they wanted his polar expertise, because he was sent to Labrador and Baffin Island to build airstrips and bases for planes being ferried to England. But someone must have squealed on him and told the War Department that he was a polar expert, because he was transferred to Guadalcanal where he served as commander of Henderson Field. He stayed there until he cracked up a plane in February 1944, busting all his ribs. He was then sent to Argentia, Newfoundland where he remained until V-E Day and his subsequent discharge. In 1968, at age 78, he received the Sam Bigony Memorial Award for being the oldest pilot at a flying meet. Ike had been living with pacemakers since 1972, and in recent years had been living in a nursing home. If any of you folks want to read about Ike, Peggy Goodrich's 84-page spiral "notebook" on him is a dandy. A large part of- it is in first person by Ike himself, and it makes very delightful, entertaining reading. It was written ten years before he died, so it amounts to a near autobiographical obituary, which has much to recommend it!

**BOB BLACK OF BLACK GLACIER DIES.** We are remiss in not having run an obituary on Robert Foster Black who died suddenly at age 65 on October 25, 1983. He had made numerous trips to the Antarctic Dry Valleys, commencing in 1959, ending in 1982, in which he undertook detailed studies of ice-wedge and sand-wedge polygons and their growth rates. He was internationally recognized in the field of permafrost studies. Bob started his professional career as a geologist at the New York State College of Forestry in 1941-42. The following year he joined the US Geological Survey, and served as chief of the Alaska Terrain and Permafrost Section from 1946 to 1949. From 1953 to 1956 he was Foreign Exchange Scientist with the Point Four Economic Assistance Program in Mexico. In 1956 he left the USGS to join the University of Wisconsin at Madison, and in 1970 he moved to New England to become Professor of Geology at the University of Connecticut. He was a prolific writer, having a publication list of 120, exclusive of abstracts and book reviews. And he was an experienced pilot. Bob is survived by his wife Hernalda (Nelda), their two children, John and Dean, and two granddaughters, Brandy and Sherry. (The above material was obtained from an obituary on Bob by A. Lincoln Washburn which appeared in *Arctic and Alpine Research*, Vol. 16, No. 2, 1984., pp. 265-269.)

**A CLASSIC PAIR.** This was the caption under a photo which appeared earlier this year in the Peninsula Times Tribune. The photo was of a Model A Ford with a cat curled up on its roof taking a siesta, and the license plate showed California

tags "AB FORD." Needless to say, the car belongs to Antarctic Art Ford, and it seems that the cat is also a Ford. Our illustrious treasurer, censor, typist, and maileress is very much allergic to cats, and it seemed that everywhere she visited in California last year there was one or more cats - one residence had seven! This all prompted me to comment that there must be an awful lot of cat houses in California.

**ICE IS A HOT ITEM IN NEW YORK.** The same newspaper, The Peninsula Times Tribune, had an article this summer with the above headline. It seems that the president of Group W Communications brought back some glacial ice from Greenland to give some friends as Christmas gifts. One of the recipients of the useless gift was a friend of a Bloomingdale buyer, who knew that their customers would buy anything outlandish, such as glacial ice. He arranged to get some, called it "glazonice," wrapped it in a dazzling silver package, and marketed it in 35-ounce bags for \$7 per. And you know what? The ice sold like hotcakes, with buyers lining up to buy it. Art Ford has suggested that NSF should get into selling Antarctic ice, as ships taking down supplies could carry ice coming back. He feels that this would result in a never-ending source of dollars to support Antarctic research, as it's a renewable resource of unlimited potential.

**WHAT A FAMILY!** Commander Roger Planchar, Belgian Navy (Ret) wrote a letter to my favorite Antarctic publication (Antarctic, the quarterly news bulletin of the New Zealand Antarctic Society), in which he pointed out that three generations of the de Gerlache family had now wintered over in Antarctica, and that this was probably a first. Baron Adrien de Gerlache was commander of the Belgian Antarctic Expedition in 1898-1900; his son, Baron Gaston de Gerlache was commander of the Belgian Antarctic Expedition in 1958-59; and now his son, Francois is at Brabant Island, having wintered over there this past winter. It gets pretty complicated when you try to summarize family involvements in Antarctica, but I think this one really is unique. Three generations of the Byrd family went to the Antarctic, but only the late Admiral wintered over. Three Ronnes have wintered over - father, son and daughter-in-law, our own Jackie, who was one of the first two American women to spend a winter on the ice. Two Camerons have wintered over, but there isn't a third Cameron as yet on the immediate horizon. Summertime combinations are innumerable, and I'm not sure I know even half of them. Certainly John and Kris Annexstad must be among the first father-daughter teams to work in isolation in the field. Both Cam Craddock and his son have worked in the Antarctic in the summer. I believe that Bucky Wilson had both a son and a daughter with him in the field. Tom and Davida Kellogg have a potential future Antarctic in their son, Griffith Taylor Kellogg. They certainly gave him the right name, now they just have to bring him up right.

**PAINTING OF AIRCRAFTS.** Robert Baron (24312 Ross Avenue, Dearborn, Michigan 48124), who officially turned the Ford Tri-Motor over to the Byrd Antarctic Expedition back in 1928, wants to hear from any of you who might be interested in purchasing art work produced by the late Charles Hubbell, one of America's foremost painters of aircrafts.

**ANNIVERSARY WALTZ WITH BERT CRARY ON 19 NOVEMBER.** November 19th will be the 25th anniversary of the first program ever held by the Antarctic Society, and it behooves us to celebrate it in some fashion. Actually the Society was formed shortly after the IGY, but we could find nothing in our files at the National Archives relative to any gathering prior to the presentation on November 19, 1959 (film "US Navy Supports the IGY in Antarctica"). There aren't too many of the cornerstones left, but one of them, Bert Crary, has been resurrected as our 25th Anniversary Celebrant. Normally we meet on Tuesday evenings, but due to the fact that it's Thanksgiving week, plus the fact that people tell us they swim on Tuesdays, take karate lessons on Tuesdays, go to American University classes on Tuesdays, want to see their kids on Tuesdays, we're giving them all a golden chance to come to our silver anniversary program on a Monday.

**WANT TO WIN \$1000?** The AAAS (American Association for the Advancement of Science) has opened its third annual science photography contest. Awards will be given "for photographs that stimulate curiosity about some aspect of the world we live in, that celebrate its beauty, or that help explain how it works." Three categories have been identified for entries: the physical world, the living world, and synthetic images. First place prize in each category is one thousand dollars. It costs only five dollars to enter the contest, which isn't a bad investment in case you win.

**FOR THOSE CONTEMPLATING DYING.** It seems like many of us are getting older through the time order aging process and some of us are even succumbing. Some, like Bud Waite, have been proclaiming (for the past ten years) to anyone who will listen that they are practically at the gate of St. Peter. If anyone is real serious about dying, and wants to be sure he/she gets just dues in an obituary in this column, you should sit right down and write your own obituary, and send it in here where it will be held in abeyance while you continue to enjoy the good life on earth. Then you'll be sure you won't be desecrated in death by this writer. And you can write yourself up as you yourself perceive your attributes and glories, and not as some outsider might have perceived you. It ensures lasting glory, no matter how insignificant or error-filled a life you may have lead. It amounts to a twenty-cent life insurance policy, because once you commit yourself to die, you will probably hang on forever. This is a GOOD DEAL!

**DO WHALES REALLY LOVE DOTTE LARSEN?** The headline "Are the Whales Safe from Their Friends?" fairly screamed above an article by Bayard Webster in the 19 June 1984 New York Times. It seems that "many scientists believe whale-watching has become part of a widespread and worsening ecological paradox: the very people who have exhibited so much interest in and compassion for whales may have themselves become a serious factor in the dangers that confront the great beasts. The whale-watchers often harass them, the scientists say, either intentionally or unintentionally, disrupting their feeding, mating, and sleeping habits, and on rare occasions even wounding them severely by running over them with boats and deadly propellers." So I say unto you, Lady Whale Spotteress Dotte Larsen, how would you like it if whales should interrupt your feeding, mating and sleeping, or ram your propeller? Meanwhile, Dorothy Spero, Director of the West Quoddy Marine Research Station in Lubec, Maine, says whale-watching exploits rather than helps whales. One of the problems is that the noise of boats' engines is close to the frequency which whales use to communicate with one another, and that the noises completely block out whale vocalizations. And it seems that low-flying airplanes can distort the animals' reception of underwater sounds.

**WE'RE GAMBLING ON YOUR BUYING.** This year we are offering, we hope, a few goodies in the form of (1) the 1985 USARP calendar, (2) the New Zealand Antarctic calendar, and (3) a new pictorial map of the McMurdo area by Dee Molenaar. All of these are being offered on a first-come, first-served basis, at a price of six dollars each. A couple of kickers are associated with the sale offer - the uncertainty of how many calendars we will get, and when we will have them in hand. We have already received one shipment of the New Zealand calendar, and hope the other order will arrive by the end of October. The USARP calendar usually gets here at a miserable time, mid-December, when everyone is tied up with holiday celebrations and buying late, unwanted gifts for distant, seldom-seen relatives. We expect to have enough of each calendar to satisfy our members, but we would like to reserve the right to substitute one for the other if we should run out of either calendar. We hope the pictorial map will be ready by the end of the year. However, with the above stipulations prevailing, here's our offer:

USARP Calendar	\$6 each
New Zealand Calendar	\$6 each
Molenaar Pictorial Map of McMurdo Area	\$6 each

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 84-85

November

No. 3

**Presidents:**

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-2
- Mr. Gordon D. Cartwright, 1962-3
- RADM David M. Tyree (Ret.) 1963-4
- Mr. George R. Toney, 1964-5
- Mr. Morton J. Rubin, 1965-6
- Dr. Albert P. Crary, 1966-8
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-1
- Dr. William J. L. Sladen, 1971-3
- Mr. Peter F. Bermel, 1973-5
- Dr. Kenneth J. Bertrand, 1975-7
- Mrs. Paul A. Siple, 1977-8
- Dr. Paul C. Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82
- Dr. Mort D. Turner, 1982-84
- Dr. Edward P. Todd, 1984-86

**Honorary Members:**

- Ambassador Paul C. Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard

**Memorial Lecturers:**

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.) 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Sir Peter M. Scott, 1971
- Dr. Frank T. Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980
- Dr. Robert L. Nichols, 1981
- Dr. Robert H. Rutford, 1982
- Mr. R. Tucker Scully, 1983
- Dr. Richard P. Goldthwait, 1984

*25th ANNIVERSARY LECTURE*

*Dr. Harry Wexler  
and  
The IGY Antarctic Program*

by

*Dr. Albert P. Crary  
Antarctican Emeritus*

on

*Monday, 19 November 1984*

*8 PM*

National Science Foundation  
18th and G Streets N.W.  
Room 540

Bert Crary, one of the planks in the Antarctic Society, having been with us since its inception back in 1959, is the most logical person to present the 25th Anniversary Lecture. Bert is one of the giants of polar science, and, indeed, was the very first scientist to have worked at both the North Pole and the South Pole. Dr. Harry Wexler, Chief Scientist for the Antarctic during the IGY, died much, much too early on 11 August 1962 at the age of 51. Harry was Director of Research for the old Weather Bureau, commencing back in 1946. However, his Antarctic involvement was particularly dear to his heart. In fact, Dr. Morris Neiburger, President of the American Meteorological Society, who wrote Harry's obituary in the October 1962 issue of BAMS (Bulletin of the AMS), said, "I think the research he enjoyed most was that carried out as Chief Scientist for the US Antarctic Program of the IGY." Harry visited Antarctica on three different occasions, and authored/coauthored 18 papers on polar research. In many ways Bert and Harry were an unlikely twosome, as Bert was a man for the field and Harry was a real diplomatic bureaucrat, but they made a great team. Don't miss this lecture!

*Light refreshments will be served.*

\* \* \* \* \*

How about a Society necktie?

See page 3.

1. If you move, PLEASE, PLEASE let us know your new address. We bulk-mail Newsletters, and they aren't forwarded. So unless you tell us, we just lose you. Then when you surface, we have to send you back copies of those Newsletters which is a pain.
2. Those of you who renewed for multiple years, bless you! Over 150 have done so, and that will make it a lot easier next year for Ruth and me who handle memberships, checks, and correspondence, as well as writing, editing, typing, and mailing these things. And those of you who haven't renewed (about 70), please renew, or tell us you don't love us anymore so we can remove your address labels.
3. Again, remember that this column is put together by one who sees and hears evil, and puts it all into print in this column. Anything which follows could be detrimental and suspect, and in no way is an official position of the Antarctic Society. All we do is try to make it enjoyable to some segment of our group without hurting any one individual.
4. If you have a story, a memory, or even an Antarctic fact or trivia, send it on into the "Nerve Center" (905 N. Jacksonville Street), as we are always looking for inputs from our members, particularly you Antarcticans who are out there in the field and doing real things.
5. New Zealand Antarctic calendars will be mailed out by mid-November. No word yet on USARP calendars. Molenaar's McMurdo area maps should be available in January - short delay.

**SOME MEMORIES OF HARRY WEXLER.** I think it's just great that Bert Cray will honor the late Harry Wexler at our next meeting. The IGY was so long ago now that many of our members (who were in diapers then) never had the opportunity to meet this giant in meteorology. Probably none of us knew him better than Bert, as Harry was the Chief Scientist for the Antarctic and Bert was Deputy Chief Scientist. Bert has done a lot of library researching lately on the IGY, and has read a lot of Harry's letters. It should be a very memorable lecture, one most worthy of being our 25th Anniversary Lecture, as November 19, 1959 was the date of the first formal Society function.

Harry Wexler was a very personable man, sometimes very convincing. He talked a fellow in his carpool, Bill Moreland, to go to Antarctica to assume the role as head of Weather Central at Little America V for 1957. Probably no one was more ill-fitted to go to Antarctica than Bill Moreland - he never stuck his nose outdoors from the time sun set until it came up again four months later. Bill ran Weather Central like they might have in the States, with only ten-minute breaks for coffee. Meeting this same guy back in the States, I was amazed to find out that old Moreland was actually a human being.

When we arrived at Little America V, there was an old Weather Bureau technician from 1956 by the name of Chet Twombly. Harry was Chief Scientist, or its equivalent, for the old Weather Bureau, so he amounted to being Chet's Commander-in-Chief. As we

walked off the helicopter and entered camp, there stood Twombly with his gear all packed, ready to go out on the same chopper. Harry greeted Chet and said, "I would like to have you check out Sam Wilson on the GMD." Chet picked up his gear, walked towards the chopper, saying over his shoulder to Harry, "It's been a long, hard winter, Harry, I sure don't want to miss that chopper back!" So sometimes he wasn't overly convincing!

Harry must have liked lectures, as we had lectures galore in Christchurch and on the way to the ice. I distinctly remember our last night in Christchurch before going to the ice. Harry was forever lecturing in the old Warner Hotel with that large American Geographical Society map of the continent. After about ten restless minutes sitting there trying to show token interest, I whispered to Blackie Bennett (now Dr. Hugh Bennett of Michigan State), "What in Heaven's name are we doing sitting in this lousy room listening to this stuff when we could be out on the streets?" We made a quick exit, and were shortly followed by nearly all the rest. Back in those days the popularity of Americans going to the ice was amazing, and certainly Harry's words weren't as pleasant as those from choice Kiwis. But Harry won out in the end, as he had a captive audience once we got aboard the CURTISS. I owe Harry a lot, as one of his lectures I attended was about Antarctic oceanography. I didn't know much about Antarctic oceanography, but I did know enough from a couple of courses to realize that Harry didn't know a thing about the subject of his lecture. I made up my mind that evening never to be scared again of talking before a group of people, because if Harry could get up there and say the things he said that day, I could also wing it.

Harry had a great personality for meeting people, for remembering names, and I think most of the IGY people got to know him. In appearance he didn't look very explorer-like, but more like your friendly dentist back home, as he carried a little surplus in girth. A bunch of visiting firemen from Congress came to Little America V in November 1957. Seeing the manifest of incoming members, I noticed that Representative Torbert MacDonald was aboard. Torby was a great football player at Harvard, was John F. Kennedy's best man when he got married, and later endeared himself to all football fans by passing legislation on the Hill which would forbid home football teams (pros) from blacking out TV games which were sold out 48 hours in advance. As their plane came in, I heard over the radio that Yale had beaten Harvard by some ridiculous score like 57 to 0. So while the camp ate, I painted a sign with that score and nailed it over our not-so-elaborate front door! Later I broke out a football and got Torby to come out and toss it around. Harry was there, and I asked the two of them to pose by the sign, as Harry was a good old boy from Massachusetts. Afterwards Harry said, "Thank you, Paul," as he too enjoyed having his picture taken with Torby. Unfortunately, both are long gone now.

I hope the IGY contingent comes out to hear old Bert, and I hope all the young folks come, too, as Harry was a most unique individual, and it should be a great night!

**HOW DO YOU FEEL ABOUT A SOCIETY ANTARCTIC NECKTIE?** It is my belief that we should have an Antarctic tie like other Antarctic groups who have special ties which they flaunt on special occasions. Before our women members complain about male Chauvinism, let me remind you that back in the 60s the Society had an Antarctic scarf specially designed for the Society by Emilio Pucci which was strictly a feminine accessory. We have looked into the cost of having a tie designed and produced by a well-known local designer, Frankie Welch. She does really fine work, and her charges are not exorbitant in today's inflated market. My thoughts are that the Society could foot the total cost of the artist's design, plus the use of two colors on a base color. If the Society paid for basic charges, we could offer the tie at the cost of an average dinner at an average restaurant, somewhere around \$15, which would be the

bone price cost. If you think a necktie is a good idea, or a bum idea, why don't you write Bergy Bits at the Nerve Center (905 N. Jacksonville St., Arlington, VA 22205)? A strong write-in vote, either way, will help the Board make their decision as to whether they want to go forward with it or drop it. Please let us know your thoughts on this.

**WHAT A GREAT LECTURE SERIES! FANTASTIC!** In our Society Newsletter for May 1980 we published a list of all the lectures which had been presented at our meetings. In this issue we are printing the list of lecturers and programs for the past six years. We're playing politics here because we want the Silent Majority of our Washington-based members who never come to Society meetings to see just what they have been missing. The drop-off in attendance this year has been alarming, and I am deeply concerned about the future of our lecture series. This is particularly so in view of the fact that our out-of-town membership is growing like crazy. Just look at the great Antarctic names which have been lecturers in the past six years. They run the gamut from real O.A.E.'s like Larry Gould, Dick Black, and Bert Crary, to pseudo-O.A.E.'s like Bob Nichols and Bob Rutford, to noted women scientists like the late Mary Alice McWhinnie and Gisela Dreschhoff, to foreign representatives like Charles Swithinbank and Bob Thomson, to noted historians like Peter Anderson and Herman Viola, to hawk-eyed collector scientists like Bill Cassidy and his meteorites and Bill Zinsmeister and his fossils, to foreign expeditioners like Hugh DeWitt and Tom Wright, to sea ice experts like Jay Zwally and Steve Ackley, to let's-keep-at-it-until-we-get-it-done-right glaciologists like Charlie Bentley and George Denton, to poor man's sailors like Admiral Mike Benkert, to Erebus volcano lovers like Phil Kyle, to old circumpolarizing physiologists like Muckluck Milan, to biomedicine men like Chester Pierce, to whalers like William Evans, to Sherlock Holmes-type inspectors like Al Chapman, to tourists like George Llano, to polar bureaucrats like Ed Todd, to offshore polar oilers like Geoffrey Larminie, to science writers/editors like Walter Sullivan of The New York Times, to Operation Highjumpers like Lisle Rose, to nice guy glacial geologists like Dick Goldthwait, to Gondwanaleers like Jim Collinson, to environmental lawyers like Jim Barnes, to interior mountain explorers/scientists like Ed Stump, and last, but by no means least, to marine biologists like Neil Sullivan. What an array of famous lecturers! They covered the whole waterfront, many on the very cutting edge of science. I heard every one of these lecturers, and there are only two I wouldn't want to hear again tomorrow. I don't care what your Antarctic connection is, there have to be several lectures a year of interest to every Washington member. I asked the soft-spoken, kind Chester Pierce what I had to do to get you Washingtonians out. It has reached the point where I'm almost considering being nice to members. In the meantime, here's what a lot of you are missing, here's what some of us are enjoying immensely. Let's really back our lectures, PLEASE!

#### 1978-79

October 26, 1978	Dr. Mary Alice McWhinnie. "Antarctica, A Changing Scene."
December 5, 1978	Rear Admiral Richard B. Black (USN Ret). "Antarctica Revisited."
January 31, 1979	Dr. H. Jay Zwally. "Satellite Observations of Antarctic Sea Ice."
March 22, 1979	Dr. Chester Pierce. "A Physician's View of Antarctica."
April 19, 1979	Fifteenth Memorial Lecture. Dr. Laurence McKinley Gould. "My 50 Years of Antarctic Exploration and Research."

#### 1979-80

October 2, 1979	Mr. Robert B. Thomson. "New Zealand Antarctic Research Programs."
November 27, 1979	50th Anniversary Commemorative Lecture. Mr. Peter J. Anderson. "Admiral Byrd and Antarctic Aviation."
January 29, 1980	Rear Admiral William M. Benkert (USCG Ret). "Antarctica: A Sailor's Point of View."

1979-80 (cont.)

- March 11, 1980 Dr. Herman J. Viola. "Wilkes Expedition, 1838-1842 - First Round-the-World Naval Expedition."  
May 1, 1980 Sixteenth Memorial Lecture. Dr. Charles R. Bentley. "Collapse of the West Antarctic Ice Sheet, Fact or Fiction?"  
June 5, 1980 Dr. George A. Llano. "Tourism in Antarctica with the WORLD DISCOVERER."

1980-81

- October 21, 1980 Dr. James W. Collinson. "Gondwana Geology in Antarctica and Tasmania."  
December 2, 1980 Dr. Thomas Wright. "GANOVEX-79, the West German Antarctic Research Expedition to Northern Victoria Land, Antarctica."  
January 27, 1981 Dr. Hugh H. DeWitt. "The French Oceanographic Expedition to Bouvet Island and the Ob and Lena Banks: A Biologist's Perspective."  
March 3, 1981 Dr. Lisle A. Rose. "Antarctica From the Bottom Up."  
May 13, 1981 Seventeenth Memorial Lecture. Dr. Robert L. Nichols. "Captain Robert Falcon Scott and His Last Expedition."

1981-82

- September 10, 1981 Dr. Frederick A. Milan. "Recent Studies on the Human Biology of Circumpolar People."  
November 12, 1981 Dr. Gisela Dreschhoff. "A Tale of Two Projects: Radioactivity and Solar Activity."  
January 19, 1982 Dr. Stephen Ackley. "Antarctic Sea Ice: Some Results from the Joint US-USSR Weddell Sea Experiment, 1981."  
February 16, 1982 Dr. William A. Cassidy. "Planetology on the Polar Plateau/Outer Space Research in the Antarctic."  
April 1, 1982 Eighteenth Memorial Lecture. Dr. Robert H. Rutford. "Antarctica in the National and International Context."  
May 1, 1982 Dr. Edward P. Todd. "The United States Research Program in Antarctica."

1982-83

- August 31, 1982 Dr. Charles Swithinbank. "Nationalism and Internationalism in the Antarctic: One Man's Perspective - 1949-82."  
November 11, 1982 25th Anniversary of the IGY. Walter S. Sullivan. "The International Geophysical Year: Antarctica Rediscovered."  
January 18, 1983 Walter Sullivan's Videotape Interview with Dr. Laurence McKinley Gould.  
March 24, 1983 Dr. William Zinsmeister. "Discovery of Land Mammals in Antarctica: 1982 Seymour Island Expedition."  
April 21, 1983 Mr. F. Geoffrey Larminie. "Offshore Oil Development in Polar Regions: Applicability of Arctic Experience to the Antarctic."

1983-84

- September 14, 1983 Dr. George H. Denton. "Antarctica and Its Relation to the Global Ice Age."  
October 12, 1983 Nineteenth Memorial Lecture. Mr. R. Tucker Scully. "Future of the Antarctic Treaty System."  
November 16, 1983 Dr. Albert S. Chapman. "1983 Antarctic Treaty Observer Mission." (Poulter Chapter meeting, Stanford).  
December 8, 1983 Dr. Charles R. Bentley. "The Future of the West Antarctic Ice Sheet."  
January 24, 1984 Mr. James N. Barnes. "Full Protection for the Antarctic - A Viable Goal?"

1983-84 (cont.)

March 20, 1984 Dr. William E. Evans. "Whale Watching in the Antarctic.  
May 18, 1984 Twentieth Memorial Lecture. Dr. Richard P. Goldthwait.  
"50 Years Underneath Glaciers."

1984-85

September 12, 1984 Dr. Edmund Stump. "Exploration of the Queen Maud Mountains:  
The Reach to the Southernmost Rocks."  
October 18, 1984 Dr. Cornelius W. Sullivan. "Preliminary Results of the Antarctic  
Marine Ecosystem Research at the Ice Edge Zone."  
November 19, 1984 25th Anniversary of the Antarctic Society. Dr. Albert P. Crary.  
"Dr. Harry Wexler and the IGY Antarctic Program."

COMPLETE LISTING OF SOCIETY LECTURERS, 1959-1984. (Number of lectures in parens)

Abbot, Adm. James L. (2)	Goldthwait, Richard P.	Robin, Gordon deQ.
Ackley, Stephen	Gould, Laurence McKinley (3)	Rodenhuis, David R.
Anderson, Duwayne M.	Graham, Robert H.	Rose, Lisle A.
Anderson, Peter J.	Guthridge, Guy G.	Rubin, Morton J.
Armstrong, Fred G.	Hollister, Charles	Rutford, Robert H. (2)
Bakutis, Adm. Fred E.	Jones, Thomas O. (2)	Schirmacher, Richard H.
Balchen, Bernt	Kelly, Thomas F.	Scott, Sir Peter M.
Barnes, James N.	Laking, Hon. George	Scully, R. Tucker
Barretta, Peter	Larminie, F. Geoffrey	Sieg, John
Bastin, Francois	Lenton, Ralph H. Levy,	Silverstein, Samuel C.
Benkert, Adm. William M.	Maurice Lewis, Harold	Sladen, William J.L. (2)
Benoit, Robert E.	Llano, George A. (2)	Smith, Lewis O.
Bentley, Charles R. (2)	Lock, J. Michael	Smith, Philip M. (2)
Bertrand, Kenneth J. (3)	MacDonald, Edwin A.	Southard, Rupert B.
Black, Adm. Richard B. (3)	MacDonald, William R.	Spaulding, Raymond
Boxell, Walter L.	Mahncke, Frank C.	Stuhlinger, Ernest
Burrill, Meredith F.	Mallison, William T., Jr.	Stump, Edward
Cameron, Richard L.	Mason, Robert	Sullivan, Cornelius W.
Cassidy, William A.	McVay, Scott	Sullivan, Walter S., Jr.
Chapman, Albert S.	McWhinnie, Mary Alice	Swithinbank, Charles W.
Collinson, James W.	Meyers, N. Marshall	Thomson, Robert B. (2)
Craddock, J. Campbell	Milan, Frederick A.	Todd, Edward P.
Crary, Albert P. (4)	Mitchell, Jo Murray	Turner, Mort D.
Dalziel, Ian W.D.	Murphy, Charles J.V.	Tyree, Adm. David M. (2)
Daniels, Ambass. Paul C. (2)	Nichols, Robert L.	Viola, Herman J.
Dater, Henry Mo (2)	Panzarini, Adm. Rodolfo N.M.	Volbrecht, Erv
Davies, Frank T.	Peterson, Roger Tory	Waite, Amory H., Jr. (2)
Davis, T. Neil	Pierce, Chester	Watson, George E. III
Dawson, Merle R.	Pilon, Jerome R.	Welch, Adm. David F.
Denton, George H. (2)	Pomerantz, Martin A.	Weller, Gunter
DeWitt, Hugh H.	Pranke, James B.	Wexler, Harry (2)
Doumani, George A.	Quam, Louis O.	Williams, Justin W.
Dreschhoff, Gisela	Radspinner, Frank H.	Wright, Sir Charles S.
Duff, Roger	Ray, Carleton	Wright, Thomas
Eklund, Carl R.	Reedy, Adm. James R. (2)	Wulf, Norman
Elliot, David H.	Regula, R.	Zinsmeister, William
Evans, William E.		Zwally, H <sub>0</sub> Jay
Fletcher, Joseph O.		
Francis, Harry S., Jr.		
Friis, Herman R. (2)		

**IMAGINING ANTARCTICA** (Rachel Weiss). Rachel is currently in the process of organizing a major, international exhibition of art work pertaining to Antarctica. Entitled *Imagining Antarctica: The Artist's Perspective*, this exhibition will include works of artists from all of the countries involved in Antarctic research, and will travel to those countries between 1986 and 1991.

The purpose of the exhibition is to help develop further our understanding of the Antarctic, both as a region unique unto itself and as a crucial part of our world. Secondly, but no less important, is the aim of celebrating and promoting the international cooperation that is so fundamental to our efforts in the region. Through the special ability of the arts to express the perceptions, hopes and dreams of societies, the exhibition will contribute to the ongoing effort to decipher this mysterious and fascinating continent.

The exhibition will be comprised primarily of new works, created especially for this project. Nonetheless, [she is] also hoping to locate fine examples of older Antarctic art work, both in order to provide some context for the newer works and to illustrate the point that artists' interest in the Antarctic has been continuous and vital throughout the history of exploration there.

.... Owners of examples of Antarctic art work [should] contact [her] if they are interested in the possibility of its being exhibited. [She] would also welcome any inquiries into the project, and would love to hear from anyone who is interested in it. (Her address is 108 Winthrop Road, Brookline, Massachusetts 02146.)

**ANTARCTICA AND THE UNITED NATIONS** (R. Tucker Scully). Last year, the Government of Malaysia took the initiative to propose consideration of Antarctica by the United Nations General Assembly. Though Malaysia's rationale for the initiative was not clear, Malaysian representatives indicated that that General Assembly should examine whether the Antarctic Treaty might require modification or replacement.

As a result of informal discussion at last fall's General Assembly, a consensus resolution was adopted calling for a study of Antarctica by the United Nations Secretary General. The resolution was neutrally worded and required that the study be "comprehensive, factual and objective." In order to prepare the study, the Secretary General has requested views and information on Antarctica from UN members and he is to report on the study to the General Assembly this fall. As of October 26 the study has not yet been circulated and the Antarctic item is scheduled for consideration during the final week of November.

The United States - like the other fifteen Antarctic Treaty Consultative Parties - is concerned at the Malaysian initiative; because it rests on a presumption that there are basic defects in the Antarctic Treaty and Antarctic Treaty system. In the U.S. view, the Treaty represents an outstanding and successful example of the implementation of the principles and purposes of the UN Charter. The Treaty system is an open one - capable of meeting new circumstance and absorbing new interests -and has made a major contribution to international peace and security. For those reasons, the U.S. and the other consultative parties oppose any action in the United Nations or elsewhere aimed at modification of the basic provisions or replacement of the Antarctic Treaty. This will be the basis of their approach to upcoming discussion of Antarctica on the UN General Assembly.

**KELLY WELCH GOES INTO ORBIT.** Dr. David F. Welch, known to most Antarcticans as Rear Admiral Kelly Welch, Commander Task Force 43 - Operation Deep Freeze, 1969-71, has what we believe is a most unusual Antarctic first - the first Antarctic who has a feature named for him in Antarctica (Welch Mountains -highest peak 3015 meters, 70°57'S, 63°30'W) AND a minor planet! This honor was recently confirmed, and I do believe that Kelly is now accepting bids from anyone who might want to buy a house lot, all of which have excellent astronomical views. Be sure to send cash or certified check with your bids to either Kelly or to Bergy Bits. - - His planet was discovered on 18 October 1963 by the Goethe Link Observatory, Indiana University. The Minor Planet Center at the Smithsonian Astrophysical Observatory in Cambridge Bulletin 9079, dated 10 September 1984, describes, under New Names of Minor Planets, (2405) Welch = 1963 UF. It reads, "Named in honor of David F. ("Kelly") Welch, AURA [Association of Universities for Research in Astronomy] Corporate Staff Executive from 1978 to 1983. He upgraded AURA administrative and operational procedures and brought modern technology into the corporate office. He also played a major role in the preparation of' the successful proposal to NASA for AURA to establish and operate the Space Telescope Science Institute. Following (2404) Antarctica, this planet also acknowledges Welch's earlier career in the U.S. Navy, which culminated in his service as commander of the Naval Support Force for the scientific bases in Antarctica during 1969-71. Name proposed by F. K. Edmondson." So Planet Welch is 2405 and Planet Antarctica is 2404, which pleases Kelly. To the best of our knowledge, he is going to rest on his laurels and not try for a submarine ridge or mount to complete the cycle. Actually Kelly is editing a series of family Civil War letters and hopes to get them published. He writes that his editing, "plus a motor home and a pregnant mare" are keeping him fully occupied at 5022 East Camino Alisa in Tucson, Arizona 85718. If he's not there, look for him between Scorpio and Libra, and Ophiuchus and Sagittarius, as he might be up there getting some good Polaroid shots for you prospective buyers.

**EREBUS IS ILL AT EASE.** According to an NSF news release of October 11th, Mt. Erebus rests uneasily of late as "several major-and unexpected-eruptions have jolted Antarctica...One of the incidents threw incandescent lava as high as 2,000 feet above the crater rim...Also sighted were mushroom-cloud plumes and a black ash covering the summit's northwest slopes." However, cooler heads, such as Dr. Phil Kyleb, are not overly concerned as Kyle said, "We know from looking at older rocks on the mountain that Erebus has not had a history of violent eruptions. It is reasonable to assume that this situation will continue." Mt. Erebus, a stately 12,459 feet high, is the largest of Antarctica's five active volcanos, and its crater harbors one of the two active lava lakes in the world. Kyle and his associates from the U.S., Japan, and New Zealand will be revisiting Mt. Erebus during this austral summer season, and they "expect to see some lava flows down the mountain, and they suspect there may be a geyser at one eruption site. They plan to collect and chemically analyze magna and gas samples from the latest ejections" to find out just what old Erebus has been up to and has in mind for the future. You know, I think Kyle may be able to "out year" Charlie Bentley in the long run, as all Erebus has to do to attract eternal attention is to periodically get heated up and blow its top. That's easy for any self-respecting active volcano. Besides it's so close to McMurdo Station that it's like going down to the corner drug store, and Mt. Erebus is not unsurmountable.

**A PREDICTABLE SOAP OPERA.** It wouldn't have taken much of a genius to know that when four men and two women went to the Antarctic on a yacht with full intentions of wintering over in the ice, sex would raise its ugly head. It has been pretty well publicized - see the National Geographic for November 1984 and its article "Icebound in Antarctica" by David Lewis, and the Washington Post for November 2,

1984 with a long article in the Style Section by Susan Morse under the headline "Poles Apart in the Antarctic," I found it all rather amusing, and wondered why in heaven's name Guy Guthridge of NSF didn't plead "No comment" when the Post's journalist contacted him. But as long as Guy commented, why can't Bergy Bits? First, there was this 64-year-old-buck of a leader who had a relatively young woman anthropologist of 31 as his deputy, and she was described by the leader as being his "boon companion." Then there was a 29-year old Danish gamekeeper and a 24-year old British woman geographer, and quite naturally, these Europeans became very close friends. That left a 57-year old Aussie radio operator/engineer and a 25-year old Aussie zoologist to look at one another. Supposedly "neither Miller (the zoologist) or Linton-Smith (radio operator) met the expedition's screening psychologist more than briefly," If this is true, the expedition leader is at fault for not taking the time to make certain that all of his final selection - there were 100 applicants - were checked out thoroughly, both physically and psychologically. Each had come up with \$3000 for the opportunity to participate in the expedition, so presumably all really wanted to go. One of the responsibilities of the anthropologist was to do a "human-dynamics study - which used questionnaires, individual journals, official logs, and taped interviews." Anyone doing that kind of a study would be about as popular as a leopard seal, especially when you're the boss's woman which automatically qualifies you as being his covert agent, his eyes and ears. One problem was that the two Aussies who had no female companion saw little need for frequent baths, which seems to me to be very upstanding where water was a priority item. But the other guys evidently had women to wash their backs, and consequently took baths twice a week. Extravagant and wasteful! Soon they noticed that the bathless two smelled different, and got after them to take baths. From having been in prison camp in World War II, I can personally assure you that no one dies from not taking a shower or bath, although you may smell that way. So in reality I would say it was much ado about nothing. But the young Aussie didn't survive the whole year, and finally was helicoptered out for being "abusive." What evidently happened was that the 31-year old woman anthropologist told the 25-year old male zoologist that the boss said the sea ice wasn't safe to cross, and he took exception to the order. I've known a few young Aussies, and I think it's remarkable that she lived to tell about this guy being abusive. Some I've known would have probably stuffed her down a crack and kept on going. But he got shipped out. Those of you who are Antarctic buffs will probably see a corollary in Antarctic history where another man was relieved of his duty on a small private expedition. However, the worst part of the whole mess is that NASA is paying some sociologist to look into this fiasco to see if there's a message there for them in selecting future mixed (sex) crews in space. As a taxpayer, I resent NASA spending a single penny studying what may or may not have happened on this expedition. Actually it was not an expedition but a misguided, misdirected adventure. But unfortunately Antarctic adventures, such as the Frozen Sea Expedition and Transglobe Expedition, are part of the total Antarctic scene unless all nations sign some sort of a pact that only certified scientific programs will be supported.

**SMITHSONIAN GOES TO ANTARCTICA.** There have been very good articles in the October and November issues of the Smithsonian magazine on Antarctica by Michael Parfit, who is also writing a book on the continent which will be published sometime next year. Both articles ("The Last Continent" in the October issue, and "Nations are Debating the Future of the Antarctic's Frozen Assets" in the November issue) are well worth reading, and the accompanying pictures are truly beautiful, Parfit covers the whole waterfront with a virtual potpourri of facts and information about Antarctica, but it seems to me that his real interests are in the Antarctic Treaty.

**ANTARCTIC BOOKS.** Some of you have written in asking how to buy the new edition of Larry Gould's *Cold*, and thanks to Tony Meunier we have the vital information. It can be bought for \$19.95 PLUS \$2.50 for handling charges from the Carleton Book Store, Carleton College, Northfield, MN 55057. If you want to call, it's 507-663-4150, and they will accept both Visa and MasterCard. And for you, Bob de Violini, shame on you for not knowing about Carleton College. It always was one of the finest small colleges in this country, and under the presidency of our very own Larry Gould, who did some fine tuning, it became a most outstanding college, small or large. And one of our founding fathers, the late Carl Eklund, was a distinguished alumnus of Carleton.

Here's a brand new book which we hope to review in our next Newsletter - *The Norwegian with Scott: Tryggve Gran's Antarctic Diary, 1910-1913*. It's edited by Geoffrey Hattersley-Smith (a good old Maudheim boy). Ellen-Johannes McGhie did the translation from Norwegian. It totals 258 pages, is available now as a hardback book from Bernan Associates, 9730-E George Palmer Highway, Lanham, MD 20706. It is selling for \$17.95, prepayment required.

This is not exactly a new book, as it has been out two years, but we recently obtained a copy of Sir Vivian (Bunny) Fuchs' *Of Ice and Men, The Story of the British Antarctic Survey, 1943-73*, published by Anthony Nelson (P.O. Box 9, Oswestry, Shropshire SY11 1BY, England). Cost in English pounds, 13.95. I'm sure you don't have to be English to buy a copy, nor do you have to be English to appreciate it - but it might help to have a sense of humor. It has a beautiful, very personal dedication, "To the taxpayers who made it all possible." Tremendous, fantastic! There are many, many pictures - 77 in black and white, 24 in color, and there are ten maps. From what I have read about this book, published in 1982, it is one of the real good ones. I'm sure happy I have a copy,

**POLAR DUKE and the BOWDOIN.** There's a new ship on the high seas, or will be shortly, as NSF has chartered the POLAR DUKE for three to five years beginning in January 1985. The Maine crafted wooden ship HERO has been retired, and in its place will come this 219 feet long, 43 feet beamed, 615 ton, ice-strengthened research ship. It will have a crew of 14 who can support 26 scientists while the ship ranges up to 25,000 miles. It will be powered by two diesel engines, each 2250 bhp. It has four laboratories, totaling 900 square feet. It has a double hull with an ice classification (1AA) like an icebreaker, but can only work in moderate pack ice because of its low power (in comparison to icebreakers). It has a helicopter deck, too. For those of you who live in the New York area, she'll be tied up at the end of the 39th Street Pier, 26-28 November, for final installation of equipment. Interested persons can go aboard and see their tax dollars prior to the ship's departure for the Antarctic Peninsula area for the austral summer season.

Meanwhile, the rebuilt BOWDOIN was launched in Brunswick, Maine on 26 October 1984, and I'm sorry to say that I missed seeing Admiral Donald B. MacMillan's old schooner hit the ways by one day when I was down east in Maine. The BOWDOIN is 88 feet long, is 63 years old, and MacMillan commanded it for 33 years - even taking her north when he was nearly 80! Lady Mac (Miriam, the Admiral's widow) was there for the re-dedication. But BOWDOIN's polar days are probably over, as she's going to be sailing out of Boston on summer educational cruises, which, I suppose, is a better fate than death.

**FUTURE US POLAR ICEBREAKERS** (LCDR Lawson Brigham, USCG). In July 1984 an inter-agency study of the nation's polar icebreaking requirements through the end of the century was completed. Study members from NSF, US Coast Guard, Navy, MARAD (Maritime Administration), NOAA, DOT and OMB worked for fourteen months to define the future Antarctic and Arctic needs for US polar ice-

breakers. Several of the principal findings are:

- \* The polar icebreaker fleet is essential to the national interest.
- \* The US Coast Guard should operate the nation's icebreaker fleet and fund new acquisitions.
- \* Work should commence immediately on the design of a new polar icebreaker.
- \* New replacement ships (for the WIND class icebreakers) will have an icebreaking capability between the WIND and POLAR classes.
- \* The present fleet and future ships require enhanced scientific capability for work in the Antarctic and Arctic.

Since August a working group of the Icebreaker User Council (members include NSF, Navy, US Coast Guard, and MARAD) have been studying the scientific requirements for new polar icebreakers. Survey forms were sent to over a hundred prominent US Antarctic and Arctic scientists. A preliminary analysis of the information shows a need for new polar icebreakers to embark a field party of 30 scientists. Other significant capabilities include: launching moored instruments, conducting hydrographic casts, storing cold samples, computing scientific data, and providing modern wet and dry laboratories. A final workshop is being planned for the fall meeting of the American Geophysical Union in San Francisco this December. The planning, designing and acquisition processes for new US polar icebreakers will continue during the remainder of the 1980s.

**THE ANTARCTICA PROJECT** (624 9th Street NW, Washington, DC 20001, 202-737-3600). The Antarctica Project has been mentioned here before, but their existence merits more ink. This is practically a one-man operation, that of environmental lawyer Jim Barnes. And you can't help but be deeply impressed by his productivity. If all of Washington worked like Barnes, they could fire 85% of the government workers and they would still get the job done. Jim works in an obscure corridor deep in the bowels of the Young Women's Christian Association building in Washington. This calendar year the Project has been instrumental in publishing six Antarctica Briefing papers (two on Status of Antarctic Minerals Negotiations, two on An Antarctic Environmental Protection Agency, one on A Non-Commercial Approach to Antarctic Minerals, and one on Protected Areas in the Antarctic). The Antarctica Project has some sort of an alliance with Greenpeace International and they helped to prepare a very comprehensive Briefing Document, The Future of Antarctic: Background for the Second UN Debate, in October 1984 which was distributed to all UN delegates. It's available through The Antarctica Project for \$5. And there is an alliance with Friends of the Earth (and others) in publishing periodically - nine in 1984 - a tabloid named ECO which concerns itself with Antarctic environmental issues. For those of you who are interested in preserving Antarctica in its pristine state, or can't find enough to read about Antarctica, you might want to write out a check to The Antarctica Project and send it off to Jim. There are no memberships per se, but they are happy to take whatever you send in. And I can assure you that your money won't be going for any posh furniture or decorations, as he really is typing in a back corridor.

**THE GRANDEST BOONDOGGLE OF ALL BOONDOGGLES.** Once upon a distant past when I was an impressionable collegian I used to look forlornly and with great envy at those figures which showed tracks of oceanographic cruises. I thought that physical oceanographers had to be the most brilliant people in the whole universe, as the ATLANTIS would always be cruising in the Mediterranean in summer and in the Caribbean in winter. But oceanographers are pikers compared to Antarctic Treaty discussants who are going - seventy invitees - to the top of the Beardmore Glacier

in January to have a workshop on the Antarctic Treaty System. I wonder what great mastermind came up with this brilliant idea? It had to be someone with the intellect of the planner of the Boston Brink robbery or the great train heist in England. No mortal scientist would have had the audacity or the courage to propose that they meet in the middle of Captain Scott's ill-fated glacier. I thought for a long time why anyone would go to some place where even penguins and skuas do not trod, and I came up with three unplausible reasons: (1) they wanted to work long days, and would have continuous sunlight throughout their stay on the Beardmore; (2) they wanted to get away from interrupting phone calls; and (3) they wanted some nice and peaceful spot where they could rest up after too much celebrating over the Christmas and New Year holiday season. Probably the last one is the only valid one. Now if I were going to plan such a meeting, I'd pick a nice Greek island where you wouldn't be blinded by all that snow and ice, and you could sip ouzo as the sun dipped into the Aegean Sea at the end of hard decision-making days free from confusing environmental factors. But I think we'll have to hand it to the imaginative and daring genius who came up with the Beardmore idea, as it does establish for all future workshops/symposia a new ultra high baseline for boondoggles. Our humblest congratulations, and may their planes be far more successful than Siberian ponies!

**MAIL BAG.** Old *Bob Nichols* wrote, "Please treat me with great respect as in June I became an octogenarian." I'm sorry, Bob, that's not quite old enough; we have many who are a lot older, so wait your turn. Besides, you moved from Massachusetts to Florida and I haven't forgiven you for that mistake . . . . Yet the way letters have poured in about the late *Ike Schlossbach*, he has to have been one of Antarctica's greatest characters ever. Don McLean (Carmel, California) said that Ike liked to tell about the time he was coaching a Navy football team in Hawaii when a free-for-all broke out and Admiral Nimitz commanded the band play the National Anthem to stop the fight. McLean also wrote that Ike "would often make great fun of looking for his misplaced glass eye, and/or false teeth: a chewed cigar in his mouth, fully bearded, with an unbelievable mixture of clothing, he made an awesome apparition." . . . . That *Model A Ford* who works out of the USGS office in Menlo Park wrote how the late Admiral Tyree had invited him to dine at the Admiral's mess in his quarters back in 1961 when Art was just a lowly graduate student. He added, "he was very much interested in the science program and would commonly invite a few USARPs for dinner to find out firsthand what they were doing." . . . . *Dick (BAE II and US Antarctic Service Expedition) Black* recently fell down half a dozen steps and broke two ribs, cut his scalp, and bruised himself while dining at the City Tavern Club in Washington. Officially the retired Rear Admiral is 82, but it's sort of a floating 82 as the Poet Laureate of the Antarctic says there are days when he feels a hundred, other days when he feels thirty-nine and holding . . . . My favorite whaler *Dotte Larsen* writes, "I don't care if the whales love me or not." That's a funny statement by a woman who spends more time with whales than she does with her husband. Tomorrow (November 7th) Dotte is off again, this time to Patagonia to see the Southern Right whales on Peninsula Valdez. Dotte is still going through withdrawal pains after the LINDBLAD EXPLORER was sold, and it looks like those pains may become chronic with the ship being altered. . . . . Good old *Bud (BAE II) Waits*, age 83, ended chemotherapy treatment early in October. He spent 17 weeks in bed following bladder cancer surgery. He's having trouble keeping food down. Bud, in my mind, is the unsung Antarctic scientific hero, as his pioneering research on radio echo sounding led the way for valid airborne measurements of Antarctica's snow and ice. Don't let the Grim Reaper take you, Bud. Fight like hell. Our prayers are with you.

**DELINQUENTS:** This is your last chance to pay up or you're OUT!

PLEASE! Remember to send us your comments about a Society necktie!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 84-85

January

No. 4

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.), 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott MeVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984

*Human Dynamics of a Small Independent  
Antarctic Research Expedition*

by

Mimi George

Department of Anthropology

University of Virginia

and

Second-in-Command

Frozen Sea Expedition 1982-84

PLUS

Dr. David Lewis

President, Oceanic Research Foundation, Sydney  
Commander-Leader, Frozen Sea Expedition

on

*Friday, January 25, 1985*

8 PM

National Science Foundation

18th and G Streets N.W.

Washington, D.C.

Room 540

Mimi George, graduate student in the Department of Anthropology at the University of Virginia, will speak to us on the human dynamics of a small, mixed-sex, privately funded Antarctic expedition. She is particularly well qualified to speak on this subject, as not only was she on the expedition but she is a professional anthropologist doing her dissertation on this subject. Dr. Lewis will accompany Mimi to the meeting where they hope to meet many Antarcticans. We are looking forward to a lively question and answer period in which Dr. Lewis has agreed to participate. Mimi will be the third woman to ever address our Society and we want to fill the room to capacity. (See page 2)

*Light refreshments will be served.*

Bergy Bits remains the highly prejudiced, non-official, wordy collection of items of interest to the writer, and hopefully of interest to some factions within our Society. Please read the paragraph about a Society tie, as we want your opinions on the most appropriate design. This tie should be one we all can live with and be proud of, and ideas/suggestions are ENCOURAGED!

**MIMI GEORGE - DAVID LEWIS - ANTARCTICANS.** Bergy Bits sent a letter of inquiry to Mimi at the University of Virginia to see if (1) she was really there, and (2) if she would consent to speaking to us. There were many good reasons for wanting her, as the Frozen Sea Expedition was a red-hot news item - it ended in the past year; David's account of it (Icebound in Antarctica) was in the November issue of the National Geographic; and a follow-up article by Susan Moore appeared in the Style Section of the Washington Post, November 2, 1984. Mimi and David objected to major factual errors in this article in a letter to the Editor of the Post which was partially published November 16, 1984. And we know that many of our members (Guy Guthridge, Tim Hushen, Skip Dawson, Johnny Dawson, Red Jacket Jorgensen, among others) are intrepid yachtsmen and any expedition in a yacht would be their dream. We also wanted Mimi as we've had only two women speakers - the late Mary Alice McWhinnie and Gisela Dreschhoff. Mimi is a woman of many talents - an anthropologist by training, she has a minor in art. She is a professional photographer, both stills and movies. Not only is she a veteran blue-water sailor, she is also a scuba diver, and has been involved in wreck diving. And she flies light planes. She received her master's from the University of Virginia on attainment of power through ritual in Papua, New Guinea.

Not too many of our members can recall the last U.S. privately-funded expedition, that of the late Finn Ronne in 1946-48, but at least Jackie Ronne and Bob Dodson from that expedition are in town and can make their own decisions about whether things get better with time. Actually the two expeditions - on paper - had few similarities beyond the fact that they were privately funded, each had two women, were Antarctic coastal, and are fiercely proud of their scientific accomplishments. The most scientific study undertaken by the six volunteer members of the International Frozen Sea Expedition was to document and report on their own human group experiences .... a project fully endorsed from the start by each expeditioner.

Dr. Lewis has made four trips to Antarctica, including the first single-handed voyage to Antarctica in 1972-74. He has been awarded the gold medals of the Royal Institute of Navigation and the Australian Institute of Navigation, and the Superior Achievement Award of the American Institute of Navigation, plus the 1982 Blue Water Medal of the Cruising Club of America. In the real world, he is Associate in Anthropology, University of Sydney, and is currently a Scholar in Residence at the University of Virginia. He had nothing whatsoever to do with the American Cup being very temporarily in the custody of the Perth Yacht Club, a fact which will be duly rectified in the next defense of the American Cup!

We have high hopes that Mimi and David will be able to come before a joint meeting of our Society and the Smithsonian (Education Office) in late October, and present a formal lecture on the Frozen Sea Expedition and their scientific findings. They are off to New Guinea in April, but will be returning to the University of Virginia in the fall. But you all come on out here on the 25th - don't wait until October -as this one will be Family and perhaps more exciting and interesting.

**MEMBERSHIP.** Well, there is good news - 92% renewed, 18 new members, and 185 (42%) have also paid for next year, and bad news - 34 members are delinquent. We are dropping some of the delinquents now as they have had the mandatory three-count, but some of the others are good old boys and if they see their name in print here as delinquents, maybe it will stir them to write a check, hopefully for multiple years to ease the bookkeeping. Remember, \$6 per year outside the Washington area, \$7 a year if you're local.

**MAYBE YOU LOVE NEW YORK, BUT ....** How can we be happy with the Empire State when they never delivered our November Newsletter, mailed November 10th, until December 13th? It didn't hurt too much in this case as Bert Crary's talk was advertised in the October Newsletter on page 9 - "Anniversary Waltz with Bert Crary on 19 November." But it could have, and we are aware of the problems of bulk mailing. Occasionally we do put stamps on meeting notices that may be of special interest to an individual. However, our policy is to mail all Newsletters at least a week, usually two weeks, prior to meetings. And then we pray that the lousy Postal Service does not foul it up.

**SOCIETY TIE.** The response to having a Society tie has been overwhelmingly favorable, and we appreciate all of the letters which have been sent to the Nerve Center. Some have even sent in money! Bergy Bits has come to certain conclusions from reading your letters. First, Antarcticans must be sloppy eaters as many said they would buy two or more (eg, ex-Treaty Inspector Robert Yoder wrote, "I might even order two so I wouldn't have to do without if I spilled frozen custard on one tie during the long, hard Vermont winter."). Second, people want class (eg, Joel Mumford, former medical officer at Palmer wrote, "Let's be tasteful, something more than just a penguin."). Third, Antarcticans have a great disdain for wearing ties but still want one in case something special should come up (eg, Ed Stump wrote, "I put on a tie for a wedding this past week and none of my friends recognized me ..."). Bob Rutford was very clairvoyant in his comments, "Good idea for the Antarctic Society to develop a necktie. My only hope is that when you design it, you make it recognizable. While I am not in favor of something too garish, I would argue that it should be distinctive and good-looking." Bob, suggest an appropriate design! What scares me about this is that it will come down to a committee decision, and when anything goes to a committee, then you can expect the worst. I really don't think an important decision like this should rest solely on our Board of Directors who are all good loyal Society members but don't represent the New Majority in the Society (young, practicing Antarcticans). Jim Caffin, the erudite editor of Antarctic, the finest news bulletin published on the Antarctic, wrote a mighty fine letter in which he made comments on Antarctic club ties. He said, "Most people I have talked to prefer a tie with the penguins, seals, what have you, sprinkled over it .... Based on the experience with our organization it

is wise to avoid, if possible, putting too much on the tie .... Members won't buy the ties if they are going to be sold to anyone that asks." Jim summarized the designs on the New Zealand, Australian, South African, and British ties. His favorite Antarctic tie is BIOMASS, but he can't persuade anyone to let him have one. Seems that El-Sayed is always at sea so he should give Jim his tie, right? One of our members who is also a Member-at-Large of our Board of Directors, is polar archivist Mary Goodwin, who has designed many ties for surgical departments and societies. She writes that the "tie design is the most important factor." Mary is a medical illustrator, and if you ever put her in a room with John Spletstoeser and told them not to come out until they had come up with an interesting and exciting design, then we would really have a conversational piece! Bergy Bits sincerely hopes that when the design is finalized Frankie Welch here in Washington can make the tie, as we have seen several of her creations and they are just excellent. It will help, too, to have the artist nearby for consultation. We still welcome comments, additional comments, on tie designs.

**MOLENAAR'S MCMURDO MAP.** In our October Newsletter we told you all about the pictorial map that Dee Molenaar is doing on the McMurdo Sound area, and, based on some pre-publication cost figures, offered it to you at \$6 per map. Man's best-laid plans often go awry, and it wasn't until recently that Dee found someone (The American Alpine Club) to print his map. Bergy Bits talked to Dee on January 2nd, and he remains optimistic that he will finish the supporting textual material within two weeks, that they will sign a contract this month, and that the maps will be available by the end of February. Being a pessimist, I think Murphy's Law will prevail and the maps will not be available until Easter Sunday. But we have bad news. Dee anticipates the cost of the maps now will be \$7.95 each, although we hope to get a special break whereby we can buy and mail for \$7.50 each, which we will confirm in our next Newsletter. BUT no more \$6 orders will be honored. To those 57 who have sent in money for the maps, we will honor your order and you will get your maps as soon as we get them.

**ANTARCTIC CALENDARS.** We had a banner year selling Antarctic calendars - 135 New Zealand, 130 USARP. I am especially indebted to Karen Williams of New Zealand for burrowing into a hidden cache of their calendars to help us with late orders, thereby cutting themselves off. Not knowing how popular the New Zealand calendar would be, or how fast it would be available, we ordered only 50 last August. Then we reordered another 50, then 20 more, and finally another 15. We just about exhausted Karen's patience, but we surely appreciated her going the last mile. All orders were filled by the end of the year. This brings up the question as to what we will do next year. We sell both calendars for the same price, although we pay a lot more for the New Zealand calendar. I personally prefer the New Zealand one as the pictures are superb and it's nice and clean without a lot of Antarctic trivia like on the USARP calendar for January 11th (Uruguay acceded to Antarctic Treaty - so what? - and South Pole had record high of -2°F - which is incorrect). The 1985 USARP calendar supposedly has the wrong station (Cape Hallett) on the December scene! Would you USARP buyers complain bitterly if we sold only the New Zealand calendar next year? Speak up now or hold your peace! Now if any of you Antarctic photographers have calendar-quality slides which you might want to be considered for the 1986 New Zealand calendar, please submit them to Karen Williams, P. O. Box 211, Wellington, New Zealand. Slides should be marked with name and address, with a short caption. If your photo(s) is selected, you will get paid in calendars. That's a good deal. We suppose that most of you have seen those excellent penguin calendars put out by Landmark Calendars in Sausalito, California. I guess they weren't too sure how one picture should be shown, as December 1984 and December 1985 have the same backdrop, except it is printed in reverse!

Our hardworking curator in the Nerve Center, Ruth Siple, who has a nose for errors, detected that one. In her next life she will probably work in Scotland Yard!

**AMERICAN POLAR SOCIETY INVITES YOU** .... to join their ranks. The cost is minimal, only \$2 per year, \$5 for three years. Although our own Ned Ostenso is President and Vice-Presidents Dick Chappell, John Roscoe, and Walter Sullivan are more of our own, the American Polar Society is really August Howard, who has been The Society since its inception over fifty years ago. You don't find his kind of dedication any more, and if August wants more members, which he does, any of you who aren't members should get out your checkbooks right now and send off a few bucks to him - 98-20 62nd Drive, Apt. 7H, Rego Park, NY 11374. You will receive two issues yearly of The Polar Times, a potpourri of newspaper clippings of everything moral written on the polar regions in the preceding six months. Occasionally the Society holds meetings in which polar scientists present their findings and polar adventurers recount their experiences. The American Polar Society is quite large - believe it is close to 2000 - has a large international membership. It will look good on your list of society memberships and on your IRS Form 1040. Join now!

**"BLOODY STUPID!"** Bergy Bits should give out a Boondoggle Award with each issue, as it wouldn't be hard to find someone doing something in Antarctica which doesn't need to be done there. Maybe we could make it retroactive, too! Right now a 109-ton Icelandic trawler, the SOUTHERN QUEST, is about to leave New Zealand (January 15th) to take a small party to Cape Evans where five men will "winter over" prior to two of them walking in Captain Scott's footprints to the South Pole next year. Bob Thomson, Director of New Zealand Antarctic Division, was quoted in the Christchurch Star that the walk was "bloody stupid ... days for this sort of adventure are over." Expedition coordinator, Lt. Michael Hough, is from the same regiment as Captain Oates, the 5th Royal Inskilling Dragon Guards, and his boss, a devoted disciple of Scott's expedition, gave Hough extensive leave so he could go to the Antarctic to help set up the base. The two blokes who will prove nothing in particular, outside of the fact that they can walk 1420 kilometers in 75 days, are Robert Swan, 27, and Roger Mear, 32. They are going to pull sleds to the South Pole, but will take no modern mechanical equipment. The only updated items will be clothes, and sled design. Departure will be next October or November. After they reach the South Pole, they will be flown back. Seems to me that's only half the loaf - they should be told to walk out. When you get yourself in a mess, you should be prepared to get yourself out or pay the consequences. And other idiotic adventurers will follow elsewhere, expecting to be extricated home. But the 1.8M expedition has the approval of the Royal Geographical Society, Sir Peter Scott, and Lord Shackleton.

**PLANE IS DOWN.** A C-130 Hercules got stuck in a crevasse on the Starshot Glacier on 28 December, but none of the 12 people aboard was injured. The Starshot is about 240 miles south of McMurdo, and the plane is located at approximately 158°24'E, 81° 24'S. It all happened when the plane was taxiing during an open field science support mission in the Transantarctic Mountains when the scientists (two Kiwis, one Canadian, one American) were being moved to another camp site. Everyone on the plane was back at McMurdo the following day, and the Navy is conducting a routine investigation of the incident.

**BEARDMORE MEETING.** As this is being typed, the workshop on the future of Antarctica is going on at the head of the Beardmore Glacier. Officials from Antigua and Barbuda, Kenya, Malaysia, Peru, Sierra Leone, Tunisia and Uruguay accepted invitations to the workshop, but are participating as individuals rather than as national representatives. Bergy Bits understands there is only one media person, Michael Parfit of the Smithsonian. What he hears at the meetings is not for attribution,

but he can interview any willing subject "after hours." Walter Sullivan wrote in the New York Times for 30 December 1984 that the workshop was organized by the Polar Research Board of the National Academy of Sciences with a goal of bringing home to the visitors the fact that Antarctica remains a region where human survival depends heavily on modern technology and long-range support. (Ed. note. If this premise is true, how can the two Brits walk half way across Antarctica with no modern technology or support?) The workshop also will seek to demonstrate the strengths of the existing treaty system. ARCO, Mellon, Ford, Hewlett and Tinker foundations' funds helped to get the participants to Christchurch, and then the good old reliable American taxpayers took care of the rest. One can't help but wonder if this wasn't set up to help swing some decisions or votes by Third World countries on the Antarctic in the UN. But what a backdrop for a meeting - fantastic!

**(PRESIDENT TODD ADDS THE FOLLOWING.)** For the stimulation of debate free from the formalities of UN procedures and the restrictions imposed by the need for delegates to formal treaty meetings to stick to the positions of their respective governments, the workshop is being held in situ. Participants were invited to attend as individuals rather than as representatives of their governments or organizations, but they were selected so that all points of view of the "in" and the "out" would be represented. Jim Zumberge, President of SCAR, is serving as Chairman of the workshop which is being held at a temporary field camp located at the head of the Beardmore Glacier at an elevation of 6,500 feet. It is a typical major field camp of James-way huts, the major use of which will be for research projects to be conducted in the 1985-86 Antarctic field season.

The workshop brings together points of view of individuals from Antarctic Treaty consultative nations, acceding nations, nations not party to the treaty, international organizations, and the UN secretariat. The agenda provides for four days of meetings with formal, invited papers, followed by comments of panel members and open discussion. A proceedings volume is contemplated. (END OF TODD.)

**UNITED NATIONS REPORT.** According to Walter Sullivan's article cited above, Secretary General Javier Perez de Cuellar issued the UN report on Antarctica on 31 October 1984. It certainly hasn't received much publicity in the press. Sullivan quoted the report as saying, "It has yet to be proved that there are mineral resources in Antarctica worth exploiting except for possible offshore oil reservoirs." Nigeria said the treaty "fails to acknowledge the status of Antarctica as a common heritage of all mankind." Pakistan proposed that the treaty be replaced by one under the United Nations. In an article in the Washington Post for 24 December, Michel J. Berlin, writing on U.N. Session Marked by U.S. Resurgence, said, "This year, in fact, is the first assembly session at which these policies (Kirkpatrick's) have borne fruit, enabling Washington to ... stave off, in cooperation with the Soviet Union, a challenge to the Antarctic Treaty." Does that mean victory like in total victory, or is it like in Vietnam? (MORE FROM PRESIDENT TODD) Debate about the Antarctic Treaty and about whether or not the General Assembly of the United Nations should recommend its modification or replacement is well under way (see November Newsletter, page 7). At least fifty-four governments submitted information to the Secretary General for the UN report on Antarctica and, eventually their responses will be available as appendices to the UN report. A voluminous and concise report was issued in November 1984 by the UN-funded International Institute for Environment and Development. The report, prepared by Lee Kimball, contains an excellent brief review of the current state of the international politics of Antarctica and the development of the UN debate. It also contains three sets of recommendations in the areas of (a) participation in the Antarctic Treaty System, (b) information available on the Antarctic Treaty System, and (c) improvements in the operations of the Antarctic Treaty System. The recommendations are quite variable, ranging all the

way from ones that seem obvious and certain to be implemented, to a number that appears to be unrealistic. However, they are all thoughtful suggestions that merit consideration. Miss Kimball can be contacted at IIED, 1717 Massachusetts Ave. NW, Suite 302, Washington, DC 20036 if you want a copy of the report. (END OF TODD.)

**WHEN ARE YOU ABROAD?** Evidently not when you are in Antarctica, according to a decision handed down on New Year's Eve by the US Court of Appeals in Washington, DC. The decision, by a three-judge panel, keeps alive a lawsuit by families of the victims of the crash of an Air New Zealand DC10 on 28 November 1979 when 257 persons were killed when the plane slammed onto the lower slopes of Mt. Erebus. Judge Malcolm R. Wilkey, who wrote the ruling, said, "Antarctica can properly be characterized as something of an international anomaly. It is a large continent which has never, been and is not now subject to the sovereignty of any nation .... While the other non-United States/non-foreign country areas (outer space, the high seas) may be covered by some law, we have a no man's land of law in Antarctica, unless United States law covers the actions of United States citizens - not an unfair concept .... Unless this concept is accepted, Antarctica is an area without any law whatsoever." Judge Patricia M. Wald joined in the decision, but Judge Antonin Scalia is going to file a dissent. Bergy Bits thinks it would be interesting to read the whole decision, to see what was said, if anything, about the Antarctic Treaty. The above came from the Washington Post of 1 January 1985. Evidently the fact that the US has never made any political claims did not enter into it, although the additional fact that we don't recognize any of the political claims already made may have entered into it. Lawyer Jim Barnes is out of town for a month, but perhaps we can get him to comment on this in our next issue.

**U.S. BUYS ICE TO IMPORT INTO ANTARCTICA!** The Wellington Evening Press last March 29th ran an article about how many greenbacks the US actually spent in New Zealand, and for 1982-83 it turned out to be \$NZ15M, which was said to be about 18% of the total US budget for its Antarctic involvement. The biggest single item of expenditure (\$NZ3.6M) is for salaries of (1) 45 US personnel who live in Christchurch the year round, often with spouses, (2) approximately 100 people who arrive for the summer season, and (3) 60 Kiwis who work for the US. Another \$NZ2.6M goes for operational support from Christchurch for McMurdo. And if you keep going down the list you will come upon ice, as the US buys anywhere from 136 kg to 181 kg per year to ship to Antarctica where it is used for packing scientific samples. (Note: It was impossible to ascertain from the article just how much of that \$NZ15M was being 'spent by old Walt Seelig. Presumably it was comparable to what the White House spends annually in entertaining foreign dignitaries, give or take a few million!).

**CHANGING OF THE GUARD.** Two old Antarctic warriors retired on paper on December 31st, although each is planning on being retained by their respective offices as retreads until they can find replacements. One, Ed Flowers, Bergy Bits has known since 1956 when he signed up to go to the South Pole with Dr. Siple's crew, being senior meteorologist at the station during its first year of existence. This was an improvement for Ed, as one of his jobs had been to answer crank letters to the old Weather Bureau from people who were complaining about busted forecasts. Ed was probably about as ideal an Antarctic man as you could have wished for, as he was not only very capable in his profession, but was very quiet, extremely hardworking, and most cooperative. I have a good idea of the great esteem which the late Dr. Siple held for him from having read Paul's journals in the National Archives. Ed was too good a guy to be given a decent job when he got back, so they put him in charge of their solar radiation network which was a mixed bag at its best.

Our immediate Past President, Dr. Mort Turner, Program Manager, Earth Sciences, Division of Polar Programs, walked into NSF on the same day and said he was "hanging

it up." Helen Gerasimou, Ken Moulton, and Mort Turner were sort of cornerstones in the Division of Polar Programs, and no one can really remember when they weren't there, (Mort actually arrived on the scene in June 1959.) Helen weakened and deserted the ship several years ago, and now Mort is leaving - Moulton and his gimpy knee may not be far behind. Mort's term as our president was innovative. We had our first-ever joint meeting with the Smithsonian, and our first-ever west coast meeting with the Thomas Poulter Chapter in Palo Alto. And we had especially outstanding lectures during his two terms: Charles Swithinbank, Walter Sullivan, Bill Zinsmeister, Geoffrey Larminie, George Denton, Tucker Scully, Al Chapman, Jim Barnes, William Evans, and Dick Goldthwait. An excellent all-male cross-section of Antarctica! But his presidency was highlighted for me because he called only one Board of Directors meeting in 1983-84, resulting in an error-free year!

Another Program Manager in the Division of Polar Programs, Ben Fogle, Meteorology, has indicated that he will "hang it all up" in June. Ben has always had a nose for money, and it has reached the point where this big business entrepreneur can't afford to work. He is one guy who never buried his savings in the backyard; to the contrary, he has put it very wisely into some shrewd real estate investments.

**RON THORESON HAS IT MADE.** The best non-Antarctic job that I know of is Walt Seelig's in Christchurch, and recently I found out something very hard to believe - he actually gets paid for it!! But not far behind Walt is Ron Thoreson who wintered over at McMurdo on Deep Freeze '70, working in the biological laboratory. Now he works for the National Park Service and moves around quite a bit. Right now he is Chief Park Ranger at the magnificent Black Canyon in Colorado. He writes, "The view from the rim is truly awe-inspiring as you gaze down, down ... 2000 feet to the surging waters of the Gunnison River. Golden eagles are often seen soaring in the canyon depths." While Ron was doing some research for the twentieth anniversary of Canyonlands, he ran across a letter from our own Larry Gould, dated 9 February 1925, in which Dr. Gould implored Senator Reed Smoot of Utah to see what he could do to make "The Windows" area, near Moab, Utah into a national monument. It was one of those vintage letters of Larry's, pure golden prose, a real pleasure to read. How great it is to be able to express oneself so beautifully! Senator Smoot then wrote Stephen T. Mather, Director of the National Park Service, asking him to make "an examination with a view of recommending." Ron wrote, "It must have given Dr. Gould a great deal of pleasure when that area of Utah, with the Windows section as a centerpiece, was proclaimed a national monument on April 12, 1929. It was expanded to the present 73,378 acres and established as a national park on November 12, 1971." Ron himself was quite thrilled by it all as he wrote, "Who would have known that someday, someone who had been to the Antarctic and who had had the privilege of meeting Dr. Gould, would one day run across those letters and make the instantaneous connection between the Utah desert and that great white continent with which his name is so intrinsically linked." Ron's mailing address is 520 Pierce Road, Montrose, CO 81401.

**FOURTH CHRISTMAS WITH SOVIET ANTARCTIC EXPEDITIONS.** When it comes to Christmas letters, they don't come any finer than those of Ed and Priscilla Grew. You really don't have to know the Grews to enjoy their letters which are so darn interesting. To me they live in sort of a fantasy world, only one step away from the ramp leading into a Pan American plane going anywhere in the world. They never seem to live together, with Ed working in all sorts of strange places. Must not only be an ideal marriage but an ideal way to survive marriage! Ed spent this Christmas, his fourth with the Russians, near Beaver Lake on the west side of the Amery Ice Shelf, near the immense Lambert Glacier (at about 70°45'S, 68°20'E). Ed is working with a team of Russian and East German scientists studying how the Antarctic continental crust formed during the Precambrian. Near Beaver Lake are some "very interesting alka-

line dikes and breccias of alnoite, leucite basalt, and monchiquite," and Ed will be looking for xenoliths of the earth's deep crust and mantle brought up by the explosively erupted rocks. But I think Priscilla pulled a one-upmanship on Ed this year when she was the only American on an excursion of the International Geological Congress to the Kola Peninsula which was organized by the USSR Academy of Sciences and the Murmansk Geological Expedition. I do not fully appreciate what Priscilla saw, but she got the chance to explore the 'magnificent Khibiny ring intrusion of differentiated nepheline syenites - one of the world's largest." Priscilla wrote, "The minerals in a khibinite have all the colors of the Kola - nepheline the pale gray of mountain mists and the polar summer night sky; zirconium eu-dialyte, red like the fireweed; limpid sea-green apatite the color of taiga lakes under cloud; golden lamprophyllite the yellow of cloudberry and tundra poppies; black-green blades of aegirine like spruce and fir in cold evening rain." Bergy Bits sure took the wrong courses in college!

**ABOUT OUR MEMBERS.** Glaciologists were hard to come by during the IGY, so they were taking people in off the streets and sending them to Antarctica disguised as glaciologists; one of them recently surfaced - Ed "Moose" Remington. He was at the South Pole with the late Dr. Siple in 1957 and was sort of a character. Rather than dating the stratigraphy in the deep pit by years, he named prominent layers after people in camp! I think he met an Aussie on the way home and married her shortly thereafter. Well, he now owns and operates the Kwik-Kopy Print Shop in Charleston, South Carolina. His current address is Route 1, Box 29, Yorges Island, SC 29494 - but he's moving later this year. He has a Moluccan Cockatoo, a Burmese cat, an Egyptian dog, a Pharaoh hound, four Indian peafowl, six geese, and a bantam rooster. Same old Moose! .... Old Bud (BAEII) Waite isn't doing too well. Was scheduled in mid-December to go back into the hospital for more bladder surgery. The Nerve Center hasn't heard from him since, and when we don't hear from Bud we know he is suffering. . . . Louis DeGoes, our bona fide All-American who for many years was Executive Secretary of the Polar Research Board, is now living in Bellevue, Washington (17215 NE 8th Street, 98008). He's very active in the development of a tourist retirement community, but I think I'm supposed to hold back on telling you folks anything further. However, I can tell you it's not on the Beardmore Glacier or Deception Island! .... Muckluck (L.A. V 57) Milan wrote about the 6th International Symposium on Circumpolar Health. It was a great success except for some foreign representative who kissed old Muckluck on both cheeks and then head-on, but so far no AIDS! Seven hundred people from 21 nations attended to hear over 300 papers. One entire day was devoted to the presentation of the Report of the International Biomedical Expedition to the Antarctic. Forty scientists studied 12 subjects as they traversed inland and back from Dumont d'Urville for 71 days. . . . Michele (South Pole 79) Raney, a confirmed chocoholic, is finishing up her residency at Stanford and has been asked to join the staff of one of the hospitals through which she rotated as a resident. Bergy Bits found out that Michele was a baseball fan, so she has been reappraised to a higher level . . . . We understand from one of those most impeccable sources that the doctor at the South Pole this year, Nancy Sachs, the first woman since Michele, is just outstanding. Worked in some pretty bad emergency rooms and survived. . . . How would you like to help out a poor Boy Scout? Dick (L.A. V 57) Chappell and his suave bride, Alice, are selling illuminated bases (\$49.50) for the display of fine crystals in your home. You may have seen their ad in the New Yorker and not known whose ad it was. Trade name is Fine Lites. Dick's address is 103 East 75th Street, New York, NY 10021. Don't ask for credit as Scouts deal only in hard, cold cash. . . . Speaking of Scouts, we understand that Girl Scouts will soon be part of the Antarctic scene, and that one may go south next year. Wonder whether she will take those peanut butter cookies to the South Pole to sell. Poor old Ike Schlossbach would probably

flip in his grave if he knew Girl Scouts had arrived on the ice! Can McDonald's Golden Arches be far behind????? .... *Sayed El-Sayed*, the home-at-sea BIO-MASSer, recently returned from a four-week cruise on the Luxury liner, F.R.G.'s POLARSTERN, which has a heated swimming pool, exercise room, sauna and an honest-to-goodness Chinese laundry man who washes and presses such things as pajamas and BVD's. Unfortunately while Sayed was enjoying these luxuries, some problems developed with one of the propellers, curtailing the cruise, and Sayed had to go home to reality . . . . *Ed Thiel* enters Hall of Fame posthumously when last spring the Wausau (Wisconsin) School District presented its Hall of Fame plaque to Dr. Edward C. Thiel's mother, Mrs. E.A. Thiel of 221 Scott Street, Wausau. Dr. Thiel died in an Antarctic plane crash on 9 November 1961. The Earth Sciences Laboratory at McMurdo was dedicated in his name in 1973. At the time of his death he was considered one of the best Antarctic geophysicists in the entire world . . . . *Gerry Schatz*, ex-editor of the National Academy's News Report was married to Gary Kauffman on 20 October 1984. They visited the Scott Polar Research Institute in Cambridge on a U.K. honeymoon .... *Doc Abbot*, Commander Antarctic Support Force, February '67-June '69, is still plagued by back problems, but the neurosurgeon is going to let him try tennis and golf again - soon. But Doc and Margaret are hardcore participants in Eastern Airlines "Get Up and Go" program, and in 1984 travelled at 33 cents on the dollar. They look upon travel as an obligatory birthright which has to be exercised. Something like sex, I think . . . . *Walter Sullivan* has a new non-Antarctic book, *LANDPRINTS: On the Magnificent American Landscape*, published by Times Books, 229 pages, \$22.50. It was favorably reviewed in the Washington Post of 31 December 1984, including comments about "Sullivan's avid intelligence .... stunning photographs ..."

**CHILEAN BABY BOY BORN IN ANTARCTICA.** American women have proven innumerable times that they can get pregnant in Antarctica. Some feel it comes from drinking water melted from snow. Others doubt that theory. We remain undecided. Be that as it may, the US has never had a baby born on the ice, but the Chileans have - a baby boy, Juan Pablo Camacho Martino, 8 pounds - 5 ounces, was born on King George Island on 21 November 1984. Bergy Bits asks why did the kid have to be born on his birthday? The father is an Air Force surgeon, the mother a nurse. According to the Washington Post on 23 November the child and mother were "in perfect condition." There was NO comment on the father's condition.

**LIFE IS UNFAIR - JOHN F. KENNEDY.** "There is always inequity in life. Some men are killed in war and some men are wounded. Some men never leave the country and some men are stationed in the Antarctic, while others are stationed in San Francisco. It's very hard in the military or in personal life to assure complete equality. Life is unfair."

**YOU CAN GET IT IF YOU LOOK FOR IT.** The Japanese movie, *Antarctica*, which was Japan's nominee for best foreign film, has an excellent sound track featuring "the creamy music of Vangelis, who produced the memorable score for *Chariots of Fire*." It's a Japanese product and may take some looking. A friend of the Nerve Center bought the cassette and played it for us. It's very good listening.

**HIGHLY RECOMMENDED.** Smithsonian Books has a dandy out, *THE WORLD WHALES, The Complete Illustrated Guide*, by Stanley M. Minasian, Kenneth C. Balcomb III, and Larry Foster. It presents all 76 generally recognized species of whales, dolphins, and porpoises in hundreds of photographs, most in color. There are a lot of drawings, and even textual material for those who can read. It's priced at \$27.50, but it's worth every cent.

*If you move, PLEASE send us your new address!*

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 84-85

March

No. 5

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.) 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Royer Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984

*We Have Met the Enemy and They are Us:  
Diplomats Meet Scientists at the South Pole,  
The Antarctic Treaty System Meets the United Nations*

by

Lee Kimball

International Institute for Environment and Development  
and  
Executive Director of Citizens for Ocean Law

on

TUESDAY, MARCH 19, 1985

8 PM

National Science Foundation  
18th and G Streets NW  
Washington, D.C.

ROOM 540

Lee Kimball, a nongovernmental, public interest representative who has advised the United States government on Antarctic and oceans policies since 1978, comes to us directly from attending the Antarctic Treaty Workshop held on the Beardmore in early January, and a mineral resources meeting in Rio de Janeiro in February. Unaccustomed as we are to having women speakers back-to-back, a first time ever, we are most fortunate to have someone of Lee's calibre to talk to us on such a timely subject and one of such universal interest, not only to Antarcticans but to all of, sic, mankind. Lee is a graduate of Stanford University, and has a master's degree in International Affairs from the Johns Hopkins School of Advanced International Studies in Washington, DC.

*Light refreshments will be served.*

Anything you read below might have a figment of truth within it, but don't count on it. Material *is* gathered by the writer and put together with some garnish in an effort to make it interesting. We try to make it about Antarcticans, both the old and the new, who in turn will soon be old, too. One of the few benefits of putting this together is that one can at least choose the subject material and slant it his way. Whether you accept it or reject it is your problem.

**ANTARCTICAN SOCIETY TIE.** This has been a slow process because we don't want to foul it up, but it looks like a good solid step was taken at our last meeting when a three-person committee of Dick Conger (an old Navy Deep Freeze photographer back in the 50's), Bill Sladen (Antarctic bird expert), and Dotte Larsen (whale spot-teress supreme), was selected by President Todd to come up with some designs. Bill has a lot of the proper connections, and he is exploring the possibility of having two very distinguished men, whom he knows personally, come up with a design or two. We are excited about it, and only hope that something positive evolves. Bergy Bits wants to thank all of you who have responded with your suggestions. Larry Gould writes that he likes any bright color as long as it's red!

**THE MIMI AND DAVID SHOW.** Our last meeting, 18 January 1985, when Mimi George and David Lewis told us all about their Frozen Seas Expedition, really packed in the people. It was the largest crowd we have had for a non-special-function-type lecture, with approximately 85 in attendance, spurred in part by the publicity given the expedition by the media, and by curiosity about a small mixed-sex, privately-funded expedition whose base was a yacht. Mimi is not the typical run-of-the-mill, next-door type girl, as she was born for adventure and excitement, and she captivated the audience with her candid comments and truthful responses. This free spirit approached the rostrum wearing a large, broad-rimmed black hat from the 20's, saying that she was a lady of the south, and that all southern ladies wore hats. Saying that, she proceeded to throw it on the floor and got on with her presentation. There was one other unusual physical feature about Mimi -she has a tribal clan mark across her left cheek, a mark which was bestowed in New Guinea "where she is doing anthropological work which she will be continuing this spring and summer. When Mimi said that they once considered group sex on the expedition, I knew as soon as I regained my consciousness that I was really over-the-hill. If they had had group sex on Scott's expedition, they all would have gotten back to base camp in record time and would never have bothered to pick up those geological specimens on the flanks of the Beardmore. After Mimi's presentation there were a lot of excellent questions because people were genuinely interested in hearing about the human dynamics of their expedition. Jackie Ronne invited Mimi and David to her home the day after the meeting. Mimi wasn't even born when Jackie and Jennie Darlington were the first women to spend a winter on the ice. One can't help but wonder what thoughts were running through Jackie's mind as she listened to Mimi that night. Probably the biggest chuckles came when Bill Sladen admonished Mimi for being so wasteful of water with all her periodic baths. Bill has a keen appreciation for water, because he once was at a British station which caught fire and lives were lost. Although there is a 1.5 generation gap between Mimi and me, I found both Mimi, and David, to be most interesting people, folks whose lives will no doubt continue to be ones of high adventure. It was a good night.

**AMORY H. "BUD" WAITE, ANTARCTIC CHARACTER.** Bud Waite finally succumbed on the 14th of January 1985. It was a sad day in the Nerve Center at 905, as both Ruth and I have known and loved Bud for many years. I always felt a little kinship to Bud as I heard him lecture in a small town in Maine in 1935 after he had come back from the Second Byrd Antarctic Expedition. When I finally arrived at Little America V in January 1957, who was in sick bay but Bud; he had fallen off a sled which had then been dragged across his chest, cracking a few ribs here and there. He was operating a small research station, Camp Cold Bottom, near the barrier at Kainan Bay, where he was doing some of his pioneering research on the transmission of radio waves through snow. Since I was a civilian working for the Army at Little America V, he asked me to take care of Camp Cold Bottom and have it opened for his arrival the next austral summer. This turned out to be a heck of a lot of work, because when I went there at the end of winter, half the snow blowing off the interior had found its way through the keyhole of the door which Bud had never plugged, and filled the room to the brim.

Bud was a prolific letter writer, and I think he must have written everyone whoever wrote him asking questions about Antarctica. He was a staunch supporter of the late Admiral Richard E. Byrd. Several years ago we invited Senator Harry F. Byrd to come down from the Capitol to a dinner preceding a Memorial Lecture to personally thank Bud for rescuing his uncle from Boiling Advance Base in 1934. And when Bud came to Washington in October 1983 when BAE II members held their 50th reunion, Senator Byrd, at our request, gave a large photo of the late Admiral with messages of gratitude written around the border to Bud for rescuing him. Bud never received any plaques for being humble, but receiving the photo of his idol that night brought tears to his eyes and he was temporarily at a loss for words, maybe for the only time in his life!

Bud wrote Ruth and me on January 4th, ten days before he died - across the top was written "Last Message." He sent us a three-page obituary which we will abstract from in the next paragraph. He had trouble ending the letter, as his first attempt said, "My best love, gratitude, and respect to all my friends in Wisconsin, O.S.U. [Ohio State] and TAS [The Antarctic Society] and my country. Then he signed his name, and there was a P.S. "Farewell you two - I loved you long. We from whose failing hands the flag cloth fall, etc. - grab it and carry on." Then he folded it and before he put it in the envelope added one more farewell, "Final scenario! Vaya con Dios." I did write a reply as I wanted to tell him what he had meant to my life, but I was too late. His wife Betty said it came in the afternoon mail after he had died that morning. Al Lindsey, one of his compatriots on the 1933-35 expedition, was in Florida at the time, and on the morning of the 16th, he and his wife Elizabeth intended to drive to Venice to see Bud and Betty. On the way they picked up a copy of the Sarasota Herald Tribune and read about Bud's passing. We were both late, but Bud had an appointment with Admiral Byrd, Paul Siple, Tom Poulter, and Pete Demas, and he didn't want to keep them waiting any longer. And you can be sure that if Bud runs into anyone up there who hasn't heard about Antarctica he will give them an earful about the glories of the place he loved so much.

Bud would have been 83 on Valentine's Day, but he packed a lot of living into the 82 years he did live. He was the Navy's Atlantic Fleet 100-yard swimming champion .. served in China and the Far East with the Navy in 1929 .... was the chief radio operator for New England's first TV station, 1930-33 .... went south with Byrd on the Second Byrd Antarctic Expedition, 1933-35 .... gave 3400 lectures on the Antarctic .... joined the Signal Corps Research Laboratory at Ft. Monmouth in 1940 and worked there for 25 years .... put first multi-channel radio relay station across English Channel on D-Day .... took part in fourteen atomic bomb tests .... developed first radio remote control system for running vehicles into

high level radioactive fields and later for actually firing "A" weapons themselves, built six .... made 23 Arctic/Antarctic expeditions .... three winters on Hudson Bay .... seven summers in Greenland .... made first successful sounding with radio through thick ice in 1958 after eight years' study of ice - now being used by nine nations .... organized International Experiments for Glacial Sounding in Greenland in 1962-63 and brought scientists from eight nations together to prove seismic and radio only usable methods for sounding ice .... successfully sounded most of Greenland in 1965 .... made 64 flights over Antarctica and Greenland .... all soundings successful where ice colder than -2°F .... wrote over 50 papers, mostly for Army .... three daughters, 14 grandchildren, 12 great grandchildren.

Bud was an interesting person, truly a character, maybe similar in some ways to the late Ike Schlossbach whose obituary we carried in our October Newsletter. I have often felt that Bud was sort of an unsung hero in proportion to his achievement of developing the techniques of determining ice thickness by radio-echo sounding. I don't know of any one singular technological breakthrough which had such a significant impact as this did in the polar regions. Bud knew his days were numbered, although I tried to reassure him that only the good die young, that he was just too mean to die. He always wanted to die on the ice, and I'm sure his heart is really there today. It was a terrible blow to Bud when his only son and two granddaughters were killed when a drunken nineteen-year old kid crashed into them back in 1982. He never really got over that. In recent years he had been putting things together for his departure from this earth. He did a genealogy of his family, and wrote voluminous material on his findings and on polar life. Charles Swithinbank wrote us that "Bud's charm lay in the fact that he was seldom straight-faced and often subjective," and added that "Charlie Bentley saw through Bud's bubbling character to the solid achievement of putting radio-echo sounding into practice." Bud was awfully proud of the fact that the book which Charlie coauthored with the Russian scientist, Bogorodskii on polar geophysics was dedicated to him. A real nice thing to do.

**NO MORE BULL AT OHIO STATE.** Colin Bull agreed to take a position at Ohio State University back in 1960 because it was a temporary position which would allow him the opportunity of going back to New Zealand. That "temporary position" at Columbus ended at the end of January 1985 when he hung it up after 12 years as Dean of the College of Mathematical and Physical Sciences, and 24 years as Professor of Geology and Mineralogy. Prior to becoming a Dean, he was the second Director of the Institute of Polar Studies, serving in that position from 1965 to 1969, and then was Chairman of the Department of Geology from 1969 to 1972. Sounds to me like he was overburdened with a lot of administrative headaches for too many years.

He and his wife Gillian, an artist who works with fiber, are off to Seattle, where his good judgment in retirement might be tested by the closeness of the University of Washington and its strong interests in polar studies. Old Deans don't really fade away, anyway, - they just lose their faculties. And like many an O.A.E. he has visions dancing in his head of writing a book or two. One being contemplated is on the history of polar research, another is on the psychology of voluntary isolation. I have always considered Colin one of the most delightful and entertaining of all polarites, and we have been unsuccessfully pursuing him for several years to talk to our Society. But now he has flown the coop. If anyone can make the history of polar research seem interesting, it will be Colin, and I know I will want to see his book on the psychology of voluntary isolation. I suppose I should consider Bull a mortal enemy, as wasn't he the very person who organized the first party of women scientists to ever work in Antarctica? Yup, he did it. A lot of admirals stood tall, firm, and united against the happening, or else Colin would have had women

there a lot earlier! Will Colin fry in Hell for this, or will he become the un-knighted Saint of Antarctic Womanhood?

Who was the real Colin Bull, not the desk commander? He had to have done something as there is a Bull Pass and a Bull Lake in Victoria Land. We can dismiss the lake with little fanfare, as it's sort of a humpty-dumpty lake which isn't even there most of the year, but can be a mile long and an inch deep when it's in flood stage. Probably only a lichen would think\* it was really a lake. However, Bull Pass is something else that's impressive, significant, important - it connects the Wright Valley with the Victoria Valley. Colin came to Antarctica through a circumstantial route, the Arctic. When he was a graduate student in solid-state physics at Birmingham University in England, Antarctica was a sleeping giant for the most part, although the ongoing Norwegian-British-Swedish Expedition at Maudheim was outstanding with such polar giants as Charles Swithinbank, Gordon Robin, Valter Schytt, Fred Roots, Gosta Liljequist, the late Ove Wilson, and others doing great research. So Colin went to Spitzbergen in 1951, the first of two dozen visits for him to the polar regions. After graduate school he worked four years with the British-North Greenland Expedition, conducting extensive glaciological and geophysical work. He received the Polar Medal from Her Majesty Queen Elizabeth for his work in Greenland, which included some of the first studies on the paleoclimatology of ice sheets. In 1956 he accepted a position at Victoria University in New Zealand, where he remained for the next five years, during which time he participated in three expeditions to the Antarctic. His first Ohio State trip to Antarctica was in 1961-62, and altogether he led five Ohio State field parties to the continent. He has authored over fifty papers on his polar research, covering a wide range of subjects, from paleo-magnetism to snow accumulation and soil formation. An interesting guy, a fun fellow to listen to. Now if he could only learn how to talk like an American!

**INSTITUTE OF POLAR STUDIES' 25th ANNIVERSARY.** The Board of Trustees at Ohio State met on 12 February 1960 and never adjourned until they had established an Institute of Polar Studies which has flourished ever since as a Polar Citadel. Ohio State wanted to do something to celebrate the Institute's silver anniversary this year, but today's crew felt that it might be better to have a fair-weather celebration so changed the "official" recognition to 12 April. Those Buckeyes must know something that meteorological forecasters don't know, as sure enough the weather on 12 February was mean - rain and snow, followed by six inches of snow, with hazardous traveling! The April program will find Lonnie Thompson giving an afternoon talk on the Quelccaya ice cap (Peru) program which is yielding most interesting paleoclimatological data that can be related to the El Nino phenomena and several archeological problems. Then there will be 'a reception given by the Institute at which Dr. Goldthwait will be recognized. A no-host dinner will follow and the invited guests include Dick and Kay Goldthwait, Colin and Gill Bull, and Rudy and Ann Rudolph. Then Walter Sullivan of the New York Times will give a public address after dinner on the subject of Antarctica, the Treaty, and the Institute's role in Antarctic science.

**HARVARD UNIVERSITY'S BLUE HILL OBSERVATORY CELEBRATES ITS 100th ANNIVERSARY.** We have to mention this one, as the Observatory and its late Director, the eminent Charles Franklin Brooks, influenced many an Antarctic meteorologist. It probably has the finest climatological record of any station in the United States. Dr. J. Murray Mitchell, our 1978 Memorial Lecturer and a long-standing Blue Hill Observatory disciple, gave one of the keynote speeches at the anniversary observance. But meteorologists aren't as foresighted as polarites. They went ahead with their anniversary on the actual date, 1 February 1985, and had miserable weather, befitting a meteorological observatory, with freezing rain and fog, icing conditions

on top of Great Blue, and even their instruments malfunctioned and quit because of icing. So be it in the real world! The first time I worked at the Blue Hill Observatory I was paid \$115 per month by Dr. Brooks, but I should have paid him for the privilege of working under him. He was the nicest person I ever knew, and it's just too darn bad that some of his character didn't rub off on me.

BEARDMORE HIGHLY UNOFFICIAL SCORE CARD		
	SHOWS	NO- SHOWS
Consultative Nations	Argentina New Zealand Australia Norway Brazil South Africa Chile United Kingdom FRG United States France USSR	Belgium India Japan Poland
Acceding Nations	Denmark Finland Netherlands PRC (China) Peru Sweden	Bulgaria Italy Cuba Papua New Guinea Czechoslovakia Rumania GRD Spain Hungary Uruguay
Invited	Argentina Netherlands Australia New Zealand Brazil Norway Canada Peru Chile Sierra Leone China South Africa Denmark South Korea FRG Sweden Finland Tunisia France United Kingdom Malaysia United States USSR	Algeria Mexico Antigua/Barbuda Nigeria Belgium Papua New Guinea Egypt Poland GDR Singapore Ghana Sri Lanka India Uganda Jamaica Uruguay Japan Zambia Kenya
Third World Countries *	Malaysia Sierra Leone South Korea Tunisia	Antigua/Barbuda Papua New Guinea Ghana Singapore India Sri Lanka Jamaica Uganda Kenya Zambia Nigeria
<p>* Third World Countries are like quicksilver, hard to get a handle on. We turned to the Foreign Area Studies at American University, who prepare the Department of Army's Area Handbooks, for clarification. They have no listing, but directed us to the Library at the World Bank. Their references listed a number of different categories which weren't specifically helpful.</p>		

**THE BEARDMORE SCORE CARD.** Looking over the score card, one sort of gets the impression that it wasn't all that attractive an invitation to the Have-Nots. You wonder if the Academy would have held it had they known in advance how few Third World nations were going to show up. Probably they would have, as I think some of the Haves wanted to see the Beardmore, too. Like a baseball score card, a lot does not show up in the stats. It could be that one Malaysia was worth a half-dozen African countries, maybe even more. Tim Hushen of the Polar Research Board seems to feel that it was worthwhile just because Malaysia was there. However, his office sponsored the meeting, so he couldn't very well say anything to the contrary. Also, they did not pay! I suppose no one will know the worthwhileness of the meeting until it is established one way or another whether the questioning nations in the United Nations have been defused. If they have, it will be a great bargain; if they haven't, it was a good trip for a lot of people and Kodak made some money. No one right now is claiming a victory, or even a decision. Zumberge wrote Bergy Bits on 29 January, "From a technical and logistical point of view, the conference was a smashing success, but whether any views on the Treaty were changed remains to be seen." But I wonder if this really opened Pandora's Box for more Antarctic meetings, as others may now want to hold their meetings on the ice. It's all very interesting, very speculative.

**BEARDMORE QUOTABLE QUOTES.** Los Angeles Times, 24 January 1985. "Why should the developed nations be the only beneficiaries?" -*Ambassador Abdul Koroma*, Permanent Mission of Sierra Leone to the U.N. - - - "A group of countries have maintained to themselves an exclusive right to make all decisions about Antarctica. We have to ask ourselves, 'Why is that? .... "It is a very expensive proposition, joining the Antarctic club. And that leads us to think there must be other approaches to the Antarctic community that would be more fair to the World community." -*Ambassador Zain*, Permanent Mission of Malaysia to the U.N. - - - "The strategy of Third World countries should be to attach a piece of the knowledge that comes out of Antarctic scientific research." -*Lewis Branscomb*, former Chairman of the National Science Board. - - - "We are asking the new countries to try us out. If we cannot meet their concerns, then they can talk about renegotiating the treaty. But give us a chance first." -*R. Tucker Scully*, State Department, USA. - - - "Open the bar, please." -*Jim Zumberge*, President of Scientific Committee on Antarctic Research." - - - "There are even women in Antarctica now." -*Trevor Hatherton*, IGY remnant from New Zealand who obviously fondly remembers the good old days.

New York Times, 29 January 1985. "Changing the Treaty could reopen the dispute on territorial claims which is 'frozen in a key part of the treaty text. "One can open a Pandora's box. That would be a bad heritage for mankind." -*Deborah Shapley* quoting Yuri Rybakov, head of the Treaty and Legal Department of the Ministry of Foreign Affairs of the Soviet Union.

National Research Council Press Release, 31 January 1985. "We didn't come to any conclusions. That was not our purpose. Rather, we sought to generate discussion and to help remove misinformation that might bias future decision-making." - *Zumberge*, SCAR.

Christchurch Press, 22 January 1985. "Equally important, they established a basis for respect and friendship among a great variety of those active in Antarctic science and politics, which will no doubt serve well the objective of managing Antarctica to everyone's satisfaction. Of course, the scientists tended to view their own occupation as the mainstay of Antarctica, and the diplomats as hangers-on; the diplomats saw themselves as the pieces de resistance. The environmentalists placed themselves in the role of constructive - at times plaintive - critics." -*Lee Kimball*, ITED.

"It was difficult to imagine the hardships of living in Antarctica when surrounded by warm sunshine and steaks and lobsters for dinner." -*Lee Kimball*, our upcoming speaker.

**ANTARCTICAE.** Antarticae is a highly contagious parasitic blood disease com-muted through the eyes to the heart which spreads through the whole body of homo sapiens who trod south of 60°S. It is a disease which is never seen in babies, but seems to be very prevalent in young college men and women who lust for travel and adventure. Until early 1985 it was an affluent disease which was chiefly confined to a so-called "Club" of the Have Nations, but now that a Third World representative has been taken there, it is fully expected that "antarticae" will soon become truly a worldly disease of epidemic proportions. There is no known cure, and once afflicted is to be addicted; victims seem to require periodic fixes which ' are only satisfied by repeated visits to the locale. Some prominent strains of the disease have been identified - sudpolitis, erebusitis, meteoritis, bananabeltitis, transantarticitis, and beardmoritis. All of these seem to be incurable. However, there is one weak strain which never survives for a second season, which self-destructs after one austral summer, and it is called mcmurdoitis. The rarest and strangest of all strains is bentleyitis, but fortunately it afflicts only a very limited number of people who have no love for scenic beauty and who get their kicks from being placed in the middle of featureless, endless plains of snow and ice. The bad news about bentleyitis is that it appears to be self-perpetuating until the victim dies; the good news is that it affects only glaciologists, and they are probably expendable in today's world of remote sensing and satellites. Antarticae is as much a social disease as it is a natural disease, and the only sure cure is total abstinence, as once exposed is to be smitten for life. If you think you have it and want to get rid of it, you are hereby advised to spend the summer on a Greek island. That could help, particularly if you are male and the summer is long and the bikinis are brief.

**BOOKS AND THOSE KINDS OF THINGS.** In a recent Newsletter we mentioned that there was a new book out on Tryggve Gran, the only Norwegian on the ill-fated Scott Expedition of 1910-1913, entitled *The Norwegian With Scott*. This book may be somewhat of a purged edition, as Geoffrey Hattersley-Smith wrote in the excellent 12-page introduction that Gran was a prolific writer and quoted Griffith Taylor's "half-jocular comment" about Gran writing in six diaries at the same time. Whether this book reflects only sanitized comments for the British is not known, as the original diary kept by Gran is not available for scrutiny; but that is beside the point if you are a student of Scott's second expedition, or a disciple of the great Norwegian explorers. Gran inherited a considerable amount of money at a young age and commissioned an ice-reinforced 115-ton schooner be made for him to go to the Arctic. Then he met Captain Scott and was invited to go on his Antarctic expedition. Gran's diary entries begin on 29 November 1910 and continue through 12 February 1913. The last entry read, "Yes, Scott is dead, the adventure is at an end, and the future lies ahead." In Gran's case, his polar experience was just prelude to becoming a flyer. He bought an 80-horsepower monoplane and flew the North Sea from near Aberdeen, Scotland to Jaeren, Norway on 30 July 1914. It never received much attention in the press as World War I commenced about the same time, but it remained the longest out-of-sight-of-land flight for five years. Then he went back to England to enlist in the Royal Flying Corps and was credited with the destruction of 17 German planes and received the Military Cross. He must have been a most unusual man. There are 24 pictures in the 258-page book, which is handsomely published for the National Maritime Museum by Her Majesty's Stationery Office. It is available at \$17.95 through Bernan Associates, 9730/E George Palmer Highway, Lanham, MD 20706. Compared to Huntsford's *Amundsen and Scott*, it is overpriced, but what is money for, if you can't buy books? Certainly all good Scott men like Bob Nichols and good Norwegians like Jackie Ronne should BUY!

There is a provocative article in December (?) *Omni* by Patrick Tierney which is

directed towards the psychology of Antarcticans. Bergy Bits has always been interested in what influence Antarctica has had on the careers of people after their return from the ice. Invariably it was a most positive experience for the men who went south with Byrd, and many of the IGYers used it as a springboard for distinguished careers. The article said that psychologist Kirmach Natani and psychiatrist Jay Shurley "traced former Antarctic personnel now living in the United States and found that several became heavy drinkers," which Shurley attributes to the polar experience. Shurley and Natani say some who stay through the Antarctic winter never recover - they become 'professional isolates'." Bergy Bits thinks this is all a lot of bull, although I must confess there is a generation gap between my era and today's. I would place a small wager that people might drink more on that ice than after they return home. I think old Shurley ought to come to Washington and give a talk about some of these things - and bring along his data bank on us!

Sir Edmund and Peter Hillary have a new book, *Two Generations*, which must be all about mountaineering.....Charles Neider's Antarctic novel, *Overflight*, is supposed to come out this March. Watch for it.

**RUSSIANS DO IT WITH CLASS.** The Soviet Geophysics Committee has marked the triple anniversary of the First and Second International Polar Years (1882-83, 1932-33), and the International Geophysical Year (1957-58) by issuing a commemorative medal honoring "100 years of International Geophysics." Approximately 1000 of the medals were struck, and the Soviet Geophysical Committee, through its United States counterpart, the National Research Council's Geophysics Research Forum, has bestowed the medal and an accompanying certificate on approximately a hundred American scientists. The bronze medal is about 2 inches in circumference and has a prominent aurora display on one side honoring the triple anniversary. The other side has a sailing ship, antennas, and other things with an inscription which translates to "International Geophysics is 100 years old." The accompanying dark maroon-colored certificate's translation reads "In recognition of distinguished contributions to fulfillment of international geophysics programs, the Soviet Geophysical Committee of the USSR Academy of Sciences honors \_\_\_\_\_ with its commemorative medal '100 Years of International Geophysics', V. V. Belousov, Corresponding Member of the Academy of Sciences and Chairman of the Committee." We don't know how many of the 100 medals ended up in polar hands, although Charlie Bentley hopes that EOS may be able to get the complete list and publish it. Bergy Bits tried and failed, but Charlie has clout which we don't have, so he may succeed. If so, we will pilfer from him, as we aren't choosy where we get our material! But it is a very nice medal, a beautiful souvenir of the polar years and the IGY, and I'm sure all of its recipients appreciated receiving both the medal and the certificate.

**THE MOLENAAR MCMURDO MAP.** There is good news and bad news. The good news is that Dee Molenaar has completed the map; the bad news is that the contract with the American Alpine Club has not been signed. They asked Dee for some hard figures a month ago, and he provided them. Someone seems to be dragging his feet at the AAC, or maybe they are all off climbing mountains and no one is home tending the store, I have an idea that my prediction of Easter Sunday may not be worth the paper it is printed on, that it may turn out to be midsummer. I apologize profusely to all of you who sent money last fall for the map, but you will get it eventually and at that rate. Everyone had good intentions, but like a marriage, things can go asunder.

**MARY LYNNE VICKERS JOINS SOCIETY.** We have twenty-seven new members this year, and one of the newest ones is Mary Lynne Vickers, Station Science Leader at the South Pole in 1983. She is with the South Dakota State University Department of Veterinary Science in Brookings, a town of about 18,000. The department is a diagnostic and research laboratory for animal diseases. She writes that "mostly

what I am doing now is bovine diagnostic virology as well as working up some research projects." She finds many similarities between that part of South Dakota and the South Pole - flat, cold, isolated. But one aspect which is different - beautiful sunsets which happen more than once a year. Mary Lynne's address is 611 9th Avenue, Brookings, SD 57006.

**DALRYMPLE RETIRES BUT HIS FAIRLANE ROARS ONWARD.** Forty years ago this spring I was sprung from a German P.O.W. camp, and I have decided that an appropriate way to celebrate it all will be for me to terminate my government service. Outside of one frustrating year when I had an impossible double-dipping ex-military officer making life miserable for me, it has been a great career. I worked on the North Atlantic for over two years; worked on top of a mountain; was in Antarctica for the International Geophysical Year; was flying out of Bombay on the International Indian Ocean Expedition; spent a season in Greenland at Dye II; and was in Thailand four different times in conjunction with managing a large interdisciplinary environmental research program. Even Washington wasn't all bad, as I had a great tour of duty at the National Defense University. But now the time has come to really enjoy my life. My first fun thing in retirement will be going down the Colorado River with old Troy PeVe and what supposedly is a group of his college-kids-turned-alums. But he didn't have a full raft load, so he has rounded up some nefarious souls of questionable character, but with dollar bills, like Louie DeGoes, Max Britton, and me, and we're all going to take a late May dunking. I have walked on the shores of Lake Baikal in Eastern Siberia, but have never seen the Grand Canyon from the ground! Now it's time to discover America. Those of you who have been writing me at my residence in Alexandria, Virginia, please scratch that address as I'm closing out there the end of March. If you have any Society mail for me, send it to the Nerve Center (905 N. Jacksonville Street, Arlington, VA 22205), and Ruth will handle it or forward it to me. I expect to have seasonal floating addresses, but for the time being I'll be moving into my condominium in the Blue Ridges at Wintergreen, Virginia.

My retirement has been prolonged by my darn 62 Fairlane which refuses to quit. When I picked it up eleven years ago for \$275 it had 28,000 miles on it and I was 50. I hoped that I could get five years out of it, and then I would retire myself and the car. But the car was too good to drive into the river, so I kept on working. It has even provided transportation for such Antarticans as Larry Gould, Bud Waite, Dotte Larsen, Mimi George, and others. Now it has 235,000 miles and a hole through the floorboard, but the original engine roars on! It has cost me a tenth of a cent per mile! Now I wonder how Doc Abbot makes out with his twin Cadillacs. Art Ford has me beat, though, as he learned to drive on a Model A and is still driving it. A pompous showoff! However, maybe I do have a record of sorts, as I have owned only three cars in my whole lifetime. Any self-respecting spoiled brat in high school has that many cars before he/she graduates.

I'm going to keep on with the Antartican Society and the Newsletters, as someone has to tell it as it is and I'm afraid my replacement might be a cop out. But, seriously, I expect to remain in close touch with Ruth, and since the Society is basically a wintertime operation, it won't cut into my warm weather plans of summer.

**IMAGINING ANTARCTICA LOOKS GOOD.** Rachel Weiss was in Washington in late February to discuss Imagining Antarctica (see Bergy Bits for November 1984) which appears to be off to a good start. She has received something like 75 proposals from artists from many countries who are interested in exhibiting their works of art. Current plans are for the traveling exhibit to open in Austria sometime in 1986, then move to the National Maritime Museum and Scott Polar Research Institute in England in 1987, and be here in Washington at the Smithsonian in late 1987. Rachel has established a five-person Board of Directors, as well as a Board of Advisors. Our own Ruth Siple serves on her Board of Advisors.

**GENTLEMAN JIM, HIGH PRIEST OF HIGH LATITUDES.** The Alaskan Research Policy Act of 1984 mandated that an Arctic Research Commission be established to develop and recommend an integrated national Arctic Research Policy. Senator Frank Murkowski of Alaska, Father of the Act, announced in Alaska on 26 February 1985 the names of the gentlemen appointed to the Commission by President Reagan. The Chairman of the Commission is Jim Zumberge, President of the Scientific Committee on Antarctic Research, which means that Jim is the Dalai Lama of the Polar Regions. I've heard of absentee owners of sports teams, but Southern Cal must feel like they have an absentee president with Jim filling both of these most important polar positions! The Vice-Chairman is Juan Roederer of the University of Alaska, an outstanding upper atmospheric physicist. And the third member from academia, called for by the Act, is A. Lincoln Washburn, whose name is synonymous with the Arctic and whose achievements there are internationally recognized. The indigenous representative is Oliver Leavitt of Barrow, Vice-President of the Arctic Slope Regional Corporation and Board member of the Alaskan Federation of Natives. The fifth member is Elmer Rasmuson, former mayor of Anchorage and chairman of the Executive Committee of The National Bank of Alaska. Zumberge, Washburn, and Rasmuson were to be sworn into office in Anchorage on 1 March 1985; Roederer and Leavitt in Fairbanks on the same date. Our appreciation to Senator Murkowski's Press Assistant, Steve Hansen, for making this information available to us. The Antarctic Society applauds the powers that had the foresight to appoint such a distinguished group and hopes that the Arctic can become almost as successful as the Antarctic. Perhaps they, too, can host a meeting on one of their glaciers!

**KITTY GIRL IS FAMOUS CAT.** A year ago last December when Ruth and I were in the San Francisco area we were fortunate enough to be invited to Helen Poulter's lovely home in Los Altos Hills overlooking the whole Bay. Helen, of course, is the widow of Tom of Antarctica, he being the Scientific Leader on BAE II, as well as being Mr. Snowcruiser of the U.S. Antarctic Service Expedition. While we were at Helen's, this cat shot through the room like a jato bottle had sent him. Helen told us about the cat in a letter written this past January 23rd. "As a kitten she was chosen by Ray Berwick of Hollywood animal-trainer-fame to be trained and used for an electronic-implant-hearing program. A surgeon put coated wires in her cochleas and a gold button atop her head for instrumentation. When Berwick found her too uninterested in food to be trained, she was returned to Tom and Dr. Michelson (grand nephew of A.A. Michelson of speed-of-light-fame) and after some useful experiments the button was removed and she was given to us . . . . During one experiment the men were listening through the cat's ear to what she was hearing and suddenly all extraneous noise ceased and she was listening to the chirping of a bird outside the open window. Now you know how cats shut us off." I presume this same mechanism must apply to how husbands shut off their spouses, and vice versa.

**SNOWBALLING IT.** We understood that some guy was in town with his dog sled for the inaugural parade which never was because of, sic, the wind chill equivalent temperature. His name wasn't mentioned in the media, but it had to be old *Norman (BAE I) Vaughan*, who must be at least 76, as he has been here in Washington for the past two inaugural parades. . . *Nolan (Wilkes 57) Aughenbaugh* is leaving the University of Alaska this summer, and will be joining the University of Mississippi's Department of Geology and Geological Engineering in July. I thought he had found a home in Alaska . . . . *Terra Nova*, Ted Tally's stage play about Captain Robert Scott's ill-fated expedition, will be playing in Boston University's Huntington Theatre, 264 Huntington Avenue from March 9th through the 31st. Tickets range from \$9 to, gulp, \$19.50. Probably a better take-in than the Boston Bruins . . . . There is good news from Harry Keys in New Zealand, which is that the 1986 New Zealand Antarctic calendars will be available in August, and we have tentatively placed

(1) an order for 200, (2) an order for a truckload if Mt. Siple is on one of the months, and (3) an order for a shipload if Mt. Dalrymple is on one of the months. . . . The *British Antarctic Survey* has a beautiful 32-page booklet explaining their research activities, and for the all-time Antarctic understatement, how about its first sentence, "The ice-covered continent close to the South Pole is called Antarctica."? . . . Joe Lynch, polar philatelist extraordinaire, writes, "As CBS's Andy Rooney would say... 'Didya ever notice that the Antarctic Society "newsletter" doesn't really have a title?'" My answer to that, Joe, is perhaps the polar philatelists had better follow suit with their Ice Cap News if they are going to have pages and pages on Tristan da Cunha. You know, Richmond, Virginia, the capital of the Confederacy, is closer to the North Pole than Tristan da Cunha is to the South Pole! . . . . Our own Pete Barretta is writing a fantastic column on USARP in Ice Cap News, just super! . . . . John Cadwalader, ex-Navy captain, wrote about a Harry Wexler reminiscence. It seems that Harry was introducing a famous Norwegian scientist at a meeting in Buenos Aires, and the introduction got away from old Harry as he carried on and on. Just when he seemed to be reaching a climax, Harry "would take on an anguished expression" and go off on another list of the speaker's accomplishments, publications, etc. Finally, desperately aware that he could not prolong this indefinitely he blurted out 'I take great pleasure in introducing the renowned scientist, Dr. Schitt.' " . . . Rachael "Bourbon Balls" Kuivinen (Karl's mother) is now a member of the Society. It seems that Rachael and her sister, Annette (mother of Antarcticans John and Bob Evans) have been sending bourbon balls to Antarctica for quite a few years, and they are now considering opening up a local franchise right there on Ross Island as soon as they can work out some very minor logistical problems . . . . Anne Benninghoff disclaims my theory that water derived from melting snow causes pregnancies in Antarctica. I think her problem was Millipore filtering. If she had just drunk the melted snow water straight, I'm sure she would have had better results . . . . Arnold (*U.S. Antarctic Service Expedition*) Court received the 1984 Editor's Award from the *Journal of Climate and Applied Meteorology* . . . In the mail came the following, earmarked "For Bergy Bits", and it read, "What male coproducer of the Antarctic Society Newsletter has asked a female member from West Texas to share his apartment? Answer upon request." All I can say is that Bergy Bits has exquisite taste, and any male member of our Society who knows the subject of my proposition would have to agree. You have to ask, otherwise you'll never know. I sure hope she answers, soon! . . . . Hubbs-Sea World Research Institute has announced an agreement with Society Expeditions to establish the Hubbs-Sea World Research Institute Laboratory at Sea aboard the cruise ship SOCIETY EXPLORER. The laboratory will be manned by Institute staff and colleagues who are involved in research in the areas covered by the cruises. To date, Joseph R. Jehl, Jr., Frank Todd, and William Evans of H-SWRI have made cruises on the ship. Sounds like a great deal for all . . . . Did anyone tape the 4-hour show on Shackleton which appeared' on cable TV (Arts and Entertainment Channel) this winter? If so, would they consider loaning it to the Nerve Center, please? We would love to see it.

**FUTURE EVENTS.** The Memorial Lecture for 1985 will NOT be held this spring because the National Academy of Sciences' Polar Research Board meeting this spring will be held in Madison, Wisconsin. So we'll hold off until their fall meeting, and then have it at that time. Whether there will be another regular meeting this spring is not known as we go to press, but if there is one, it will be in late April. It is anticipated there will be one more Newsletter prior to our summer siesta. The Society WILL have a picnic, but it will be a fall encounter sometime in October at Horsehead Sanctuary (Bill Sladen's) in Maryland. We are picking a time when there won't be mosquitoes but there will be geese!

*If you move, PLEASE send us your new address! Newsletters are NOT forwarded.*

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 85-86

September

No. 1

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.) 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984

TWO FALL SPECTACULARS!

The Antarctic Society and the National Academy of Sciences'  
Polar Research Board are most happy to co-sponsor  
the Society's 21st Annual Memorial Lecture

NOT QUITE ALL YOU EVER WANTED TO KNOW ABOUT ICE,  
CO<sub>2</sub>, GREENHOUSE AND SEA LEVEL

by

Dr. Mark F. Meier  
Incoming Director

Institute of Arctic and Alpine Research (INSTAAR)  
Boulder, Colorado

and

Professor of Geological Sciences  
University of Colorado

on

*Thursday evening, October 10, 1985*

*8 PM*

The National Academy of Sciences  
2101 Constitution Avenue NW  
Washington, D.C.

*Preceded by*

*Cocktails in the Great Hall at 5:30*

*and*

*Dinner in The Refectory at 6:30*

---

## Fall Picnic

HEAR YE! HEAR YE! OUR ALMOST-ANNUAL, ALMOST-MIDWINTER PICNIC WILL BE HELD AT BILL SLADEN'S HORSEHEAD SANCTUARY IN GRASONVILLE, MARYLAND ON SATURDAY, OCTOBER 12, from 12 noon to 5 PM. DETAILS ON THIS OYSTER AND CHICKEN GALA ARE ON page 3.

MAKE YOUR RESERVATIONS ASAP FOR THE DINNER - AND THE PICNIC!!! (See last page)

If you haven't received a Newsletter since March, it's because there hasn't been any. Retirement has somehow resulted in much less free time. Following a nose operation, I found out from my brother, a dentist, that I needed extensive reconstruction (gum surgery, root canals, bridges, partial), so he has been holding me hostage in Maine while all this goes on. I interrupted that major project to drive back to Washington in mid-September to get this Newsletter in the mail prior to the Memorial Lecture AND the Almost-Annual, Almost-Midwinter picnic. Then I will drive on back to the dentist chair, a round trip of 1400 miles! We are putting this together in a hurry, and, per usual, Bergy Bits comes with no truth assurances, nor does the Antarctic Society endorse any of its contents. We trust there may be an item of interest to every member, as we do try to find stories of general interest as well as periodic items from different Antarctic eras.

**MEMBERSHIP - ALMOST 500 IN VIEW.** Our Society has 483 active members as we start the 1985-86 season. Last year we picked up 42 new members, four died, and 22 were dropped (for nonpayment of dues). So we could possibly hit 500 by next June. This isn't so bad considering that seven years ago we had only 150 paid-up members. The Society becomes more and more a national organization in contrast to its former position as basically a Washington area group. Dues will remain the same - seven dollars locally, six dollars out-of-town. We hope to get the bills out in the very near future, and if you don't get one, you are paid up. Forty-six percent of our members are paid up this coming year, and that's just great for Treasurer Siple. And those of you getting bills, won't you please consider sending in your check for multiple years which helps our bookkeeping tremendously? Remember, this is a small-time operation by Ruth and myself, Paul Dalrymple, and even though it's a labor of love, we do like to do other things, too. So those who get bills, please pay early, and pay for several years, and we might possibly, though unlikely, say something good about you in the future.

**BON VIVANT MEMORIAL LECTURER.** Mark Meier overcame his midwestern upbringing in Iowa City to become a Man of Many Glaciers, and has never seen a glacier which he didn't love, be it in the Pacific Northwest, Alaska, Greenland, Alps, or Antarctica. His field work produced the first structural map of a glacier (Dinwoody Glacier, 1950); the first determination of strain-rate tensor field on a glacier, and an early attempt to compare flow law data from surface and subsurface deformation data (Saskatchewan Glacier, 1954); the first detailed work on deformation and temperature fields around forming crevasses (Greenland, 1955); and all kinds of other good, imaginative, provocative research since those early days. He has done pretty well for a corn-fed kid, being an Institute Scholar at Cal Tech, 1952-53, and Fulbright Scholar at the University of Innsbruck in Austria, 1955-56, where his appreciation for the good life must have been nurtured/refined by the late Herfried Hoinkes; and receiving the Sigma Xi Award for Exceptional Research by a Graduate Student at Cal Tech, 1957, the Distinguished Service Award (Gold Medal) from the Department of Interior, 1968, three medals from the USSR, and the Seligman Crystal from the International Glaciological Society in 1985. Currently Mark is Project Chief, Glaciology in the Water Resources Division, Geological Survey, in Tacoma, Washington, but in November he will become Director of the Institute of Arctic and Alpine Research (INSTAAR), and Professor of Geological Sciences, University of Colorado, Boulder.

He has many loves, such as sailing, good music, fine wine, gourmet food, and art. He has been accused of coining "Gesundheitstrasse" to describe every aspect of the constitution, structure, and other features of a longitudinal septum that ran the whole length of a lower glacier (on the Blue Glacier). He vehemently denies coining the phrase, but this column never lets the truth get in the way of a good story, so we present it as gospel. Mark is a delightful character and an excellent speaker, so this erudite scientist, who has long been concerned with sea level changes around the world, will no doubt give a most memorable lecture for our 1985 Memorial Lecture. The National Academy of Sciences' Polar Research Board will be in session here in Washington, and we are looking forward to all of their members being at the lecture. Be sure to mark it on your calendar, NOW, and let's pack the place - 2101 Constitution Avenue, N.W. - the Citadel of Scientific Knowledge in Washington.

**PRE-MEMORIAL LECTURE BLAST.** In the best of Mark Meier's lifestyle, there will be drinking and eating preceding his Memorial Lecture. It will all start at 5:30 PM with cocktails in the Great Hall, followed by dinner at 6:30 in The Refectory downstairs. The Academy has a peculiar ground rule which prevents selling booze by the drink, although there is nothing wrong with having liquid refreshments available as part of the dinner cost. The dinner will be buffet style, and will consist of breast of chicken, salmon mousse, pasta, fresh vegetables and cheeses, salad, and chocolate mousse. The total cost will be \$23 per person, regardless of how much or how little one may drink. Previous meals in The Refectory have been just excellent, and it has always been an enjoyable evening. This is our biggest blast of the year, and we want a really good representation. Since we are required to have an early head count (by October 3rd), please let the Nerve Center know ASAP if you are coming for dinner. If we don't hear from you, we may send Tony Meunier over to your house to do a little arm twisting, and we know you wouldn't want Tony showing up on your doorstep. So act NOW!

**MIDWINTER PICNIC A TRIFLE LATE - OCTOBER 12, 1985.** We firmly believe" in variety being the spice of life, and to jazz up our lives a bit, we have something new and novel for your consideration - a midwinter picnic in the good old fall at a wildfowl sanctuary an hour's drive from Washington. Our own Bill Sladen is director of Horsehead Sanctuary and he will be there in person to give us a guided tour. Last spring a Society task force of Ed Todd, Dotte Larsen, Pete Barretta, Ruth Siple, and Bergy Bits went out to look over the Sanctuary and to see the many birds, and had a delightful time. There are some 310 acres of wetlands, with six distinct marshland habitats, and one can expect to see lots of wood ducks and black ducks flying from pond to pond, migrating ducks, herons and shorebirds from the blinds, new ducks and swans in their captive collection, and, as an aside, white-tailed deer. Over 67 species of water birds frequent the surrounding area. The Sanctuary is on the Smithsonian's list of critical areas to be protected because of its special ecological and educational value.

If you like sitting in a chair, you jolly well had better bring your own folding lawn chair, as no one else is going to bring one for you, and the afternoon could get long. Also bring your own liquid libations to go with a catered oyster and chicken feast. For \$10 one will get oysters (raw and steamed), barbecued chicken, au gratin potatoes, potato salad, cole slaw, green beans, baked beans, possibly corn on the cob, rolls, cakes, and coffee. How can you beat that when whistling swan, tundra swan, and snow geese are providing music to eat by! Kids should love it, but we hope they are trained to respect wildlife and the environment. Police your litter, and let's leave the place as nice as when we arrived. It's a privilege to be invited there, and we surely don't want to abuse it.

**ANTARCTIC CALENDARS.** I don't know why we get involved in the sale of Antarctic calendars, but perhaps it's tied in to the fact that we aren't very smart. There

are so many nice calendars now, that we wonder if ours will sell. We're going to push the Harry Keys' New Zealand Antarctic Calendars, but are also going to sell the USARP calendars. Bergy Bits feels that the New Zealand calendars are an order of magnitude better than the USARP calendars, but then there are those who prefer the USARP calendar. The New Zealand calendar seems to have better pictures, better reproduction, less ink, and, foremost, are here in plenty of time for mailing out before Christmas. But we understand that the USARP pictures this year are much better, and presumably the calendar will again feature a chronology of Antarctic events throughout the year. We will be selling them both at the same price, \$6, including mailing. If you pick them up at the Nerve Center, only \$5. If you want to go higher class, The Antarctica Project, 1845 Calvert St. N.W., Washington, DC 20009, will have their Antarctic calendar available in November. Jim Barnes anticipates that it will cost "about \$12.50." Their 1984 calendar was just great. Then there is the commercial penguin calendar from Sausalito, California which one can find in any reputable bookstore which carries calendars. However, why don't you buy from us so we won't get stuck with a bunch of leftover calendars? PLEASE!

**MCMURDO SOUND AREA MAPS FOR SALE.** At long last, Dee Molenaar's Oblique Pictorial Map of the McMurdo Sound Area has arrived. Those of you who ordered them last year should have received your copies by now. It's rather hard to anticipate its popularity, so we ordered only 200. It is 24" x 38" (overall), and the back side is covered with a potpourri of facts and information about Antarctica under the title of "Summary Guide to Antarctica and the McMurdo Sound Area." If you have an inquisitive mother-in-law you can't stand, you could give her one of these maps and hopefully avoid having to answer a lot of foolish questions about Antarctica. There are some errors on the map, but only a Ruth Siple would find most of them. On the whole it is something novel and interesting, and should be a popular item in McMurdo. The initial response we received from those who ordered early is that they are very happy with them. Your Society will be selling them for \$7.50 by mail, fifty cents cheaper if you pick them up at the Nerve Center. This is more than we originally anticipated, but production costs ran much higher than Dee anticipated. Once we sell out our supply, we won't reorder, so if you want one, come in NOW with your order!

**CHANGING OF THE GUARD.** If the polar community doesn't look exactly like it did a couple of years ago, it's because it isn't. The post-World War II crowd are disappearing over the horizon, and there is also a lot of movement among the younger people. The Peter Wilkniss Division of Polar Programs has experienced many changes, with three of its Program Managers (Mart Turner in Earth Sciences, Dick Cameron in Glaciology, and Ben Fogle in Atmospheric Sciences) leaving. The Manager of the Polar Operations Section, Price Lewis, also retired, and his long-time deputy, Ken Moulton, has his retirement papers filled out for the end of the calendar year. A lot of seniority has gone out the door, and with Moulton's leaving, the Silver Fox of Christchurch and Potomac, Walt Seelig, will become The Grand Old Man of the Antarctic at NSF. No one knows exactly how old Walt is, but with his position he would be foolish to retire as he has the best of both hemispheres, never knowing winter. Fogle has been replaced by John Lynch, while two acting managers, Tony Inderbitzen and Jane Dionne, have moved temporarily into Turner's and Cameron's positions, respectively. Ron La Count has replaced Price Lewis. Meanwhile, down the street at the corner of 21st and Pennsylvania, we find that Tim Hushen is no longer in residence as Staff Director of the Polar Research Board, National Academy of Sciences. His main purpose in life is now serving the whims of the U.S. Arctic Research Commission in Los Angeles, although we understand that his umbilical cord to the Polar Research Board will not be totally severed. Currently Shere Abbott is acting like Tim Hushen, although much more prettily. Charlie Bentley's tour of duty as Chairman of the Polar Research Board has expired, and he has been replaced

by Gunter Weller of the University of Alaska, who once served as a program manager in the Office of Polar Programs at NSF. And there's a new kid in town, Jerry Brown, who is filling a newly-created position as Head of Arctic Research and Policy Staff in the Division of Polar Programs. Jerry is a workaholic, human dynamo of fifty years who doesn't have a single grey hair in his full head of hair.

We wish all of those who have left the very best, and particularly want to thank Mort Turner, Dick Cameron, Tim Hushen and Ken Moulton for the many fine years of service which they have given to this Society. And for those moving in, we wish you happiness in your new positions and hope that you will join our Society, if you are not already members (Brown and Inderbitzen have been members for several years). A new broom can sweep clean, and it must be refreshing to Peter Wilkniss to have so many of the old hands retiring so that he can put some people of his own choosing into key slots - like a new head coach of a football team bringing in his own staff! It just does not happen that way in the government, but it has almost happened that way in DPP. Good luck, all!

**BIG BERT IS BACK.** The Antarctic community was aghast to hear that Bert Crary had fallen upon ill health this year, but as we are preparing to go to print, it appears that he is soon going to be released by the Good Samaritan Hospital in Baltimore to the tender, loving care of Mildred at their home. Bert, Mr. Antarctica IGY, the very first scientist to have worked at both the North Pole and the South Pole, started to feel ill shortly after he spoke to our Society in late November 1984. He has had a real rough ordeal, and the old warhorse had some days in early July when they didn't know for sure if he was going to make it, but he came back. Bert has more lives than that proverbial cat, and if he were meant to die early in life the Grim Reaper would have taken him when he was cast into the Ross Sea while making a hydrological station on the barrier when it calved and tossed him into Kainan Bay back in 1958.

Bert had subacute bacterial endocarditis (SEE). Doctors and tests failed to diagnose it for more than four months, by which time he was being checked out at the George Washington University Hospital. They gave him antibiotics and in two and a half weeks sent him home, with Mildred and a night nurse continuing the IV antibiotics. The SBE destroyed his aortic valve and did further damage inside his heart. He wound up in the Washington Hospital Center, having emergency surgery to replace the valve and clean up two cavities surrounding that valve. Apparently he had a stroke at the time. He was in the intensive care unit for two weeks and in the hospital for another five and a half weeks, beginning in late July/early August to talk and receive therapy.

On August 15th Bert was transferred to the rehabilitation unit run by Johns Hopkins in the Good Samaritan Hospital in Baltimore. He suffered another minor stroke on the 19th, but since then has made steady gains. He lost forty pounds, but has already put ten of those back on. They gave him an overnight pass on September 7th so he was able to go home and have a glass of champagne. But he said it didn't taste all that great, so you can see Bert hasn't fully recovered. He walked by himself on the 8th, and with continued improvement hopes to come home (8301 Beech Tree Road, Bethesda, Maryland 20817) from the hospital about the time most of you will be getting this Newsletter. I presume that it won't be long before he'll be back on his home computer continuing to write the history of the IGY.

Bert is a most unusual man, and dearly loved by all who served with him in the field and by those who worked for him back here in the States. Somehow or other he is both a Man's Man and a Lady Charmer; he's a rough diamond as well as a polished jewel. He would be equally at home talking to the President or to a local union of garbage collectors. I was privileged to spend a year with him at Little America V in 1957, and it was just great. I was sorry to see Bert get married as we used to have some good nights on the town, but Mildred was probably the best thing that ever happened to Bert. If it were not for her, he wouldn't be alive today. I'm sure happy he's making such a good recovery, and it will be good to drink beer with him once again.

**OHIO STATE UNIVERSITY ACQUIRES BYRD PAPERS.** Peter Anderson ascended directly into Heaven without dying on September 6th when Ohio State University formally took physical possession of approximately two-thirds of the papers of the late Admiral Richard E. Byrd. The Boston's State Street Bank and Trust Bank, executors of the Byrd estate, solicited proposals from universities concerning their interests in purchasing the Byrd papers, and The Ohio State University won. The material was appraised at \$155,000, and that's what Ohio State paid for between 500 and 600 boxes of material, which will fill more than 35 file cabinets. David Elliot, Director of The Ohio State University's Institute of Polar Studies, in a "Dear Colleague letter" of 30 July 1985, wrote, "The matter of fund raising in order to establish the Byrd Polar Research Center is under discussion within the University and has to be tied in with a major fund-raising campaign that was announced earlier this year." The Byrd Foundation is also establishing a Fellowship Program at Ohio State University, one in the name of Marie and Richard Byrd, which will be for advanced graduate students, presumably polar-type doctoral candidates. The material is currently in temporary storage in the University library, and it will be several years before everything is catalogued and filed, at which time it will be opened for researchers to study.

This is sort of the culmination of a dream for Peter, as he has been actively pursuing these papers since 1973. He is as happy now as a pig in a yard full of mud. Peter would very much like to have a definitive study out on the late Admiral in 1988, which will be the 100th anniversary of his birth, although Peter doesn't think this is very realistic because of the short time and all the researching yet to be done. He had an interesting comment on the Admiral, calling him "Grandfather of Us All", and saying that if it were not for his interests in Antarctic exploration and discovery, it all would not have gotten off the ground so early or so successfully.

Peter talked about some of the things in the Byrd holdings, including a one. and a half page letter from James Clark Ross to a member of the Byrd family. When I talked to Peter on September 11th he was looking over material from Byrd's 1925 Desk Diary which has many interesting comments on his polar activities. There is a running log of Byrd's TransAtlantic flight. I asked about correspondence, and Peter said there was "a tremendous amount," which is certainly exciting to those of us who like to read other people's mail! There are letters from many former presidents, and one from the late Captain Finn Ronne in 1955 soliciting Byrd's support to stay in polar research; Byrd's personal photo album from the 1st Byrd Antarctic Expedition; a volume of articles about Byrd and the Antarctic which was evidently bound by the New York Times; many scrap books of press clippings; radio logs; ships' logs; personnel files on members of the expedition (including their signed contracts, salaries paid, source of said funds, et cetera); and boxes of letters requesting philatelic mailings. The holdings are "very heavy on photography," with some 16" x 20" prints which Peter surmises may have been hung on the walls at Little America I. There are also picture postcards with Antarctic scenes. And, as the saying goes, this is only the tip of the iceberg. But isn't it exciting, something like getting hold of the Mother Lode! Bergy Bits is happy for Peter Anderson and Ohio State, and I think it is all just great news.

**SENTIMENTAL JOURNEY.** Operation Deep Freeze I and the original South Pole personnel traveled to Norfolk, Virginia in early August where they held a three-day 30th reunion in a highly emotional atmosphere at the Quality Inn, Lake Wright. Dave Canham, former lineman at the University of Michigan (in the halcyon days of Tommy Harmon and Forrest Evasheski), who was the senior Naval officer wintering over in 1955-56, masterminded the Gathering of the Clan. I'm sure 1955-56 was the last super-great year for the Navy in Antarctica, as civilian scientists started coming during the IGY, and never again was it the same for the military. There was a lot of pride among those men, and their esprit de corps still runs high. All together, including wives and children, 115 people gathered, 56 of whom were Navy personnel from McMurdo. To begin the full day of planned activities on August 2nd, Father John Condit, the Catholic chaplain

at McMurdo, renowned for his pugilistic accomplishments, and Dave conducted a memorial service for those departed. Then a greeting from Rear Admiral John Paul Jones, current head of the Navy Seabees, and one from the residents of McMurdo, were read. An interesting presentation on the current status of our Antarctic bases was given by Commander Robert Harler, Operations Officer, COMNAVSUPP Force Antarctica. In the evening everyone gathered for the banquet. Entertainment was provided by John Condit and his accordion, after which Dave was presented a captain's chair by those attending the reunion, and presumably he will be able to use it shortly as he is contemplating retirement. Many of the Navy personnel attending were also involved in the construction of the South Pole station.

The South Pole reunion was unique in that it found both Sand Crabs and Navy personnel coming together as one; it was in this same spirit that the late Paul Siple and the late Jack Tuck led the camp through its first year. It is my strong personal opinion that this group never got its due recognition, and that Siple suffered from being a close associate of the late Admiral Byrd. Not being notified at the South Pole of the dedication of their station at McMurdo only resulted in their strong in-camp unification. South Pole reunion attendees were Bob and Marilyn Benson and son, Greg, Cliff and Jean Dickey, Ed Flowers, Herb Hansen and his fiancée, Dorie Marshall, Mel Havener, Floyd Johnson, Mac and Marie McPherson, Tom Osborne, Moose Remington, Ruth Siple, Peg Tuck and son, Jonathan, and Ken Waldron.

Dave Canham says they are going to go for it all again in another five years, meeting in San Diego. There evidently was a reunion of VX-6 personnel of McMurdo in Oxnard, California from June 7-9, but Dave feels that he had the real doers at Norfolk. It looks like 30 years is the period of time it takes to whip out all the bad memories, as they all seemed to have had a great time!

**ED HILLARY, COMMISSIONER AND AMBASSADOR.** They have taken a perfectly normal human being, 65 years of age, with great physical drive and determination, stuck a white shirt and necktie on his upper body, and made him into a diplomat. What a sad way to wind down one's interesting career! Ed Hillary is now New Zealand's Commissioner to New Delhi and Dhaka, and Ambassador to Nepal. It must be an awful letdown, but he is not taking it that way at all as he philosophized about it.. "I'm basically a restless person, and I don't feel I've done as much as I could have. I've had my problems and I've had my good days. But knowing I'm a person of modest abilities, my main attribute has been that I tried to make the most of the opportunities that have been around. Life is a constant challenge. If you are physically unable to meet the challenge of younger days, and you are sensible, you set new challenges. And most of my adventures today are in the social and diplomatic field. I think I have been very fortunate. I've had a good life.." He still hopes to spend six weeks a year in the Himalayas and also "spend a great deal of time out of Delhi." This was all in an article by Louis Berney in the Boston Sunday Globe of 14 July 1985.

**FOOTSTEPS OF SCOTT.** In last January's Bergy Bits we mentioned that Robert Swan, then 27, and Roger Mear, then 32, were about to board the SOUTHERN QUEST which was to take them to Cape Evans to winter over prior to hiking in Scott's footsteps to the South Pole this austral summer. Presumably everything is still on "go", although just how they will ever get "home" from the South Pole is still not known. Hopes to have Giles Kershaw fly them out have gone awash because of his plane's previous commitment to the Arctic. They had planned to walk the 1420 kilometers in 75 days, pulling sledges behind them.

**90 DEGREES SOUTH EXPEDITION.** This one may never fly, hopefully, but as Yogi Berra once said, "It is never over til it's over," so we'll have to wait and see. It supposedly was to be a British-Norwegian expedition retracing Amundsen's trek to the

South Pole, even going by dog teams. The leader of the proposed expedition is a comely, young 33-year old Norwegian glaciologist by the name of Monica Kristensen who works for the Meteorological Institute in Oslo. They supposedly put two years into organizing the expedition, but evidently never did any homework on U.S. support of adventurers, which has been negative since our arrival in Antarctica. A couple of times the State Department and the White House have changed positions, but without the highest intervention the U.S. does not equivocate on their stand. Let's hope they can stand firm this time!

**A NEW ERA BEGINS - GIRL SCOUT SELECTED TO GO TO ANTARCTICA.** Commander Richard E. Byrd, before he ever met the late Paul Siple, was most wary, if not reluctant at heart, to have to take a Boy Scout to the Antarctic with him back in 1928. Wonder how he would feel today if he were told that a Girl Scout was going south with him? Everything comes to those who wait patiently, even for Girl Scouts, and this year Robin Moyle of Scarsdale, New York and future Cornell University freshman (or is it freshperson?) will be going to McMurdo Sound to work with biologists in that area, in addition to visiting other U.S. installations in Antarctica. Robin's credentials are most outstanding, and it's no wonder she beat out 65 other applicants chosen by different Girl Scout Councils. In Scouting she has achieved the Silver Award, the Silver Leadership Award, the Gold Leadership Award, and is currently working toward the Gold Award. Her hobbies are painting, drawing, and writing poetry, and she relaxes with movies, horseback riding, swimming, and dancing. She was a track star throughout high school so we imagine that she will be favored in Las Vegas to come in first among all women in the annual 10K race at McMurdo this coming austral summer. She is interested in wildlife and hopes to become a veterinarian, going to Cornell's Agriculture College after she returns from the ice. She's 5'8" of old-fashioned virtues like honesty, respect for others, modesty, politeness, commitment to family and religion," wrote her British Literature Honors teacher. *I really didn't know that we bred kids like her any more, and she must be a great joy and satisfaction to her folks, even though she didn't end up being a third-generation Brown University student. She has a clean, wholesome, scrubbed-behind-the-ears look, accented with a china doll complexion. Bergy Bits thinks she is a lot prettier and softer than Scouts Paul Siple, Dick Chappell, Mark Leinmiller, and Doug Barnhart all rolled into one! I have the feeling that they would have seconded the selection of Robin as she appears to be too good to be true. We wish her a great experience, and perhaps we can get her to submit some Antarctic poetry for a future issue of Bergy Bits. An alternate was chosen. She is Karen Prentice of Port Orchard, Washington who has an exceptionally strong background in backpacking and camping.*

Girl Scouts and Boy Scouts are here to stay in the Antarctic scene; NSF is even looking for a third responsible, science-oriented youth group to join them in alternate years. Incidentally, Scout Mark Leinmiller, the 50th Anniversary Scout, got married this past spring, and we wish Mark and Pam the very happiest of lives together. Scott Miller, a runnerup to Mark in 1978, will be getting his PhD at Harvard in entomology next spring. Way to go, Scott!

**AH, THOSE CHINESE!** The Chinese created quite a bit of a stir last December when they sent 600 men on two ships to King George Island to establish a research station, "The Great Wall." It seems that some of their military personnel weren't checked out on proper Antarctic etiquette, and their behavior was witnessed with great misbelief by some of the other parties on the island - there are six stations on the island which is 70 km long by 25 km wide. Dr. Dietrich, leader of the West German expedition, said that bands of up to 50 Chinese marched about the island bullying many species of seabirds. Glass and metal objects were put in skuas' nests, petrel eggs were painted, and penguins were chased over the edge of cliffs. The Russians

even accused the Chinese of eating penguins. However, Mr. Quo Kun, the Chinese leader, denied that any penguins were killed. According to *Newsweek*, the West Germans have reported the alleged offenses to SCAR.

**THE ANTARCTICA PROJECT.** They have a beautiful 38" x 24" colored poster out on Antarctica which shows its native inhabitants - birds, seals, whales, dolphins, krill, and penguins, as well as sites of special scientific interest. All college professors who claim any Antarctic interest should have one in their office. It's available from The Antarctica Project, 1845 Calvert Street N.W., Washington, DC 20009 for \$10.95 (plus shipping, which varies from \$1.41 in the Washington area to \$2.40). But if you order in lots of ten or more, there is a discount of 20%, plus shipping. It's really nice. As most of you know, they periodically publish "Antarctic Briefings," and in mid-July they put one out on the status of Antarctic Minerals Negotiations. They sell for \$2.50 each, but are worth every cent of that if you want to keep up on what is going on and are not privy to be a participant. The 7th session of the Special Consultative Meeting on Minerals is going to take place in Paris from 23 September to 6 October. The last one was in Rio de Janeiro, 26 February through 12 March 1985. They sure know how to pick meeting sites! But maybe if they went to some place like Grenada, Mississippi or Pawtucket, Rhode Island they might get more accomplished and wouldn't have to hold so darn many meetings. There is also an occasional newspaper published by Friends of the Earth and others at international meetings of environmental importance" which reports on the various Antarctic Treaty Consultative meetings, and has interesting material on Antarctica, which is available through The Antarctica Project.

**CALIFORNIA, MAYBE.** We have fifty odd members out there in California, and it behooves us to throw them bits from time to time so they won't execute a coup and take over the Society. The Scientific Committee on Antarctic Research (SCAR) will be holding a large international conference in San Diego next June (16th-27th). With Sea World and the Penguin Encounter being an added incentive, we are thinking of holding a west coast meeting in San Diego during the SCAR meeting. The last time we went west, old Art Ford and John Katsufakis handled all the arranging, but they are a long way from San Diego. But we think it can be done. Anyone any thoughts on the subject?

**NAS POLAR RESEARCH BOARD AND SCAR REPORTS.** Our Memorial Lecturer, Mark Meier, has a new study out on "Glaciers, Ice Sheets, and Sea Level: Effects of a CO<sub>2</sub>-Induced Climatic Change." We haven't seen it yet, but we do know it's on the streets and that Mark will present its highlights on October 10th. Then there is an ICSU/SCAR report, "Man's Impact on the Antarctic Environment," by Benninghoff and Bonner which appears to be an excellent study. It's short enough so that one will want to read it, then afterwards its beautiful, colored cover of an Antarctic Peninsula scene (?) makes it attractive enough to keep in your library. Tim Hushen wants me to be sure that Bergy Bits informs you all that the "Proceedings of the Future of the Antarctic Treaty System," all 275 pages of it, will soon be published. At one time this column attacked holding the meeting on the Beardmore as "the boondoggle to end all boondoggles." It was the site, not the subject matter which we questioned. There is another SCAR report out on "The Conservation Areas in the Antarctic." We haven't seen this one either, because the summer has been spent in dentist chairs. But if you want more information on the availability/cost of these publications, you should contact Shere Abbott, Polar Research Board, National Research Council, 2101 Constitution Avenue N.W., Washington, DC 20418.

**RAFTING WITH PEWE" ON THE COLORADO.** You might recall in the last Newsletter that Bergy Bits was celebrating his retirement by going rafting with the exalted polar

glacial geologist, Troy Pewe, he of Pewe Peak and Lake Pewe (he made out pretty well in the Antarctic considering he went down for only one austral summer, 1957-58). Troy rounded up a motley group of relatives, friends, neighbors, and innocents and told them to meet him at the South Rim of the Grand Canyon on a specific date, at a certain time. And you know who the last person was to show? - our dynamic leader! We all had received instructions, and were told to keep our total weight down to 45 pounds. I deliberated at some length on whether I should bring some beer for the eight-day trip, and guiltily brought a six-pack of Bud. But the guilt turned to chagrin when a former graduate student, wise in the ways of Pewe, arrived and unloaded his gear, which included seven cases of beer! The second blow came the first night when we made camp at Lee's Ferry, and all of the veterans started erecting beautiful tents, although tents were not mentioned in Troy's equipment list. Louie DeGoes, former Executive Secretary of the Polar Research Board at the National Academy, brought his wife, Allison, and his daughter, Ginger and her spanking new husband, an ex-major league pitching prospect whose career was terminated when he was involved in a terrible automobile accident. But Louie's life would have been in greater jeopardy the first night on the river if Allison could have found, some weapon to extinguish the old All-American from Colorado Aggie, as she wondered what she had ever done to Louie to merit his taking her along on the trip. Fortunately Louie had an unlimited quantity of Scotch along, so they survived all. Max Britton, the old Arctic man of great renown, was along with his effervescent wife, Vera, who was always seen in her nightgown down by the river's edge brushing her teeth at the first crack of dawn. Max was fantastic at putting up their tent in near-record time; he got the prize for getting his erection up first on each and every night. One of the real highlights of the trip came when two women from Alaska showed up at an evening cocktail hour bikined in penguin bottoms. The skintight shorts came from an outfit in Rhode Island. We have tried in vain to find out how we could purchase some for the Society, but they never answered. However, if you should ever be in Fairbanks, go to Murphy's Drug Store and ask the owner, Jim Murphy, if you could possibly see his wife's penguin shorts. If she, Sally, should model them, all the better, as she has a beautiful .... well, they just look great on her. Some of the rafters were great folks to raft with, such as a retired Air Force officer, Jim Bales, whom Pewe had suckered into returning to graduate school. Probably the piece de resistance was when one of the boatmen, Ray, mooned us all as he left us onshore (for helicopter pickup) and took off for Lake Mead.

Rafting with a bunch of geologists is sort of a trying experience. These guys have the biggest imagination of any group of pseudo-scientists I have ever encountered. They can see anything they want to see when it comes to a formation, and they always had an excuse when they couldn't find some fossil - "the water is too high this year; if it had been a normal year, they would have been all over the place." We never saw a trilobite, but we still all survived quite well, none the worse for their nonexistence. The biggest coup on the trip was something passed off as the Great Unconformity. If it wasn't The Great Pewe Hoax, it represented something like 50 million missing years between two formations. I was brought up in the Boston area, and a proper Bostonian defines the Great Unconformity as the left field fence at Fenway Park, the so-called Green Monster. Those who were geologically minded all went up and kissed Pewe's Great Unconformity. I barely survived the trip, not on account of the waterfalls which were a thrill to ride through, but because of all that geology. I finally told Troy, "If I hear the word 'Precambrian' one more time, I'm going to scream." Little did I know that we had run out of the damn stuff, and that the rest of the trip would be totally enjoyable.

Rafting on the Colorado through the Grand Canyon is a great experience, and you might as well go with Troy as anyone. With a little self-discipline, you can tune him out and just sit there and enjoy the great scenery. Some of the side canyons are truly spectacular, with the Havasupai Canyon being tremendously beautiful. Rafting with

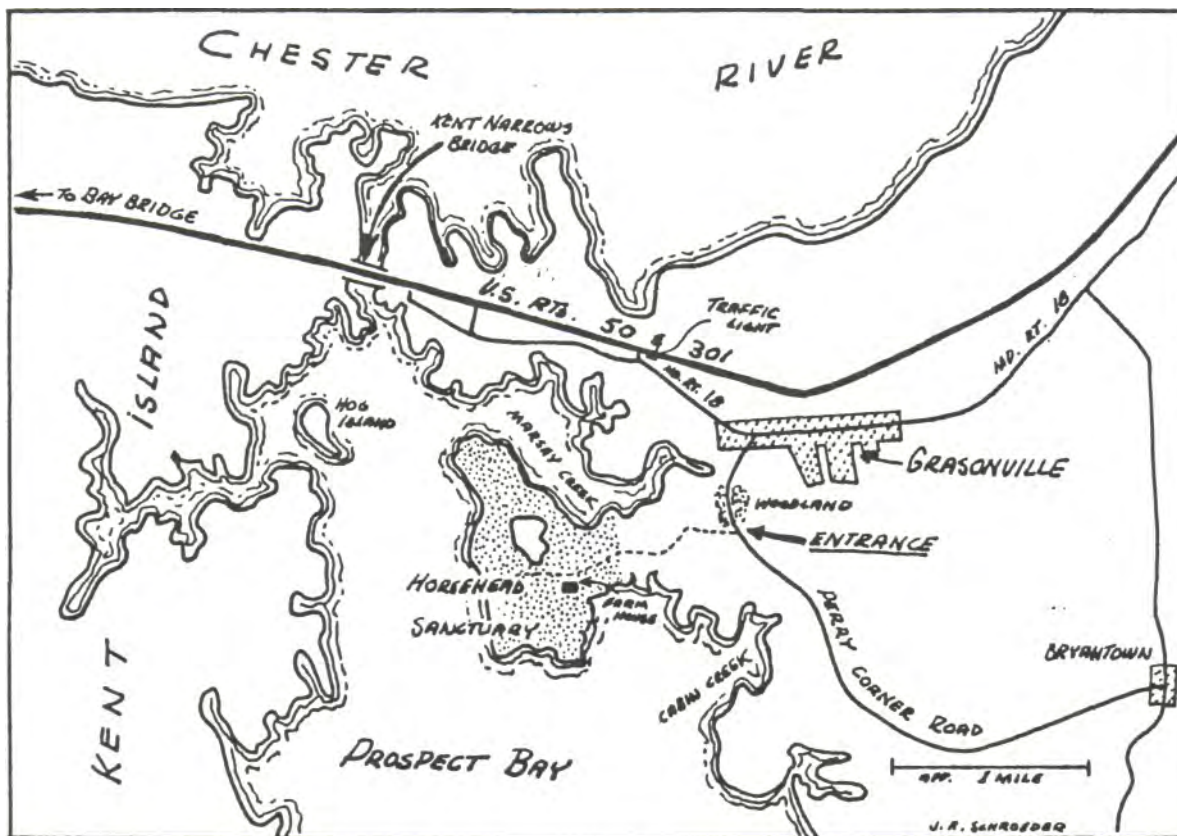

Pewe is about two-fifths vodka, one-fifth geology, one-fifth exploration, and one-fifth rafting. There's something in it for everyone, even an Allison DeGoes!

**CLARIFICATION OF POORLY-WORDED SENTENCE RE/ OHIO STATE AND BYRD PAPERS.** On page 6, we mentioned Ohio State taking possession of two-thirds of the Byrd papers. They will also be obtaining the other third, but couldn't get them into the truck on the 6th of September. So Ohio State is getting ALL available Byrd papers.

**LATE NEWS. GIRL SCOUT ADDENDUM.** Karen Prentice, runner-up Girl Scout, is also going to the Antarctic. Wonder if this means there will be two Boy Scouts next year?

**ICE CHIPS.** Just before going to press we called *Pete Burrill*, our immediate past President, and were aghast to find out that he had had a stroke in July. I knew he should have stayed in Pemaquid all summer! The good news is that he appears to be making a good recovery. It affected his speech and right side, but he is now walking, and will be going back to his alma mater, Bates College, for a meeting the end of this month. Another one of our past presidents, *George Doumani*, Byrd Station '59, got married over my violent objections. He married something very blonde, very beautiful, and much too young for George. If he survives this, he's in better shape than I suspect. They are living in Yemen where he has accepted a new assignment. George, eat your Wheaties and keep the oxygen bottle nearby! .... *WICKIUP*, the former fantastic retreat of the late Admiral Byrd in Sullivan, Maine burned down in July 1984 after a dog supposedly knocked over a lighted kerosene lantern. It was a 12,000 square foot, 2-story log cabin, on a 1315-acre estate which had about 23,750 feet on the southern shore of Big Tunk Lake. A court fight is going on right now as to who actually owns the property. . . . *Bergy Bits* saw *Ron Thoreson* in Montrose, Colorado this summer. Ron once ran the biological laboratory at McMurdo, but is now Head Ranger at Black Canyon National Monument. If you should ever be in Montrose, you might hear Ron and the Park Superintendent playing at the local laundromat. It's not Carnegie Hall or Nashville, but Ron thinks they make an effective combo, and the price is certainly right. When in Montrose, you should go to a popular cafeteria where they have the world's best peanut butter pie. Fantastic! .... The *POLAR DUKE* visited Palmer Station, 29-30 August, and is expected to call again in late September - all part of a trial to determine whether the *POLAR DUKE* could access Palmer during the winter. . . . The 9500-ton *VLADIVOSTOK* icebreaker liberated the *MIKHAIL SOMOV* on 3 August 1985 from her beleaguered, ice-locked position in Antarctic waters where she had been trapped with her 53 members since mid-March. They took off immediately for New Zealand for refueling before returning to Vladivostok. . . . *Al Fowler* is having a big year; not only did he get his second hole-in-one, but evidently his wife agreed to stick with him a while longer after they recently celebrated their 40<sup>th</sup> wedding anniversary. . . . Fantastic cover on the September-October 1985 issue of *International Wildlife* showing a King penguin and chick, which must be the surliest, burliest, and meanest-looking chick that ever walked. Only a mother could love that fat little monster. . . . *Dotte Larsen*, our beloved whale spotteress, is off in Kenya, presumably looking for some whale fossils. She never stays home, which can be both good and bad for The Professor. One of *Dotte's* pictures - one of a polar bear - appears in the 1986 Sierra Club Wildlife calendar. Congratulations! .... *Ruth Siple* tried to subscribe to FEAM so she could get a copy of the second issue, but she was turned down, and received her \$50 back! That man has some real problems..... *Alice Dater* is going on a barge cruise up the Rhine in early October. She's a real swinger, and no grass grows under her feet. . . . *David Kellogg* is in a family way. Now the question is whether this one will also be named for some polar explorer. . . . With *Ken Moulton* hanging it all up, I wonder if any American will ever eclipse his number of trips to Antarctica. *John Katsufakis* might do it, possibly *George Denton*, but I don't think *Charlie Bentley* will make it. Are there any other heir-apparents? *Tony Gow*? *Phil Kyle*? *Art Ford*? *Bill Cassidy*?

**DIRECTIONS TO HORSEHEAD SANCTUARY:** From Washington, take Route 50 East; go across the Chesapeake Bay Bridge (Annapolis), continue approximately 5 miles; cross the Kent Narrows Bridge; at first light (Holly's Restaurant on left) turn RIGHT; turn LEFT on Route 18; turn RIGHT on Perry Corner Road (just past fire station); go down Perry Corner Road about one mile; you will see a sign on right for Horsehead Sanctuary, and a small dirt road; drive straight down that road until you come to a complex of old buildings where you can park your car. (See map below)

ORDERING INFORMATION

MEMORIAL LECTURE DINNER, October 10 (including Cocktails)	\$23 per person
MIDWINTER PICNIC AT HORSEHEAD SANCTUARY, October 12	\$10 per person
1986 USARP Calendar (15-month calendar)	\$6 each
1986 New Zealand Antarctic Calendar	\$6 each
Molenaar's McMurdo Sound Area Pictorial Map	\$7.50 each

Please make checks payable to ANTARCTICAN SOCIETY

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.), 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984

Vol. 85-86

No. 2

## A PRE-THANKSGIVING TREAT

*MODERN ICEBREAKER OPERATIONS*

by

Commander Lawson W. Brigham  
United States Coast Guard  
Liaison Officer to Chief of Naval Operations  
Washington, D.C.

on

*Tuesday evening, November 26, 1985*

*8 PM*

National Science Foundation

18th and G Streets NW

Room 543

- *Light Refreshments* -

This presentation by one of this country's foremost experts on icebreakers should be a great attraction. It will first focus on the Soviet Arctic marine transportation system. Topics will include an overview of the Northern Sea Route, Soviet technical accomplishments, the USSR icebreaker fleet with impressions of sailing aboard the Soviet icebreaker DIKSON, historic Arctic voyages and future developments. Canadian operations in the Beaufort Sea and plans for the new Canadian Coast Guard POLAR 8 icebreaker will be discussed. U.S. POLAR class operations in the Alaskan Arctic and Antarctica will also be reviewed. The lecture will end with information concerning the requirements for new U.S. polar research icebreakers.

---

*Bring money and come in a joyful, buying spirit as we will be trying to sell out our stock of 1986 Antarctic calendars. They are only \$5 at the door (\$6 if mailed, and make excellent Christmas gifts. Molenaar's McMurdo Sound Area maps, another good buy, will be available at \$6.50 each (\$7.50 by mail).*

The following paragraphs were assembled to meet the fulfillment of a newsletter, but opinions expressed therein do not constitute an endorsement by the Society; they are only the loose thoughts of an Antarctic who hasn't been there since 1958. The writer is still commuting between a dental chair in Camden, Maine and the Society's Nerve Center in Arlington, Virginia, which is not conducive to gathering Antarctic news/ information. So why not help us out by sending in your news to the Society at the address shown on our letterhead? We do reserve all rights to edit dull, mundane stories! And please! if you move, send us your new address! Our Newsletters are not forwarded because they are sent "bulk mail."

**COMMANDER LAWSON W. BRIGHAM, UNITED STATES COAST GUARD, OUR SPEAKER.** Commander Brigham graduated from the Coast Guard Academy in 1970 and has had a most distinguished career serving the Coast Guard and this nation ever since, rising at one point to the exalted position of Sailing Coach at the Academy! He has a master of science degree from Rensselaer Polytechnic Institute and is a distinguished graduate of the Naval War College. His tours of duty have included being navigator aboard the oceanographic cutter ROCKAWAY, command of the patrol boat POINT STEELE, command of the Great Lakes icebreaker MOBILE BAY, and teaching oceanography four years at the Academy. During his career he has been assigned to the Arctic and Antarctic aboard the polar icebreakers NORTHWIND, POLAR STAR, and POLAR SEA. From 1982 to this past June he served in the Ice Operations Division at the Coast Guard Headquarters as facilities manager of the nation's icebreaker fleet, and coordinated plans for the new U.S. polar icebreakers. He was also coordinator of a technical exchange program with Finland, and traveled extensively throughout the Baltic in 1983 sailing aboard Finnish, Swedish, and Soviet icebreakers.

Our Society has never really had a presentation just on icebreakers, although Captain Edwin MacDonald, an old icebreaker, was on our program back in June 1960, and my all-time-favorite-everything, Mike Benkert, retired Coast Guard admiral, spoke to us in January 1980 on something about which he was personally most highly qualified, activities of Coast Guard icebreaker officers and men when they go ashore. But Commander Brigham will give the first pure presentation on icebreakers, resplendent with color slides. This will be our last meeting until after Christmas, and it's time you guys and dolls get off your duffs and back our excellent lecture series. The price is right, the speakers great, and all that is required of you is a little get-up-and-go. Don't miss it! Be there!

**MEMORABLE MEMORIAL LECTURE BY AN OLD PRO.** In our 21st annual Memorial Lecture Mark Meier presented the hypothesis that we were all safe for the time being, that the infinitesimal rise in sea level was nothing for us to be concerned with personally. However, the fact that Mark is moving from Tacoma, Washington to Boulder, Colorado wasn't lost on his audience of about a hundred people. It was probably one of the most learned, thought-provoking Memorial Lectures given before the Society. Although he appeared to have covered all bases, a CBS science reporter buttonholed him after his presentation and interviewed him on tape for at least another fifteen minutes. Mark came back the following Tuesday and gave essentially the same lecture to a local group of the Audubon Society. The bottom line for Ant- arcticans is that the continent is apparently not wasting away, that, in fact, it

may be adding to its mass. Mark has recently completed a study for the Academy entitled *Glaciers, Ice Sheets and Sea Level: Effect of a CO<sub>2</sub>-Induced Climate Change*. It was a limited edition publication, already sold out, which is being reproduced by the Department of Energy for their extensive CO<sub>2</sub> mailings. The publication, however, can never show the time-lapse motion picture record of a surging Alaskan glacier which suddenly and rapidly retreated. It should be noted that Mark had predicted well in advance that it would be retreating, although the glacier was slow in getting the word from Mark and was several months late in fulfilling his prediction. Mark had a young thing with him whom he was passing off as his wife. Was she really his wife? If so, Mark must have surged into old age as she has retreated into youth!

**ALMOST-ANNUAL PICNIC WAS A WILDFOWL/GASTRONOMICAL SUCCESS, BUT POORLY ATTENDED.**

What did you Washingtonians do on Saturday, October 12th? We had a great attraction lined up for you all at the Wildfowl Trust of North America's Horsehead Sanctuary in Grasonville, Maryland, and most of you bypassed it. We had only twenty-nine there, including Ron Thoreson from Montrose, Colorado, Whale Spotteress Dotte Larsen and her travel benefactor, Bill, of Pittsford, New York, and Gene (Little America 57) Harter and his wife, Jennie, from Fort Wayne, Indiana. Bill Sladen devoted all afternoon to telling us all about the birds in the various gatherings, as well as describing future plans for the Sanctuary. The food was catered by Fisherman's Inn in Grasonville, and it was fantastic! Oyster lovers had their pick between oysters on the half shell and steamers, and the main table was a food lover's delight with broiled chicken, potatoes au gratin, green beans, potato salad, pasta salad, ambrosia salad, cole slaw, rolls and butter, coffee and cokes, and a delicious cake for dessert. There was so much that three generations of Meuniers couldn't wipe it out - Tony alone can eat as much as six stevedores! Ruth Siple thought the pasta salad was out-of-this-world, and when they divided up the leftover food at the end of the day, she walked out with a bucket of it! Those who were there thought it was a great place to visit, that the wildfowl, our host, and the food were all outstanding. Bergy Bits missed the lovely Dolores Sladen who is a majestic, lovely creature in her own right, but then again the high quality of the faithful few who did attend the picnic helped to make up for her absence. Are picnics out, or what was the reason the masses chose to avoid it? It was a great time of the year to be there - no mosquitoes, plenty of wildfowl, wandering white-tailed deer, and cool temperatures.

**PLEASE RENEW MEMBERSHIP IF YOU GET SECOND NOTICE.** Our Society is on its way towards "500" as we now have 490 members. The renewal rate has been good. We entered the year with 45% of our membership already "banked." So we had to send out only 258 bills on which we pleaded (in the good name of treasurer, Ruth Siple) for each person to consider multiple-year renewal. It worked, as 60% of the 147 who have renewed have done so for multiple years. That's great, tremendous, and we thank you! You know, it's the common guy/woman who is multiple-year renewing; those members of our Society who know where all the meals for the rest of their lives are coming from renew for only one year. When someone renews for four years, Bergy Bits blesses them, first for their kindness towards Ruth and me, then blesses them for their poverty. The 109 who haven't sent in their dues will get second notices with this Newsletter, and if you aren't planning to renew, how about dropping us a card so we won't waste any more of our time/your time bugging you for dues? Please! Bergy Bits considers Canada and New Zealand as two of the United States, based on the fact that mail to Canada is the same rate as for the States, and that we utilize Walt Seelig's privileges for getting mail to New Zealand. So Kiwis and Canadians can pay the same membership fees as do the rest of us.

**BUY, BUY, BUY.** The Society maintains its low dues by picking up pocket change from

the sale of calendars and from corporate memberships. So far this year we have sold over 200 calendars (134 New Zealand, 83 USAKP). That's the good news; the bad news is that we still have 66 New Zealand calendars, and it could be that Ruth and I might end up eating them for dessert on New Year's Day if you folks don't help us out with more orders. The New Zealand calendars are very nice and our price is right. We don't anticipate any leftover USARP calendars, as we hope the additional 30 which we recently ordered will be enough. As of this date, 30 October, all orders received in the Nerve Center have been filled, but we are temporarily out of USARP calendars.

**MOLENAAR'S POPULAR PICTORIAL MAP OF MCMURDO SOUND AREA.** Dee Molenaar<sup>1</sup>'s unique pictorial map of the McMurdo Sound area has proven to be a very popular item with veteran Antarcticans, who have reordered additional maps from us and sent along their praises. We have sold over a hundred, and have close to another hundred for sale (\$7.50 each). Again, this a fund raiser with a minimum markup, made possible by our buying early at a bulk price. It is a one-of-a-kind production, and is a very vivid eye-in-the-sky version of how the McMurdo area really looks. And the historical/ geographical description of Antarctica on the reverse side has all the information one needs to know about Antarctica to be an expert on the continent!!

**MASTERPIECE THEATRE'S "THE LAST PLACE ON EARTH."** Roland Huntford rides again in the six-part Masterpiece Theatre series dramatizing Scott's and Amundsen's 1910-11 trips to the South Pole. Isn't it hard to believe that the English would produce a film showing Captain Scott in such a poor light? Recent history has not been kind to Scott, but isn't it carrying it all a bit too far to make out that the real brain in the family was Kathleen Scott? It will be interesting to see how Masterpiece Theatre treats her relationship with Nansen while her husband was on the ice. But the really interesting part will be their interpretation of the last days of Scott in the tent. I wonder how much impact such a series will have on viewers. Bergy Bits has found it hard to follow who is saying what to whom with those accents. I also wonder where it was filmed. Masterpiece Theatre appears to be even more pro-Amundsen than Huntford was in Scott s Amundsen. Huntford wasn't overly kind towards Amundsen, but in comparison to Scott, Amundsen came out smelling like a rose. Scott may be dead, but he will never die, as his last words in his diary assured his immortality. Clever like a fox, right?

**THE XIIIth ANTARCTIC TREATY CONSULTATIVE MEETING (ATCM).** The XIIIth Antarctic Treaty Consultative Meeting was held in Brussels, Belgium from 7 to 18 October, 1985. It was preceded by a Special Consultative Meeting (SCM) the morning of 7 October which considered and approved applications for consultative status by the Peoples Republic of China and by the Oriental Republic of Uruguay.

The Xlllth ATCM thus convened with eighteen Consultative Parties (CP) and observers from the fourteen Non-Consultative Parties (NCP) participating. The meeting adopted an agenda covering twelve substantive items that were treated in two working groups. Mr. Rolph Andersen of Norway chaired a working group on the Operation of the Antarctic Treaty System (ATS); this working group prepared four recommendations, subsequently adopted in the plenary session on:

- Public availability of information about ATCM
- Biannual reports on the ATS
- Exchange of information
- Observer status of NCP at all ATCMs

Mr. Filipe Soares of Brazil chaired a second working group on environmental matters; this working group prepared eleven recommendations, subsequently adopted in plenary

- on:
- Code of conduct
  - Additional protective arrangements
  - Siting of stations
  - Specially protected areas (5 recommendations)
  - Sites of special scientific interest (3 recommendations)

A sixteenth recommendation adopted in plenary added seven new sites to the list of historic monuments in Antarctica. A detailed final report will be published in the four official languages (English, French, Spanish and Russian) by the host government. (Submitted by Joseph E. Bennett, DPP)

**WILKES COMES ALIVE IN SMITHSONIAN EXHIBITION, 14 NOVEMBER 1985 - 9 NOVEMBER 1986.**

The Natural History Building of the Smithsonian Institution celebrates its seventy-fifth anniversary by presenting a major exhibition, in the Evans Gallery, ground floor, that traces the history of the epic Wilkes expedition to the South Seas and Antarctica. In conjunction with its official opening on 14 November, there will be 1) a two-day symposium on Men of Daring: Triumph of Exploration on 14-15 November which is cosponsored by the National Museum of Natural History and the Smithsonian Society; 2) a lecture on 22 November by Dr. Herman Viola, renowned authority on the Wilkes expedition and the principal curator of the special exhibition; and 3) a book, *Magnificent Voyagers: The U.S. Exploring Expedition, 1838-42* will be published in conjunction with the exhibition.

Any Antarctic worth his/her salt will want to see this exhibition on his/her next trip to Washington, as this will be a big one. In fact, this is going to be the largest temporary show (fourteen hundred objects related to the Wilkes expedition) ever organized by the National Museum of History. More than forty individuals and institutions have lent materials for the exhibition, which is being sponsored by a generous grant from the Atlantic Richfield Foundation and the Smithsonian Special Exhibitions Trust Fund.

Lt. Charles Wilkes, a daring, colorful, and often controversial commander, led the expedition whose mission was to explore the coast, islands, harbors, shoals, and reefs of the South Seas. Six U.S. naval vessels had nine civilian scientists who joined naval personnel in the first joint peacetime scientific endeavor. The expedition lasted four years, covered 87,000 miles, and lost two ships, one of which went down with all hands while rounding Cape Horn. Two officers were killed by Fijians on Malolo Island. Scientific reports and atlases, charts, and maps were among the important results of this expedition. Also of lasting interest were the thousands of plant and animal specimens and ethnographic objects collected by the young scientists. Fifteen years after the voyage, the Smithsonian Institution in 1857 took possession of the collections, which became the foundation for the present study collections at the National Museum of Natural History.

The symposium on 14-15 November will be in the Baird Auditorium, \$30 for Associate members, \$45 for nonmembers. The program will open on the 14th at 3 PM with a paper by William Goetzmann of the University of Texas at Austin on *The Age of Discovery*, and will be followed at 4 PM by Stephen Jay Gould of Harvard speaking on *The Essentiality of Field Studies*. There will be three papers on the morning of the 15th, starting at 9:30 AM with H. Lewis McKinney of Kansas on *Humboldt and His Followers in South America*, then William Stanton of Pittsburgh on *The U.S. Exploring Expedition*, and ending with Mary Lawson of Toronto on *Agassiz's Expedition to Brazil as a Challenge to Darwinism*. In the afternoon Harold L. Burstyn of Rutgers opens at 2 PM with *British Science Goes to Sea: The Challenge Expedition*. Then Trever H. Levere of Toronto talks on *Exploration of the Canadian Arctic in the 19th Century*. Our own Stephen J. Pyne will speak at 3:45 PM on *Heart of Whiteness: Exploration of Antarctica*. Steve will be followed by Clayton R. Koppes of Oberlin on *Men and*

*Machines in the Exploration of the Solar System*. Incidentally, Steve has completed his manuscript on his Antarctic book, *The Ice: A Journey to Antarctica*, though there is no firm publication date as yet.

All in all it looks like a great program - the exhibition, the symposium, Dr. Viola's lecture, and the new book. Dr. Viola presented a talk on Lt. Wilkes at one of our Society meetings several years ago, and he was a great delight. If any of you Washingtonians haven't heard Viola on Wilkes, be sure to go to Baird Auditorium at noon on Friday, the 22nd. It's free, and we guarantee that he will be well worth it!

**BRUCE MOLNIA GOES TO WASHINGTON.** When W. Timothy Hushen left Washington as Staff Director of the Polar Research Board to cast his luck with Jim Zumberge and the Arctic Commission in Los Angeles, it resulted in his position being sliced up and divided three ways. A small slice of Tim, -20% of his time-, will still be shown on the books at PRB. The main brunt of the work will be done by the current incumbent, Shere Abbott, who has the responsibility for the biological/botanical aspects, and by Bruce Molnia, who will assume leadership over the physical and geophysical sciences on 10 November 1985. Shere has been on the Washington polar scene long enough so we don't feel we have to give you her statistics, although they are good. Bruce, however, will be making his debut as a Washington bureaucrat after a multi-faceted, Alaska-oriented career with the U.S. Geological Survey, Bureau of Land Management, and the National Parks Service. He currently is Deputy Chief of the Data Production and Distribution Branch of the EROS Data Center, Sioux Falls, North Dakota,

Bruce is from the New York City concrete jungles, and graduated from the State University of New York at Binghamton where he majored in geology. He picked up his masters at Duke University in 1969, and his PhD at the University of South Carolina in 1972, with some studies being taken at Cornell University. In 1973 he accepted a position in the Los Angeles Continental Shelf Office of the Bureau of Land Management, but left there the following year to join the U.S. Geological Survey in Menlo Park. In 1976-77-78 he apparently worked for the National Parks Service, and was involved in many on-site studies in Alaska. In 1979-80 he did a lot of work in Glacial Bay. He joined EROS in 1983, and has been there ever since.

Bruce made over a hundred trips to Alaska to investigate offshore and onshore geological and geophysical problems. He has authored a book on Alaskan glaciers, and has written seventy-nine scientific publications. He recently edited a book on glacial marine sedimentation. Bruce prepared thirteen slide sets which are used as teaching aids in high schools and colleges. He is an Adjunct Professor at California State University at Northridge, and has at one time or another taught at Amherst and Mt. Holyoke. In between these scholarly pursuits, he managed to find time to produce and raise four youngsters, two of whom are still with him and his wife Mary. It is our understanding that Bruce has an IPA appointment to the Polar Research Board for the next two years, and we are looking forward to his arrival. (Bergy Bits took the above over the phone from Bruce's associate, Rita, on 29 October, and we think we have things relatively close - close enough for this column!)

**M.V. ICEBIRD, WORLD'S FIRST SPECIALLY BUILT POLAR RESUPPLY SHIP.** The two newest members of our Society are Lawrence E. Cosgriff of Abingdon, Maryland and Captain Ewald Brune of Gromitz, West Germany. The former serves as the North American Representative of the Antarktis-Und Spezialfahrt-Schiffahrts-gesellschaft mbH (Antarctic and Special Transport Shipping Company) of West Germany, and Captain Brune is an experienced West German Master Mariner who captained the maiden voyage of ICEBIRD to Antarctica last year. Cosgriff, an old Antarctic, having served as a deck officer aboard the USNS PRIVATE JOHN R. TOWLE, sent us material on the ICEBIRD which seems appropriate to have in this issue since the upcoming lecture is on icebreakers.

Besides, everyone likes ships, and it's timely, as the ship was only launched a year ago last month.

The ICEBIRD is 109 meters long and has a revolutionary V-shaped hull which gives the ship the same capabilities as a medium-class icebreaker. She can move through solid ice up to 90 centimeters thick, and through almost solid one-year-old ice up to 1.5 meters. Supposedly, when she has to, she can break through ice ridges 6 meters thick and 25 meters wide. She has a temperature-controlled double skin for both the cargo hold and the engine room which is maintained by circulating preheated fuel around the ship. The hull is fitted with fins at the stern to protect the variable pitch propeller from ice damage. Blades are individually mounted, and can be changed under water without removing oil from the shaft. She carries a helicopter on a fully designated flight deck with fueling station. The special strengthened deck is able to handle a Sea King or any helicopter with a 26-meter-diameter rotation blades. For additional safety, the ship's flight deck is fitted with its own foam-based fire fighting system. It's a fuel-efficient ship, incorporating an isometric stern, which helps the ship achieve a remarkably low consumption figure of 7.6 tons a day at 10-11 knots.

Twin deck hatch covers also serve as pontoons, coining complete with an ice-strengthened pusher barge. There are two 40-ton cranes which, when working in tandem, can handle 72 tons. The cranes have a 25-meter reach, which allows the ship to put personnel ashore by basket. The forward crane is also a crow's nest. The cranes, hatch covers, superstructure, lifeboats, and davits are made from special, resistant steel. The ship has a high level of leakage stability. Two of the ship's seven watertight compartments can be full of water without the ship suffering a crippling loss of stability. Covered lifeboats that can carry 57 people have skis fitted underneath so they can be dragged across the ice - Sir Ernest, eat your heart out! Four-hundred dollar immersion suits can help victims endure icy Antarctic waters five times longer than normal (but who knows what's normal, not even Murray Hamlet!)

The ICEBIRD has a detachable three-deck accommodation module which is fully equipped and can house up to 93 scientific personnel or passengers. The top deck of the module has three-berth cabins with their own toilets and showers - for top level scientists. Cabins have seats that convert to single beds, as well as beds that pull down from the wall. The middle deck has four-berth cabins, but they have to share toilet and shower facilities. There is a large recreational room on the middle deck where one can enjoy liquid libations, watch television, or, Heaven forbid, even read something worthwhile from the ship's library. The bottom deck of the module has a 50-seat cafeteria. On the side opposite the cafeteria is a hospital, especially designed to treat frostbite victims. Temperature can be lowered to freezing, then raised gradually, reducing the risk of shock in those suffering from exposure. Looks like they'll be able to save the patients, although they might lose a few doctors in the process! The module has its own engine room which provides fresh water and independent power for lighting, heating, and air conditioning. Underneath this deck is a gymnasium in one of the cargo holds.

The permanent superstructure has the captain's quarters and crew (22 members) accommodations. Sounds like an excellent idea keeping the sandcrabs in the detachable modules away from the ship's officers and crew, as long as some seaman doesn't get mad at some scientist and unbolts the detachable module some night, pushing the whole shebang overboard. The bridge has been ergonomically designed (is this good?), and Captain Brune's station supposedly resembles the driver's seat of an oversized Porsche. Too bad it doesn't have the room of a 62 Fairlane! The communication system is all state-of-the-art. One could say they engaged in a little overkill when the pusher barge was equipped with its own satellite navigation system. There is one other plus - if you want to rent this ship for your next cruise, the beer is German.

**FORMER VX-6 PILOT MISSING OFF COAST OF SANTA BARBARA.** Retired LCDR Joseph Detwiler apparently died in an airplane crash at sea on October 3, 1985. He was a private pilot for Sonoma Tech Company and was gathering air samples off the coast of California between San Miguel Island and the Mandalay Power Plant, four miles north of Oxnard, when the plane disappeared. The last radio contact was 8:45 PM, and there were no problems at that time. However, a red flare was reportedly seen at 11:30 PM fifteen miles north of Santa Rosa Island. He was aircraft commander of the 2nd Super Connie (C-121), #131659, attached to VX-6 in 1962. He was Officer-in-Charge of Christchurch Detachment VX-6, January-April 1963, and flew various missions to Hallett, Byrd, and the South Pole, 1962-66. His home address was 1491 Elnora Court, Los Altos, California 94022 for those who may want to write to his family.

**ANTARCTIC COAL MEASURES STUDY GROUP (N.S.W., AUSTRALIA).** This group was informally established (and still is informal) about 5 years ago giving an identity to some old coal geologists and stratigraphers working on coal-bearing sequences in the Beacon rocks of Antarctica. Currently Barrie McKelvey is all hyped up to go off for his tenth (yes, tenth) field season in the Transantarctic Mountains. He is in the team with Peter Webb from Ohio State working on the Sirius tillite. The old firm of Webb & McKelvey has now been going for 28 years.

Cliff McElroy and Toby Rose have two papers in press - one on Antarctic Coal Potential and one on Beacon stratigraphy with accompanying detailed geological map. This follows their more recent work, sponsored by NSF, in the Beacon Heights area in 1980-81, following earlier work in the mid-60<sup>1</sup>s, with colleague Kerry Whitby. John Bryan and Kerry continued the geological mapping to the north of this work in 1982-83 and Toby and Graham Bradley likewise in 1984-85. These last two expeditions were sponsored by the Ross Dependency Research Committee, New Zealand, and the work greatly benefitted from the inclusion of New Zealanders in the parties. We hope to keep the field work going in spite of old age creeping up on some of us; in the meantime, we're doing a lot of lab work and writing up. (Submitted by C.T. McElroy)

**THE CHINALIZATION OF MORT AND JOANNE TURNER.** When Mort Turner retired from the Division of Polar Programs at the National Science Foundation at the end of last year he had visions of staying on at the Foundation as a retired annuitant until they could find a replacement for him. But there was a hiring freeze and he suddenly found himself unceremoniously out on the streets of Washington. This was a bit of a shock as he had been a pillar in the office since its earliest days; in fact, only the aging Ken Moulton preceded him into the office. But things have a way of sometimes working out for the best, and they probably did in this case. Joanne had already been invited to take part in a paleontological expedition to Southwest China to hunt for fossil dinosaurs, mammals, and small reptiles from Triassic-age rock. She thought with special training that she could make something out of her husband, as he did have a strong back and was in good health. She prevailed upon the Chinese Academy of Sciences and the expedition to let Mort go along to do the geology of the dinosaur area. So in mid-March they flew to Beijing where they met the other three American scientists. Then with four Chinese scientists they flew to Kunming, the capital of the Yunnan Province, in SW China. This was the China end of the Burma and Lido roads during World War II. There they transferred to a minibus and with an accompanying jeep carrying the field gear, they traveled another 100 km to the west to an area near the small town of Lufeng.

The expedition worked for six weeks in the Lufeng area successfully collecting fossils of dinosaurs, mammal-like reptiles, lizards, and small crocodiles, all from Upper Triassic and Lower Jurassic rocks. They were the first foreigners permitted to work in this area since the PRC was established in 1949. Mort made a detailed geologic map of the area, while Joanne did the record photography, helped with the

fossil research, and assisted in the geologic mapping. When the rest of the American scientists returned home, the Turners returned to Beijing by train with the Chinese scientists to continue discussions with the Chinese Academy of Sciences on a possible cooperative program of their own. Both Mort and Joanne had been interested in the problem of early man (Pre-Larry Gould, that is), in the Americas, and the two of them had actually spent six weeks working together on Pleistocene-age sites in the northern Rocky Mountains in Idaho. What they learned there, combined with their knowledge of early sites in China, suggested that a project comparing Chinese Pleistocene sites with those of seemingly comparable age in the northern Rockies would be valuable, especially if Chinese scientists could be involved in the western North American field work. The discussions with the Chinese scientists were promising, and plans were made for Mort and archeologist Rob Bonnichson, Director of the Center for the Study of Early Man at the University of Maine at Orono, to visit China in October (1985). Then Joanne and Mort left China by way of Burma and Thailand where they looked at research on early man in those areas. Here Mort ran into his only real problem on the whole trip, keeping Joanne from spending their accrued wealth on precious gems which are in the Bangkok market. As many of you know, Joanne designs and sells her own line of jewelry, and she was like a kid in a candy store in Bangkok.

On October 1st Mort and Rob Bonnichson flew to Beijing where they conducted three weeks of negotiations and field investigations of potential research sites in Inner Mongolia and Central Asia. As we go to press (31 October) Mort is back in Washington with a chronic case of Chinese jet lag. Mort says life has never been more hectic, but on the other hand he is especially happy in retirement as it means that he and Joanne are finally able to work together (violin music, maestro!).

But Mort also had a good career with NSF. During his years with the Antarctic program he managed research projects in every discipline, especially in the early years when he and Tom Jones were the only scientists on the staff. Mort's interests always went beyond the bureaucratic greed to process proposals. He had a deep interest in science and the scientists involved and, in particular, tried to support as many good and innovative researchers as was possible with the available funds. He was particularly interested in continental drift and paleoclimate, even when they were considered unorthodox subjects, and encouraged research along those lines whenever possible. For example, many of the early breakthroughs in plate tectonics came from ELTANIN data and from paleoclimate records of the deep Greenland and Byrd Station ice cores and glacial geological work in the polar areas.

The Antarctic continent has developed into a source of scientific information of worldwide significance. Many of the projects in Antarctica have produced basic information for significant breakthroughs in applied research in the rest of the world. Mort is proud to have helped to support many of the scientists who have worked there. While he misses the stimulation that came with the constant contact with researchers on the leading edge of science, he is enjoying tremendously the challenges of his own research, and searching for evidence of the time and circumstances of the peopling of the Americas. (Draft submitted by Mort; family interrelationships concocted by Bergy Bits).

**FINN RONNE'S SPIRIT LIVES ON.** Karen Ronne Tupek, the only daughter of Jackie and Finn Ronne, has a very acute case of penguinmania; It is in its most advanced stage, and beyond any help from any of the modern wonder drugs. It manifests itself every time she sees something with a penguin design, resulting in an automatic, wallet-reaching reflex action. Recently while walking through an old-line Washington store named Woodward & Lothrop, she noticed a Christmas tree loaded with penguin decorations. After all, it was the Christmas season -the first week in October- so she wasn't aghast until she looked at the top of the tree and saw its crown of "North Pole." Her first reaction was BUY, and buy she did, a hundred dollars worth of

fuzzy little penguins and crystal penguins. Her rational action after buying was to raise a little hell with a store who didn't know one pole from another, so she wrote the president of Woodies, and she also wrote a columnist with the Washington Post, giving them a little lesson on polar geography. Incidentally, Karen's son is now two years old, and she has another one on the way, due for an early spring debut. Karen is her father's own daughter in another way, she is a very accomplished skier. The Ronnes are taking great delight in the Masterpiece Theatre production on Scott and Amundsen, and well they should, as Karen's grandfather, Martin, was a member of Amundsen's ice party at Framheim. Jackie tells me she saw the whole series in Norway this past summer, and says that Masterpiece Theatre sticks to Huntford's version as to how Scott met his end.

**SOCIETY EXPEDITIONS WILL TAKE YOU BEYOND ANTARCTICA.** While watching the morning news on TV on 30 October, we heard that Society Expeditions, our sole corporate member, is getting into space travel. It seems that a space vehicle is going to be made or is in the process of being made, and Society Expeditions hopes to be able to offer you a day in space orbiting the world for only \$50,000. How about that! And to think in my lifetime mail was delivered by a horse-drawn carriage, the ice man actually brought hunks of ice for the refrigerator, and family doctors made house calls! But with all this space technology, how come someone can't come up with a stickless snow shovel?

**SOCIETY TIE.** Things haven't worked out here at all, for one reason or another, but it has not been scrapped. I think it should be the highest priority in the Society for the next six months, as something might be better than nothing. There is still a faint hope that a well-known bird man will consent to draw a design for us, although at this point in time I'm not optimistic.

**DEEP FREEZE I COMES ABOARD.** Ruth Siple went to Dave Canham's Call to Quarters of all Deep Freeze I personnel last August down in Norfolk as a hundred-odd men, wives, and children gathered to celebrate their 30th anniversary (see September 1985 Newsletter) . Ruth took along some application blanks and a sturdy whip, and she corralled quite a few of them into joining our Society. We're real happy to have them aboard as we need more Navy personnel. Welcome Charlie Bevilacqua, Robert Chaudoin, Audrey Garrett, Pat McCormick, Donald Scott, Bill Stockton, and William Stroup, plus Mel Havener, Deep Freeze II at the South Pole. If any of you have any good stories about old Dave Canham, George Dufek, or anyone else which might be of interest, send them on in and we'll publish them!

**SIPLE STATION FUTURE LOOKS PROMISING.** At the recent Polar Research Board meeting, the astute and personable Lou Lanzerotti of Bell Telephone Laboratories was talking about the growing importance of Siple Station. It seems that there is serious consideration being given to the station being internationalized or becoming a national laboratory. So it looks like it will become a permanent station, and naturally Ruth is very happy about that.

**WANNA INVEST SOME MONEY WITH LOU DEGOES?** The chain-smoking, old football warrior with the bad knee, former Executive Secretary of the Polar Research Board, Lou DeGoes, wants to talk to you if you have money you want to invest in real estate. He is Vice President of Kino Development of America, Inc. which is developing Bahia Kino in Sonora, Mexico, a residential/recreational project. They own 4,100 acres valued at \$130 million plus. Everything is on track and they are about to issue a formal offering to potential investors - 25% return on one-year investments. The offering cir-

cular is being prepared and follows guidelines provided by the Security Exchange Commission and the State of Washington Real Estate Commission. If you have had enough snow and ice, and want to look into Bahia Kino as either a home or as an investment, Lou wants to hear from you. It's Louis DeGoes, 10900 Northeast Eighth Street, Suite 900, Bellevue, Washington 98004, telephone 206-747-7817.

**ERRATA, MAX BRITTON, NOT MAX BREWER.** In our last Newsletter, prepared in great haste, we credited Max Brewer with the fastest erection (tent) on the Pewe<sup>1</sup> Colorado Rafting Expedition of 1985. Over half of the Newsletters went out with the correct Max, but some went out with the incorrect Max. Both Maxes are synonymous with the Arctic, and in our haste to get the Newsletter on the street, we blew it. Also, some copies got Pre-Cambrian rather than Precambrian, but who cares about that!

**ICE CHIPS.** *Bert Crary* seems to be doing just fine, although it has been a long road back. The physical therapy is behind him, but he still goes to speech therapy. He's around 160 pounds, and wants to get back into his fighting weight of 180 pounds. . . . *Dick Cameron*, the nomadic Antarctic, is moving out of Washington early in 1986. Back in his bachelor days between marriages Dick was justly famous for all the beautiful single girls he seemingly had at his beck and call. Going to his house for a Christmas party was like going to a Playboy mansion - they were all over the place. Probably he had to hire them to be there, but they were there! He recently came back from a visit to the Arctic and Antarctic Research Institute in Leningrad. He and Sally will be living in some place called Collinsville, Illinois, across the great Mississippi from St. Louis. We're going to miss both Dick and Sally. . . *Rudy Honkala* has found ways and means of ferreting out obscure used-book stores and finding Antarctic books - by delivering automobiles all over the country. . . We understand that *Line Washburn* wants to sell his home and move elsewhere. It seems that this decision was made shortly after Colin Bull moved into the same neighborhood, and, as the saying goes, there went the neighborhood. Incidentally, if any of you folks are interested in selling your Antarctic library, contact Colin as he is into polar books (9219 S.E. 33rd Place, Mercer Island, Washington 98040). . . Letters from 18th-century British explorer *Capt. James Cook*, and other documents about his famous voyages, were sold at auction at Sotheby last summer for \$181,200. That was roughly the same price range as Ohio State University paid for the papers of the late Admiral Richard B. Byrd. . . . The *Vernon Houk* who got a lot of ink last year relative to lead in gasoline is the very same *Vernon Houk* who was doctor at the South Pole in 1958. *Bergy Bits* never thought he would make good, as he was born of money and was sort of a mommy's little boy, but he is/was Acting Director of the Center for Environmental Health in the Center for Disease Control in Atlanta. *Houk* ran a nationwide program that screened millions of children for lead poisoning and directed attention to those needing help. One year the program screened 550,000 children and identified 26,000 with elevated lead levels. . . . *Rachel Weiss* writes that plans for the IMAGING ANTARCTICA exhibition are going well, with responses remaining enthusiastic and encouraging. She has received a contract from NSF for the preparation of the scientific portion of the exhibition, which she writes "promises to be beautiful, exciting, and also informative." . . . . *Jim Bergstrom*, deputy Naval commander at McMurdo in 1956, is being taken to the Antarctic to help celebrate the 30th anniversary of the construction of McMurdo Station and Deep Freeze I. *Dave Canham* was the original choice as he was the senior Navy man at McMurdo that year, but he has some physical problems and could not pass the physical. . . *Henry and Frances Heyburn* recently coauthored a book, "Postcards of the Falkland Islands, A Catalogue: 1900-1959" which is beautifully done. Over 340 postcards are identified, with two-thirds of them being illustrated. It's available for \$US20.90 through the Picton Publishing House, Citadel Works, Bath Road, Chippenham, Wiltshire SN15 2AB. *Henry* has been in love with the Falklands longer than he has been with his wife,

as the Falklands go back to when he was twelve years old and didn't know about girls. During the Argentine occupation he and Frances formed the Kentucky Committee for the Falkland Islands which raised and distributed \$4,500 to various Falkland-related organizations. The Heyburns live at 3918 Leland Road, Louisville, Kentucky 40207. .... *Alice Dater* is becoming a better traveler, and soon she will be able to leave home without our worrying about her. Remember two years ago she fell overboard in McMurdo Sound and all her wild antics of the past septuagenarian years flashed through her mind as she thought she was going to meet her Maker. This year all she lost was her rain cap while going through one of the locks on a barge trip through the Lowlands in Europe .... *John Millard* (86 Broadway Avenue, Apt. 18, Toronto, Ontario, Canada M4P 1T4) is an enterprising devil who assigns himself special, difficult Antarctic studies from time to time (such as the survey of all copies of "Aurora Australis"). Right now he is researching the publishing history of "The Worst Journey in' the World" and is seeking information about reviews of the book. He sent us a copy of H.L. Mencken's review which appeared in *The American Mercury* for September 1930. I think John should talk to Ralph Lenton about his thoughts on certain passages in the book, as Ralph once visited George Bernard Shaw's home in the U.K. and supposedly saw passages from the book written in Shaw's handwriting. Shaw and Cherry-Garrard were close friends, and what are good friends for if not to help you out? .... *Dr. Monica Kristensen*, the young, attractive Norwegian glaciologist who was going to lead the 90 Degrees South Expedition this austral summer, was injured in an automobile accident and hospitalized. So her plans to follow Amundsen's route to the South Pole had to be scrapped, at least for this season .... Meanwhile, the two Britishers, *Robert Swan* and *Roger Mear*, were still in the McMurdo Sound area in late October, waiting for good weather so they could take off on their Footsteps of Scott Expedition to the South Pole. It looks like they could possibly leave at about the same time as Scott cleared Hut Point, 1 November . . . *George Doumani*, our official Yemen correspondent, writes that Yemen is a geologist's dream, and the green and rugged mountains are extremely spectacular. Sanae is about 7,200 feet in elevation, and the weather is great.

**OH HOW SWEET IT WAS!** It's not very Christian-like to enjoy revenge, but I let it all hang out when the Kansas City Royals beat those St. Louis Cardinals in the 7th game of the World Series by the outrageous score of 11-0. You see, when I was a kid those same Cardinals, who were popularly known then as the Gas House Gang, beat my beloved Detroit Tigers in the 7th game of the World Series in 1934 by the score of 11-0. I went to bed crying that night. This year I went to bed with a great big smile on my face. Thank you, Mr. Howser, thank you dearly for winning it in the same style for the same little kid! (Written only for baseball fanatic, Henry "BAE I" Harrison.)

**HOMEWORK ASSIGNMENT.** "Why Whales Leap" by Hal Whitehead - *Scientific American*, March 1985; "The Ecology of the Southern Ocean" by Richard M. Laws - *American Scientist*, January-February 1985; "The Antarctic Ice" by Uwe Radok - *Scientific American*, August 1985.

**LATE NEWS.** The United States was involved in late October in an ill-fated mercy flight to Davis Station to pick up an Aussie who had been severely burned. The C-130 made the flight from McMurdo and picked up the victim, but he was in bad shape and died before they could get back to McMurdo..... The weather has been unusually bad at McMurdo this spring and has delayed deployment of personnel. We understand that they hope to reopen Siple Station close to 1 November and also to get into the South Pole about the same time.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET

ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

## Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.) 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86

## Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

## Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975

ANTARCTICAN SOCIETY FINALLY RECOGNIZES ATMOSPHERIC CHEMISTRY!

## A VALENTINE EVE SPECIAL

ATMOSPHERIC CHEMISTRY MEASUREMENTS IN THE ANTARCTIC

by

Dr. Dagmar R. Cronn

Associate Professor - Associate Research Chemist  
Laboratory for Atmospheric Research  
College of Engineering  
Washington State University  
Pullman, Washington

on

*Thursday evening, February 13, 1986*

*8 PM*

National Science Foundation  
18th and G Streets NW  
Room 543

*- Light Refreshments -*

Dr. Cronn is a veteran Antarctic who has been actively involved in Antarctic research for the past decade, having spent four austral summers in Antarctica, 1977-78, 1980-81, 1981-82, and 1984-85. Her interests are widespread: Antarctic meteorology and air chemistry, climatic change caused by anthropogenic emissions, analyses of trace gases, stratospheric ozone depletion, and tropospheric/stratospheric exchanges. But she is also into campus administration, being Vice-President of the Faculty Senate. Dr. Cronn's degrees are from the University of Washington in Seattle - bachelor's and master's in chemistry, and doctorate in atmospheric chemistry from their Civil Engineering Department. We have high hopes that fellow colleagues of Dr. Cronn's on the Division of Polar Programs' Advisory Committee for Polar Programs will see fit to attend her lecture. We want wall-to-wall people - the more the merrier.

MARK YOUR CALENDAR NOW!

*If you move, PLEASE send us your new address!!*

This is a completely biased, IGY-prejudiced assemblage of bits of information which may or may not be of interest, depending on your own biases and background. It is the Non-Voice of the Antarctic Society, but it does fill sheets of paper and we pass it off as a newsletter. Those of you who have complaints about its contents can always send us your material, and chances are that it will get published in some form - although perhaps not recognizable to you. We do need current information about you people and your programs, so please let us know what you are all doing.

**LAWSON BRIGHAM, A FOUR-STAR COMMANDER.** Commander Brigham gave a great presentation on icebreakers at our November meeting. It was very well organized - no snow job - and most complete. I have the feeling that everyone loves ships, and that icebreakers fascinate people by both their power and their ability to continue rolling even when tied up to a dock! We had a good turnout, and it was certainly great to see beautiful slides of so many different classes of world icebreakers. I was happy that my friend Mike Benkert, a retired Coast Guard admiral, and former president of American Institute of Merchant Shipping (AIMS) was there. When Commander Brigham was talking about women on today's icebreakers, Mike commented, "I had enough trouble in my day with women scientists, I don't think I could stand it today." Probably so, Mike. Commander Brigham was very well received, and the nearly full house kept him and his bride, Ellen there for at least an hour afterwards asking questions.

**MEMBERSHIP.** We indicated earlier that we might make it to 500 during 1985-86, although it didn't appear likely. We have twenty-four new members, but our delinquent-deadwood list is longer. We list their names here in one last effort to keep them aboard.

Anderson, Duwayne	Fischer, Viola	Litwak, John	Troxel, Charles
Belknap, David	Grew, Priscilla	Murcray, Frank H.	Tuck, Peg
Boutin, Katherine	Heinz, Lisa	Riordan, Allen	Zapol, Warren
Brown, Jane	Holm-Hansen, Osmund		Zohn, Harry
Chapman, Al	Inderbitzen, Tony	Siefka, Erik	
Crumrine, Art	Kelmelis, John	Small, Bryan	
Ege, John	Kessler, Carl	Sparkman, Jim	
Eisner, Bob	Rosters, John	Stuart, William	
Erickson, Erik	Leinmiller, Mark	Trabucco, William	

From the bottom of our mercenary hearts we thank all those who renewed for multiple years - actually 60 percent whose dues came up for renewal this year did - altogether a total of 234 have already paid next year's dues. Fantastic! Keep it up! And listen, you all, when you move, PLEASE send us your new address right away! We do not appreciate having to mail out another whole set of newsletters just because you didn't send us your change of address. (This is a muchly watered-down interpretation by RJS of what I really wrote - PCD)... No more calendars this year! We had good sales this past winter, and we hope your calendars arrived in good shape. Incoming comments from those who got both calendars seemed to indicate a strong preference for the New Zealand calendar. The USARP calendar needs editing; there's bad stuff

in it - like for today, 11 January, it says the South Pole had its record high of -2° F. Bad mistake, real bad - not even close to the max record.

**1986 MEMORIAL LECTURE IN SAN DIEGO, PROBABLY 24 JUNE.** Jim Zumberge, President of SCAR (Scientific Committee on Antarctic Research), and Occasionally-on-Campus-President of the University of Southern California, has invited Claude Lorius. to give our annual Memorial Lecture in San Diego at the time of SCAR's XIX Meeting in June 1986. The tentative date is 24 June, and the subject suggested by Gentleman Jim would be on climatic change over the last 160,000 years as reconstructed from deep ice cores from Antarctica. There will be more on this later, but since a couple of people in the San Francisco area have indicated they would be interested in going to San Diego, we are letting you know- now that everyone is "moving out" on it. Relative to Lorius, a funny thing happened in Helsinki at the IUGG meetings held right after the IGY. I was sitting with a former cohort at Little America, the late glacial meteorologist, Dr. Herfried Hoinkes of the University of Innsbruck, and the late Dr. Paul A. Siple with whom you are all familiar, when Lorius got up to give his paper. He read the first sentence in English, and immediately switched to French for the rest of the paper. Dr. Hoinkes knew some English when he went to Antarctica, and, being a quick learner but not very discriminating, he immediately became very proficient in the Navy's version of English. After all, there were 85 Navy men at Little America V that year. As soon as Lorius switched to French, Hoinkes immediately quipped rather loudly that he had fouled up, although not in those specific words. As I recall, it was the first time that Dr. Siple had met Dr. Hoinkes, and my innate sense of humor got a kick out of his pronouncement in front of the Boy Scout of Antarctica. We trust that Lorius's English may have improved over the years, and that he will be able to give the Memorial Lecture in English. Otherwise, I might be tempted to reecho the profound words of my former, good friend Herfried!

**MASTERPIECE THEATRE'S THE LAST PLACE ON EARTH.** I imagine everyone who has any interest in adventure must have watched this series, and people who never heard of Scott or Amundsen now know who the good guy was, and who the bad guy was. Or do they? Most of you will be interested, I think, in what that pseudo-American, erst-while Brit, Charles Swithinbank, thought about the production. In a letter written 7 December 1985, Charles wrote:

Over here we did not think much of the Masterpiece Theatre series on Scott and Amundsen. The biggest trouble was selecting such a weak character (Martin Shaw) to play Scott. True, that fitted Huntford's line, but it was totally implausible that anyone like that could have organized and led two great expeditions which, apart from the polar journey, achieved enormous contributions to knowledge of Antarctica. It contrasted unrealistically with the portrayal of Amundsen, which was excellent.

In another communique from Charles, received on 15 November, he wrote:

With all his (Scott's) faults and mistakes, he was a leader. I have known Debenham and Priestley well; they admired Amundsen for what he did, but Scott so much more because his people did so much more for science. Why must we judge them by the same criteria?

Amundsen ran a great race and achieved his objective, but he never really received the personal recognition and fame he probably deserved. Scott was immortalized

and practically became an English saint through his death. I think it's sad in a way that Amundsen's trek to the South Pole masked all of his other great polar accomplishments. I think Masterpiece Theatre strongly exaggerated Nansen's unhappiness with Amundsen for not moving out on his long-planned Arctic trip, which he actually did undertake on the MAUD, leaving in July 1918. Huntford's Scott and Amundsen does not portray a distraught Nansen at all, but more of an understanding Nansen.

I wished there had been more of Dr. Wilson in Masterpiece Theatre. They had Scott asking Wilson why he wasn't writing in his diary, with Wilson replying, "I've run out of paper." Really wasn't that way at all, as Wilson's biographers have published copies of three rather long letters that he wrote on March 22nd and 23rd; so he had paper. I almost got the feeling from reading between the lines of Wilson's last letters that perhaps they (he and Birdie Bowers) could have gone on if it weren't for the condition of Scott's frozen foot.

I wonder why Masterpiece Theatre didn't use Scott's "Great God! This is an awful place and terrible enough for us to have laboured to it without the reward of priority," and Dates' "I am just going outside and may be some time." It seems to me, with the exception of the last passage in Scott's diary, that these were the best quotations of the whole journey. Their exclusion disappointed me.

Remember the president of the Royal Geographical Society making the sarcastic toast, when Amundsen addressed them, saying, "I propose three cheers for the dogs"? I have a personal add-on to that. I have the two volumes of Scott's Last Expedition personally inscribed by Kathleen Scott to that president, Lord Curzon. The good Lord, Curzon, that is, really must have been deeply appreciative and enjoyed the books, because when they came into my possession back in December 1958, the pages had not even been cut!

Some people have asked where the series was filmed. One of our underground moles, John Millard in Toronto, sent us the Toronto Globe and Mail (26 October 1985 issue) which said it was filmed "in the snowy wilds of Norway, Frobisher Bay, Scotland, and London." That same paper quoted the director of the Masterpiece Theatre production, Ferdinand Fairfax, as saying the Scott family lobbied hard to have the miniseries cancelled; and when it did air in Britain the "Scott camp went bananas, to put it mildly." He was also quoted relative to Scott's diaries, saying, "At the time of the finding of the Scott diaries the passages most damaging to the Scott legend were expurgated. Those passages reappeared in 1968."

Charles Swithinbank told me about the facsimile edition of Scott's diaries which were in the explorer's own handwriting, but said they were hard to come by. The National Archives has a set of all six volumes, and Alison Wilson made them available to me. They were assembled by University Microfilms, Ltd. in 1968. Rather fascinating to see these volumes, although Scott's handwriting is about as bad as any I have ever seen - almost impossible to read. I was interested in reading his account of arriving at the Pole and the trip back down the Beardmore. It appears that when Scott wanted to convey his bad luck with weather or whatever, he was able to write almost legibly. Another thing impressed me - his fatalistic attitude after he found that the Norwegians had beaten him to the Pole - it almost seemed like a fixation with him, that they would never get back. He lost that Big MO (motivation) when he found Amundsen's tent. I was happy to see his more famous quotes to be truly direct quotes. I was looking for kind words about Dr. Wilson, but didn't see them. It appeared that he thought very highly of Birdie Bowers, and had many kind things to say about Dates after "I am just going outside and may be some time." I came away with the very strong feeling that Scott may have died

four or five days earlier than March 29th - the date of his last entry in the diary. And the reason I conjecture this is that there was a great drop-off in his scribblings on the 21st and then the 22nd and 23rd, which were combined; not only was the writing very weak and wobbly, but it didn't seem to be totally coherent (on the 22nd-23rd). However, when you come to the last entry on the 29th, the handwriting is steady, the letters are large and firm, and it is all very legible. Methinketh that perhaps the man wrote the "last entry" when he was quite stable, pre-dating it, conjecturing that they (Wilson, Bowers, and himself) would all be gone by that date. There is absolutely nothing between the pathetic writings of the 22nd-23rd and the last entry on the 29th; I bet the last entry may have been actually written on the 19th. Wilson's three long letters of the 22nd and 23rd were excellent farewell-type letters, so he had to be in much better shape than Scott who could hardly write then. Previously Scott's entry on March 18th said, "Bowers takes first place in condition but there is not much to choose after all. The others are still confident of getting through. X don't or pretend-to-be I don't know." It looks like Scott went first and that Bowers and Wilson ... well, no one knows. If anyone is interested in trying to read these diaries, the Sledging Diaries are Vol. 5 (January 1911-September 1911) and Vol. 6 (November 1911-March 1912. One of the volumes, No. 4, is not a diary at all, but copies of the printed South Polar Times.

Did it ever occur to you that there were probably more similarities between Captain Scott and Admiral Byrd than any other two polar explorers in history? There are 17 letters in Robert Falcon Scott; 17-in Richard Evelyn Byrd. We presume the Byrd family can be traced back to England, so both were of English descent. Both were born into money, brought up in servant-staffed homes. Both went off to naval schools and became commissioned officers. Both married into very prominent families. Both had some difficulties in the Navy, and decided to serve their nations in exploration. Both were recognized as good fund raisers. Both could probably be categorized as headstrong. Neither was a scientist, but both were smart enough to realize their own personal limitations and the need to surround themselves with top scientists. Scott had Dr. Edward Wilson as his naturalist and confidant, Byrd had his counterpart in Dr. Paul Siple. To a lesser degree Scott had Frank Debenham, Byrd had Larry Gould; Scott had Raymond Priestley, Byrd had Al Wade. Probably neither Scott nor Byrd will be recognized in polar history as truly great leaders, but both will long be remembered for the great scientific discoveries made on their expeditions. Each spawned an Antarctic explorer who broke out on his own - Scott - Ernest Shackleton, Byrd - Finn Ronne. Both had their Norwegian detractors - Scott -Amundsen, Byrd - Balchen. Both felt the urge on their second Antarctic expedition to do something outstanding when they were about the same age, in their mid-forties. Scott went to the Pole, and Byrd went out alone to Boiling Advance Base. Both left rather firm orders that those in camp should in no way jeopardize themselves by sending out search and rescue teams. The British obeyed their master, but the Americans went out in the middle of winter and rescued the Admiral. Otherwise both would have perished on the very same ice shelf at about the very same age, and Byrd would have become as much a legend and hero in this country as Scott was, and is, in his country. Could this have been a secret wish of Byrd? And if Scott had returned, he probably would have made admiral, so death cheated him out of a rank comparable to Byrd's. Interesting? I think so.

**FOOTSTEPS OF SCOTT EXPEDITION SUCCESSFUL.** Three British adventurers arrived at the South Pole of 11 January after an 883-mile walk from Cape Evans, following the route taken by Scott in 1911-12, including the ascent of the Beardmore Glacier, making it in about the same number of days. Originally the Footsteps of Scott Expedition called for only two to make the trip, but somewhere along the line a third

man, Gareth Wood, was added. The co-leaders were Robert Swan, a 28-year old tree surgeon and self-styled explorer, and Roger Mear, a 34-year old professional mountaineering instructor. Both had experience with the British Antarctic Survey at Rothera Station on Adelaide Island. There were no advance depots set up for the men, there was no air support. Each man started out the journey on skis, hauling a sledge with 136 kg of food, fuel, and equipment. They used a tent which weighed less than 9 kg which was designed to withstand winds up to 115 knots. The adventurers evidently wanted no part of walking on back to Cape Evans, so were flown from the South Pole to McMurdo, making it sort of a Roger Maris type achievement, one that calls for an asterisk saying that they only followed those footsteps part way. Maybe this is a significant achievement, but when you are about 30, an experienced mountaineer, can't you lick the whole world? The three-man polar party, the five-man shore party and the twenty-one ex-SOUTHERN QUEST crew members were all scheduled to be flown out of McMurdo for Christchurch on 15 January on a ski-equipped C-130. And so endeth another British Antarctic adventure! An aside, Swan's brother-in-law, John Drew, recently bought for 4,114 at auction a duplicate of the Polar Medal awarded to Petty Officer Edgar Evans for his services with Scott's Discovery Expedition, 1901-04. The original medal probably was with Evans when he perished on the 1911-12 trip, and the duplicate was struck for his widow.

**SOUTHERN QUEST SUCCEUMBS TO ICE.** A 26-year old, 139-foot, 361-ton converted Icelandic and North Sea trawler, the SOUTHERN QUEST, (formerly the oil-pollution-control vessel CLEANSEAS I), went down off Beaufort Island enroute to McMurdo Sound on 11 January. She was bound for the Antarctic to pick up the members of the Footsteps of Scott Expedition, when she ran into heavy ice. It is our understanding that she had been traveling with the Greenpeace ship, GONDWANA, a 1,000-ton converted ocean-going tug, which was able to stay out of the heavy ice. United States helicopters at McMurdo were able to evacuate all 21 crew members of SOUTHERN QUEST, so no lives were lost. According to Antarctic, the excellent news bulletin of the New Zealand Antarctic Society, the SOUTHERN QUEST had undergone "a major refit in South Shields. Her hull was ice-strengthened, deflectors were added to protect the propeller, crew accommodation was extended, and the former fish holds were provided with six watertight hatches. Finally more sophisticated radar and satellite navigation equipment were installed. To improve the ship's stability the port and starboard companionways were enclosed." The propeller was also replaced when hairline fractures were discovered in the old one. Before SOUTHERN QUEST departed her berth in the Thames in November 1984, Lord Shackleton and Sir Vivian Fuchs escorted Princess Anne around the (ugly) ship. The trawler departed Port Chalmers, New Zealand on 30 January 1985, taking members of the Footsteps of Scott Expedition and their supplies to Ross Island. She arrived at Cape Evans on 8 February, and departed on 22 February, not knowing that it was to be her one and only successful cruise to Antarctica. Adventure and tragedy walk hand-in-hand in Antarctica - another example follows later in the Newsletter (page 8).

**SHACKLETON BY ROLAND HUNTFORD.** I wish I could say I had read the whole book - which appeared in England in early November, here in early January - but Christmas got in my way and I never had the opportunity. However, I have read specific sections which had fascination for me, and there is no doubt in my mind that here is another fabulous biography by Huntford. I'm sure that Huntford must be the most thorough polar biographer of all time. All you have to do is to look over the voluminous number of references - 2,167 in 55 chapters occupying nearly 700 pages of text! If there is a weakness, it may be that Huntford is such a thorough seeker of details that he uncovers too much personal information and thus develops personal

biases through osmosis. However, it appears Shackleton will survive this book just as well as he did the demise of the ENDURANCE. He always enjoyed the reputation of being the explorer with whom most polar men would have liked to have traveled, as he never lost a man on any of his adventures, Shackleton never saw a woman he didn't like, and he enjoyed the good life. He was very mortal.

There are a lot of good photographs in the book, and under one portrait it reads, "One of the patrons of the Nimrod expedition, William Beardmore (later Lord Invernairn), after whom the Beardmore Glacier may have been named." It seems that one of Shackleton's lady friends was Elspeth Beardmore, wife of old William, and he had promised her that he would name one of the highest mountains after her, and a glacier after Will. But in the end only the glacier was named, and no one is really certain for which Beardmore benefactor it is named! When Shackleton was thirty-nine he wrote Elspeth, "I feel much older and a bit weary, but perhaps the Antarctic will make me feel young again." So now I know why old Charlie Bentley keeps on going back; he has a little bit of old Shackleton in him!

If you have a smattering of interest in Antarctic history and exploration, this book is a must. We have seen three reviews (Washington Post, London Daily Telegraph, and Edinburgh Daily Telegraph - last two courtesy of that pseudo-American in Cambridge, CS). The London reviewer, David Holloway, was still carrying a chip on his shoulder for what Huntford had done to Scott and used his space to glorify Frank Worsley's Endurance. The Edinburgh reviewer, Alexander Maitland, paraphrasing Huntford, wrote that Shackleton was "a forceful leader, who betrayed no class-prejudices, radiated charm and generosity, and compensated his private failings - mental sloth, infidelity with communicable virtues - journalistic flair, self-assurance, and persuasive oratory." Maitland said "Shackleton will be remembered as a pathfinder rather than a conqueror, a complex, charismatic personality and a great leader." The Washington Post reviewer, Dennis Drabelle, wrote, "Clearly and colorfully written, intelligently organized, shrewd in its judgments of men and its assessments of risks, vibrant with narrative brio, Shackleton is a splendid performance." So BUY. It's available from Atheneum for only \$29.95, which is a bargain nowadays. Now wouldn't it be great for us readers of Antarctic history if Huntford now did a study on Sir Douglas Mawson? Yeah!

**STEPHEN J. PYNE, A MAN WITH WORDS.** At the cocktail party preceding Mark Meier's Memorial Lecture last fall, an Antarctic author asked me who I thought the best Antarctic author was. It caught me off-guard, although I said I thought the best magazine article on Antarctica in the past decade was probably written by Katherine Bouton in The New Yorker. For Antarctic biographers I would have to cast my vote for Roland Huntford, who surely does a tremendous amount of researching/probing. But historian Stephen J. Pyne is coming out with an Antarctic book in 1987 entitled The Ice: A Journey to Antarctica which should be a great book, as Steve has a great way with words. I bugged him to let me have a copy of his presentation at the November 1985 Polar Symposium at the Smithsonian when they opened the Wilkes' Exhibition, and he reluctantly-, begrudgingly sent it to me just to get me off his back. My apologies to Steve for being obnoxiously demanding. His whole lecture was of the finest kind, and because we have a lot of Scott-Amundsen-Shackleton in this Bergy Bits, let's hear what Steve said at the Smithsonian about this era and events:

The tragedy of the Polar Party was only one of many that accompanied the TERRA NOVA expedition. The hardships and adventures of the Polar Party are rivaled (and in some cases exceeded) by those of Raymond Priestley's Northern Party and the nightmarish Crozier Party of Edward Wilson and Apsley Cherry-Garrard. As physical adventure the experiences of the

TERRA NOVA expedition are matched by Ernest Shackleton's NIMROD and ENDURANCE expeditions, by the saga of Douglas Mawson's solitary odyssey, by the exploits of Amundsen. Yet the story of the Polar Party has dominated, even paralyzed, Antarctic literature and history. The reason is that, even as he knew death approached, Scott left a legacy of writings— his diary and letters— that took Antarctic exploration out of the category of simple adventure, or even of science, and created for it a moral universe. Scott's writings claimed the status of moral epistles. The inevitable comparison of Scott to Amundsen is thus problematical. While Amundsen triumphed as a practical explorer, Scott succeeded as a moralist. The story is complicated, too, because Scott has become a British Custer, and the fate of the Polar Party, a British analogue to the massacre at the Little Big Horn. Hero or fool, attitudes towards Scott seem to reflect the contemporary state of British self-esteem and change with each generation.

**FLOOD GATES ARE OPEN?** It looks like Antarctica has a price, and if you have enough greenbacks, Adventure Network International (ANI) will get you wherever you may want to go. This past austral summer, ANI has taken at least two teams of Canadian and American climbers to Vinson Massif (16,863'). The teams were flown from Punta Arenas, Chile, to the base camp at the foot of the mountain in a Twin Otter of Antarctic Airways, crewed by the British polar specialist, Giles Kershaw, and flight engineer, Rick Mason. The expedition was organized by ANI which currently operates research vessels, land-based camps, and expedition services. ANI was formed by Michael Charmer Dunn of the U.S., and Patrick Morrow and Martyn Williams of Canada. The expedition was assisted by the Chilean Air Force, which airdropped fuel and supplies, using a C-130 Hercules. The Twin Otter can carry only eight passengers because of its internal 250-gallon ferry tank (which provides a 12 1/2-hour endurance at 135 knots). There doesn't appear to be much of a margin for error, as the trip takes six hours each way! The Canadian team was the first to climb this summer, followed by an American team. Kershaw, himself, got to make an ascent when one of the climbers was forced to withdraw. Kershaw, who in real life is a Boeing 737 captain with UK charter operator, Britannia Airways, was scheduled to take several more U.S. teams to the mountain before starting another Antarctic expedition from Hobart, Tasmania early in 1986. According to the magazine article sent to me by Charles Swithinbank, "The prime objective of ANI's activities is to open up the region to explorers and private travel. Until now the continent has been the preserve of government agencies." How about that? Poor old Vinson Massif - I bet it wishes it wasn't the highest. Can Holiday Inn be far behind?

**EIGHT U.S. TOURISTS MEET THEIR MAKER IN ANTARCTICA ON NEW YEAR'S EVE.** A 48-hour charter excursion for eight from Punta Arenas to Lieutenant Marsh Air Base in the South Shetlands Islands costs about \$7,000, but the one made on New Year's Eve by the Chilean-owned Aeropetrel charter company also cost the lives of eight "relatively older men" and the two-man Chilean crew. They were not able to land the twin-engine Cessna 404 on their first pass - presumably because of fog - and crashed into Nelson Island, six miles away. The eight were a microcosm of America - school teachers, engineers, librarian, and even a retiree. Marsh has 30 permanent residents, and has had about 300 tourists in recent years, accommodating about 40 visitors at one time. Aeropetrel has been operating Antarctic tourist flights for the past six years. People who don't know what to do with their money should really go white water-rafting, not flying off to Marsh to see penguins and sea lions which they can always see safely on PBS.

**GIRL SCOUT ROBIN MOYLE ENRICHES ANTARCTICA.** We asked Robin Moyle (see Bergy Bits for September 1985) if she would send us one of her poems from Antarctica. With a nice letter written in late November she sent one which we would like to share with you.

ANTARCTICA

A vast white land  
Its beauty is crippling  
and leaves me numbed.  
I am  
but tolerated  
and dictated only by fate.  
Sensory engulfment  
Blinding horizons  
An intoxicating perfectness  
A terrifying power.

Thin dry snow sweeps across the crust  
and  
like fine sandpaper  
it tries to smooth the scratching, swirling winds that fill the air.  
Isolation.  
Paralysing cold and moody weather.  
Eerie calls of seals,  
odd shadows on ancient ranges,  
mirages, and the savagery  
of a lone skua.  
Each, an individual key  
to the grand piano.  
Capable of a delicate sonata  
or,  
of unleashing a violent overture.

**MOULTON THE YOUNGER FINALLY RETIRES.** After making over thirty trips to Antarctica in the past thirty years, Ken Moulton has somewhat reluctantly hung it all up. Whether he can live without McMurdo is a very moot question, especially at Christmas time, when he usually escaped the maddening commercial holidays of today. Ken isn't really certain how many trips he has made to the Antarctic; he lost count after he ran out of fingers and toes, but he knows he made over thirty, because some years he made multiple trips which more than compensated for any off-years he may have-missed. So Moulton holds the American record, and old age will probably catch up with John Katsufakis, Tony Gow, Charlie Bentley, George Denton, Phil Kyle, Bill Cassidy and other home-escaping reprobates before they can catch Ken. But he doesn't hold any world record for Antarctic trips, as Bob Thomson of New Zealand has an all-time lock on that, going to the continent so often that one suspects he must have a favorite female penguin down there. As most of you know, Ken is the second family member to go to Antarctica; his brother Dick was a dog-team driver on the U.S. Antarctic Service Expedition, 1939-41. So between the two of them they cover a lot of Antarctic history. Ken should now find a way to get his daughter to go to Antarctica, as the continent won't seem the same without a Moulton.

They had a four-star farewell party for Ken in the former Executive Dining Room of NSF on the top floor of their building in mid-December. It was one of those prim and proper farewells, strictly in keeping with the image that Ken has developed and nurtured down through the years. There wasn't any roasting, because they couldn't

find any skeletons in his closets; he evidently has led a completely moral, error-free, dull life. They should have checked with his ex-wife! They gave him some really nice presents, one being a beautiful wall clock whose face was a map of Antarctica, attractively mounted with words from the Antarctic Treaty on a plaque below the clock. The clock was probably set on McMurdo time so he won't get lost timewise. There was some speculation that the Division of Polar Programs might fold up when Ken retired; however, they survived the retirement of Mother Superior, Helen Gerasimou, so they should be able to get along without Ken. But it won't seem the same without the 1985 departees: Mort Turner, Richard Cameron, Price Lewis, Frank Williamson and Ken Moulton. There is only one Antarctic remnant from the IGY in NSF, Ron Taylor, a meteorology program manager in atmospheric sciences. Ron was a meteorologist at Little America V in 1957. Don't let Ron's young looks confuse you - he is just well preserved from sipping all that fine California wine!

National Science Foundation gave Ken their highest award, the Foundation's Distinguished Service Award. I asked him for a copy of the citation, because I thought his myriad number of friends might like to read it. Ken said he was very embarrassed by all the flattering things it said about him, but when I checked through channels, I found out it was a direct copy of what Ken had written for himself.

#### DISTINGUISHED SERVICE AWARD

The U.S. Antarctic Program and its research segment known by the acronym USARP are the outgrowth of the International Geophysical Year (IGY) and reflective of U.S. interests and initiatives in Antarctica that are also embodied in the Antarctic Treaty of 1959. Mr. Kendall N. Moulton began his outstanding career in Antarctica at the time the support stations for the IGY were established in 1955.

His experience in polar science support and operations began even earlier when he wintered-over in the Arctic in 1951 with the U.S. Weather Bureau at Donki Station at Thule, Greenland, and later served at Eureka Station on Ellsmere Island. In 1955 Mr. Moulton went to McMurdo Station on Ross Island, Antarctica as a part of the National Academy of Sciences IGY team. In 1957-58 and 1958-59 he served at McMurdo Station as the U.S. Antarctic Program Representative with the IGY Group.

Mr. Moulton came to NSF from the Academy in March of 1959 when the Office of Antarctic Programs was being organized under Dr. Thomas O. Jones. His honest and straightforward approach to problems earned him the respect of all who were associated with him. During his 28 trips to Antarctica, Mr. Moulton represented the NSF at remote U.S. Antarctic stations, aboard the NSF research vessel ELTANIN, with U.S. Coast Guard icebreakers engaged in research projects and at McMurdo and Palmer Stations. In 1966 he was appointed Associate Program Director and was later promoted to Associate Manager in the Polar Operations Section. During the past several years while serving in extended assignments to Antarctica, he was appointed Senior U.S. Representative in Antarctica.

Mr. Moulton has served with distinction in the management of operations and logistics for the U.S. Antarctic Program. He has earned an impeccable reputation for being cost-conscious, honest, and persevering. He is widely recognized in the polar scientific community for his skill in meticulously planning and for his firm, safe, execution of logistic support for field research in Antarctica. He is well-known for his strength of character and integrity together with a rare "gift" of steadfast composure in the face of adversity.

During Mr. Moulton's career at NSF, the Foundation has been given responsibility

to manage and fund the entire national program in Antarctica. He was one of a small handful of people who took up the complex program management responsibilities dropped by the Department of Defense. It is significantly to Mr. Moulton's credit that the Foundation's performance during and following this extraordinary transition has proven so successful.

It is a pleasure to present the Foundation's Distinguished Service Award to Mr. Moulton.

(signed) Erich Bloch  
Director

**DEBORAH SHAPLEY'S *THE SEVENTH CONTINENT*.** \_ We have been looking forward with great anticipation to Deborah Shapley's book on Antarctica being published, and it was in mid-January. The title of the book is *The Seventh Continent: Antarctica in a Resource Age*. It was published by the Resources for the Future, has 350 pages of all you ever wanted to know about the U.S. involvement in Antarctica, the Antarctic Treaty, and resource issues. It has two appendices, one on the Antarctic Treaty, one on the Convention on the Conservation of Antarctic Marine Living Resources. A pre-publication release said it "is the first authoritative analysis encompassing the historical, legal, technical, and political factors that make the seventh continent the world's last and most challenging- frontier." Deborah was one of the participants in the conference held on the Beardmore in January 1985 in which an effort was made to 'convince the Third World nations that Antarctica was a most unique continent whose natural resources weren't all that available, and that the Antarctic Treaty was still in good working order. Deborah is a well-known journalist who writes on science, public affairs, and national defense topics, and is currently a visiting scholar at Georgetown University's Center for Strategic and International Studies. Her scientific lineage is outstanding, her looks are superb, and her hyperactive professional duties seem to meld into her other roles as a wife and mother. Hopefully she will be one of our winter-spring lecturers.

**CLIMATOLOGIST HELMUT LANDSBERG DIES.** Helmut Landsberg, age 79, died in Geneva in early December while attending a climatological gathering. Although he never went to the Antarctic, Landsberg had no limitations as a world climatologist, and edited the *World Survey of Climatology*, which included one volume on the polar regions. His death elevates our own J. Murray Mitchell to the role of senior climatological expert in the U.S. It used to be said that when meteorologists met there were only two climatologists, Landsberg and Mitchell. Then this country came up with a National Climate Act in 1978, fathered by Congressman Brown from California - for whom Grace Ostenso labors - and this sort of legitimized climatology as a science, and closeted climatologists then came out of the woodwork. For you folks in Washington, a one-day memorial symposium honoring Dr. Landsberg is scheduled at the Adult Education Center at the University of Maryland on 10 February. An excellent program, which is open to the public, will start at 9 AM. There will be a series of invited papers by some of the best meteorologists and climatologists in this country, followed by a commemorative ceremony. Landsberg was a gentleman and a scholar, and like all great men, he never really retired, he just kept on going, dying in the saddle with his boots on.

**ADDENDUM TO SOUTHERN QUEST** (page 6). According to the New York Times of 14 January, the crew on SOUTHERN QUEST just escaped onto the ice before being rescued by our helicopters.

**ICE CHIPS.** Future Antarcticans are *Nathaniel Bartlett Kellogg*, 1 Ibs. 1 oz., born on 2 November 1985 to Antarcticans *Tom and Davida Kellogg* of Orono, Maine. The little tyke was named after Nathaniel Palmer and Bob Bartlett, so let's hope he likes wooden ships and not Barbie dolls. His brother is *Griffith Taylor Kellogg* and, *Benjamin Ethan Wolak*, who checked in at 8 Ibs. 2 oz. on 14 October 1985 at the home of ex-Holmes and Narverite *Richard and Toby Wolak*. Dick works in Norwich, Connecticut, as assistant Chairman of Pressure Pak, Inc., manufacturers of pressure cylinders..... *Murray* (Antarctic Service Expedition and thereafter) *Wiener*, a retired bank vice-president who turned into a Master Golfer and Champion Fisherman - or was it the other way around? - was enticed out of retirement to become Vice-President of Marketing for 54 plush condos at Del Rey Colony in Venice, California, and also to serve as Vice-President of Christians Commercial-Builders. This is only temporary; the Wieners will eventually be back in Green Valley, Arizona. Wonder why old warriors find it so hard to really retire..... *Cliff* (South Pole '57) *Dickey* and his wife *Jean* left home in San Diego after Easter (in 1985) and were still traveling at Christmas time! They either love to travel or hate to stay home..... *Art* (South Pole '58) *Jorgensen* has a new job - Vice-President, Marketing and Sales, Image Systems, Inc. of Tucker, Georgia. He and son *Eric* sailed their 37-foot cutter FORWARD down the coast from Jersey to Hilton Head. He has put it up for daily charter, as he lives five hours away from Hilton Head Island, so if you want to charter it, call Red Jacket at home (404)498-6289 and tell him that Scroungy said he should give you a good Antarctic discount. . . . *John Roscoe*, geographer of notoriety and Antarctic bibliographer, spent the summer in Denmark, Norway, Lapland and then joined a Royal Geographical foray into interior Iceland. Relative to Iceland he wrote, "A most interesting aspect was rounding the mountains above Byjafjordur on the north coast and seeing the USCG icebreaker NORTHWIND in the fjord - but with a much different silhouette than when we moved Admiral Byrd's flag aboard in the Antarctic back in 1946." He was entertained on board by Captain Caster and enjoyed it tremendously. John also met the King of Norway on his trip. . . . *Jim Reedy*, retired Navy Admiral who was Commander of the Naval Support Force, Antarctica, November 1962-May 1965, was guest of Father Hesburgh at this year's Navy-Notre Dame game. Jim was a former football great at the Naval Academy, but his presence doesn't seem to help the Academy, as every time he goes to South Bend, the Irish win. Perhaps Notre Dame should have kept Faust and hired Jim to go to all their games! . . . *Steve* (Little America V) *Den Hartog* has evidently sired a great athlete. Sports Illustrated for 13 January 1986 showed a picture, with a write-up, of Dorcas Den Hartog, a junior at Middlebury College, who recently won the NCAA Division III cross-country title in Atlanta. She ran the 5000-meter race in 18:05, 36 seconds, a course record. Now, if old Denny had been able to run that fast back in 1958 when Big Bert Crary fell off the barrier into Kainan Bay, he might have gotten help to Bert a lot faster. Presumably Dorcas gets her athletic ability from her mother! Our congratulations to Dorcas..... *Charles Neider's* Antarctic novel, *Overflight*, is scheduled to come out in October 1986. He also has a new book on Tom Sawyer which got a mixed review in the Washington Post . . . . *Karl Kuivenen* has told Guy Guthridge who told Bergy Bits that Michael Parfit's book on Antarctica entitled *South Light* has been published. We have no details as to content, publisher, or price . . . *Mo Morris*, Deep Freeze pilot in 1964-65-66, has a publisher for his second novel, *The Alpha Bug*, - Presidio Press, fall 1986. Mo was the first pilot to fly to McMurdo from South America, made the first flight to Plateau Station, took Admiral Reedy on his "longest" exploratory flight, and so on and so on . . . *Frank Williamson* sort of reluctantly bid adieu to the Division of Polar Programs at the National Science Foundation, and took the position of Director of the Institute of Arctic Biology at the University of Alaska. . . . *Al Palmer*, young boat builder in Pemaquid, Maine, a direct descendant of Nathaniel Palmer, is interested in building a replica of the original HERO and sailing it to Antarctica. All he needs is money! . . . *Jerry Huffman* just out of the hospital after major surgery on his back (3806 Towanda Rd., Alexandria 22303).

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Vol. 85-86

March

No. 4

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.) 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984

*FEDERAL INCOME TAX DAY EARLY DIVIDEND*

*AMERICAN IN ANTARCTICA*

*1955-1985*

by

Kendall N. Moulton  
Retired-and-Loving-It

on

*Tuesday evening, April 15, 1986*

*8 PM*

National Science Foundation  
18th and G Streets NW  
Room 543

*- Light Refreshments -*

Because of Mr. Moulton's longevity in Antarctica, he has been given a free rein to talk about anything he wants to talk about, as long as he is through by 10 PM. He will present the best of his Antarctic photography, although he disclaims any photographic expertise.

*So, COME ONE! COME ALL!*

The Annual Business Meeting will be conducted prior to Ken's presentation. Normally this amounts to election by proclamation, and should be over in a matter of minutes.

*UPCOMING MEETINGS*

Joint dinner meeting with the Washington Chapter of the Explorers Club, Saturday evening, May 17th, at the Cosmos Club. Dr. Peter Wilkniss, Director, Division of Polar Programs, NSF, will speak on the 1985-86 Antarctic Program.

Annual Memorial Lecture, Tuesday, June 24th at San Diego, California — in conjunction with ongoing SCAR (Scientific Committee on Antarctic Research) meetings. Dr. Claude Lorius will speak on "Polar Ice Cores: A Record of Climatic and Environmental Changes."

--- IF YOU MOVE, LET US KNOW WHERE YOU'RE MOVING TO, SO WE CAN FOLLOW YOU ---

This column is the unofficial voice of the Antarctic Society, presenting a conglomerate of bits of information on Antarcticans and the Antarctic which have been gathered by an interested person. Please read the first paragraph below, as you all can make substantial contributions to this column which would materially improve the quality of the Newsletters. We need your help. If you should move, please remember to let us know your new address; bulk mail is not forwarded and we'll never find you.

**EDITORIAL ON SOCIETY DILEMMA.** Bergy Bits is concerned about the increasing difficulty in getting information about ongoing programs and investigators in the Antarctic, even though we have pleaded with Society members to give us their news. In the past few years, many of our contacts have retired; others find themselves too busy to contribute; it isn't much fun trying to make something of interest out of marginal material. The forecast is gloomy, although not hopeless. If those of you who are engaged in the Antarctic want the Society's Newsletter to flourish, they can take steps to see that we get newsworthy items. Bergy Bits feels that the Society should be primarily about Antarcticans and what they are doing in Antarctica. We publish only six Newsletters a year. What we want from you current investigators is very little of your time, just an occasional update on your activities. The Society is composed of OAEs, current investigators, tourists, philatelists, environmentalists, and polar freaks. I really don't know why polar philatelists join up with us, as they have an excellent house organ of their own in Ice Cap News; nor do I really understand why the environmentalists have joined, when Jim Barnes and The Antarctica Project thoroughly cover that waterfront. Once upon a not-so-distant past the Society was essentially a Washington-based society of closely knit Antarcticans, but right now we are essentially a national organization with over two-thirds of our 477 members being out-of-towners. We have to find ways of being more nationally responsive, of getting all people more involved. Anyone with ideas should get in touch with the Nerve Center.

**DR. DAGMAR CRONN SPEAKS BEFORE A FULL HOUSE.** Our January meeting was well attended, and the large gathering was rewarded with a fine presentation by Dr. Dagmar Cronn, atmospheric chemist from Washington State University. Dagmar had an excellent mix of science, humor, and beautiful kodachromes, and her bottom line seemed to be, "I have had great field seasons in Antarctica, all four of them, but I still need to go back to verify my results and conduct further investigations." Of our last five speakers, three have been women. We're changing!

**YOUNGER MOULTON WILL TELL ALL - WELL, NOT QUITE.** Ken Moulton, Mr. USARP for the past thirty years, is a walking history book of Antarctica during its scientific era. He is the only person still alive who was there before they built McMurdo, and then remained active in Antarctica up to 1986. Ken was a plank in the Antarctic Society, as he can recall the great social gatherings of charter members in the home of our first president, the late Carl Eklund. It has been Bergy Bits' contention that Ken was miscast in the Antarctic program, that anyone so closemouthed should have been working as an undercover Secret Service man in covert actions for the CIA. Don't expect any sensational disclosures on the evening of April 15th, as we are certain all of his comments will be well sanitized. But he will have some story

to tell, as he bridges the gap from the time Antarctic was exploration to its present advanced stage of scientific wizardry. No American has been to Antarctica more times than Ken, a record which will probably never be broken, as who else would have the gall and the tenacity and the desire to go there over thirty times! Ken is more or less single, so we should declare Tuesday night, April 15th, Ladies' Night. We are looking for a great turnout, as not only is Ken a very special person, he is extremely popular in Antarctic circles.

**POLAR EXPLORATION EXHIBIT OPENS AT U.S. NAVY MEMORIAL MUSEUM.** The Navy Memorial Museum, located in Building 76 at the Navy Yard, recently established a new exhibit, Polar Exploration, which is very interesting. It was formally opened on 17 December 1985 when Jackie Ronne gave the dedication lecture, speaking about the lives and achievements of three Navy explorers of note, Lt. Charles Wilkes, Admiral Richard E. Byrd, and Captain Finn Ronne. She duly noted that she had an intimate relationship with one of those explorers, although she was also magnanimous in her praise of the other two! Jackie was overly aggressive with the scissors, so the battery of photographers were never able to get any publicity shots of her cutting the ribbon and officially opening the exhibit. Only one old Navy Antarctic man showed up - Admiral Dick Black, accompanied by his lovely wife, Aviza. Probably the piece de resistance of the exhibit is the hut which Admiral Byrd had occupied at Boiling Advance Base. This must have brought back poignant memories to Ruth Siple, as her late husband helped to assemble the shack. Ruth's day was made when she found the name of one of the Antarcticans in the exhibit was misspelled! One of the pictures in the exhibit is of Moulton the Elder, in a scene from the U.S. Antarctic Service Expedition. Light refreshments were served, with a real polar touch being provided by chocolate and vanilla Klondike bars! Visitors to Washington now have two polar exhibits to attend - the Wilkes exhibit in the Museum of Natural History at the Smithsonian, and this Polar Exploration exhibit at the Navy Yard. There's plenty of room at both museums, so you can visit each without fear of being overrun by hordes of little monsters touring Washington.

**SHACKLETON - BY ROLAND HUNTFORD.** What a book! Fantastic! Bergy Bits is one who thinks that Huntford is a most thorough researcher, and feels that his two polar biographies, Scott and Amundsen and Shackleton, represent the most thorough, scholarly investigations ever done on polar explorers. No matter how you may feel about Huntford, you have to be impressed by the voluminous diaries and letters that he used in writing these volumes. For best reading, keep a finger back in the reference section to ascertain sources.

There were two Shackletons, the one on the ice, the one in the city. The former has long been cited as the leader under whom people would have wanted to serve in Antarctica, and this comes out very strongly. Anyone who reads this column realizes that its author is a renegade himself, and as an old enlisted man without much regard for rank, found it very easy to sympathize with Shackleton. His finest hours had to be in getting all of the ENDURANCE men back safely, and, naturally, 'this is treated in great detail and is the best polar reading it has been my pleasure to read. Hunt-ford's chapters on Shackleton's trek up and down the Beardmore Glacier are also superb. Just great! But there are many heroes in this book; it is not just the story of Sir Ernest, and one gets enthralled by their behavior, too.

Shackleton back home wasn't so lovable. He was a terrible handler of money; once he got his hands on it, he forgot about his obligations. Many a loan was never repaid, and evidently many of his men were never fully recompensed for all their services. He never had more than token support from the august Royal Geographical Society (whose dedication and loyalty remained with Captain Scott). He used his

great charm to solicit money from many affluent women, and, seemingly he never seemed to fall into disgrace with any of them. But many of his male benefactors turned against him. It is doubtful if Shackleton ever won any honors for being Husband of the Year, spending only a minimal amount of time at the home hearth. On shore he was happiest when hustling money for his next expedition or looking for an "El Dorado" investment. In spite of his expedition-written letters to his wife, Emily, telling her that he would never go south again, he probably was predestined to keep going until he died. Like many an old baseball player, he never realized he was washed up, and was sort of a pathetic figure at the end. However, the person one ends up feeling sorry for was Emily. If he had only returned from the ENDURANCE and lived out the rest of his life in the country with her, it would have been true Hollywood, but it would not have been Shackleton! Besides, he would have been miserable without Antarctica in his life.

Huntford's last chapter is entitled "The Last Presence", and concerns itself with Shackleton having the feeling, while crossing the mountains and glaciers of South Georgia, that "we were four, not three." Shackleton had also expressed the feeling that Providence had guided them "against the storm-white sea that separated Elephant Island from South Georgia." The Fourth Presence of Shackleton's became immortalized in T.S. Eliot's *The Waste Land*, and Huntford ends his 697-page book with "the final, poignant irony of his life is that Shackleton, the frustrated poet, found a more hidden immortality through one of the great poems of the age." Although there were several deeply religious members on the early expeditions, Shackleton wasn't really one of them. Yet history has enshrined him as a religious man through Eliot's poem. Talk about the luck of the Irish. This had to be it!

There will be some odd characters who won't like this book - some modern-day women, people who are rank conscious, supporters of Captain Scott, and even some Antarctic scientists. But Huntford won't worry about them on his way to the bank, as this book has enough overall appeal to be a great seller. All of the reviews that *Bergy Bits* has seen have been very favorable. My only criticism is that Huntford uses a lot of big words, and at times overkills subjects. The book could have been reduced by a hundred pages, and it would have been better. If one just put all of the on-the-ice chapters together, it would have been a fantastic story of a fabulous man. However, when his whole life is included, Shackleton becomes a mere mortal.

*Bergy Bits* has not seen all of the made-for-television documentary on Shackleton, but what he has seen seems to be in harmony with Huntford's book, with one major exception, Shackleton's relationship with his wife. The television production portrays Shackleton as a dutiful, married man, extremely cognizant of his wife's feelings. The book's version is anything but that. One nice thing about the film on Shackleton is that you can understand the spoken word, plus the fact that the man who portrays Scott is much more believable than the person who portrayed him in the *Masterpiece Theatre* production. However, the actor who played Shackleton looks more like a wimp than the macho-appearing Shackleton.

**WITH WHOM WOULD YOU WANT TO GO TO ANTARCTICA?** Writing about Scott, Amundsen, and Shackleton, and remembering what has been written about each of them as leaders, it seems appropriate to ask, "With whom would you want to go to Antarctica?" My pick to go anywhere - polar, tropics, deserts - would be old Mike Benkert, the retired Coast Guard admiral who used to skipper icebreakers. When you went anywhere with Mike, you knew you were coming back. You would probably be involved in a brawl somewhere along the line, might get bloodied up, but Mike would see you home. Men are either fighters or lovers; Mike is both. He always marched to his own set of drums. He defied the Russians and took the NORTHWIND into the Kara Sea and took bottom measurements. When he was on a Treaty inspection tour of Antarctic stations,

the State Department told Mike they were interested in a new station that had just been established, Mike took the ship there, but the weather was bad for several days, so he said he wasn't going to waste any more time there, and took his ship out, to the chagrin of the State Department! My second choice would be old Bert Crary. What Bert doesn't know about the polar regions really isn't worth knowing, and if you were with Bert, you could just relax, as you knew he could and would write up the report when you got back. Bert is a diplomat; if he had been skippering that icebreaker, he would have stayed there forever, as his philosophy would have been, "We might as well stay here and drink beer until the weather clears, as there's no good reason to get on home." My third choice would be old Fred "Muckluck" Milan, the aficionado of circumpolar people. The reason I'd like to go with Muckluck would be his endless supply of stories about Eskimos, Lapps, Terra del Fuegians, Aborigines, et cetera. It sure is fun listening to someone who has a sense of humor and seems to have met everyone who ever set foot in the Arctic. But you could never turn your back on Muckluck, as he would slip a thermocouple into you if given half a chance. My fourth choice would be George Denton. I understand that he is a human dynamo in the field, an indefatigable worker. If you're going to be where muscles are required, you had jolly well better have some raw-bone hulk along to do the heavy stuff. My fifth choice is based on a scenario whereby I might find myself in a tent on a glacier with a depleting food supply and a raging blizzard that would not stop. Then I would want to be with Gisela Dreschhoff. I have never had a blonde girl friend, and I think every man should probably have one before he dies. So there are my top five. If you send in your list, we'll see to it that it gets some notoriety.

**DIFFERENCES OF OPINIONS.** Bergy Bits is less than enchanted by the way some of our polar giants have been neglected in Deborah Shapley's new book, *The Seventh Continent: Antarctica in a Resource Age*. I particularly wondered about her treatment of the late Dr. Paul A. Siple. He is mentioned twice as the builder of the South Pole Station, not as its first scientific leader who took an almost completely polar-inexperienced crew through a most successful and happy year. He was the right man at the right time for the right job. He labored under extremely difficult circumstances, being a pro-Byrd man in a regime which had little or no regard for Byrd people. And there were light years of differences between the life styles of Siple and the late Admiral Dufek. Siple became famous as the Boy Scout selected to go to Antarctica with Byrd, but his immortality hangs on windchill, which he developed from experiments with Charles Passel on the U.S. Antarctic Service Expedition, 1939-41. And he was responsible for the development of probably the most significant item of polar clothing ever made, the rubber thermal boot. It was one of Siple's eight patents for protective clothing, No. 2,433,834. During World War II, the U.S. had 50,000 casualties in Europe from trench foot. Insofar as I know, we have never had a single case in Antarctica. Deborah wrote, "From 1959 on, the scientists gained on the older group of Antarcticans such as Dufek and Siple," Outside of Bert Crary, I don't know of any other Antarctic scientist who was gaining on Siple in 1959. Siple was in his prime at age 50. Charlie Bentley was still trying to grow a beard. Siple was very highly thought of by our State Department which, in 1963, sent him to Canberra to serve as our country's first Scientific Attache to Australia and New Zealand. I think Siple (his legacy) will outlive all Antarcticans from the International Geophysical Year, and I think it is too bad that he never really got a fair shake in Deborah's book.

Another man who came out on the short end was the late Dr. Thomas C. Poulter. In a 100 plus-word sentence about scientific credentials of polar experts, he is mentioned as "a physicist". True, he was a physicist, but not just an ordinary one, he was a great one. Deborah said a generation of polar experts was trained by Byrd-

Finn Ronne, Paul Siple, Dick Black, Tom Poulter, Bud Waite, Pete Demas, Harry Dater, Carl Eklund, and Larry Gould. First mistake was that Byrd never really trained anyone. Second, she said Larry Gould was the only one with scientific credentials that were extensive enough to continue as a leader in Antarctica's age of science and the IGY. Baloney! Larry's credentials are unchallenged as a university administrator and for Antarctic wisdom, but when it comes to Antarciticans with scientific credentials, Dr. Poulter's name should be at the head of the American list. He was a scientific giant, had more than seventy-five patents on diverse inventions, was director of two research foundations (Armour and Stanford), and established Stanford Research Institute 's Bio Sonar Lab for the study of biological sonar and diving mammals, including studies with blind people. SRI named a laboratory after him for his contributions in the fields of detonation and shock pulse phenomena. Unfortunately, most people associate his name with the ill-fated Snowcruiser, but the concept wasn't all that bad. Haven't the Russians come up with similar-sized vehicles for use in Antarctica, vehicles which have been highly successful?

**RALPH LENTON SURFACES.** Ralph Lenton is an old FIDS (Falkland Islands Dependency Survey) man who established an all-time record for number of cups of coffee/least number of hours of sleep in a five-day period when the British Commonwealth Trans-Antarctic Expedition (TAB) stopped off at the South Pole in January 1958. He recently called the Nerve Center from his home in Quebec (558 White Crescent, Greenfield Park, PQ J4V 1G1) to tell us his middle son, Anthony, a biologist, left for Siple Station on the anniversary date when he himself had set off for the South Pole. Ralph still keeps up with TAE people, and went back to Cambridge for their 25th reunion. The only one who failed to come back was meteorologist. Hannes LaGrange from South Africa. The British sure know how to hold reunions and get the old boys back. Ralph said that mountaineer-photographer-academic George Lowe, who shot both the Everest and the TAE films, had joined Ed Hillary's Himalayan Foundation. They were mountain-climbing buddies long before Everest. Ralph also said that Ed Hillary and Jan Mulgrew (widow of Peter Mulgrew, the Kiwi who lost his life when the DC-10 crashed on the lower slopes of Mt. Erebus in 1978) were very close friends, saying that pictures of the two of them had appeared in a fall issue of People Magazine. A further bit of news from Ralph was that Hugo Neuberg (Ellsworth '57) had retired and was in Nepal working with his son for a couple of months. Ralph and bride Helen went back to England over the holiday season, and brought back some disconcerting news about Bunny Fuchs (Sir Vivian Fuchs, leader of the TAE). It seems that his home was recently broken into, and the culprits walked off with all the trophies, cups, plaques, and awards given to the TAE, as well as much of his polar library containing many valuable first editions. Bunny doesn't expect to get anything back, feeling that anything with precious metals has probably been melted down and sold on the open market. The world is sure full of jerks. Bunny's health isn't all that great, and like Bert Crary, he is impatient to get back to his former self. Old Ralph has some ticker problems, and is going back into the hospital this spring for some fine tuning. Probably stems from all that coffee he drank at the South Pole. We have Ralph on hold for a meeting next fall when he will come to town and tell us about the Brits and the TAE.

**COLIN BULL AND BOB PETERSON INTO POLAR BOOKS.** There are a couple of new kids on the street selling polar books, one being one of our own, old Colin Bull, former Director of the Institute of Polar Studies at The Ohio State University, and the other a newcomer by the name of Bob Peterson. Colin issued his second catalog on 2 February 1986 with 120 listings, broken down into contemporary accounts, less expensive (\$20 and below), and all-the-rest. Colin has been involved in polar research since 1951, and recently retired to the Pacific Northwest, where he currently lives, temporarily, at 9219 SE 33rd Place, Mercer Island, Washington 98040. His

phone is 206-232-7518. If you are interested in selling off your library, get in touch with Colin, as he has deep pockets and a lot of money.

Bob Peterson came out with his first Polar Regions catalog late in 1985, listing 280, 159 of which are on Antarctica. His place is called the Blue Dragon Bookshop, located in Ashland, Oregon 97520, (P.O. Box 216), and his phone is 503-482-2142. The great thing about Bob is that he doesn't charge you an arm and a leg for his books, being the only reasonably priced polar book dealer I know. Bergy Bits found out the hard way how other book dealers buy from him, then double or triple his price and resell (e.g. Bernacchi's Saga of the DISCOVERY was listed by Bob for \$22, dealer who bought it sold it for \$65; Joyce's The South Polar Trail was listed for \$20, dealer resold it for \$60). So if you want to get on Bob's catalog list, don't dilly-dally around after you get his listing, as the biggies will be swooping down and siphoning off his best buys.

**LAWYER CHRISTOPHER JOYNER WRITES ON ANTARCTICA.** Chris Joyner, a member of our Society's Board of Directors, and an Assistant Professor of International Law in the Department of Political Science, The George Washington University, has written several articles, none of which Bergy Bits has read, as they just recently came into the Nerve Center. But for those of you who are students of the Falklands/Malvinas War there is "Anglo-Argentine Rivalry After the Falklands/Malvinas War: Laws, Geopolitics, and the Antarctic Connection", published in Vol. 15, No. 3, Winter 1984 issue of Lawyer of the Americas, The University of Miami Journal of International Law. Another article appeared in the Journal of International Law of Case Western Reserve in Spring 1985 (Vol. 17, No. 2), and that was "The Southern Ocean and Marine Pollution: Problems and Prospects." In Volume 15, No. 2, 1985, of Ocean Development and International Law, appears "Security Issues and the Law of the Sea: The Southern Ocean." And in the National Resources Journal (issue unknown) is "Oceanic Pollution and The Southern Ocean: Rethinking the International Legal Implications for Antarctica." Knowing Chris, we would recommend all, although he forewarns they are "admittedly somewhat dry and hyper-documented as law journals are wont to be."

**MARTIN H. BELSKY MAINTAINS AN ANTARCTIC LAW INTEREST IN FLORIDA.** Marty Belsky, young Harvard Lawyer who used to run around the halls of NOAA, and had some sort of an exalted overseer position relative to the National Climate Program Office, chucked the bureaucracy several years ago to become Director of the Center for Governmental Responsibility at the University of Florida in Gainesville. He remains very much interested in Antarctica, and "in fact do some of my research about Antarctic legal problems." So he sent us a copy of the San Diego Law Review, Vol. 22, No. 4, 1985, in which appeared his article describing a proposal for management of large marine ecosystems, "Management of Large Marine Ecosystems: Developing a New Rule of Customary International Law." By his signature, Marty must have gone to medical school first, as it is totally illegible. How come great brains have rotten penmanship?

**SOUTH MAGNETIC POLE ALIVE AND DOING WELL.** For the first time in thirty-four years, the South Magnetic Pole has been located. At noon on 6 January 1986, an experiment on the M.V. ICEBIRD determined its position to be 65°18' S, 140°02' E, offshore 94.3 miles NNW of Dumont D'Urville. Australian scientists from their Bureau of Mineral Resources used a sensitive magnetometer mounted on a nonmagnetic boom protruding from the stern of the ship. Direct measurements of the South Magnetic Pole had been made only three other times - 1909, 1912, and 1952. Since explorer James Clark Ross came within 155 miles of it, it has drifted 807 miles in a NNW direction at an average speed of 5.5 miles per year.

**EDGEWORTH DAVID ESTABLISHED IN HUNGER HILLS.** Australian geologist Edgeworth David led a field party on the Shackleton 1907-09 expedition to the South Magnetic Pole, an Antarctic first. Later he became Sir Tannat William Edgeworth David, but the Australians must have decided this was a bit too much, so they named their newest station, Edgeworth David. It's on an ice-free area, about halfway between Mirny and Casey, and will be manned for at least three summers. Australian Minister for Science, Mr. Barry Jones, said in Australian News, 6 February 1986, that the new station represented a new direction in Australian Antarctic activities. He said the program was part of the government plan to restore Australia's credibility in Antarctic research, and was the first major step in the expansion of its Antarctic program. "This is the first major onshore field program we have mounted since the late 1970's. Australia lays claims to 42 percent of Antarctica, and it is only by getting out into the field and studying our territory that we can sustain the credibility of our claim," said Mr. Jones. Appears that good old Barry doesn't really recognize the Antarctic Treaty.

**HUSKY OWNER PREFERS CLIMBING.** C. Vernon Cooper, Jr. is the Society's male counterpart to Dotte Larsen, and, indeed, their paths have crossed, as they were shipmates on the LINDBLAD EXPLORER in bygone years. Vernon is a dog owner - owns five huskies -who dabbles in finance, being president of the Peoples Bank S Trust Company of Hazard, Kentucky. It is almost the perfect name for his bank and town, as it takes a lot of people's trust to put money in his bank when he is more apt to be climbing some mountain peak in Argentina than sitting behind the presidential mahogany desk. A real hazard! As I understand it, Vernon is a born-again mountaineer, taking it up with a vengeance when he was in his fifties. He's a mountaineering cult hero in Argentina because he once almost singlehandedly brought back to life an Argentine military mountaineer officer who was suffering from exposure and high altitude sickness. Subsequently the Argentine Army hosted a dinner for him and presented him with a Diploma of Honor and pinned on him the Condor Dorado. The Golden Wings of the Condor are the highest honor bestowed on the Troops of the Mountain. This past January Vernon found himself back in Argentina for the dedication of the Refugio Vernon Cooper, which is near the majestic mountains of Cerro Fitzroy and Cerro Torre. Although he is 62 and has been climbing for only nine years, he has conquered Blanc, Eiger, Lanin, Cayambe, Copahue, Chimborazo, and some other equally tongue-twisting mountains. Later this year he will be climbing in the Himalayas, and after that he will go to the Antarctic with the Argentines. There is no way I would leave any of my millions overnight in his bank! Imagine what the auditors must find when they go over his bank accounts - all kinds of mountain doodlings! He is actually more than a part-time bank president and part-time mountaineer, as he is one of those do-gooders who is community-, state-, and nation-oriented. A couple of years ago he won a national award from the American Library Association, and recently was in town to attend a conclave of people concerned with Appalachia.

**AL LINDSEY (BAE II) GETS OAK LEAF CLUSTER TO GO ON HIS HALLEY COMET RIBBON.** Al Lindsay biologist on the Second Byrd Antarctic Expedition, will be 1.04 Halleys old when he catches his second look at Halley's comet outside Laredo, Texas in April. He recalled how, in 1910, his parents held hands as they took their 3-year old son across a Pennsylvania meadow for a look at the comet, which silhouetted a barn roof. He was impressed, saying, "There was this colossal phenomenon. I was almost scared because it was so far across the sky that the tail spun out toward the east, incandescent in the solar wind." He went on to tell a Louisville (KY) Courier-Journal reporter, "Realistically, the expectable span of human life now very closely matches the intervals between visits of Halley's comet, which is 76 years, and I call this more human unit of time than the Halley."

**AMERICAN INSTITUTE OF BIOLOGICAL SCIENCES (AIBS) HONORS MR. BIOMASS.** "Sayed Z. El-Sayed, professor of oceanography at Texas ASM University, College Station, and an expert on Antarctic science has received the 1985 AIBS Distinguished Service Award. The award, conferred in August at the AIBS annual meeting in Gainesville, Florida, recognizes El-Sayed's contributions not only to basic biological research, but to his successful blending of research and international diplomacy.

"For more than 20 years, with more than 100 scholarly publications, El-Sayed has pioneered the study of biological productivity and energy flow in the Southern Ocean. He has also worked in the Gulf of Mexico, South Atlantic, Southern Indian Ocean, Central Pacific, and Eastern Mediterranean Sea. His research intertwines with his efforts to encourage international scientific cooperation; the combination has earned him professional and personal stature not only among Western nations, but throughout Middle and Far East and Eastern Bloc countries as well. Robert A. Abel, president of the New Jersey Marine Sciences Consortium, writes in his nominating letter, 'El-Sayed's career is a fine model for integrating biological disciplines, improving public policy, and enhancing international cooperation, all for the betterment of society.' His work, Abel notes, may contribute significantly to achieving future world peace.

"Many national and international research organizations regularly seek El-Sayed's expertise. He served NAS and the National Research Council as a member of the academy's Polar Research Board and as the first Convenor of the Ross Ice Shelf Project, and he twice represented NSF as Chief Scientist on the USNS ELTANIN. He has also contributed to the International Council of Scientific Unions (ICSU) through two scientific committees, chairing a working group on oceanic research and serving as convenor for a special group studying Southern Ocean ecosystems and resources. In this position, he led the way to formulating the BIOMASS program (Biological Investigations of Marine Antarctic Systems and Stocks) and organizes multiship international experiments. The first, in 1981, was the largest such experiment in biological oceanography ever mounted, including 14 vessels from 11 countries.

"As convenor, El-Sayed was invited by the USSR Institute of Oceanography and Fisheries and the Polish Academy of Sciences to discuss BIOMASS and to organize a scientific meeting in Cracow, Poland. Shortly after the war in the Falklands, El-Sayed played a key role in getting British colleagues to attend a symposium on aquatic Antarctic biology in Bariloche, Argentina. He lectured in China for three weeks at the invitation of the People's Republic of China's Bureau of Oceanography and succeeded in getting that country to join the BIOMASS community.

"Born in Alexandria, Egypt, El-Sayed, 59, received his B.S. and M.S. from the University of Alexandria; he came to the United States in 1952 on a Fulbright Fellowship at the Scripps Institute of Oceanography, La Jolla, California. He earned his Ph.D. from the University of Washington, Seattle, in 1959 and joined Texas ASM that year. He became a US citizen in 1965. In 1983, NSF awarded him the Antarctica Service Medal of the United States of America, and the US Board of Geographic Names recognized his contributions to Antarctic science by naming El-Sayed Glacier in West Antarctica in his honor. El-Sayed belongs to more than 25 scientific and professional organizations, including AAAS, AIBS, the American Society of Limnology and Oceanography, and the American Fisheries Society. He also edits the BIOMASS newsletter, the BIOMASS Report Series, and the BIOMASS Scientific Series; lectures widely; and serves on numerous other boards, committees, and working groups."

The above was confiscated from the files of AIBS; we would like to congratulate old Sayed for this most deserved award. I note it didn't mention anything about his family, though I do know he is married. I doubt if he practices "marriagism" with the same intensity that he does biomassism, or that he has received any rewards for "husbandry", because he always seems to be at sea or else posing front center in group pictures of people who claim similar interests. Actually I'm just jealous of his lifestyle and personal accomplishments.

**QIC AT MCMURDO, DEEP FREEZE I, SUCCUMBS.** Dave Canham, who as a Lieutenant Commander was the senior Naval officer at McMurdo in 1955-56, died on 5 February in Dickinson, Texas. He was 65 years old, and was the assistant director of the University of Texas' Marine Science Institute in Galveston. He was selected to go to Antarctica this past austral summer, it being the 30th anniversary of Dave and his men building McMurdo Station, but he failed the physical because of gall stones. However, his deputy, Jim Bergstrom, represented Dave and made the trip south in November-December. Dave went into the hospital in January 1986, had the operation for removal of gall stones, and was apparently making a good recovery at home, when he experienced some difficulties and had to be readmitted. Dave was a very friendly giant of a man, and had hosts of friends. Although he never went back to the Antarctic, his year on the ice made a lasting impression on him, and he thought longingly of Antarctica every day of his life. He kept in touch with most of his old crew, and this past summer issued a call to quarters to his men to assemble at Norfolk to celebrate the 30th anniversary of their leaving Norfolk for Antarctica. It was a gala event, very well attended, and everyone had a great time. They departed with avowed intentions of gathering again in two years at San Diego, but now their leader will not be there. Bergstrom attended the memorial service in Dickinson. There was a floral arrangement in the form of a penguin with an attached card which said it all, "From his explorer friends". Dave's ashes will be scattered over Canham Glacier sometime this coming austral summer.

Because of Dave's close friendship with Ruth Siple, Bergy Bits got to know him quite well, as Dave, whenever he came to Washington, dined with us. A three-page, single-spaced letter to Bergy Bits written in September 1984 recounted the pros and cons of that first winter of McMurdo life, but it is much too private to share. Dave wasn't exactly enamored by old Antarctic explorers, except for the late Dr. Paul Siple, and he more or less felt that the achievements of his men at McMurdo were accomplished not because of, but in spite of them! Canham's crew was a tight little island unto themselves, enjoyed/shared a tremendous esprit de corps, and thought of themselves as explorers, referred to themselves as explorers. Jim Bergstrom wrote:

The tasks of constructing McMurdo in 1955 and the South Pole in 1956 were enormous. Dave met this challenge head-on with foresight, innovation, and a determination that infected every man in his command. The severe cold, isolation and total darkness were but three of many obstacles in the path to completion. They were overcome, as were all the others. His leadership was the key to the success of OPERATION DEEPFREEZE I and II. He led, he did not push. As formidable as the tasks were, he still maintained a warm relationship with his men. That relationship continued for the next thirty years through written correspondence culminating in a reunion in Norfolk, Virginia last August. It wasn't until years later that many of the OPERATION DEEPFREEZE I and II personnel realized the tremendous contribution of this man. He was a true explorer, not willing to risk men and material until a high degree of success was attainable,,

One of the nicest tributes that could have been paid to Dave was in The Polar Times, June 1956, in an article written from McMurdo Sound on March 9th, "In the carefully considered opinion of ninety-two Americans, Lieut. Comdr. David W. Canham, Jr., of Detroit, is one of the nicest things that could have happened to them, in the Antarctic or anywhere else . . . Seldom in the Navy or out of it, have a group of men taken to their boss as these men have taken to Commander Canham, and vice versa."

**ANTARCTICA: THE FROZEN CONTINENT - A SUPER BOOK.** Anyone who cares for Antarctic history should buy the new Reader's Digest book, Antarctica: The Frozen Continent. It is unlike any other book on Antarctica, and has many chapters' dealing with highlights of nearly all the Antarctic expeditions. It was published in Australia late

last year, and is being distributed in this country by Random House. The price of the book is \$32.95. It's terrific!

**SKIP DAWSON DEAD AT AGE 76.** Col. Merle "Skip" Dawson, former project manager for ship operations in the Office of Polar Programs, 1965-1970, National Science Foundation, died of respiratory failure on 14 February 1986. His nickname probably came early on, as he steered ferry boats from Annapolis across the Chesapeake Bay from 1930 to 1936 when they were the only close link with the Eastern Shore. His military career began in 1943, and ended in August 1964. Somehow or other, in only twenty-one years of military service, he accumulated 44 Army and Navy decorations, including three Legions of Merit and two Bronze Stars. He served in both Europe and Asia during World War II, and was in the Korean War. Skip commanded Operation Swamp Fox in the jungles of Panama, took part in the building and resupply of the Distant Early Warning Line across North America in 1952 and 1953, was an instructor at the Army Transportation School at Fort Eustis, served as president of the Army Transportation Equipment Testing Board, evaluating landing crafts. He served as beachmaster in the landing at Inchon, Korea, and was harbor pilot at the evacuation of United Forces from Hungnam, Korea. Outside of that, his military service was pretty humdrum.

Skip achieved lasting fame as an Antarctic for establishing a safe trail from Little America V to Byrd Station in November-December 1956. The preceding austral summer a small tractor party, led by Lt. Cdr. Jack Bursey (dog team driver with the First Byrd Antarctic Expedition, and also a member of the U.S. Antarctic Service Expedition, 1939-41), discovered that the 632-mile route was fraught with some prodigious crevasses. The Pentagon recalled Major Dawson that summer, briefed him on the situation, and asked him if he could provide a safe route to the proposed location of Byrd. Being a "can do" person, he accepted the responsibility, and led a party of eleven individuals out of Little America V on 7 November 1956. A junior officer working alongside Skip was Lt. Phil "Crevasse" Smith, now an exalted super-high administrator at the National Academy of Sciences. Another colleague was Major Palle Mogensen, who subsequently became Station Scientific Leader at the South Pole, 1957-58. With crevasse detectors in front of weasels, and inching their way on their bellies while tied to safety lines, the group successfully crossed the dangerous area and prepared the way to build Byrd Station. Forty-seven hundred pounds of explosives were set off collapsing suspicious snow bridges. One cleft was 40 feet wide and 160 feet deep, and D-8 caterpillar tractors had to doze 105,000 cubic yards of snow into it to make a safe 30-foot roadway across the gap! The Caterpillar Tractor people made a 40-45 minute movie on establishing the Byrd trail, which remains a classic Antarctic film. The trek to Byrd was completed on 16 December 1956, and a week later the construction crew arrived to build Byrd Station.

Skip served in the Office of Polar Programs from 1965 to 1970, and one of his favorite assignments was sailing on NSF's Antarctic research vessel, the ELTANIN. Like a true man of the sea, he was never happier than when he was on the water. He retired in 1970, but continued to enjoy the Chesapeake from his residency in Annapolis. Each year he would invite two of his landlubber Antarctic friends, Walt Seelig and Ken Moulton, on an all-day fishing excursion, and, sometimes they even caught fish. Walt recalls fondly the day they caught a 56-pound and a 52-pound striped bass! Skip was extremely well liked by his colleagues - he was unassuming, modest, quiet, dignified, thoughtful, and extremely capable. He is survived by his wife, two daughters, and six grandchildren.

**ICE CHIPS.** No births to report, but Happy 30th Wedding Anniversary to *J. Murray Mitchell* and His Fair Lady. Murray, an avid outdoor enthusiast and one of the world's pure nice guys, still talks enthusiastically about his trip to the South Pole . . . .

*Captain John Cadwalader*, the old Navy Antarctic of yore, is still sprightly enough at age 76 to go hunting in the Brooks Range of Alaska, but he writes, "I envy people who are only 70." John feels the debunking of Capt. Scott has gone too far, and he presents a strong case in behalf of Scott which we may include in another issue.... *Fred "Muckluck" Milan*, he of Circumpolar People fame and practicing physiologist at Little America V in 1957, has pulled the plug in Alaska and is sort of retired. He has an unpaid position as Affiliate Professor of Medical Sciences at the University of Alaska, which means that they allow him to continue to use his office and do research without charging him! I think they are really letting him have the facilities just to regale the new generation with ribald stories of the Arctic, plus pity for his bride Leda, not wanting him driving her crazy at home.... *Jerry Huffman* has evidently made a complete recovery from his herniated disc operation, and he and bride Gundel spent a week in Jamaica in mid-February where Jerry took therapy in salt water. The only problem now is how to get Jerry's eyes back into their sockets after seeing all those bikini-clad bodies on the beach. Jerry and Gundel hope to move into their steel-shelled house in Rixeyville, Virginia sometime in 1986. Jerry is going into the Christmas tree business, and has planted 500 seedlings. See him in another five years, bring your axe and pocketbook. No freebies . . . *Doc Abbot*, Commander of the US Naval Support Force, Antarctica, February 67-June 69, reports that his back problem "is nearly gone." He is back on the tennis court, back on the golf course, and still delivering boats - making five deliveries in 1985, bringing his post-retirement deliveries up to 42. He also maintains his Commercial Pilot's license, and has hopes of delivering a boat to a destination from where he can fly a charter plane back, or vice versa. Doc's Dad is now 97, and is the sixth oldest living graduate of the Naval Academy. Doc's son made Captain in the Navy a year ago this past January. That's a real Navy family..... Better treat glaciologist *Chet Langway* with greater respect, as his nephew is the one and only Rod Langway, premier defenseman for the Stanley Cup champion-bound Washington Capital hockey team. Rod has won the award for being the best defenseman in the National Hockey League for the past two years. He is so rough and so mean that he doesn't have to wear a helmet! But he also has had about 17 broken noses!! .... Who knows anything about any glass bottles made for BAE I by *Owens Bottle Company*? The bottles measured 5 and 5/8 inches high, and "Byrd Antarctic Expedition, 1928-29" was in raised letters on the front. There were 567 bottles delivered to the old ELEANOR BOLLING in Norfolk, and the director of the Antique and Historic Glass Foundation in Toledo, Ohio, *Carl Fauster*, wants to know what in heaven's name happened to those old bottles. Larry Gould doesn't know. How about you other fellows - Henry Harrison, Norman Vaughan, Howard Mason, and John Bird? .... If you want to invest some money in Mexico, you might want to contact *Lou DeGoes*, former executive secretary of the Polar Research Board, in his business venture at Bahia Kino on the Sea of Cortez. Louis (10900 Northeast Eight St., Suite 900, Bellevue WA 98004) will be most happy to sell you all the \$25,000 Series A Promissory Notes that you want. Interest is payable at 25%, so readeth a flyer from the old Footballer. EBASCO Services, Inc., a New York-based international construction company with over 35 years' experience in Mexico, will be breaking ground there early this year. .... We dropped USGS's *John Kelmelis* from the Society for going delinquent, but he doesn't need us when his wife comes through like she did this year. A radio station in Washington had an Hungarian cookout, and she went into her memory bank and came out with an old family recipe which took first prize. The award - an eight-day, all-expenses-paid trip for two to Budapest. The moral here is to make sure your next wife is an outstanding Hungarian cook, as it doesn't pay to marry a modern-day American woman brought up in McDonald's . . . I understand we have two "Sirs" in the Society, *Geoffrey Larminie* and *David Ward*. How about that! .... If Bergy Bits were King of the United States, what Antarcticans would be on his New Year's list? He would knight *J. Murray Mitchell* and *Bill Field*, and find some way to make *Ruth-Lady Siple*. I would probably make Ken Moulton-Lord Moulton, as the title and name sort of go together and have an aristocratic sound. So please come out and hear Lord Moulton on the 15th!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

## HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

Our beloved Honorary President, Ambassador Paul C. Daniels, died in New York City on April 6, 1986. The Ambassador was one of the founders of our Society, and remained one of its strongest supporters. He was universally acclaimed for his efforts in helping to draft a workable Antarctic treaty, and was generally recognized as the Architect of the Antarctic Treaty.

### Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.) 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86

### Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

### Memorial Lecturers:

Dr. William J. L. Slader, 1964  
RADM David M. Tyree (Ret.) 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles K. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984

Joint Meeting

THE ANTARCTICAN SOCIETY - THE EXPLORERS CLUB

AMERICA IN ANTARCTICA

by

Dr. Peter E. Wilkniss Director,  
Division of Polar Programs  
National Science Foundation

on

Saturday evening, May 17, 1986

Cash Bar - 6:30 PM : Dinner - 7:00 PM : Lecture - 7:40 PM

at

THE COSMOS CLUB  
2121 Massachusetts Avenue, N.W.  
Washington, D.C.

In accordance with the explorers' way of life, this is a dinner meeting, although non-diners can be walk-ins for the lecture. But why not join in the fun and revelry? Come drink with real live explorers, eat with them at a sit-down dinner, and then walk with them down the sacred corridors of the Cosmos Club to their auditorium where Dr. Wilkniss will tell us everything we should know about the United States program in Antarctica.

Dinner reservations, \$22 per person, MUST be made by MAY 13th!  
Make checks payable to *The Explorers Club - Washington Group*,

and mail to:

Dr. Earl G. Herminhaus  
Montebello  
5902 Mount Eagle Drive, Apt. 704  
Alexandria, Virginia 22303

## BERGY BITS

We are probably remiss in not acknowledging more of the mail which comes to us; even if you don't get an answer, we do appreciate each and every letter or card sent in. We are always looking for news items, and especially about what is going on now on the ice. Dr. Wilkniss, Director of the Division of Polar Programs at NSF and our upcoming speaker, has promised that his office will give full cooperation in our efforts to get current news items. If you are a new member - we have picked up 39 this year - you should know that this is not the official voice of the Society, but just the writings of one interested member, who strives for interesting items/stories. What you read could actually be factual, but don't bet on it!

**OUR HONORARY PRESIDENT - AMBASSADOR PAUL CLEMENT DANIELS.** Ambassador Paul Clement Daniels died Sunday, April 6, 1986 at the Memorial Sloan-Kettering Cancer Center in New York City. His eventual demise was a heart attack which followed an operation for tongue cancer. There will be a private memorial service in June at Salisbury Cemetery in Lakeville, Connecticut.

Ambassador Daniels was born in Buffalo, New York on October 26, 1903, and early on in life saw the advantages of getting out of Buffalo. He was a Cum Laude graduate of Phillips Academy in Andover, Massachusetts, and then went on to Yale, where he was elected to Phi Beta Kappa in his junior year. Although he officially graduated from Yale in 1924, he never really left Yale. His heart was there, he was a loyal supporter of their athletic teams, and if they should happen to have a good football team, he wouldn't think of going south for the winter until after Yale had paddled Princeton's behinds. He did postgraduate work in France at the universities of Dijon, Grenoble, and Toulouse. He was single then, and one can imagine that he fully enjoyed the good life in France. After teaching French briefly, he entered the Foreign Service, holding consular and diplomatic posts in Colombia, Brazil, Honduras, and Ecuador, -being ambassador in Honduras in 1947 and in Ecuador, 1951-53. He occupied an unlikely position (for him) as Chairman of the Inter-American Coffee Board from 1941 to 1943, although he may not have been obligated to drink the substance. On the other hand, drinking coffee for those two years may have driven him to other more pleasing liquid refreshments! He also served stints as Director of the American Republic Affairs in the State Department, and Ambassador to the Council of the Organization of American States. But his most shining hours, we hope, were those years spent as a Special Advisor on Antarctica for the State Department, working on the development of the very successful Antarctic Treaty which was truly a wondrous landmark accomplishment. For close to thirty years all nations with serious scientific intentions have been able not only to conduct their investigations without political hindrances, but to work with one another in a true family spirit of cooperation. The Antarctic Treaty has been fine-tuned a bit down through the years, but essentially it is still the same treaty, and has been a great success. Let's hope it is not cast asunder.

Ambassador Daniels visited Antarctica several times, and Daniels Range at 71°15'S and 160°00'E honors his memory. His retirement years have been outside of cold regimes, as spring-summer-fall were spent in Lakeville, Connecticut, and winters in Lafayette, Louisiana. The only clinker in his career seems to have been that he was a New York

Yankee fan, which was most unfortunate, but aren't there flaws in each of our lives? His widow, Teddy, is a very delightful lady, much prettier than the late Ambassador, and a monument to his good taste and judgment. Unfortunately they lost two children in their infancy, but one daughter, two grandchildren, and a sister survive, besides Teddy. Mrs. Daniels' address is: 105 Green Oaks Drive, Lafayette, Louisiana 70503 (until the end of May) - then: P.O. Box 346, Lakeville, Connecticut 06039.

**REFLECTIONS ON ONE OF THE REALLY NICE GUYS.** It has been somewhat of a subdued Nerve Center with the passing of our Honorary President, as he was one of our real staunch supporters. Bergy Bits felt a special kinship with him, as we both shared the same first and middle names, which was always worth a comment when sending him his Newsletter. He really liked our Society, and expressed his love by giving us shares of Eastman Kodak stock to help us along the way. He was hoping this would be "seed shares" which would encourage others to make similar donations to the Society. He presented two lectures to us, one on October 2, 1963 on "Antarctic Treaty", and the other on October 11, 1966 on "Does Science Contribute to World Peace?"

He came to town periodically, but not too often in recent years, as he suffered a mild coronary two years ago. However, back in September 1979 he met with several of us at the Cosmos Club, and around a jug of cocktails talked about how we could improve the Society. Something monumental must have been said, although all I can recall now is that a great time was had by all. Two years later on July 11, 1981, he and his lovely Louisiana bride, Teddy, came to our Mid-winter picnic at Stronghold, which was actually his last Society function. Our Society was founded by a bunch of bon vivants, guys who really enjoyed equal proportions of good talk and fine liquid libations, and the Ambassador fitted in just great with the likes of Carl Eklund, Bert Crary, Harry Dater, and some of the other planks. Walter Sullivan, the very astute, debonair science editor of the New York Times, wrote Bergy Bits that he and the late Ambassador used to "lunch in the basement restaurant of the Hay-Adams Hotel - elegant and noted for the manner in which it served martinis - straight gin plus an atomizer of vermouth." He also wrote of the late Ambassador's "complete discretion in never letting slip what was going on behind closed doors during those long treaty negotiations. We lunched periodically and I plied valiantly, but he never let anything slip."

The Ambassador's ending wasn't very easy. He wasn't aware of his plight until early this year, when he visited his dentist in January to see if his problem was a dental one. Then there was a trip to an Ear, Nose and Throat specialist, and in late February he had to go to the Sloan-Kettering hospital in New York City. He had cancer of the tongue and had to be operated on. Several days later he had a heart attack, and the following week he died. He was an habitual pipe smoker, and his widow, Teddy, pleaded with Ruth over the phone to tell all of you Antarcticans out there who smoke pipes to get rid of them - NOW! You have been duly warned, so destroy them.

We are all going to miss Ambassador Daniels, but we won't mourn his departure, as he would want us to continue to enjoy the good life. And I hope the Society, whatever it is or may become, will never stray far from the ideals he had for it. Let's raise a glass in appreciation to our Honorary President, Ambassador Paul Clement Daniels, who will never be forgotten.

**CHANGE IN BY-LAWS.** We have quite a few husband-wife memberships with each paying the full fee. Somewhat sheepishly we have taken money from both, although we send them only one newsletter, using the other membership to send newsletters to such libraries as Scott Polar Research Institute and Goldthwait at Ohio State, to people who have or are making Antarctic contributions, like Jim Caffin and Max Hamilton in New Zealand, plus copies to our Honorary members who are not billed for dues. However,

in a moment of weakness, we decided that we didn't have to be all that mercenary, so asked the Board and members if we could institute a husband-wife membership dues of only \$10 per couple. That carried unanimously. So Pete and Edna Barretta, Hal and Margaret Borns, Pete and Betty Burrill, Gene and Reba Campbell, Bert and Mildred Crary, Hugh and Jane DeWitt, Tom and Davida Kellogg, George and Sallie Toney, Mort and Joanne Turner, and Link and Tahoe Washburn, you are all going to get a small break. The Society has appreciated your most loyal support, and we thank you. Incidentally, the Society has no plans at all for raising dues, even though we haven't raised them since the late 1970's, in spite of many postal increases, including three so far in 1986. P. S. Add Allen and Ruth Franta to the couples above.

**PATRON SAINT OF THE ANTARCTIC HONORED.** We are indebted to Al (BAE II) Lindsey for the following information, as he was a house guest of the President of the University of Arizona for a week this spring, a week in which one of our Honorary members, the legend-in-his-own-time, Laurence McKinley Gould, was honored with another colleague by having a beautiful, new ten-story building named after them. Al sent us a whole portfolio of material, along with a piece of the 'coronation' rock, a slab of polished granite with an engraved plate, one of which was given to each of the 200 plus attendees.

It all happened on March 21st of this year, a day which Larry told Al afterwards was the happiest day of his life to date, which covers only eighty-nine years. There could be happier days downstream for Larry, but for now he will settle for what happened that day and rejoice in its glories. First of all, they built this beautiful ten-story, 214,000 square foot, twenty-one million dollar brick building on campus at the University of Arizona, making it the biggest building on campus. The University wanted to provide "visible inspiration to the scientists who will be working there", and so they decided to name the building after Larry and the late George Gaylord Simpson, former professor at Arizona, famed for his contribution to the theory of evolution and paleontology. The University wanted "to continue the tradition of good science which dominated the lives of Dr. Gould and Dr. Simpson," so they dedicated the Gould-Simpson Building with a keynote speech by Dr. Frank Press, President of the National Academy of Sciences. Dr. Press served on at least one of the IGY Panels for the Antarctic when Larry was Director of the U.S. Antarctic Program for the IGY. Real keys were given to both Larry and Dr. Simpson's widow, so they will never be locked out of their own building. The first five floors are already being utilized by the Geoscience Department, and the sixth floor will be for research in insect neurology. The building is ninety-percent completed, so Larry has some supervisory responsibilities in front of him to see that they finish it up right.

Following the morning dedication and noon luncheon, they held open house all afternoon with a mariachi band playing typical penguin music, preselected by canvassing senior members of the Cape Crozier rookery who know Larry. Then there was a reception and cocktails, with classical guitarist, Thomas Patterson, performing. After a banquet, Larry showed a movie video of his 1535-mile dog sledge journey to Queen Maud Mountains in Antarctica. It was quite a day; in fact, Larry told Al afterwards that this building dedication was his finest honor - this from a man who has 24 honorary degrees, ten medals and awards, and three geographic features in the Antarctic named after him -Mount Gould, Gould Coast, and Gould Bay.

Our Society wishes to congratulate Larry on this great honor, and only hope that he finds the time to occasionally go over there to just sit and enjoy his building. Imagine having something named after you that cost 21M, and you don't even have to sweep its floors or clean its heads. Fantastic! That building should go a long way towards making this world a better one in which to live, but I hope those building scientists never lose sight of the fact that one of its owners once drove dogs for a living!

Incidentally, Larry now sports a beard. If you want living proof, turn to page 17 of the April issue of Arizona Highways, and there Peg and Larry are in living color. Bergy Bits looked at the picture and said, "Peg is sure a lot prettier than Larry. Wonder why she ever married him?" It couldn't have been because he ever promised her a rose garden, as the picture shows them in front of an old saguaro!

**WHO'S AN EXPLORER?** Meeting with The Explorers Club - Washington Group started Bergy Bits to wondering if there are any Antarctic explorers, or are they something of the past? We have lots of adventurers, and we have lots of scientists, but I don't think there are any more Antarctic explorers. In the Reader's Digest volume ANTARCTICA, they list Antarctic explorers down through the ages, showing 78 in all, with only six Americans, all deceased - Palmer, Wilkes, Byrd, Ellsworth, Dufek, and Siple. One could get into a big argument over which ones were really explorers, although it is this opinionated soul's feeling that the only true explorer in the American group was Byrd. The same publication shows only five living Antarctic explorers - England's Bunny Fuchs, Australia's Phil Law, New Zealand's Ed Hillary and David Lewis, and Norway's John Giaever. If Bunny Fuchs belongs on the list, then I surely think that Bert Crary belongs there, as they are counterparts across the seas. In fact, Bert and Bunny probably have better credentials than all of the rest of them.

The current chairman of the National Academy's Polar Research Board, Dr. Gunter Weller, of the University of Alaska, wrote Bergy Bits on March 28th relative to the issuing, on May 28th, at North Pole, Alaska, of four stamps honoring five Arctic explorers - Kane, Greely, Stefansson (Canadian by birth), Peary, and Henson - Peary and Henson appear together on the same stamp. Gunter asked about "rattling the chain to get Antarctic stamps." Bergy Bits loves to rattle chains, and we will start out with names Gunter mentioned as possibilities, those being Palmer, Wilkes, Byrd, Ellsworth, Dufek, Ronne, and Siple. Byrd's 100th birthday is coming up in 1988, and it would be nice if the Father of U<sub>0</sub>S. Antarctic exploration could be honored that year with a stamp.

Within the last fortnight I attended a lecture by Wally Herbert of the UK at the National Geographic Society? one of its Vice-Presidents introduced Wally with "Without a doubt, the foremost living polar explorer alive today ..." Bergy Bits was glad to find out who the National Geographic thinks is number one, although Wally doesn't seem to exactly fit the explorer mould as imagined by Bergy Bits. True, he has a beard, and any self-respecting person passing himself off as an explorer must have a beard to have any legitimacy. And he speaks well and has a fine accent. If one doesn't really have an accent, forget it; without an accent, you are nothing more than another Walter Cronkite. After hearing Wally, Bergy Bits visited the Division of Polar Programs at NSF to find out who they felt was the foremost polar explorer. Most had no nominee, although they were almost unanimous that it wouldn't be Wally. It all goes back to what we said in the beginning - there really are no more Antarctic explorers. We do have a lot of adventurers - they seem to be an ever endless lot - but let's not confuse these people with explorers, as they are nothing more than opportunistic adventurers.

If someone wanted to present a case about Crary being the foremost living polar explorer, Bergy Bits would certainly go along with that. Who has better credentials? No one! Bert was the first scientist to have "worked" at both Poles, he lived on one of the earliest ice islands, he led numerous multi-month Antarctic traverses, and he dug enough glaciological pits which, if they were put end to end, would go from Pole to Pole. Not only that, he did a lot of geophysical research in the oil fields of South America and the Middle East. And some of his very best exploration has been in bars, not only in the U.S. but worldwide. He will go to any extreme to analyze ice cubes, a pure scientist with an exploring mind.

**MCMURDO WAS A THREE-RING CIRCUS.** We understand that McMurdo never really had anything quite like this past summer, with the Footsteps of Scott, the visit of Lord Ernest Shackleton, the sinking of the SOUTHERN QUEST, Giles Kershaw, the visit of two Alaskan Eskimos, two Girl Scouts, Greenpeace, Scott Base dogs, and finally the three Americans who went recreational. But there was considerable good news, too, as no lives were lost, and Greenpeace was not able to get into Cape Evans to establish their base!

The centerpiece at McMurdo had to be the Footsteps of Scott enterprise as so many other happenings were spin-offs of that. One of the funny things that happened occurred en route to the Pole when they lost track of Scott's seventy-four-year-old footprints and ended up following some freshly-made American footprints near Mt. Hope. They followed them all the way to the mess hall, and then practically ate the small field party out of house and home. They weren't too sympathetic either when the Americans pleaded that the quarter pound of butter they were devouring was the last in camp. Supposedly these were the guys who were hauling all their supplies with them? A few hours after the Footsteps people completed their 70-day hike to the South Pole (departed Williams Field, Ross Ice Shelf, noon, 3 November; 'arrived at the Pole, evening of 11 January), their support ship, the SOUTHERN QUEST, beset in the pack ice 3,7 nm east of Beaufort Island, sank. Two U.S. Coast Guard helicopters off the POLAR STAR rescued the eighteen men and four women and flew them to Beaufort Island, from whence they were picked up by Navy helicopters from McMurdo on the morning of 12 January. The SOUTHERN QUEST had already off-loaded a ski-equipped Cessna 185 which had been chartered to bring the Footsteps fellows back from the South Pole, as they had no desire to follow Scott's footsteps back down the Beardmore. The Cessna was at Williams Field, along with polar adventurers' favorite pilot, Giles Kershaw, supposedly all set to take off for the South Pole. However, the U.S. asked him not to fly, and they brought back the Footsteps party to McMurdo. Subsequently the U.S. flew all of the expedition members out, save three who were left in the Antarctic to care for their hut and aircraft and make sure everything would be in order to be removed next year. However, there were some ruffled feathers, supposedly including some of the personnel at both McMurdo and Scott, about the treatment of the private expedition. A letter with 56 signatories told their tale. The Royal Geographical Society sent a long letter to the London Times on 24 March, 1986, published on 29 March, about "Obstacles in the Steps of Scott\*" They got a bunch of knights (Fuchs, Hunt, Scott, Shackleton, Hemming, and Bishop) to sign the letter. The only residual seems to be that authorities have banned the three expedition members wintering over from visiting Scott and McMurdo, except for the use of the post office at Scott! Who would want to visit a post office when no mail is incoming or outgoing? It all seems to be much ado about nothing, and just goes to show how things can run amuck when adventurers intrude themselves upon legitimate scientific Antarctic operations. (Bergy Bits wondered how Bunny Fuchs would have felt about it all if it had happened to him back in his heyday.) Somewhere in there some of the Greenpeace people showed up at McMurdo, and they found out in a hurry that they were about as welcome as the plague, both by the U.S. and by New Zealand, and they had to camp out on the ice!

After being in the Antarctic continuously since 1955, the U.S. decided to take two Alaskan Eskimos to McMurdo to study and report back to the NSF about survival in Antarctica. One was the Mayor of the North Slope Borough, the other a whaler. One can imagine what their report will say! Then there were the two Girl Scouts. There was a rather offbeat interview in a state of Washington newspaper about the young woman from the Northwest. She prefaced her story by telling how some Naval officer got all the men together before the Girl Scouts arrived, and told them he had a daughter the same age as the Scouts, and that it would be strictly verboten for anyone to touch either of them. He evidently established himself as their guardian angel!

Bob Thomson had come to the conclusion at the beginning of the season that the dogs

at Scott Base had served their usefulness, and had to go at the end of the season. This seemed like a most logical decision since they had done nothing constructive since the base was built in 1957, and part of their diet was seal meat. But you don't fool around with dogs, as the Japanese found out back in the IGY when they couldn't get back into camp to get their dogs out before evacuating their station. Dog lovers are international. Some were at Scott Base, and they threatened to quit, and people back in New Zealand clamored for their safe return. Everything was handled with a lot of savoir faire, and it appears that what looked like a national issue has been peacefully settled. The Kiwis were told that if the dogs were brought back, they would have to be in quarantine for a whole year and would suffer tremendously from the change in climate. They were told also that the dogs were aging, that their average age at death at Scott Base was about five years, and they would be better off being left there. The final verdict, we believe, was that the aging dogs at Scott Base would be put away at the end of the season, and the others would be kept at Scott to die a natural death.

After all the summer folks had left McMurdo, three employees of the contractor decided they needed a little recreational exercise, and evidently took off from camp without telling anyone. We heard one rumor that they wanted to climb Erebus, which may or may not be true. Regardless, they got outside of camp, and bad weather set in. Rescue teams from McMurdo and Scott bases spent three days looking for them, finally finding them seven miles from the station, evidently none the worse for their ordeal. Life is never dull in Antarctica!

**BELIEVE IT OR NOT, OLD WALT SEELIG IS FINALLY GOING TO RETIRE.** There were two people I thought would never retire - Gordon (Mirny 57) Cartwright, meteorologist in Geneva, and Walt Seelig, evermore USARP Representative in Christchurch. I think the meteorological family thought they had found a way to retire old Gordon about five years ago when he was recalled to Washington and honored for 50 years of dedicated work. But he fooled them, he hopped right back on a plane, went back to Geneva, and got back into meteorology. Walt Seelig looked potentially like another Cartwright, as he had the world in the palm of his hands, living springs and summers, escaping falls and winters. But, foremost, half of his year was spent in New Zealand, which is sort of akin to being in Heaven without dying. And there was that added bonus of being away from the Head Shed. It was really much too good for Walt, although Josephine deserved every bit of it.

Walt has been working for the government since the Taft administration, I believe, and has all this accumulated leave on which he has already paid taxes. When Congress started thinking about taxing that money all over again, Walt sashayed his old body over to the Office of Personnel Management and signed on the dotted line. So he is leaving the end of May, with some 44 years of government service behind him.

Walt is a war baby, World War I. He was born in Brooklyn, New York on 14 November 1919, graduated from Brooklyn College in 1941, and became a graduate assistant at the University of Nebraska. He went to the U.S. Geological Survey in 1942. His aeronautical mapping capabilities were considered of a higher potential usefulness than his killing instincts as a soldier, sailor, or marine, so they left him there. His luck was running high, so he continued on the roll by marrying Josephine in 1945, a marriage which was to be blessed by three little Seeligites. In 1946 he established mapping control for Alaska.

Walt's bio shows that he was on the Planning staff at the USGS from 1958 to 1960. He was Special Assistant to the Chief Topographic Engineer for Antarctica, when he was called in by the late George Whitmore in 1959 and told that he had to go to the Antarctic - on Saturday. Whitmore was supposed to go, but at the last minute couldn't

make it. At about this time, Dr. Alan Waterman, Director of NSF, was thinking about the need of developing a mapping project for Antarctica. Everyone had liked the work Walt had done, and his services were requested. His boss told him, "I wish I could tell you that you have a choice, but you don't." That's the real bureaucracy in action! So Walt was loaned to NSF for a nine-month period in 1960, and he never went home. One could say that the loan will officially terminate the end of May when Walt retires. His first position at NSF was as their Geodetic Liaison Officer, and in 1964 he became Associate Program Director, International Cooperation and Information Program. Five years later, 1969, he became the International Coordinator of the Division of Polar Programs, and has remained in this jewel of a position. He was the USARP Rep in Christchurch in 1971-72, and has filled that position continuously since 1976 - ten consecutive years, eleven overall. If he doesn't have the best job in the whole government, we don't know who does. Imagine getting paid to put in six months a year in New Zealand in its spring and summer. Fantastic way to make a living! (P.S. If you have read this and thought you were reading an obituary, our apologies, as Walt is really very much alive and doing handsomely. In fact, he should be good for at least a few more years.)

**ULTIMATE BOOK ON ANTARCTICA - READER'S DIGEST ANTARCTICA.** Unequivocally the best all-purpose book on Antarctica ever to be published! But you should realize that the book was published in Australia, and is by and for United Kingdomites. There is not a single American shown in their list of thirty-nine "major contributors." However, don't let this deter you from getting the book which is being distributed in the U.S. by Random House. There are some 900 paintings, drawings, maps, diagrams, and rare historical photographs supporting a text divided into four parts: continent and wild-life, explorers, special features, and atlas and chronology. This is really a fantastic book, one which anyone interested in the history of Antarctica must have. Bergy Bits thinks it's the most comprehensive, non-biographical book ever written on Antarctica.

The section on explorers is really an encyclopedia of all expeditions that have gone to Antarctica, with a few exceptions, such as Ronne's to Deception Island and the Norwegian-British-Swedish expedition to Maudheim. There are individual chapters, including pictures in each chapter, on expeditions of Jean Bouvet de Lozier, Joseph de Kerguelen-Trémarec, James Cook, Thaddeus von Bellingshausen, James Weddell, the Enderby brothers, Dumont d'Urville, Charles Wilkes, James Clark Ross, H. J. Bull, Adrien de Gerlache, Carsten Borchgrevink, Erich von Drygalski, Robert Scott, Otto Nordenskjöld, Jean-Baptiste Charcot, Ernest Shackleton, Roald Amundsen, Wilhelm Filchner, Douglas Mawson, Sir Hubert Wilkins, Richard Byrd, Lincoln Ellsworth, and David Lewis. Shackleton leads with ten separate chapters devoted to his expeditions, followed by Scott with eight chapters. There are eleven chapters on American efforts (one on Palmer, one on Highjump, two on Ellsworth, three on Wilkes, and four on Byrd). There are chapters on eleven different nations' activities in Antarctica: Australia, Belgium, England, France, Germany, Japan, Norway, Scotland, Sweden, United States, and the USSR. There are also short biographies of seventy-eight Antarctic explorers, which we have chosen to cover in a preceding section in this Newsletter, the one on WHO'S AN EXPLORER?

The Antarctic Time Chart is very interesting. There are exactly 100 significant dates shown, starting with 1501 (Vespucci) and ending with 1983 (UN). The time chart is divided into four periods: 1500-1818, the death of Terra Australis; 1819-1894, coastline takes shape; 1895-1922, age of heroes; 1923-84, mechanized age.

If one doesn't like heroes and expeditions, there is always the first section on the continent and its wildlife, which fills the first sixty-five pages (these aren't small pages, or large pages with wide, blank margins, but pages with print 8" x 11"). The special feature chapters, seventeen in number, are great, too. They include such

subjects as clothing, food, shelter, and the like, but also ones on historic huts, sledge dogs, women left behind, and other offbeat subjects. Bergy Bits found it refreshing that there is only one chapter on the Antarctic Treaty, which seems to be a stable product of every current book on Antarctica, repeating the same old material with which we all are already familiar.

Title: ANTARCTICA. Published by Reader's Digest, Distributed by Random House. Price, only \$32.95.

**HISTORY IN THE REMAKING.** Peter Webb sort of upset the applecart of the geological history of Antarctica when he, David Harwood, and Barrie McKelvey were working out of the Beardmore Camp, 'scouring sixteen sites along the Dominion Range and the Beardmore Glacier. A mere handful of rock, wood, and plant material gathered in December has resulted in the following conclusions:

1. Large portions of the East Antarctic ice sheet are only 2.5 million years old, not 15 million years!
2. Possibility of a series of massive freezing and thawings of the continental ice.
3. Recurrent formation of inland seas over East and West Antarctica resulting in ...
4. Changing of ocean circulation and raising/lowering of sea level.
5. Perhaps as much as 4,000 feet of uplift in the Transantarctic Mountains occurred within the past 2.5 million years.
6. Evidence of major faulting in the geology of the Beardmore area indicates that the mountain range had risen while the level of the ice sheet rose and fell.
7. Mountains were much lower only a few million years ago, with less ice in the ice sheets.
8. Wood samples found in sedimentary rocks appear to be from low forest or shrub vegetation similar to that found near glaciers and lakes in the Arctic, northern Scandinavia, Chile, and the Sub-antarctic islands.
9. Transantarctic Mountains during the thaw must have resembled Scandinavia with portions of East Antarctica resembling the Canadian Arctic.
10. Researchers surprised that such vegetation was able to grow within 400 miles of the current South Pole, as area had to be warm enough in summer for growth and not so dark or cold in winter to kill the plants.

An article in Science News for 8 March 1986 quoted Webb and David Elliot as saying that the wood is fairly young because it is not very fossilized. It still floats and can be burned. Peter Anderson wrote the Nerve Center that the wood samples "look like smoothed driftwood that one would find on a beach or river bank. It feels like wood, not rock. It's young stuff!!!"

**BEARDMORE PROJECT 1985-86** (Condensed from report by David Elliot). Fifteen earth sciences projects and two atmospheric sciences projects were conducted in a 74-day period, 12 November 1985 to 24 January 1986, out of the Beardmore South Camp in the central Transantarctic Mountains. The scientists were blessed with great weather which allowed them to get in 711.5 science hours of helicopter time, breaking the previous maximum hours of helicopter support by 95 hours. Food was good, cook was great, and morale ran high.

Names in this paragraph identify only the principal investigators, but stand for their groups. -- Tom Taylor made substantial collections of silicified peat of Permian age and Triassic age which showed "exceptional preservation of the anatomy of the plants." The Triassic peat is unique material, and there is "no other deposit anywhere in the world of that age. Excellent collections were also made of the *Dicroidium* flora of Triassic age; these leaf collections include cuticle material."

... Bill Hammer searched for vertebrate remains, and found 300 specimens, although "mostly of disarticulated pieces." He found "two species of *Lystrosaurus*, the carnivorous mammal-like reptile *Thrinaxodon*, three *Labyrinthodont* amphibian species, a theridont carnivore-insectivore, and possibly a new species of thecodont reptile."

... George Denton found till and glacial erratics "at high elevations on Mt. Falls, Mt. Markham, Mt. Mackellar, and the Mt. Kirkpatrick massif" which "constitutes compelling evidence for substantial overriding of the mountain range by ice." ....

Bill Cassidy found meteorites at almost all blue ice areas visited, but "significant numbers were discovered only on an unnamed glacier between the Lewis Cliffs and Coal-sack Bluff and near the Davis Nunataks." .... Ed Stump "studied the relationships of the Upper Precambrian Beardmore Group and the Lower Paleozoic Byrd Group, and established the structural relations including confirmation of the postulated folded unconformity separating the two sequences. This demonstrates that there was a separate deformational event associated with both the Beardmore and Ross Orogenies."

... James Bockheim conducted soil surveys in conjunction with Denton's glacial mapping..... Don De Paolo and Scott Borg mapped rocks and took large collections for geochemical studies..... Bert Rowell "mapped and measured sections in the Shackleton Limestone in the Nimrod Glacier region." .... Molly and Julia Miller "examined the Permian glacial and post-glacial strata of the Victoria Group, Beacon Supergroup." .... James Collinson measured sections and sampled post-glacial sequences, and "also worked with paleobotanists and vertebrate paleobiologists, providing expertise on the stratigraphy and depositional environments of the fossils."

.... Gunter Faure collected samples for geochemical analyses ..... David Elliot mapped, measured sections, and sampled volcanic rocks.

**CHIEF SCIENTIST POSITION IN DIVISION OF POLAR PROGRAMS (DPP) FILLED.** Dr. Ted E. Delaca has been selected to fill Frank Williamson's old position as Chief Scientist in DPP. His PhD dissertation at the University of California in 1976 was relative to Antarctica, being entitled "Distribution of benthic foraminifera and the habitat ecology of marine benthic algae of Antarctica." In the early 1970's he worked out of Palmer Station, studying benthic ecology and was both a project leader and chief scientist on the R. V. HERO. He was the Biology Project Leader on the Ross Ice Shelf Project from 1976 to 1978. Ted continued his Antarctic endeavors as principal investigator of the physiology of benthic rhizopoda at McMurdo from 1980 through 1985. This 42-year old scientist has been smitten by Antarctica and has apparently found a home therein, as he has been intimately connected with biological studies in Antarctica for the past fifteen years. He will be coming to the Division of Polar Programs for two years from the Scripps Institute of Oceanography where he works as a marine biologist. We wish him the best of luck ... and hope he joins our Society, as we still have room for a good man.

**MEMORIAL LECTURE IN SAN DIEGO, 24 JUNE 1986.** We will be publishing another Newsletter in mid-May relative to the upcoming Memorial Lecture, which will be given by Dr. Claude Lorius of France. It is entitled "Polar Ice Cores: A Record of Climatic and Environmental Changes", and will be presented at 8 PM on Tuesday, 24 June in the Kona Kai Club, 1551 Shelter Island Drive, less than five minutes from the intersection of 1-8 and 1-5. It is expected that arrangements will be made for us to visit Penguin Encounter the following afternoon.

**WILKINS' PAPERS GO TO OHIO STATE.** Peter Anderson informs the Nerve Center that Ohio State has picked up the papers and memorabilia of the late Sir Hubert Wilkins. Hitherto they had been in the Wilkins Cultural Center established by two of Sir Hubert's old theatrical friends, Winston and Marley Stevens Ross. Old-timers may remember Winston under his stage name, Lanny Ross, a popular singer back in the 1930's. The Center was sort of lost in the wilderness of Montrose, Pennsylvania, so it's good news that the Wilkins' material is where it can and will be used.

When the IGY came along, they got all the scientists going to Antarctica together at Davisville, Rhode Island to be outfitted with clothes and hear a few innocuous speeches. Sir Hubert came on down from the Quartermaster Research and Development Center at Natick, Massachusetts with other Army clothing experts to help outfit the men. No one thought of asking Sir Hubert to talk to the departing scientists until the gathering was coming to a close. Finally someone said to Sir Hubert, "Would you like to speak to the group?" And he replied, "Yes, I would. When you all get down there, don't urinate in all the crevasses." That was his whole speech, although he used an abbreviated, popularized version of urinate.' It could have been the very first environmental impact statement issued for the Antarctic during the IGY.

Sir Hubert, the first man to ever fly in Antarctica, the first man to ever go under the ice in a submarine, never got to fly over the South Pole. He had made the mistake of giving an honest interview at McMurdo, which soon found its way back to McMurdo, resulting in his being ostracized by the admiral whose ego matched his drinking, and who was not receptive to anything derogatory.

Incidentally, there was a sad postmortem to that meeting at Davisville. That evening Bergy Bits returned to Natick, Massachusetts with Sir Hubert and some of the other QM people, and we were listening to radio music as we drove through the night. An announcer broke in and said that a plane had crashed at McMurdo and that lives were lost - three, although a fourth died later. All of a sudden, Antarctica was not a place of penguins and parkas and thermal boots, but a very realistic place where lives could be snatched away. It was a very quiet ride home.

**ANTARCTIC EXPLORATORIUM.** Pat Kraker, who has been kicking around Antarctica for the past thirty years, had an accident last year when he was on a three-week bicycle tour. The cause of it was the R.V. HERO, his old ship. He sighted the HERO unexpectedly as he was bicycling across the bridge at Reedsport, Oregon, and proceeded to drive right off the bridge!

In early April of this year, Pat was invited back to Reedsport to take part in their 6th annual Spring Festival and Blessing of the Fleet. He gave a two-hour lecture/slide show on Antarctica at the local high school, so now all the kids in Reedsport know everything there is to know about Antarctica. Also present were another HEROite, Jay Morrison, second officer during its 1984 season, and Michael Parfit, whose new book on Antarctica, SOUTH LIGHT, has been getting excellent reviews all across the country.

The HERO is the centerpiece of an Antarctic amusement park named Antarctic Exploratorium, which is the product-in-the-making of a nonprofit organization called the International Oceanographic Hero Foundation. Right now all they have is the HERO, but they are planning an outdoor-? penguin pool; a Hall of Heroes where names of everyone who has ever been to Antarctica will be displayed; a cold room where people can put on polar parkas and have their pictures taken against a backdrop of "imported icebergs", It all sounds really weird. The caption across the top of the centerfold showing a pictorial of Antarctic Exploratorium reads, "The Oregon Coast Antarctic Exploratorium can be 'a great learning experience.'" Bergy Bits thinketh that it will be a two-way learning experience!

The former director of NOAA, currently president of Oregon State University, said, "A significant contribution to the State of Oregon. I encourage and support this endeavor." What a political statement! Peter Wilkniss gave a much more reserved endorsement, "You are assured of the emotional support of all connected with the Division of Polar Programs." That word "emotional" is just superb, the perfect word! Needless to say, they are looking for money, and donations should be sent to William E. Hewes, International Oceanographic Hero Foundation, P.O. Box 187, Reedsport, Oregon 97467. Telephone (503) 271-3669. Hewes is an attorney and a helicopter pilot who achieved national acclaim for his early airlifts off Mt. St. Helens.

**ICE CHIPS.** Our President, *Edward P. Todd*, along with Boy Scouts Dick Chappell, Mark Leinmiller, and Doug Barnhart, are going to convene in Louisville, Kentucky on 23 May 1986 to select the next Boy Scout to go to Antarctica. Why only one Boy Scout, when two Girl Scouts got to go this year? Discrimination. Aren't males and females alike once you get them into parkas and on the ice? .... *Greenpeace's* Peter Wilkinson says they are definitely going back to Antarctica, as they have \$NZ1.7M invested in the boat and its cargo. He figures it will take another \$US200,000 to go back, and they are in the process of raising it. They hope to set up at Cape Evans, and are also talking to the Footsteps people about using their old base. Meanwhile, the 34 crew members have returned to their homes . . . *Jennifer Dewey*, 44-year old illustrator of children's books, evidently had a ball at Palmer Station dancing the summer away with 20- and 22-year old youngsters. She and three other women were there with thirty men, and, according to an interview, enjoyed the dancing better than anything-else, and is looking forward to going back down next February. She was quoted as saying that it was easy to get a grant from the National Science Foundation. Whom does she know??? She hopes to publish three books on Antarctica in 1987. Will one be on dancing? .... *George Doumani* is "still married and enjoying every minute of it." I thought that stunning blonde would have left him long before this. George, who is Peace Corps Director in Yemen, is our resident Antarctic expert in that country, and recently gave the first Antarctic lecture in Arabic ever given in Yemen. George wants one of those Pucci Antarctic scarves that the Society sold many years ago, and will pay any price. I don't know anyone who has one who would sell. Is there a seller? They are a real collector's item, and to think that those silk scarves with Antarctic designs by Pucci were sold by us for ONLY \$10! .... *David Lewis* has an offspring following in his wake, as son Barry, 37, skippered the 47-foot yawl RIQUITA into Antarctic waters this past summer. He wanted to go farther south than any yacht, but was ready to compromise, saying, "We are just interested in having a look at the bloody place." They did visit Cape Hallett, Cape Adare, the Ballenys, and Macquarie Island. The season was getting late, and when they couldn't get any ice reports from McMurdo, headed back home. .... *Bergy Bits* and Ruth visited with *Henry Harrison*, BAE I meteorologist, and his wife, Grace, in Asheville, North Carolina in early April. There's a rain gauge on his front lawn, an instrument shelter off to one side, and business goes on as usual. Talk was mainly about his expedition, and baseball . . . *Ken Moulton's* presentation to the Society on 15 April was vintage Moulton, slides judiciously selected, text well prepared. Had a good turnout, wall-to-wall people, including many of the biggies. .... Our newest member is *Commander Maurice Gibbs*, who started out as an enlisted man weather observer on Deep Freeze I aboard the USS ARNEB. Later he served with Captain Edwin MacDonald and Admiral Doc Abbot. He wintered over at McMurdo as a meteorological lieutenant in 1966-67, and has been to Antarctica a bunch. How come he got so smart so fast and got all those promotions? .... *Bergy Bits* recognizes that this Newsletter is very opinionated, and probably has something objectionable in it for everyone. We hope we didn't slight someone by not offending him/her. But really, we meant no harm!

REMEMBER!!! If you move, PLEASE let us know!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — AMBASSADOR PAUL C. DANIELS

OCTOBER 26, 1903 - APRIL 6, 1986

Vol. 85-86

May

No. 6

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-2  
Mr. Gordon D. Cartwright, 1962-3  
RADM David M. Tyree (Ret.) 1963-4  
Mr. George R. Toney, 1964-5  
Mr. Morton J. Rubin, 1965-6  
Dr. Albert P. Crary, 1966-8  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-1  
Dr. William J. L. Sladen, 1971-3  
Mr. Peter F. Bermel, 1973-5  
Dr. Kenneth J. Bertrand, 1975-7  
Mrs. Paul A. Siple, 1977-8  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank T. Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984

*1986 MEMORIAL LECTURE*

*POLAR ICE CORES - A RECORD OF CLIMATIC AND ENVIRONMENTAL CHANGES*

by

Dr. Claude Lorius

Centre National de la Recherche Scientifique  
Laboratoire de Glaciologie et Geophysique de L'Environnement  
Associe a L'Universite Scientifique et Medicale de Grenoble  
Grenoble, France

on

*Tuesday evening, 24 June 1986*

*8 PM*

at

*Kona Kai Club*

*1551 Shelter Island Drive  
Shelter Island  
San Diego, California*

This meeting is cosponsored by SCAR (Scientific Committee on Antarctic Research of the International Council of Scientific Unions) which will be holding its 19th meeting in San Diego, California, 16-27 June 1986.

On the afternoon of Wednesday, 25 June, 2-10 PM, there will be a SCAR tour of Sea World, reception at Penguin Encounter, and barbecue, which Society members may attend. There is a charge of \$10 for the barbecue, payable on arrival.

*It is an honor to have Dr. Lorius, a very distinguished scientist and an internationally renowned glaciologist, present the Antarctic Society 1986 Memorial Lecture on a timely subject of universal interest. Dr. Lorius has been Vice President of the International Commission for Snow and Ice, International Council of Scientific Unions, and has served on the Joint Scientific Commission for the World Climate Research Program.*

*Dr. Lorius's lecture will include an analysis of the 2,083-meter ice core recently obtained at Vostok Station. The core goes beyond the last inter-glacial, and has yielded a 150,000-year climatic history. It is one of the most significant studies to ever come out of Antarctica.*

This is a milestone for Ruth Siple and Bergy Bits as it marks our 50th Newsletter. We drafted a full page of reflections on the past eight years of literary pursuits, but she wouldn't go along with all of it. Mainly it was about the efforts we put into each issue. It isn't easy when our members have been active in Antarctica from 1928 to date, the old wanting to read about their comrades, the young wanting to know about current activities. You look for common themes of interest, such as Antarctic books; you look for anything on Mt. Erebus, penguins, the BEAR OF OAKLAND; you look for news on Antarctic heroes, be they dead or alive; you look for future trends and predictions. But when you get right down to it, the Newsletter really depends on you people sending us news items, as some of the best are invariably what we get in the mail. Bergy Bits is especially happy with the new cooperation being given by Dr. Peter Wilkniss and his staff at the Division of Polar Programs, in providing us with information on what is going on now in Antarctica. You will see evidence of this cooperation in this Newsletter, and we hope you are as pleased to read new information as we are to bring it to you. If it continues, it could mean that we may actually become a newsletter.

The Society has been in existence for close to thirty years, and in that time we have published a total of 76 newsletters, and have had a total of 125 lectures (including the one Dr. Wilkniss gives on 17 May 1986). Altogether 725 pages have been written. In the 50 newsletters which Ruth and I have put out in the past eight years, there have been 595 pages of some truths, some fiction, some fabrications. This is strictly a labor of love, because one has to be in love with Antarctica to take the time to collect news items and write them up. Ruth wields a cutting censorship which precludes your reading the best stuff, but she has to be appeased; otherwise we'd have to pay to get someone to type these things. Although this is a two-person operation (membership, treasury, newsletters, sales), there isn't that much pride of authorship that we wouldn't turn it all over to anyone who would appear on the horizon and want to devote hours and hours and hours of their time without compensation. We usually hear from people when we pull a real faux pas, and it's good to be corrected. Sometimes it's hard to hear the applause for the boos. But I guess what really helps to keep Ruth and me going are the nice letters we get from such people as Peter Anderson, Anne Benninghoff, Marybelle Bentley, John Cadwalader, Louis DeGoes, Sayed El-Sayed, Mary Goodwin, Larry Gould, Charlie Greene, Henry Harrison, Davida Kellogg, Dotte Larsen, Al Lindsey, Joe Lynch, Ingrid Malva-Gomes, Charlie Murphy, Bob Nichols, Jim Reedy, Bob Rutford, Arville Schaleben, Charlie Swithinbank, J, Van Bekhoven, and a few others. If there was a reward for doing things for the Society, it came from the mouth of Gentleman Jim Zumberge who made kind and gracious comments at a Washington dinner preceding one of our Memorial Lectures,

Probably the bottom line is that more people read these newsletters than we think. Our paid membership when we went after delinquents with an ice ax in 1978 was only 150; as we go to press, we are real

close to 500 - 496! We don't really want to get bigger, just better. Our treasury is now very stable, as Ruth provides a home for the Society and a lot of free services which formerly cost us money. This is a milestone Bergy Bits is totally enjoying, even if Ruth is somewhat embarrassed by it all.

**FORMER MESSENGER BOY INCOMING PRESIDENT OF SOCIETY.** The Moulton Meeting of the Antarctic Society also served as our annual business meeting, and we are pleased to announce the election of our new officers and Board of Directors. Our new president is Robert H.T. Dodson of the Bureau for Private Enterprise, Agency for International Development, Department of State, Washington, D.C. Back in 1944, Bob was a 16-year-old messenger boy in the Navy Department, and became enchanted by the lifestyle of a young lieutenant in the Navy whose desk he periodically visited on his rounds. The officer's name was Finn Ronne, and Finn talked to him about Antarctica, evidently giving him a real good snow job. Several years later when Finn was putting together his own expedition to the Antarctic, he contacted Bob who was then a worldly 19-year-old at Harvard. Finn asked him if he knew of a good geologist, and after talking with some of his professors at Harvard, Bob told Finn that there was a man at Tufts College chafing at the bit to go to Antarctica, and so Bob Nichols was fingered. Then Finn told Bob that he had lost the photographer he had lined up; could Bob find a photographer. It turned out that Bob knew just the man Finn was looking for - Bill Latady. He found him at Pinkham Notch, New Hampshire, and in 24 hours Latady was committed to go. Bob, himself, went down as an assistant glaciologist to Bob Nichols; and as chief dog team driver -more than 150 days on the trail; supply officer; and civilian observer for the Office of the Quartermaster General. Bob was a key figure in the midwinter rescue of Harries-Clichy Petersen from a crevasse. So on the 40th anniversary of the Ronne Antarctic Research Expedition, we have one of their members as our new president.

A great deal of thought and effort went into getting Bob Dodson elected. First, the candidate had to be an old-line New Englander, all other people being rightly considered suspect. Dodson had been kicking around New England for years (Harvard, Dartmouth, Harvard Business School, Exeter, et cetera), but his wife had one flaw -she made the mistake of not going to Mt. Holyoke College, going to Vassar instead. After serious deliberations it was felt that this should not be held against Bob's candidacy. After all, he is a Fellow of the American Geographical Society; former officer and Director of the American Alpine Club; had organized and led the last foreign expedition to the Sikkim Himalaya (fall of 1952); and had climbed extensively in the Alps, Africa, Turkey, and the U.S. His professional career has been in international business, where he has been truly international - Calcutta, Ankara, Geneva, and other way-stations. There are four not-so-young Dodson boys scattered around the world, with one still in college. Bob is an enthusiastic member of our Society, and even attended meetings when he lived in Connecticut.

The incoming Vice President is Guy Guthridge who is known to all Antarcticans. The new secretary is really not new, as we dusted off a former secretary, Pete Barretta, and told him he was it - the penalty for coining to all our meetings. There was no election for treasurer, as our By-Laws were changed several years ago so that Ruth Siple is treasurer unto death or convicted on charges of absconding with Society funds, whichever comes first.

There's a new look on our Board of Directors, with less of the Honorable and Ancients, and more of the nouveau Antarcticans. Tony Meunier, of the USGS at Reston, was put back on, and at six-feet six, 235 pounds, he will also sort of serve as unofficial

sergeant at arms and bouncer. He also has a good record in moving tables and chairs for our meetings. Tony wintered over at the South Pole in 1974, and he also set some sort of an all-time record for cashew nuts consumed on a Cassidy meteorite searching team in summer 1982-83. He has authored/coauthored ten publications on Antarctica. Bob Hickerson, of Towson, Maryland goes onto the Board for the first time. He is another young man who has been in the Antarctic in the modern era, April 1978-January 1981 (airborne science on LC-130R), and is a faithful attendee at our Washington meetings. Jorge Carnicero is the third young Antarctic going onto the Board. He was a communicator in the early 1980's at McMurdo, Scott, Siple, and Byrd Surface Camp. Actually the reason Jorge was put on the Board is that there is always a beautiful woman not too far away from him, enhancing the whole environment. Our new At-Large member is C. Vernon Cooper of Hazard, Kentucky about whom we wrote in our last issue. People who write letters to the Nerve Center (OOPS! We omitted his name on page 2 ... sorry, Vernon.) can expect sooner or later to be asked to serve, as correspondence is considered tantamount to volunteering. Vernon wasn't asked if he'd like to serve, he was just told - something which he said seems to happen to him all the time. But he's a doer, an idea man, and will be a good one. To replace the late Bud Waite as an At-Large member, Bob Nichols was voted in, because in every group there should be an old, intrepid explorer who will keep everyone else honest. It was a good election, even if it was a railroad job.

**ANTARCTIC BOOK DEALERS.** In a recent issue we mentioned that Bob Peterson and Colin Bull had gotten into polar book sales, and we thought that perhaps we should list addresses and telephone numbers of polar book dealers. A Society member who probably has the best private polar library but wishes to remain anonymous for fear of hurting someone's feelings, sent us input material for this paragraph, with two pieces of general advice to share with us. First, if serious about getting into book collecting, we should acquire and study the "bible" - ABC For Book Collectors by John Carter, published by Alfred A. Knopf, now in its 5th edition.. Second, beware of "any fancy color-illustrated literature/history catalogues of collectors/sellers of fine editions and manuscripts, though they might offer a Flora Antarctica (Ross and Hooker, 1830's) because of the superb illustrations." Now for the book dealers, by country:

**PERSONNEL CHANGES ON DPP HORIZON.** Dr. Richard B. Williams, Program Manager, Polar Biology and Medicine, is going to retire on 1 December 1986. That will leave Lettau the Younger as the Grand Old Man among program managers in the Division of Polar Programs, although it seems to this one that Bernie just came to NSF! Time flies! Meanwhile, recruitment efforts are going on to fill the program manager shoes in earth sciences and in glaciology, as well as Associate Manager of Polar Operations. It is expected that the glaciology manager will come aboard on 1 June, the earth sciences manager on 1 September; no date has been set for the Polar Ops' position. They have people for all of these positions, and it is just a matter of finalizing the actions. Meanwhile, there have been many applications to fill Williams' job when he leaves. Dr. Wilkniss has a very healthy attitude towards people leaving; even though he hates to lose good people with experience, he realizes that an organization needs to rollover people periodically to bring in new blood with fresh ideas. And he looks upon filling of positions as an opportunity to select people who might have a more global outlook and integrate themselves into the broad missions of NSF.

**DR. WILKNISS AND LADY DI OPEN WORLD FAIR IN VANCOUVER.** One of the central themes of the newly opened World Fair in Vancouver is transportation and communication, and in conjunction with the opening of the Exposition they hosted an International Polar Transportation Conference. Although Lady Di may have made the headlines, it was Dr. Peter Wilkniss of the Division of Polar Programs at the National Science Foundation who was the keynote speaker at the Conference banquet on 7 May 1986, addressing the audience on "Polar Transportation: Bi-Polar Perspectives." Dave Bresnahan of Wilkniss's staff presented a paper on "Aircraft Support of Research in Antarctica"; Capt. Joseph Wubbold of the US Coast Guard spoke on "Icebreaking Operations in McMurdo Sound, Antarctica"; Commander Lawson Brigham of the USCG gave a talk on "Winter Marine Transportation off Alaska"; and Capt. Ewald Brune and Bob Thomson spoke on "The ICEBIRD, a New Generation of Polar Resupply Vessel." Our Newsletter of last November had an article on the ICEBIRD; we had a lecture by Commander Brigham in late November on "Modern Icebreaker Operations"; Capt. Wubbold has volunteered to talk to our Society at some future date; and Dr. Wilkniss will have given his joint Antarctic Society-Explorers Club lecture at the Cosmos Club by the time this is mailed!

There was to have been a presentation by a representative of Salen Lindblad Cruising on "Cruise Ships in Arctic and Antarctic Waters", but the speaker was a no-show, as he was called back to the battlegrounds to confront the problem they are having with people canceling their summer cruise reservations to Europe. In answer to Bergy Bits' question as to what was the single, most significant feature of the symposium, Dave Bresnahan replied that he felt it was the tremendous differences in the driving forces of polar transportation, that everything in the Arctic is tied in with profit incentive, whereas in Antarctica it is primarily concerned with supporting or conducting science. In answer to a follow-up question as to what he had learned about hovercrafts and their possible utilization in Antarctica, Dave said the more he learned about hovercrafts, the more he questioned their utility in the Antarctic. There is evidently a very serious icing problem whenever they are in a water environment. The National Science Foundation is currently in the phase of negotiating a possible lease from Griffin of a hovercraft with high-speed diesels for use in the McMurdo area.

**THERE IS A HOLE IN ANTARCTICA.** There is a hole in Antarctica which is getting progressively bigger, and causing worldwide concern, as it's in the ozone layer. It's not a small hole, it's a gap, a big gap, the size of the United States, extending over most of the continent with maximum decreases inside the polar vortex. It was identified by the British in the mid-1970's, and has been monitored rather closely by Nimbus 7 satellites for the past seven or eight years. It is an austral spring-

time phenomenon, roughly from mid-August to the end of October, with ozone levels dropping sharply in October. Last year the ozone decreased as much as 60 percent in the hole, compared to 45 percent depletion the preceding year. Dr. F. Sherwood Rowland of the University of California at Irvine said that the ozone reduction in Antarctica is "unprecedented anywhere else in the atmosphere ... the questions now are will it spread and how quickly will it spread." In an article by Cass Peterson in the Washington Post for 24 April 1986, she wrote, "Scientists have hypothesized that any decrease in ozone levels would be most pronounced in Antarctica, partly because atmospheric changes tend to be intensified at the Earth's poles and partly because of unique meteorological conditions there. The seasonal depletion that produces the hole occurs at the time of the year when atmospheric conditions over Antarctica create a massive vortex, or whirlwind, that keeps the same mass of air swirling over the ice caps for several months in darkness and bitter cold."

The Geophysical Monitoring Climatic Change (GMCC) personnel at the South Pole this year have been periodically sending up ozonesondes. The United States is now preparing to mount a large ozone study program this coming Antarctic spring, sending four teams totaling 12 people, to the continent on Winfly in August. There will be a three-person team from the University of Wyoming under the direction of David Hufmann taking electrochemical ozonesonde observations three times per week. This will result in detailed ozone and temperature vertical profiles from the ground to about 30 km. Three particle-size distribution sondes will measure particles from about 0.15-2 microns. A three-person team from the State University of New York at Stonybrook under the leadership of Bob deZafra will be measuring CLO vertical profiles every twelve hours. If the ozone depletion is chlorine related, CLO abundances obtained near 20 km will be measurable, and will be about 100 times greater than normal. Simultaneous measurements of the ozone column will also be maintained. A four-man team from the Jet Propulsion Laboratory at Pasadena will be taking infrared spectrometer measurements of the complete solar spectrum from 2 to 16 microns. Barney Farman will head up their group. The fourth group, a party of two from NOAA, led by Susan Solomon, will take measurements with the visual spectrometer of the column of NO and O about every five minutes, using scattered sunlight when the solar zenith angle is less than about 95 degrees. The set of experiments which these four groups of people will be undertaking, utilizes some of the most advanced ground-based instrumentation available in atmospheric research.

Ozone in the upper atmosphere screens out more than 99 percent of the sun's ultra-violet radiation. Researchers estimate that losing as little as 2.5 percent of the ozone could harm plants and animals and cause half a million additional cases of human skin cancer each year.

**WHERE HAVE ALL THE KRILL GONE? WHERE, O WHERE, HAVE THEY GONE?** According to the Washington Post, their issue of 11 May 1986, marine biologists at the University of California at Santa Barbara say they are "not nearly as plentiful in the wild as once thought, and the current comparatively low volume of krill fishing may be depleting the population." Researchers Robin Ross and Langdon Quentin have reported on their investigations in the current issue of Bioscience. It seems that their studies show that "their [krill] huge schools are not distributed uniformly and that their reproduction is about half as prolific as once thought. Also, the main fishing season, the Antarctic summer, is also the breeding season. This means krill trawlers have an unusually severe impact on the species' reproductive potential." "Just a few years ago experts forecast that krill could supply up to 150 million tons of high-quality protein per year, more than double the total amount of seafood harvested worldwide. Now, it looks as if the current krill harvest, a modest one million tons a year (mainly by Warsaw Pact countries and Japan) may not be sustainable." The USSR catch has fallen to one-quarter of what it was three years ago.

**POLAR DUKE GETS BETTER.** The POLAR DUKE is scheduled to have an equipment upgrade in June and July, one which will make an already great ship a better one. She will put into a navy/civilian shipyard at Asmar, Chile (the seaport for Concepcion), where she will be in drydock for two weeks, then alongside a pier. The equipment upgrading includes installation of a single-channel seismic system, a precision depth recorder, backup computers, a global positioning system, and the fantail will be fitted with an articulated crane for oceanographic support. The POLAR DUKE schedule is already filling up with proposals which will utilize the newly-installed equipment. The ship has proven to be very economical to operate, on the order of \$12,500 per day. Buzz Betzel says the ship is mechanically perfect, that its 12-man crew is responsive in every way, and that they have been getting good reports from all principal investigators who have been on board. Its power and strength have turned it into a ship for all seasons, having made its first winter cruise to Palmer in August 1985 without any problems. It seems that now it can operate in what was hitherto "winter exclusion periods." Buzz says that it is practically compatible to the Wind class icebreakers, but there's one fly in the ointment - they will have to strengthen the pier at Palmer to handle the ship. Buzz spent five weeks on the POLAR DUKE in the summer of 1985-86 in the Weddell Sea, and spoke glowingly of how easily the ship handles. It sounded as though Betzel would rather be at sea on the POLAR DUKE than sitting on the bridge of NSF at the 18th and G pier.

In an allied sea story, Buzz told of the reaction of the former master of the HERO, Pieter Lenie, when he received the highest award given by the National Science Foundation for his 11 1/2 or 12 years as skipper of the ship. When Dr. Wilkniss read the citation, which was in booklet form, Lenie was visibly affected. After he received the citation, he took the booklet and placed it over his head, saying, "But I have lost my beautiful ship." Old sailors never die, they just lose their HEROs!

**HERO CHAMPION DIES.** John T. Crowell died at his home on Kimball's Island, Isle au Haut, Maine on 25 April. This bi-polar man of the seas was formerly employed by the National Science Foundation as the officer responsible for the conversion and commissioning of the ELTANIN, and for the design, construction, and commissioning of the HERO. He took part in several icebreaker voyages to the Antarctic Peninsula, and was a member of the site selection team for Palmer Station on Anvers Island.

Jack was born in Gloucester, Massachusetts in 1898 and graduated from the Massachusetts Maritime Academy, serving his apprenticeship on the coal-fired barkentine NANTUCKET. He sailed in the full-rigged ship BRYNHILDA, and was second mate on the four-masted schooner BLANCHE PENDLETON. Jack held an unlimited Master Mariner's license for both sail and steam.

He was torpedoed from a cargo ship in World War I off the coast of France, and after the war he served on cargo ships operating to the west coast of South America. His polar career began in 1926 when he became an associate of the late Admiral Donald B. MacMillan. In 1940-41, he was in charge of establishing and maintaining the first base at Frobisher Bay, Baffin Island. In 1942-44, he served on the west and east coasts of Greenland in charge of establishing and supplying bases as part of the Army Air Force arctic air route to Europe. He retired from the Army as Lieutenant Colonel.

In 1951-53, as Officer-in-Charge of the weather station at Thule, Greenland, he had one of his most challenging assignments, taking a young kid from Meredith, New Hampshire, who was still wet behind the ears, and making a polar specialist out of him in one short year. He evidently was successful, as Ken Moulton went on to have a long and distinguished career in Antarctica. Jack was truly an arctic expert, and served as an advisor to the Air Force. He was involved in the pioneering party that installed the DEW line stations in Canada, HIRAN stations in Greenland, emergency air strips in North Greenland, and Fletcher's Ice Island, T-3. He had retired to Kimball's Island

where as a lobsterman he had, in his own words, "... posed no threat to the resource."

**ERNEST A. WOOD SUCCUMBS.** Bob Dodson has told us that Ernest Wood died in Florida last August, although there are no details on his death. He was a member of the Ronne Antarctic Research Expedition, and as a U.S. Weather Bureau employee, when the IGY came along, was involved in the establishment of the U.S. meteorological programs in Antarctica. Bergy Bits believes that a Little America V meteorologist, Ben Remington, married one of Wood's daughters, but no one knows what happened to old Ben. But Ernie is gone.

**AN INTERESTING WIND CHILL EXPERIMENT.** Some researchers at the University of Wisconsin have recently conducted new experiments on wind chill, supposedly duplicating the late Dr. Paul Siple and Charlie Passel's original work on the 1939-41 U.S. Antarctic Service Expedition. The original experiments utilized copper cylinders filled with water and exposed to cold and wind. William Kaufman and Debra Bothe "dressed" their cylinders in fabric similar to that of a lightly insulated windbreaker and wrapped them in wet fabrics to determine the effect of wind on wet clothing. The cylinders were then exposed to temperatures of 40°F and -10°F. They were then exposed to winds of less than 1 mph, 2 mph, and 5 mph. Unclad, the water in the cylinder quickly became as cold as the temperatures to which they were exposed; but clothed, the temperature of the water did not change with wind velocity. The wet, clothed cylinders lost heat quickly in the wind, but when a garment equivalent to a raincoat was put over the wet fabric, the heat loss stopped. It has all been written up and was published in a recent issue of Aviation, Space, and Environmental Medicine. It sounds like an interesting experiment, particularly for Madison, Wisconsin, but Bergy Bits doesn't see any Antarctic spinoffs. First of all, no one walks around Antarctica in wet fabrics; second, those temperatures are very mild, winds very low. Anything above -40°F doesn't count, right?

**LEOPARD SEAL VETOES FOOTSTEPS OF SCOTT.** The footsteps of Scott were heard by a vigorous leopard seal, and he/she, deciding to see just how a follower would taste, ambushed one of the three Footsteps of Scott men still in Antarctica, returning in early May from a walking trip to Cape Crozier. Supposedly the seal hopped out of a tidal crack or whatever, and bit one of the men on the leg. One version going around says there was a tug-of-war between the other two men and the leopard seal to see who would get the bitten man! His leg was lacerated by the seal's teeth, so they contacted the doctor at McMurdo to find out how to attend to the wounds. Is this the first time in Antarctic history that a leopard seal has bitten a man? Bergy Bits bets the seal was trained by Greenpeace and released there last summer. There's another true anecdote on the Footsteps of Scott Expedition. It seems the leader of that expedition carried along his own good luck charm in the form of a little teddy bear. At a stopover at an American encampment, the teddy bear got lost, and the leader was visibly shaken. Fortunately all was saved when it was discovered that the teddy bear had not vanished; it had just fallen into the head, and was salvageable. Of such incidents are great expeditions made! Incidentally, in our last Newsletter it was erroneously written that the U.S. asked the British pilot not to fly into the South Pole to get the Footsteps of Scott men. They were never told not to fly, nor even requested not to make the flight. Our column quoted from a British newspaper which did not have its fact right. Sorry about that!

**SIR HUBERT REALLY DID FLY OVER THE SOUTH POLE.** Bergy Bits really goofed in the last issue when we said that Sir Hubert Wilkins had never flown over the South Pole. Link Washburn points out in his letter of 9 May to the Nerve Center that Sir Hubert actually

did on 17 October 1957, as Link was with him and has the evidence - a GI plastic spoon on which Sir Hubert inscribed his name and the date commemorating the occasion. This had to have happened before Sir Hubert fell into disfavor with the Navy commander for his ill-fated interview, as thereafter all he could do was bootleg local flights out of McMurdo. Although Sir Hubert never landed at the South Pole, part of him did, because he had given this writer one of his Eskimo parkas to wear at the South Pole - the one which is now in the museum at Christchurch. Link pointed out that "Sir Hubert was a fine companion then, and on every other time we met." True. And he was probably the most humble of all Antarctic explorers.

**A WOMAN BEFORE HER TIME.** Bergy Bits has recently read Self-Portrait of an Artist by Lady Kennet, the widow of the late Captain Robert Falcon Scott. What a most unusual and interesting person, one whose interests were more of the 1980's than of the 1900's. This wasn't any old Victorian wife sitting at home waiting for her man to come back from the ice, but a very active, professional artist/sculptress whose ideals and mores seem to be those shared by today's women. Her book is essentially entries from her diaries and memoirs, and one comes away with the feeling that Roland Huntford pretty well captured the real Kathleen Scott in his book, Scott and Amundsen. One of her entries said, "I used to say I wanted a baby but not a husband, and I've got it, but with a difference." And her entry after the birth of Peter, "I fell for the first time gloriously, passionately, wildly in love with my husband. I did not know I had not been so before, but I knew now." And how serenely she took the news of the death of Scott and his men on the Barrier, "Oh well, never mind! I expected that. Thanks very much. I will go and think about it." And then she proceeded to her regular scheduled Spanish lesson where she "acquitted myself well." Holy mackerel, what a strong woman! She was just as professional as Scott, in reality, probably much more so. Her sculptured busts are all over the U.K.: National Portrait Gallery, Tate Gallery, Westminster Abbey, The National War Museum, St. Dunstan's, and Bristol Cathedral. She has statues in Waterloo Place, Cheltenham, Huntingdon and Welwyn, Dover, and Litchfield; a portrait relief is in the crypt of St. Martin-in-the-Fields. Bergy Bits wonders if there has been any other Antarctic wife whose own career was filled with so much personal success.

She died much too early in life, at the age of 69. She wrote her own epitaph for a tiny gravestone - "Kathleen. No happier woman ever lived." What a fantastic person she must have been. Wow!

**ANOTHER FAMOUS WIFE.** Bergy Bits likes to write about the late Sir Hubert Wilkins because he once worked with the gentleman back in the 1950's. Here was an explorer who was probably never cut out to be a married man, although he had a lot of gracious charm around women. He got married relatively late in life, being almost 41 at the time. It was one of those convenience marriages, but they did have a couple of things in common - both were Australians, and both loved the theater. She, Suzanne Bennett, once a Ziegfeld girl, was a well-known actress on Broadway when Wilkins met her at a New York City reception following his successful flight from Alaska across the Arctic Basin to Europe. She always maintained her New York City residency, and Sir Hubert's home was anywhere on the globe where there was adventure. Once Lady Suzanne called the office to speak to Sir Hubert. She was told he was not there, and then she asked where he might be. She was told he was in the Sahara Desert, and then she asked how long had he been there. Only then did Lady Suzanne find out that he had been there something like six weeks! It was one of those kinds of marriages, where each respected the other's freedom, and saw to it that they never intruded upon the other one's turf. Sir Hubert spent Christmas 1957 alone in a run-down derelict of a hotel in Framingham, Massachusetts where he lived because "Lady Suzanne sent me a postcard saying she was busy over the holidays and not to bother to come home." The next

Christmas Sir Hubert was in the Antarctic, and he never lived to see another Christmas, dying the night of 30 November 1958 in that delapidated old hotel. Bergy Bits wonders if any of the name Antarciticans had such a strange marriage; in real life one was truly made for exploration, the other strictly for Broadway. The late Lowell Thomas wrote an excellent biography on Sir Hubert, which, for all practical purposes, ended with his extensive search of the Arctic for Sigismund Levanevsky in 1937-38. His efforts were in vain, but the Russians still look upon Sir Hubert with the greatest respect for all of his efforts on their behalf. Perhaps this Lenin look-alike is more of a hero there than in his adopted country here in the United States. He achieved many great things - first man to fly in the Antarctic, first under the ice in a submarine, one of the very first aerial combat movie photographers, but he also had sort of a pitiful non-existing home life. But so did she.

**BRITISH PATENT 1,047,735 (NOVEMBER 9, 1966).** This is sort of ancient history, but it's real Bergy Bits-type material. An inventor by the name of A.P. Pedrick came up with a plan that would pump fifty 10-foot iceballs per second from the Antarctic plateau through a 3000-mile pipeline to Australia's "outback". Remotely controlled, vehicles would scoop snow into spheres which would compact into iceballs. The balls would then be channeled into the pipeline where gravity would accelerate them to about 500 miles per hour by the time they reached sea level. This Pedrick fellow said that the speed could be maintained on the level in the undersea pipeline by the accelerating effect stemming from the earth's rotation combined with its increase in radius as the balls roll from a higher to lower latitude. He would accelerate the iceballs by evacuating the pipeline to 5 p.s.i. absolute. The vacuum would be created by exhausters powered by electricity produced on generators turned by windmills floating on rafts in the Antarctic area.

**UNITED STATES RESEARCH IN ANTARCTICA, 2000 A.D. AND BEYOND.** The National Academy of Sciences' Polar Research Board report on the above has been completed in draft form, and is about to go through the formal review procedures prior to publication, probably late in the fall of 1986. It is our understanding that the report is somewhat short on length but very substantive.

**AMBASSADOR PAUL C. DANIELS' WIDOW CONTACTS RUTH SIPLE.** Teddy Daniels, the very affable widow of our former honorary president, called Ruth early in May to say how very much she appreciated the many kindnesses tended her since the Ambassador died, including the letters which some of you have written her. She was touched, too, when she received the small "memorial tree" with leaves of rose quartz (an alternate birth-stone for October) which we sent on behalf of Society members. She said she and her daughter would like to be active members of the Society, which pleases us, as it seems most fitting that we continue to have a couple of Daniels limbs.

**WRAP-UP FOR 1985-86.** That's it, folks, for another year. Our incoming president, Bob Dodson, our greatest asset, Ruth Siple, and Bergy Bits will all be out in San Diego to attend the Memorial Lecture by Claude Lorus, and to see some real live penguins at Sea World. We hope to see many of you there. That will be my 50th consecutive Society lecture! .... We appreciate the inputs given by Peter Wilkniss, Dave Bresnahan, John Lynch, and Bruce Molnia. Thanks loads . . . Let's end the year with a quote from the erudite Charlie (BAE II) Murphy, a very successful man of the pen, writing about a man currently writing an investigative book about BAE I, "They are the night soil on which the gardens of publishers depend." .... See you in San Diego, or back here in September. You all have a great summer. Don't smoke. Drive carefully.

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

Vol. 86-87 September No. 1

THE ANTARCTIC SOCIETY AND THE NRC'S POLAR RESEARCH BOARD

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-73  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mori D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986

present

ANTARCTIC OZONE HOLE

by

Dr. James Margitan

Discipline Scientist

Upper Atmosphere Research Program

NASA Headquarters

Washington D.C.

on

Friday evening, 17 October 1986

7:30 PM

in

Room 451

National Academy of Sciences

21st and Pennsylvania NW

Washington, D.C.

Dr. James Margitan is a chemist with the Jet Propulsion Laboratory who is on a two-year assignment at NASA Headquarters here in Washington. He will speak on the most holy of all Antarctic issues, the so-called ozone hole. NASA scientists have been in the forefront studying the phenomenon, and they addressed the issue in NATURE (28 August 1986). This meeting is at a most opportune time because it is expected that preliminary findings obtained by 13 specialists flown into Antarctica on WINFLY in late August will be available. It's a most timely presentation on a subject of great interest by one of the key men involved in the study. Come one, come all! Bring friends!

Coffee and cookies will be served.

PLEASE NOTE THE ADDRESS AND THE TIME I

*Mark your calendar NOW. Co-meeting with The Explorers Club-Washington Croup has been set for Saturday, 15 November 1986. This will be a dinner meeting at the Cosmos Club.*

Order your 1987 Antarctic Calendars. See page 12.

Well, here we go again. It's Ruth's ninth year as La Grande Dame of the Society; it's the eighth year of Bergy Bits. As before, this column will be a potpourri of pieces about Ant-arcticans, some of which may even be truthful, although a good story gets priority over truthfulness. Our main objective is to present human interest articles about Antarcticans of all ages. We encourage you to send in your items which will make our job easier and the Newsletter better. Married members should note reduced rates as we go benevolent.

**THE PAUL C. DANIELS MEMORIAL LECTURES.** As you can see from our new stationery, our Society has named our Memorial Lectures after our late, beloved Honorary President, Ambassador Paul C. Daniels. It was unfortunate that we didn't do this when he was still alive - we should have. He epitomized in so many ways what our founding fathers - of which he was one - meant our Society to be, both then and in the future. Although he enjoyed the social camaraderie and the tinkling of raised glasses, he never lost track of what Antarctica should be for people of all nations. His name will always be synonymous with the Antarctic Treaty, and hopefully his name will always be associated with our Society. We know of no better way to see that it is preserved than in having our annual Memorial Lectures given in the name of Paul C. Daniels.

We have heard several times from his widow, Teddy and from his daughter, Jean who "adored [her] father and was immoderately proud of his accomplishments." Upon hearing that the Society had named its annual Memorial Lectures after her Dad, she wrote:

Thank you for splendidly honoring the memory of my father by naming the Society's .annual Memorial Lecture for him. I like to think that my father's high aspirations for Antarctica (and, through its example, for all lands) may continue to be remembered along with his name.

The group of relatives and friends who gathered at the Salisbury, Connecticut Cemetery on June ninth seemed - to share my feeling of returning to God a very precious gift. Dad's mortal remains were lowered gently into the earth, next to the graves pf his other daughter and son, by his grandson, Paul Daniels Portell. We will miss him very much.

My mother has difficulty sometimes adjusting to her loss - of course! But she is doing very well under the circumstances. Your sympathy and your actions at the Society have comforted us both greatly. It is no wonder that my father was so proud of the Antarctic Society; you all seem to be such lovely persons.

I think it was most appropriate that a foreign scientist, Professor Claude Lorius of France, the incoming president of that august Antarctic body, SCAR (Scientific Committee on Antarctic Research), should give the first Memorial Lecture after Ambassador Daniels' death. It was a most scholarly presentation on "Polar Ice Cores - A Record of Climatic and Environmental Changes," one that he would have enjoyed. Presenting Dr. Lorius that evening was the person whom Bergy Bits calls with much justification, Gentleman Jim, Dr. James Zumberge, president of the University of Southern California and the. outgoing president of SCAR. One could not have hoped for a better script, two men of distinction honoring another, with a most learned presentation, before a large international gathering of Antarctic decision and policy makers from all the Antarctic Treaty nations, plus some Society members.

**SOCIETY OFFICERS AND BOARD OF DIRECTORS.** Your Society is run by four officers and twelve directors, who meet periodically throughout the year to make decisions, favorable or unfavorable, for the Society. This Newsletter is the unofficial voice of the Society, but we try to pass on the Board's feelings, especially if we agree with them. Our incoming president is Robert H.T. Dodson, who many long years ago was a member of the Ronne Antarctic Research Expedition. He is currently with the State Department, and has been an enthusiastic supporter of our lecture series for many years. He is very much interested in our Society, so one can expect that he will be a very active president. Our Vice President is Guy Guthridge, who needs no introduction to any American Antarctic, as he is head of the Public Information Office in the Division of Polar Programs at the National Science Foundation. But we will tell you he is an avid racing yachtsman, almost as good as Ted Turner. Our treasurer, Ruth Siple, was voted in for life or until she quits, whichever comes first. Pete Barretta has been rotated back in as secretary. It's not that anyone can read Pete's scribblings, as no one can, not even he himself, but he comes to each and every meeting, and you want your officers there. The new Board members are all relatively young Antarcticans who have been to the ice in the past decade: Tony Meunier, Bob Hickerson, and Jorge Carnicero. Meunier will also serve as Sergeant at Arms, Bouncer, and any other position requiring muscle and size. Vernon Cooper of Hazard, Kentucky is our newest Member-at-Large Board member by dint of his writing so many letters to the Nerve Center. Also, he is president of a bank, and it is always nice to have a member on the Board who is independently solvent in case we need a loan.

Other active Board members (terms are for three years) are Chris Joyner, Professor at George Washington University who is interested in the Antarctic Treaty and conservation (as well as being an expert on terrorism); Dick Conger, former chief Navy photographer in the Antarctic on Deep Freeze I, II, III, and IV; Joe Dukert, author of a book on Antarctica and well-known writer on energy issues; Jackie Ronne, widow of Antarctic explorer, Capt. Finn Ronne, and first (along with Jennie Darlington) woman to winter over on the ice; Herb Nickens, recently retired cartographer from the US Geological Survey who spent many years mapping Antarctica; Walt Seelig, another retiree, former Mr. Christchurch while working for NSF; Bob Nichols, retired glaciologist who still feels the most significant work done in Antarctica was accomplished by men hauling sledges; and Charles Swithinbank, a lend-lease glaciologist from the UK who is partly American through marriage and association with American programs. Both Nichols and Swithinbank are Members-At-Large.

A last-minute note from Bob Dodson, dated 9/7/86, from Geneva:

Let me say, right off, how tremendously pleased I am to be named President of the Antarctic Society. It really is an honor, as I'm somewhat different than past presidents, having not been in Antarctica since 1948. You might say I'm an antique, one of the dwindling number who have driven dog-teams, lived on pemmican a la Sig Gutenko, and travelled to the Antarctic without benefit of air transport. I am looking forward tremendously to my new association with all of you. R.D.

**MEMBERSHIP DUES.** We decided that it wasn't fair to ask both husband and wife to pay full memberships when we send them only one Newsletter, so we have come up with a new category, husband-wife duo-membership for \$10. The rationale was to save a few bucks for old-timers - Pete and Edna Barretta, Hal and Margaret Borns, Pete and Betty Burrill, Gene and Reba Campbell, Bert and Mildred Crary, Hugh and Jane DeWitt, Tom and Davida Kellogg, George and Sallie Toney, Mort and Joanne Turner, and Link and Tahoe Washburn. We have been using the extra money to send Newsletters to Scott Polar Research Institute, the Goldthwait Library, National Archives, Jim Barnes, Jim Caffin, Bernie Coyne, Max Hamilton, Lee Kimball, and our Honorary members, as well as to people who write and want to see/hear what we are all about. So if you want to sign

up your husband or your wife, or whatever, you can come aboard at \$10 per twosome, but you will get only one Newsletter.

Bills are being mailed to those members whose dues are due, roughly 45% of our total membership. We greatly appreciate all of you folks who renewed for multiple years, as it makes it a lot easier for the team of Siple and Dalrymple to keep the books. This is a two-person operation, and we do it for our love of Antarctica and Antarcticans. If you want to drop out of the Society, now is the time to do it, as we really aren't looking for 1,000 - we think 500 is just great! However, we would very much appreciate it if droppees would just tell us they are abandoning ship; then we won't bug you with further dues notices or Newsletters. And your name will never be printed as a delinquent!

**MEMBERSHIP.** Back on May 17th, at our joint meeting with the Washington chapter of The Explorers Club, this cameo-complexioned beauty came up to Bergy Bits and said, "I'm Lisa Fetterolf." I recognized the name, as she had just joined the Society, so I replied, "I've been waiting to meet you for a long, long time." You see, Lisa is our 500th member, a number which I had more or less picked several years ago as our membership goal. Since Lisa, we have more new members, so now we total 518, our highest ever. It is interesting to note that our members come from 46 states, plus the District of Columbia, and eleven foreign countries. Here's the breakdown:

Virginia	70	Alaska	8	Mississippi	3	Australia	4
Maryland	62	New Jersey	7	New Mexico	3	England	3
California	49	Illinois	6	Connecticut	2	Canada	2
D.C.	33	New Hampshire	5	Alabama	2	West Germany	2
Colorado	24	Nebraska	5	Indiana	2	Argentina	1
New York	24	Oklahoma	5	South Carolina	2	Austria	1
Massachusetts	20	Rhode Island	5	Utah	2	Belgium	1
Florida	17	Vermont	5	Wyoming	2	Chile	1
Texas	17	Kansas	4	Arkansas	1	Korea	1
Washington	14	Minnesota	4	Delaware	1	New Zealand	1
Ohio	13	Missouri	4	Hawaii	1	USSR	1
Arizona	12	Nevada	4	Montana	1		
Pennsylvania	11	North Carolina	4	South Dakota	1		
Maine	11	Wisconsin	4	Tennessee	1		
Oregon	10	Georgia	3	Louisiana	1		
Michigan	9	Kentucky	3				

Now those half-persons are not lightweights; they are just nomads who have the wherewithal to live in the south in winter and the good sense to go to New England in the summer. Not long ago we were basically a bunch of Washingtonians, but now only 28% of our Society live within 50 miles of Washington. It is great to have such national representation, but the small number of members in the Washington area - 146 - makes it extremely difficult to get large turnouts.

**TYPICAL IGY ANTARCTICAN SUCCUMBS.** When the IGY came along, a bunch of characters came out of the woods and volunteered to go to Antarctica, a bunch of guys who had been waiting a long time to go to Antarctica. The largest group was from the old Weather Bureau, many of whom had previous Arctic or Alaskan service. One of them was Gene Harter, who went to Little America V and had a ball for himself. Gene was a very likable guy, but is no more, as he dropped dead this summer following a typical Harter adventure, being towed in a tube by a speeding boat. Pulling himself back into the boat, totally exhausted, he reached for a cigarette, lighted it, and that was the end. His wife, Jennie says he died from smoking. She may be right.

Old Gene lived and died with gusto; he knew no other way. He never should have been allowed to go to Antarctica, as once he had severely frozen his feet after a terrible aircraft accident back in December 1947 when an Air Transport Command C-54 went down in the boonies of Labrador, killing 23. Gene walked out to civilization and brought back a rescue team to the other living five. When he took his Antarctic physical, he kept his socks on; otherwise, he would never have made it.

While recuperating in the hospital in Bethesda after that accident, Gene met this young thing from Silver Spring, and told her he'd take her away from terrible Washington if she would only marry him. She agreed without reading the fine print, which said that he planned to take her to Alaska as the other half of a husband-wife Met team. And in very small print there was a clause that he planned to get her pregnant each and every year. But Jennie was happy to get out of town, and now all those kids are her big support and happiness.

Gene chucked the Weather Bureau shortly after the Antarctic, went into business for himself in Fort Wayne, and became very successful. Those of us who knew him at Little America V would not have believed there was a minister in the Harter clan, but there was, and he conducted the funeral service. When Jennie picked music for the funeral, she insisted on including "My Way" because she said this was Gene. To me he epitomized the IGY men who had burning desires to go to Antarctica. Bergy Bits is going to miss the old scoundrel.

**CALL TO QUARTERS FOR ALL DEEP FREEZE IV PERSONNEL.** Mel Havener, 278 Lantana Street, Camarillo, California 93010, is organizing a reunion of all people who were on Deep Freeze IV, 1958-59. No place or time has been selected, so get in touch with Mel now and have an input. Mel was a young enlisted man at the South Pole with Dr. Siple in 1957, and liked it so well that he went back to the Antarctic and wintered over at McMurdo in '59. He attended the Deep Freeze I reunion in Norfolk a year ago August, and had such a good time he thought he would try to pull one off for IV. Ruth and Bergy Bits stopped off to visit several hours with Mel and his family as we drove up the coast of California. His wife, Shirley makes' the best sticky buns ever, so ask for them when you visit. They are great! We made the mistake of not taking some along with us when we left. Incidentally, after Mel finished his Navy career, he decided to go to college, and now has two college degrees. Unusual fellow, real nice guy!

**MORE ANTARCTIC BOOK DEALERS.** In our May 1986 Newsletter we gave addresses for five stateside and five foreign book dealers who routinely sell Antarctic books. Thanks to our good friend, John Millard, here are four more polar book sellers:

Bluntisham Books  
Oak House, East Street  
Bluntisham, Huntingdon, Cambs., PE17 3LS  
United Kingdom  
487-840449 (phone)

Kenneth Hince  
823 Glenhuntly Road  
Caulfield South, Victoria 3162  
Australia

Patrick J. Walcot - Books  
60 Sunnybank Road  
Sutton Coldfields, W. Midlands B73 5RJ  
United Kingdom  
21-382-6381 (phone)

Gaston Renard, Fine & Rare Books  
G.P.O. Box 5235BB  
Melbourne, Victoria 3001  
Australia  
3-417-1044 (phone)

John writes, "A word of caution regarding Australian books prices, they are astronomical compared with U.S.A. and Britain, surface parcel post rates are high, and it takes 2-3 months, at least to this destination." D.W.H. Walton of Bluntisham Books wrote us, feeling hurt about being left off our May listing. We really don't strive for

perfection in Bergy Bits, we just look for enough words to fill ten pages, but we are sorry that we didn't mention Bluntisham before. They are a legitimate concern which publishes four catalogues a year on polar books, totaling around 1,200 items.

John Millard is a man of many fascinations which he pursues with great vigor and probably much expense. As mentioned in earlier columns, one is finding out who possesses copies of Shackleton's Aurora Australia. John wrote that an original copy was sold at auction in London in April for 6500 pounds, plus a buyer's fee of 10%. Oh la la! There is a Trade Re-print Edition (of A.A.) which may or may not be sold out by now. If interested in one, you should have at your disposal 480 greenbacks, as that is the cost through Bluntisham. There were only 12 unsold copies left in late June, so run, don't walk, to your nearest Western Union office. Fifty-eight copies were published - the same number as the original - and they are numbered. Both the original paper type and the boards have been closely matched in the facsimile. It is printed in black and red on 115gsm handmade, watermarked, acid-free deckle-edged paper. Quarter bound in calf and 3-ply plywood with chamfered edges, blind-tooled with the title and the "Sign of the Penguins". Sheets punched and threaded onto silken ties. Size 210 x 275 mm. Supplied with a 24-page booklet containing a Preface by Lord Shackleton and a detailed account of the history of the book by John Millard. Presented in a specially strengthened, dustproof, cloth-covered library box.

John has been making real progress on his study of "The Worst Journey in the World", and we would like to quote from what he wrote Bergy Bits, but thinketh perhaps we best hold off on that one, because John "hopes to publish the results in the early fall."

**"ANTARCTIC SUMMER" AT SMITHSONIAN.** The Smithsonian's National Museum of Natural History currently (until November 15) has an exhibit of watercolors and drawings by Lucia de Leiris, artist-illustrator, who was in Antarctica, November '85 - March '86, working out of Palmer Station when not on board the POLAR DUKE. The exhibit is set up in the Discovery Gallery on the second floor, and is quite interesting. There are over thirty paintings, most of which are quite small, but there are several good-sized scenic ones (Le Maire Channel, Gerlache Straits, Birth of the Sea Ice, Le Maire Channel II). There are two paintings of Chinstrap penguins, and one each of a Gentoo, an Adelie, a Macaroni, a Giant Petrel, and sea life; several of stations on the Peninsula (Palmer, Port Lockroy, and Faraday); one of the Society EXPLORER. De Leiris evidently devised a heated tent with a vinyl window to protect herself and her watercolors, but she must have had problems, as a journal quote with the exhibit said, "Painting on the glacier was a disaster. Starry patterns emerged on the paper as the washes froze in seconds. Another brush stroke would turn it all into colored snowflakes that would coat the end of the brush." One can't go wrong visiting any Smithsonian museum, and if you should not like this exhibit, which we feel is quite good and most worthwhile, you can always go back down to the first floor and go to the Antarctic with Wilkes.

**IN THE FOOTSTEPS OF SIPLE (ALSO CHAPPELL, LEINMILLER, AND BARNHART).** (Submitted by Dr. Edward P. Todd). In 1928 a national competition was held for the purpose of selecting an Eagle Scout to accompany Admiral (then Commander) Byrd on his first expedition to Antarctica. The winner was Paul A. Siple who went on to develop an outstanding career in Antarctic activities and in the Foreign Service. Twenty-nine years later, Eagle Scout Richard L. Chappell won a similar contest and spent the year 1957-58 in the Antarctic. Chappell is now a professor at Hunter College. More recent contests have produced winners Mark Leinmiller and Douglas Barnhart.

Last year negotiations began again between the Boy Scouts of America (BSA) and the Division of Polar Programs of the National Science Foundation which have resulted in an agreement to send an Eagle Scout to Antarctica once every three years. The winner will be selected in a nationwide contest and, besides participating in the United

States Antarctic program for a season, the winner will also play an important role in the national BSA organization for a three-year period after his return.

The affairs of the BSA are the responsibility of a National Council which is a very large group of national and regional Scout officials which meets biennially. The day-to-day operation of the national BSA is the responsibility of a professional staff of several hundred people, headquartered in Irving, Texas and guided by a small executive council on behalf of the National Council. Three of the positions on the executive council are reserved for "youth members" who are generally college age Eagle Scouts selected to represent significant phases of scout life. In line with a decision to place more emphasis in Scouting on academic activities, including science and engineering, the Antarctic Scout is, upon his return, appointed for a three-year term to one of these "youth" positions on the National Executive Council. Mark Leinmiller has completed his term, and his successor, Doug Barnhart, is currently serving. Thus, the Antarctic Scout is integrated into the longer range plans of the BSA by serving as a role model consistent with the desire to strengthen the emphasis on the academic phase of Scouting.

This year's contest produced about 150 semifinalists whose applications were extensively reviewed at national headquarters and, with considerable difficulty, the field was winnowed down to produce a group of four finalists. The finalists, and a group of four judges, were invited to the biennial National Council meeting held in Louisville, Kentucky in late May for the difficult process of selecting the winner. The judges were three former winners, Richard L. Chappell, Mark Leinmiller, and Douglas Barnhart, and Edward P. Todd, a retired former director of the Division of Polar Programs.

The finalists were an imposing group of four young men, any one of whom could be expected to serve with distinction if selected. They were Joel S. Davidow, a freshman majoring in geology at Amherst College; Jeffrey S. Janda of Berwyn, Illinois, a high school senior with a strong interest in science and mathematics who had received a strong impetus from his membership in an Explorer Post at the Argonne National Laboratories; Willis M. Potts of Miles City, Montana, a high school senior with a straight A average, a strong interest in science and mathematics who plans to attend college to study petroleum engineering; and Louis P. Sugarman of Southfield, Michigan, a freshman at the University of Michigan majoring in chemistry with a leaning, perhaps, to pre-med.

The selection process must have been hard on the boys since the judges put them through a grueling series of interviews. On Wednesday, following a brief orientation session, the assembled judges interviewed each boy in turn. On Thursday, a series of one-on-one interviews was held until each judge had had a private interview with each boy. On Thursday evening, the judges met together to decide on the winner. This was a most difficult process since any one of the four would have been suitable.

On Friday morning, the Scouts and the judges were invited by the National Eagle Scout Association to attend the Eagle Scout Breakfast. Each Scout was introduced to the assembly of several hundred adult Scouters. They also met several older, rather famous (in Scouting circles) Scouters. Interestingly, one of the Scouters who dropped by our table for a chat was Perry E. Piper of West Liberty, Illinois who, in his youth, had been one of the Eagle Scout semifinalists in the contest won by Paul Siple.

Following the breakfast, the judges took the boys off to a nearby office where they were informed that Louis P. Sugarman had been selected as the winner. [Louis told Bergy Bits he never slept a wink the preceding night!] Louis has passed his physical exam and attended the USARP Orientation session in September, and then on to the Antarctic in early October.

**A DAY AT SEA WORLD.** The day after the June 24th Memorial Lecture, Sea World Invited participants of SCAR XIX to be their guests, and Antarctic Society members in town were graciously included. It turned out to be a most delightful day, and early in the afternoon Ruth and Bergy Bits ran into Myrt Eller, a new member of our Society, who is a volunteer worker at Sea World. This was a stroke of good fortune for us, as she became our personal guide, seeing to it that we got where we should for all the proper shows - and one improper show, where two giant seals (in the midst of their mating season) decided that they could think of something better to do than to complete their act on stage. The maestro had to recruit two younger seals who weren't as concerned with mating as they were with seeing that the "show must go on."

The highlight of Sea World for all Antarcticans has to be their Penguin Encounter. Myrt introduced us to Frank Twohy, the Assistant Curator for Birds, who showed us the working areas of Penguin Encounter. Having seen Frank several times on national television with E.P. and K.O., and having read about him in Currents, it was quite a thrill to meet him. Following a great barbecue in the evening, Frank took several of us in amongst the 400 penguins where he explained the facts of penguin life to us. We even found out how a female Emperor penguin, who hasn't paired up, walks when she is advertising - or at least looking for a swimming partner. Frank has one blue-eyed cormorant who is quite tame; he/she/it allows you to stroke his/her/its back and neck. It is amazing how the six species of penguins in the room segregate according to light, with the gradation going from the Emperors who prefer to do their thing in the dark, to the Kings who seem to prefer the lighter areas. Sea World will open other Penguin Encounters in Florida (Orlando), Ohio (Aurora), and Texas.

It was great seeing so many Society members in San Diego. The one walking around with a cheshire-cat grin, looking like he had swallowed the canary, was old Gil Dewart, who had wintered over with Carl Eklund at Wilkes in '57 and with the Russians at Mirny in '61. However, it wasn't his Antarctic memories which had him smiling, it was this comely lass with the broadest brimmed hat in town whom he had in tow. But he wasn't the oldest, as John Roscoe, who did photogrammetry and photo interpretation on High-jump in '46-'47 and Windmill in '47-'48, was there. Fauno Cordes, Miss Fictional Antarctica, came down from the San Francisco area, and it was nice meeting her. We had never met Big John (Stagnaro) who is justly famous for all his many years of running phone patches for Antarcticans. Big John had his XYL along, and seemed to enjoy an evening away from the rig, meeting such characters as Dick Cameron, and seeing old friends like Rob Flint. Bob Feeney and his wife came down from Davis for the lecture, and Richard Miller, leader of the Ross Sea Ichthyology Project '58-'59, was also there. Our new president, Bob Dodson, veteran of the Ronne Antarctic Research Expedition '47-'48, came from Washington, DC to join in the festivities. We should have more meetings in California. They have fun towns.

**HOWARD MASON, BAE I RADIO OPERATOR, DOING WELL.** On our trip to the west coast this summer, Ruth and Bergy Bits dropped by to see Howard and Genevieve Mason. Howard, one of the radio operators on the 1928-30 Byrd Antarctic Expedition, showed us some old glass slides from that expedition, using a projector made in the mid-1920's which looked like a cannon for harpooning whales. Howard was one of the fortunates on that expedition - he was paid handsomely, \$100 per month by the New York Times. When he came back he walked around San Francisco with his fortune, looking for a safe bank in which to deposit it. He picked the one with the most elegant pillars, figuring that must be the best bank, but it folded within the week. So beware of banks with great pillars! Howard is a very interesting fellow. He went north twice with George H. Wilkins, later to become Sir Hubert. Having been a coworker with Sir Hubert, it was interesting to meet a person who had been north with him before he became famous. Howard built his own home in Seattle, and he and his wife of long-standing make a delightful couple. It seems strange that he didn't know there was a mountain named

after him at 84°43'S, 169°48'W. Bergy Bits hopes to get a picture of it for Howard, as he's such a nice guy. Evidently many members of the early expeditions never knew they had geographic features named after them. It's great fun visiting with these older explorers; their enthusiasm for the Antarctic has only been enhanced by the years.

**THE HERO LIVES ON.** Our April 1986 Newsletter told you about the proposed Antarctic Exploratorium in Reedsport, Oregon. The centerpiece for whatever may follow is the HERO which is tied up in Reedsport. One crewman from its Antarctic days survives -and he's the captain, a fellow by the name of Jay Morrison. The HERO is open to the public for a very nominal fee, and occasionally they fire her up and off she goes. One such day was this past July 4th, when it lead a flotilla of pleasure craft upstream under the Umpqua Bridge being honored for surviving 50 years. As Ruth and Bergy Bits were to be on the west coast, they had asked us to come along for the ride. The night before the 4th, a sudden storm hit the central Oregon coast, and the intrepid HERO was blown onto a sandbar. So they had to get her off the bar in the morning, then dock her in order to pick up a hundred or more patrons of the International Oceanographic HERO Foundation. This turned out to be quite an ordeal with a neophyte crew, taking well over an hour. Then they went downstream to meet the pleasure craft, and lo and behold, ran aground again on another sandbar. Everyone had to go stand on the bow. It worked, but by that time there was no flotilla in sight! So the HERO went full throttle ahead for Reedsport, and made a spectacular arrival at the bridge at high noon, whistles blaring, balloons flying, just like in the script! Meanwhile, back on the east coast, an Arctic ship, Admiral MacMillan's BOWDOIN, followed the Coast Guard Cutter EAGLE into New York harbor in their Tall Ships extravaganza. Both the HERO and the BOWDOIN sponsors need monies, so if you want to help keep a couple of good old polar ships active, contributions would be welcomed.

**ANTARCTIC SNOW CRUISER.** Two of our members, J. Stephen Dibbern and Dean Freitag, have recently collaborated on a 34-page report on Dr. Poulter's Antarctic Snow Cruiser, which was taken on the U.S. Antarctic Service Expedition 1939-41. The bottom line appears to be that the vehicle was three to five times too heavy for its tires to support itself on snow surfaces. It says that "the snow cruiser remains a monument to a bold attempt to push at the frontiers of both exploration and mobility which failed in a spectacular fashion." There was nothing wrong with Poulter's idea of having a mobile, self-sufficient exploration unit. Sixteen requirements' were set forth, some of which were really far-reaching - cruising distance from four to six thousand miles, negotiating open crevasses up to fifteen feet wide, a cruising speed between five and ten miles per hour. The documentation of the Snow cruiser's overland trip from Chicago to Boston, then its offloading at Little America III make excellent reading. In fact, the whole article is very interesting. It is not a negative, debilitating story, but an upbeat one emphasizing the contributions made to polar mobility research. One thing Bergy Bits never realized was that all of the Little America stations are now gone. This fellow Dibbern has also published a letter report on Vehicular Transport at McMurdo Station Antarctica. Wonder what Scott or Shackleton would say if they could see this report? No Siberian ponies, no dog teams!! Did you ever wonder just where Scott and his diehards in the tent are today - perhaps still on the Barrier.

**LCDR DAVID ELI BUNGER, WHERE ART THOU?** The Australians want to talk to you about Bunger Oasis, but no one knows where you are, so please surface. Aussie Bob Tingey, science coordinator, ANARE Bunger Hills party 1986, writes that last year they "commenced a three-year cycle of summer field observations in the Bunger Hills region and a small field base camp was established in the SW corner of the Bunger Hills. The base camp was named Edgeworth David in honour of the eminent Australian geologist who accompanied Shackleton's 1907-1909 British Antarctic Expedition. The 22-strong field

party - 21 men, 1 woman - frequently discussed Bunger and his landing, one reason being the fact that the marine inlets remained icebound well past the date of Hunger's original landing. Although we encountered some fairly windy weather which resulted in some boisterous flying conditions, we had a very productive field season from mid-January to early March. The Bunger Hills party developed a considerable respect for the people who went before us, and we are keen to find out more about and make contact with David E. Bunger and his crew." Bunger was flying an old Martin Mariner seaplane off the tender CURRITUCK at the time he discovered Bunger Hills on 11 February 1947. If Gus Shinn or John Roscoe doesn't know where Bunger is, he is probably pretty well buried.

**MURRAY WIENER REAPS.** Murray Wiener, Antarctic protege of the late Admiral Richard E. Byrd, Dr. Paul A. Siple, Bud Waite, and others, enjoyed a good military life as a commissioned officer. He looked forward to retirement, as he liked his golf and his fishing, and was real comfortable with a nice pension. He and his bride Ruth were thinking Mexico, and on their way south to look for a retirement home, they stopped off in Green Valley, Arizona. And one might say they never left Green Valley, as they fell in love with the town, bought a lovely home right on the golf course, and settled down to live happily ever after. But it didn't turn out that way; a new bank hired him, and he soon became its vice-president. Then along came an old friend who told Murray he just had to have him to help sell some luxurious, spectacular condos in Del Rey Colony, Venice, California. Murray said okay, but only for one year, as he's getting on towards seventy and hasn't really retired. It turns out that everything Murray touches, including his wife, turns to gold - she's a golden beauty, still looking very much like the Miss Junior Prom she was at Syracuse University several decades ago. No wonder Murray wakes up every morning with a smile on his face! He has made a fortune this year, has so much money he doesn't know where to bury it, but he does know that he's going back to Green Valley and really hit that golf course. And, if you are looking for a whistler for your next social function, contact Ruth Wiener, as this songbird whistles up a storm at the drop of a note (or a bond). She also can cook. We know, because we were houseguests of the Wieners in late June.

**ICE CHIPS.** Mr. Antarctica, *Larry Gould*, turned ninety this past August. Ordinarily this would have been a gala occasion, but it was tempered by the fact that Larry had to have open heart surgery earlier in the summer. He had sort of an engine overhaul, has a new valve, and is taking therapeutic walks under the control and guidance of their faithful dog, Gray..... Meanwhile back here on the east coast, *Big Bert Crary*, First at Both Poles, is making a slow recovery from multiple problems, the latest of which was a bad reaction to the combination of pills he was taking this past spring. But Bert is back walking, and even reports that he tries a bit of jogging on his walks, He goes regularly to a pool where he is put through a series of exercises. Bert is back up to 174 pounds. It's ironic and sad that three of the biggest IGY Antarctic men, Larry, Bert, and Bunny Fuchs, should all have major physical problems in the past year..... *Ken Moulton* was enjoying retirement, his Red Sox were walking away with the American League pennant, he was in good health, and his pockets were full of dimes and nickels. Then he was summoned by Dr. Wilkniss to temporarily fill the large shoes that Walt Seelig had left behind in Christchurch. At first Ken turned him down, but then he realized that if he went south, he could escape Christmas in the States. That turned the tide, and old Ken will be in Christchurch for three months starting in late October..... *Joe Wubbold*, who must have set some kind of a record for most ballast carried around the waist by a Coast Guard captain, retired from the service this summer and is going to spend the coming year at the Scott Polar Research Institute in Cambridge. We understand he will be concentrating his efforts on Antarctic policies. .... *Linda Young* of Woodland Hills, California, is a writer preparing a series of educational children's stories designed to encourage and increase knowledge and under-

standing of the real world among young people. Her first book will be on Antarctica.... *Scott Miller*, one of the Boy Scout finalists for the 50th anniversary of Siple's selection, is picking up his PhD in entomology at Harvard this month, and has been chosen to be the director of the famed Bishop Museum in Hawaii. He is phenomenal, and as we congratulate him on his many achievements, we wish him and Pam the beat at the Bishop.... Speaking of Scouts, a lesser known Boy Scout is *Art Owen*, one of our newest members, who was on the Ronne Antarctic Research Expedition. Art had a career as a petroleum geologist working for both major and independent oil companies, with both domestic and international assignments. He's an avid mountaineer, and is now starting up a consulting practice ... *Captain Edwin MacDonald* is going to cruise up the Rhine from Holland to Germany in October, although presumably not in an icebreaker. Then the MacDonalds will spend the Christmas holidays in London.... *Al (BAE II) Lindsay* says that Halley's Comet was not a hoax, that he confirmed its presence with six sightings from Florida to Arizona. As one who made repeated fruitless efforts to see it last winter and spring, Bergy Bits questions the authenticity of Lindsay's sightings. One experiences certain hallucinations as one grows older, and Al must have been having one at the north foot of the Santa Catalinas where he reported he "saw it with a clear tail rising in gap on mountain skyline." The Lindseys held an all-hands family Halley Rally in Zapata, Texas, April 5-7, and when there were actual witnesses, it seemed they had difficulty seeing it!.... *J. Murray Mitchell* retired this summer from NOAA after a most illustrious government career. He reports that he seems to be doing fine after going through chemotherapy treatments last year. He has been walking around for the past sixteen years with a secret passion - not a stately blonde or a statuesque redhead, but a fervent desire to study the effects of the moon on our weather. Right now he is in the throes of building his own research laboratory in the back yard, and tells us that "there is gold in them thar hills" - referring to his future research ... *Billy-Ace Baker* wrote that he ran into Gus Shinn in a veterinarian's waiting room in Pensacola. There's a good name out of Antarctic polar aviation, being the pilot of QUE SERA SERA when that plane made the first landing at the South Pole back in 1956. Billy-Ace writes that a couple of former VXE6 pilots are his neighbors - LCDR Ed Feeney and LCDR Billy Blackwelder, both of whom are now retired ... In our January 1985 Newsletter, we mentioned the excellent sound track from the Japanese movie "Antarctica", featuring the creamy music of Vangelis, who produced the memorable score for "Chariots of Fire", It takes time for our Newsletters to get to Massachusetts, so Dr. Joel Mumford, medical officer at Palmer in 1972, discovered this piece of music on his own and is excited about it, writing, "It is just a smash. The record is by Polydor, Ltd. of Japan. I found the music absolutely enchanting ... very evocative of both the beauty and the danger of the ice. Even if the movie is a dog, it would be worth the price of admission just to hear the music." .... There's a new technical director at CRREL (Cold Regions Research and Engineering Laboratory) in Hanover, New Hampshire, and his name is *Ed Link*. Bergy Bits has known Ed for about six years, and he is a real good man. It was a great coup for that laboratory when they enticed him to come north. And he's a good guy, too.... Was *Bill Zinsmeister* born under some lucky star, or is he an indefatigable field worker with great eyesight? His 1982 finding of the jaw of a marsupial on Seymour Island may have been exceeded by his finding this summer of a 75-million-year old fossilized clam that measured more than five feet across on Ellesmere Island. The Toronto Globe and Mail quoted Zinsmeister as saying, "It would most probably have made one hell of a clam chowder. You could have eaten it for days." His cheek-to-cheek picture with the clam appeared in some stateside papers - Bill was the one with the smiling face. He had to "shell out" \$2,000 in air freight cost to bring back what may have been the world's biggest clam. After he gets through examining it, the clam goes back to Canada, to their Geological Survey... A Greenpeace environmental group announced in Auckland on 3 September that they are planning to land a four-man party on Ross Island in either December or January, and that they will remain there until early

1988 carrying out scientific research on fish population and body heat loss. The purpose behind their madness is to try to meet the requirements of the Antarctic Treaty by establishing a year-round station and carrying out a scientific program, thus giving them a say on the development of the continent.... Want a penguin brooch in oxidized and polished sterling silver, with an eighteen karat gold "bill" and a coral "eye"? It's waiting for you at Tiffany's, and it's only \$200..... The USGS is coming out with a 1:250,000 scale topographic map of Ross Island and Vicinity which is a dandy. Guy Guthridge refers to it as a "helicopter map". It can be bought by stateside residents from the USGS at Denver for \$5 which includes postage. Make check payable to the Department of the Interior and send it to Distribution Branch, USGS, Box 25286, Federal Center, Denver, CO 80225..... The next man at the Division of Polar Programs to retire will be Joe Bennett, Head of their Polar Coordination and Information Section. Joe is going out this fall . . . At the excellent General Session of DPP's 1986 Orientation the astute Phil Kyle, speaking from sixteen years of field experience, said that the quickest way to get a scheduled helicopter to arrive is to start making grilled cheese sandwiches. It has been proven foolproof; the chopper will appear on the horizon immediately. He said the best piece of equipment you can have in the field is a mirror... *Marty Pomerantz* said at the same session that the South Pole is the most "user unfriendly" place in the world. Imagine how good he is going to feel when he doesn't go there any longer. We understand that his retirement becomes effective this winter while he is sitting on, the South Pole.

**1987 ANTARCTIC CALENDARS.** As we have not seen either the USARP or the New Zealand Antarctic calendars for 1987, we are not able to tell you what they look like, although we can probably assume that the USARP calendar will be much the same as previous ones. The New Zealand Antarctic calendar will be somewhat different, as Betty and Colin Monteath have taken over the enterprise from Harry Keys and Karen Williams. They are using a larger format, and presumably bigger pictures are better. Although they have raised their price \$3.20 each, we are upping ours only \$1.50. However, we ordered only 100 - half the number we had last year - so if you want a New Zealand calendar, order early.

For the first time we are selling an Antarctic engagement calendar. This we have seen, and it's a beauty. But bear in mind it is not for hanging, but for your desk. It's 8.5 x 11.5 inches, printed on fine glossy stock with excellent photos by Bruno Zehnder. The prototype of this calendar won several design awards in 1985. This will be an annual calendar, featuring new photography, and a special section on current Antarctic science. We have ordered only 30 of these calendars, so if you want one, order early.

1987 USARP Antarctic Calendar	\$6.00
1987 New Zealand Antarctic Calendar	\$7.50
1987 Antarctic Engagement Calendar	\$9.00

**GROUND RULES FOR SOCIETY MEMBERS.**

1. When you move, send us your change of address, as bulk mail is neither forwarded nor returned.
2. When you get your bill, renew immediately for multiple years to help us out on paper work.
3. Send in items of interest and suggestions to the Nerve Center. We need material.
4. If you live in the Washington area, please support our lecture program. It's super!
5. If you have a prospective member, tell him/her that dues are \$7 local (within 50 miles of Washington); \$6 out-of-town; \$10 husband-wife; \$14 foreign. Give them our address.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

Vol. 86-87

October

No. 2

#### Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88

#### Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

#### Paul C. Daniels

#### Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Franke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986

Joint Dinner Meeting

THE ANTARCTICAN SOCIETY - THE EXPLORERS CLUB, WASHINGTON GROUP

STRUCTURE AND EVOLUTION OF THE ANTARCTIC CONTINENT:  
ONGOING AND FUTURE RESEARCH

by

Dr. Ian W.D. Dalziel

Senior Research Scientist  
Professor of Geological Sciences  
Institute for Geophysics  
The University of Texas, Austin

on

*Saturday evening, November 15, 1986*

Cash Bar - 6:15 PM : Dinner - 7:00 PM : Lecture - 7:40 PM

at

*The Cosmos Club*

*2121 Massachusetts Avenue, N.W.  
Washington, D.C.*

Dr. Dalziel has been active in Antarctica since 1968, and is currently serving on the National Science Foundation's Division of Polar Programs Advisory Committee. He obtained his PhD in 1963 from Edinburgh, and then joined the faculty at the University of Wisconsin. From 1967 to 1986 he was Associate, and then Professor and Chairman of the Department of Geological Sciences at Columbia University, and a Senior Staff Member at Lamont-Doherty Geological Observatory. In 1985, he joined the staff of the University of Texas at Austin. His main interests are in Cordilleran orogenic processes and tectonic evolution of southern oceans and continents, But don't let this scare you, as we understand that he will devote much of this talk to his thoughts about future Antarctic research.

*London Broil Dinner -- Reservations, \$24 per person, MUST be paid by November 12<sup>th</sup>!  
Make checks payable to THE EXPLORERS CLUB, WASHINGTON GROUP, and mail to:*

*Tony Meunier  
P.O. Box 2321  
Reston, VA 22090*

Hopefully, 1987 Antarctic calendars will be available at the meeting.

B E R G Y      B I T S

This column includes a potpourri of information and misinformation on Antarcticans and the Antarctic, and in no way should it be considered the Voice of the Antarctic Society. Our 536 total membership includes Antarcticans from the first Byrd Antarctic Expedition through present-day researchers, and our aim is to try to find something of interest for each segment of our Society. However, we would like to emphasize current activities, and implore young researchers to pass along their own bergy bits of information in order to make us more interesting and acceptable for the younger generation. If you find too much on the OAE's, just wait a few years; it won't take too long before you, too, will be one of us. Time does not stand still for mere mortals, even Antarcticans.

**CALENDAR CRISIS.** It is always hard to anticipate how you folks will support our sales program, and it appears that we have gone overboard again ordering the excellent 1987 New Zealand Antarctic calendars. We ordered the same number as we sold last year - 200 - but evidently you aren't buying calendars for this Christmas like you did last year. This calendar is just excellent, super, better than last year's, with a new sturdy envelope for mailing. So we implore all of you who have friends worth \$7.50 to buy them a Christmas calendar. You won't be disappointed, the recipient will be pleased, and Ruth and I will love you for taking us off the hook.

We aren't pushing the USARP calendar, because, first, we have not seen them, and second, we want to unload our New Zealand ones. However, for those confirmed USARP calendar fans who won't accept a substitute, we will have about 25 more than we have orders for to date. So if you want a USARP calendar, order right now! The engagement calendar sold better than we had anticipated, so we bought another thirty. We don't expect any problem selling them, and can get more quite easily, should we need them.

New Zealand Antarctic calendars	\$7.50
USARP Antarctic calendars	6.00
Antarctic Engagement calendars	9.00

Selling calendars is our only profit-making campaign, although our markup is ridiculously small, especially considering shipment costs from New Zealand. This will be the last year we will beg you to buy; next year we will temper our self-enthusiasm with a large dose of realism.

**AN ANTARCTICAN SOCIETY CHALLENGE.** At the end of Dr. Peter Wilkniss's (Director, Division of Polar Programs, NSF) presentation last spring to a joint meeting of the Antarctic Society and The Explorers Club-Washington Group, he challenged both bodies to help the Government resolve the vexing problem raised by the increasing number of private expeditions to Antarctica. It turned out that Peter was serious, wanted help, and wasn't just patronizing the two organizations. Towards that end, each group came up with a task force, and Bergy Bits felt that all of you in the tri-world outside of Washington should know about our committee so that you can add your own two cents worth, should you be so moved.

Dr. Eugene Campbell is chairman of our group. He's a retired Department of State

employee who has been to Antarctica with Society Expeditions, so knows a bit about Antarctica from the tourist side. Another retired State Department employee on our committee is Bill Littlewood, whose Antarctic connection and interests go back to before the IGY. A third member is Gerry Schatz, former editor of the National Academy of Sciences' NEWS REPORT, now a consultant. A fourth member is Walt Seelig, a local professional/pleasure fisherperson, who once had to deal directly with adventurers when he served in New Zealand as the NSF Antarctic representative. And the fifth member is a pacifist-type person, walking the tight wire between retirement and part-time Antarctic employment, Ken Moulton. They have met several times, have come up with a rough draft, and want to finalize their product sometime this winter. It's a good committee, they are dedicated, and as long as Gerry Schatz is on the committee, something is going to be said. Our president, Bob Dodson, another State Department employee, sits in on most of their discussions, although he is not a working member.

There was some thought of asking out-of-towners to serve, but that presented meeting attendance problems. Many of you have some pretty definite ideas about adventurers, and Bergy Bits thinks you should address your thoughts in writing to Dr. Eugene P. Campbell, 4701 Willard Avenue #1206, Chevy Chase, Maryland 20815. Although we understand that David Lexis is currently in Leningrad trying to make arrangements for sailing north of Siberia, he should write us with some of the comments he had previously expressed privately to Bergy Bits. Not only is David a polar adventurer; so is his son who sailed into Antarctic waters last year. Another person who should write Dr. Campbell is C. Vernon Cooper, as he is very close to going to Antarctica with the Argentines. He's a world traveler, an avid mountaineer, and a respectable person in the business world who should have a say from the adventurer's side. Bergy Bits would also like to see an input from Dotte Larsen, the Society's Whale Spotteress. She has been to Antarctica at least five times with Lindblad, but she should not be classified as a tourist. She probably is as conservation-minded as anyone in the Society, and truly loves the continent and wants to see it preserved in its pristine beauty. She is also smart - she summers in Maine - and she should be heard. A fourth member who should write, as he was one of the very first of the Antarctic adventurers, is Nick Clinch, who led the very first mountain-climbing expedition into Antarctica, 1966-67. Everyone wants to climb in Antarctica now, and Mt. Erebus could become another Mt. Washington with people all over it like flies. Nick's views would also reflect another segment of our Society, as I believe he was/is an executive secretary of the Sierra Club. One of Admiral Byrd's old dog-team drivers, Norman Vaughan, wanted to be part of a dog-team adventure to the South Pole. But I presume this may have been part of a short-lived fantasy, and that it has been scrubbed as he approaches 80 years. However, if Norman should want to speak up in behalf of dog-team leaders - there are many pawing on the ground wanting to take their dog teams south - he should write. Bergy Bits presumes there are others out there who might want to be, heard on the pro or con side, and they, too, are encouraged to write to Dr. Campbell. But don't procrastinate as he is a doer; if you wait until after Christmas, you might go unheard.

**MORE ON ADVENTURERS.** The problem with adventurers in Antarctica is that they are probably going to inadvertently upset some scientific apple carts, even though this was the farthest thing from their minds when they cooked up their schemes. To get the Antarctic scientist into the field and to support him/her requires a lot of logistical planning, especially flight requirements. If planes have to be diverted for rescue missions, if fuel has to be given to some lame-brained adventurer, then it all comes at a cost to science. Presumably every scientist's proposed work has been judged by his peers as essential to the understanding of what goes on in Antarctica, and the scientists themselves are giving time away from their univer-

sities or laboratories hoping to contribute to global knowledge of the polar regions, time and support are critical to them.

No one denies that adventurers have a right to go to Antarctica, but the problem is how to deal with them in emergencies. You can tell a Transglobe expedition that you can't supply them with fuel when they reach the South Pole, but in the end that expedition had - and used - governmental clout to get what they wanted. And that long-stemmed, aging American beauty aviatrix who flew around the world by both poles several years ago supposedly had the right White House connections to get fuel at McMurdo. That's the real world, who you know!

There was a lesson learned - but shortly forgotten - on the lower slopes of Mt. Erebus in 1979. The world is full of people with money they don't know what to do with, who are just waiting to go to some place where their neighbors have not been. The big Antarctic adventure this summer is the recreation of Amundsen's trek to the South Pole - this being the 75th anniversary. A comely blonde glaciologist, a supporting scientist, two dog-team drivers, and 28 dogs will presumably race to the South Pole with 5,000 sets of five commemorative covers to be cancelled on the anniversary date of Amundsen's arrival, December 14th. The support ship for the expedition, a 54-meter long, 34-year old ice-strengthened ship named the AURORA, will also supposedly be making three separate voyages of several weeks each from New Zealand to North Victoria Land, transporting tourists and mountain climbers. This is high adventure on a large scale, and the stamp cancellations will pay all their debts.

On the other end of the scale there is a character from Vermont, plus two others, who are going to row a 28-foot self-righting Swampscot dory from Punta Arenas to King George Island, and then go on to Hughes Bay on the west coast of the Antarctic Peninsula. They are figuring on twenty days from Punta Arenas to King George, where they will rest for a few days before proceeding on to Hughes Bay.

Other adventuring plans include a transantarctic flight of a single-engine Piper Malibu from Marambio (Seymour Island) to McMurdo and then on to New Zealand; a commemorative flight with descendants of Captain Scott and Amundsen to the South Pole by a twin-engine Otter aircraft, flying from Punta Arenas to the South Pole via King George Island, Adelaide Island, the Ellsworth Mountains, and the Whitmore Mountains. They want to arrive at the Pole on the anniversary of Captain Scott's party arrival, January 17th . . . . . Mountaineers will again be climbing Vinson Massif, and seven Austrians, under Bruno Klausbruckner, will be climbing 13,600-foot Mt. Minto in the Admiralty Mountains . . . . . And then there is Greenpeace, who again will be trying to establish a year-round base on Ross Island. It's going to be a busy old austral summer, both for scientists and adventurers.

**OZONE HOLE ATTRACTS ATTENTION.** Dr. James Margitan of NASA, speaking before members of the Society and of the Polar Research Board on October 17, said that the ozone layer would be about an eighth of an inch thick if it were all compressed into one layer. Undoubtedly more will be written in the next five years on that eighth of an inch than on all the other combined strata of Antarctica, as ozone depletion has captured the attention of scientists, industrialists, and the public. The May issue of this Newsletter reported that a 13-person National Ozone Experiment (NOE) team was going into McMurdo on Winfly to study the ozone problem, and we told you what each group (NOAA's Aeronomy Lab, University of Wyoming, Jet Propulsion Laboratory, and the State University of New York at Stony Brook) would be doing. An entire issue of a scientific journal in November will be devoted to the Antarctic ozone, although it will not include the ongoing research at McMurdo.

In mid-October, Jack Renirie of the National Science Foundation set up a press conference in Washington where reporters could ask the investigating scientists on the

ice just what they had or had not discovered. This was a major media event, with ten cameras aimed at Renirie's balding head, obviously a glowing target for ultraviolet rays should the ozone hole spread northward to the Chesapeake. Dr. Susan Solomon of NOAA acted as spokesperson for the scientists at McMurdo, and read a prepared statement which was handed out to about a hundred persons attending the news conference. Then Dr. Solomon and her cohorts entertained questions - nineteen - from the investigative reporters. Afterwards Dr. Margitan interpreted some of Dr. Solomon's answers in laymen's terms.

The ozone hole appeared on schedule in September, and a decrease in total ozone of about 40 percent, the same as last year, was observed. As in previous years, the hole did not remain stationary, and observers were able to take observations both inside and outside the hole. The hole will probably exist into November, and the scientists will remain in Antarctica taking measurements until its disappearance. Much of their data requires the use of sophisticated computers at their home institutions, so nothing more definitive is expected before their analyses are done here in the States this winter. A press release from NSF on October 20 summed it all up in three sentences. "The scientists said, 'At present we have not conclusively established the cause of the ozone hole. However, we have strong evidence against theories that upward winds or high solar activity caused the depletion. We suspect a chemical process is fundamentally responsible for the formation of the hole'."

The ozone problem is predestined to draw more and more attention, as society would change drastically if the Antarctic observations were a first sign of the occurrence of a catastrophic deterioration of the atmosphere. According to an analysis of 65 years of data from a monitoring station in Switzerland, there has been about a three-percent loss in ozone since 1920. There is also evidence of an ozone depletion in the Arctic. Major producers of chlorofluorocarbons have recently announced, through an industry coalition, its support for steps to limit the number and size of plants producing the chemical. DuPont has gone one step further, backing an overall limit on production, and suggesting that a safer substitute could be available within five years.

This is the first time that the Antarctic has really struck home. Even though the man/woman on the street has applauded Bill Cassidy finding all those meteorites, Bill Zinsmeister finding marsupial fossils, and condoned Phil Kyle setting up annual summer quarters on the upper reaches of Mt. Erebus, he/she has never really lost any sleep over any of those activities, as they never affected his/her life-style. But if the ozone depletion is a harbinger of his/her having to give up air conditioning in automobiles, then it becomes a major catastrophe affecting their daily lives.

There is a flip side to the coin - Congress will continue to fund Antarctic research handsomely as long as it is the center of possible global implications. One immediate fallout has been the fast production and publication of the Nimbus-7 total ozone measurements maps, which are now available to researchers in days rather than seasons - (although why aren't they printed with the prime meridian to the top?) These appeared on national TV following the NSF press conference.

Another flip side comment is that it could not be occurring in a better place at a more opportune time. The total population under the hole probably does not exceed 500 at the time of its greatest depletion, and when any of the 500 may venture outside, it is still cold enough so that they are parka'd out of the realm of getting skin cancer. So if the Almighty has to create ozone depletion, he picked a good place and a good time to have one, and Antarctic research dollars only stand to gain. And, hopefully, it was all discovered early enough so that preventative action can be taken so it won't be catastrophic.

**ANTARCTIC STAMPS.** Bob de Violini, past president of the American Society of Polar Philatelists, is out on the street soliciting - he feels that the U.S. Postal Service should come up with a companion set of polar stamps on Antarctic explorers to match the fine set of Arctic stamps issued earlier this year. It would be interesting to take a vote within our membership to see who would be proposed as possible candidates, I presume Admiral Byrd would be on everyone's list, that Paul Siple would be on many lists, that there would be some support for Charles Wilkes. We certainly don't want to hasten the demise of Jackie Ronne and Jennie Darlington, but as the first two American women to winter over, they would merit consideration on a broad stamp. By that Bergy Bits means that we shouldn't put them too close together, that there should be space enough so that each could be appreciated for her own beauty. Or whatever! But on to old de Violini:

Members of the Antartic Society should make themselves known to the Citizens Stamp Advisory Committee, the group that passes on all the proposed stamp topics and designs, with suggestions for a similar block of four stamps for explorers of the Antarctic.

Some of the names that come to mind include Nathaniel Palmer, Charles Wilkes, Lincoln Ellsworth, Richard E. Byrd, and Finn Ronne. And there are a number of others who could be properly commemorated on such a set of stamps.

I suggest that each of you who want to see Antarctic exploration honored in a manner equal to that of the recent Arctic exploration issues write a letter to that effect, giving some suggestions of who should be on the stamps, and why.

But make your letter not more than two pages long, and to the point -they won't want to read dozens of pages of your commentary. Send your letter to the Citizens Stamp Advisory Committee, % Stamp Development Branch, U. S. Postal Service, 475 L'Enfant Plaza, S.W., Washington, DC 20260.

A large number of individually-written letters are more impressive to this group than either a flood of postal cards with identical wording or a folder of petitions sent to the Committee. So use your own words to express your ideas on this subject.

It may well develop that the CSAC will listen, and we will see the Antarctic getting noticed in 1989 or 1990. It is not too early to start writing them on this subject.

**MORE ANTARCTIC BOOK DEALERS.** We evidently did a poor job of listing polar book dealers, as new ones keep coming to our attention. Dr. Warren Zapol recently returned home from Paris to Harvard Medical School and Mass. General Hospital, and he writes:

I would like to suggest you add these two delightful sources to your list of European book shops carrying used Antarctic books. I have dealt with both of them in 1986.

Francis Edwards	Librarie Jean Polak
The Clocktower Bookshop	Marine et Voyages
The Pavement	8 Rue de L'Echaude
Hay-on-Wye	75006 Paris
via Hereford HR3 5BU	France
England	

Warren thinks that Edwards is the best shop in England, and writes that they carry

many U.S. and U.K. volumes. As to Polak, he says that it is "by far the best bookshop in France. Jean Polak is an honest expert on all French polar editions, and he has the best collection of J. Charcot volumes and a rare Dumont d'Urville." Many thanks, Warren.

Then a Cathy Lilburne found us through Art Ford, and she writes that they (Antipodean) publish four catalogs a year and have quite a collection of Antarctic books, as they "specialize in Australia, Antarctica, the South Pacific, books, maps, prints, photos, ephemera, everything." Their address:

Antipodean  
P.O. Box 189  
Cold Spring, New York 10516  
Tel. (914) 424-3867

Their Catalogue 16 is most unique, as the cover is a photo of their new grandson born in Perth last November! Antipodean looks like more than just a Ma and Pa operation, as there are other Lilburnes operating subsidiary outlets in such faraway places as Art Cellars in Subiaco, Washington.

**OLD ICE PROFESSOR WANTS US ALL TO HELP HIM WRITE HIS NEXT BOOK.** Bob Feeney, who roamed around McMurdo, Hallett, and Crozier for six years between 1964 and 1971, is about to write another book. (His *Professor on the Ice*, published in 1975, has recently been translated into Japanese and published by the University of Hokkaido Press.) The new writing venture is currently titleless, but "the subject matter is food, nutrition, and health in cool living." He is trying to synthesize into one production three of his major interests: his 22-years experiences in the southern and northern polar areas, his hobby of collecting and reading books on polar exploration, and some knowledge of foods and nutrition. He finds there are many interesting and intriguing relationships and episodes which ought to be consolidated for the general public's reading. So now he is asking all of you to draw on your vast experiences and to share with him any advice, help, or information you may have. In particular, he would be interested in descriptions of either malnutrition or diseases (mental or physical) attributable to polar exploration and working conditions. He feels that we are hoarding a wealth of information in our memory banks, and, if we will only release some good stuff to him, he will duly cite us and give proper credits He will even consider a paragraph or two in our own words! These should be sent to:

Dr. Robert E. Feeney  
Department of Food Science and Technology  
1430 Chemistry Annex  
University of California, Davis  
Davis, California 95616

Bob sent along an outline of his new book. There will be eight chapters, including nearly everything from both polar regions, except a chapter on sex, although maybe that falls under chapter eight entitled "Sports". Considering the number of Antarctic pregnancies, one cannot very well say that Antarctica is a sterile desert, or that food is spiked with excessive saltpeter.

**RALPH LENTON, BRITISH OAE AND FORMER SOCIETY OFFICER, SUCCUMBS.** Ralph Lenton, age 63 died in a Montreal hospital the night of October 15, 1986, ending the career of a dearly beloved Antarctic who once held the record for most Antarctic winters, spending seven on the ice in the ten-year span, 1948-1957. He was London born, went to a private school outside of town, and thence directly into the service. Much of his service

in World War II was in the North Atlantic, where he was a radio operator in the Fleet Air Arm. In the 1942-43 time frame, while quaffing a malt in a Yarmouth, Nova Scotia pub with a friendly Canadian, he was invited home for dinner. It turned out to be a most rewarding dinner, as the Canadian had a ten-year old daughter who was fascinated by her father's house guest, and she volunteered to be his pen pal. Fifteen years later, this same girl went to England on vacation, looked up her friend from the past, and it wasn't long before Helen and Ralph married. Bergy Bits knew they were officially married, because he had the honor of standing up for the two, as well as having the nearly impossible task of getting them to leave their wedding reception so their guest could go home and go to bed.

Ralph could do anything, although his main forte in Antarctica was as a radio operator. He was a master craftsman and built a couple of the Falkland Island Dependency stations (FIDS). He also was an excellent cook, and Bunny Fuchs wrote glowingly of a great mid-winter dinner that Ralph came up with at Shackleton. And he also served as base leader at two of the FIDS stations. Chronologically he was at Signy in 1948, Admiralty Bay in 1949, Deception in 1951, Port Lockroy in 1952, Argentine Island in 1954, and Shackleton in 1956 and 1957. The piece de resistance for Ralph was the opportunity of being included in Bunny Fuchs' British Commonwealth Transantarctic Expedition, doing yeoman work on that famous expedition. Ralph loved the Antarctic and loved to talk about it. When the TAE arrived at the South Pole in January 1958, Ralph could always be found in the galley drinking coffee and talking about the crossing. At that time, the media was trying their very best to create a mountain out of a molehill because of Ed Hillary's decision to continue on into the South Pole laying out support depots for the TAE. Ed's radio operator, the late Peter Mulgrew, had remained at the Pole as sort of a goodwill ambassador from New Zealand. Peter and Ralph were rather disgusted with the press, for they had handled all messages, and knew there were no bad feelings between Hillary and Fuchs. It is hard to believe that both are now gone, Peter having lost his life on the ill-fated DC-10 crash on Ross Island, November 29, 1979.

Ralph changed hemispheres after marrying Helen, although he remained a polar man, bringing his expertise to the Arctic Institute of North America. He frequently went to the Arctic, occasionally to the Antarctic. He almost became chopped hamburger for a beautiful, immense white polar bear; he was away from his tent in the Arctic when he had this sixth-sense feeling that there was someone behind him. He turned around and found this polar bear sizing him up as to where to take the first bite. Ralph was almost petrified, because the bear was between him and the tent where he had a rifle, and the only thing he had with him was his camera. He threw the camera at the bear to distract him/her and made an end run for the tent, got the rifle, and dropped the bear with one shot. Said bear was to become a conversation-piece rug for the Lentons.

Ralph had a heart problem, and retired to Canada in the early 1970's. There are three Lenton sons, and one, Anthony, may be following in his father's footsteps, as he worked for the U.S. contractor at Siple Station last summer, and is supposed to go back again next month. The Brits have an annual black-tie Antarctic gathering each year, and it pleased Ralph a great deal that he could take Anthony with him this year, Ralph wrote Bergy Bits at the end of February that "My cardiologist wants to start on my arrhythmia problem within the next month. He considers my congestive heart failure problem well controlled so that I can move ahead. I do not know what it will all mean, but I do know I have to be under close control at the outset because of possible side effects of the particular drug they will be using .... It sounds somewhat experimental and I don't mind helping if it is going to help others eventually. I have complete confidence in my doctor's abilities as he is a dedicated man at the top of his profession." What got him in the end was a staph infection which went through his blood system and attacked the liver. Ralph was quite a guy, a nice fellow, one whom

everyone couldn't help loving. He is going to be missed. He was treasurer of our Society for several years, and on its Board of Directors for many years. Lenton Bluff, 79°00'S, 28°13'W, and Lenton Point, 60°44'S, 45°37'W, immortalize his Antarctic presence. Helen's address is:

558 White Crescent  
Greenfield Park, PQ, J4V 1G1  
Canada

The family requests that donations in Ralph's memory should be to the Fonds du Dr. Rouleau Insuffisance Cardiaque, Hospital du Sacre Coeur-Montreal, 5400 Gouin 0. Blvd., Montreal, Quebec, Canada.

**CHRIS JOYNER BECOMES SENIOR RESEARCH FELLOW AT WHOI.** One of our Board of Directors. Dr. Christopher C. Joyner, has taken a leave of absence from George Washington University through August 1987 to be a Senior Research Fellow in residence at the Woods Hole Oceanographic Institution. Bergy Bits doubts if he will ever be happy again in Foggy Bottom after being at Woods Hole for a year. But let's let Chris tell us what he is doing on the Cape:

My primary ambition during this time is to complete work on a study which comprehensively analyzes and assesses the important ramifications for Antarctica and the Southern Ocean posed by the 1982 Convention on the Law of the Sea. It is a formidable challenge, but hopefully this time next year I shall be able to say that in the past tense. I should also add that along the way I am involved in four other Antarctic/Southern Ocean-related studies, the published versions of which I shall forward to you when they become available. One last tidbit worth mentioning is a co-edited volume I am producing with Sudhir Chopra, an environmental lawyer from India. The book is entitled *The Antarctic Legal Regime*, and will be published in 1987 by Martinus Nijhoff in the Netherlands. Fourteen contributors, including friends of the Society such as Lee Kimball and Jim Barnes, will explore legal aspects of Antarctica ranging from the newly evolving minerals regime, offshore maritime jurisdictional zones, and possible implications for private criminal law, to the need for environmental monitoring and appraisals of resource allocations throughout the Southern Ocean. This anthology should be available by late spring next year. So, what all this boils down to is the fact that I am still very much preoccupied these days with Antarctic concerns, particularly as set within the context of international law.

**ICE CHIPS.** *Mike Kuhn*, of the University of Innsbruck, a disciple of the late Herfried Hoinkes, who has spent considerable time in Antarctica as a glacial meteorologist, reports that he has had a difficult year since "I got a rather aggressive form of cancer. They removed one ear and several other parts, and after each operation told me I was ok now. I feel quite well now, and I have learned to rely on love and faith more than anything else." Mike is currently involved in planning European glaciological research in the polar regions, meanwhile wondering if he ever will get back down south. Mike wintered over at Plateau in 1967, and appeared in the NSF science film on Antarctica taking radiation measurements away from camp at the South Pole. Mike is planning to bring bride Barbara with him to the IUGG meetings in Vancouver next August, then visiting the East Coast..... *Tom Henderson* has a piece of bad news concerning Jon Sorensen who participated in the Ross Ice Shelf Project as a surveyor and who wintered over at the South Pole in 1975. Jon, who is only 38, has a rare form of lung cancer. He is a former employee of the USGS, and now lives in southern Colorado (we don't have his address). The Society

joins Tom in his best wishes and prayers for Jon ..... Congratulations to *Priscilla Grew*, who will become Director of the Minnesota Geological Survey, and Professor, Department of Geology and Geophysics at the University of Minnesota on November 1, 1986. Priscilla is the remote wife of Antarctic Ed Grew of the University of Maine in Orono, and for the past six years has been a Commissioner in the California Public Utilities Commission. She was a protegee of former Governor Jerry Brown, and is a global woman who travels extensively in search of/with Ed. Their Christmas letters are outstanding ..... *Walter Dodd* became owner and publisher of the *Corning, California Daily Observer* on July 1, 1986. Walter retired from NSF several years ago from the Public Affairs and Congressional Liaison Office. He escorted members of the press and Congress to Antarctica during the austral summers of 1966, '67, '72, and '73. There once was a rumor that he might succeed August Howard publishing the *Polar Times*, but it looks like Walter is now well settled on California's Interstate 5 in the north Sacramento River Valley..... *Charles Neider's* long-awaited Antarctic novel, *Overflight*, will finally be published - November 17th. Look for it in your favorite bookstore ..... And that well-known Antarctic pilot of yore, *Moe Morris*, is pleased to announce that *Presidio Press* has published in hard cover his Antarctic novel, *Alpha Bug*. Meanwhile, he is doing a major rewrite on another Antarctic novel, *The Icemen*. His publisher wants him to put it into the present time scale, not DF 66, .... *D. Harold Byrd*, 86, a cousin of the late Admiral Richard E. Byrd, died at home in Dallas, Texas on September 14th. He was a co-founder of the Civil Air Patrol, and made his fortunes in Texas oilfields. A geologist by training, he used his oil profits to build a financial empire that included recreational facilities, manufacturing, real estate, commercial and industrial ventures, and farming enterprises. He also helped finance the exploration of Antarctica - the Antarctic range known as the *Harold Byrd Mountains* was named in his honor. We should have had him as a benefactor to the Society! .... Mountaineer *Nick Clinch*, and his daughter, *Lee*, did some backpacking this summer, including *Shasta*. He also climbed in the Cascades with *Tom Hornbein*, and did some climbing in the Tetons. Nick and his wife, *Betsy*, are doing a "book on a remarkable English couple, the *Littledales*, who explored Central Asia in the 1890's. -We made a one-week trip to England and tracked down various sources, including finding the diary of a *Wal Fletcher* who was with them on a remarkable trip through northern Tibet. *Betsy* also went back for another week's visit to England and found even more sources. Your first bibliography is like your first expedition. If you knew what you were getting into, you wouldn't do it." There is only one trouble with getting a letter from a guy like *Nick*; it makes you feel so darn insignificant, and your skin turns so green with envy that you can't even scrub it off with steel wool. . . *Kristine Annexstad* is going to be married this Christmas to a non-Antarctican. She and *John* formed the first father-daughter team to work in Antarctica when they were a meteorite-searching team under *Bill Cassidy*. *John* is teaching geological and geophysical courses in the Division of Science and Mathematics at *Bemidji State University* in *Bemidji, Minnesota*. Meanwhile, he will sell you his old home in *Dickinson, Texas*, real cheap! .... As we go to press, *Office of Naval Research* is celebrating its 40th anniversary. And they did all this in spite of having *Ron McGregor* in their ranks for so many years!

**WRAP-UP.** Eighty percent of our membership has renewed; forty percent have already renewed for next year. Great! Those who owe dues for this year will find a notice with this mailing. We would *greatly appreciate* it if those who are not renewing would let us know. That will really help *Ruth* and me. Remember, should you move, we need your new address, as bulk mail is neither forwarded nor returned. And one more sales pitch for the 1987 New Zealand Antarctic calendar - only \$7.50 and it's a dandy!

MAKE YOUR RESERVATION NOW FOR THE NOVEMBER 15th DINNER MEETING!

# THE ANTARCTIC SOCIETY

ARLINGTON, VIRGINIA 22205

Vol. 86-87

December

No. 3

## Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88

## Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

## Paul C. Daniels

### Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986

SOUVENIR NON-NEWSLETTER FOR 30th ANNIVERSARY  
OF ANTARCTIC IGY PROGRAMS

## AN ANTARCTIC ADVENTURE:

Thirty Years of Inspiration

by

Dr. Richard L. Chappell

Professor, Biological Sciences Department  
Hunter College, City University of New York  
and

Research Scientist, Marine Biological Laboratory  
Woods Hole, Massachusetts

on

Friday evening, January 30, 1987

8 PM

National Science Foundation  
18th and G Streets N.W.

Room 543

- Light Refreshments -

Dick Chappell, Eagle Scout, was the youngest person in the Antarctic during the IGY, arriving pure as the driven snow, leaving relatively unscathed and still pure. No matter how hard an Antarctic Boy Scout works, no matter how brilliant he may be, no matter how old he may grow, to Antarcticans he will always be "the Boy Scout." But he was and is outstanding! (see page 15). Mark your calendar now, and set aside January 30th for a MUST meeting!

*This is the 30th anniversary of IGY Antarcticans starting their scientific programs on the ice, and it has been decided to have an Antarctic IGY breakfast/luncheon on Saturday, January 31st at Evans Farm Inn, McLean, Virginia. IGYers and their families interested in attending should contact Ruth Siple, 703-522-2905.*

B E R G Y      B I T S

This Newsletter, sic, is being written in mid-November, as Bergy Bits will be out of the country in December and did not want to drop the whole ball in Ruth Siple's lap at the holiday season. We are also taking the liberty of changing the format for this one special issue. This fall is the 30th anniversary of IGY personnel leaving for the Antarctic, and we wanted to do updates on some of the more prominent people from the 1957-58 era. As Antarctica does not have the conventional doctor, lawyer, Indian chief, we settled for a pilot, a Jesuit, an Eagle Scout, a spelunker, a knight, and a non-bossing leader. Bergy Bits looks at these people from a very prejudiced point of view, so if you don't have an interest in Antarctic history or an ounce of nostalgic blood in your vein, file this in the circular file, and go back to your latest issue of the Wall Street Journal. Our thanks for buying most of those calendars - we appreciate that. If you are one of the fifty-odd who have not paid your dues, the enclosed notice is your last chance ---there's no charity in the Nerve Center, even at Christmas!

**IGY LEADERS.** The IGY brought a strange collection of bedfellows together, especially in 1957. It wouldn't be far from the truth to say that the sixty-nine people who wintered over in 1957 constituted a motley crew. There were some bona fide polar scientists, a few Antarctic veterans, but the run-of-the-mill were a conglomeration of graduate students, adventurers, and misfits who were hard to distinguish one from another. The chief scientist was the top scientist in the old tightfisted Weather Bureau, Dr. Harry Wexler. Harry was very personable but he really wasn't a man of the ice and snow and cold, and was totally miscast in the Antarctic environment. A saving grace was his deputy, Bert Crary, who was something like a humanized polar bear, except deep down he had the heart of a soft teddy bear. Bert was as much at home in the polar regions as Harry was lost there. At the South Pole stood the late Paul Siple, the last bastion in the Antarctic supporting the late Admiral Richard E. Byrd. Paul had more total Antarctic experience than all the rest combined, and through some peculiar quirk of events ended up as the right man in the right place at the right time. Someone must have goofed, as things aren't supposed to work out in a logical way. Of all the IGY leaders, there is no question that Paul was the best of the lot in amalgamating the scientists and the Navy men into an integrated, harmonious whole. Over at Ellsworth Station, Finn Ronne uneasily wore two hats simultaneously, that of the station scientific leader and that of naval commander. He was the only boss in Antarctica wearing the Sherlock Holmes two-pronged hat by dint of his once being a former Antarctic expedition leader and also an officer in the US Navy. Wilkes Station had the third Antarctic veteran, Carl Eklund, who was tremendously popular with his men, a bon vivant in real life who never changed colors in the Antarctic. Byrd Station had an experienced Arctic man, George Toney, whose biggest responsibility was how to divide up two cases of beer for the whole camp for the whole winter. He handled it superbly, no one killed anyone, but there sure was a bunch of sodden drunks the first night after leaving Byrd, at Little America! Over at Hallett was Jim Shear, a good-time Charlie, an impeccable dresser, who really did not belong in Antarctica, but he had a lot of company in that regard. The aforementioned Bert Crary was the ward leader at Little America V, but more on Bert will

follow. It is hard now to believe that Siple is gone, Eklund is gone, Shear is gone, Ronne is gone. That's not a very good record. Finn was the only one of the four who lived to see 60 - he lived to be 80, Shades of Shackleton.

**TAPS.** Many of the rest have gone, too. One of the very first was Bob Johns, a meteorologist at Byrd in 1957, who was probably the first black to winter over for the U.S., if not for any nation. No sooner had Bob arrived back in the States than he learned that the Weather Bureau wanted him to take this Arctic position on a floating ice island. He accepted, went directly there, came down with pneumonia, and died shortly thereafter..... Another man who went in a hurry, was Bill Cumbie, a crew man on Gus Shinn's immortal first flight to the South Pole. While at Little America V in 1957, Bill was involved in several aircraft accidents, believe it was seven. After a particularly harrowing one in which an engine cut out on takeoff, swerving a wing tip into the snow, the pilot counteracted by cutting off the other engine, and at the same time the first engine came back, flipping the other wing into the snow. The net result was the plane became airborne with both wing tips torn off! So Bill said that was enough, they could take their old flight "skins" (pay), he wasn't going to fly any more. He came on back to the States, and was killed on the highway within a month. .... One of the most promising of all Antarctic IGY scientists was Ed Thiel. He was truly destined for stardom, a la Charlie Bentley, but he lost his life at Wilkes Station on November 9, 1961, when a twin-engine Neptune crashed on takeoff, killing Ed and four crewmen. What a terrible accident, and what losses for this country..... Jack Tuck, who wintered over at McMurdo in 1956 and was Naval leader at the South Pole in 1957, lost his life in a tragic accident at home, when a rifle he was cleaning accidentally discharged. He survived a couple of days, but that was it..... A lot of the meteorologists have succumbed, including the senior meteorological observer at Little America V in 1957, Ben Harlin. Ben was all business during the year, took his job very seriously, no horseplaying in camp. He was just a quiet, overweight, hard-working bachelor of about forty years who, throughout the winter, sent the exact same love messages simultaneously to two women in Kentucky and Florida. His intent was to visit both after he got home, then decide on which one he should marry. His master plan failed, as he was so charged up after a year on the ice that as soon as he saw the one in Kentucky, he up and married her. Ben died about ten years ago in Arizona. .... Other meteorologists who have departed are Wes Morris - believe he was hit and killed by a speeding motorist while changing a tire; Gerry Fierle; Norm Helfert; then last summer, Gene Harter; and last, but by no means least, Herfried Hoinkes, glacial meteorologist at Little America V, from the University of Innsbruck in Austria, who died about ten years ago. Herfried appreciated the good life, had a lovely frau, and a nice family. He died much too early, but his spirit lives on in Mike Kuhn, one of his better students who also experienced the thrill and happiness of doing science in Antarctica..... A more recent loss was Dave Canham, the very professional and dearly loved commander at McMurdo, whose men were responsible for building the stations at McMurdo Sound and the South Pole, who died February 5, 1986. He was practically worshipped by all the men who served under him, a tightly knit group which forms an integral part of this Society.

**SANDCRABS.** IGY personnel in the Antarctic were affectionately called "sandcrabs" by their Navy counterparts, a form of endearment fostered by a difference in pay scale, enhanced by an obligation to support them whenever they asked for it. Sandcrabs came from everywhere, some were really well qualified, some were taken in off the streets. In Bergy Bits' case, there was no other applicant in micrometeorology, and by dint of having taken the only course in the history of MIT entitled "Micrometeorological Instrumentation", he found himself eminently qualified. The discipline glaciology

was a near vacuum, with Dick Cameron being the only one who was truly qualified. They did have one other hot one lined up, but the head shrinker refused to pass him for Antarctic service. So anyone on the street who looked like they had enough muscles to shovel quantities of snow, and had sense enough not to get frostbitten, were enlisted as glaciologists and sent to Greenland for a short wonder course on glaciology. One was picked off a ship in Baltimore, sent to Canada where he had a valid visa, and then brought into this country. Supposedly one had a colonel father who was a personal friend of an ex-five-star general who was then living at 1600 Pennsylvania Avenue. Another, brought in from a foreign country, immediately found peace and happiness in the United States. Arriving in New York, and not speaking English very well, he was directed by the pilot to get a room at the YMCA in New York City, Sloan House; going to his room, he discovered a very receptive maid making up his bed, one who could talk in his native tongue, and within minutes he had established a meaningful liaison. He swore he would never go back home again, and he hasn't! Another character was the head of Weather Central, Bill Moreland. He never should have left Washington, but Harry Wexler was a pretty convincing talker, and he talked Bill - who was in his car pool - into going to Antarctica. Only his outer body was at Little America, as he ran Weather Central like a stateside office with ten-minute coffee breaks. When Bill was asked at the end of four sunless months if he was going outside to witness raising the camp flag for summer, his reply was, "Why should I? I never took it down." Bill went all that distance never to step outside once during the winter night! I was amazed later on to find out that Bill was actually a human being, as our paths have crossed several times at meetings, and the guy is actually not a jerk at all here in the States. The above sort of gives you a taste of what the camp leaders had to lead.

Probably the biggest problem in the Antarctic during the IGY was the feeling the Navy had for sandcrabs, who, for the most part, remained insensitive to Navy feelings. Naturally it varied from camp to camp. Siple and Jack Tuck were able to defuse everything at the South Pole by putting everyone onto K.P. and snow melter detail, and there was no real class distinction. On the other hand, life at Ellsworth was a continual uproar all winter with Crary getting frequent calls on the radio asking how to arbitrate problems. No matter how serious any problem was, Bert could always find the comical side to it. Once at Little America, the Navy leader, a Captain Bill Dickey - wishing for a star which never came - approached Crary one morning and said, "Bert, my men are upset because they are pulling KP and your men aren't. I support their complaint and want to know what you are going to do about it." Bert drawled, "I think your men have a just complaint, Willie. Tell you what we will do; you and I will do KP tomorrow, and then we will work our way right down through the rank and file." That ended that horse, and Willie's 95 men continued to support the 13 sandcrabs! We can't end this paragraph without paying due respect to the late Carl O. Wyman, a retired Marine Corps colonel who went to Antarctica in 1957 because he just didn't have anything else to do. They found a job for him, helping a young Dane run the ionosphere program, but in reality Carl found a much more meaningful and enjoyable job around camp, baiting the Navy. He carried this out to near perfection, highlighted by getting snookered one evening with a Navy chief photographer mate and getting into some mischief. Captain Dickey wanted to bring the chief up before the yardarm, and wanted to know what Bert was going to do to discipline the aging ex-Marine Corps colonel. Antarctica was sure fun in the old days! It was great being a sandcrab.

Things which probably set sandcrabs apart from other mere mortals were their adventuresome nature, their motivation, and their thirst for knowledge. As one looks at the list of sandcrabs in Antarctica during the IGY (69 in 1957, 71 in 1958), one finds that a great many went on to obtain advanced degrees. We know at least twenty-two PhDs came out of the Class of '57 - over 30%. Who said you can't teach sandcrabs

anything? In alphabetical order, there's Nolan Aughenbaugh, John Behrendt, Hugh Bennett, Bob Benson, Charlie Bentley, Dick Berkeley, Dick Cameron, Dick Chappell, Bert Crary, Paul Dalrymple, Gil Dewart, Carl Eklund, Mario Giovinetto, Herfried Hoinkes, Arlo Landolt, Olav Loken, Fred Milan, Ned Ostenso, Jim Shear, Paul Siple, Ron Taylor and Ed Thiel. Only three had their degrees when they went to the ice - Siple, Hoinkes, and Shear. The Class of '58 did not have as many - fourteen. Besides the aforementioned Bentley, Crary, Dalrymple, and Giovinetto, who were held back as slow learners and spent a second year on the ice, the other ten included two Jesuit priests, Father Henry Birkenhauer and Father Edward A. Bradley, plus John Annexstad -Mr. Perseverance who finally got his degree a couple of years ago, Matt Brennan, Jim Burnham, Johnny Dawson, Charlie Greene, Kirby Hanson, Lyle McGinnis, Willie Tressler, and Buck Wilson. Bergy Bits is sure he has missed many others with whom he is not familiar. Probably the station which ended up with the highest percentage of advanced degrees was South Pole - maybe the long winter night convinced them that they should get an education so they wouldn't have to work for a living! - including the two medical doctors plus the eight PhDs - 55%! There were other Antarctic PhDs from the IGY - Tony Gow, who was down with his fellow Kiwis from New Zealand before defecting to the States, Jim Sparkman, who was flying around with a gravimeter, having already been converted from a science writer for the Christian Science Monitor to a budding geophysicist, and Jim Weinman. Of course, there were all kinds of PhDs in the Antarctic for the summer of 1957-58, although back in those days, we really considered anyone who came down just for the summer as illegitimate children, only slightly better than tourists!

**WILSON OF THE ANTARCTIC - SAM, THAT IS.** Before Bergy Bits starts writing about some of the so-called successes from the Antarctic, he feels there must be some words for the Sam Wilsons of the Antarctic, because even though they constitute a small minority, their existence should be acknowledged. Sam was an electronics technician with the Weather Bureau in the midwest, living happily in his own little world. While drinking beer one mid-afternoon at a watering place in a small midwestern town, the pay phone at the end of the bar rang. The bartender answered, then turned to Sam, saying, "Washington is calling, they want to talk to you, Sam." It seemed that a technician for the Antarctic had pulled out at the last minute and they needed a man in a hurry. In a moment of weakness, Sam said he would go, not knowing really what he was getting into. Surely if he had stopped to realize that Antarctica was womanless, he would never have consented, as Sam liked women about as often and in the same magnitude as he did beer, which was bountiful. In a few short weeks Sam found himself arriving at Little America V. The Weather Bureau had sent down a fellow by the name of Chet Twombly in 1956 to get things set up for the IGY, and as scientists were brought in by a chopper from the USS CURTISS, wintering-over people were being flown back out to go home. Harry Wexler saw Twombly standing by the door and said, "Chet, I would like to have you stay here and check Sam out on the GMD." Chet proceeded to pick up his duffle bags and said, "Harry, it has been a long, hard winter and I sure don't want to miss that ship." Then he turned towards Sam and said, "The GMD is up that ladder, Sam," and disappeared outside. This was the beginning of a miserable year for Sam, although he performed his assigned duties well. When it came time to go home, Sam was at the head of the line trying to get out. He was with a group flying home via Hawaii, where they were scheduled to lay over one night, then resume the flight to the U.S. the following morning. Sam wanted none of that, he just wanted to put as many miles as possible between himself and Antarctica, so he went over to the civilian terminal, bought his own tickets back to the States, and has never been heard from since. Sam is probably back in that midwestern bar drinking beer and wondering whatever possessed him to go to Antarctica. Probably there are many Sam Wilsons in Antarctic history. Bergy Bits doesn't want to think too much about them

for fear he will come to the conclusion that they are the sane ones, that those of us who go back are the ones with loose marbles!

**PETER THE GREAT.** Without a doubt, the biggest character at Little America V in 1957 was a German by the name of Peter Schoeck. According to Peter, he asked Larry Gould for the most challenging job in the Antarctic, and ended up being given the responsibility for the aurora and glaciology programs. Ordinarily it would take Peter only a few minutes to antagonize someone, although, in select cases, he could do it in much less time. By mid-winter he was totally friendless, but he did provide a great source of amusement to his cohorts. There were a lot of World War II films sent to the Antarctic in 1956, and Peter used to go to all of them. His only life tragedy had been that the Fuehrer had not awarded him an Iron Cross during the war. Peter would sit through the movies as long as the Germans were winning, then when the Allies started to win, he would get up and angrily stomp out of the recreational hall to a hail of comments from the rest of the audience . . . . Peter was a superb physical specimen, and was one of Muckluck Milan's test subjects. He always wanted to be the first one tested, as he thought he could set standards beyond the limitations of the rest of us mere mortals. He certainly was outstanding doing the Harvard Step Test, where he would bang along steadily for more than a half hour without his pulse rate changing at all. One test he couldn't handle was where Muckluck measured body temperatures at multiple places under cover of a blanket in an unheated room, then suddenly jerked the blanket off and continued the readings. Poor Peter would react violently, shivering so drastically that he would fall right off the bunk! Great, tremendous - there is a God! There was one other test he couldn't handle, which Bergy Bits excelled at - proving that everyone can do something - and that was in moving nails from holes in one end of a board to holes in the other end. in an unheated environment. Peter would be in such great haste that the darn nails would be flying off the overhead and bulkheads, never touching the board! Loved that test! .... Peter was an excellent cross-country skier, and supposedly was on the German cross-country Olympic team. He would leave camp on skis in the darkness of winter and go outside of the camp area and deliberately get himself lost so that he could set up rescue patterns and find his way back into camp . . . The only true hoax played on anyone at the station was played on Peter, and it worked most successfully for about four days. Supposedly Peter got a hamgram from a book publishing house by the name of Jim Johns, requesting exclusive rights of publishing the official story of his year in Antarctica. Peter swallowed it hook, line and sinker, and ran around camp asking questions such as, "When did we cross the Antarctic convergence on the CURTISS?", You see, Peter was not keeping a journal, and wanted to collect all that irrelevant data for his great forthcoming book! After several days, he began to get suspicious, and went around camp comparing type on all the typewriters to see which one had typed the message. As I recall, he ascertained that it came from meteorology, but no one would confess up to it. The general feeling was best expressed by Austrian Herfried Hoinkes, "I'm sorry to say that I wasn't clever enough to have thought it up, as I would have truly loved to have been the one." And to this day, after much frustrating, investigative research we don't know if it was Milan, if it was Cromie, if it was Barter, if it was Taylor, if it was Lieske, if it was Crary. Wouldn't it be hilarious and wonderful if Jim Johns was actually the Russian Vladimir Rastorguev? Anyway, it was the highlight of winter . . . There's one more good Peter story, and that involved his participation on Crary's Ross Ice Shelf Traverse. After a short time out, a message came into camp that Peter had fallen into a crevasse. They were near Roosevelt Island, and Peter, Walter Boyd and Blackie Bennett were walking over area they had walked on previously that day when, whoosh, Peter was gone, and there was a round hole in the snow. Knowing them both, there must have been some hesitation as to whether they should start cheering or sound an alarm. Fortunately for Peter, he had

fallen onto a ledge, unfortunately for Peter, he had fallen a considerable distance, had broken several ribs, and had some internal injuries. Crary told people at Little America V not to send a plane out until they could determine how much of the area was crevassed. However, one of the pilots disregarded Bert's instructions, and flew right out and brought Peter back into camp, from whence he was evacuated to a hospital in New Zealand. It turned out that Peter was lucky the pilot went out, as bad weather set in around Roosevelt Island, and he might not have survived without immediate medical attention. An interesting aftermath was that Crary needed a replacement for Peter, and Crevasse Smith, who was at Little America V, volunteered. As Bergy Bits recalls, Bert sent a message back in, "Don't send me Phil. I need someone to keep me the hell out of crevasses, not someone who wants to go into them." . . . . Peter recovered quite quickly in New Zealand, and wanted to rejoin the traverse, but by then everyone had had his fill of him, and was quite content to see him go home to Germany. On the way, he got into a street riot in the Middle East, where someone supposedly took him for an ugly American, whereupon he grabbed a native and put a dagger to his throat until he convinced the local people he was an innocent abroad . . . . There was one last stop for Peter before returning home - to visit Frau Hoinkes in Innsbruck and attempt to sell her some of his Antarctic pictures. Trudy gracefully declined, saying, "I will soon have my Friedl back home with me from Little America and he will have his own pictures," to which Peter replied, as only he could, "But his pictures won't be as good as mine." Don't you think they really should have left him down in that crevasse?!

**HISTOGRAMS.** Bergy Bits wanted to run some profiles on some of the more prominent Antarcticans of the IGY, not only the sandcrabs, but a cross section of various Antarctic types. Naturally, since we were doing the writing, we selected those we wanted to hear about, and asked them to send in hysterical updates of what they have done/are doing since the IGY. We hope that you will enjoy hearing about the first man to land a plane at the South Pole, the first Catholic priest to celebrate mass on solid earth in Antarctica, the first spelunker to become a renowned crevasse expert, the first Eagle Scout since Siple to winter over in Antarctica, the first scientist to have worked at both the North and South Poles, the geophysicist who measured the world's thickest ice, the first geophysicist to winter over with both the U.S. and the USSR, a geophysicist who still considers Antarctica his laboratory after nearly three decades of research, a radiation climatologist who believes the sun never sets on the South Pole, and Bergy Bits' memories of the IGY visit to Antarctica of the now deceased knighted polar explorer, commander of six Antarctic expeditions.

**PHILIP M. SMITH.** Phil Smith is Bergy Bits' Crevasse Smith, as this is the nickname this erstwhile spelunker had when he was a young Transportation Corps officer in Antarctica helping lay out the oversnow route to Byrd Station. Being somewhat of an honest man, I will have to confess that I was not one of his fans. It never occurred to me in my wildest dreams that he would ever amount to anything. How foolish I was, as this man has scaled heights which I'm sure he himself never expected to reach when he was Crevasse Smith, hanging around with the likes of Bill Hartigan, composing ditties about Hugh Odishaw! I knew of his meteoric rise through the bureaucracy, but it wasn't until I started writing this column and reading the mail that came into the Nerve Center, that I realized how much of an influence this man has been on Antarctica. There are many letters which read, "I owe it all to Phil Smith for giving me a chance," or "It was Phil Smith who made it all possible." His interests cross a very broad spectrum, and it is my opinion that this man has probably opened more Antarctic doors for more outsiders than any other American. But let's let Crevasse Smith, alias Phil Smith, tell you what he has been doing since the IGY . . . .

Well, the first thing to keep in mind is that I continued to be involved

in arctic and antarctic affairs over the whole decade onward through the 1960s until 1971. You know about all of the things that went on in that period--the improved logistics, the large international cooperative scientific programs, the then new laboratory facilities in Antarctica, the research ships which have come and gone from antarctic service, and other important changes, for example, the opening up of Antarctica to women scientists and women support personnel. In retrospect, I consider this one of my greater accomplishments and am proud of my role in getting this change instituted. I finished up my polar days in the 1970/71 period when I made my last trip to Antarctica and supervised the negotiations for the new budgeting and appropriation arrangements that put the entire funding for the U.S. Antarctic Research Program at the National Science Foundation.

Ready at that point for personal change, I left the National Science Foundation and went to the Office of Management and Budget to the General Science Branch as Branch Chief, spending upwards of a year there, but then returning promptly to the NSF at the point when the Presidential Science Advisory mechanism was coupled together for the two-year period of 1973-75 with the office of the Director of the National Science Foundation. During that period I was in Guy Stever's office and then both he and I went over to the White House in 1976 to start the Office of Science and Technology Policy under the legislation that was passed by the 94th Congress. I stayed on there over the rest of the 1970s in OSTP, departing in 1981. Happily, the science advisors that I had close association with at NSF and in the Executive Office of the President--Don Hornig, Ed David, Guy Stever, and Frank Press--have all continued to be part of our activities and I greatly enjoy and value all of these associations, but especially my daily association with Frank. Since 1981 I have been the Executive Officer of the National Academy of Sciences and the Academy of Engineering, for the conduct of the scientific, technical and policy studies which we undertake for government and other sectors, It is an absolutely terrific job.

Since I left my active field days, I have continued to try to get out and about from time to time for interesting adventures. Fortunately, my health has continued to be superb; thus, I have spent a lot of time in the western part of the United States white water river rafting, and among my memberships I proudly list the Western River Guides Association. And I hike into wilderness areas whenever possible, for example, a week in the Grand Canyon a year ago, and a six-day, 72-mile hike in the high Sierras this past July, ending up on Mount Whitney on an absolutely marvelous day--the kind of day I used to enjoy so much in Antarctica. I have not been back to the Antarctic since 1970, but I did make a trip to Central and Southern Alaska last year for several weeks in the national parks. It reminded me both of the good times of the past and also some of the cold weather that I wonder now how I enjoyed so much three decades ago.

**LT. COMMANDER CONRAD S. "GUS" SHINN, USN (Ret).** Gus Shinn's name became permanently enshrined in the annals of Antarctic aviation on 31 October 1956 when he landed an old R4D, *QUE SERA SERA*, on the South Polar Plateau, the very first landing of an aircraft at the geographic South Pole. Flying copilot that day was an old World War II South Pacific buddy of his, Captain William H. "Trigger" Hawkes; navigator was Lt. John Swaden; aviation mechanic was John Strider, who recently visited Gus; and the elec-

tronics technician was the late William A. Cumbie. Two passengers along for the ride were the late Rear Admiral George J. Dufek and Captain Douglas L. Cordiner. Bergy Bits asked Gus how he was selected to be the pilot that day, and he feigned not to know why. However, further conversation brought out that he had to be the best qualified pilot with ski-equipped planes. His military background included considerable testing of ski-equipped planes in Canada, and he also participated on Operation High-jump as a pilot. Asked if he had any special memories of that historic flight, Gus said there were none, that it had all been well documented, but he did confess to having had some concern when the oil vent froze up, spewing oil all over the side of the plane. Gus said that *QUE SERA SERA* is sitting behind some building at Pensacola just gathering rust. We had been led to believe that she was going to be put into some sort of a museum at Pensacola. We learned from Gus that Harvey Speed, one of the VX-6 pilots, had died three years ago from Lou Gehrig's disease. Harvey lived with gusto, and one of his drinking buddies was Baseball Hall of Famer, Eddie Matthews. When asked about Jack Coley, Gus said the last he knew about him was that he was with Lockheed in San Diego. Maybe a recent joinee of our Society, Gordon Ebbe, VX-6 commander prior to Jack, can shed some light on his whereabouts. Gus wanted to know what had happened to Larry Gould, Bert Crary, and Father Dan Linehan, and we updated him on all three. He also expressed his burning desire to revisit Antarctica. It was great talking to Gus, as he had flown me and a young husky pup named Blizzard to the South Pole on 4 December 1957 on the 27th plane landing at the South Pole. Bergy Bits had also had the pleasure of being flown by his friend, the late Harvey Speed, in *QUE SERA SERA* from Little America V to McMurdo in late November 1957. As for what Gus has been doing since the IGY, let's turn to his letter of 16 November to Ruth ....

I left VX-6 in the spring of '58. While enroute to NAS Pensacola, FL I stopped by Donaldson AFB to visit Col. Ellen, C.O. of the AF squadron supporting DF. He had a flight to N.Z. and invited me to go along; permission was obtained from the Navy through Capt. Cordiner (VX-6 DF 2 C.O.) then at the University of Ga. at Atlanta. We had a great visit in N.Z.; friendships were fresh from recent tours of DF 1,2,3. Upon return to the States I reported to Pensacola where I was assigned to the Operations Department at Sherman Field. I became the personal pilot of Adm. Duerfeldt. On 1 April '63 I retired having served 21 years.

During 1963 I reestablished contact with Dr. Mooney who invited me to accompany VIPs and others on the C-135 flight to N.Z. We were there when the President was shot. For a year after retirement I travelled, then back to Pensacola. I had toyed with the idea of living in NZ but lacked the motivation to make the move. Since then I've been living in a small book-cluttered apartment with a large family of cats. I discovered I was a 'cat person'.

It is a quiet life, leisurely and pleasant are the days. You could call me an interested observer! Please remember me to all my old friends of the 'good days'.

**NED A. OSTENSO, BYRD STATION, 1957.** It is appropriate that Ned follows Gus, as both are big men who are short in stature. Ned has had a very successful government career, and is a member of the illustrious government senior executive service corps. He supposedly is in charge of the Sea Grant Program of the National Oceanic and Atmospheric Administration, but Bergy Bits suspects that what he actually does is represent NOAA at any and all meetings held outside of Washington, as he is never., never at home. As this is being drafted, he and his bride of multiple decades, Grace, are touring Italy looking for antiques and other useless things. As his secretary is tardy in getting his vitae to us, we are sparing you that agony, but we are including

his comments to us and excerpts from an interview in a NOAA publication about Antarctica and life. He's pretty articulate for a fellow from Chippewa Falls. His letter ....

My introduction to Antarctica was both casual and traumatic. The casual part was a brief note from an unknown named Bert Crary with some terse instructions about a physical examination and reporting to Davisville. Upon investigation, I discovered that George Woollard had volunteered me for 2 years of Antarctic service. The fact that I had not been his graduate student since being given an irrefusable offer to serve my country in the U.S. Army Signal Corps, or that I was then happily engaged in the search for oil in the Gulf of Mexico, or that I may harbor some independent views about my future did not occur to George. By the same token, it never occurred to me that I should not go.

The traumatic part was a little warm-up exercise in Greenland. Someone (to this day, I don't know who to blame) thought that we were entitled to a preview of coming attractions by driving across Greenland along the 80°N parallel to the region (pole of inaccessibility, if not undesirability) where an earlier British-French expedition had failed to get seismic reflections. Charlie Bentley, Hugh Bennett, and I were greeted in Thule by the Air Force Strategic Air Command with unlimited access to their junk yard and garbage heap, from which we finally assembled three working weasels and rations. We got there, and we got back. In between there was a lot of unpleasantness.

On the JOSEPH F. MERRILL, we shared the number four hold with Mort Rubin, Mario Giovinetto and Vern Anderson for a 2-month cruise to the Bay of Whales, My first view of the Ross Ice Shelf under the Antarctic sun was the first of a long series of visual, emotional and intellectual experiences I was to have for the next 18 months of oversnow traverses and station life. I remember no hardships or privations, only beauty and excitement. But most of all, I remember people. Comrades are, after all, the heart of the Antarctic experience and the soul of the continent.

Ned reflected on his personal history in an article in NOAA Magazine of October 1978 which bears quoting ....

To begin with, I had the good sense to be born at a time and in a place where the action was. ... Mine has been a privileged life. Not by fortune of inheritance nor heritage, rather, luck and good timing .... When I was in college, my research grant constituted the use of my major professor's gasoline credit card, thanks to Dr. George Woollard's own munificence. It wasn't until the day before sailing for a year and a half tour in Antarctica that I learned I was actually going to get paid. Not only had I taken the term "volunteering" literally, but having the opportunity to do research was generally regarded as a privilege and not a source of income. For the most part, the equipment we had was what we made ourselves, from seismometers to magnetometers. I am not saying that those are the good old days, albeit the memories are fond. Today's reasonable compensation to the researcher plus his supporting infrastructure of technicians, laboratories, computers, etc., is the proper and necessary direction of social evolution reflecting society's expectations from the scientific milieu.

Discovery that the Antarctic ice cap was kilometers thick, rather than tens or hundreds of meters as commonly believed, drastically revised concepts of the global water budget with profound environmental implica-

tions. I still proudly hold title to the world's thickest ice sounding of 4,270 meters. The discovery was' sufficiently startling that when we finally arrived at Byrd Station and radioed our findings back to the Academy of Sciences, the message was believed to have been a garbled transmission.

**GIL DEWART, WILKES STATION, 1957; MIRNY, 1961.** Gil is another one of those small human dynamos, a la Gus Shinn and Ned Ostenso. Unlike most of the other Antarctic geophysicists he has gone the consulting route. We asked him for his comments on the IGY, and he sent us some long, sentimental sentences which say, I think, that it was all fantastic ....

The International Geophysical Year was a time of marvels, a mythic interlude - there should be such a Camelot somewhere in life for all of us. That expedition was at once the realization of a long-held dream and the beginning of a career that would occupy me professionally for many years. Above all, though, was the experience itself, an island of wonder as unique amid the ordinary stream of existence as our Great White Whale of a continent is from the rest of the physical world.

To have journeyed through that enchanted crystalline landscape and to have observed the workings of the universe with a grand company of adventurers - for such were my fellows in that time and place - was a splendid thing.

**JOHN C. BEHRENDT, ELLSWORTH STATION, 1957.** John is one of the two IGY scientists who has remained active in Antarctica, although Charlie Bentley may have a more continuous record. Both men have been very prominent nationally and internationally, and both will continue to play key roles in the future. John sent us some of his thoughts on the past, present, and future, and we want to share them with you ....

My experiences working in Antarctica and in Antarctic research more or less continually since the IGY have obviously greatly affected my professional career as well as my personal life. I started as a student assistant at Ellsworth IGY Station and made the Filchner Ice Shelf Traverse with Ed Thiel, Hugo Neuburg, Paul Walker and Nolan Aughenbaugh. I remember how we all used to scorn "Old Antarctic Explorers." Where does that leave me now? I saw by the October 5 NYT that the Grand Chasm in the Filchner ice shelf appears to have rifted completely open, sending the area of the start of our traverse into the Weddell Sea. It was a reminder that time has passed; progress, I suppose I should call it.

There are a lot of positive changes in the logistics, safety, various technological advances in instrumentation and data acquisition techniques, etc., that are obviously quite impressive over the last 30 years. Those of us at Ellsworth Station not only wintered over, but had to spend three months on a ship fighting through the pack ice of the Weddell Sea to get there. It certainly is much more efficient to fly into McMurdo in a few hours. Unfortunately we (in the US) can no longer do geophysical work on the Filchner ice shelf. A focused effort like the IGY is unlikely to be planned and carried out by the US in Antarctica today. I am, of course, most familiar with the Oversnow (Glaciological-Geophysical) Traverse Program which operated three simultaneous identical field parties out of three Antarctic stations separated by 2500 km. This

work continued for about 10 years and systematically covered the Antarctic ice sheet coordinated with similar traverses by USSR, France, and others. The type of research we are all engaged in now is much more undirected, which certainly has good scientific advantages. However, a systematic, directed, decade-long program (like that started in IGY) appears difficult for US to organize and accomplish, even if it would fulfill important national needs. Antarctica, anyhow, appears pretty much the same, which is why I still intend to keep returning.

**KIRBY HANSON, SOUTH POLE, 1958.** Kirby, an ex-taxi driver who spent much time in meteorological offices at various airports after dropping off passengers, decided that as long as he was spending so much time there, why not get paid for it. So he joined the Weather Bureau, and shortly thereafter found himself at the South Pole. Kirby was very ambitious, and was destined to go places besides the South Pole. However, he had trouble leaving the Pole altogether, because for many years he was in charge of Geophysical Monitoring of Climatic Change (GMCC), which included the South Pole station! In recent years he has returned to Miami where he is a senior meteorologist who can work on anything which tickles his fancy. And we love his wife, Lisa (Alicia), Miss South Pole 1958! Kirby wrote us on Halloween ....

Antarctica is particularly interesting for me, as it is experiencing a modern-day ice age. Being there, one gets the feeling of what the periods of the great glacial advances over portions of the Northern Hemisphere must have been like so many thousands of years ago. In a sense, these of us fortunate enough to have seen Antarctica, have done a small number on the Grim Reaper.

The one story that sticks in my mind, is a "Harry Wexler" story. He told it of himself, on returning from a summer visit to Antarctica, in a talk at the National Academy of Sciences. Dr. Wexler, as many of you know, was not a physical or athletic person. So it came as quite a surprise to most of the audience to hear him say that he had spent a few days with a field party, but what he didn't say, of course, was that living conditions in the field were not exactly a piece of cake. One can visualize, again, the pristine conditions of Antarctica from Dr. Wexler's personal comment about how he felt at the end of those days in the field. He said, "He had never felt so clean on the inside, and dirty on the outside in his entire life."

**REVEREND DANIEL LINEHAN, S.J.** One of the advantages of writing this column is that you can knock on doors, and if they haven't read too many of your columns, they will let you in. Such was the case in early November when I dropped in on Father Dan in Weston, Massachusetts. Although we were together at McMurdo in late November 1957, and flew to the South Pole on the same day, 4 December 1957, I never before had had the opportunity to sit down and talk with him about his experiences in Antarctica. Originally I had intended to stay only one hour, as I was enroute to Maine, but reluctantly I had to pull myself away after two hours. For those of you who have never had the pleasure of meeting Father Dan, your life has a void, as he is a most delightful person. I used to say he had the kindest eyes of any man I had ever met. I can now enlarge upon that feature to include the whole person.

Father Dan is now officially retired from being the Director of the Weston Observatory, although he lives only a stone's throw from it in Campion Center, a home for Jesuits in Weston, about fifteen miles west of the non-Catholic church where they

hung the lantern for Paul Revere! He is comfortably situated on the top floor in a corner suite of four rooms (one is a study, one is a bedroom, one is for hamming - radio, that is, and one is a workshop for keeping his rig on the air). Now for the bad news - he's 82 and not quite so robust. He has had some problems with his feet and legs, and all of the toes on his right foot have been amputated, so he has to sit with his legs resting on another chair or footstool. He's an early riser, celebrates mass each morning at 5:30, and evidently still spends a lot of time on the radio, including working the two-meter band in the local area.

Father Dan made three trips to the Antarctic, and the late Admiral Richard E. Byrd was one of his early benefactors - or maybe Father Dan was Byrd's benefactor! During the IGY, some of us sandcrabs thought Father Dan was Admiral Dufek's answer to the IGY, because it seemed that when there were too many stories in the papers about the IGY, the Admiral would load the Jesuit in his plane and fly off somewhere to take a seismic shot. It must have helped the Admiral's blood pressure, as well as give Father Dan a chance to do his thing in seismology. Although he is proud of being the first man to take a seismic shot at the South Pole, one gets the feeling that what he is most proud about is being the first priest to have celebrated mass on terra firma in Antarctic - Ross Island. And he was also the first priest to celebrate mass at the South Pole, 4 December 1957.

We got to talking about Gentleman Jim Zumberge - we were running out of people to talk about, you can see that! One day Jim came in out of the field, looking pretty scroungy, and asked, "You're a Jesuit priest, aren't you?" Father Dan replied that he was, so then Jim asked him to cut his hair, as he figured all Jesuits learned barbering when going through training. After the haircut Jim said to him, "You're a ham operator, aren't you?", and Father Dan replied in the affirmative. So Jim asked him if he would mind trying to contact his wife that night and telling her that he was okay. So Father Dan got through to Jim's XYL that night, and she asked him how Jim was looking. The reply was that he looked pretty bad when he walked into camp, but after giving Jim a haircut, he looked great.

Evidently Father Dan carried the necessary elements so that all faiths could practice their religion in the Antarctic. He mentioned that at the end of one of his trips, he gave the wine left over from the Jewish allotment to Murray Wiener so he could celebrate his own service(s). We imagine that Murray was truly grateful to Father Dan for his deep consideration and concern for his religious needs!

One thing Father Dan didn't know was that he had a geographical feature named after him. He said that Admiral Dufek told him once that he would get a mountain or some feature named for him, but he had never heard another word about it. At the time, I wasn't aware of what it was, so I contacted Ruth and asked her to find out and then let him know. Afterwards he wrote Ruth "it was a pleasant surprise" to learn there was a Linehan Glacier. He went on to write, "There have been quite a few craters on the Moon named after Jesuit astronomers, and other items as 'eye tests' flowers, etc., but I think this is the first item in Antarctica to be so named. My brother Jesuits here were quite pleased." We hope that Bob Allen can come up with a picture of Father Dan's glacier, because he should see it after all he has contributed to Antarctica. A visit with Father Dan is certainly an uplifting experience, even for a Protestant! This fellow is really one of the truly nice guys, and we should be proud that he is one of us.

For you amateur radio operators, I believe Father Dan is W1HWK (Hard Working Catholic). He said that Paul Blum, W2KCR, who handled all of those hamgrams for all stations for the entire IGY, is now living in Westchester County, somewhere near White Plains, New York. And from Mel Havener, who is planning a giant reunion of all Deep Freeze IV personnel next summer, we have a new address for Jules Madey,

K2KGJ, the sensational high school student with a powerful rig who never slept during the IGY, because he stayed up for two years running phone patches. It's Box 390, Route 21, Hillsdale, NY 12529 .... After we typed the preceding, Father Dan Cassem, a colleague of Chet Pierce and a close friend of Father Dan, sent us a very complete resume of Father Linehan - which we had requested. It is interesting to note that among his multitude of achievements and honors is "Honorary Member of the U.S. Navy Seabees, 1962"! -- While on the Dow Expedition to the Arctic in 1954, he made the first magnetic studies on the ground to determine the new location of the North Magnetic Pole; in 1957-58 his seismic tests determined the depth of ice at the South Geodetic Pole. But Father Dan is not a Pole Cat, in spite of his work in Antarctica, the Canadian Arctic, and Greenland; his work has taken him to Hawaii, Canton, Fiji, Philippines, Borneo, Java, Sumatra, Burma, Thailand, Laos, Singapore, Hong Kong, Japan, all countries in South America at least once, France, Spain, Portugal, Switzerland, Morocco, Tunisia, Greece, Turkey, Iran, Yugoslavia, Italy, Egypt, Ethiopia, Madagascar, Tanzania, Kenya, Uganda, Burundi, Ruanda, Zaire, Congo, and the Central African Republic. Sounds just like one of the Ed and Priscilla Crew's Christmas letters! Now v/hat Bergy Bits want to know is, who was minding the store back at Weston Observatory (Seismologist-in-charge, 1934-1950; Director, 1950-1972), to say nothing about who was teaching his classes in geophysics at Boston College (Chairman, Department of Geophysics, 1948-1962). We can only presume that he explained his absences at the Observatory and on campus when he went to confession! SEISMOLOGIST PRIEST, HAS PASSPORT, WILL TRAVEL!

**SIR HUBERT WILKINS, 1888-1958.** Bergy Bits was a colleague of the late Sir Hubert Wilkins when the IGY came along, as we both served the same master, working for the Quartermaster Corps Research and Development Center. Sir Hubert was a fascinating man, and anyone who has never read Lowell Thomas's biography on him should read it. Many people said he was the only polar explorer without an ego, and it is probably so. Many a stormy day at Natick he would never go home, but would spend the night sleeping on the couch in the women's John!

But his last trip to the Antarctic was sad in several respects. He arrived at McMurdo on 12 October 1957 and departed from Wilkes on 26 January 1958. He was treated royally by the Admiral when he got there, and was having the time of his life. But he made a mistake, he granted an interview to a reporter while on the ice - always give your interview on your way out. Nothing is sacred with the media, and it was duly published that Sir Hubert said that McMurdo was a filthy camp, that living conditions were horrible, that morale was down, and that Shackleton and Scott had better camps in the old days! That was the end of Sir Hubert's IGY Antarctic honeymoon. He got kicked out of the Admiral's quarters, and he soon arrived at our front door at Little America V where he sought haven until the tempest calmed down at McMurdo. Bergy Bits was the beneficiary, as Sir Hubert stayed for two weeks, helping dismantle the micrometeorological system. He was a fantastic snow shoveller, in spite of his sixty-eight years, digging up 500 feet of cable buried three feet deep!

Sir Hubert dearly wanted to stand on the South Pole, but after he was ostracized, there was no way the Navy was going to send him there. However, he had already flown twice over the Pole, and he got to go to Liv, to Byrd, to Hallett, and, of course, to Little America V. He also went on many local flights out of McMurdo, as he would just walk down to the strip, see a plane loading up, hop into it, and after it got airborne ask a crewman where they were going! Being the first man to fly in Antarctica, he must have considered this an inalienable right. He had many Arctic friends who were on busmen's holidays at McMurdo (Link Washburn, Bill Field, Troy Pewe<sup>1</sup>, Dick Goldthwait, and George Llano), so he was in good company in the Quonset, and he really enjoyed them.

But Sir Hubert probably was doomed before he ever arrived in the Antarctic. Bergy Bits does not know of a single old Byrd man who was welcomed with open arms, nor has

he ever heard of an incoming group of camp personnel who wanted the old crew to stay around to indoctrinate them or provide an overlap. No one was as unwanted in Antarctica during the IGY as someone who had been there! They would rather make their own mistakes than be told by a veteran of the preceding year or of a preceding expedition. This was something foreign to Sir Hubert, as he was listened to in the Arctic when he went on annual wintertime military maneuvers.

After he got back to Natick, Sir Hubert spoke of what he considered a real tragedy, the heavy drinking at McMurdo, and said that it commenced at the very top and went on down through the ranks. This did not come from a teetotaler, as Sir Hubert was not averse to drinking; in fact, he picked up \$10,000 in 1957 for sitting at a piano with an umbrella over his head endorsing a dry gin! The Admiral heard about Sir Hubert's trip report, and asked Natick for the opportunity to go there and reply to him. But he must have thought it over and come to the conclusion that even though he hated what Sir Hubert had said, the old boy had hit a few nails right on their heads, as he never showed.

**RICHARD L. CHAPPELL, LITTLE AMERICA V, 1957.** Dick's introduction here will be an unsolicited commercial urging all of you people with class and money to hustle right out and buy Hoya crystal. His wife Alice is President of Hoya Crystal USA with a new gallery in Manhattan, and she is also Fine Lines International Ltd. Dick designed a fluorescent illuminated display base (patent pending) for crystal and other art objects, so he moonlights for/with Alice. If you read the ads in the New Yorker and see Baselite by Fine Lines, that's the Chappells. End of commercial. Now let's hear it from Dick ....

It is difficult for me to imagine how my life has not been influenced by the type of adventure made available to me as a young man spending a year in Antarctica during the IGY (1957-58). It influenced my concept of science, nations, and individuals. I found great inspiration from the accomplishments of those around me and a sense of the international bonds of the scientific community which have never left me. I was no longer in awe of greatness but valued those moments I was able to spend with great explorers and scientists. This, in turn, encouraged me to accept other opportunities which followed. I came to think of science as an international endeavor rather than an individual competition and have enjoyed what have turned out to be stimulating and productive collaborations in Europe, Asia and around the US. While it would be difficult to point out any one thing as being a direct result of my Antarctic experience, I believe it gave me a new concept of scale and a greater appreciation of style in the way things are done. More specifically, there were people like Paul Siple who spent long hours giving me confidence that I could, indeed, do the kinds of things that he had done; Larry Gould, the author of the first Antarctic book I had read years earlier, who provided not only the reality of a true international scientist but also a new friendship on our cruise to Antarctica; Bert Crary who gave me responsibilities I had never dreamed possible and a masterful example of a special type of low-key leadership based on a combination of example, judgement and hard work; Phil Smith who convinced me to get involved with doing things while others are busy talking about what should be done; or Harry Wexler who made it seem that it was still all right to dream a bit now and then. In the years that followed, I found that I had acquired a larger family and shared a special bond with those who had shared the Antarctic experience and even some others who had been involved in similar undertakings. It was surprising how often an old friend turned up when

least expected – even Father Darkowski in the middle of the Mediterranean Sea. Most importantly, it certainly changed my direction from engineer to scientist. It stimulated what has become a lasting curiosity about how things of the natural world actually work.

Upon my return from the Antarctic, I spent the spring traveling around the country for the Boy Scouts of America. I saw the country and learned a bit about public speaking. That summer, I wrote my book, *Antarctic Scout*, finishing the last chapter and proofing the galleys as a freshman at Princeton. I took the Engineering - Physics program, earning a BSE degree. My senior independent work was done at Princeton's Elementary Particles Laboratory where I worked part-time for three years on fiber optics and statistical studies of single photon effects. Upon graduation, I received the Reserve Officers Association Award as the outstanding Princeton Graduate commissioned in the US Navy.

My Navy duty took me to Washington on the staff of VADM Hyman G<sub>0</sub> Rickover where I worked in the office of the Technical Director with responsibilities that included development of nuclear accident plans for all nuclear reactor sites and nuclear shipyards involved in the Navy's nuclear power program. A year later, I attended the Bettis Reactor Engineering School in Pennsylvania and was transferred from there to Electric Boat Division of General Dynamics in Groton, Connecticut where I reported to Rickover each week, and became the AEC representative for the first overhaul and refueling of the polaris submarine USS PATRICK HENRY.

After four years of active duty (Ensign to Lt.), I entered graduate school in the Department of Biophysics at Johns Hopkins University where I earned a PhD doing research on the retina at the Wilmer Institute of the Johns Hopkins Medical School. From there, I went directly to the Biological Sciences Department of Hunter College of the City University of New York as an Assistant Professor, joining the faculty of the Graduate Center shortly thereafter. In addition to my teaching responsibilities, I am conducting research on the structure, function and pharmacology of the retina both in New York and at the Marine Biological Laboratory in Woods Hole, Massachusetts each summer. I am now a tenured Professor and benefit from the support of grants from both the National Institutes of Health and the National Science Foundation. My research program was helped greatly by the receipt of a Research Career Development Award from the National Eye Institute of the National Institutes of Health which provided full time research support for five years. I have especially enjoyed the opportunities for collaboration with other laboratories, first at the University of London, and, more recently on a sabbatical at Japan's National Institute for Basic Biology.

One other activity may interest you. As a result of my numerous appearances at service clubs and secondary schools, I became increasingly involved in efforts to improve scientific literacy of the general public. Recently, our efforts have focused on the needs at the level of secondary education. For this purpose I have been involved with the establishment of a non-profit corporation, Gifted Student Development Programs Inc., which has evolved from Saturday programs at the Bank Street College for Education and at Fordham University to include graduate summer courses for secondary teachers. Our latest project concerning the Investigation-Colloquium Method for science education involves a consortium with the Dalton School and New York University with a major grant in review at NSF.

I have had the benefit of a unique access to the public as a representative of the science community and hope that some of the excitement I have seen in special programs at the secondary level can become a part of the daily educational process.

**ALBERT PADDOCK CRARY, MR. ANTARCTIC IGY.** As anyone who reads this column knows, Bergy Bits has great admiration for old Bert. There is no one like him, there will never be another; they threw the mold away when they made him. To have wintered over with Bert was the ultimate. He epitomized the best of IGY, and, in fact, was so knowledgeable in the geophysical sciences that he himself constituted a complete IGY team. The rest of could just as well have stayed at home. As great as Crary is as a scientist, he is even greater as a person. He is most unusual, one who would be equally at home in the National Academy of Sciences or with stevedores on the waterfront. To have drunk his beer through the past three decades has been a great pleasure, as it doesn't get any better than cold beer and Bert's company, although not necessarily in that order. Mildred, his bride of seventeen years, sent the following:

For several years after the IGY, Albert simultaneously planned arctic programs for the Air Force Cambridge Research Center, planned the post-IGY antarctic program for NSF, and finished papers reporting arctic and antarctic data. From December 10, 1960, to February 12, 1961, he led a 1250-mile traverse from McMurdo to the South Pole; he had been a member of the party which flew from T-3 (Fletcher's Ice Island) to the North Pole May 3, 1952, and thus he became the first person ever to have set foot at both Poles ("my dubious honor," he calls it). He became Chief Scientist for USARP and later Deputy Director and then Director of the NSF Division of Environmental Sciences, participating in several ELTANIN antarctic cruises.

Retiring in 1976, he served on the Polar Research Board and several AGU committees. On a Mellon Foundation grant, he and T. O. Jones compiled historical material on the U.S. antarctic program. He completed a 500-page book on his arctic and antarctic scientific explorations just before he became gravely ill two years ago. He is now revising the manuscript and would welcome suggestions for a replacement for his late agent. Several excerpts from Bert's book recall IGY days in Antarctica:

Crevasses - "The return trip from our furthest west to the plateau cache, occupied nine days. . . By the 19th of January we were near Twin Rocks, ready for another crossing of the crevassed area and pleased with our foresight in flagging the crevasses on the outgoing trip. To our dismay, we found many new crevasses, and many crevasses we had flagged were missing or altered. We changed our plans and tuned up the crevasse detector again. Three of the 'probers' went ahead with me, either sitting on the detector timbers or walking alongside, as I worked the vehicle slowly down the trail, with one eye on the meter and the other one on my helpers. One time Denny, walking alongside, dropped into an unmarked crevasse, but his fingers caught and glued to a timber. Later one of the crevasse detector pans fell in a crevasse, snubbed and split a supporting beam, upsetting Bucky, all before I could glance at the detector needle and back up again. The next day we finished crossing the crevasses, locating eight new crevasses and several of the old ones out of 28 detector signals, before getting out of the Twin Rocks area. Not at all sorrowfully, we said adieu to Twin Rocks.

"Much later, I had an occasion to ask Bunny Fuchs how he ever managed to get through the Twin Rocks crevasses. He gave me a blank look, 'What crevasses?'

It seems too far-fetched to expect that the crevasses had developed between late March when he came down and the end of the year when we went through. I had to assume that he was a professional traveler, and I was not."

McMurdo to South Pole traverse - "Sven [Evteev, the Russian glaciologist] rode with me in the drill Cat when we travelled.... Sven had learned to drive during the winter at McMurdo and it was his favorite avocation. He would gladly have driven the whole distance if I had not insisted, over his protests of 'I drive, I drive,<sup>1</sup> that I also liked to drive and was entitled to my share. To the delight of the traverse participants, Sven had an ample supply of 'Playboy' magazines from McMurdo, a part of the U.S. culture, he said, that he was required to study as one of his exchange science responsibilities. I could not have asked for a more delightful traveling and working companion.

"On February 12th, Sven and I rode triumphantly into the South Pole Station. Except for the smoke rising here and there, the station could have been abandoned, and I thought: 'not another movie!' Eventually we found our way through the underground labyrinths to the kitchen where the cook, getting ready for dinner, offered us coffee without any questions. Soon Ben Harlin came in, the head of the meteorologists at LAS in 1957, and now Station Scientific Leader, and also chief meteorologist at the Pole Station. 'Hey, you aren't due here until tomorrow.' And tomorrow's plane duly arrived the next day with the Public Relations personnel ready to welcome us. By then, we had used up most of the hot water at the station and looked like any other tourist group...

"... There was a handwritten letter, from Harry Kelly of the NSF. Harry hoped that I would accept full employment with the NSF as Chief Scientist of the USARP office, so that I could start recruiting a staff of scientists to enlarge this part of the program. Well, I knew it was about time to be thinking about my next step. In a few months my contract with the Arctic Institute of North America would be up and I would also be 50 years old. I had to admit it was high time to hang up my field boots, and accept the motto that 'hardships are for the young.' If I had to become an administrator, why not administer in an agency like the NSF under the supervision of such tolerant men as Alan Waterman, Harry Kelly and Tom Jones, along with the antarctic 'youngsters' like George Toney, Phil Smith, Ken Moulton and Harry Francis, with responsibilities in the science of the antarctic region. I decided to accept Kelly's offer." (Crevasses and McMurdo ... Albert P. Crary 1985).

**CHARLIE BENTLEY, BYRD STATION, 1957 and 1958.** We wanted an input from the one sand-crab who has never really crawled off the Antarctic continent, Charlie Bentley, but he didn't reply to our request. But we can't end this runaway non-Newsletter on the IGY without a limited number of kind words about Charlie. Bert Crary says that the real hero coming out of the Antarctic IGY group is old Charlie, that he was highly professional then, has continued to be, and will remain so into the future. Bert feels strongly that Charlie has never gotten his just rewards for his Antarctic research. Bergy Bits doesn't deny this, but being married to Marybelle is something like having your cake and eating it too. It takes a special kind of person to sit at home tending to brush fires and the kids while the other half rides all over Antarctica under the guise of science. So while we salute Charlie, let's not forget Marybelle who represents so well the other halves of our families who stayed behind doing the real work.

Bergy Bits apologizes for this runaway non-Newsletter, as it got out of hand and snow-balled on us!! Ruth and I hope that you all had happy holidays!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

Vol. 86-87

February

No. 4

#### Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88

#### Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

#### Paul C. Daniels

#### Memorial Lecturers:

Dr. William L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986

### 1987 Paul C. Daniels Memorial Lecture

#### STUDIES OF SPACE FROM THE POLAR REGIONS

by

Dr. Louis J. Lanzerotti  
Bell Telephone Laboratories  
Murray Hill, New Jersey

on

Friday evening, 10 March 1987

at

National Academy of Sciences  
Joseph Henry Building  
21st and Pennsylvania N.W.

Reception (cocktails)	6PM	4th Floor Reception Area
Dinner	7PM	The Refectory, 2nd Floor
Lecture	8PM	Room 451

Dr. Lanzerotti is your basic small-town, country boy (Carlinville, Illinois) who has led a very sedentary existence, going to only one graduate school (Harvard), and having only one job (Bell Laboratories). But Lou has been a Visiting Astronomer at Kitt Peak National Observatory, Visiting Professor at the University of Calgary, Visiting Scientist at the Max Planck Institute for Aeronomy, and is an Adjunct Professor at the University of Florida. His principal research interests include studies of planetary magnetospheres, energy particles emitted by the sun, and the impact of space processes on space and terrestrial technologies. He has published extensively - authored or coauthored 264 publications - and has been coauthor or coeditor of three books. Other than that, he has not done much with his life, although he is considered one of the real nice guys and a great speaker. This lecture is cosponsored by the Polar Research Board of which Lou is an outstanding member. Come and hear this brilliant polar satellite!

-----  
*This meeting is our Society's only dinner meeting of the year, and we urge all members to attend the Memorial Lecture and, if at all possible, come to the dinner, too. There is an all-inclusive price of \$25 per person, which includes cocktails and the dinner. (We don't have the menu, but the entree will be fish, presumably filet of sole. As we have to guarantee a certain head count, PLEASE make your reservation NOW!!! Mail your check, payable to the Antarctic Society, to the Society, c/o R. J. Siple, 905 North Jacksonville Street, Arlington, Virginia 22205.*

This column constitutes a potpourri of stories, anecdotes, fabrications, and, occasionally, some facts - about Antarctica and Antarcticans - which have been gathered from both reliable and unreliable sources and put together to fulfill our requirement for a newsletter. Under no conditions should anything herein be considered sanctioned by the Society. An effort has been made to find something enjoyable for each of the many separate enclaves within the Society. Our aim is to make everything as interesting to our readers as is humanly possible, never letting the truth get in the way of a perfectly good story. Occasionally there are inputs from outside sources, and they are duly cited. PLEASE! When you move, send us your new address! Bulk mail is neither forwarded nor returned!!

**IRS, NATIONAL ACADEMY OF SCIENCES AND ANTARCTICAN SOCIETY PRESENT LOU LANZEROTTI.**

Our 1987 Paul C. Daniels Memorial Lecture will be on March 10th, when the Polar Research Board (PRB) meeting is being held in Washington. We hope our dragnet will snare many of their members. The Antarctic Society has been wanting Lou Lanzerotti to speak to us for several years, and finally we have corralled him as he departs the Polar Research Board. Lou is one of the really bright lights on the PRB, is an excellent speaker, and one can be sure that his presentation will be of exceptionally high quality. It's a one-stop affair, as the dinner and the lecture will both be in the same building. There is one other advantage, the price of the dinner includes cocktails and wine, so you won't have to bring extra greenbacks for your libations. And if you go to only one banquet/speaker meeting per year, you can write this one off on your income tax next year, as Money Magazine for February 1987 says "if you attend a banquet meeting that features a speaker, and if you dine with a group of 40 or more people and more than half are from out of town, 100% of your expenses will be tax deductible. The loophole vanishes in 1989." So the IRS is co-hosting this meeting along with the National Academy of Sciences. All this and Lanzerotti, too. You can't go wrong!

**DICK CHAPPELL WAS OUTSTANDING.** In spite of Washington's double dose of snow in the preceding week, we had a full house for Boy Scout Dick Chappell's presentation on January 30th. He didn't leave out anything, taking us with him from the crib to his first primer, Larry Gould's *COLD*, through his Scout selection for the Antarctic, McMurdo, Little America V, Hallett, Wilkes, Mirny, Princeton, Admiral Rickover, Johns Hopkins, Hunter College, Woods Hole, Japan, Baselites and Hoya crystal, and finally, the Gifted Student Development Program. Never before has the Society been taken into the inner sanctum sanctorum of a speaker in such detail, and everyone came away with the feeling that they knew everything about Dick. We think he lost most of the audience when he tried to make us all experts on his retina research. He ended up by showing us some of the products of his wife's business - she is president of Hoya Crystal, USA. He had several beautiful pieces of crystal which were handsomely enhanced by lighted bases designed by the Chappells. He gave one to Ruth Siple and the other to his old Antarctic mentor, Bert Crary and his wife Mildred.

Bergy Bits told Dick it was too bad that Paul Siple wasn't still alive and present, as Paul would have been so proud of him. Dick has been on the Selection Committee for all of the Antarctic Boy Scouts after him, and he read a short letter from Louis Sugarman, the Scout selected in 1986, who was in Antarctica this past austral summer, captivating everyone with his eagerness to assist one and all.

The following day, twenty-five aging Antarcticans gathered to have lunch with the Chappells and to show Antarctic slides. We weren't encumbered with any limitation on slides, so we all sat around for several hours watching Rudy Honkala's slides of Wilkes, Bob Benson's of the South Pole, Jackie Ronne's of the Ronne Antarctic Research Expedition, Bernie Fridovich's of McMurdo, and then Dick Conger showed us everything from Operation High Jump through Deep Freeze III, as he was there for it all, being the Navy's chief photographer in Antarctica. It was quite an afternoon following a great evening.

**MY EYES HAVE SEEN THE GLORIES OF ....** Bergy Bits is most happy to tell you that he returned to the ice as the 30th anniversary IGY scientist, and that it couldn't have happened to a more appreciative guy. It was an outgrowth of NSF sending Jim Bergstrom to the ice last year as the 30th anniversary Navy builder of McMurdo, which more or less opened the door for sending a scientist this past fall, as it was the 30th anniversary of the IGY Antarctic scientists' departure. Seventy-one civilian scientists departed the U.S. in November-December 1956 for Antarctica, and the following year another 67 were sent down; altogether 136 scientific personnel wintered over in Antarctica during the IGY. Four of us (Bert Crary, Charlie Bentley, Mario Giovinetto, and myself) were detained on the ice for a second year. Bert was indispensable and had to stay, while the rest of us were either slow learners or were considered expendable by our home offices. But staying a second year put Bergy Bits in a good bargaining position as a 30th anniversary scientific candidate, although we don't think it had a very high priority at the corner of 18th and G Streets! They are really more interested in sending down people who are in a position to help them downstream, not some old has-been. It was gratifying, however, to hear several of today's generation of Antarctic scientists express the thought that it was a good idea to send down someone from yesteryear. When one considers that NSF invites about fifty so-called VIPs a year to Antarctica, they probably had enough available spaces for all they wished to send. I dare say that none of the other invitees who went south this past austral summer appreciated it anywhere nearly as much as I did, as it was my first trip south since the IGY.

Thomas Wolfe was right; you really can't go home. There was something real special about being there at the beginning of the IGY, as it was all so new. And I think the people were different too, because there were many who had been waiting for years for the opportunity to go south. The biggest change since those early days has to be the introduction of women to the ice. Other significant changes are the full-service support which scientists receive today, and the magnitude and diversity of the operation. Antarctica is big business, make no mistake about it. The population at McMurdo this past austral summer was 1,200 persons, many more than we totaled at any time during the IGY at McMurdo, Little America V, Byrd, South Pole, Ellsworth, Wilkes, and Hallett. McMurdo never was a nice, little suburban town, but now it's a big, sprawling, urban monstrosity whose ugliness is unparalleled in the polar regions - and that is high condemnation, considering the likes of Point Barrow! On the plus side is morale, which appeared to me to be just excellent. I think this can be attributed to the presence of women, as it seems they fill many roles - scientists, scientific supporters, common laborers, dance partners, et cetera. ITT alone had 55 women at McMurdo this past austral summer,

many more than they have had in previous years; when you add in the Navy and the scientists, there must have been a hundred women at McMurdo. During the IGY bitching was a highly developed form of rhetoric, especially among the Navy who just weren't certain why they were in the Antarctic. It appears that nowadays everyone in Antarctica knows his/her place, knows why he or she is there, and loves it. McMurdo may and does look like a large mining camp, but personnel-wise Bergy Bits thinketh it has many of the attributes of a highly motivated polar college community - it wouldn't be far off to describe McMurdo as an institution!

Some of you may be interested in what Bergy Bits saw and did. First, to set the stage, I was traveling with an Assistant Secretary of State - youngest person in the State Department with the rank of an ambassador, an environmental lawyer in the State Department who is involved with Antarctic Treaty discussions, and a staff officer of the National Academy of Sciences' Polar Research Board. By dint of the mix, I was predestined to see the best! The first day was sheer ecstasy, as they took us on a seven-hour helicopter flight around McMurdo Sound. The first stop was Cape Evans, the home base of Captain Scott's ill-fated 1910-1913 British Antarctic Expedition. For an Antarctic history buff, it doesn't get any better than this; your heart strings tighten as you look at that old, elongated table in the middle of the room and realize that this table hosted the famed mid-winter dinner party pictured in so many publications. Sacred territory, indeed. The second stop was at Sir Ernest Shackleton's hut at Cape Royds, home base of the 1907-1909 British Antarctic Expedition. To a long-time Shackleton admirer, this ranks right up there with Scott's hut at Cape Evans as an Antarctic nonpareil visit. The building is still in excellent shape, and the backdrop of Adelie penguins sitting on their eggs in a nearby rookery, plus Mt. Erebus, makes the station site a photographer's dream. It was very exciting, as well as a real privilege, to visit those two historic camps. In retrospect, everything that followed seemed mundane.

We were then taken out to what is now referred to as the "ice edge", and this was essentially an Eastman Kodak stop for pictures of Adelies, Emperors, and Killer whales. Then we were whipped over to the Dry Valleys, where our first landing was at Bull's Pass, although Colin wasn't at home. Artifacts were noted, and then it was on to Vanda Station. The Kiwis there are capitalistic entrepreneurs, and they immediately took us to this hole cut through the lake ice, inviting each one - for a five-dollar bill - to become a registered member of the Lake Vanda Swimming Club. Bergy Bits found out that he could have become the oldest swimmer when he noted that Trevor Hatherton of New Zealand had claimed that honor by going in the preceding day. However, this seemed like a senseless honor, so we kept our clothes on, although two of my traveling companions did go in. After thirty-six hours, their teeth stopped chattering, and it appears they will go on to live a fruitful life, although it's not certain whether they will father any more offspring. Incidentally, the hole is unisex, and women at McMurdo were clamoring for the opportunity to join the club - one had been duly recognized and baptized the day before.

We had hot tea and scones before taking a trip up Wright Valley onto the polar plateau, where we turned left and came back down on to West Beacon where we landed to look at all those rocks with small, spherical holes. Then it was down Taylor Valley to Lake Hoare at the terminus of the Canada Glacier. What an imposing site for a research station - fantastic! Each scientist has his/her own tent, as the buildings are reserved for science connected with a study of oxygen levels in the lake. A short stop at New Harbor found no scientists at home - they knew we were coming, and we returned to McMurdo seven hours after takeoff, having flown for three and a half hours. Great day - super! Thanks, taxpayers.

The next day we flew to the South Pole in a Hercules LC-130. After being in a

chopper shooting over mountain peaks, zooming down valleys, eyeballing icefalls from close range, flying at 24,000' seemed anticlimactic. In the old days, flying to the South Pole in an R4D meant flying several thousand feet above the Beardmore Glacier, looking up at tributary glaciers! Nowadays you miss all the lower half of the glacier, although the Upper Beardmore is still spectacular. It is hard to put into words how I felt about returning to the South Pole after 28 years. I have to remain loyal to the Siple-built station where I lived very comfortably for a year, but I also have to admit that the current station is the Grand Prix. Even though I had seen many pictures of it, walking under the Dome is an uplifting experience, its magnitude is overwhelming. It's more impressive than I thought it would be, but the loud rock music in the mess hall made me very cognizant of the fact that it was actually better in 1958! One can get used to women at the South Pole, but how can one live with that kind of music and maintain any sense of sanity? Incidentally, I was welcomed at the South Pole by Ellen Mosley-Thompson - the Devil sent her to greet me! My biggest surprise at the Pole was to find an honest-to-goodness, full-sized bathtub; next was the luxurious Sky Lab. By the way, Bergy Bits talked at some length with the station's doctor, Nancee Schaffner. She is a big improvement on Lt. Vernon Houk, that's for sure.

The rest of the time was spent in and around scenic McMurdo. A trip was made to Hutton Cliffs, and I wondered whether Don Siniff actually pays NSF for the privilege of going there. If he doesn't, he should at least forfeit all pay, as this is a beautiful spot. Mt. Erebus is in one direction; Mt. Discovery in the opposite direction; another quadrant has the Erebus Tongue; while opposite it are Hutton Cliffs, which had beautifully overhanging cornices of snow when we were there.

Bergy Bits remained at McMurdo for some extra days because of a middle-ear infection, and this gave me the opportunity to go fishing with Art DeVries. I found Art to be a throwback to the kind of people who were in Antarctica during the IGY, and I thoroughly enjoyed his company and appreciated his taking me out to his fish shacks. He took along a few cans of Budweiser, and after he got through with his work, we all sat around the hole drinking beer and talking Antarctica. One night we had smoked filets of cod and sushi after we got back to Eklund Laboratory. Art has several articles in print about his current Antarctic research, but probably the most readily available one is in the November issue of Scientific American on "Antarctic Fishes," coauthored with Joseph Eastman. Other articles about his findings are in the November 22, 1986 issue of Science News, and in the September-October 1986 issue of Sea Frontiers.

Bergy Bits felt that one thing had changed drastically since the IGY, and that was the clarity of the air at McMurdo. It seemed as if the arctic haze problem has arrived in Antarctica, because I don't recall it existing there in the three separate times when I was in McMurdo in 1957 and in 1958. Were we there during a period of poor visibility, or is the visibility deteriorating in Antarctica? Anyone any thoughts on the subject?

Leaving Antarctica wasn't traumatic; all too well I realized that time had passed me by, that my remaining years should be spent pursuing outdoor sports. Going to the plane, I found a former cohort from the Corps of Engineers, a retired expert on the mechanics of snow for the Cold Regions Research and Engineering Laboratory, Al Wouri. He had been at the South Pole with a contractor trying to find the right mix of pulverized snow and sawdust which would allow wheeled planes to land at the South Pole. When I had gone south on the USS CURTISS thirty years before, another CRREL scientist, Austrian Andy Assur, was with us to solve the problem of how to get open holes in the runway - where planes had crashed - to refreeze. So thirty

years later, here I was with another CRREL man, but the stage had shifted from McMurdo to the South Pole. So some things change only slightly. It was great to represent the other 135 IGY Antarctic scientists, and I came back knowing that I was there in the right era; even though it is great now, it was better then!

**TREKKING IN NEW ZEALAND.** Bergy Bits has long felt that the real lure of the Antarctic has been New Zealand. Kiwiland has something for everyone, not the least of which are its recreational assets. If you like white-water rafting, there are forty-nine fully licensed outfits waiting to take you rafting on some of the most exciting rivers one will find anywhere. It is probably the leading growth industry in New Zealand. However, if you aren't that adventuresome, may we recommend some of the best walking trails in the world. Most of you probably have heard about the Milford Track; many of you have had the pleasure of walking it, either as part of a guided tour or as an independent walker. But there are eight other major tracks in New Zealand, as well as a very exciting new one being constructed in the Kepler Mountains which will open in 1988. In addition to the major tracks, there are probably over a hundred other challenging trails available for the more adventuresome.

Bergy Bits did two tracks in December - the Milford before Christmas, the Routeburn before New Year's. The former was immortalized when someone described it as "the finest walk in the world," and if you are rain tolerant, I am sure it is. However, the Kiwis have a love affair with the Routeburn, and I was directed by their Washington Embassy not to return to the States without doing that track. Both are in Fiordland, and are practically adjacent to one another, so one can go from one to the other without missing a step or a heartbeat. It also means that you can walk both tracks and never see the sun, as rainfall is close to 300" per year, and it doesn't discriminate in that area of New Zealand. One trekker from California wrote in the hut at Routeburn Falls that walking the Routeburn was like standing in a cold shower tearing up twenty-dollar bills! At times you feel like that's what it's all about, but rain on the Milford can also be a blessing, as it is essentially a long, four-day valley walk, and when it rains, the walls of the valley become a myriad of spectacular waterfalls cascading down to the valley floor. Once I stood and counted over twenty-five beautiful falls within half a mile. In an effort to escape the commercialism of Christmas, Bergy Bits signed up for the last guided group before the holiday, and found himself with twenty-three others of the same ilk - well below the Track's normal number of forty-two. It rained on four of the five days, but the heavens parted and gave us a beautiful day to cross McKinnon Pass, so we had to be doing something right to be graced by the Lord with a fine day when we were on the most spectacular part of the Track. On the Routeburn, it rained only two out of the four days, but unfortunately one of those days was when we were highest up, had a large number of miles to cover, and the wind brought the rain horizontally smack into our faces.

What are the differences between the Milford and the Routeburn? The big difference is in the terrain, the facilities, the meals, the organization. The Milford is essentially a well-maintained valley trail of 54 kilometers; the Routeburn is a mountainous track of 39 kilometers. If you like botany, have an affinity for lovely ferns, take the Milford, as it is beautiful; if you like to look long distances down into valleys and at spectacular mountain scenery, go Routeburn and pray for sun. The Milford is very well organized, and everyone is walking in the same direction, with the independent walkers (the so-called Freedom Walkers) well ahead of you as they stop at special huts and are on the trail ahead of you. If you so desire, you can walk the Milford in solitude and have the whole world to yourself. There is no such privacy on the Routeburn. It can be and is walked from both directions;

there is no control over the number of independent walkers; and it is something like being on a freeway around Los Angeles or walking the Presidential Range in New Hampshire with people everywhere. On the Milford, you stop at well-appointed huts maintained by husband-wife teams, get a good meal, get an evening slide show over what you have covered and what you can expect the next day, and are in constant walkie-talkie communication with others up and down the line, so you don't get hung up in water over your neck, although we walked through water which was nearly waist deep. The facilities on the Routeburn aren't so plush, your guides carry the food, and you share in the housekeeping. The only communication is in the evening when they check with the boss man in Queenstown. The Milford Track ends with a bang - you stay at a really plush hotel at Milford Sound, have a break-up banquet (where such creatures as the little blonde pixie, Martina, from Stuttgart show up in an off-the-shoulder gown), and then, on the morrow, a great two-hour trip on the Milford Sound on one of the fantastic Red Fleet boats. It's a great finale! On the Routeburn you hop on to a bus making ranch stops enroute to Queenstown where they dump you on the street, an inglorious ending to a fantastic walk. But I think the Kiwis like the informality of the Routeburn over the more regulated Milford, as almost universally I heard them singing the glories of the Routeburn. The biggest advantage the Routeburn has over the Milford is that the track is above the flying limit of the sandfly, and it has less keas. If there is a more miserable damn bird in this world than the kea, I hope I never come up against it. It's very common in Fiordland, and will attack anything left outside - boots, raincoats, windbreakers, anything and everything. It's raucously loud and disturbing, and is no respecter of sleeping hours. Price-wise, the Milford is about \$US345, the Routeburn \$US220.

I would like to walk both trails again tomorrow, as each is so different. At 63, I was the oldest on the Routeburn, the second oldest on the Milford. There is no problem keeping up with people, as it isn't all that rough. Recently a woman 79 and a man 81 walked the Milford. For the first time in history, a blind man walked the Milford. They never accept blind walkers, but because this man showed up at Christmas time, they didn't have the heart to turn him down; so they gave him a special guide, and he did the whole track. What a great gesture by the Kiwis, what a great performance by the blind man! The Milford is heavily booked into next season, but you can generally find openings on the Routeburn. There is more of an international group on the Milford, which I found interesting; while the Routeburn is more of an Australia-New Zealand-United States-England mix. The Milford is described in the January 1978 National Geographic; the Routeburn was written up in the New York Times, September 19, 1986. If you are interested in finding out more, contacts are, for the Milford, Tourist Hotel Corporation, P.O. Box 185, Te Anau, New Zealand; for the Routeburn, Tourist Hotel Corporation, P.O. Box 271, Queenstown, New Zealand.

**AND THEN THERE WERE EIGHT.** John Bird, 80, crewman on the CITY OF NEW YORK, 1929-1930, died in Georgetown University Hospital on 11 January following a stroke. According to BAE I archivist, meteorologist Henry Harrison, that leaves eight known living members from the first Byrd Antarctic Expedition - Leland Barter, Carroll Foster, Eddie Goodale, Larry Gould, Howard Mason, Dean Smith, Norman Vaughan, and Henry, himself. John, like several other members of that expedition, was a graduate of Harvard. He once was firearms editor for Sportsman Magazine, knowledge which presumably he might have had an opportunity to use while on active duty in World War II and the Korean War. He attained the rank of colonel in the Army, and was awarded the Legion of Merit. In the early 1950's, he joined the Office of the Chief of Ordnance, and sixteen years later, in 1967, retired as chief of the Army Materiel Command's Technical Forecasting and Objectives Branch. However, he continued as a consultant to the Army until the mid-1970's. We can't tell you much about him, but he carried himself very erect, was very distinguished looking, and very quiet - typical Harvard man!

**CANHAM'S ASHES GUARD ENTRANCE TO MCMURDO SOUND.** The cremains of Dave Canham, Builder of McMurdo Station, senior Naval Officer at McMurdo in 1956, were taken up the north side of Mt. Erebus on 27 October 1986 where Chaplain Timothy Sims, Commander Rightly Perry (deputy Commander of the Naval Support Force Antarctica), Lt. William Gerardi (Force Medical Officer), and Lt. Harry Koerner (Medical Administrative Officer) conducted the Memorial Service. They flew about a hundred meters above a sharp outcrop of rock called Abbott's Peak (named for Petty Officer George P. Abbott, RN, British Antarctic Expedition, 1910-13), about half-way up Mt. Erebus. Chaplain Sims wrote Dave's widow, Betty, that the site has "a lovely view north past Mt. Bird to the open water. It would be possible to see the ice forming and breaking up there each year, and the icebreakers coming down to McMurdo. The white of the ice and snow, under the bright sun, made a dazzling contrast to the deep blue of the open water to the north. It was high enough, and windy enough, to be quite cold that day, even with the bright sunshine."

**RALPH LENTON'S ASHES TAKEN TO SOUTH POLE BY SON ANTHONY.** Bergy Bits pretty well covered the death of his friend, Ralph Lenton, in the October 1986 Newsletter. His ashes were taken to the South Pole by his son, Anthony, and Chaplain Sims this past austral summer. Bergy Bits thinks it is very appropriate that Ralph's cremains were left at the South Pole, as not only was Ralph an important member of the first trans-antarctic expedition (British Commonwealth Transantarctic Expedition), he thoroughly enjoyed their delay enroute while staying at the South Pole for five or six days in mid-January 1958. I often tell people that Ralph never slept at the Pole, that he spent all his time in the galley drinking coffee and telling stories about the crossing. His Memorial Service was conducted at -40°C or F (take your choice) with a 10-to 15-knot wind - a typical Lenton day! Sims wrote "a bright sun picked out ice crystals in the air around us, the crystals swirling and dancing in the light like the heavenly hosts as we prayed 'Eternal rest grant him, O Lord, and let perpetual light shine upon him'." There should have been an addendum mentioning hot coffee! But what an appropriate place for Ralph's ashes. Scott may have gotten there first, but Ralph's are the first British cremains to remain there.

**GREENLANDAIR TWIN OTTER MAKES HISTORIC FLIGHTS.** How would you like to fly to and from Antarctica in a deHaviland Twin Otter? Well, it was accomplished during the past austral summer season, when a Greenlandair charter, piloted by Sven-Olof Ahlquist and Jan Friden, with engineer Allan Laugensen, flew 1200 miles from Invercargill on 12 November 1986 to an iceberg. The berg, located at 60°S, 169°E, was approximately 800 meters by 800 meters, about 80 meters high. Then a helicopter from the Norwegian research vessel AURORA flew fuel to the plane so that it could continue its flight to Cape Evans. But on its way back in late December, the same plane outdid itself, flying all the way from Moubray Bay at 72°11'S, 170°15'E (between Cape Roget and Cape Hallett) to Christchurch. Originally the return flight was scheduled into Invercargill, but when they got favorable winds, the pilots decided to fly all the way to Christchurch. The Twin Otter and the AURORA were both in the Antarctic in support of the 90 Degrees South Expedition led by Norwegian glaciologist, Monica Kristensen. The AURORA found a suitable landing strip for the Twin Otter near the Bay of Whales on 12 December. From there the aircraft laid out five supply depots across 1350 km, crossing the Ross Ice Shelf, up the Axel Heiberg Glacier, across the polar plateau past Titan Dome. The last drop was within 120 km of the South Pole.

**90 DEGREES SOUTH EXPEDITION DOWNGRADED TO 86 DEGREES SOUTH, ABOUT-FACE EXPEDITION.** For the past several years we have been hearing a lot about the 90 Degrees South Expedition, the one where the world's best looking glaciologist was going to follow

Amundsen's route to the South Pole, utilizing his means of transportation, dogs. However, for one reason or another, which are unknown to us, Monica Kristensen, Neal McIntyre, and two Norwegian dog drivers, plus their twenty-two dogs, were real late in getting underway from the Bay of Whales, not leaving until 16 December - past the date of Amundsen's arrival at the South Pole! She was defeated before she even started. Amundsen required 53 days to go to the Pole, and he came back in 39 days, a total of 92 days. Pretty good statistics. Monica's trail support had been laid out by the Twin Otter, so they hoped to be able to beat Amundsen's overall time. The real bad news was that her ship, the AURORA, was to come by the Bay of Whales about 28 February to pick up her party - only 74 days after her departure. So she had to pick up 18 days from Amundsen's overall trip. When she reached the top of the Axel Heiberg Glacier, she was dead even with Amundsen's time, but had not picked up any time, even though caches had been laid out ahead of her by Greenlandair. Then, for some inexplicable reason, she laid over there for almost ten days while she contemplated what she should do. If she had continued right on, she would have reached the South Pole, some 265 miles away, while we still had flights going there. However, she had no assurance that the Americans would fly her out. She asked the National Geographic if they could supply a rescue plane, probably hoping they would hire Giles Kershaw or a look-alike to bring them back from the South Pole. However, the National Geographic was very affirmative in their negative reply. She deliberated so long at the top of the glacier that it got down to whether she wanted to play Shackleton and forget the Pole, returning on home, or whether she wanted to play Scott and go on at all costs. Not being British, she decided to go home; a valiant warrior is really much better than being a cold dead heroine, particularly when you have most of your life in front of you. Besides, a rerun of Scott would not play on today's stage; instead of being sainted, she would have been looked upon as a fool.

They will be talking about this one for a long time, but we don't think that Monica had a real choice. She had cut her legs off by getting such a late start, and Antarctica is not very forgiving for those who make miscalculations. It will be interesting to see what she tells the press when she gets back to civilization. Let's hope that, as custodian of the South Pole, the United States does not get blamed for the failure of the expedition; after all, it's quite obvious where the blame lies. Let's also hope that she pursues her chosen professional career of glaciology and leaves the adventuring to those who can't make it as scientists. Bergy Bits imagines that folks like Will Steger will now redouble their efforts to go to the South Pole by dog teams. However, let's hope it doesn't become the Iditarod of the South.

**RUB-A-DUB-DUB, FOUR MEN IN A TUB --- GOING NOWHERE.** A Dartmouth man and three companions were going to row across the Drake Passage this austral summer in something called the SEA TOMATO, but they aborted the trip, and left me holding a lot of funny material absconded from Adventure, Outside, and the Dartmouth Alumni Magazine. They were towed out of Punta Arenas on 4 January, and were going to take off for the South Shetland Islands as soon as they got favorable conditions. But something must have happened, as they are all back in Punta Arenas, and the material I thought was so funny doesn't sound so funny anymore. With Monica turning back, with Ned aborting, what is happening to these gallant adventurers?

There's no way anyone could love this guy Gillette unless you happened to be his mother. Some of his critics present him as nothing more than an opportunistic, entrepreneuring fraud, although he was a good cross-country skier, having been on the U.S. Olympic team once upon a time. One of the things he supposedly did was

ski around Mt. Everest between 17,000' and 27,000', but it seems that at the time of the year when he was doing the skiing, there was no snow on much of the mountain. When he supposedly was in the middle of that expedition, he showed up in Las Vegas as a representative of one of his sponsors at a trade fair!

One of his partners in this latest endeavor was Mark Eickenberger, whom many of you Antarcticans know from his employment by ITT around the Antarctic Peninsula. As we go to press, we don't know what Gillette plans to do. He received \$110,000 in cash and \$80,000 worth of navigation equipment and foul weather gear for this undertaking. He also had supposedly lined up assistance from the Chilean Navy, Air Force, and Hydrographic Office. Bergy Bits believes he will make another attempt next year, as he was quoted in the Dartmouth Alumni Magazine as saying, "This is the grand finale. For this one I've put together everything I've learned over the years. Everything has been focused on this now for three years. How often do you get a chance to really leave your signature on something?" If he really means that, doesn't he have to go back next year and sign off on those waves?

For you boat lovers, the SEA TOMATO has nine watertight compartments and is self-righting (not to be confused with self-righteous). It has a small cabin midships and rowing cockpits fore and aft with gliding seats. It has sophisticated navigation gear, a satellite tracking system, automatic self-steering, an emergency sailing mast, and could carry supplies for thirty days. Gillette was planning to do some skiing in Antarctica, before returning to the islands and flying back to Chile. He was going to do a documentary for television, and was going to write something for the National Geographic. Downstream, he hopes to get into photo-journalism.

**GREENPEACE HAS LANDED.** Thanks to small donations from its one and a quarter million members, Greenpeace has fielded a \$NZ2.6M expedition to Antarctica. They departed Lyttelton, New Zealand on 6 January and arrived safely at Cape Evans on Ross Island later on in the month. Thirty-five men and women were aboard the GREENPEACE, although only four are wintering over. Present plans are to occupy the camp for two years, although an entirely new staff will winter over in 1988. Base leader is Kevin Conaglen, a 26-year old professional guide at Mr. Cook, who was a camp malcontent when he wintered over at the New Zealand Antarctic base at Scott in 1985. He was reprimanded by his employer, the DSIR Antarctic Division, because of his talking with the media. He claims he found it difficult to slot back into life because of government pressures. He was quoted as saying, "What I like about the Greenpeace thing is freedom from government influence. I expect the expedition to highlight such things as the pollution and chemical dumpings at Antarctic bases." So he sounds like just the right man for heading up Greenpeace operations in Antarctica, as he comes already brainwashed. The base scientist is Gudrun Gaudian of West Germany who supposedly "will conduct scientific studies on fish life and pollution." Bergy Bits read in one Kiwi paper that she said relatively little research has been done on Antarctic krill, and that she would be studying them during her year at Cape Evans. That tells a lot about her knowledge of what has been transpiring in Antarctica for the last two decades. Their medical doctor is Dr. Cornelius van Dorp from Holland and New Zealand. He has been very impressed with the medical kit supplied by Greenpeace, and said, "I could perform open heart surgery down there." Presumably this might be required because Antarctica is so badly polluted. The other member of the team, Justin Farrelly, is a New Zealand telecommunications technician who doubles as a helicopter pilot. Telex and facsimile equipment will keep the base in touch with Greenpeace offices around the world, and send out color photographs.

They will be living in a well insulated, prefabricated plywood hut, 16 meters long

by 6 meters wide. Two diesel generators will heat and light the hut, as well as power the video player for which they have 150 films. They will have fresh lettuce and tomatoes throughout the winter, thanks to hydroponics and special lighting - plus no pollutants, no doubt. They aren't going to tide-crack any rubbish, and all of their effluents, except for washing waters, will be returned to New Zealand in drums. Boy, you should be able to smell those drums several hundred miles off Invercargill. It looks like Antarctica's loss will become New Zealand's gain, or are they going to keep carrying those drums around the world to show their supporters that they left Antarctica pure? Greenpeace is hoping that operating a base at Cape Evans will qualify them for observer status in the Antarctic Treaty Consultative meetings. However, if this does not happen, they are going to continue to lobby for Antarctica being declared a world park, which they have been campaigning for since 1982. Their ship GREENPEACE, a converted tug, sported a banner on the bridge deck proclaiming "World Park Antarctica." I read in a Wellington paper that Bob Thomson, Director of the New Zealand Antarctic Division, said something to the effect that Antarctica has been an international scientific park for several decades, that Greenpeace wasn't proposing anything new. Anyway, Greenpeace is finally in Antarctica, for better or for worse. In the meantime, stand by for those colored pictures of how all the bad guys are polluting Antarctica.

#### **DEWITT REVIEWS SHAPLEY'S "THE SEVENTH CONTINENT: ANTARCTICA IN A RESOURCE AGE."**

One of the hardest jobs is to find someone neutral to review an Antarctic book. Ruth talked her son-in-law, Hugh DeWitt, into reviewing *THE SEVENTH CONTINENT*, and here it is:

As Deborah Shapley states in her preface, this new book "...differs from most Antarctic writing ...". Its major focuses are the role the United States has had in the Antarctic, the workings and history of the Antarctic Treaty, and some possibilities and probabilities in the future for both. As such it emphasizes aspects of history not often covered by the standard accounts, which enlarge upon the heroic age and similar aspects of the expeditions of Byrd and Ellsworth, etc. Shapley focuses more on the way science and politics have interacted, the political desires of US Antarctic leaders, the political implications of their expeditions, and the reactions in Washington to the claims made (and made possible) by these expeditions.

For example, I was surprised by the number and extent of claims markers left by sledge parties or dropped from aircraft by numerous expeditions from those of Byrd on, and about the debates in Washington over whether the US should make territorial claims based upon American discoveries and activities. I was never made more aware of the predominance of US Antarctic exploration up through at least the IGY. Similarly, Shapley's discussion of the IGY and the manner in which science and national interests were wedded made sense to this naive reviewer. I participated in the 1958-59 season, a transition period between the IGY and USARP (for a brief time called CARP) programs. I remember wondering how my interest in Antarctic fishes justified the cost of sending me down to the Ross Sea and McMurdo. Shapley describes how scientists were able to make agreements between countries for the mutual benefit of their researches (e.g. in preparing for the IGY) which later influenced the politics surrounding the Antarctic Treaty. Her story of how the US fell into the responsibility of Pole Station is amusing.

The author also describes how the treaty nations, in responding to pressures created by science activities and using treaty provisions designed to assure the continued access to Antarctica for scientific and peaceful purposes, broadened the treaty's functions and responsibilities through a series of

agreements and conventions. These began with purely conservation measures such as designating areas of preservation or special scientific significance, but were expanded to include regulation of ocean resources in the Convention for the Conservation of Antarctic Marine Living Resources. Thus the original treaty, which concerned itself with land and ice areas south of 60 degrees South and specifically stated that the high seas were under international law, came to regulate, through CCAMLR, a pelagic resource encompassing all the area inside of the Antarctic Convergence and then some!

Shapley's real aim, however, is to present the current status of both the US Antarctic program and the Antarctic Treaty, point out their strengths and weaknesses, and present some possible changes. I agree with much of her assessment of the US program and the problems that our National Science Foundation has had in administering it. The US program is unique in this regard. I think Shapley is correct that some kind of Polar Research Institute should be developed, but I don't agree that it should replace all of NSF's USARP activities. The university/research-institute proposal system has worked well in general and is suitable (perhaps even desirable) for many aspects of Antarctic research. Where USARP has had most difficulties is in long-term programs, such as resource assessment, and in managing the laboratories and logistics, where NSF has no permanent personnel and must rely on contracted services. I am not able to comment on her assessment of the Antarctic Treaty, the signatory nations, and their relations with the United Nations, third world countries, and with each other regarding the problems of mineral resources. The ideas she presents are certainly thought-provoking, however.

The volume is well edited by Resources for the Future, Inc., and I found few typographical errors (e.g. on page 110 "Marconi" should be Macaroni [the penguin]). There were a few places which showed, I think, that Ms. Shapley is not personally familiar with the Antarctic and its biota. For example, her description of the Antarctic Convergence as an area where "...great water masses.... collide with the cold Antarctic surface water....The resulting turbulence creates an oceanic barrier..." is both inaccurate and misleading (page 2). Again, on page 28, the "...unique ten-legged spider..." found by James Eights is a sea spider or Pycnogonid, not a land arachnid as implied. But these are minor blemishes in an otherwise attractive, well-produced and thoughtful work. Whether or not one agrees with everything Ms. Shapley presents, *TEE SEVENTH CONTINENT* is worth reading by anyone interested in the Antarctic and its future.

**PETER WEBB REMEMBERS PHIL SMITH.** The last, endless non-newsletter brought several responses into the Nerve Center, and one which we would like to share with you came from the Chairman and Professor of the Department of Geology and Mineralogy at The Ohio State University, Peter Webb.

Here are a few of my impressions of the 1957-58 season in the McMurdo Sound area. In 1957 Barrie McKelvey (now on the faculty at University of Armidale, N.S.W., Australia) and I were seniors at Victoria University of Wellington. Early in 1957 we decided that a trip to Antarctica might be an interesting way to spend an austral summer. We volunteered our services in any capacity during a visit to Transantarctic Expedition headquarters in Wellington. Result, thank you but no thank you. U.S. Deep Freeze Globemasters were droning their way over Wellington the previous summer, and this sparked the idea of joining the U.S. IGY expedition. We presented ourselves at the U.S. Embassy and were received by a kindly if somewhat bemused Military Attache. He

thought our arguments were all very reasonable, said "sure" and said he'd get back to us after sorting out arrangements with the Deep Freeze office in Christchurch. So far so good. This apparent end-run around the Trans-antarctic Expedition and International Geophysical Year authorities was duly relayed to New Zealand administrators by our "patron" Professor Bob Clark, who seemed to relish the prospect of international meddling. In a matter of days we were invited to join NZTAE/NZIGY, as cargo handlers on HMNZS ENDEAVOUR. The catch was, "you will go down on the ship, help unload cargo and come straight home to New Zealand." So in late 1957 we sailed into McMurdo Sound very uncertain of just how long our trip would last. For several days we drove those little kiwi farm tractors back and forth between the ship and Scott Base and were fortunate to run into Phil Smith, George Dufek, Ed Hillary and Harry Wexler. This was a stimulating group of leaders. They were excited about Antarctica and its potential for exploration and science. Strategies evolved by the hour and it was a privilege for this fledgling geologist to just watch them in action. These were heady days indeed. Ed Hillary extracted us from cargo-handling and moved us to Scott Base. One of us joined Ron Balham, Dick Barwick and Andrew Packard on a two-week visit to Wright and Victoria Valleys, an excursion that resulted in the first maps and geologic and biologic details of the northern part of the dry valley system. We used the cumbersome old helicopter "King Pin" (King Pin Nunatak) during these trips. In those days you could actually get lost in the dry valleys and helo pilots were very apprehensive about just where they were going. We were after all using 1910-1913 maps and Wright and Victoria Valleys were then uncharted. Phil Smith had been following our activities and also knew we were being sent home on the TOWLE or GRENVILLE VICTORY. It seemed safer to be living at McMurdo than at Scott Base. So with Phil's help we joined USIGY and took up residence at the far end of a darkened jakesway, filled with Sea-bees. Very educational! While at McMurdo that summer we ran into Troy Pewe and Jim Zumberge. The latter introduced us to the joys of the SIPRE corer during trips onto the ice shelf. I vividly remember Jim shouting down into a deep hole as I labored to dig a frozen corer head out. His abilities to command people were well developed even at that early stage. About this time the McKelvey and Webb names were again starting to emerge near the top of the "repatriate to New Zealand-urgent" list. Phil Smith provided a helicopter and field gear and suggested we "go west" fairly soon. This we did. From time to time New Zealand authorities attempted to retrieve us but Phil seemed to be able to arrange bad weather, poor radio conditions and helicopter problems at will. This allowed us to get a lot of useful geological work done on Beacon Supergroup successions in Beacon Valley and upper reaches of Taylor Glacier. Later this work was to become part of our M.S. theses. Before long it was February and we really did have to go north. As I look back thirty years to IGY I say a big thank you to Phil Smith for teaching me a few long-remembered lessons on how to progress and survive in spite of the system.

**LC-130 LOOKS GOOD.** As we go to press, NSF is about to issue a press release on the reclamation of an LC-130 damaged in 1971 near the Adelie Coast. They have already salvaged four engines and three struts which have been sent back to California for overhaul, and they will soon be back in the Navy's inventory. The fuselage was inspected by representatives of the manufacturer, and found to be in good condition. It is now sitting on top of the snow surface, and next year will be flown out. There are two great benefits in getting the plane back - one monetary, one supply. The

total cost will probably run between \$7.5M and \$9M; the cost of such a plane today would be on the order of \$28M. Since the planes are only made on order, getting one back is a big plus on the inventory side.

**SNOWBALLING.** Congratulations to two of our Society members, *Thomas N. Taylor* and *Edith L. Smoot* who were married recently. Edie has left Hope College in Holland, Michigan and has joined TNT in the Institute of Polar Studies at The Ohio State University . . . . . Also our heartiest congratulations to our whale spotter - someone said it was real sexist to call her our whale spotteress, so whale spotter it will be - *Dotte Larsen*, who for years has been dreaming of becoming a poster girl. She finally has made it with The Center for Environmental Education printing a large 17"x24" colored poster from one of her pictures of two King penguins. She previously made a Sierra calendar, I believe, and she has some photos in that worldwide traveling Antarctic art exhibit. Dotte has been having some arthritis problems this winter, so may be forced to stay home occasionally with The Professor. That will cramp both of their life styles . . . . . *Franklin Dukes*, who was a member of the 1967 State Department Antarctic Treaty Inspection Team, is an active ham (KB4MUF), and he would enjoy a QSO with any Society member who is a ham. He says he can be found most days on 21.385 Megahertz at 1430 hours EST. Franklin lives outside of Charlottesville, and apparently is none-the-worse for having sailed on that inspection trip with my old buddy, *Admiral Mike Benkert* . . . . . There's a new book out, *WOMEN ON THE ICE*, by *Elizabeth Chipman*. It's a history of women in the far south, and was published in Australia, where it sells for \$A28.50. A woman I met on my trip suggested that perhaps Ms. Chipman picked the wrong title, that it might have been more realistic if she had entitled it *COLD WOMEN*. Anyway, it's out there if you want to buy it. . . . . If you haven't already, you all will be getting a flyer on *Stephen Pyne's THE ICE: A Journey to Antarctica*. I like the way Steve writes, so hope to write a review of it for the next Newsletter. *Guy Guthridge* says it's a great book, and it has gotten excellent reviews. *Bergy Bits* hopes someone buys the book so Steve can come up with six bucks to pay his delinquent Society dues. . . . A lot of people in the Division of Polar Programs were extremely unhappy with *Charles Welder's OVERFLIGHT*, but The Washington Post found a sympathetic reviewer in *Dennis Drabelle* who gave it a good review in its 9 January 1987 edition. *Mildred Crary*, an aspiring novelist and Guardian Angel of First at Both Poles, *Bert Crary*, is reviewing it for our next Newsletter . . . The *David W. Canham, Jr.* Library and Conference Room was approved by the University of Texas System Board of Regents on December 4, 1986. They have received about \$2500 to date, and the funds will be used to improve the existing facility and add materials to the library. Additional contributions will be most appreciated. Contact *Dr. Robert H. Rutherford*, President, University of Texas at Dallas, P.O. Box 830688, Richardson, Texas 75083-0688 . . . Argentine scientists have discovered the first fossils of dinosaurs ever found in Antarctica. . . . The fossils, found by an expedition under the direction of *Eduardo Olivero*, consist of part of the skull, a scattering of other bones and parts of bony plates that armored the dinosaur's back . . . Newly unsealed papers of the late *Sherman Adams* provide an inside look at the Eisenhower administration, . . . and even on Antarctica policy. . . *Murray Hamlet* of the Army Research Institute of Environmental Medicine (and an occasional, illuminating speaker on cold weather clothing and injuries at the USAP September Orientations) has done it again. In an article in The Washington Post on 22 January 1987 on how to dress for the cold, he was quoted as saying, "Clothing is like sex - the first part and the last part are the most important." . . . *Franklin Dukes* has suggested that we change the name of this column from *Bergy Bits* to *Brash Ice*. I only wish that I had been clever enough to have thought of that back in October 1978. *Bergy Bits* was used because back then we wrote real short paragraphs. In it, Franklin writes, "Brash seems to describe your style!" Love it . . . .

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22206

*ROOM 540*

*- Light Refreshments -*

Steve Dibbern is an "adverse terrain vehicle" expert with the Army, and as such has been mainly concerned with oversnow vehicles and air-cushion vehicles (hovercraft). He has been bumping around in various vehicles in Alaska, Canada, Sweden, and Antarctica for the past twenty years. Several years ago NSF asked Steve to go to McMurdo to do a survey of their vehicles uses, which he did. Then this past austral summer he returned to the ice to follow up on some specifics of his first year's suggestions. He has recently written a Letter Report in which he recommends utilizing a 1- to 1.5-ton, pay-load-class type air-cushion vehicle around McMurdo.

Steve, is a geographer by education and an Antarctic historian buff by choice. He recently coauthored (with Dean Freitag) an article on Doc Poulter's Snowcruiser, without a doubt the most publicized vehicle ever taken to the ice. Away from the office, Steve is a sailor, but he evidently doesn't believe in wind power, as he is currently building a steamboat. So his transportation interest sort of covers the whole waterfront, loosely speaking. It should be a very interesting presentation, and he might even be able to tell Washingtonians how to drive on snow!

Last meeting of the 1986-87 year - MAY 12th at NSF - with Dr. Richard Williams, USGS on "Global Monitoring of Glaciers"

Please notify us if you did NOT get Newsletter No. 4 announcing Lanzerotti's Lecture!

An independent, non-authoritative, highly prejudiced collection of items about Antarctica put together by a single member of the Society to meet its requirements for a Newsletter. After fifty-five Newsletters, we came up with egg all over our face on the cover sheet of the last issue. We had the right date, but the wrong day of the week. As we don't aim for perfection, and since Friday is close to Tuesday, we were close - but not close enough. We hope no one was led astray. We got the input for the cover the morning of the printing, and in our haste, did the mockup with our head in the snow.

**ADMIRAL OF THE ENDS OF THE EARTH.** This was the title of a rather lengthy article on the late Admiral Richard E. Byrd which appeared in the Boston Globe Magazine for 1 February 1987. It was written by William A. Davis, a travel writer for the newspaper. If you left out the North Pole controversy - who really cares, anyway? - the article becomes interesting in other respects. Davis described Byrd as "one of the most famous and lauded men in America ... Byrd was an elusive figure, highly visible but with most of his feelings and motivations well hidden. Familiar to many, he was truly known by very few. Byrd was capable of inspiring both admiration and hatred. To all appearances an honorable and selfless officer and dedicated scientific pioneer, he seemed the epitome of noblesse oblige. But some who knew him well charged that he was an egotistical and ruthless man who took credit for the achievements of others and used fraud and deception to further his ends." Bergy Bits never had the honor of really knowing the late Admiral, although he did steer me into the IGY programs. But I have had the pleasure of sitting in the company of many Byrd people, talking to many at some length, and the common thread that seems to come out of all conversations is that the Admiral had a deep concern for his men.

There are very few books on the late Admiral, one of the reasons being that his papers were not available for researchers and biographers. Davis wrote, "Over the decades many documents were lost or mislaid, others were damaged by dampness or mishandling. Protective of his memory, family members denied would-be biographers access to Byrd's journals, personal papers, and expedition records - the scholarly materials" needed to flesh out the skeleton of his historic reputation." As most of you know, the Institute of Polar Studies (IPS) at The Ohio State University bought from the Admiral Byrd Foundation all of Byrd's papers in the Foundation's possession for \$155,000. Proceeds from the sale of the papers, along with existing assets of the Foundation (\$417,000, largely derived from the sale of Byrd's Brimmer Street home on Beacon Hill, Boston), were given to Ohio State to establish a research fellowship at the Institute as a living memorial to the Admiral and his wife. But let's go back to Davis, "Admiral Byrd himself was fastidious, so it is ironic that many of the most useful scholarly clues to the mysteries of his life - that is, the most personal and revealing documents such as journals and letters - were among the moldering contents of several plastic garbage bags, part of the material widely dispersed when the Brimmer Street house was sold." Peter Anderson of Ohio State said that the most valuable documents in the Byrd collection were found in the basement of a Newton house, where they were about to be thrown out as trash. Kenneth Rendell, a document dealer who appraised the Byrd papers for the Foundation said, "The stuff in the trash bags was really gold.

Most of the other material was mechanical files with no sense of the man. Every thing personal was literally in trash bags or Star Market bags. It was badly stained - it couldn't have been much worse if it were kept under water. A couple of more years, and it probably would have been lost."

Relative to the above, The Ohio State University has officially announced the Byrd Fellowship Program. It appears to be restrictive to post-doctorals who have received their PhD degree within five years of selection, really narrowing the number of qualified candidates. (See following section). The purpose "is to provide fellowships at The Ohio State University to men and women with distinguished academic backgrounds pursuing advanced research on either Arctic or Antarctic research problems." The awards carry a stipend of \$24,000, plus a research and travel add-on of \$3,000 per year. The starting dates would be sometime between 1 July and 1 October, and the awards are for one year. Selection will be made by a committee consisting of the Director of IPS and members from the University and polar communities. For further details contact the Byrd Fellowship Committee, Institute of Polar Studies, The Ohio State University, Columbus, Ohio 43210 (love that zip!).

One thing which is of interest to Bergy Bits, and hopefully to our Society, is what sort of recognition will be given to the late Admiral's 100th birthday a year from October 25th. Since Ohio State University is now the home of the Byrd Polar Research Center, it would seem that they should be the logical place for some sort of a commemorative program. Our membership shows a growing number of important polar people in and around the Admiral's adopted home of Boston, and perhaps Brad Washburn of the Boston Museum of Science could be talked into holding a suitable seminar. There is some precedent in going there, as he/they did host the big polar dinner for the Man Living in the Arctic symposium in 1959 (or was it 1960?). Anyway, food for thought, although if anything big is to be done, it should get underway this spring.

**ANTARCTIC DISSERTATIONS, 1983-86.** In our December 1983 and January 1984 Newsletters we published listings of PhDs on Antarctica obtained since time immemorial in the U.S. We found 191, dating back to 1933. We now update that listing with sixteen more, although one on high-latitude, plankton-feeding seabirds is suspect - probably is all Arctic. We're not saying our listing is complete, because we are not all that familiar with key words of Antarctic scientists of today to get the computer at the University of Michigan to come up with everything. However, this isn't all our fault, as we did go to two members of the Washington Antarctic community who could have helped us with their listings of key words, but struck out. So we did our own, and this is the result:

DISSERTATIONS ON GEOLOGY.

Palais, Julie Michelle. Tephra layers and ice chemistry in the Byrd-Station ice core, Antarctica. 1985. The Ohio State University.

Borg, Scott Gerald. Granitoids of Northern Victoria Land, Antarctica. 1984. Arizona State University.

Macellari, Carlos Enrique. Late Cretaceous stratigraphy, sedimentology, and macro-paleontology of Seymour Island, Antarctic Peninsula. 1984. The Ohio State University.

Allen, Richardson Beardsell. Geologic studies of the Scotia Arc region and Agulhas Plateau. 1983. Columbia University.

DISSERTATIONS ON GEOPHYSICS.

Lingle, Craig Stanley. A numerical model of interactions between a polar ice stream,

the ocean, and the solid earth: Application to ice stream - E, West Antarctica. 1983. The University of Wisconsin - Madison.

Rydelek, Paul Anthony. Observations of long-period motions of the earth at the South Pole. 1983. University of California, Los Angeles.

DISSERTATION ON ATMOSPHERIC SCIENCES.

Tuncel, Gurdal. Trace elements at the South Pole atmosphere: Temporal variations and sources. 1985. University of Maryland.

DISSERTATION ON PHYSICAL OCEANOGRAPHY.

Macayeal, Douglas Reed. Rectified tidal currents and tidal-mixing fronts: Controls on the Ross Ice-Shelf flow and mass balance. 1983. Princeton University.

DISSERTATION ON BIOLOGICAL OCEANOGRAPHY.

Weber, Larry Henry. Spatial variability of phytoplankton in relation to the distributional patterns of krill. 1984. Texas ASM University.

DISSERTATION ON ZOOLOGY.

Hui, Clifford Allen. Swimming in penguins. 1983. University of California, Los Angeles.

DISSERTATIONS ON MICROBIOLOGY.

Mikell, Alfred Thomas, Jr. Physiological adaptations of microorganisms to high oxygen in two oligotrophic lakes. 1985. Virginia Polytechnic Institute and State University.

Miller, Karen Joy. The effects of temperature and salinity on the phospholipid and fatty acid composition of a halotolerant, psychrotolerant bacterium isolated from Antarctic dry valley soil. 1984. University of Massachusetts.

DISSERTATION ON BOTANY.

Moe, Richard Lee. The benthic marine algal flora of Antarctica with special reference to Himantothallus, Ascoseira, and the Ceramiaceae. 1983. University of California, Berkeley.

DISSERTATION ON INORGANIC CHEMISTRY.

Kwok, Jane Elizabeth Dennison. Trace element analysis of Antarctic H chondrites: Chemical weathering and comparisons with their non-Antarctic counterparts. 1986. Purdue University.

DISSERTATIONS ON ECOLOGY.

Roby, Daniel Dulany. Diet and reproduction in high latitude, plankton-feeding seabirds. 1986. University of Pennsylvania.

Pietz, Pamela Jo. Aspects of the behavioral ecology of sympatric south polar and brown skuas near Palmer Station, Antarctica. 1984. University of Minnesota.

**AL WADE BEING HONORED BY THE MUSEUM, TEXAS TECH UNIVERSITY.** F. Alton Wade, who devoted nearly half a century to studying the geology of Antarctica, is being honored at this time (some eight years after his death) by an exhibition set up in The Museum of Texas Tech University. The exhibition opened on 22 February 1987 and will close on 29 May 1988. If you are going to be in Lubbock on 26 March, 7 April, or 23 April, be sure to drop in The Museum at 10 AM to hear Vestal "Pappy" Yeates, retired Texas Tech Professor of Geology and former Antarctic cohort of Al's, talk about him and then lead a tour through the Museum.

Bergy Bits doesn't know of any other American who devoted so many years to field studies in Antarctica; Al started on the 1933-35 Second Byrd Antarctic Expedition, and was still going strong in the 1960's (led a Texas Tech entourage in 1962, plus four more field parties between 1964 and 1969). One might say he was the forerunner of what we now refer to as the Bentley Syndrome, which manifests itself among geoscientists in the winter season in the northern hemisphere, when there is a strong internal mechanism which drives otherwise perfectly normal people to return to the ice to collect samples which lead to further knowledge but never, never to fully solving problems.

Al, Paul Siple, Steve Corey and Olin Stancliff went on a rather famous 77-day field trip exploring uncharted areas in eastern Marie Byrd Land in 1934. Al returned to the ice in 1939 as Senior Scientist on the U.S. Antarctic Service Expedition. During World War II he was a base commander of the Greenland Ice Cap Detachment, and helped write survival manuals for soldiers stationed (stuck) in the polar regions. He taught eighteen years at Miami University in Oxford, Ohio, and then left to become Head of the Geology Department at Texas Tech University in 1954. After ten years he became Horn Professor of Geosciences and Director of the Antarctic Research Center. He was Chairman of the Antarctic Panel of the Circum-Pacific Map Project at the time of his death in 1978 at age 75. As a tribute to Al, *Antarctic Geosciences*, a book about the geology of Antarctica, was dedicated to his memory by friends and colleagues in 1982.

One of the best things that ever happened to Al was when married Sarah Jane Richards in 1938. Once upon a time the Antarctic map showed a beautiful twin-peak mountain Mt. Jane Wade, but Jane was defrocked by the Board of Geographic Names when most women's names, including Mt. Ruth Siple, were removed from Antarctic features. Bergy Bits has always thought the removal of Jane's name from that feature was most unfortunate, as it was rather obvious that the feature and Jane had much in common. The Siples and the Wades were/are close friends; the middle Siple daughter was named for Jane, who fortunately, inherited some of her namesake's basic characteristics.

**GREENPEACE ANTAGONIZES.** Greenpeace certainly had a unique way of endearing themselves to their neighbors in McMurdo Sound, soliciting the aid and support of Sir Peter Scott, son of you-know-who, telling him that they had been denied access to Captain Scott's hut at Cape Evans. This wasn't true at all, as at least twelve Greenpeacers visited the hut on 8 and 9 February when it was open for them and for passengers from the MV WORLD DISCOVERER. Jack Elofsson, master of the tourist ship, said the Greenpeace claim was "amazing and utterly disgusting." Bob Thomson, Director of the Antarctic Division of DSIR, told Sir Peter that Greenpeace's information was "grossly misleading."

It really didn't take Greenpeace very long at all to wear out its welcome in Antarctica, as one of its first acts was to take a large banner, *WORLD PARK ANTARCTICA*, spread it in front of the rubbish dump at McMurdo and take pictures for the world press. With neighbors like that, who needs enemies! Ron LaCount of the Division of Polar Programs at the National Science Foundation was the senior U.S. representative when Greenpeace sought to visit the station. He told Peter Wilkinson, the Greenpeace leader, that they did not have the right of access to McMurdo, but no resistance would be offered. The officer-in-charge of Scott Base, Stuart Guy, made it quite clear how he felt about their presence, sending a message back, "I must advise you that you do not have any authority to visit Scott Base, and further that you or your pilots do not have the authority to land your helicopters on or at any Scott Base-operated or controlled facilities at any time in the foreseeable future." But we understand that they infiltrated both bases, and were soliciting comments

from camp members who were sympathetic with their cause. They, Greenpeace, apparently have all the finesse and tact of mothers-in-law, and probably should be treated just the same way!

**MT. VINSON BECOMES COSTLY HIGH-LATITUDE, HIGH-ELEVATION GOLF DRIVING RANGE.** Money will buy anything in this world outside of health and happiness, and people with twenty-five thousand dollars worth of pocket change are stumbling all over one another for the opportunity to climb Mt. Vinson. One might say that mountaineers are turning to Antarctica in ever increasing numbers, threatening to reach epidemic proportions. Paul Pfau, a deputy district attorney in Burbank, California, decided to organize an expedition last year, and in no time at all had a hundred people fighting to go with him. It seems there is a fad now for mountaineers to climb the highest peaks on as many continents as is possible, and where Vinson requires more dollars than skill, people with money are rushing there. Giles Kershaw, the well-known British pilot-for-hire, charges about \$15,000 for the 1500-mile hop between Punta Arenas and the mountain, and he takes seven at a crack for \$105,000. One member of the expedition said that altogether it cost upwards of \$200,000 for the whole expedition.

Kershaw flies under the banner of something called the Arctic Airways - never mind the name, it's the only carrier flying to Mt. Vinson! The service was started by some Canadian adventurers two years ago. They forged an agreement to make refueling stops at Chile's bases along the Antarctic Peninsula. The flight involves icecap takeoffs and landings on King George Island and Adelaide Island, and an Antarctic fuel drop by the Chilean Air Force. Just how many expeditions - if you can call them that - go to Vinson is not known by Bergy Bits, although the seventh went there in late November, and at least two more went in December. Perhaps the most famous Vinson climber during the past austral summer was Reinhold Messner, the human machine from Italy, who attacks mountains like they are molehills. He went from the base to the summit and back in three days.

But most of the folks going to Vinson are fuddy-duddies bent on ego-building missions. They usually take a week to climb the mountain. Some must be queer ducks, like Dave Tollakson, former junior high math teacher, who got carried away with his numbers rather than common sense. While building a snow fence around his tent at base camp, he forgot to put his boots on over seven - yes, seven - layers. So within two hours after he got off the plane, he had frostbitten toes! But he made it to the top, and according to the Los Angeles Times for 14 December 1986, cut a hole in the ice and buried photos of his wife and father, and a roster of the Los Angeles Single Ski Club. Another guy, a 56-year old pathologist from Santa Barbara by the name of Robert Falling took a #5 iron and an orange golf ball to the summit, and teed off. Then he left the golf club on the top of Vinson. If you ever have thoughts about your own sanity, all you have to do is to compare yourself with adventurers; then you are reassured that you aren't so crazy after all. This guy Falling took pride in being the oldest to ever climb Vinson, but his pride was shattered eleven days later when a 59-year older climbed it on 5 December. Anyway, it sounds rather awesome, or is it sickening!

**ANTARCTICA NEEDS A PETER UEBERROTH.** Watching John McWhethy's three evening reports on Antarctica on ABC's Evening News, plus Dateline's coverage on the same network, was revolting. Conversely, watching the excellent coverage of the ozone hole over Antarctica by NOVA was refreshing. The world is really grossly ignorant about Antarctica, and the scientific community does a real lousy job of selling itself. The average man on the street distrusts anything coming out of Washington, feeling there are ulterior motives for scientists working in Antarctica. Perhaps the Division of Polar Programs should be a covert action assigned to the University of Maine at Fort Kent! SCAR

should probably hire Peter Ueberroth as Commissioner of Antarctica. Anyone who could get all baseball owners to unite against hiring free agents should have no problem selling the Antarctic Treaty, which is basically sound and good. Yet, for some unknown reason, folks listen to Greenpeace and believe them. Did you ever hear so much garbage about Antarctica as that Greenpeace babe foisted on the American public when ABC gave her air time? That was really disgusting. And because NOVA is on PBS, opposite crime, violence, and bloodshed, it was probably seen by a very small percentage of our population.

David Belknap, one of our Society members and a major book dealer of mountaineering and polar books, wrote a letter to Gene Campbell, Chairman of the Society's Committee on Adventurers, which was disconcerting to Bergy Bits. I was appalled at his ignorance about Antarctica and its workings, but what really upset me was that this was from an educated person - Lord only knows what the rest are thinking of Antarctica. If his thinkings are really representative of the public's, then Antarctica really needs that Peter Ueberroth mentioned above. Belknap thinks that everyone concerned with Antarctica is old and not able to contain bodily gases in the lower extremity of his/her body. Having never met Belknap, I would be willing to bet on Peter Wilkniss over him in any physical endeavor, including holding those bodily gases! Antarctica is really a young person's world; the average age of its investigating scientists must be about thirty, and they are extremely dedicated, practically working around the clock every day of the week when on the ice. A lot of people evidently think scientists are there for national political interests. Maybe some of the funding is politically motivated, but Antarctic scientists are there because of their personal scientific interests. Belknap thinks that the "American scientific community" makes decisions on what adventurers should or should not be there. That's pure rubbish, as any adventurer who wants to go to Antarctica can go there; he or she does not need anyone's approval. Bergy Bits feels there were two major awakenings in Antarctica this past austral summer - first, Ned Turner, the SEA TOMATO would-be rower, and second, Monica Kristensen. In previous years both might have gone on and taken their chances, figuring Uncle Sam would rescue them. But this year evidently the message got through loud enough and clear enough to make them both turn back. Maybe the adventurers are learning. But how do you reach the Belknaps of this world?

**CARTOGRAPHY IS A NEVER-ENDING SCIENCE.** In what has been described as covert action, two members of the U.S. Geological Survey, Jim Stoner of Reston and Kathy Covert of Denver, have just returned from the McMurdo area where they tied in points on Ross Island, Beaufort Island, White Island, Black Island, Brown Peninsula, Minna Bluff, and several sites in and around the dry valleys (Vanda, Mt. Bastion, Mt. DeWitt -probably first time old DeWitt has ever been controlled). They were assisted in the surveying by three Kiwis, Bryon Anderson, Roff Paton, and John Oldridge of the New Zealand Land and Mines Survey, as this was/is a joint effort between the United States and New Zealand. It will result in a series of new 1:50,000 maps of approximately 10,000 square miles. Altogether there will be about forty individual maps; the first ones to come out will be on the dry valleys, tentatively scheduled for early 1988.

We aren't exactly sure what they all did this past austral summer, but we are sure they probably had the best job in the Antarctic, as they got in forty-three helicopter flying days over some of the best scenery one would ever want to see. They were placed at sites where they wished to establish control points, and if they weren't able to place a marker in the rock, they would end up by sticking a steel rod a foot into the ground. Then they would set up a T-2 or T-3 theodolite and take both horizontal and vertical angles. Satellite receivers were left at the sites for several days until they had received enough data for their mapping purposes.

From the satellite receivers they were able to get the true latitude, longitude, and elevation above sea level of that site.

While there they tested a portable, lightweight, automatic, electronic, distance-measuring system, the Microfix 100C, and it worked out just great. It can measure distances very accurately, within 15mm from 7 meters up to 60kms. Jim says they obtained the first electronic measurements across the Sound. This instrument has been used in the Rockies for about ten years, but for some undetermined reason had never been introduced to Antarctica. The group also placed gravity meters on all stations where they could be set, and new charts with geoidal heights will result. This is just one step in the preparation of overall Antarctic coverage.

It was Jim Stoner's baptism to the continent, although he is a veteran mapping campaigner with the USGS. He grew a heavy beard, and went the whole yard of being a latter-day explorer. Kathy Covert was returning to Antarctica, as she was the third woman to winter over at the South Pole. Together they formed a fearsome twosome from the States, and with the Kiwis made a very formidable team which loved their work and ended up having a very successful season.

**LAKE HOARE TIED TO MARS?** Dr. George Simmons of the Virginia Polytechnical Institute and State University told the Christchurch Star in mid-February that Lake Hoare in Taylor Valley is a window to ecosystems which existed from 3 1/2 billion to 600 million years ago. Lake Hoare is 58 meters above sea level, 4.1 km long, 1 km wide, and has a maximum depth of 34 meters - your basic standard New England frog pond. Scientists made 65 dives, involving more than 30 hours, this past austral summer. About 24 core samples were obtained, and they found layers of algae. Simmons said, "It was like going for a walk off the main route and coming across a valley containing a herd of dinosaurs." The dry valley lakes provide a valuable insight into sediment deposition mechanism and possible fossilization of ancient life in Martian paleolaccustine environments. That is pretty sacred turf, and to think that this innocent soul wasted his time there this past summer taking pictures of the beautiful Canada Glacier standing guard over the lake! Win some, lose some!

**IF YOU DON'T SUCCEED AT FIRST, KEEP ON GOING BACK, AND BACK, AND BACK.** Dr. Tetsuya Torii, 69, must qualify as (1) the Grand Old Man of the Antarctic, (2) precinct political boss of Dry Valleys, or (3) candidate for Japanese Express Card - don't leave Tokyo without it. After visiting Antarctica twenty-six times in the last twenty-seven years (what happened in that one year?), he has hung up his thermals to dry rot, although for some strange reason he's going back next year as a visitor - guess his home life can't be all that great! He has made twenty-four visits to Wright, Taylor, and Victoria dry valleys, and has written fifty scientific papers. He feels his most important contribution to science "deals with the origins of salt in Lake Vanda," although their origins are still unsolved! Is he another Bentley?

During Torii's 1959-60 stay at Syowa, a Japanese scientist got lost in a blizzard, and his body wasn't located until seven years later, only 4 km from the base. That's hard to believe, but true. Dr. Torii is Secretary-General of the Japan Polar Research Association; he told the Christchurch Star in mid-February that Antarctica "is the only continent where all people work together and investigate important scientific items for the benefit of future humans. We must continue the international cooperation in research work as we have for the last thirty years."

**NEGROPONTE TALKS SENSE.** One of the WVIPS to visit Antarctica in early 1987 was

John D. Negroponte, Assistant Secretary of State for Oceans and International Environmental and Scientific Affairs, who oversees America's Antarctic involvement for the State Department. He was quoted in a New Zealand newspaper as saying, "The Antarctic Treaty system has proved to be a very workable one. The countries that are really interested in Antarctica would probably be better off to join the system rather than try to break it. It is not as if the Third World is really frozen out, as India, Brazil, and China have joined."

**AN ACCIDENT THAT WON'T QUIT.** It was over seven years ago that the ill-fated New Zealand DC-10 crashed on the lower slopes of Mt. Erebus, and it will never be forgotten. It was the blackest day in the history of the whitest continent. The original cross commemorating the site where so many (257) lost their lives has been blown away, and this past austral summer a new stainless steel cross bearing an inscription and the aircraft number was anchored to an Oregon wood base drilled into a rock outcrop near the tragic site. May it remain there in peace.

Meanwhile, back in New Zealand, they are getting ready for a four-hour mini-series, *Erebus, The Aftermath*, which is going to be shown on one of their television stations later this year. The drama is based on the book by the late Mr. Justice Mahon. Let's hope the film stays in New Zealand. Who needs another reminder?

And here in the States, there is a 16-million dollar claim against the United States government over the Erebus disaster. Said claim has been filed in behalf of relatives of sixteen of the flight and cabin crew who died in the crash. Each claimant is suing the U.S. Navy for a million dollars in damages, on the grounds that Navy radar operators at McMurdo should have alerted the pilot that he was off course. The Washington lawyer pursuing the case is Juanita Madole of Speiser, Krause, and Madole. The case probably won't be heard for a few more months. There is something called a "discovery period" which was due to be finished by the end of February, although we don't know if it was or not. After that it usually takes at least two more months before a case can be heard.

**NO WAILING AT MCMURDO SOUND.** For the first time in thirty-one years, there are no dogs in McMurdo Sound. The New Zealand folks came to some sort of an agreement whereby the Steger Outdoor Centre in Ely, Minnesota took the fourteen dogs from Scott Base. If the name Steger sounds familiar, it is; he was the leader of a recently successful oversnow expedition to the North Pole. And he will lead the 1989 Trans-Antarctic Polar Expedition. He supposedly took the dogs to provide new stock for their big training and breeding centre. The dogs went back to New Zealand on the GREEN WAVE, and then were flown to the States. One dog who apparently didn't like the prospects of becoming Americanized died enroute.

**FAME IS FLEETING.** Peter Stalkus was living the good life last year as navigator on San Francisco's 12-meter entry, USA, skippered by Tom Blackwaller. It was one of our best entries in the America Cup races off Freemantle. But along came the irascible Dennis Conner and his STARS AND STRIPES, dispatching USA in four quick races. Bergy Bits often wonders what happens to yesterday's heroes, and in this case we can tell you what happened to the losing navigator. He ended up in Lyttleton, New Zealand as skipper of the container ship GREEN WAVE, and was soon making his third trip to Antarctica, dodging icebergs rather than rounding race buoys. If he had been a Russian navigator, he would have been dispatched to Siberia, but we treat losing navigators worse, we send them to McMurdo!

**THE ICE: A JOURNEY TO ANTARCTICA. STEPHEN J. PYNE. UNIVERSITY OF IOWA PRESS.** This is a most unusual book. Bergy Bits doesn't think there has ever been one quite like it. It's a book for the intelligentsia - it's profound, it's complex, it's dull. Pyne writes as an Antarctic editorialist, and he does it well. He's not only a scholar, but he did his homework exceedingly well. Pyne's chapters are units of ice (berg, pack, shelf, glacier, sheet) interspersed with theme chapters (exploration, literature and art, earth sciences, and geopolitics). It is a welcome relief to come to the end of those drawn-out ice chapters and have a chance to read the alternate chapters, as we all have our ice limitations, don't we?

It isn't easy reading, as Pyne likes to use multisyllable words; it's like walking through snow up to your waist. A person like myself can read sentences on just about every page and have no idea whatsoever what Pyne is saying or trying to say. Yet, I'm sure the more erudite among you will not only understand what he writes, but will revel in his artistry with words. Of *The Worst Journey in the World* Pyne wrote it "is a massive book, dense with information, and Anglo-Saxon monosyllables." This one sentence tells a lot about Pyne. For some reason he has complete disdain for simple, precise, clear, understandable English.

If I had one legitimate Antarctic complaint, it pertains to his falling into the snakepit that has suckered in other Antarctic writers, that wintering-over personnel survive the winter only by enduring one personal crisis after another. Listen to Pyne, "Psychosomatic and psychosocial disorders of the winter-over syndrome include depression, outbursts of hostility, sleep disturbance, social withdrawal, and impaired cognition." That is plain hogwash, idiotic. I think I have a general idea of what it's like to winter over, as I have been in a camp with 108 people (Little America V), and in a camp with 18 people (South Pole). Once you get rid of all the summer tourists who are a pain, things become just great.

The chapter I liked best, by far, was the one on literature and arts, and the section which interested me most was on Heroic Age, page 168-185. Pyne wrote that Scott's major literary rival was Cherry-Garrard. And about Scott's Message to the Public and his last letters to relatives and friends, Pyne wrote there are no real equivalents "with the possible exception of Byrd's soliloquy, *Alone*." The same chapter has some very interesting comparisons on Frank Hurley vs Herbert Ponting, on Emil Schulthess vs Eliot Porter, and why artists never seem to get beyond the periphery of the continent.

Pyne wrote that the IGY was the last hurrah for the Byrd boys. Not so. Their last hurrah was Operation Windmill. The IGY was really a new ball game, and one could say with some degree of truthfulness that the only strong Byrd loyalist on the ice during the IGY was Siple. Although Dufek served under Byrd, he certainly put as much distance as he could between himself and Byrd.

I rest my review with a representative sentence of his style - "The esthetics of modern art could accept the abolished perspectives, abstract geography, and simplified iconography of Antarctica." This book could very well win some sort of a literary prize. Hopefully it will then be translated into laymen's language. I don't think it's a book you want for your personal library, but it is a great book to give as a gift, as it serves two purposes - making the recipient think you are learned, and also complimenting his/her intelligence to be able to understand the book. BUY!

**ADD-ON.** Monica Kristensen, Neil McIntyre, two Danish dog-team drivers, and twenty-two dogs returned from their aborted trip to the South Pole on 27 February, and were picked up by their support ship, the AURORA.

GLOBAL MONITORING OF GLACIERS

by

Dr. Richard S. Williams, Jr.  
Research Geologist  
U.S. Geological Survey  
Reston, Virginia

on

*Tuesday evening, 12 May*

*1987 8 PM*

National Science Foundation  
18th and G Streets N.W.

ROOM 543

- Light Refreshments -

Glaciers are the largest element of the cryosphere and the second largest "reservoir" of water in the global water budget (hydrologic cycle). Throughout geologic time and especially during the Quaternary Period, glaciers have waxed and waned in response to climatic warming or cooling with concomitant variations in sea level. The Landsat program, which began in July 1972, provides the kind of repetitive data needed by various disciplines in the natural sciences to carry out cooperative international studies which are globally oriented. In his illustrated lecture Dr. Williams will provide a review of the present and future capability to scientists of using satellite remote-sensing technology to monitor the area and volume of ice caps and ice sheets, to compile inventories of glaciers in remote areas, and to monitor seasonal changes in glacier faces. Dr. Williams will use examples from his research on Icelandic ice caps, his chapter on "Glaciers and Glacial Land-forms" in the newly released NASA Publication 486, *Geomorphology from Space: A Global Overview of Regional Landforms*, and his author-editorship of U.S. Geological Survey Professional Paper 1386, *Satellite Image Atlas of Glaciers of the World*. The USGS professional paper will be published in 11 parts, the first chapter of which, 1386-B, *Antarctica*, will be published in mid-1987.

Remember Steve Dibbern on polar transportation 16 April  
AND mark your calendar NOW for 12 May!

*LET'S END THE 1986-87 LECTURE PROGRAM SERIES WITH FULL HOUSES!*

This is always our favorite Newsletter of the year, because with this one we put the cover on the old manual Underwood and take off for Maine for the summer. This is our 56th Newsletter (or whatever) in the past nine years. We almost threw in the towel a couple of issues back - we were within hours of quitting - as things can get pretty sticky at times. Needless to say, anyone desiring to take over this all-work, no-pay job would be most welcomed. Again, we remind our readers that this column is not the Voice of the Society; in fact, it may truly represent that of only one member! In closing for the year, may I express my thanks to those who have said they enjoyed the non-Newsletter on the IGY, and the follow-up on my going back to the ice, as these two were my all-time favorites. Also thanks to those who kindly sent Christmas cards/messages. Have a good summer! And, for heaven's sake, when you move, PLEASE let us know, as bulk mail is neither forwarded nor returned, and we lose you!

**LANZEROTTI IS A NICE GUY.** The Antarctic Society is a lucky society, as we get the very best speakers on Antarctica - all gratis. Not only are our speakers on the so-called cutting edge of Antarctic sciences and operations, but they are all nice folks. But our Memorial Lecturer, Lou Lanzerotti was something special. In his introductory remarks before his lecture, he spoke of how honored he was to be invited to give the 1987 Paul C. Daniels Memorial Lecture. One of the reasons he was so gracious may have been that he was spared an introduction by his friend of some thirty years, past president Edward P. Todd. Nevertheless, he made it sound like he was indeed honored that his name will follow the likes of Gould and Bentley and Rutford and Goldthwait and Meier and Lorius. Lou is quite a guy.

For those who could not attend the Memorial Lecture, may we tell you that we had wall-to-wall people, a goodly mix of some OAEs, a lot of IGYers, many past presidents, members of the Polar Research Board, and plain good folks. Those (64) who went to the dinner were treated to an excellent meal, most unusual for a large group, and Bergy Bits even got a second chocolate mousse - Lou's!

**RICHIE WILLIAMS, OUR MAY LECTURER.** Richie is a good old boy from New England who married a good old girl from New England (whom he picked up on the New York Central Railroad), and who got his academic impetus from a good old New England institution, Colby College in Waterville, Maine. He transferred to the University of Michigan where he got both his bachelor's and his master's degrees in 1961 and 1962, respectively. Then he went on to Penn State where he picked up his PhD in 1965. The next six years were spent back in Massachusetts at the Air Force Cambridge Research Laboratories where he worked in their Terrestrial Sciences Laboratories as, first, a military officer, and then as a civilian scientist. Richie joined the U.S. Geological Survey in 1971, and has had a spectacular career with them, receiving, among other high honors, their Graphic Communications Award in 1977, and the Department of Interior's Meritorious Service Award in 1979. He has published more than 145 books, journal articles, abstracts, and maps; he is a Fellow of the Geological Society of America, and a member of just about every society with geology, glaciology and

geophysics in its title. He is also a member of the Cosmos Club and of The Explorers Club. He is going to dry-run his presentation to the Antarctic Society by taking it on a road trip to the University of New Hampshire and to Dartmouth College. So when he comes before us on May 12th, he will have a highly polished gem. We expect that much of his presentation will deal with the Antarctic chapter in the upcoming USGS Professional Paper (1386-B) Satellite Image Atlas of Glaciers of the World, which should interest all of us. All USGS Society members are required to attend Richie's lecture - attendance will be taken.

**POSTAL SERVICE - BOO!** There is no way you can beat the Postal Service. Here they are making more money than ever, and we are getting worse service. Out-of-town members want to receive their Newsletters prior to the date of the meetings, but often they do not. We mail the Newsletters a full month ahead of the meeting being announced. But in February the dodos who work (or show up for pay) in the Postal Service must have played games with our two bags, or they tossed them aside. After a week had passed, and no local members had received the February Newsletter, we notified a responsible person in the bulk mailing facility at Merrifield (Northern Virginia) ; that was an exercise in futility. We called various persons; we had a tracer put on the mailing, but no one seemed to know anything about it. Finally the Newsletters were sent out. Walt Seelig got his in Potomac, Maryland thirty-four (!) days after we mailed it, which meant that the Postal Service moved it about half a mile a day. Please contact your Congress persons and ask them to bring back the Pony Express so you will get your mail in a reasonable amount of time.

**REMINISCENCES OF ROB FLINT.** Rob Flint is a warm-blooded Antarctic who has served time (there) since 1964. Only a few penguins know Antarctica better, although they haven't seen anywhere nearly as much of the continent as Rob has. He wintered over in West Antarctica at Byrd in 1964; he wintered over at the high elevation station of Plateau in 1966 - its very first year; he wintered over with the Russians at Vostok, the Cold Pole of Antarctica, in 1974. And he somehow seems to surface somewhere in the Antarctic during each austral summer. Rob has recently shared some most interesting transcriptions from his notebook, which he made while bouncing across Terre Adelie two austral summers ago in a French "Hotchkiss" vehicle.

First, people whom Rob missed seeing: "Jerry Huffman ... Eddie Goodale in Christchurch, though there couldn't have been a more worthy replacement than Walt Seelig ... Phil Smith, who made his way through the Navy brass by smoking smellier cigars than they did ... Bert Crary ... Bill Austin with his creative cynicism, and who introduced me to swizzlers at the Golden Parrot ... T. O. Jones, who started every orientation with the words, 'The Antarctic is a strange mistress' ... Admiral Reedy, who planned a 3-pronged spectacular assault on Antarctica in September 1964, and ended up at Byrd where the toilets weren't working as the result of the one (bent) prong which did get on to the continent ... Hugo Newberg with his Finn Ronne stories: it was no secret that they weren't the best of friends at Ellsworth ... Ed Siemiatkoski, aurora man at Byrd in 1964 who later died of cancer. When they were handing out geographical names, they had to find a L-O-N-G glacier to hold his name ... Jack Grabe, cook extraordinaire at Byrd in 1964 ... Helen Gerasimou: why didn't they send her to the ice? She was too tough for Antarctica! ... Bob Rutford - what a degree of sense and personality at the top! ... Charlie Roberts - a story about every place on the globe ... Sastrugus, the dog. Pets were an idea that didn't work out, but I'm glad they didn't know that in 1964. He could hear a package of M&M's being opened the length of the camp."

And Rob's list of people he never missed, because they kept coming back: "Ron Sefton, who spent three winters at Byrd in five years ... John Katsufakis - 'Mr. Antarctica' -

who gave me my first job and has been to Antarctica virtually every year since ... Walt Seelig, who saw me through my year at Vostok. I shall indeed miss Walt in Christchurch."

And one he doesn't miss: "CDR 'Curly' Olds, not because of anything personal, but because he represents an attitude I'm glad to see gone: at orientation at Skyland he said, 'If you people have a problem, I don't want to hear about it. We work through a chain of command and I solve problems that my command gives me.' Those days, thank goodness, are gone."

And now for his list of changes at McMurdo 1963-1986 for the better: "Town is cleaned up and neater ... Flush toilets ... Everyone friendly - no overt resentment of the 'redcoats' ... Vermin Villa gone and replaced with a women's (yes!) dormitory ... USARP stuff in Ship's Store ... A female barber with orange hair, high heels, gave better haircuts than Navy, but price is same (free) ... Scott's hut protected ... There are authorized boondoggles to South Pole ... Dining area not government green (on other hand, see below) ... There is running water (sometimes) ... Ob Hill is still there - just right size for great view and great feeling of accomplishment, but not too much for anyone."

Plus changes for the worse: "Didn't have lobsters ONCE! ... Orientation at McMurdo consisted of a lot of prohibitions and regulations ... Miss the old USARP Headquarters with its view. Now all the view is expropriated by the honchos' offices ... Miss the old chapel with its fabulous winter-over made artwork."

And some things that don't change: "Despite fact that dining hall isn't government green, it is awfully grim - dimly lit, no windows. Contrast to Dumont D'Urville with its triple-pane picture windows looking out on its fabulous view ... McMurdo has a world-class view and location, but somehow architecture doesn't take advantage of it . . . The hotel has nice balcony with view, but the sliding door was irreparably broken; so you couldn't get out there! ... Living quarters overheated, as always ... Still, in 1980's no good personal communications system: you have to go to Scott Base to make a phone call."

Finally, Rob questions whether these changes are for the better: "Lots and lots of people through town ... Continent accessible in just 6 hours by C-141 ... Movies only once a week, replaced by videos: tends to allow people to stay in own living spaces instead of mixing ... Foot travel highly regulated: yes, I know it's safer, BUT... ... Nude over the bar at the O Club is gone."

**PENSACOLA'S NAVAL AVIATION MUSEUM** (by RMC Billy-Ace Baker, USN). *Que Sera Sera*, first plane to land at the Pole, is on display at the Naval Aviation Museum. At the present time she is on rotating display outside the museum and will be there until the museum is enlarged. Since the museum is funded by public donations, it may be years before the building is large enough to enclose all the planes that are stored outside. My friend, Jim Landy, who is a Chief Aviation Mechanic stationed in New Orleans', recently came down to visit us, and we went out to the museum to see what kind of shape the *Que Sera Sera* was in. Compared to most of the other planes that are stored outside, the *Que Sera Sera* was in great shape. Jim pointed out to me that the tail surface which is now covered in sheet metal and is painted in the traditional VXE6 colors was originally fabric. Other than that, he could see no real bad deterioration, and he thought that the plane had been carefully maintained. Jim served two tours on the Ice with VXE6. His first tour was in the early 70's, and his second tour was in the early 80's. On his second tour he was a C130 crew chief. Incidentally, the museum has a beautiful painting of the *Que Sera Sera* when it landed at the South Pole. Also the Coast Guard section has a painting of the USCGC GLACIER breaking ice,

but if you didn't know anything about polar operations, you would not know that it was the GLACIER because the painting is not labeled and all it shows is the hull number. The museum also have several elaborately made models of the planes that RADM Byrd used during his Antarctic expeditions. If you ever get a chance to come to Pensacola, you should make it a point to visit the museum.

**AN ANCIENT AND HONORABLE SURFACES.** The Commanding Officer of VX-6 in Operation Deep Freeze I, 1955-56, Gordon K. Ebbe, has joined our Society. He lives in Colorado Springs, Colorado (2211 Wynkoop Drive, and the zip code is 80909-1442). There are quite a few Antarcticans in that area - novelist Moe Morris, Brian Shoemaker (who is with the Space Command), and Paul Streich (tax counselor) - and they are looking into "the possibility of forming an Antarctic Society of sorts here in Colorado Springs." They seem to have their priorities in order as Gordon wrote, "We are getting together next week to swap lies, go over pictures, and go over my 75-page Antarctic scrapbook." He also has an hour-long slide show on the Antarctic which he gives periodically; it seems people love those 30-year old pictures. Incidentally, he wrote Ruth that he had roomed with Paul on the GLACIER, and that he flew Paul and Admiral Byrd over the South Pole on January 8, 1956.

Gordon raised the question as to whether "anyone has started a collection of Antarctic memorabilia for preservation?" He turned over his aviation material to the Naval Aviation Museum (see above Bergy Bit). However, the answer to his question must be both no and yes. There certainly is no museum in this country comparable to the one the Soviets have in Leningrad, or the Kiwis have in Christchurch, nor can we realistically expect that one will materialize because of the great expense in establishing and maintaining a polar museum. The Navy has an excellent ongoing polar exhibition at their Washington Navy Yard Museum, but it is rather small and selective. The Byrd Polar Research Center (BPRC) within the Institute of Polar Studies at The Ohio State University could possibly develop into the major U.S. depository for Antarctic papers. However, things are so scattered - Admiral Dufek's material is at Syracuse University; Dr. Harry Wexler's papers are at the Library of Congress; and many members of BAE I and II have donated their material to the National Archives - that the BPRC could never become a sole source center. If one wants to do research on U.S. polarites, he/she had better have infinite patience, great dedication, lots of travel funds, and no deadlines.

**HUSBAND OF KIWI ANNE DUDLEY FINALLY JOINS THE SOCIETY.** The first Naval captain to be permanently assigned as Commander, U.S. Naval Support Force, Antarctica, when the billet was downgraded to Captain in 1972, has recently joined the Society. He is Harry W. Swinburne, Jr., of 4969 North Cascade Place, Oak Harbor, Washington 98277, and he is married to the president of ABC's Travel in Seattle, the former Anne Dudley of Christchurch, New Zealand. To put Harry into the proper Antarctic geological time series, he was Deputy Commander and Chief of Staff under RADM Kelly Welch and RADM Les McCuddin, and interim Commander between the two. The well-known Washington golfer. Captain Al Fowler of the Division of Polar Programs at NSF, relieved Capt. Swinburne as Commander of the U.S. Naval Support Force in 1972. Harry retired in 1972, and describes himself as "a part-time lumberjack" living on a most enjoyable island, Whidbey. He also occasionally fills in as a tour escort when Anne has need for another guide on tours to Australia, New Zealand, and the Fijis. If any of you folks are contemplating going' on a trip in that direction, you might want to talk to Anne or Harry (1-800-843-4341). They have a 24-day trip scheduled for this fall, and there are a few openings.

Harry has a lot of the Antarctic (and New Zealand) in his blood. He wrote, "One would

think that 27 trips there would be enough, but I always looked over my shoulder when leaving Cape Adare and hoped that there would be one more. After three years of developing (and changing) plans for the new South Pole station, I've really hoped to see the completed product. Only the utilidor and base rings of the geodesic dome were completed on my last inspection." He added that he was tempted to apply for the position as South Pole station manager! After he retired in October 1972, he toured every little corner of the South Island of New Zealand, and trekked the Milford for only \$90 vs today's \$340. Concerning the infamous sand flies (from which Bergy Bits found a way to escape, i.e. hike in the rain), Harry says they "are the world's most vicious animal - pound for pound. I'd like to see their mouth under a microscope."

Harry really has it made, living in the Pacific Northwest on a lovely island, piddling around cutting down trees, married to a friendly Kiwi who brings home a paycheck every Friday night, having an opportunity to occasionally serve as a tour guide to a wonderful part of this old world, and having Old Antarcticans like Kelly Welch and Sam Youngman (a former Deep Freeze medical officer) drop by for meaningful visits.

**SURVIVING ANTARCTIC MINKE WHALES REJOICING.** The Ides of March bore no ill tidings for the Minke whales in Antarctic waters, as the weekend of 14-15 March saw the cessation of five decades of Japanese whaling in Antarctica. The Soviet Union had previously announced at the 37th annual meeting of the International Whaling Commission in Bournemouth, England in July 1984 that they planned a temporary halt in their commercial whaling in Antarctic waters effective with the 1987-88 season. Most of the Minke whales caught in the southern hemisphere have been caught by Japanese and Soviet factory ships. Japan will continue whaling near their own shores for another year, then they will end their commercial whaling. The International Whaling Commission will review the world situation in 1990, with the possibility of allowing resumption of limited whaling.

The Japanese news media gave the final expedition to Antarctica full "end-of-an-era honors." Newspapers put reporters on the vessels to witness the final hunt. Whale meat has been an important source of protein in the Japanese diet, and an official of the Japanese Whaling Commission, Kinshiro Sorimachi was quoted as saying, "We believe whales are a resource that should serve mankind." Japan moved grudgingly in the face of strong international pressures, denying that the whales it has hunted were endangered, and saying that whaling is a valuable facet of Japanese culture which should survive. Threats from the United States to deny the Japanese fishing rights in American waters brought about Japan's agreeing to end whaling in 1988. There is nothing wrong with a little old-fashioned arm-twisting. We should try it on our youngsters!

**MONICA HAD A WONDERFUL TRIP.** Monica Kristensen told the Christchurch Press that she was disappointed not to have reached the South Pole, but did not consider the expedition a failure. She said, "Getting to the Pole was only one aspect. We did a lot of scientific work and we had a wonderful trip." She blamed the failure to reach the Pole on delays in the beginning, plus warm weather resulting in a lot of deep snow, making the dogs work excessively hard. The AURORA was held up ten days in December because of ice conditions, although there is some feeling among the polar community that her planning for establishing her base left something to be desired. Monica thought the most difficult part was doing the 47km up the Axel Heiberg, and said, "We climbed 2700 miles in five days, God I was tired."

The decision to abandon was made at the fourth depot. At that time they had been able to average only 30km a day, and to get back to the Bay of Whales in time to meet

the AURORA, they would have had to average 45km to the South Pole and all the way back. So the four-person party reached a unanimous decision to turn back, 450km short of the Pole. It's ironical that on their way back to the Barrier they were able to average 45km per day! Fears that the party might have to be rescued were totally unfounded, according to Monica. They apparently had enough supplies to have been able to survive through the winter.

A Norwegian correspondent who spent some time on the AURORA was in Washington over St. Patrick's Day, when film of the expedition was dropped off at the National Geographic; he spoke very highly of the two Danish dog team drivers. It seems that Monica and her party had some difficulties finding the caches laid out by the Green-landair support plane, and one of the reasons they were reluctant to go beyond their fourth depot was apprehension that they could not find the fifth depot. One of the dog team drivers had been with the pilot when they put in the cache; it seems they were very uncertain themselves as to just where they were. So this may have been the turning (around) factor. It was interesting that one dog - there was a total of 22 - was sort of ostracized by the other dogs, who wouldn't have anything to do with her/ him/it. Because of the Danes' very strong feeling about all dogs surviving, this one dog was given a free ride on the sled for the first part of the journey. But the other dogs must have envied the reject sitting back, getting a free ride and enjoying the scenery, so they suddenly accepted him back into harness, and everyone lived peacefully and happily everafter.

It doesn't appear that there was much Amundsen in Kristensen. Amundsen had planned to perfection; Kristensen had planned herself into failure; Amundsen had tremendous drive to get to the South Pole; Kristensen said she was not fanatical about it, although she would have liked to have gotten there "to tidy up." And this was supposed to be a 75th anniversary to Amundsen? Amundsen would flip in his grave.

**HARBINGER OF BAD NEWS TO COME.** The Wall Street Journal for 12 March 1987 (courtesy of C. Vernon Cooper) told its front page readers that "A Thirst for Firsts Sends Adventurers to the Polar Regions." It seems they are running out of "firsts" for Mt. Everest, as they have skied it, they have hang-glidered it, they have kayaked it. However, it could be that justice will be served, as a recent article in another newspaper conjectures that old Mt. Everest may not be the highest mountain after all! If it turns out to be accurate, it will be a victory for all armchair mountaineers.

Adventurers are stumbling over one another in the Arctic. Last summer a French physician, Jean-Louis Etienne, skiing to the North Pole met a pair of Frenchmen trying to fly there on ultralight aircraft - basically hang gliders with motors. It seems that one crashed, and bad weather blocked the other guy. A Canadian tried motorcycling to the North Pole, but his dirt bike couldn't climb the ice ridges. An Australian twice failed in his attempts to fly a helicopter to the North Pole. Once his navigation instruments froze, a second time his generator gave out. And then, there is this 95-pound, 40-year old woman from Willow, Alaska by the name of Pam Flowers who is mushing solo - took off from Cape Columbia, Canada on 5 March - with her ten Alaskan huskies to the North Pole, wearing six - yes, six - layers of wool underwear. Must take her an inordinate part of the day just to relieve herself. She has thirty corporations backing her, sponsoring the 60-day (?) trek, costing \$200,000. But Pam isn't so solo as you might think, as planes are going to drop food every 10-14 days. She is planning a South Pole expedition in 1989. Aren't there other things that 42-year old women who weigh less than a hundred pounds should be doing, such as knitting one, purling two?

In addition to the dog team of Will Steger, there are other teams (one from Germany, one from Idaho) waiting to race across Antarctica. Then there is a dog team from

Georgia, presumably led by Norman (BAE I) Vaughan, age 81, going out to climb Mt. Vaughan. With all those dogs, Bergy Bits is afraid that the Great White Continent will shortly become the Great Yellow Stain. In case you are wondering how much it would cost to foot an expedition to cross Antarctica by dog, the figure being raised by Steger is a cool three-million bucks.

We don't imagine that anyone is really concerned with what happened to Dartmouth's Ned Gillette and his SEA TOMATO, as only a devoted mother could get enthralled about the kinds of things he does. But his partner quit - showing that at least he had some common sense - and old Ned took off and went ski touring in Antarctica! However, he claims he is going back next year, and will row from South America to Antarctica. One of Bert Crary's favorite statements is, "There's no fool like an old fool." That should be changed to, "There's no fool like an adventurer."

**THE POOR MAN'S/WOMAN'S HANDS-ON-ANTARCTICA.** If you don't want to hock your family jewels to go to Antarctica, but wouldn't mind going into debt for several thousand dollars, here are some alternate ways of going there as presented in the April issue of Outside (sent to us by Tom Frostman, Class of 68, Plateau Station). First, there is the 400-foot Argentine polar-research ship doubling as a cruise ship, the BAHIA PARAIISO. A 12-day excursion leaving from Ushuaia goes for \$3150, and passengers can take optional trips by dogsled and snowcat, or a helicopter trip to the base of Mount Francais. The U.S. agent is Mountain Travel, 1398 Solano Avenue, Albany, California 94706 - (415)527-8100. One of our Society members, C. Vernon Cooper of Hazard, Kentucky, has just come back from a trip on the BAHIA PARAIISO, and reports that they visited Esperanza, Almirante Brown, Palmer, Great Wall, Deception Island, Melchior Island, and Primavera. According to an article in The Hazard Times for 28 January 1987, he brought back "the original sign that had been placed at an Argentine Military Base in 1903 and discovered only two years ago during excavation of the base."

There are three French yachts which can be chartered for summer trips - the BASILE, the KSAR, and the KOTICK. Supposedly you don't have to be an experienced sailor, just have a deep pocket and a strong stomach. The BASILE is a 50-foot ketch, steel-hulled with a retractable keel, and has accommodations for your dog team! Her skipper is Alain Coradeo, and he will coordinate special cruises for climbing, camping, skiing, whale watching, boardsailing, or whatever is your fancy. For more information, contact Bertrand Dubois at Basile Expeditions, Le Collet, 74170 St. Gervais, France.

The KSAR can be chartered from Jean Paul Bassaget, c/o Agencia Tiempo Libre S.A., San Martin 154, 9410 Ushuaia, Tierra del Fuego, S.A. This fellow Bassaget runs mountain climbing expeditions to the Antarctic Peninsula, but Bergy Bits is sure that he will take you as far as your money will go. The KOTICK is owned by Oleg and Sophie Bely, who have sailed for ten years, some 120,000 miles; charge, total for all passengers, is \$500 per day. Both the KOTICK and the KSAR are crewed by their owners. If you are interested in the KOTICK, contact Oleg at the same address as Monsieur Bassaget.

Then there is something cheaper than \$500 a day. It seems a handful of yachts leave from the Falkland Islands every October and November to spend the summer in the Antarctic. So go to Stanley Harbor, find a skipper-in-need, and sign on as a crew member. Supposedly many welcome extra crew.

**DYNAMIC DUO PREPARING FOR THE ARCTIC.** Those intrepid Antarctic-adventuring scientists who teamed up on the Frozen Seas Expedition, namely David Lewis and Mimi Clark, are planning to sail north to the Kotzebue region of Alaska on a 60-foot ketch (donated by newspaper magnate, Charles Scripps) next year. They will be sailing under the

auspices of the non-profit Inter-Polar Research Society to study the culture of the native people and the ecology of the region. Besides Mimi and David, Edith Turner, anthropologist at the University of Virginia, and Yuir Rytkeu, a noted writer who is a native of the Soviet Arctic, will go along on the expedition. They hope to increase their numbers to include indigenous peoples and other scientists from both the U.S. and the USSR, including biomedical researchers from the Siberian Academy of Sciences. Once the ocean freezes, the boat will be used as a self-contained base of operations. A similar expedition is planned to the Soviet Arctic in 1990, with a future venture back to Antarctica under consideration.

**HARD TIMES CAMP YIELDS MANDARIN ORANGES TO METEORITE HUNTERS.** One of the nice things about Antarctica is its native population, and among the natives, one of the nicest has to be the bewhiskered Bill Cassidy. We will never forget the time he forgot about giving our Society's lecture in Washington until it was too late to catch a plane, whereupon he hopped into his car and cruised on into Washington just prior to the meeting. Whattaguy! He is just back from another successful field season, where the climate was evidently ideal for growing a new crop of meteorites, but rather than tell you another success story, let's let Bill tell you how he found things around old Hard Times Camp.

I thought the readers of your Newsletter might be interested to learn, as a historical footnote, that during the 1985-86 season we reoccupied the old Hard Times Camp on the Walcott Nev6, abandoned since they stopped mining vertebrate fossils at Coalsack Bluff. We stumbled across it during the early days of our season when we were doing day trips out of the Beardmore Camp and hadn't yet found any meteorites. We were running south by snowmobile toward the Plateau proper, to visit some exposed ice areas south of Coalsack Bluff when we noticed a couple of black dots to the southeast of our track. We drove over to take a closer look, and one dot became the old generator shed; the other dot was a partly exposed 55-gallon drum. The generator shed was essentially a box built of 2x4's and plywood. It was filled with snow, but there was a wind scoop around part of it. There were a number of fuel drums with snow drifted up around them, so that just their tops were exposed, and seven or eight 4x4 posts sticking up here and there with electrical wiring still running up them. Nailed to one post was a sign with the faded name barely legible: "Hard Times Camp."

Later that day we found our first meteorites only three miles away on exposed ice near Lewis Cliff. We then spent some weeks in a series of field camps around Otway Massif and the Dominion Range, but planned to return to Lewis Cliff. When we did return, toward the end of the season, we put our camp at Hard Times. We ate a lot of mandarin oranges from the old food cache there. Later, Jim Collinson told me they had had a tremendous surplus of them, and he had eaten so many that he had never been able to eat any since then.

We found the site to be quite windy, and rather inhospitable because of the wind, although it had a certain lingering attraction connected to its historical past. Jim told me that they used to judge the weather outside by the volume of snow blowing across the floor of their Jamesway, coming in through cracks on one side and going out through cracks on the other. Hard times, indeed! We left some of our surplus food cached there too. Last season (1986-87) we tried to pick a better site a few miles away, but it was just as bad. In one of the areas where we searched for meteorites last season, we spotted a few big "rocks" some distance away, in an area where you wouldn't expect rocks. We thought they would be nice big meteorites,

but discovered instead a strewnfield of old, used JATO bottles - more relics of the Coalsack Bluff operation. It seems more and more difficult to go somewhere that no one has been before!

**EAGLE SCOUT LOU SUGARMAN HIKES ONWARD AND UPWARD.** Upon his return from the Ice, Lou Sugarman attended the Scout Jamboree going on in New Zealand, and came away disappointed in his fellow Scouts from the States. But he didn't let their behavior hold him down; he visited the Navy in Christchurch and scrounged all the hiking equipment he could - it was minimal - and took off for some good old Kiwi trekking as a freedom (independent) walker. He did the Routeburn, the Caples, the Dart, and the Rees in quick succession, in his sneakers, and he got his fair share of the rain on the Routeburn! Then he came home and was given the royal treatment in Washington. Besides meeting with the Director of the National Science Foundation, he met a three-star general in the Pentagon, ten members of the House of Representatives, the Under Secretary of Health and Human Services, the Assistant Director of Secret Service, and the Secretary of the Interior. It seems like he met someone else, too - oh yes! he met the President. But after meeting Art DeVries in one of his fish houses at McMurdo, it must have been pretty routine meeting Ronald Reagan in the White House. Now the question is, did Lou give Ron one of his Boy Scout Antarctic shoulder patches? Speaking of Boy Scouts and the White House, our own Ruth had tea with Eleanor after one of Paul's trips to Antarctica. So the beat goes on!

**ANOTHER SPLINTER GROUP OF ANTARCTICANS GETTING ORGANIZED.** As the Colorado Springs Antarcticans were assembling, so were Antarcticans deep in the Heart of Texas. Duwayne Anderson sent us a letter about their first meeting, which read:

On Wednesday evening, December 10, June and I hosted the first meeting of the Bryan-College Station Antarcticans. We were privileged to have with us Greta Fryxell, Worth Nowlin, John Wormuth, Nan and Sayed El-Sayed. Not only that, we also had the great Curly Wohlschlag and his lovely wife up from Aransas to join us.

What's more, in addition to all of these folks, their colleagues and students, we also had Phil and Debbie Rabinowitz (Phil is director of the Ocean Drilling Program) and several members of the science team that will embark from Punta Arenas on the drill ship Resolution to begin Leg #113 to the Weddell Sea. They will first position the ship at the preselected site and then collect cores from the bottom of the Weddell Sea. This will be added to our growing store of cores from other waters for archiving and study in our new ocean drilling building.

We had a wonderful time. The evening consisted of refreshments and appetizers to begin, one of June's great meals, and a slide show consisting of contributions from all those present who wished to share their memories and experiences. You will understand our limiting each person to three slides in the initial round. Enthusiasm runs high in Antarcticans and without this limitation we would have been there all night. We were treated to some spectacular photographs and warm recollections of friends and favorite places.

Before the evening ended, I took the liberty of convening an organizational meeting of Antarcticans in Texas. We elected Curly Wohlschlag president by acclamation with the understanding that Sayed and I would be his deputies. Worth Nowlin was given the task of coming up with a suitable name and acronym. The next meeting is scheduled for June at the home of Sayed and Nan El-Sayed.

**ANTARCTICA AWAITING A LITERARY VOICE.** An interesting letter came into the Nerve Center in mid-March from Michael Parfit, well-known Antarctic author of *South Light*, which will be reissued as a paperback in May. He writes:

I think that writers are still looking for ways to grasp Antarctica, trying to find the range, or the proper mood, or something. As Pyne says, we take preconceptions (or golf clubs) to the place, and write about it as we would about more familiar landscapes. I think he's wrong about the continent being a nothing place, a mirror or a sink; I think rather it is just like any other place that is strikingly new to our culture; we haven't figured it out yet, or we haven't cut ourselves enough apart from the thought habits of the temperate world to learn Antarctica's unique way of affecting our lives. I know that my own book was not in any sense "Antarctic" literature, and though *Alone* and Scott's diaries and *The Worst Journey* may indeed fit that description in a kind of preliminary way, I suspect that it will be a while before we begin to see a unique literary voice coming from the south. After all, it took America centuries to find a tongue.

**JOHN DYER ON ADMIRAL BYRD.** John Dyer, an M.I.T. man who was Chief Radio Engineer on the 2nd Byrd Antarctic Expedition, and was very close to the late Admiral Byrd on that expedition, wrote us on 12 March about Byrd the Man.

Lots of people didn't understand him. He was a very well intentioned person, with a devotion to science in which he had little training. He was pretty deeply committed to serving science. I think he was entirely sincere - and stories saying otherwise just would have been entirely false. REB was not a good judge of men and made some pretty bad choices.

John and Byrd were chess partners. It seems that the late Admiral thought that John was a great chess player, but John wrote, "I was not, but he was worse!"

**IF YOU WANT TO BUY SOME CLASS.** If you want something beautiful and distinguished looking, we have several suggestions. We ran across a piece of crystal from Sweden with penguins, part of a signature collection of Mats Jonasson. Mats developed a new technique for sandblasting glass, and supposedly his various wildlife crystals have gained him international recognition with collectors. The penguin piece is about 5 1/2 inches high, 6 inches across, and sells for \$107. But it is worth it, a real beauty. The Ecology House is handling them in this country, and there are three - in Portland, Maine at 7 Exchange Street (04112); in Provincetown, Massachusetts at 356 Commercial Street (02657); and in Lahaina, Maui, Hawaii at 658 Front Street #166 (96761).

But if penguins don't turn you on, and you're an ice man a la Stephen Pyne, then we can highly recommend one of the Hoya crystal icebergs (5" high, \$165; 4" high, \$115; 3 1/2" high, \$90; 2 1/2" high, \$85). They can be bought from the Hoya Crystal Gallery, 450 Park Avenue, New York, New York 10022-9902.

But then you should get one of Dick (Little America V) Chappell's Baselites to display your choice piece of polar crystal. They come in two shapes, circular and square. The square one (6 3/4" on a side) has a wooden base and sells for \$65; the circular one (7" diameter), in silver, gold, or black, sells for \$75. Add \$3 for mailing. Their address is Fine Lines International Ltd., Box 408 Lenox Hill, New York, New York 10021-9990.

If you should buy either of the above combinations, I'm sure you would be pleased, as they are really beautiful.

**SNOWBALLING.** We were sorry to hear that Dick (Wilkes 57) Berkley has cancer. The Men of Eklund have remained fairly close since the IGY, and they are leading in prayers for his recovery. However, the prognosis is not overly encouraging... Deep Freeze IV is holding a reunion from 30 July to 2 August at the southern end of Port Hueneme in California. The exact site is the Casa Sirena, 3605 Peninsula Road, Channel Islands Harbor, Oxnard, California 93030. The point of contact is Mel Havener, 278 Lantana Street, Camarillo, California 93010 - phone (805)987-8158, and he has done a great job of rounding up the old boys. But if he missed you and you want to go, get in touch with Mel, as there's always room for more . . . Jerry Huffman, veteran employee of yesteryear with DPP, has left the big city, becoming a distinguished part of the landed gentry in Virginia, moving out into the Shenandoah near Waynesboro (Route 2, Box 296, Waynesboro, Virginia 22980). Before he finalized his conversion to a good old country boy, he (along with Gundel) took a mid-winter trip to Jamaica. Once upon a time Jerry told us that Gundel was the best thing that ever happened to him, that he was killing himself trying to keep all the girls in Christchurch happy . . . The multitude of friends of Walt Seelig will be happy to hear that he is making good recovery from the heart attack which befell him at Dick and Sally Cameron's Annual Christmas Bash. Walt is going back to the doctors in mid-April to have them use that new balloon technique again to clean up two arteries. And speaking of old Dick Cameron, he is a mayoral candidate in his adopted hometown of Collinsville, Illinois. If you want to make a financial contribution to his campaign to keep him out of science (and also out of soybeans), send him some of your cold, hard cash. Dick won't have any problems getting elected if he knows half as many women out there as he did in Washington . . . Fauno Cordes (355 Arballo Drive, San Francisco, California 94132) who prepared that comprehensive list of Antarctic novels (see Bergy Bits, August 1983), writes that her bibliography has doubled since then, and is still growing. She considers the novel, Antarctic Cookbook a significant book as it depicts Antarctica, for the first time, as a place for a private summer country home . . . John Cadwalader writes that Bergy Bits was in error relative to the first mountaineers, per se, in Antarctica. He said that a brother-in-law of Ed Hillary named Harrington and a bunch of his fellow Kiwis went south on an icebreaker back in DF II or DF III, and did some climbing in the Victoria Range . . . Psychology Today, March 1987, tells us that medical histories and psychological profiles of all Navy personnel who were accepted for Antarctic duty between 1963 and 1974 had lower hospitalization rates after returning home than other sailors, suggesting that they learned valuable coping skills. Bergy Bits believes that the same coping skills could have been developed by the very same sailors over the same period if they had not gone to Antarctica and had been dating redheads. Besides, their findings can't be applied to sailors in Antarctica today, as back then it was basically a man's world, while today it is very much a heterogeneous society. And the stresses are back . . . . Did you ever wonder who that fellow Elisha Kent Kane was who showed up on that Arctic exploration stamp? Well, the secret is out, he was the great uncle of a great aunt (by marriage) of Rob Flint. And all this time we thought he was a relative of some politician . . . Have you seen those Antarctic fauna stamps from Chile? Pretty neat. We wonder if there are any other signatory nations of the Antarctic Treaty besides the United States which have not issued an Antarctic stamp (since the Treaty) . . . Guy Guthridge has told the people in New Zealand that he does not want any more USAP calendars with NZARP pictures. Now if he would only tell them to scrub off the foolish listing of dates when nations acceded to the Treaty, that would really help!

**FINALE.** That's it for another season - six Newsletters, 76 pages (total now for Bergy Bits is 56 Newsletters, 672 pages). This one was written eight weeks prior to the meeting, as we wanted to close up shop. It has been a bittersweet year. Some real great things like going back to the Ice and New Zealand, but there have been downers, too. Time to reassess. Summers are for enjoyment. Time to go home. ENJOY!

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

Vol. 87-88

September

No. 1

Welcome to the Society's 28th year and to its 133rd lecture!

**Presidents:**

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-62
- Mr. Gordon D. Cartwright, 1962-63
- RADM David M. Tyree (Ret.), 1963-64
- Mr. George R. Toney, 1964-65
- Mr. Morton J. Rubin, 1965-66
- Dr. Albert P. Crary, 1966-68
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-71
- Dr. William J. L. Sladen, 1971-73
- Mr. Peter F. Bermel, 1973-75
- Dr. Kenneth J. Bertrand, 1975-77
- Mrs. Paul A. Siple, 1977-78
- Dr. Paul C. Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82
- Dr. Mori D. Turner, 1982-84
- Dr. Edward P. Todd, 1984-86
- Mr. Robert H. T. Dodson, 1986-88

**Honorary Members:**

- Ambassador Paul C. Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard

**Paul C. Daniels**

**Memorial Lecturers:**

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Sir Peter M. Scott, 1971
- Dr. Frank Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980
- Dr. Robert L. Nichols, 1981
- Dr. Robert H. Rufford, 1982
- Mr. R. Tucker Scully, 1983
- Dr. Richard P. Goldthwait, 1984
- Dr. Mark F. Meier, 1985
- Dr. Claude Lorius, 1986

SOUTH POLE STATION 30 YEARS AGO by

Dr. Robert F. Benson  
Space Scientist

Laboratory for Extraterrestrial Physics  
NASA's Goddard Space Flight Center  
Greenbelt, Maryland

on

*Tuesday evening, 27 October 1987*

*8 PM*

National Science Foundation  
18th and G Streets N.W.

ROOM 543

- Light Refreshments -

Bob Benson, ionospheric physicist at Amundsen-Scott in 1957, is coming before us to tell us the story of the first wintering-over party at the South Pole. Led by the late Dr. Paul A. Siple and the late Jack Tuck, it was one of the most harmonious camps ever, and many of its men, including our speaker, went on to have distinguished careers. Bob's areas of expertise are linear and non-linear plasma wave phenomena, ionospheric physics, and planetary radio emissions. Hopefully he won't talk too long on these subjects, but will tell us what it was really like building the first station at the South Pole, and being a member of that first American station to experience temperatures below -100°F. Bob serves as Deputy Project Scientist, Attached Payloads Panel, Space Station Users Working Group at Goddard.

*Officers 1987-88*

President - Robert Dodson  
President - Guy Guthridge

Treasurer - Ruth Siple  
Secretary - Peter Barretta

*Board of Directors*

Through 1988

Herbert Nickens  
Jackie Ronne  
Walter Seelig

Through 1989

Jorge Carnicero  
Robert Hickerson  
Tony Meunier

Through 1990

Lisa Fetterolf  
Bruce Molnia  
Herman Zimmerman

*At-Large*

Charles Swithinbank C. Vernon Cooper

James Caffin

Bergy Bits has run its course, so we're taking Franklin Dukes' excellent suggestion and switching the title of this unexpurgated, unrestrained, nearly-uncensored, and sometimes out-of-control column to something more in keeping with its contents. We're late in getting back into the Nerve Center, as this person has been spending more time in Maine with his 91-year old mother who had an unsuccessful eye operation this past spring. Having made seven trips from deep in lobster country to doctors/hospitals in Boston this past summer, we are much more familiar with looney Boston drivers than we are with Antarctic happenings. However, lack of knowledge has never hitherto limited/restricted us in putting together newsletters, wo why should this be any different? Let it roll

**SOCIETY BUSINESS — BILLS ARE IN THE MAIL.**      The good news is that membership dues are still the same:

Husband-Wife	\$10
Local (within 50 mi. of D.C.)	\$7
Out-of-town (beyond 50 mi.)	\$6
Foreign (outside U. S.)	\$14
BAE I & II, US Ant. Serv. Exped.	\$3

We are maintaining the same dues, despite the fact that your Society is about to enter the computer age and has to dig into reserves for some healthy expenditures. This (computering our newsletters, memberships, billings, labels) will be an acid test as to whether you can really teach old dogs new tricks. For the time being, we are still drafting on an Underwood Manual, typing on an IBM Selectric II, and running the membership/treasury according to a unique system which only two people really understand.

If you get a bill, how about renewing for multiple years? It makes it a heck of a lot easier for us (RJS and PCD). As we go to press, we have 564 members, an all-time high, but because many of you renewed for multiple years, we had to send out only 240 bills! Great! Running the Nerve Center is getting to be quite a job. We beseech all of you who move to let us know your new addresses as soon as you move. We go totally beserk every time we hear from some character who moved twelve months before and asks "Where are my newsletters?". Bulk mail is NOT forwarded, nor is it returned, so it's up to you to let us know where you are.

Last year we initiated a husband-wife membership category for \$10. This was done to help out nine old faithful couples (the Barrettas, Borns, Campbells, Crarys, Burrill DeWitts, Kelloggs, Toneys and Turners) who had been paying full share for two. We didn't realize how many thought it would be a good idea to sign up their other halves, and ended up with 32 married memberships! Husbands and wives don't get separate newsletters, as we work on an ill-founded suspicion that husbands and wives do talk and do share. The extra dollars we pick up from husband-wife memberships help to support several libraries, several complimentary members, and allow us to send out sample copies to prospective members. So if you want to enroll your roommate, try that \$10 family membership. It is all for a good cause.

Several members have been more than benevolent in support of the Society, and in an unsanctioned but lasting edict, we are telling Helen Poulter, Charlie Murphy, Howard Mason, Henry Harrison, and Jean Portell that we don't want any more of their green-

backs. Howard was an extremely bad offender; every time he went to the postoffice he would send us an unsolicited draft. We also have Honorary members, so Larry Gould, August Howard, and Teddy Daniels (widow of our late Honorary President) also are exempt.

For those who are statistically minded, last year's totals reveal that we picked up 87 new members, four died, three went inactive, and 25 deadbeats were dropped, so we ended up with a plus 55. It was our third best year in the last decade. Incidentally, if any of you are not renewing, we would like to encourage you to let us know so that we can drop your name, and not waste your time and our time trying to get money from you. We want to streamline these operations, and one way we are doing it is by sending out one second notice and a final notice, then chop, chop, chop.

**1988 ANTARCTIC CALENDARS.** We have not seen either the New Zealand or the USARP Antarctic calendars, but we HOPE to have them earlier this year. In mid-May we sent dollars to Colin and Betty Montieth for 200 New Zealand calendars, which we anticipate having in hand by 1 November. We trust that Max Hamilton will be able to get us 200 USARP calendars by then, too. Most of you are familiar with both calendars, but for any neophytes buying Antarctic calendars, the USARP calendar usually has pictures of U.S. operations in Antarctica, with historical data printed on specific dates, and a primer course on Antarctic exploration, marine life, bird life, fossils, et cetera on the bottom of each page. No space is wasted, a good calendar for Christmas gifts for those who have never been there, as well as for USARPs. The New Zealand production is more a work of art, having more majestic Antarctic scenes without people, planes, and snowmobiles cluttering up the forefront. It is not into teaching Antarctica, so all you get are high quality photographs on good quality paper. In fact, the dates are so small that you need 20/20 eyesight to even read them. We hope you buy plenty of each, and buy early, so Ruth Siple can get out of the calendar business by Thanksgiving. This is the Society's only fund raiser, although it is ridiculous to call selling the New Zealand Antarctic calendar a fund raiser, as our mark-up on them would buy only a cup of coffee or a daily newspaper, not one of each.

1988 New Zealand Antarctic Calendar	\$7.50 each
1988 Navy USARP Antarctic Calendar	\$6.00 each

**ANTARCTIC STAMPS ARE ON THE WAY.** The Society set up a committee last spring to investigate the best approach for getting the U.S. Postal Service to approve a set of Antarctic explorers stamps - to complement the set on the Arctic issued this year. While our committee was doing their undercover work, the U.S. Postal Service announced that four commemorative stamps will come out sometime in 1988 honoring Richard Byrd, Lincoln Ellsworth, Nathaniel Palmer, and Charles Wilkes. Where the Antarctic commemorative proposal originated is a mystery, but it had to be proposed at least four years ago, because it takes at least three years to create a stamp after the subject is approved (according to our august secretary, Pete Barretta, a prominent member of the American Society of Polar Philatelists, who hardly ever lies). It seems that the proceedings of the U.S. Postal Service may be the best kept secrets in Washington, so we may never know who the proposer was. Isn't it a bit ironical that two of the explorers being honored probably never set foot on Antarctica, and that one of the two was court-martialed after his expedition, although he was eventually cleared! There is very slim hope that there might be a stamp commemorating the 30th anniversary of the Antarctic Treaty. Presumably it will be proposed before the Antarctic Treaty's Consultative meeting in Brazil in October of this year. One of the U.S. problems with issuing anniversary stamps is that events of historical significance are considered for commemoration only in multiples of fifty years. (Thanks to Pete Barretta for the above.)

WALT SEELIG ALMOST AS GOOD AS NEW. Walt Seelig suffered a heart attack at Dick and Sally Cameron's annual Christinas bash last December, and was hospitalized several times. First they tried to reopen some arteries using the new balloon technique, but eventually they had to do some heart bypasses, ending up with three. It was all complicated by the fact that when they operated, they found out what we all already knew that he was all heart. Now he is back out on the streets, walking a couple of miles each day, and well on his way to his former meanness. Reluctantly he has made one concession to his condition, and he has very mixed emotions about it. His son Bill talked him into buying a new lightweight Old Town canoe, one that weighs only 59 pounds. It seems Walt owned one that Pocahontas used to rescue John Smith, and for sentimental reasons Walt wanted to keep on using it. So if you know of anyone who is interested in owning a 1929 Charles River model of an Old Town canoe, contact Walt, as he wants it to have a good home. Only a few were made, as the mold burned in a fire. Walt says that all you have to do is dip the paddle in the water and it will glide for half a mile. Meanwhile, he has a new canoe which he can lift, but he is killing himself trying to get it to move like the old charmer!

**THE IMMORTAL BERT CRARY UNDER THE KNIFE AGAIN.** Bert Crary, Deputy Chief Scientist for the Antarctic IGY Programs and Chief Scientist for USARP for the 1960's, has a hard time staying out of hospitals in recent years. On 15 September, he was operated on at George Washington University Hospital in Washington for the removal of two tumors at the end of his spinal column. Bert was in the hospital receiving radiation treatment for the tumors when he began to lose movement in his legs. Because paralysis began setting in, he was rushed into surgery. Less than twenty hours after surgery (in which one of the tumors and part of the other were removed), it was reported that Bert was both garrulous and hungry. However, the best news was that he had movement of his toes, knees, and legs, and that the remaining half tumor is in a position where it can receive radiation treatment. As readers of this column know, Bert has been beset with a series of health problems over the past three years, and it is only because of the loving care of Mildred that he is still alive. She has changed the direction of his health care several times when he wasn't responding to treatment, and has insisted that he have the very best of medical attention. These have been trying times for them, and Mildred feels that visits and letters from his friends will be an important part of his recovery. Their home address is 8301 Beech Tree Road, Bethesda, Maryland 20817.

Bert is a most unusual person, one of those rare characters whom many try to emulate, but no one succeeds. He combined being an indefatigable field worker with being a top administrator, plus being an analytical scientist who publishes profusely in many geophysical disciplines - a triple threat in the true sense. But it is as a person that sets Bert aside from all others, as underneath his parka, and behind that expaint brush mustache is one of the softest, kindest, caring pussycats in the whole world. Everyone who knows Bert at all has a myriad of priceless stories about him, some of which might even be publishable in today's world. Because of his long stint as head of what is now the Division of Polar Programs at NSF, he has probably helped more U.S. Antarcticans than any other person. To which we all say, "Thanks, Bert."

This past spring the University of Wisconsin honored Bert by the creation of the Albert P. Crary Chair of Geophysics. It is most fitting that the first man to occupy that chair is Antarctic Charlie Bentley, who has been intimately connected with Bert since the IGY. There is great mutual respect and admiration on each side for the other, and we know that Bert considers Charlie the best scientist to come out of the IGY Antarctic programs. Charlie is just one of several Antarctic geophysicists who got his PhD at Wisconsin. Some of the others were John Behrendt, Hugh Bennett,

Ned Ostenso, Ed Robinson, and Jim Sparkman, all of whom have gone on to great achievements. May the Antarctic geophysical record at Wisconsin be a prelude to future successes. Charlie looks just great, sitting in the Crary Chair. Now if he could just grow some hair and put on some weight, he would look more distinguished. But then, again, that wouldn't really be Bert. Geophysicists aren't supposed to look like bank presidents, are they?

**THE INDESTRUCTIBLE NORMAN VAUGHAN.** Once upon a time Harvard University was noted for turning out fine dog-team drivers, although in more recent years it has gained some notoriety as an institute of higher learning for those who can't get into Yale. One of the Harvardian dog-team drivers was Norman Vaughan, who went south with Commander Byrd on his First Antarctic Expedition (BAE I) in 1928-30. Evidently he still has a strong affinity for dogs, as this past winter, at 81 years, he finished the 1,157-mile Iditarod Trail Sled Dog Race. He was two weeks behind the winner, Susan Butcher, but he was accompanied by a woman companion, Carolyn Muegge, and they probably did the race in style. After all, when you are over 80, successful in enticing a young woman into the boondocks, you should savor the experiences!

The May 1987 magazine *Alaska* has a close-up picture of Norm and one of his huskies on its cover, and inside an excellent feature article, entitled "The Mushing Methuselah." That seems like a most appropriate title for Norm, as Methuselah also has a strong Antarctic meaning, being the name of a bottled booze provided for expedition members for medicinal and therapeutic purposes. The author, Tom Clark, describes Norman as "half P.T. Barnum, half Peter Pan, the man who taught the Pope to drive a dogsled and crashed President Carter's Inaugural Parade, who has played polo with the Shah of Iran and hunted foxes with the Prince of Wales, the man who has finished the Iditarod four times since turning 70, the man who has a mountain named after him in Antarctica and a folk song sung of him in Anchorage."

Norman has had somewhat of a checkered history on the Iditarod, and has had to be rescued three times, the last being in 1986 when his sled hit a frozen tussock and he fell, breaking six ribs. A sports writer for the *Anchorage Daily News* wrote a column advising Norman to retire. Shelley Gill, a newspaper publisher, said, "His trail judgment isn't always good. He still drives the way they did in the 20's and 30's. Norman does not travel light. He always got a come-along, and brakes that would stop the Gates of Hell from closing, and three sleeping bags, and so many watches strapped to his arm he looks like a thief from Brooklyn."

Norman is still going full throttle, in spite of three failed marriages. This past summer he went back to Greenland in search of some downed P-38's from World War II which are buried somewhere under 80 feet of snow and ice. He hopes to return to the Antarctic with dogs for one last fling, talking about mushing to the South Pole via Amundsen's route and then returning to McMurdo by Scott's footsteps. The last time Norm was in the Antarctic was in November 1979, the 50th anniversary of Byrd's flight over the South Pole; the commander of the aircraft flying him was his son.

Carol Phillips, an Anchorage writer, wrote, "He is still excited about life, and he still has a lot of plans for his life. He still has eyes full of dreams. If you asked him, he would say the best is yet to come." If any Antarctic is going to die in harness with his boots on, it will probably be Norman, as it doesn't look as though the guy has enough sense to come in out of the cold and sit in front of a nice fireplace and sip brandy.

**ANTARCTIC SCIENCE IS A BIG WINNER.** *Antarctic Science* is the most comprehensive book ever done on science in Antarctica, and we unequivocally recommend it to every Antarctic who has any interest in science. The only bad thing is that it is pub-

lished by and for the Brits, although there are no restrictions on Americans buying the book (Cambridge University Press, \$42.50). Actually the price is cheap, as you will be getting more facts for your money than from any other Antarctic publication we know about. It is too bad that we in the United States didn't have the foresight to get out our version of who does what in Antarctica. It's not that the U.S. program is totally disregarded, it isn't, as one can read about the scientific discoveries at Siple Station, read about the ozone studies conducted at McMurdo last spring, the research on krill, et cetera. But what is lacking for those of us who are interested in Antarctica as a breed of people are the names (and human interest stories) of Americans working in Antarctica. Maybe it isn't important who finds fossils, who picks up meteorites, who catches Antarctic cod, but to this simple soul, science results because of people, and it is kind of nice to know something about the Charlie Bentleys, the Bill Cassidys, the Art DeVrieses, the Gisela Dreschhoffs. It's not that people are left out of the book, they are not; it's just that they all seem to be carrying British passports.

However, let's not be overly picayune and jealous about the Brits, as the United Kingdom's recent contributions to Antarctic literature are just great - Roland Huntford's *Scott and Amundsen* and his *Shackleton* have to be the most thoroughly researched Antarctic bibliographies ever published; and the Reader's Digest's *Antarctica*, published in Australia, is just a fantastic assemblage of Antarctic history. So the UK now has four major victories in Antarctic literature for the 1980's. The following comments are taken, in part, from a review of *Antarctic Science* which Brash Ice did for *The Scientist* this past summer:

*Antarctic Science* is a most unique book in that it is the first-ever publication which attempts, and is successful, in presenting a comprehensive history of scientific research on Antarctica. The amazing thing about the book is that five different scientists from the British Antarctic Survey in Cambridge (David Walton, Christopher Doake, John Dudeney, Inigo Everson, and Richard Laws) have combined their expertise to present a coherent, well-balanced book. Its timing is excellent as it chronicles a century of polar activities in Antarctica since the First International Polar Year (1882-83), summarizes thirty years of intensive international research that has followed the International Geophysical Year (1957-58), and precedes the year (1991) when the Antarctic Treaty will come up for review and extension . . . . . Even though many of the more significant U.S. research programs are not mentioned, this reviewer feels that the breadth of the scientific coverage in the book is so great that one should not be concerned with certain U.S. omissions.

The book is profusely illustrated with many fine colored photographs (marine life) and diagrams (solar-terrestrial relationships), excellent black and white pictures, including many from the heroic age of exploration, and hundreds of sketches, diagrams, tables, graphs, and figures. But, unfortunately, there is no numbering of the illustrative material. The Select Bibliography includes 63 references, only the tip of the iceberg when it comes to significant Antarctic research publications.

Part I covers the geography, history, and geopolitics of Antarctica. A non-polar person can read these 62 pages and have all the background information needed on the continent. One subject which was not touched upon, which probably should have been, is the role of women scientists "on the ice." Their advent in 1972 was the single most important "Antarctic introduction" since aircraft in the late 1920's. It turned Antarctica into a non-sexual scientific laboratory.

The three science sections are all excellent, particularly the one on biology which includes chapters on biogeography, ecology, physiology, food webs, and fisheries. Since the book has been published, the Japanese have indicated that

they will restrict their future catching of Minke whales to a limited number for research purposes. However, there is also bad news with over-fishing of several species in the Southern Ocean. In spite of all the efforts being exerted in the multidisciplinary BIOMASS (Biological Investigations of Marine Antarctic Systems and Stocks) program they have hardly broken the surface of the water.

The two chapters on weather and climate are interesting, and they touch upon the red-hot scientific issue of Antarctica today—the early spring occurrence of an ozone hole over a large portion of the continent. The U.S. will soon be sending another team of scientists to the Antarctic in an effort to find out what causes this hole to occur. The two chapters on space research from Antarctica are just excellent. Stanford University's researchers at Siple Station have been playing a lead role for the past 15 years, investigating wave-particle interactions in the magnetosphere in the region of the plasmopause. Very appropriately this fine book ends with a chapter on the future entitled "Cooperation or Confrontation?" which discusses science, the Antarctic Treaty, and the future.

Although the book was written because someone in the British Antarctic Survey saw the need and presumably a market, it constitutes sort of an endorsement of the Antarctic Treaty, showing how science can be conducted very effectively by people from many nations, working within the framework of the Treaty. It should disquiet any Third Worlders who might think science isn't doing just fine on the ice. The book is very factual, very truthful - a real no-nonsense book on science which you all should have in your own library.

**ORIENTATION 1987 AND GEORGE SIMMONS.** The Division of Polar Programs changed the format at their annual orientation in September by presenting a sextet of Antarcticans talking about "Doing Science in Antarctica." The first speaker was George Simmons of Virginia Polytechnic Institute, and after he got through there was no need for the other five to speak at all because they couldn't top George; it was just a matter of their filling in time before tapping off the kegs of beer for the social hour. Brash Ice thought that George's three keys were right on target: Be prepared, be motivated, be human. He told the people going south that their failure or success had already been determined, and that now it was just a matter of their execution on the ice. The last of the six speakers spoke on Palmer; his presentation didn't seem compatible with what we had heard from the previous speakers. It was like we were getting a report from the Camden, Maine Yacht Club, not from a prominent scientific station in Antarctica. The biggest change in Antarctica in the past thirty years seems to be on the social end; only those who go out in the boonies experience exploring conditions. McMurdo and Palmer are probably more Alaskan than Antarctic with all of their activities. Progress?

**A BLUE-RIBBON PANEL.** The Director of the National Science Foundation has established a U.S. Antarctic Program (USAP) Safety Review Panel to perform a comprehensive review of safety in the U.S. Antarctic operations. The chairman of the group is Russell Schweickart, a former astronaut who has evidently given up the mundane existence of walking in space to the more exciting life of Antarctica. Rusty's panel comes from the highest levels - American Alpine Club, Harvard, US Air Force, National Science Board, Navy, and even a bureaucrat from the Department of Commerce. Brash Ice was particularly interested in the person who is a professor of medicine at Harvard University, Dr. Howard H. Hiatt, as his name had a very familiar ring. Meeting at a reception, he didn't look very familiar, but it turned out that we were together in Worcester (Mass.) Classical High School several years ago - or was it really over forty-five years ago? Howard and I had very little in common back in Classical, as we were on opposite ends of the scholastic achievement spectrum. His going to the South Pole in a couple of months just goes to show that the high and mighty sometimes,

although maybe only briefly, come back to trod on the ground, or in this case the snow, of the under-achievers. Brash Ice thinks it is just great that Howard is going to the ice, and with the proper indoctrination from Chet Pierce, he will do just fine.

Brash Ice never thought Antarctica was a very dangerous place, thinking of it more in terms of a safe getaway from the real hazards of life - commuting across the 14th Street Bridge into Washington, Christmas shopping in malls in November and December, rock band music, et cetera. The U.S. has had a really outstanding record of safety, at least insofar as fatalities are concerned, in Antarctica, although we aren't certain how many man hours may have been lost from injuries or whatever. The biggest difference in camp life between the IGY and now certainly has to be booze. There has always been some drinking in Antarctica, even on the early Byrd expeditions, but now it is more highly organized and competitive, because of its ready availability, plus red-blooded, enterprising, fun-loving people always ready for a party. However, one has to be impressed by the leadership of Bob Becker of ITT - without people like him, it could be real bad.

**ANTARCTIC CLIMATOLOGY LEGITIMATIZED.** Climatologists are usually squares whose physical makeup and conservative nature have kept them away from dynamic meteorology and risk-taking forecasting to desk/computers loaded with data. They like to work with neat little blocks of data, at least thirty years' worth, and, at long last, for them, Antarctica has become of age. Towards that end, the National Snow and Ice Data Center at the University of Colorado, recently (10-11 September 1987) hosted a workshop "U.S. Antarctic Meteorological Data Delivery System." Brash Ice had the privilege of sitting in on the meetings, and they were rather interesting. When it comes to the conventional surface and upper air observations, the U.S. really does not have a pot; all they have is Amundsen-Scott (South Pole) and McMurdo (whose surface data are probably near useless for climatological purposes because of the ever ongoing constructional changes in the configuration of the camp). But Antarctica is unique climatologically because of its supplemental data - paleoclimatic data from deep ice cores, hundreds of ten-meter firn readings (which approximate the mean annual temperatures for those sites), an excellent sea-ice climatology from satellites, radiation data from two polar orbiting satellites, several sites with micrometeorological data of research quality for studying the boundary layer, and an infinite amount of information on ozone. These special observations, if one can call them special, are much more interesting than standard measurements, and have and will lead to great findings. In addition, there are many relatively short-period climatological records from stations like Little America V, Byrd, Eights, Siple, Plateau, Palmer and others, plus data from tens of field stations set up for several weeks or months. Altogether they constitute sort of a hodgepodge, but at long last, climatologists now recognize that there is an Antarctica. Everything has to have a beginning.

**RENOWNED ANTARCTIC PILOT DEAN SMITH SUCCUMBS.** Dean Smith, pilot on BAE I, 1928-30, died in his own bed in Easton, Maryland on March 4, 1987, ending a very illustrious aviation career dating back to World War I. As a young sergeant at Kelly Field in Texas, he applied for flight school, and after 56 hours and 45 minutes of flying instruction, was commissioned a second lieutenant. He showed so much promise as a cadet that he was kept on as an Army flight instructor - at age 17, the youngest in Army history.

He was discharged in 1919 and barnstormed for a short time before joining the U.S. Air Mail service, for which he flew for eight years. The service averaged a forced landing every 800 miles, a dead pilot every 80,000 miles. Once, flying out of

Chicago, his engine quit and he was forced to land. A telegram to the mail superintendent in Washington explained the incident, "On Trip 4 westbound. Flying low. Engine quit. Only place to land on cow. Killed cow. Wrecked plane. Scared me. Smith." He quit the service to become a commercial pilot for United in 1927-28, from whence he signed on with Commander Byrd on his first expedition to Antarctica.

Henry Harrison, meteorologist on the expedition, recalls Dean as being "a powerful man, mentally and physically." When the expedition came back from the ice, New York City tended them a ticker tape parade. Riding down Broadway, Dean spotted this good-looking girl on the sidewalk, jumped down, and talked her into a date. Whether he ever got back into the parade is unknown, but the girl, Beth White, must have been impressed as she married him and, as the story goes, lived happily ever after. That's what we need in this country, more spontaneous marriages before people get to know one another!

After the Antarctic, Dean first joined American Airlines and later went to work for Curtiss-Wright as a test pilot and sales executive. He quit flying commercially in 1943 and spent the remainder of his career as director of development for Fairchild Engine and Airplane Corps, and then as director of customer relations for Hughes Aircraft Company. Did he meet Jane Russell? His last job, in 1965, was as a consultant to Douglas Aircraft.

His honors were many, including the Distinguished Flying Cross and the Harmon Trophy, given each year to the person judged to be America's foremost pilot. He was the last president of the National Air Pilots Association before it became the Airline Pilots Association. He was named to the Aviation and OX5 Halls of Fame, both reserved for pioneer flyers. And he was given the Collier Club Award and the Detroit News Aerial Trophy. If you want to read more about Dean, go to your local library and get a copy of his *By The Seat of My Pants: A Pilot's Progress from 1917 to 1930*. Dean's passing reduces the BAE I winter-over party to five living members - Eddie Goodale, Larry Gould, Henry Harrison, Howard Mason, and Norman Vaughan. (The above from an obituary in the Los Angeles Times, 17 March 1987, graciously sent to the Nerve Center by Bob deViolini.)

**SICK BAY.** *Eddie Goodale* of BAE I fame and the earliest NSF Representative in Christchurch continues to live a rather sad life in a nursing home in Bangor, Maine. Ken Moulton dropped in to visit with Eddie this past summer, but wasn't really certain whether Eddie knew who he was, although when Ken greeted him and told him who he was, he held Ken's hand in a tight grip for a prolonged period. His wife, Eleanor, lives nearby in Winterport. *Sig Gutenko*, cook at West Base, U.S. Antarctic Service Expedition, also on the Ronne Antarctic Research Expedition, isn't in very good shape. His legs and hands are paralyzed, and he can't move without help. Sig is 83 years old, and lives at 4019 Foxborough Blvd., Valdosta, Georgia 31602 (telephone is 912-247-0706).

**ICE CHIPS.** We're happy for Lisa *Fetterolf*, one of our Board of Directors, who is going to Antarctica this austral summer with the contractor. She had to resign from her job at the Pentagon, although this didn't bother her, as she wanted to go to the ice so badly. Go for it, Lisa! ... *Wild Bill Cromie*, glaciologist of sorts and camp rounder at Little America V in 1957, normally Executive Director of the Council for the Advancement of Science Writing, Inc., is at M.I.T. this year as a Knight Science Journalism Fellow. Part of Bill's career was spent serving as a ghost writer for the astronauts; and you have seen him in print in the Antarctic Journal and NSF's Mosaic. Here is a man who has come a long, long way from when Bill Field plucked him off the sidewalks of New York and sent him to the Antarctic. If one had polled his peers at Little America V, it would have been a near unanimous decision that Bill would return from the ice and open up a string of "entertainment" houses in Nevada.

M.I.T. may not be ready for Wild Bill, but I m sure he will find some comrades in Cambridge . . . . *Chuck Stearns* of Wisconsin, the automatic-weather-station man of the Antarctic, rowed on the varsity crew at the University of Wisconsin when they were a national power. So if you have any disagreements with Chuck, best that you don't prolong them to a feat of strength, because you will only lose . . . . *Mike Pavlak*, who as a Holmes and Narver employee was frequently in Antarctica, has done it again. He and his good-looking blonde wife have come up with another little production of their very own, a girl named Jennifer was born May 20th. Let's all pray that Jennifer looks like Cathy! Their son Matthew is two. . . . *Alice Dater*, widow of Harry Dater, who for many years was Mr. Antarctic Society, has moved into a retirement home in Chevy Chase, leaving housekeeping to others. She still gets around, will spend Thanksgiving in Montana, Christmas in Maine. Alice is a sweetheart. Her new address is Chevy Chase House, 5420 Connecticut Avenue NW, Washington, DC 20015. . . . Presume you all read with some interest how the purported Eskimo sons of Robert Peary and Matthew Henson were given the red carpet treatment when they visited the States this summer, but did you see where one, *Anaukaq Henson*, died from cancer three weeks after returning home? While here, he met with some fifty relatives. - One of the great features of the Antarctic in the heroic age of exploration was that there was no temptation once you cleared New Zealand. Probably many a wife left at home slept soundly, knowing with some certainty for the first time just where her old man was that night! . . . *Bob Dodson*, our illustrious president, will be lecturing on the Society Expeditions Project Antarctica cruise of 5 December. There will be a bunch of geographers aboard, and Bob is going to tell them how rough it was back in the days of dog teams . . . . We have heard that *Michele Raney* may be going back down to the ice in some sort of a capacity as an expert on anesthesiology to advise the Navy doctors. If so, we are most happy for Michele, as she came back from the ice part-penguin, and it behooves all penguins to periodically return to their home rookery . . . . *Mike Metzgar*, a former rotund Antarctic, recently surfaced in Reston for a few hours. He is a business world tycoon, working for his father in the golf club business. Seems that he has lost about 150 pounds. We miss Mike in the Washington area, as he amounted to our undercover Antarctic eyes and ears, always seeming to know what was going on during mid-winter when everyone else was in the dark. . . . *Mel Havener* hosted a real big reunion this summer of Deep Freeze IV personnel. For some unknown reason, the Navy people are much more prone to attending reunions. Mel devoted a lot of time and effort to locating his colleagues, and it paid off in handsome attendance - about 60 former ice persons, including families about 150. Well done, Mel! . . . *Clarence Walton*, who worked at McMurdo as a general field assistant for the Antarctic contractor, surfaced this summer as a member of the Washington Commandos in the newly formed Arena Football League. Walton, 23 years old, is 6 feet, 250 pounds, and plays in the line. He was quoted in the Washington Post as saying that he is looking forward to rules that allow for one of the three linemen to be eligible for passes. Remembering his playing days at Lehigh, he said, "I haven't generated any positive yardage yet. I'm ready for spiking the ball. I've got it all planned out." . . . *Bill Benninghoff* retired. It's really a shame that people like Bill, Link Washburn, Bill Field, and others don't actually retire, as they are all nice guys and deserve to sit on the back porch with a highball watching the world go by. But what do they do? They keep on researching, keep on studying, keep on publishing. Sad! . . . One of the reasons we switched from Bergy Bits to Brash Ice, besides its representing more the author's style, is to disassociate it entirely from the uncouth way in which the American Polar Philatelists now have for displaying their Bergy Bits in Ice Cap News. If that is what it represents to them, we want no part of it. They should be ashamed of themselves . . . . IMPORTANT! We are looking for material from the younger Antarctic scientists. We prefer the truth, but we'll settle for anything which makes a good story . . . . PLEASE REMEMBER to BUY CALENDARS.' RENEW MEMBERSHIPS: SEND NEW ADDRESSES: NOW.'

# THE ANTARCTICAN SOCIETY

90S NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

Dr. Albert Paddock Crary  
First at Both Poles, "My Dubious Honor"  
25 July 1911 - 29 October 1987

#### Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Berrnel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86

A Pre-Christmas Present, An Eminent Polar Scientist!

LAKE HOARE, ANTARCTICA  
A Laboratory for Future Frontiers

by

Dr. George M. Simmons, Jr.  
Professor of Zoology

Virginia Polytechnic Institute and State University  
Blacksburg, Virginia

on

*Tuesday evening, 1 December 1987*

*8PM*

National Science Foundation  
18th and G Streets NW  
*Room 543*

Dr. George Simmons is currently spending his tenth season in the Dry Valleys of southern Victoria Land studying Lake Hoare, and will return to the States in late November. Dr. Simmons and other researchers have been using Lake Hoare as a model to understand Precambrian ecosystems, as well as to help scientists prepare for the future collection of samples from ancient lake beds on Mars. They are currently unravelling a story that relates climate changes in the thick ice cover on Lake Hoare to regional climatic shifts in the Dry Valley area. Dr. Simmons and Dr. Robert A. Wharton, Jr., Desert Research Institute in Reno, Nevada, and Mr. Mark Jenkins, Executive Director for Innerspace Foundation, Inc., have produced a documentary on the research being done at Lake Hoare. One of the themes of the documentary is to demonstrate that frontiers still exist and await those who are prepared to be the explorers. Dr. Simmons is an electrifying speaker with a great sense of humor. It should not only be a great evening, but a fun evening. This program should be an inspiration to young people with a scientific bent and/or with an interest in the environment. *Come with youngsters!*

We still have some 1988 New Zealand Antarctic calendars at \$7.50.

If you move. PLEASE send us your new address!

Writing this Newsletter seems sort of meaningless and empty, as our heart is full of sadness over Bert Crary's death. But having known Bert closely for over thirty years, I realize he would not want us to mourn his passing but to remember the good times we had with him. So this Newsletter may come out sounding like an Irish wake on paper. Bert was one of the founders of our Society, and I am sure when he gets upstairs he will reunite with Ambassador Paul Daniels, Carl Eklund, and Paul Siple - three other planks. It is too bad he couldn't have taken a couple of bottles along so they could all celebrate Bert's arrival; besides, all three of them would probably appreciate a good drink about now! To those of you who knew Bert, you have been rewarded by his friendship; to those of you who never had the pleasure of his company, all I can say is they threw away the mold when they made him, so you will never meet any one just like him. And as for you Bert, you better watch your language up there, as they are pretty straightlaced in Heaven, and you wouldn't want to go to that other place, it's not polar!

**WHO ARE WE?** It is always good to periodically sit back and see what we look like, as our Society has an ever-changing face. As we go to press, we number 579, which is a new all-time high, and within that number are fifty-two husband-wife memberships. There was a time, not very long ago, when we were basically a Washington group; now only 28.4% (163) of our Society lives within fifty miles of the Charles Wilkes memorial tablet on Capital Hill. One would think with a local membership of 163 we could sustain good attendance at all of our meetings, but we have to fight to get out forty. Once we had members from all the States except Idaho. We really didn't mourn not having anyone from Idaho, as you never hear of anyone coming from or going to Idaho, which means it must be some sort of an enigma lost somewhere in the northwest. But with people moving, we are now memberless in Arkansas, Louisiana, North Dakota, and West Virginia, as well as Idaho.

Virginia	85	Oregon	9	North Carolina	4
Maryland	61	Alaska	8	Wisconsin	4
California	57	Minnesota	8	Indiana	3
District of Columbia	33	New Hampshire	8	Kentucky	3
New York	28	Illinois	6	New Mexico	3
Colorado	24	Kansas	6	Alabama	2
Massachusetts	22	Rhode Island	6	Delaware	2
Arizona	17	Missouri	5	Iowa	2
Ohio	17	Nebraska	5	Nevada	2
Texas	17	Oklahoma	5	South Carolina	2
Washington	17	Vermont	5	Utah	2
Florida	14	Connecticut	4	Wyoming	2
Pennsylvania	14	Georgia	4	Montana	1
Maine	11	Hawaii	4	South Dakota	1
Michigan	10	Mississippi	4	Tennessee	1
New Jersey	9				

Can you imagine fourteen Antarcticans living in Florida? Disgusting. We sort of downgrade all members living in Florida, because with their background they should be up north shovelling snow and savoring the four seasons. We also have members

in Canada, England, Belgium, West Germany, Austria, Chile, New Zealand, Australia, and Korea.

**A MESSAGE TO THE 94 DELINQUENTS.** Eighty-four per cent of our members are now in good standing, and we want to especially thank the renewers who paid-up for multiple years; this helps our bookkeeping and we can forget you for a year or more. In fact, nearly three-fourths of those renewing heeded our plea for sending multiple-year dues. THANKS! We also appreciate those who wrote saying they were dropping out, which means we don't have to waste time sending out unwanted Newsletters. So if you do wish to drop out, please let us know now, as our Society is essentially a two-person operation, both of us having less time and less efficiency (?). So those of you getting your second notice with this Newsletter, pay up or ship out!

**ANTARCTIC CALENDARS.** First of all, there are no more USARP calendars for sale; we got only 144 of them and they sold out. As we feel the 1988 calendars are below standard, we won't be placing a supplemental order. However, we did purchase 200 New Zealand Antarctic calendars, and as we go to print, we still have 53 left. They are excellent, with good pictures, except for December. They also come in a firm mailing folder, so will go through the mail in good shape. After these are sold, we are closing up the ship's store for the season, so get your order in early. We were most sorry to hear from one member that his calendar(s) for last year were received in bad shape. If that happened to you, please let us know. It could be that in the future we won't order calendars which don't come in heavy mailing envelopes.

- 1988 New Zealand Antarctic Calendar - \$7.50 -

**SOCIETY PLANKS.** A Society membership list prepared by the efficient Ken Moulton shows that, as of 21 January 1960, the organization had 47 stouthearted men, of whom Admiral Dick Black, Capt. John Cadwalader, Gordon Cartwright, Larry Gould, Bill Littlewood, Herbert Nichols, Phil Smith, and Mort Turner remain on the rolls. We also have six widow members of original planks - Mildred Crary, Teddy Daniels, Alice Dater, Harriet Eklund, Jackie Ronne, and Ruth Siple. Say one thing for those planks, they had an eye for beauty and personality - none of them are deadbeats. Our records show that an additional ten actives joined the following year: Fred Alberts, Len Dykes, Laurence Eklund, Herman Friis, Herb Hansen, George Llano, William Radlinski, Walt Seelig, Bill Sladen, and George Toney. We have been accused of not being responsive to these forefathers, and we have also been accused of being old-explorer oriented. The first accusation is ill-founded, as we have maintained a pretty good relationship with most of the planks; have seen that those who wanted to serve have served; have maintained correspondence with many of those out-of-town. The old-explorer image is more difficult to defend, outside the fact that we continually beseech the newer generations to send us material. While we honor and respect the past, we recognize the fact that things have changed tremendously within the Society since its inception, and that we have an obligation to our out-of-town members to try to be more responsive to them.

**BERT CRARY, A GIANT AMONG MEN.** Bert Crary is gone, but he will never leave us, as he is immortal polarwise. When polar men get together, they will always talk about Bert, as he was truly a legend in his time. No one ever said a harsh word about Bert; he was a man's man, one whose demeanor brought respect from those who came in contact with him. Physically he was like the village blacksmith, but inside he was a pussycat. He was kind, he was considerate, he was warm. It was difficult to see Bert go through this last ordeal; he suffered so greatly. About a month ago when I was visiting at his bedside, I asked him if the pain was real bad, knowing that it must be, and he looked at me and said, "It's terrible!" Although Bert put up a terrific fight, he was no

match for cancer, and I think he realized it. Once, when he could communicate, I asked him if there was anything I could do for him, and he replied weakly, "Just feel sorry for me." His last three weeks were spent battling overwhelming odds.

Since his mid-September operation (tumors on his spinal column were threatening paralysis at the time), he had gone downhill and was in a lot of pain. Any other person but Bert would have cashed in the chips several weeks earlier, but he told Mildred that as long as she was willing to fight, he was, too. His son came home from college, and Bert was able to recognize him. Tom Jones came in, and he recognized him. A letter from Bill Field brought a faint smile. It is my personal feeling that he was mentally prepared for death. Two days before he passed away, Bert's condition deteriorated drastically, and the writing was on the wall. They were able to make him fairly comfortable, and nurses said he wasn't experiencing any pain. Mildred was with Bert at the end. Although she denies it, she was a pillar of strength throughout the ordeal.

There will always be funny stories about Bert; one of the last ones had to be about a fortnight before he died when a very attractive, diminutive blonde nurse came in to give him a liquid concoction of pills (including flutamide which Mildred had been able to obtain). As she was trying to empty the contents of the cup into Bert's mouth, he was uttering gutturally a quick succession of a popular earthy word (most normally associated with a barnyard, but heard most anywhere under stress). She asked, "What is he trying to say?", and Mildred told her what he was saying!

If Bert had a dying wish, it had to be that his book on his activities in the Arctic and Antarctic be published. The Ohio State University Press has expressed an interest in the book, but they wanted to see some changes made in the draft. When he was in the recovery room following his mid-September operation, it was said that he asked for the manuscript so that he could go to work on it!

Bert is survived by his devoted wife Mildred\*who maintained a constant, faithful, loving vigil at his bedside during her waking hours, and his son Frank, a brilliant, mathematically-oriented student at the University of California at Berkeley.

**CRARY THE SCIENTIST.** Bert was born in Pierrepont, New York, and was a classmate in high school of former Secretary of State Rogers, who only grunted when Bert approached him to renew acquaintances at the issuing ceremonies of the Antarctic Treaty stamp. Bert graduated magna cum laude from St. Lawrence University with a B.S. in chemistry. He was a lineman on the football team, opening up holes for running back Hal Schumacher who went on to become a Hall of Fame baseball pitcher for the New York Giants. When approached in spring training a couple of years ago, Prince Hal recalled fondly his associations with Bert at St. Lawrence. Bert then went to Lehigh where he picked up his master's degree in physics in 1933. "That same year, he began geophysical research with Maurice Ewing, with whom he published papers on various topics in seismology, electrical resistivity of rocks, and submarine geophysics, including the first of the landmark series of papers on 'Geophysical Investigations in the Emerged and Submerged Atlantic Coastal Plain.' "

"From 1935 to 1945 Crary worked in geophysical oil prospecting in Colombia, Venezuela, and England, with interruptions for antisubmarine research during 1941-42 at Woods Hole Oceanographic Institution, and for a short period of oil exploration on the Persian Gulf. His research on upper air acoustics for the U.S. Air Force resulted in a series of papers on upper atmosphere winds and temperatures.

"He joined the USAF Cambridge Research Center in 1946, and worked as a geophysicist for them until 1960. From 1951 to 1955 he worked on an assortment of problems dealing with sea ice, ice islands and the ocean. When ice island T-3 ("Fletcher's Ice Island") in the Arctic Ocean was occupied in 1952, Crary became chief scientist for Air Force work on the island, continuing until T-3 was abandoned in 1955. It was

\*Mrs. Mildred Rodgers Crary, 8301 Beech Tree Road, Bethesda, Maryland 20817.

while working on T-3 that he discovered and explained 'Crary waves', an unusual type of guided, elastic-plate wave, and also flew to, and landed at, the North Pole.

"In 1955 he set up the Glaciological Headquarters for the U.S. National Committee for the International Geophysical Year, and organized the U.S. Antarctic work in glaciology including oversnow traverses. In 1957 he went to Antarctica as Deputy Leader of the U.S. scientific efforts, and was scientific leader at the Little America Station. He remained in Antarctica until 1959, leading the summer traverses on the Ross Ice Shelf and Victoria Land. In 1960-61 he returned to lead the McMurdo-South Pole traverse. When he arrived at the South Pole he became the first person to have set foot on both Poles. In 1966 he returned to the Antarctic again aboard the research vessel "Eltanin"

"Although he ceased active work in Antarctica thereafter, he continued to play a vital role in the organization, direction, and support of Antarctic research through his successive positions in the National Science Foundation as Chief Scientist of the U.S. Antarctic Research Program, and Deputy Director and then Director of the Division of Environmental Sciences. At the same time, he continued to publish the results and analyses of his own Antarctic work. He retired in 1976.

"His output of research work is as versatile as it is large, and he is regarded as one of the outstanding scientists in his field. Recognition of his work has come in the form of many awards: the U.S. Department of Defense Distinguished Civilian Service Award, the Cullum Geographical Medal of the American Geographical Society, the Patron's Medal of the Royal Geographical Society, the U.S. Department of Navy Distinguished Public Service Award, the Vega Medal of the Swedish Society of Anthropology and Geography, a medal from the Soviet Academy of Sciences commemorating 100 years of international geophysics, and an Honorary D.Sc. degree from St. Lawrence University."

**COLLEAGUES' TRIBUTES TO BERT CRARY.** At the time of Bert's death, *Dr. Frank Press*, President of the National Academy of Sciences, signified to Charlie Bentley that Bert's passing marked the end of an era. Mildred thought she would like to include other tributes to Bert in an obituary which she was preparing for various newspapers, and many excellent ones came in as soon as the scientific community learned of his death. With her permission, we would like to share some of them with you. First, we should start with the Grand Patriarch of the Antarctic, *Larry Gould*, who said, "If I have ever known an indispensable man, it was Bert Crary. When I was helping to organize the IGY expedition to Antarctica, Bert Crary was the first man I picked." - Then the consummate Arctic scientist, *A. Lincoln Washburn*, Commissioner of the Arctic Research Commission, wired, "Tahoe and I grieve at the passing of a heroic figure, but we are grateful that suffering is over. We shall always cherish his warm friendship and his many contributions to the world. His accomplishments will stand as a magnificent memorial to him." - *Gentleman Jim Zumberge*, the immediate Past President of the Scientific Committee on Antarctic Research, and occasionally-at-home President of the University of Southern California, called in with "Bert Crary was an exceptional man because of his ability to combine his genius as a scientific explorer with his qualities as a human being. For this he will be remembered by those of us who were his compatriots in science and friends in life." - Before he rushed off on an overseas mission, *Walter Sullivan*, Science Editor of the New York Times expressed himself, "To me, Bert Crary represented the finest in polar explorers and scientists. In contrast to so many, he was not driven by vanity or ego but by the advancement of knowledge. And he was a wonderful human being." - The erudite *Mark Meier*, Director of the Institute of Arctic and Alpine Research, responded, "Bert Crary, perhaps more than any other person, brought modern geophysics to the study of ice and the land in the polar regions." - *Charlie Bentley*, who sits very comfortably in the Albert P. Crary Chair of Geophysics at the University of Wisconsin, said of his very close friend and long-time associate, "Bert Crary was the man who, more than any other, was responsible for the

introduction of solid geophysical techniques into both north and south polar studies. Both by his leadership and by his personality, he was an inspiration to two generations of polar scientists." - *Gordon de Q. Robin*, retired Director of the Scott Polar Institute at Cambridge University, passed along the following, "Bert Crary was the leading light in glaciology in Antarctica during the IGY. In the post-IGY era, as Chief Scientist of the U.S. Antarctic Research Program at the National Science Foundation, he provided vigorous national and international leadership, including support for the U.S.-U.K. Program to use airborne radio-echo sounding to determine the thickness of the ice sheet in Antarctica. He was an outstanding scientist and a great friend." - Representing the American Geographical Society, the termini glacier man, *Bill Field*, said, "A great scientist, a great companion, and a great friend. I'm proud to have been associated with him." - The founder and first Director of the Institute of Polar Studies at the Ohio State University, *Dick Goldthwait* interrupted his morning walk along the sands of a Florida beach to say, "He was a great man at the end of an era of getting into the Antarctic and learning about it. We mourn the loss of a great friend, a friend who would listen to everybody."

**CRARY MOUNTAINS AND CRARY ICE RISE.** There are two geographical features in Antarctica which honor Bert - the Crary Mountains at 76°48'S, 117°40'W, and Crary Ice Rise at 82°56'S, 172°30'W. The mountains are ice-covered, 35 miles long, have peaks of more than 3,500 meters, and are located 50 miles southwest of Toney Mountains. They were probably seen first on the U.S. Antarctic Service Expedition by Admiral Byrd on flights from the BEAR on February 24-25, 1940, but were never mapped until the 1957-58 traverse from Byrd Station to the Sentinel Range led by Charlie Bentley. The ice rise is in the south-central part of the Ross Ice Shelf, and was the subject of study by various researchers of the Ross Ice Shelf Project in the 1970's. Bert had conducted studies near the ice rise while on traverses in the 1957-58 season.

**FATHER DAN, WJHWK (HARD WORKING KATHOLIC), GOES TO HEAVEN.** One of the kindest and gentlest persons ever to go to the Antarctic, Father Daniel Linehan, died in Glover Memorial Hospital in Needham, Massachusetts after a short illness on 27 September 1987. Father Dan, as he was popularly called, was a Jesuit priest for over fifty-one years, and was internationally renowned in seismology and geophysics. He served as Director of Boston College's Weston Observatory for thirty-two years, and resided in Campion Center, a home for Jesuits a stone's throw away from the Observatory. Fortunately for this writer, he visited with Father Dan for several hours less than a year ago (see *Bergy Bits*, December 1986); it was a most rewarding and exhilarating experience to sit with him and listen to him talk about his Antarctic memories.

Father Dan's introduction to the Antarctic was at the invitation of his friend, the late Admiral Richard E. Byrd, who called and invited him to go to the Antarctic. Father Dan was born with a large amount of travel dust between his toes, and immediately said he would go. That evening he realized the Admiral had asked him to meet the ship in New Zealand, but had not promised any travel support funds. But everything turned out well in the end, and Father Dan did go with Byrd. Father Dan told me he took the geophysical measurements/observations at McMurdo which determined that it was the proper place in that area to build a U.S. facility. So you see, even Catholic Jesuits are not beyond making mistakes! He also took geophysical measurements at Marble Point. He was better known for his activities during the IGY when he was flown all over Antarctica by the late Admiral Dufek. One of the flights on December 6, 1957 went to the South Pole where he took the first seismic shot at that station. We remember it well, as this soul arrived on an R4D flight later that day, and was there when Father Dan set off the seismic charge in the hole created where a Caterpillar tractor had streamed in about thirty feet when its chute never opened.

Father Dan was more proud of his ministerial functions in Antarctica than he was of his many scientific endeavors. He was the first person to hold mass on the continent of Antarctica, although another Catholic priest (Rev. William J. Menster) who was on shipboard during Operation Highjump celebrated mass in Antarctic waters (see his book Strong Men South). Father Dan was also the first priest to celebrate mass at the South Pole, and, according to the obituaries in the Boston papers, he performed the first baptism in Antarctica. We don't know who that person is/was, but maybe some of you members do. Father Dan was made an Honorary Seabee when he was in the Antarctic, probably the only Seabee who had a clean tongue! Father Dan was bipolar, as he went on the Dow Expedition to the Arctic in 1950, although my notes show that he was there in 1954. Regardless, he made the first magnetic studies on the ground to determine the new location of the elusive North Magnetic Pole while on the Dow Expedition.

Among his non-polar accomplishments was introducing seismic techniques to the field of archaeology in locating buried tombs and walls during excavations under St. Peter's Basilica in Rome. He was on many UNESCO seismological missions in Africa, Asia, and South America, and was truly a dynamic, if not dynamite, travelling priest with a charge and impact! He touched many, as, besides being Director of the Weston Observatory, he taught physics and geophysics at Holy Cross, Weston, and Boston College, and served as Chairman of the Geophysics Department at Boston College from 1948 to 1956. This was one Antarctic who went directly to Heaven (without being degaussed enroute), and we hope there are others there, as Father Dan would only enrich those with whom he comes in contact. What a nice guy!

**CHLOROFLUOROCARBONS COULD BE ANTARCTICA'S ACHILLES.** The late winter-early spring ozone hole over much of Antarctica has created more scientific interest than any other single happening in the history of the continent. Twelve solo NASA Lockheed ER-2 high altitude flights and thirteen DC-8 flights supplemented another intensive ground program by six teams of atmospheric scientists at McMurdo. According to a press release from the National Science Foundation on 27 October, they said "evidence strongly supports the theory that chlorine derived from chlorofluorocarbons is at least part of the cause of the antarctic ozone 'hole'. Also, it corroborates information obtained by airborne experiments and satellite observations performed in September by NASA."

From accounts in Time Magazine for 19 October 1987, it must have been a real hairy experience for the three pilots who made the seven-hour solo missions over Antarctica. The pilots wore pressurized suits and had to breathe pure oxygen for an hour before takeoff in order to remove nitrogen from the blood and tissues, thus preventing bends which can result from rapid reductions in air pressure. The pilots, who were strapped in, found that the plane did not warm when it soared into the stratosphere, with temperatures plummeting to -130°F, low enough to cause worries about fuel freeze-up. They also encountered winds up to 150 knots, although the most difficulty came from 40-knot winds that tossed the plane around during landings.

Meanwhile, a specially-outfitted DC-8 was flying parallel flights out of Presidente Ibanez Airport, twelve miles north of Punta Arenas with 40 odd scientists and support crews. They made thirteen twelve-hour round-trip flights at altitudes up to 40,000 feet, but at least they could get up and walk around in the plane. But if you think they were all getting great views of Antarctica, you are mistaken, because they were in clouds most of the time. Even the high-flying ER-2 encountered clouds at 61,000 feet. Pilot Ron Williams was quoted as saying, "I went into clouds at 61,000 feet and did not come out for the whole time." Both aircraft were part of a \$10 million scientific mission carried out by the United States under the combined sponsorship of NASA, NOAA, NSF, and the Chemical Manufacturers Association.

Meanwhile, back at that frontier mining town of McMurdo, six teams of scientists were confirming and expanding what they learned last year on the first National Ozone

Expedition. "Leader Susan Solomon and her associates from the NOAA Aeronomy Laboratory in Boulder, Colorado, collected visible and near ultraviolet light from the sun and moon and analyzed it for absorption by such atmospheric molecules as ozone, nitrogen dioxide, chlorine dioxide, and bromine oxide. The latter two are important because they are produced mostly by chlorofluorocarbons and bromocarbons. The chlorine dioxide levels observed in Antarctica were much greater than those measured at other latitudes, and were comparable to results obtained by the group last year at McMurdo. The instruments used this year were much more sensitive to chlorine dioxide than those used last year, and they could be used to detect bromine oxide, which was not measured last year.

"A research team from the State University of New York at Stony Brook, directed by Robert de Zafra and Philip Solomon, has again detected very high levels of chlorine monoxide (ClO) in the lower stratosphere—more than a hundred times the amount normally present at comparable altitudes outside Antarctica. Using an improved microwave emission spectrometer with twice the spectral range of that used last year, the group measured the daily cycle of ClO, as well as its long-term behavior, through September and early October. The team also collected data on nitrous oxide (N<sub>2</sub>O) and hydrogen cyanide (HCN) to estimate vertical and horizontal transport within the antarctic vortex.

"Bruce Morley of SRI International in Menlo Park, California, used a two-wavelength laser radar or lidar (light detection and ranging) system to monitor the vertical distribution of polar stratospheric clouds and aerosols over extended periods of time. Polar stratospheric clouds are believed to play an important role in the destruction of antarctic stratospheric ozone by providing the necessary surface area on which certain chemical reactions can take place. Such clouds, at altitudes ranging from 10 to 22 kilometers, were detected on 16 of 22 days that lidar measurements were made. Significant changes in the vertical distribution of the clouds were observed in time intervals as short as five minutes.

"After preliminary analysis of data obtained by their lidar ozone measurement system, the NASA Goddard Space Flight Center team, headed by William S. Heaps, found that there is a considerable reduction in ozone over McMurdo, starting at about 12 kilometers, with a minimum at about 15 kilometers. They noted also that polar stratospheric clouds were considerably more common than expected.

"The University of Denver team, led by Frank J. Murcray, set up a solar infrared spectrometer system at Arrival Heights, above McMurdo Station, in early September. It was operated jointly with scientists from the New Zealand Division of Scientific and Industrial Research. Although cloudy weather hampered early data collection, preliminary results from on-site data processing indicate unusual chemistry in the atmosphere, with low values of hydrochloric acid, nitric acid, and nitrogen dioxide. The instrument records much of the infrared solar spectrum, and allows the measurement of the absorption of solar infrared radiation by many trace gases in the atmosphere. Further analysis, using large computers unavailable in Antarctica, will yield amounts of chlorofluorocarbon 11, chlorofluorocarbon 12, methane, nitrous oxide, ozone, chloronitrate, and other gases. Measurements will continue into November.

"A University of Wyoming group launched 35 balloons carrying sounding equipment to measure ozone and particle distribution as a function of altitude. The group, under the direction of David J. Hofmann, recorded some of the lowest ozone levels ever measured. Near 15 kilometers altitude, a layer of the stratosphere about three to four kilometers thick contained only about three percent of the amount of ozone considered normal."

Time Magazine said, "Scientists are still not completely sure why the hole remains centered on the Antarctic or why the depletion is so severe . . . . It is not clear whether ozone depletion in the Antarctic is an isolated phenomenon or whether it is

an ominous warning sign of more slowly progressing ozone destruction worldwide. Data indicates that the decline over the past eight years is 4% to 5%. Scientists estimate that natural destruction of the ozone could account for 2% of that figure. The Antarctic hole could explain an additional 1%. The remaining 1% to 2% could simply be the result of normal fluctuations." Murphy's Law?

**BAY OF WHALES, ALLES KAPUT, AGAIN.** According to the late Charles Thomas, ice is where you find it, and there is a big glob of it floating westward off the Ross Ice Shelf. If you are sailing in those waters, you can't very well miss seeing it, as it is 98 miles long, 25 miles wide, and about 750 feet thick. Where did it come from? Well, right off the end of the Ross Ice Shelf near Edward VII Peninsula. It wiped out the general area where all of the Little America stations once were, except they, too, had long since been gone to sea on previous calving. There is something like 2,450 square miles of ice surface floating westward. The berg would stretch from the Statue of Liberty to Independence Hall, and hopefully could bury much of that megalopolis corridor. Supposedly it represents two to three times the annual ice discharge of the continent. It's being called B-9 because of its original map coordinates. Its happening and subsequent movements are being documented by the NOAA-10 meteorological satellite, operated by the Department of Defense and NOAA. I suppose the Society should run a lottery on when this tremendous berg will be reduced to a bergy bit - ashes to ashes, dust to dust, so must go all bergs.

**NASA LOOKS TO THE ANTARCTIC.** Paul Humphrey, an aging Antarctic golfer in Raleigh, North Carolina sent us a clipping from the Raleigh Times of 3 October 1987 about how NASA is studying Antarctic camp life for ways to preserve astronaut harmony amid confinement, monotony. The article by Thomas H. Maugh II of the Los Angeles Times wrote that "psychologists are growing more concerned that the confinement, monotony, and prolonged close contact with other crew members will reduce astronaut efficiency and productivity. Such conditions might even lead to psychotic behavior that could endanger the crew or its mission." It seems that NASA psychologists are turning to what many consider the closest earthly analogy of a spaceship: the Antarctic camp where small groups of men and women spend seven to nine months. Supposedly psychologists have found that isolation and monotony take a big toll in the confined outposts, with productivity dropping, anxiety and hostility soaring, risk-taking and rule-breaking escalating, and bizarre and eccentric behavior becoming more common during the long winter night. If they wanted to study that kind of behavior, but more pronounced, they should take a sampling of Boston drivers. Now there is a large group of real neurotic who are out there on the highways endangering lives every day.

The article said that a Russian scientist axed a colleague who beat him in chess; that an Australian cook chased a mechanic with a meat cleaver for three hours before both got tired, got drunk and got reconciled; that another Australian crew built stocks outside, locked an unpopular mate in them for four hours and showered him with garbage. To wit we say, "So what?" One can hear the same kind of news any night of the week on the six o'clock evening news in any major city, except what happens back here is more gory. This writer takes strong exception to comments from a Patrick Cornelius, an astronautical engineer with Boeing Aerospace Corporation who has wintered over in Antarctica twice as part of a support crew, and anthropologist Jeanne Williams of the University of Texas, who wintered over as a satellite ground-station technician. They painted a pretty dim picture of mid-winter camp life, full of tension and stress, and low productivity. On the other hand, psychologist Sybil Carrere of the University of California, Irvine, who wintered over at Palmer Station with her husband, seems to have conducted some very valid psychological and physiological studies on nine of the twelve men at the station.

This person feels that NASA has too much contract money, that they will study anything any time. It would seem that there should be a world of difference between those selected to go into space and those chosen to winter over in Antarctica. There never could be a Sam Wilson in space, as there's not enough room out there, but the Antarctic is full of Sam Wilsons. The article suggests that it might be useful to send potential crews on some type of high-risk adventure like the Outward Bound program, where operation and resourcefulness are emphasized. Probably the best advocacy in the whole article.

**ANTARCTICA FOR SALE.** If you have the bucks, Mountain Travel of Albany, California has an Antarctic deal for you. They start at a paltry \$2,845 and go up to \$69,500, so they have something for everyone. They will put you on an Argentine polar research/supply ship, the A.R.A. BAHIA PARISO which carries up to sixty passengers, which will make six cruises to the Antarctic between December 6th and January 31st. Some are slightly longer than others, but most average fifteen days. They have up to four multi-lingual guides who speak English, German, French, Spanish, Portuguese, and Japanese. Mountain Travel puts their own guide aboard if they book fifteen or more passengers. If you want to spend additional time in Antarctica, the Argentines will drop you off at Esperanza Base for two weeks (for which you will have to pay an additional \$2,750). Cabins on the ship start at \$2,845 per person and go up to \$6,530.

If your will is to climb Mt. Vinson, Mountain Travel offers 30-day junkets commencing November 19th which start at \$19,000. However, if you are loaded with money and want a nice, little easy ski to the South Pole, they will drop you over the horizon at the Thiel Mountains (85°15'S) and get you to the Pole for \$69,500. But you have to find nine companions, as they won't start up the supporting snowmobiles until they have a total of ten payees. You will have a very casual ski to the Pole, carrying a light pack, as four support personnel will be driving the vehicles hauling your food and supplies. They will do about fifteen miles per day, and drag it out for about forty days. If you are a woman and have the bucks, you will go down in history -?- as the first of your sex to ski to the South Pole. It all sounds rather disgusting to this soul. Has Antarctica just become a big playground for the rich? We think it would be beautiful if the South Pole closed up their ship store and post office (for inventory purposes) when adventurers arrive, forcing them to leave without T-shirts and mailing post cards.

John Yost of Sobek Expeditions was quoted in the Dallas Morning News of 4 October as saying that there will be about a thousand tourists in Antarctica this austral summer, and this figure does not include three-day trippers out of Chile. Sobek is offering a small boat trip down the peninsula on the CAPTAIN ACAZAR, one which includes hiking, skiing, wildlife viewing, and optional overnight camping near some of the whaling and scientific bases along the coast. The price of this trip is \$3,595, plus airfare from South America. Karen Ronne Tupek, pack your skis, and go back to where you were just a twinkle in the old man's eyes!

A three-day excursion to a Chilean seasonal base is yours for only \$1,500. This includes airfare from the mainland, accommodations (a full hotel staff is flown in for each season), food and sightseeing. It's all like a weekend in New York City, but without theater tickets. John Rasmus, a United Press syndicate writer, speculated that in a couple of years Super-MaxSavers may be available if you're willing to stay over a Saturday. Antarctica, what is happening to you?

**ICE CHIPS.** *Norman Vaughan*, 81-year old veteran of the Byrd Antarctic Expedition, 1928-30, survivor of three busted marriages, must have done something right on the 1987 Iditarod race, as his travelling companion on the 1,157-mile race, *Carolyn Muegge*, married him afterwards. It's not whether you win or lose, but how you run the race! To the newlyweds, our heartiest congratulations and a sled full of good luck.

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

Charles J. V. Murphy, 1904-1987

"I stopped at his house and was greeted by one of his sons and daughters. I asked for Charlie and they said he was in the next room dying. They explained he had lung cancer and was comatose. I asked if I could see him even if, because of his condition, he wouldn't recognize me. I stood beside him and could feel the very real presence of death. I bade a good friend goodbye, and left."

Steve Corey, wintering-over mate of Charlie's,  
Little America II, 1933-35

#### Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63

JOINT DINNER MEETING

with THE EXPLORERS CLUB, WASHINGTON GROUP

COMMUNICATION WITH ANIMALS

by

Mr. James Nollman  
President, Interspecies Communication  
Friday Harbor, Washington

on

Saturday evening, February 20, 1988

Cash Bar - 6:00 PM : Dinner - 7:00 PM : Lecture - 8:00 PM  
at

*The Cosmos Club*  
2121 Massachusetts Avenue N.W.

*Dinner- reservations, \$28 per person, MUST be paid by February 16th! (No refunds)*  
*Mail checks, payable to Treasurer, Explorers Club, to P.O. Box 2321, Reston, VA 22090*

Thank heaven the holidays are over, and we can get back to such fun things as trying to straighten out the calendar mess, collecting dues from deadbeats, and hustling some stories you might or might not want to read in the newsletters. The good news is that this column can be on anything the writer wants it to be; the bad news is that Ruth is a puritan and won't type anything she thinks is off-color. BUT, it isn't all bad, because she's so naive we can slip some things through!

It's terrible to have lost so many dear friends in the Society. Charlie Murphy was one of the most colorful. His face was the map of Ireland, and he lived a full life. Be sure to read his obit as he was quite a guy.

If we had two wishes for 1988, one would be that you folks would return telephone calls, and the other that you would let us know your new address when you move; but after ten years of asking you guys and dolls, we don't have much hope. But please help us, as this is strictly a labor of love, and some newsletters, like this one, only happen because I come back from Maine to put it out. When we hand this over to the Postal Service for whatever shenanigans they may have up their sleeves for possible deliveries, then the 1961 Buick heads back to beautiful Maine!

**DOUBLE HEADER MEETINGS.** We are sorry to do this to you, but we do have back-to-back meetings in mid-February. One is our almost-annual meeting with the Washington area Explorers Club where we socialize with real live explorers and then listen to a lecturer; the other is one of our Tuesday Specials at the National Science Foundation. One of our ex-presidents, William J.L. Sladen, has been moaning and groaning for the past two years that we never have anyone talking on the biology of Antarctica. It seems he is fed up (to his gills) with Gondwana and ice streams. So here is the opportunity for you folks who believe that marine living resources constitute the most important Antarctic wealth. Bob Hofman is particularly well qualified to speak on the subject. He spent six austral summers in Antarctica between 1969 and 1974 studying leopard, Ross, and Weddell seals. His PhD dissertation at Minnesota was on "Distribution Patterns and Population Structure of Antarctic Seals." He joined John Twiss at the Marine Mammal Commission in 1975, and has served as its representative on the Intra-governmental Working Group on the Antarctic since 1978. He also served as the U.S. representative to the Scientific Committee on the Conservation of Antarctic Marine Living Resources, 1982, 1983 and 1984. He's knowledgeable, well organized, and an excellent speaker. We want you all out on the 9th. Attendance will be taken!

We regret we don't have much information on Jim Nollman, although he is supposed to be an authority in his field. He has done research all over the world - sounds like he's Sherwin-Williams - with various species of animals: Beluga whales in the Arctic, dolphins in Australia, monkeys in Panama. One of his specialties is studying the musical communication with Orca whales off Vancouver Island. He is the author of *Animal Dreaming*. Unfortunately Jim will be speaking right in the middle of the Winter Olympics in Calgary, but hopefully they will be showing only luge racing that night so we can go and learn how to communicate with animals we live with or who live with us. And remember, checks have to be in by February 16th. If you park on a Cosmos Club lot, you should pay Tony Meunier, the Washington area Explorers Club treasurer,

\$3.50. Also, don't delay Nollman's presence with unnecessary questions after 9:30 PM, because after that the Explorers have to pay double their high fee for the use of the room. Everything has its price, including questions and answers!

**GET TOUGH TIME.** There was a time when the management of the Society was soft on delinquent members, but now that we have more members, delinquents are not welcome, and we drop them after a count of three (notice, second notice, last notice). In fact, some who are unknown to us had their heads rolled after a second notice! Right now we want the Twenty-One Club below to send in their money, as this is it:

Duwayne Anderson	William Hammer	Mark Meier
Hugh Bennett	Osmund Holm-Hansen	Bernard Mendonca

Our paid membership is now 555, which is a new all-time high. Fifty new members have joined since last Midwinter Day. We have 61 husband-wife memberships, which really help the treasury. Even better is the fact that a lot of you folks, in fact 261, heeded our plea for signing up for multiple years, so next year you won't get pestered for dues, and we will have more time to enjoy the outdoors.

**PROMISING YOUNG SCIENTIST LOSES HIS LIFE AT NEW HARBOR.** Mark T. MacMillan, 22-year old research assistant working with Bill Stockton's team at New Harbor, McMurdo Sound, lost his life when diving on November 14, 1987. He was evidently working on the bottom when he suddenly shot up to the under-surface of the sea ice. Cohorts brought him immediately to an opening in the ice, but presumably he was dead by the time he reached the under-surface, probably dying from an air embolism which had entered his arterial blood system. Mark was a member of a research team of the Marine Biology Research Division of Scripps Institution of Oceanography, part of the University of California, San Diego. He was a graduate of the University of California, Santa Cruz, and Stockton called him "a cheerful, idealistic dreamer, whose world view was centered on ecological goals." He was an accomplished, certified diver with experience off the northern California coast. MacMillan's group was conducting dives in an effort to learn more about the role of predatory foraminifera, minute single-celled animals, in the biological community beneath the ice. Mark was the first diver to lose his life in Antarctic waters, although several years ago a former Antarctic diver lost his life in the waters off southern California.

**FIRST EVER FATALITIES ON A C-130.** It was an ill-fated C-130 flight to D-59 from McMurdo on December 9th, as two Navy personnel died in the landing, and eight more Navy and one civilian were injured. The site was where a similar plane had crashed in 1971, a plane that recently had been dug out of the snow and was being repaired so it could rejoin the limited number of C-130s in the National Science Foundation's fleet. Those killed in the accident were Lt. Comdr. Bruce Bailey, 45, a multi-year Antarctic, and a young aviation storeman, Donald M. Beatty, 24. Although there have been several accidents involving C-130s in the Antarctic, the plane has had a remarkable safety record, and these two deaths were the very first on the ice in an Antarctic Hercules.

It appears that the plane caught its left wing tip in the snow as it came in for a landing, which caused the plane to flip over. As we understand it, the people at D-59 were fast upon the scene, and finding two dead persons, concentrated their

efforts getting the wounded out of the plane. This was accomplished successfully before a fire broke out in the plane which, in turn, was eventually put out by the surface party. Certain components of the engines may be salvageable, although the plane itself was totalled. At a time when lives are lost, you don't bemoan losing a plane, but this C-130 happened to be the only one equipped for photographic and mapping purposes. So there was no mapping per se by the USGS in Antarctica this austral summer.

**ANTARCTIC LITERARY GIANT GOES SILENT - CHARLIE MURPHY DEAD AT 83.** Again we find ourselves writing an obituary of an Antarctic friend a few short hours after returning from a memorial service, held in the Church of the Epiphany in downtown Washington, B.C. The church, still bedecked with the greenery of the holiday season, is well-known locally for its excellent organ pipes, and to the music of J. S. Bach, Vaughan Williams, and someone named Traditional, the soul of Charlie Murphy was given a rousing wafting into the Heavens before a large gathering of distinguished-looking relatives and friends (including Hugh Sidey, political journalist and commentator).

Charlie Murphy was a dear friend to many of us, and he was especially tolerant of Bergy Bits/Brash Ice. We have some twenty letters in our files from Charlie, and they are priceless for their forthrightness. Here was one Antarcican who called it as he saw/experienced it. He was especially close to the late Admiral Richard E. Byrd, who wanted him to go south with him on his first Antarctic expedition. However, Charlie thought it would be better getting married than living with the Commander, so he got married. Later, the Admiral persevered and talked Charlie into joining him as his administrative deputy on the second Byrd Antarctic Expedition, 1933-35. Charlie knew most of the polar giants of the time. It is most interesting to note that there are two common threads in his letters, his great personal respect for Byrd as a person, and his steadfast support of his achievements. Most of his comments have appeared in earlier newsletters, but we might just go through his letters at a later date and cull them for our newer members. His name has been associated with Byrd's in the publication of *Little America*, *Discovery*, and *Alone*. Charlie wrote us that he helped Byrd with all three books and that *Little America* "was a close collaboration." However, it is generally felt that Charlie was the highly visible ghostwriter behind *Alone*.

The Washington Post obituary was both long (some 20 inches) and truthful ("He was said to have had an encyclopedic mind and a love for good whiskey and good conversation."). His name has been closely associated with the Duke and Duchess of Windsor since the late 1940's when he was commissioned by the Duke of Windsor to write the Duke's autobiography, *A King's Story*. He then wrote the Duchess's autobiography, *The Heart Has Its Reasons*, which came out in 1955 after Charlie had been fired upon completing 75 percent of it, then rehired to finish the job! In the late 1970's he coauthored with Joe Bryan, a best seller, *The Windsor Story*, a book about the life of the Duke and Duchess after abdication.

Most of Charlie's career was spent with Time, Life, and Fortune magazines. He retired in 1966 after being chief of Fortune's Washington bureau for 14 years, where he specialized in defense- and intelligence-related coverage. His account of the 1961 Bay of Pigs invasion in Cuba was highly critical of President Kennedy, incurring his wrath, and "cost me a Brigadier's star in the Air Force Reserve." Charlie was a very close friend of the late James Jesus Angleton, the fabled former counterintelligence chief of the Central Intelligence Agency, who accompanied Charlie to some of our Society meetings. It is said that the two of them could be found on most any day sharing a table at the Army and Navy Club discussing matters such as the British debacle at Gallipoli during World War I or General MacArthur's tactics during the early months of the Korean War. One of Charlie's duties in the Air Force Reserve was advising and writing speeches for NATO officials. He also wrote children's books. *Little Toot*,

a popular book about a tugboat in New York harbor, appeared in the 1940's; and then there was *Hercules and Loop*, a book about an airplane.

Charlie went to Harvard for two years, but evidently Harvard wasn't right for him, so he left to become a night rewrite man for the old Boston American. Then he went to work for the Associated Press and United Press in New York. He was fired by the United Press in the late 1920's after rewriting a 27-word dispatch on the fall of Nanking to the Kuomintang during the Chinese revolution into a dramatic 1500-word account that was distributed nationwide on the UP wires! His editors said the facts did not support Charlie's version. You gotta love the man - the world is full of too many mundane souls who are afraid to make a decision on their own.

He was a World War II war correspondent in both the European and Pacific theaters. In May 1941, he was a passenger aboard the Egyptian steamer ZAMZAM when it was sunk in the South Pacific by the famous ATLANTIC, a Nazi warship, some 1500 miles west of Capetown. He wrote a dramatic account of the incident and the rescue of all 323 passengers for Life Magazine. Charlie wrote us once, "My stay at Little America enabled me to accept without any sense of acute discomfort the some five weeks I passed in the hold of a German blockade runner, enroute to a French port held by the Germans."

I always wanted Charlie to write a book on BAE II, and he said he would after he finished his biography on the late James Forrestal and then did a treatise on the Eisenhower administration. He knew about an ex-NSF public information-type man who was/is writing a book about the second Byrd Antarctic Expedition, and wrote, "Nothing can be done about a man like him. They are the night soil on which the gardens of publishers depend."

Charlie Murphy was quite a man, lived a fascinating life, but in one of his letters he confessed, "I was always a bit ashamed over lacking a single technical skill that would have enabled me to lead the so-called relief expedition (to Boiling Advance Bas^ . I couldn't work a radio, repair a tractor, or navigate. It was I who persuaded Poulter to go." On the presence of women in Antarctica, Charlie once wrote, "For myself, I shall merely note that the presence of a handsome young woman would certainly have brightened the climate of my shack, although her lustre would almost certainly have been shadowed by the soot from the stove burning soft coal."

I feel badly that I haven't seen Charlie in the past two years. In April 1986 he wrote sadly, "Now I doubt if I shall ever write the tale (Little America II). The Forrestal book is almost beyond my remaining resources. The changes in my life brought on by my wife's death, followed by the unwise move from Washington, somehow combined to cause me to lose control of my day." Last March, after we had commented on an ill-mannered piece about Byrd in the Boston Globe, he wrote, "I was gathering up the resolve to write a riposte for the Globe when it was my misfortune to fall victim to a glaciological condition. I slipped on a patch of ice, fell and broke my arm. I am only recovering a measure of mobility. If you would like me to answer to that piece, and also speak up for the case of honoring Byrd, I'm prepared to do so, typing out a labored prose with the right index finger on a venerable Smith Corona."<sup>1</sup> But I got involved with a health problem of my mother, and let it fall through the crack.

Charlie Murphy was the warm-up speaker for Bob Rutford's Memorial Lecture on 1 April 1982. Two more outspoken men could not have been found! We printed Charlie's "Some Vagrant Recollections of an Elderly Antarctic" in our April 1982 Newsletter. There are eight and a half pages of The Best of Charlie Murphy; reread it - it's real Antarctic history. At the top of the cover sheet of this Newsletter we have included the touching account of Steve Corey's visit to Charlie's bedside the day before his death. I think perhaps Charlie had a sense of his finality, because in his last letter to us he wrote, "The tender West Point ballad to which MacArthur referred

could well supply the requiem for aged Antarcticans: Old men of the ice never die; they only fade away - sinking with the pale March sun below the graying horizon." In a relatively short time span, cancer has claimed our distinguished Honorary President-Ambassador Paul Clements Daniels, the most distinguished polar scientist -Bert Crary, and now the Literary Bard of the Antarctic - Charlie Murphy. If there is a bar in Heaven, these guys are certainly going to meet, because they were a thirsty lot. We will miss all of them, and trust they are now resting in peace and out of pain.

**321 FLIES AGAIN!** As that great American philosopher Yogi Berra expounded, it is never over until it's over, and so it was to be with old 321. According to the March 1972 issue of Antarctic (News Bulletin of the New Zealand Antarctic Society), the plane was "damaged when attempting an open field takeoff after it had left fuel and supplies. It was written off, and the remaining missions (supporting a French traverse team from Carrefour to Vostok) were completed by airdrops." But C-130s are only made now on special order, their price is fantastically high, and the powers-that-be at the National Science Foundation took all this into consideration, along with Yogi's philosophy, and decided they should take a look at 321. The decision was made that it was probably worth the time and effort to get it back into the inventory, and so a crew of people brought it to the surface, and the necessary repairs, including overhauled engines and propellers, were made.

On January 10, 1988, slightly more than sixteen years after its premature commitment and subsequent interment, 321 was flown by Comdr. Jack Rector, Commanding Officer of the Antarctic Development Squadron, back to McMurdo Sound, a distance of about 800 nautical miles, a flight of about five hours. Peter Wilkniss and Ron La Count of the Division of Polar Programs at NSF were in an escort plane which maintained visual contact with 321, flying under a deck of clouds.

The only anxious moments evidently came prior to the flight when a starter device in salvaged engine No. 4 had to be removed to stop an oil leak. They brought 321 with its three engines running up behind the escort plane (on the skiway), which then revved its engine, creating a "prop wash" that activated No. 4 engine on 321! Which shows that there is more than one way to skin a cat, or, in this case, to get an engine started. Jim Herman of the Naval Air Reworks Facility at Cherry Point compared it to using an electric fan to move a pinwheel. With all four engines running they made an ice speed taxi run down the skiway for show to see how the plane handled and whether any problems would become apparent near take-off speed. They were so satisfied that they scrubbed a second trial run, and blasted off for McMurdo. We don't know whether Peter Wilkniss is a religious man or not, but if he isn't, we bet he got some foxhole religion in a hurry when 321 took off. It ended a remarkable undertaking, one that had become increasingly more important in view of losing another C-130 earlier in the season in support of this recovery. For those of you who think in terms of taxpayer dollars, you are \$28M ahead, as this operation cost \$10 million; a new plane would have cost \$38 million. Congratulations to all - those who had the foresight, those who had the know-how, and those who had the guts. Also to Yogi, who knew all along that the plane could fly again!

Most of the above was gleaned from an article by Charlotte Evans in the New York Times, with slight interpretations and additions, such as Yogi Berra, by Brash Ice. We don't feel too guilty using Charlotte's material, because about a year ago, while in Wellington, New Zealand, at a bus stop, I engaged in conversation with this writer from the States who happened to be associated at the time with a Wellington newspaper. One thing led to another, and she said she would love to get an Antarctic assignment. I told her to give me her name and address - a devious ploy at its worst - and I would get back to her with a letter. That letter told her that Dr. Wilkniss was coming back to Christchurch soon, would in all likelihood be holding a news conference on the re-

trieval of 321 and wanting publicity on it, and that she should contact Ken Moulton relative to covering the story. To make a long, irrelevant story less prolonged, it was Charlotte who wrote up the C-130 in the New York Times! The moral of this story is not to be wary of strangers at bus stops, at least while overseas.

**WHEN YOU WISH UPON A SUPERNOVA, GO TO ANTARCTICA.** Al Fowler in the Division of Polar Programs started talking to me the other day about a supernova, and I thought he was talking about some character out of Doonesbury, so kept my mouth shut so as not to reveal any further ignorance. Upon coming back to the Nerve Center, there was an article on supernovas which Ruth had clipped and put out for my elucidation/edification, or whatever. It seems that supernovas are rare - one has not been visible to the naked eye since the 17th century. They occur when stars, such as the sun, exhaust their chemical fuel, collapse inward and then explode. Studies of Supernova 1987A, now going on in Antarctica, are expected to produce new understanding of the life and death of stars. If you are into astronomy, the death of a distant star is pretty head\ stuff, not to be taken lightly. We assume that Supernova 1987A (the year it was discovered) is of sufficient interest to you Antarcticans that we should quote liberally and freely from a long message sent into NSF from the Antarctic on January 10, 1988.

Fact: At 12:14 local time at McMurdo on January 8, 1988, investigators from seven organizations successfully launched from Williams Field a high-latitude, helium-filled balloon, carrying an advanced gamma-ray detector to collect data on the spectrum of gamma-ray emissions from Supernova 1987A. The 11.6 million cubic foot balloon is the largest ever launched in Antarctica, and is made of a very thin, cold-weather, durable plastic called Astrofilm. It is 0.8 mils thick, except at the top where a second layer is added to cap it, making it 1.6 mils thick. The balloon will ascend to an altitude of 115,000 feet, at a rate of 1,000 per minute. Researchers hope to keep the balloon aloft for 21 days, but admit they will consider it a success if they can get three days of data from it. After it passes beyond the horizon at McMurdo, they hope to use one of the C-130s to track it and receive data. The exact position and altitude of the balloon are being tracked through the ARGOS satellite system. At the end of the balloon flight, the instrument package will be released and parachuted to wherever it may happen to land.

As we go to press, we understand that after three days of good data, the program was terminated when the solar cells' power dropped off and resulted in weakened signals. So the powers-that-be, deciding it would be best to end the experiment when they knew where the balloon was, sent a message skyward for the balloon to drop its payload. The balloon was about 200 miles from Vostok at the time, and McMurdo is now sending a C-130 to pick up the payload. They surely do fascinating things in the Antarctic. If you are a good old country boy, it's all like science fiction.

There is a group of twenty Supernova 1987A investigators in Antarctica, including an experimenter team of eight scientists and engineers from the University of Florida, Goddard Space Flight Center, Catholic University, and the Defense Advanced Research Projects Agency's Nuclear Monitoring office. A team of twelve balloonists from the Air Force Geophysics Laboratory, New Mexico State University, and Oklahoma State University assembled and launched the balloon and its payload, and operated the tracking and telemetry station.

The gamma-ray detector - of a design never before flown in space - was originally developed by University of Florida scientists for experiments on the Space Shuttle. Modified for this experiment, the solar-powered detector is housed in a gondola attached to the balloon and is suspended on a parachute that will return the instrument package to earth. The gondola was designed and constructed by engineers from the University of Florida and the solar power system and panels by engineers from New Mexico State University.

Investigators selected Antarctica for the experiment and for testing new detector technology because it offers advantages not found at other sites. First observed on 23 February 1987, Supernova 1987A can only be seen in the Southern Hemisphere and at the time of the launch was almost directly above Antarctica. For the detector materials tests, radiation levels above Antarctica more closely approximate those in space.

Supernova 1987A (SN1987A) is in the Large Magellanic Cloud, approximately 50 kiloparsecs (about 170,000 light years) from Earth. After observing the region for several months, astronomers have agreed that SN1987A was once the star Sanduleak minus 69 degrees 202. Although 170,000 light years away, SN1987A is the nearest supernova to Earth that has occurred since 1604 - making it the closest since the invention of the telescope.

According to theory, a supernova occurs when the inward gravitational pressure exceeds the outward radiation of energy. A star starts out converting hydrogen to helium, as nuclear reactions occur in its core. This process generates energy that is radiated. After millions of years, hydrogen is greatly diminished, and the star begins to convert helium to heavier elements. These elements gravitate to the core while the remaining hydrogen and helium form layers on the outside. An imbalance between the outside and inside causes the core to collapse. Shock waves moving outward are triggered and blast away the outer layers of helium and hydrogen.

As the remnants of the star cool, they emit gamma-rays characteristic of the atomic nuclei produced by explosive nucleosynthesis. Each type of radioactive isotope has a unique gamma-ray signature by which it can be identified. Scientists working on the antarctic supernova experiment will be looking at the gamma-ray spectrum SN1987A specifically for evidence of the isotope cobalt-56.

According to Dr. Carl Rester of the University of Florida, the project's lead principal investigator, the experimenter team hopes to confirm that cobalt-56 was produced as Sanduleak minus 69 degrees 202 "supernovaed." He also said that they will be acquiring new information about how fast the shock waves passed through the mantle of the exploding star.

**STUBBORN POLAR VORTEX BAFFLES SCIENTISTS.** The mass of extremely cold air that form over Antarctica during the winter persisted into late November; normally it breaks up in late October or early November. Robert Watson, NASA atmospheric scientist, was quoted in the December 19, 1987 Washington Post as saying, "This is the latest that it has failed to break up. It may be what you would expect because there is so little ozone there. What one has to consider are the ramifications." Meanwhile, F. Sherwood Rowland, University of California expert in ozone depletion, said it "could be the first indication of major climatic change. There is no way of judging the impact, but it's an ominous trend." Mark Schoeberl of NASA downplayed its significance, saying, "I don't think it makes a difference in the troposphere. It means that temperatures in the polar regions are still anomalously cold relative to previous years."

When the polar vortex breaks up in the spring, ozone levels over Antarctica rise, and the so-called "hole" disappears. Scientists theorize that the vortex may have held on longer because of the magnitude of ozone loss in winter, which was down more than 60 percent this Antarctic spring. Some have speculated that the small amount of ozone over Antarctica may have slowed the heating necessary to break up the polar vortex. According to another article in the Washington Post of November 27, 1987, the ozone depletion over Antarctica has little effect on any humans there. Since the sun is so low, its rays travel slantwise through the ozone layer. Even passing through the depleted layer, those rays traverse more ozone than rays striking the United States. So, Antarcticans, even though you may be sitting under history-in-the-making, you're probably a lot safer than if you were on the beach at Malibu.

**ONE OF THE NEW GUARD, DEBBIE ENZENBACHER.** Debra Enzenbacher is the material specialist currently wintering over at the South Pole, responsible for inventory and supply at the station. We met last year on the road to the ice runway at McMurdo when one of my compatriots recognized her (as she drove by) as a person whom he had met in another year in the Arctic. We got to meet her later on, and as she had an uncommitted six dollars, signed her up for the Society. She is probably typical of many women working for the contractor - she's young, she's ambitious, she has an advanced college degree, and she has a love for the Antarctic. We think Debbie is a little bit special, as her Antarctic interests drove her to do her master's thesis at the University of Chicago on the Antarctic Treaty. Last year she was a shuttle driver at McMurdo, but yearned to go to the South Pole. This year she went in on the first flight to the Pole, a Halloween Day Special. She wanted to go so badly she could have probably flown a broom there, although Debbie is far from an old witch.

Debbie is a good writer, is going to keep a daily journal, and we're sure it will make good reading. Although she found "the South Pole to be incredibly beautiful .... a different beauty from the Ross Ice Shelf region," she is really looking forward to "the people experience during the winter." Debbie, you can meet all kinds of people on subways, on beltways, on street corners, in bars, but you will never be in a place just like the South Pole. We gave her some old explorer advice - go outside every day, just stand there and "suck it up," feel the environment and let it feel you. Debbie admits that "I am lucky and privileged to be here on a vast and desolate polar plateau. There is a power here, so pervasive and unforgiving, that it is difficult not to realize how privileged man is to even be here. Logistically speaking, it is a marvel that modern man can overcome challenges presented by nature, but anyone in tune with what the South Pole really is might concur that it is always abundantly clear just where the final say is held and by whom." Debbie, you are going to have the best year of your life, because you have a great attitude. Happy Midwinter Day!

**THE AMUNDSEN PHOTOGRAPHS, EDITED AND INTRODUCED BY ROLAND HUNTFORD.** Amundsen was reborn in the spring of 1986 when the widow of the explorer's nephew uncovered a Horlick's Malted Milk case in the attic which contained more than 200 of Amundsen's original lantern slides. That is all an enterprising polar writer like Roland Huntford needs to publish another book. The pictures aren't earth-shaking, more like what you might have seen in one of your grandmother's albums, but they certainly are unique. Amundsen had the misfortune of returning alive from the South Pole, so he was never raised to the level of deity by the public. But he was a winner, a charismatic winner, and you might want the book. Mind you, the pictures aren't Ponting caliber, not Hurley's caliber, but they are part of epic-making history. I like the book, although I would buy anything with Huntford's name on it. It is published by the Atlantic Monthly Press in New York and the price is \$35. However, you can beat the price at a place like Crown Books.

**HELP! ANTARCTIC HERITAGE TRUST NEEDS DOLLARS.** The Antarctic Heritage Trust of New Zealand has been established for the conservation and preservation of the historic huts and sites in the Ross Sea sector of Antarctica. The sites and buildings needing support are those at Cape Adare (1899), Hut Point (1902), Cape Royds (1908), and Cape Evans (1911). Funding of the New Zealand Antarctic Research Program is inadequate to carry out the professional conservation envisaged, and the Ross Dependency Research Committee has decided to raise a capital fund from which revenue can be obtained to implement the work. To raise and control this fund, a Trust Board has been established under the New Zealand Charitable Trusts Act of 1957. Every man who is anyone in New Zealand finds himself on the Board (there are no women), as well as such people as Sir Peter Scott, Lord Shackleton, Sir Edmund Hillary, and Sir Vivian Fuchs. They have the titled people all lined up, and now are looking for the common folks with open

checkbooks. So if you are a commoner and would like to make a contribution, why not send a check, made out to the Antarctic Heritage Trust, to Robert Thomson, Department of Scientific and Industrial Research, Antarctic Division, Christchurch, New Zealand. Bob is a member of the Trust Board, presumably is honest, and hopefully he will see that your check gets into the proper bank account.

**LEE KIMBALL, ANTARCTIC MAN OF THE YEAR (IN BRASH ICE'S EYES).** This word player would like to propose that Lee Kimball of the International Institute for Environment and Development be the Antarctic Man of the Year, or, if we must, Antarctic Person of the Year. Her "Report on Antarctica" which came out in December 1987 fills a great public void on happenings in the Antarctic Treaty System, Antarctic Treaty Consultative meetings, Convention on the Conservation of Marine Living Resources, Convention for Conservation of Antarctic Seals, Scientific Committee on Antarctic Research, Managers of National Antarctic Programs, and other categories. It is really a fantastic publication, and we think Lee did a great job, one that was badly needed. Brash Ice, whether justified or not, always thought that there was a minimum amount of information coming out of the State Department for public consumption on what went on at the various Antarctic meetings. If you were lucky enough to be invited to the Polar Research Board meetings, you got biannual updates, but when it came to written reports, they just did not seem to be out in the public domain. There were books like Philip Quegg's and Deborah Shapley's which summarized, but they were as personally biased as this column. We have a lot of personal respect and great admiration for Jim Barnes of The Antarctica Project, but his efforts with public information bulletins end up being a crusade for Greenpeace. But Lee's Report is really just what the layman like myself wants, and it is all presented in a very professional manner. Last year this column expressed an opinion that the U.S. did a poor job on selling the nuts and bolts of Antarctic activities to the public, including Third World nations. I think reports such as Lee's present Antarctica in a really good light. Unfortunately the average man-on-the-street will not see it, but at least it is in press, and supposedly available in libraries. Lee, I think you did a great job. Congratulations!

**PETER WILKNISS HITS GOVERNMENT LOTTO.** The Queen of England may have her New Year's Day awards for do-gooders, but our President has bags of money in the White House basement which he can distribute to senior executives in the government and to other over-achievers at the end of the calendar year. The money is sort of like the rabbit at the dog races - it's held out in front as an incentive to keep on barreling down the lane without deviating off on another tangent - that is, to stay with the government. Fifty-eight distinguished senior executives were presented the Presidential Rank Award in late December, along with checks for twenty grand, and one of those recipients was Peter Wilkniss, Director of the Division of Polar Programs, who is sometimes in his NSF office, but more likely "on travel." When Uncle gets through with his cut, Peter will probably end up with enough money to buy a minivan to transport his soccer team, buy a four-wheel drive Jeep to escape his creditors into the backwoods, buy Edith a full-length sable coat, or throw a wingding of a party for one and all. The latter has history on its side, because when the Air Force gave the late Bert Crary \$5000 for his efforts when he left them and went to the Antarctic, the first thing Bert did was rent the Officers' Club at Hanscom Field and have an all-hands party, which included some stunning women! We wish to extend our heartiest congratulations to Peter for his award, and whatever he does with all that loot, we hope he really enjoys it. Money does not buy health or happiness, but you can sure have fun with it.

Apologies for this Newsletter coming out sounding something like a newsletter. We are in a Christmas slump! Hopefully the next issue will be "up front and personal."

H A P P Y      N E W      Y E A R I

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT - MRS. PAUL A. SIPLE

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

Paul C. Daniels

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970

*Welcome to our gracious second Honorary President!*

## MENTAL HEALTH EVALUATION OF WINTER-OVERS IN ANTARCTICA

by

CDR John M. Mateczun, MC, USN  
M.D., MPH  
Chairman, Department of Psychiatry  
Portsmouth (VA) Naval Hospital

and

LCDR Elizabeth Holmes, MSC, USNR  
PhD, Clinical Psychology  
Thrasher Faber Associates  
Norfolk, Virginia

on

*Thursday evening, 24 March 1988*

*8PM*

National Science Foundation  
18th and G Streets N.W.

*Room 543*

*- Strong hot coffee and good commercial cookies -*

John and Betsy were the psychiatrist and psychologist team from the Naval Hospital in Bethesda who screened for Operation Deep Freeze from 1983 until 1987. Both have gone to Antarctica to debrief the winter-overs. Betsy went to McMurdo in 1985 and presents research on the 84 personnel. John went to the South Pole in 1986 and will present his observations of the 19 people who wintered over. Both will speak on the Navy Medical Department's support to the National Science Foundation. This could be a hot and lively meeting, and those of you who were ever debriefed by either John or Betsy had better show up and defend yourselves. This should be a fun evening. Come and be psychoanalyzed!

Isn't it just great we have Ruth Siple for our Honorary President! She is an awful prude, but a fastidious and devoted worker. So it's like signing her up for life with the Society - a life-time contract to work without compensation. We're shrewd!

This issue is a mini-milestone, marking the 60th Newsletter, by the unlikely twosome of rjs and pcd, in the past ten years. There have been a lot of anecdotes recounted, some special features, too many obituaries, and occasionally even some news items. There is no game plan for this column outside the fact that we try to find something of interest for all Antarcticans, young and old, and that we never let the truth stand in the way of a good story. However, we are making efforts to make it more timely, and we beseech current investigators to send us personal accounts of their achievements. We leave the hardcore science to the professional publications, and try to highlight the "up-front and personal."

The meeting with Bob Hofman on *Conservation of Marine Living Resources* was the Society's 135th in our 28-year old history. Brash Ice has been to the last sixty meetings (29 March 1977 -9 February 1988), but missed the joint meeting with the Washington Group of The Explorers Club in order to watch on TV the two Brians at Calgary. C'est la vie!

**RUTH J. SIPLE BECOMES OUR HONORARY PRESIDENT.**      Your Board of Directors unanimous] agreed that Ruth Siple should become our second Honorary President, succeeding the late Ambassador Paul C. Daniels who died on April 6, 1986. This was announced by President Robert Dodson to a near-capacity group of attendees at the February 9th meeting. It is expected that an "official induction" will take place at the 1988 Memorial Lecture.

Ruth became a member of our Society in 1962, which means she is eligible to wear our mythical 25-year diamond penguin brooch. She would have joined earlier, but the forefathers in our Society were a bunch of good old boys from the Antarctic, and women were recognized as mothers of their children who remained faithful to them while they went south and then met them at dockside on their return. Ruth has served the Society in a number of capacities, including being its first woman president. Her official title now is "Treasurer for Life," but she is far more than just that, as she does all of the hard-core administrative work. Her hardest job is censoring Brash Ice (formerly Bergy Bits) so it can go into every member's living room!

Ruth was born in Cincinnati, Ohio, and some years later her parents moved to Meadville, Pennsylvania, home of Allegheny College, which just happened to be where Paul A. Siple was an undergraduate, and where they met. Both graduated from Allegheny, and several years after he returned from the Second Byrd Expedition, they were married in the college chapel. Their honeymoon was spent at the annual meeting of the Association of American Geographers in beautiful, downtown Syracuse, New York, on their way to Clark University. After Paul obtained his PhD at Clark, he went on the U.S. Antarctic Service Expedition, serving as leader of West Base, and doing the experimentations for his wind chill computations. While he was in the Antarctic, their first daughter, Ann was born. Two years later Jane arrived. Then there was another expedition, Operation Highjump, and Paul saw to it that there would be another baby around the house to keep Ruth out of trouble while he was gone - their third daughter, Mary Cathrin. Fortunately for Ruth there was a hiatus of Antarctic expeditions between 1947 and 1957, and so endeth the growth of a wonderful family.

Ruth is very family oriented, is the catalyst who keeps in contact with her five brothers, and sister, and her love for her daughters and their families is a thing of great beauty. She has strong religious faith, but is now experiencing heartaches over developments the past six years within her beloved Episcopal church. She is probably the most forward-looking person any of you will ever know, never talks about yesterday, and greets every day with unabated enthusiasm. She loves everyone, and promises to be the most kissable Honorary President in the United States.

After family and church, cometh the Antarctic Society. I doubt if there is any Antarctic who keeps in touch with more of the early American Antarticans than Ruth; she is the lightning rod they all contact when in trouble, sorrow, or need, or just to be friendly.

Her Antarctic highlight came on 9 January 1975, when she actually stood at the South Pole, having been taken there by the National Science Foundation for the dedication of the new South Pole station. Those eight hours at the Pole were probably the sweetest eight hours of her life; at the slightest mention of the trip, she pulls pictures from her billfold to show herself at the Pole. Usually nothing much good happens to good people, but in this instance, here was something real great happening to a truly fantastic person - having the opportunity to also go into the original South Pole station which her late husband had built in 1956, and to sit, presumably, where he sat in the science building.

Our Society cannot help but be graced and honored by her serving as our titular head our Honorary President. She adds class to our group. She will be an active Honorary President, as the Society will continue to function out of her home, and she will continue working like a sledge dog. Congratulations, Ruth! We love you, and may your 40th birthday be a long way off.

**SIPLE STATION FADES AWAY.** Add Siple Station to the list of defunct U.S. Antarctic stations, as it is about to join Little America I through V, Ellsworth, Wilkes, Hallett, Eights, Byrd, and Plateau as former U.S. stations. There actually were two Siples - the one dating late 1969, first as a summer station, then as a permanent station in 1971; and the rebuilt Siple from the early 1980s. However, the ravages of time have had their effects, and there is no way one can bely hydrostatic pressure which has pushed the subsurface buildings up into the steel overhead arches (which were once 22 feet high, 44 feet wide). It would be an expensive operation to put Siple back into a safe operating mode, and right now the National Science Foundation has much higher financial priorities - the building of the new science facility at McMurdo and a new ice-strengthened research vessel. Siple was also a victim of its strategic location (as a conjugate station to Roberval, Quebec), 1250 miles from McMurdo. It wasn't a favorite flight of pilots, as not only was it a long flight, but the station often had foul weather. So Siple will be closed after approximately five retrograde flights during which they will remove desirable equipment, and then burn off several thousand gallons of fuel.

We should probably try to entice either Bob Helliwell or John Katsufrakis to write an obituary on Siple Station. Its demise and closing certainly mark the end of one of the most brilliant scientific chapters in Antarctic history. And you know something? No woman ever wintered over at Siple, making it man's last wintering-over bastion in the Antarctic! I remember once hearing the astute and personable Lou Lanzerotti say at a National Academy of Sciences' Polar Research Board meeting that Siple Station merited becoming an international station. Could it be reborn?

**HOVERCRAFT PASSES EARLY TESTS IN MCMURDO WITH FLYING COLORS.** Last April Steve Dibbern, polar vehicular expert with the Army's Science and Technology Center in

Charlottesville, told us about the possible glories of using an air-cushion vehicle at McMurdo. Within the past month, Steve's dream has come true, as an English Griffon 1500-TD hovercraft, made in this country by Frank W. Hake, Inc., arrived on ship at McMurdo. Erik Chiang tells us that it has been successfully tested in trips to Willy Field and also to White Island. It normally takes five to six hours for tracked vehicles to make a round trip to White Island; the hovercraft made it out and back in only 90 minutes - cutting the overall time by three-fourths! Evidently this would have been an excellent year to have had one in full use, as the ice went out early, and it could have saved a lot of expensive flying time maintaining personnel at such places as New Harbor. The hovercraft has a cruising range of 200 miles, and bids well for a great Antarctic future.

**NEW U.S. RESEARCH VESSEL FOR ANTARCTICA BECOMING MORE THAN A WISH.** The United States has had a long-standing need for research ships with ice-breaking abilities for use in both polar regions. The Coast Guard breakers are not only ill-fitted for scientific laboratories, but the Department of Transportation, their parent organization, has priced their utilization by the National Science Foundation completely out of the picture. So ITT has solicited bids for a research vessel, approximately the size of the old Wind class icebreakers, with ice-breaking capabilities. Hopefully the contract can be awarded by the middle of this year, and there is a wistful dream that it will be in operation by January 1990. This vessel will have a full-time commitment to Antarctic waters, and will, in all likelihood, be based out of Punta Arenas or Ushuaia. However, she won't be in port very often, as she will really be a seagoing workhorse. - P.S. The Washington Post for 8 February 1988 said the Coast Guard is drafting a plan "to decommission two aging polar ice breakers, the WESTWIND and the NORTHWIND."

**VIKING DEATH FOR NELLA DAN.** The 26-year old NELLA DAN is no more; she took her own life on Christmas Day 1987, sinking in 4570 meters of water off Macquarie Island. The ship was unloading fuel oil to the Macquarie base on 4 December 1987 when its anchor suddenly dragged in 32-knot winds and high seas. Within half an hour it was driven onto a reef, tearing holes in its bottom, with water filling the engine room and drive shaft. On Christmas Eve she began her final trip, being towed out to sea where she was going to be stripped of her fittings and then scuttled. But like any proud woman, she had her own ideas about her demise - a fire suddenly broke out, presumably from two diesel generators running on deck to pump water. The salvage crew hightailed it off the ship when she listed 30 degrees, and Jim Bleasel, Director of the Australian Antarctic Division, reported that the NELLA DAN looked like a Persian oil rig with flames soaring high into the air before she sank. She took with her \$NZ550,000 worth of equipment which will not be salvaged. Bleasel said that the NELLA DAN chose to die like a traditional Viking rather than accept the planned scuttling. Shades of the famed BEAR OF OAKLAND!

Australia has already awarded a contract for the replacement vessel to Carrington Slipsway, in New South Wales, and the new ship is expected to be finished by September 1989. Meantime, the Aussies made a worldwide search for a replacement cargo ship, and found one lying idle at a Montreal dockside, the 103m LADY FRANKLIN, blessed with a skipper and crew boasting of plenty of Antarctic experience. She was due in Hobart on 15 January to pick up 55 builders to take to Casey where they will build a new station. It seems that Casey is in precarious shape, as one article said they could not "guarantee beyond March that it won't be blown to bits in a blizzard." The Aussies really moved out on the ship procurement and contract, didn't they? Don't they have bureaucratic red tape down under?

We are indebted to our own Paul L. Adams for these news items. He is currently living in Auckland, having swapped houses with a Kiwi for several months. Incidentally,

Paul, how did you go about that? I think that's fantastic, trading off winter months in the States for summer months in New Zealand! Was your agent the shrewd Walt Seelig?

**CHALET PREVIEWS ALAN CAMPBELL.** A relatively young - depending entirely on which side of 37 years you may be - artist from Athens, Georgia by the name of Alan Campbell has taken his southern accent, paint brushes, and pencils to McMurdo Sound and produced 23 watercolors and drawings which were recently shown at the Chalet at McMurdo. An article in the New York Times for 15 February by Charlotte Evans didn't say whether any penguins viewed the showing, nor did it say how it was received by camp personnel, but there were a lot of comments from Alan which we will confiscate for Brash Ice. Following the sneak preview at the Chalet, the show took to the road, and people in Christchurch, Wellington, and Auckland are getting a chance to see it. When Alan completes his Antarctic paintings/drawings, he expects to have about a hundred. The opening exhibition in the States will be in September at the Thomasville (Georgia) Cultural Center. Its itinerary is "still incomplete," but tentatively will be seen at the Macon (Georgia) Museum of Arts and Science, and at Oglethorpe University in Atlanta - Georgians really love Antarctica - then the Hunter Museum in Chattanooga, and the Addison-Ripley Gallery in Washington.

Alan has been in the Antarctic for the past two and a half months, seeking to meld art and science with brush and pencil. Maybe there should be an Alan Campbell Antarctic Calendar, as it seems he may have caught it all - an ice cave in Taylor Valley, the POLAR STAR breaking ice in McMurdo Sound, a penguin rookery at Cape Royds, Shackleton's Hut, hot scones at Vanda, et cetera. But there were some Antarctic qualities that Alan thinks may not be paintable. He recalled sitting on the bank of Lake Fryxell in Taylor Valley at 2 AM, trying to draw glaciers and suddenly being overcome by Denton's silent Antarctica. Alan asked, "How can you convey total silence in a painting? I am partially able to get it into words. I'll have to see the paintings to see if it's in the paintings at all." He also found it hard to adjust to the unexpected range of colors, as "you get things that are incredibly far away that look very close because of the clarity of the cold air and bright light and the resulting optical effects."

Alan was amazed at the "incredible clarity of light." As a Mainiac, Brash Ice takes great pride in Alan's comments that "the only place I've ever seen that approximates it, is Maine." Alan must have a brilliant future in front of him! He said, "On a glacier you just don't have white with gray shadows. You might have yellows and pinks in the white of the sunlight working with pastel blues and lavenders and violets in the shadows. But to convey the feeling of this place, you need to know how to control those things, to know that a pale yellow-white against a certain type of violet will give you a stronger sensation of light than just white against blue." Alan also spoke of the fusion of reality and abstraction in the Antarctic landscape, "The more real you attempt to paint it, the more abstract it becomes." You know, Alan sounds a lot like Casey Stengel! May he be one tenth as successful, as Casey died an extremely wealthy man.

**MORE ON SUPERNOVA.** In the last Newsletter we wrote about the ongoing supernova research in Antarctica, and to wrap it up, we are reprinting the news release of 22 January from the National Science Foundation on the experiment.

An advanced gamma-ray detector, launched in Antarctica and borne aloft to an altitude of 115,000 feet by a helium balloon measuring 11.6 million cubic feet, has collected data on the spectrum of gamma-ray emissions from the supernova 1987A..... Originally intended to be flown aboard the space shuttle, the detector was housed in a solar-powered gondola, attached to a parachute, and suspended beneath the balloon. After the January 8 launch from Williams Field, ... near McMurdo Station, ... the balloon and payload remained aloft

for 72 hours. Released on a radio signal from scientists, it made a soft landing on the remote east antarctic plateau, approximately 200 miles from the Soviet station at Vostok, and was retrieved by a U.S. Antarctic Program LC-130 Hercules airplane on January 13.

While the balloon was in sight of McMurdo Station, the instrument system, designed by a University of Florida team led by A. Carl Rester, telemetered data directly to Williams Field. During the first two days, scientists recorded ten hours of gamma-ray data on supernova 1987A and eight hours of data on background radiation in the earth's stratosphere. Once past the horizon, the instruments automatically stored data in memory for transmission to an airborne station aboard an LC-130 flown under the balloon.

Researchers flying under the balloon on January 11 discovered that a 3,000-volt power supply in the detector was delivering only 1,135 volts. Their choices were to leave the instrument package aloft, allowing it to circle the geographic South Pole to obtain data on circumpolar wind patterns, or to bring it down in an area where they could retrieve it. Opting for retrieval, they brought the gondola safely down by parachute. By bringing the instrument back to the laboratory at McMurdo, the team [was] able to study the radioactivity induced in the detector by exposure to the cosmic rays.

..... The objectives of the balloon-borne antarctic gamma-ray detector experiment are to confirm that cobalt-56 was produced in supernova 1987A and to acquire new information about how fast the shock waves passed through the mantle of the exploding star.

Participants in the project include eight scientists and engineers from the University of Florida, the Goddard Space Flight Center, the Catholic University of America, and the Defense Advanced Research Projects Agency (DARPA) Nuclear Monitoring Office. A team of 12 balloonists from the Air Force Geophysics Laboratory, New Mexico State University, and Oklahoma State University assembled and launched the balloon and its payload and operated the tracking and telemetry system.

**MARRIAGE - A GAME FOR ONLY THE STOUTHEARTED.** Our youngest-at-heart member, Norman Vaughan, 82, Harvardian dropout who drove dog teams on the First Byrd Antarctic Expedition, 1928-30, entered the hallowed halls of marriedom for the fourth time, marrying another Society member, Carolyn Muegge of Atlanta, a youthful lass of 45 years in early January. You may recall that Norman and Carolyn did the Iditarod race as a twosome last winter, and this column speculated that their late finish - two weeks behind winner Susan Butcher - might have been due to some hanky-panky along the 1,157 miles, as Norman isn't really that slow a driver!

According to the Frontiersman of 6 January 1988 (provided to us most gratefully by one of our loyalists, Arville Schaleben), they were married in some place called Peters Creek - a most appropriate place for any 82-year-old's marriage - during "lightly falling snow outside of rustic Forks Roadhouse, eight miles from the nearest plowed road and fifty miles from Mount McKinley." Two hundred friends and family arrived by dogsled, snowmachine, cross-country skis, and helicopter. The altar was a snow-covered platform festooned with spruce boughs and a ceramic dog-team molded in miniature. The vows were administered by a fellow Iditarod mustier, Burt Bomhoff. Then the fur-hatted guests moved inside and crowded around a bar heated by a wood stove and decorated with bearskins, moose racks, and gold-mining artefacts.

Norman looked just great in an accompanying picture, more like 52 than 82, and sure is a great endorsement of why one should live in Alaska and not Arizona. He was quoted after the informal ceremony punctuated by howls of dogs as saying, "I'm a

very happy man. Getting married to a girl like Carolyn is a great experience and a great adventure. You can't beat that." Sounds like the winning quarterback talking after winning the Super Bowl! After the reception he and Carolyn drove a dog team off to his log cabin where they supposedly enjoyed "a brief honeymoon." After all, when you are 82, what man needs a prolonged honeymoon? Quicker is probably better, if not bestest! Besides, Carolyn needed to return to Atlanta for business, and Norman had to continue his preparations for his 11th run in the Iditarod. Watch for it and Norman and Carolyn on national TV in late March, as one of the major networks is covering the race.

One must keep things in their right perspective, and not get overwhelmed by something as mundane as a simple old honeymoon. This summer Norman is going back to Greenland in another effort to recover two bombers and six fighters that crash-landed during World War II. He also plans on going back to the Antarctic, taking a dog team to the South Pole, being there for his 85th birthday, 19 December 1990. Don't count him out; he'll probably be there. Norman, you are a devil. You are also being envied by every old codger in our Society who wishes he was in your boots. Go for it!

**ONCE A FOKKER, ALWAYS A FOKKER.** The Fokker Universal monoplane which flew itself backwards for half a mile into complete destruction in the Rockefeller Mountains on 15 March 1929 was recently seen by a four-man New Zealand expedition studying the geology and biology of the area. Originally Bernt Balchen and Harold June had flown Larry Gould into the area so Larry could conduct some geological studies. They set up camp on the snow, but soon were beset with foul weather. Murphy's Law then took over, and conditions worsened. Larry estimated that the winds which tore the plane loose from its moorings were about 150 mph. Our immediate past president, Ed Todd said that Larry's description of the blizzard in Cold is the best description of a blizzard he has ever read.

The New Zealand field party expressed surprise at how exposed the Fokker was, saying that "most of the aircraft is on the surface ... with only the tail and the lower portion of the wing being buried in ice." The little Fokker originally had a 425-horse power Pratt and Whitney Wasp engine. Three men on the Second Byrd Antarctic Expedition (EdMoody, Paul Swan and Duke Dane) had salvaged the engine, propeller, and instruments from the plane in 1935. Jim Caffin, Mr. Antarctica, is interested in what happened to the engine after they got it back to Little America II. Steve Corey, you must know what happened to the engine - can you help us out?

**KERSHAW - SWITHINBANK OPEN ANTARCTICA.** (Reprinted from Flight International, 23 January 1988 with permission of Reed Business Publishers, 205 East 42nd Street, Suite 1705, New York, New York 10017. ... Brash Ice did change the title; theirs was 'Antarctic Airways' frozen future.") Last November a tatty and somewhat travel-weary DC-4 touched down on a 16km sheet of ice, set 3,000ft above sea level among the Patriot Hills, just 600 n.m. from the South Pole. It was the climax of three years of planning and heartache by a small band of dedicated Antarctic enthusiasts, who believe that access to the continent should be available to private individuals at an affordable cost.

The use of a remote ice landing strip has made the dream possible. Adventure Network International (ANI), trading as Antarctic Airways, has now started commercial operations. The company hopes that private individuals will take advantage of flights which, for the first time, link the interior with the outside world, using a conventional wheeled transport aircraft.

Until now, private organisations or individuals wishing to enjoy the unspoilt scenery or to climb mountains in the central Antarctic have had no easy means of getting there, whatever price they might be prepared to pay. The logistical

cost of supporting any Antarctic programme is enormous, for sea conditions prevent ships from resupplying the continent for much of the year. Any stores landed by ship must then be moved inland using ski-equipped Twin Otters or Dornier 228s, unless assistance is provided by military C-130 Hercules aircraft, and only the United States has ski-equipped C-130s.

Aircraft operations are impossible during the Antarctic night, which lasts about eight months, and fuel supplies have to come by sea, so these operations are very expensive. Hitherto, only government-sponsored agencies have had sufficient funds to support such ventures. Private expeditions are seen as a costly drain on limited resources by such agencies and are generally discouraged. Moreover, each government acts in isolation, with little international cooperation. There is a lot of politics dressed up as science, believes AMI, which aims to transcend purely national interests.

ANI was created in 1984, to break the stranglehold on exploration imposed by Antarctic logistics and to provide support for anyone wishing to visit the continent. A ski-equipped Twin Otter was leased from Canada, and a Chilean Air Force C-130 was hired to airdrop barrels of fuel in the Ellsworth Mountains. A route from Punta Arenas, Chile, to the Ellsworth Mountains was established with a ski-equipped Twin Otter, using the 4,000ft hard runway on King George Island (61°10'S, 58°55'W) and a ski landing at Adelaide Island (68°45'S, 69°W) as refuelling stops. A small base camp was established at the foot of the 17,000ft Mount Vinson, the highest peak in the Antarctic and an attractive challenge to the world's leading climbers. The first round trip under the Antarctic Airways banner was made in November 1985 by Capt Giles Kershaw, who since 1974 has gained Antarctic flying experience with the British Antarctic Survey (BAS) and other expeditions.

Thanks to the weight of supplies and emergency equipment carried, the payload-range of the Twin Otter allowed only eight revenue seats. The small cache of air-dropped fuel permitted only three round trips. Despite the arduous flight time (14hr, exclusive of the two refuelling stops) and great cost, demand for places was high and all seats were sold. Groups of climbers from Canada, the USA, and Korea were flown in for stays of two to three weeks.

The shortest one-way trip proved to be 18hr, while adverse weather forced Kershaw to make four unscheduled landings on one trip. On each occasion passengers were unloaded, accommodated in tents, and fed on emergency supplies until fair weather arrived. The one-way journey took seven days. "None of the passengers complained. They seemed to enjoy the stops in remote locations," says Kershaw.

During the following summer season five more flights were made to the Ellsworth Mountains and, in addition to passengers, two huts and 2 tons of food were flown in. During December 1986 the Twin Otter also flew 3,000 n.m. from Punta Arenas to Cape Evans (77°38'S, 166°22'E) on the New Zealand side of the continent to pick up three members of the ill-fated "Footsteps of Scott Expedition," whose supply ship had been lost in pack ice, fortunately without loss of life.

During this period Kershaw searched for a suitable icefield large enough for wheel-equipped heavy transport aircraft. In 1974 he had flown an extensive echo-sounding programme for BAS under the direction of Dr. Charles Swithinbank, its renowned glaciologist and head of earth sciences. They had then discovered extensive bare icefields south of the Ellsworth Mountains, suitable for use by wheeled Twin Otters. They were convinced that, if larger fields could be discovered, direct flights by heavy aircraft might at last end the need for resupply by ship.

Swithinbank retired from BAS in 1986 and joined Kershaw in the Antarctic in a bid to find a suitable site, starting in the area visited 12 years before. The Chilean Force air-dropped more fuel to allow Kershaw to undertake local reconnaissance

flights from the Mount Vinson base camp.

Using NASA Landsat images they determined that the best icefields were to be found in the Heritage Mountain range, and that the ideal criteria for a runway would be 3,000m x 50m, dead level and orientated into the prevailing wind. Unobstructed approaches allowing a 50:1 glide ratio were essential, something normally provided only by sea ice or frozen lakes. Since ice sheets are fed by gravity, via a slope, they move slowly but constantly, acquiring a ridged or crinkled surface in the process, which may be so severe as to restrict use to ski-equipped aircraft. Ideal sites are therefore hard to find.

Kershaw and Swithinbank made a reconnaissance of some 200km sq of bare ice, but found just two suitable areas. The most promising site was the icefield close to the Patriot Hills (80°19.5'S, 81°16'W). Kershaw left Swithinbank and his assistant, Dr. Michael Maxwell from Vancouver, at the icefield for a detailed survey. They determined that the field would provide two runways, one 3,400m x 50m and a shorter 1,700m strip of similar width. Mean transverse gradients were 0.72 per cent and 0.43 per cent respectively.

A week later Kershaw returned and carried out a series of high-speed landings with taxi and braking tests. The surface was found to be slightly corrugated and scooped by the wind. Paradoxically, this proved to be beneficial, and traction was "astonishingly good", according to Kershaw, who found that quite severe braking was possible without wheel-lock or skid, though he suspects that at higher temperatures the surface may be more slippery.

Not all was plain sailing, however. With its large tail area the Twin Otter, if lightly loaded or at aft e.g., was prone to weathercock when taxiing in strong crosswinds owing to insufficient nosewheel traction. With a 25kt crosswind the whole aircraft would drift sideways, though in lower wind conditions, it could be controlled with asymmetric braking and reverse thrust, Kershaw discovered.

Heavier aircraft would probably be limited to a 5kt crosswind component, but standard full-power recovery techniques were not found to be a problem owing to the length of the runway available for the Twin Otter. Kershaw noted that the area might in some directions offer up to 6,000m of useable runway, though long wave undulations might make them unacceptable for large aircraft.

Despite the encouraging icefield survey, ANI knew that before the Chilean Air Force could be persuaded to land there with the C-130, the company would have to prove the concept by setting up a base, marking a runway, and landing a large wheeled aircraft of its own. Such an aircraft had to be able to fly an unrefuelled round trip of 3,400 n.m., with reserves, while carrying a commercial payload of 10,000lb. Many aircraft were considered but, not surprisingly, no operator would allow its aircraft to be used for such a hare-brained venture. They simply would not believe that directional control and braking was achievable. ANI saw that it must get its own aircraft, though without government or private backing the choice was limited and the risks were very high.

The whole venture might never have got off the ground had it not been for the support of Calgary-based Kenn Borek Air, which had already leased ski-equipped Twin Otters to ANI. The Calgary company bought the DC-4 and leased it to ANI with \$25 million of insurance and a crew consisting of three pilots and three engineers, led by Jim Smith, an old hand on the type. All six had Arctic experience. The DC-4 dated from 1945, and was modified with long-range fuel and oil tanks, an auxiliary power unit (APU), new avionics (including an Omega long-range navigation system), and a 20-seat interior.

The aircraft left Calgary during late October last year, but suffered a bad delay in Punta Arenas when all four engines had to be changed following oil contamination

from an unknown source. Meanwhile, the two Twin Otters flew on to the Patriot Hills to provide essential ground support and emergency backup. Finally, after further weather delays, the DC-4 departed from Punta Arenas on November 15 for the 1,700 n.m. flight to the icefield.

Fully loaded to the maximum takeoff weight of 73,000 lb, with 3,500 lb of wing fuel and a further 1,500lb of fuel capacity in the cargo compartment ferry tanks, a maximum endurance of 24hr was expected for a planned round-trip time of 20hr. Under average wind conditions outbound flight time proved to be 10 hr 20 min, with 9hr 40min for the return flight. Thanks to unfavourable winds and detours around bad weather, the inaugural outbound flight took 11 hr 43min, touching down after several low passes over the landing area. The Omega had packed up enroute, but Kershaw, who had flown the route more than 20 times, found the field by dead reckoning.

Landing conditions were not ideal. There was an unpleasant 35kt surface wind and a ground temperature of -25°C. Braking action proved effective, however, and the 8,000lb of personnel and cargo was soon unloaded, speed being essential to avoid excessive cooling of the Pratt & Whitney radial engines before restart. As a precaution some extra fuel was uplifted for the return flight, and before takeoff some taxiing tests were carried out which demonstrated that the aircraft could be taxied downwind with full flap selected. Traction was sufficient to allow full-stop braking without skidding.

The lightened aircraft was airborne in just 1,000ft, thanks to the strong wind. A 175kt cruising speed was maintained on the return flight, 10kt higher than on the heavily loaded outbound flight. Despite having return fuel, the crew responded to a request to divert to King George Island to pick up 14 Chinese nationals whose inbound C-130 flight had been delayed for several weeks. The DC-4 then resumed its return flight to Punta Arenas.

Since the inaugural flight in November, a number of route-proving flights to the Patriot Hills have been undertaken, each one building up the ground facilities and resources at the icefield. Commercial passenger flights started, and ANI needs ten flights during February to break even this season. Kershaw believes that using bare ice for landing is the most significant step forward in Antarctic logistics since the first ski-equipped C-130s came into service.....

**THIRTY-FIVE WELL-HEALED TOURISTS ARRIVE AT THE SOUTH POLE.** As a follow-up to the above, we now know that money can get you to the South Pole, as thirty-five tourists paid up to \$35,000 each to fly to the Pole between 12 January and 21 January. Nineteen of those tourists were shuttled in on three flights on 12-13 January, which meant that they were carrying 6.33 persons on each flight! What do you get for all those bucks? – a chance to look over a featureless plain of snow which must resemble North Dakota in mid-January; an opportunity to make a quick visit inside a geodesic dome and see real, live human beings, some with beards, staring at you like you were creatures from Mars; a chance to drink a cup of hot coffee; a chance to buy one souvenir; and, according to our friend Charlotte Evans in the New York Times for 7 February, an unauthorized chance to toss your cigarette butts onto the snow. The layovers were said to be two to three hours long.

Most of the visitors were Americans, many over 60-years old, and several had difficulty breathing at the high elevation (where the atmospheric pressure equates to about 12,000). It seems we heard from someone that some of the tourists needed oxygen while there, and had to be taken back out to their plane on sleds. You know this has all the potential for the South Pole becoming Barnum and Bailey South. Can McDonald's golden arches be far behind? There is a ceremonial South Pole, a Geographical South Pole, and perhaps there should be a Tourists' South Pole where Kershaw could

set up an Amundsen-like tent, let the tourists be photographed there, and leave the scientific station for its normal business.

Meanwhile, Mountain Travel is lining up intrepid skiers with deep pockets to ski to the South Pole next year. There are quite a few requirements. First, you have to be both a cooperative and tolerant person, which would immediately disqualify me; second, you have to have \$69,500, after you have paid your airfare to and from Punta Arenas; third, you need another \$1,500 to \$2,000, as you'll have to go through a ten-day survival trip in the boonies of the Canadian Arctic this March; fourth, you have to have a boss who would just as soon you don't show up at the office, as it will take sixty days to ski to the South Pole; fifth, you have to have a husband or wife who would prefer that you not be home over the holidays, as arrival at the Pole is on or about 10 January 1989. They already have eight serious candidates, who have put down \$5,000 each to show their seriousness. Brash Ice would call them somewhat of a motley group, although Mountain Travel must see them as beautiful people. There's an army colonel from New Delhi, a real estate developer from Lansing, Michigan, a manufacturer from Colorado, a landscape designer from Auburn, California, an investment banker from Los Angeles, a retailer from Toronto, and, of all things, a married couple from Napa, California. Will they end up developing real estate on the polar plateau, opening a southernmost bank, landscaping crevasses and sastrugi, establishing a manufacturing site, opening an outlet mall, et cetera? Anything is possible in this crazy world!

Mike Parfit, who bids well to becoming the official Antarctic reporter/writer, wrote in the Washington Post on 24 January 1988 that a survey of tour companies going to Palmer revealed that tourists wanted five things: jacket patches, postal cachets, T-shirts, a look at krill, and a chance to have their picture taken. Is there really any difference between tourists and high school kids - outside the fact that high school kids might bypass looking at krill? Adult toys do cost more, but they are probably more appreciated. Last year sixteen cruise ships were scheduled to visit Palmer, so this year NSF put a limit on the number of tourists who could drop in -400. They also sent an official tourist liaison person to Palmer. The Antarctic Peninsula is so downright beautiful that every adventurer/tourist worth his pocket-book wants to go there. NSF estimated this year that 7,200 tourists would visit Antarctica; this may be low, as we have seen figures from one of the prime movers of people that approximately 10,000 tourists would go there. Tourism has really exploded in Antarctica, and will probably run rampant until the next catastrophe. However, what's a human life, or two or more, when a successful return gives you bragging rights throughout the neighborhood that you have been somewhere where they have not? Insignificant. One final weird thought in closing - do you suppose Kershaw gives all the men going to the South Pole fur-lined jocks and all the women fur-lined bras? Nothing, absolutely nothing, would surprise me! (Information above on Mountain Travel courtesy of Art Ford.)

**MUCH ADO ABOUT NOTHING, WE HOPE, WE PRAY.** Some of you people may have heard on CNN News, or on the radio, on 13 February, about some supposedly detonations of nuclear devices by Israel in the Antarctic. We were able to obtain a copy of the UPI article from Cairo which quoted at length from the Egyptian semi-official newspaper, Al Ahram, that there had been three nuclear tests in Antarctica. The report in the newspaper was attributed to its military analyst, Mohammed Abdel-Menem, although the article did not say how he had obtained his information. It all sounds like science fiction of the worst kind. The first test was supposedly in cooperation with South Africa in 1979, and the last two tests in 1986, one on 5 March in Queen Maud Land, and the other on 3 December. The article said that Israel was "now involved in intensified nuclear activities in Antarctica on Buffet Island which it has leased for 20 years from France." The USGS has no record of a Buffet Island in Antarctica. The article goes on to say that "an Israeli port is now being established

northeast of the island in which 500 Israelis 'including 150 military personnel<sup>1</sup> are stationed and living." Our Middle East expert, George Doumani, is quite familiar with the newspaper, Al Ahram, and says it is really the voice of the government. The Press and Information Office at the Norwegian Embassy in Washington told Brash Ice on 17 February that the article was "sheer nonsense, complete stupidity." As we go to press, the French Embassy had not returned our call, but we chalk that up to their being French, although not returning calls is a Washington malaise, not restricted to the French.

**MURRAY HAMLET HAS A CURE FOR RAYNAUD'S DISEASE.** According to the New York Times of 19 January 1988, Mr. Hypothermia Himself, the irascible Murray Hamlet of the Army's Research Institute of Environmental Medicine at Natick, Massachusetts, has a cure for Raynaud's disease, which is evidently a curtailment of blood flow to the hands and feet as the body saves energy to cope with the cold. It can also be induced by emotional stress or frequent use of vibrating machinery. It seems that curtailment of blood flow is harmless to most folks as one's circulation normally resumes after about ten minutes. But Raynaud's victims do not regain circulation to their fingers, causing a painful condition that increases the risk of frostbite, and in severe cases can force amputation. There is good news for us men, bad news for you women, as Raynaud's is more female selective, affecting perhaps as many as ten percent!

Now for the remedy - it's hot water and an ice chest! This is nothing new, as the original procedure was devised a decade ago by an Army doctor in an Alaskan laboratory, but only recently have scientists at Natick refined it. The current procedure finds Raynaud's sufferers undergoing treatment three to six times a day, every other day, in which they sit indoors with their hands submerged in warm water, and then are placed in a cold environment, exposed to the cold except for their hands, which are submerged in an ice chest filled with warm water. After fifty rounds of treatment, all of the 150 test subjects at the laboratory were able to venture into the cold without losing circulation to their hands. Murray says, "We just retrain those blood vessels to dilate rather than restrict in response to cold. It works extremely well." However, if you are a Raynaud's victim who developed it as a result of other illnesses, such as high blood pressure, arterial disease, drug abuse, and trauma, the treatment may not work.

**PBS BUYS KIWI DOCUMENTARY "UNDER THE ICE".** PBS is going to show throughout the States a New Zealand beneath-the-ice documentary film produced by Neil Harraway. But first they have to find an American voice and have the sound track redubbed into English! It is an ecology film, looking at how life exists in Antarctic waters. Diving on a reef between McMurdo and Scott bases, the photographic team saw giant multi-colored sponges, two meters tall and wide. Harraway said, "There were sea spiders as big as your hand, sea lice as big as your fist, giant marine worms up to a meter long, and starfish as big as your head." Supposedly this is an excellent film, and Harraway (*Journeys in Natural Parks* and *Ice Bird*) says it's one of the best things he has ever done. Sounds great - let's see it!

**RUTH J. SIPLE SPEAKS.** Words, spoken or written, are not my forte, but may I humbly express my deep, heartfelt appreciation for the undeserved honor of being named the second Honorary President of the Antarctic Society. As I tried to say through tears at the February 9th meeting, I am completely overwhelmed to think that I was selected to follow in the footsteps of our beloved first Honorary President, the late Paul C. Daniels. From the bottom of my heart, thank you for the great honor. With your support, the Society will go forward. My love to you all!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET

ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT - MRS. PAUL A. SIPLE

Vol. 87-88

April

No. 5

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree(Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree(Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986

THE ANTARCTICAN SOCIETY AND THE NRC'S POLAR RESEARCH BOARD

present

GEOCHEMISTRY OF THE WEDDELL SEA: LOCAL PROBLEMS OF GLOBAL INTEREST

by

Dr. Ray F. Weiss  
University of California, San Diego  
Scripps Institution of Oceanography  
La Jolla, California

on

Friday evening, 29 April 1988 8 PM

The National Academy of Sciences  
2101 Constitution Avenue N.W.  
Washington, D.C.

PRECEDED BY

Cocktails in the Great Hall at 5:30 PM  
and  
Dinner in The Refectory at 6:30 PM

Dr. Weiss is a current member of the Academy's Polar Research Board, where he serves as its expert on chemical oceanography and atmospheric chemistry, particularly on the Southern Ocean. He majored in chemistry at Cal Tech where he obtained both his bachelor's and master's degrees. His PhD was from Scripps in earth science. He is very much interested in the interactions of oceans. He first visited Antarctica in 1973, and has been involved in its oceanography ever since. Come and hear this authority talk on a subject of unusual current interest!

As this is a dinner meeting in the main Academy building, the price of dinner has to include cocktails. Our chicken dinner, with drinks, will be \$25. Please make your checks payable to *The Antarctic Society*, but SEND THEM TO The Polar Research Board, Attn: Mrs. Mildred McGuire, 2101 Constitution Ave. NW, Washington, DC 20418.

Reservations MUST be in by 25 April!

Each Newsletter is a giant step towards a newsletterless summer which we always look forward to with great expectation. The Washington area is a big fat zero from 15 May to 15 September when humidity becomes a repulsive way of everyday life. But fortunately there is a State of Maine. In fact, we spend nearly all of our time there, both winter and summer. We are about to enter the computer age, purchases have been made, and hopefully there may be an edition later this year from the shores of Penobscot Bay rather than from the banks of the Potomac. This Newsletter has a lot of marine-oriented items - hope you like them. Again, what follows does not constitute an official position of our Society, being just the prejudiced opinions of a solitary member. It may be the whole truth, may be part truth, or, perhaps, it may even be a complete fabrication. There is no identification key to which is what - it's up to you to decide.

Our President, Bob Dodson, has recently accepted a position in a satellite Antarctic country - Morocco. Wherever Bob goes, you can be sure he will spread the word about the good old Antarctic days with dog teams. Good luck to you, Bob. Keep your cool!

**WHO ARE WE, ANYWAY?** We thought we knew who we were until we read Mike Parfit's article on the Fearsome Traveler in the Washington Post on 24 January 1988. It was rather disconcerting to find that Montana Mike had lumped us in with the Explorers Club and the Alpine Club as an adventure group. It was almost enough to make me want to resign from our Society, but then he did call us "respected adventurers", and I decided to stay! No one knows the constituency of our Society better than I, as I more or less handle the membership end of the organization and have a personal interest in the backgrounds of our members. Several years ago we went through the whole membership and found out that three-fourths of our members had been to Antarctica, nearly all as working scientists or distinguished guests of our government. About half of our members had geographical features named after them. Although we have picked up quite a few new members who are saviors of the pristine Antarctic environment or have been there as tourists, we in the Nerve Center still feel that our Society is basically an organization for people who have worked in Antarctica. As much as is possible, all of our speakers are professional Antarcticans who have worked on the continent. Our Memorial Lecturers are almost always people on the cutting edge of Antarctic science. As much as we respect Mike as an Antarctic writer, this time we have to take exception to what he wrote.

**AFFLUENT GREENPEACE SENDS FOUR MORE GREENS TO CAPE EVANS.** Greenpeace, which projects \$NZ62.5 million support for 1988, is allocating \$NZ3.1 million on Antarctica over the next three years. The 1988 four-person wintering-over crew has similarities to the first four Greens who wintered over at Cape Evans. The camp leader, again, is a malcontent from a past wintering-over crew. He, Keith Swenson, worked as a mechanic at McMurdo Station four years ago. He is sort of a nondescript character who has worked as a river guide and a forest ranger, and is a mountaineer with Himalayan experience. He hails from some place called Idaho, a nonentity left out when Montana, Oregon, and Washington were drawing up their boundaries. In keeping with

last year, one member is some sort of a scientist, has some sort of a doctor's degree - Sabine Schmidt of West Germany. She was described in the New Zealand press as "short, friendly, and feminine." Isn't it just great that she isn't tall, hostile, and masculine! You don't have to look too far to find an Australian who is willing to do anything, and they have such a soul in the Dutch-born Sjeord Jongens, a veteran of seven Antarctic visits and two winter-overs. He could not have found Antarctica too revolting to have gone back all those times, but, then again, there is no accounting for what Aussies will do. The other Green is Wojtek Moskal, a "genial, bearded oceanographer" from Gdansk, Poland, who, after three years on an expedition to Svalbard, returned there to live with the trappers. He will actually be closer to the equator at Cape Evans than he was when in Svalbard, so one could say he has gone to Antarctica to escape the long harsh winters!

Jongens is going to install computerized communications at their station. The Greens will try to monitor all of the shenanigans of the law-abiding Antarctic Treaty nations in Antarctica, alerting major news services such as Reuters and the Associated Press when they see something bad. Greenpeace at McMurdo is sort of like having your mother-in-law living in your basement, a no-win situation, as even perfection would not be good enough. One would think that in an organization with 2.5 million members someone in authority would be able to come up with a better utilization of funds than monitoring what is added to the McMurdo dump.

**ANTARCTIC HUMOR.** We have been lifting the words of Charlotte Evans off the pages of the New York Times in our past two issues, but this time we are presenting a sneak preview of her input into an upcoming cruise book. Sounds a bit like vintage John Splettstoesser or Rob Flint. Her observations are the result of eleven weeks at McMurdo and elsewhere this past austral summer. We thank Charlotte for letting us use it, as these pages need some humor, especially following Greenpeace!

Most Pointed Item of Proof That It Is Still a Man's World - The ladies' room on a Here.

Least Credible Response to a Plea - Commander John Schaedel, the supply officer, who insisted, under repeated prodding, that he did NOT have a secret stash of bikini panties with the legend: 'Coldest Spot on Earth.'

Best Emperor Penguin Impersonation by an Officer on a Thursday - Captain Dwight Fisher, hands - er flippers - down.

Least Scientific Response to a Question - Professor Art DeVries of the University of Illinois on why the Conservation Act covers birds and mammals but not fish - 'Fish are ugly.'

Most Colorful Creation by the Galley (not to be confused with Most Taste Tempting) - Melange of red and green Jello cubes with marshmallows, shredded carrots and raisins.

Most Predictable Personal Loss - The \$85 sunglasses with the white frames (probably on the outskirts of Willy Field in the aftermath of the supernova balloon launch). The \$12 ones with the red frames persist.

Most Charitable Assessment of Public Transit - Betty Moser, medical corpsman at Palmer, on the Nodwell: 'I don't care what they say about those foreign cars; you can't beat the ride in a Lincoln.'

Most Exasperating Item of Clothing Issued by NSF - The tube sock.

Most Exasperating Omission at NSF Orientation Meeting in September - 'Bring a towel.'

Least Soundproof Building in the World - The Mammoth Mountain Inn.

Least Predictable Cocktail Sensation - The T'nT, a mixture of HOT Tang and Tequila, enjoyed by a science party in the Dry Valleys.

Most Overrated Reputation for Efficiency - Hill Cargo.

Most Amazing Nonscientific Discovery - The Kaopectate at the South Pole is powdered

**OZONE GLOBAL PROBLEM WITH SEVERE ANTARCTIC HEADACHE.** We always felt with a large degree of discomfort that our demise on this earth would be tied in with some crazy Boston driver getting us on the highway; they are a terrible cult of pure maniacs driving time bombs with reckless abandon on the byways of New England. But wait, the Washington Post for 16 March had an article by Cass Peterson in which she reports on the severity of global ozone depletion. Robert Watson of NASA is quoted as saying, "Things are worse than we suspected. There has been a long-term change since 1969 that had not been recognized before..... All of the previous reports have said there is no statistically significant trend since the 1960s. What we are reporting is clearly a statistically meaningful decrease in ozone. Our models are not doing a good job."

Antarctica is the odd man out in this fragile game. Peterson wrote, "Last year, ozone levels over Antarctica dropped by more than 50 percent, the deepest depletion since the 'hole' was first reported." The article included a map based on a recent study by a team of a hundred scientists from U.S. and U.N. agencies which analyzed nearly two decades of ozone data gathered by satellite and by ground-based instruments; it showed that there has been a 10.6 percent year-round decrease between latitude 53°S and 60°S!

The worldwide figures were startling because the overall ozone decreases are three times greater than expected. One problem, scientists said, was that current models do not take into consideration the added effect of ice crystals, which form over Antarctica in the coldest months and provide a base for chlorine reactions with ozone. F. Sherwood Rowland of the University of California at Irvine, head of one of the study groups, said the current changes are occurring at chlorine levels of about three parts per billion in the atmosphere, and the Treaty (the pending International Ozone Treaty) will allow chlorine levels to reach six to seven parts per billion before they can be reduced. Rowland was quoted as saying, "We're seeing severe damage now, and we know it is going to get worse because we have more chlorine." Watson and the other scientists said there is little doubt that the ozone depletion is attributable to chlorofluorocarbons and other man-made chemicals that destroy ozone in the atmosphere. The figures reported in their study were adjusted to account for natural ozone changes, which can come from sun spots, volcanic activity and unusual weather patterns.

The U.S. unanimously approved an international treaty on 14 March to halve the world's consumption of chemicals that erode the gaseous ozone zone, and it was expected that President Reagan would sign the instrument of ratification. Thirty other nations have tentatively approved the Treaty. It is the first treaty that represents an international agreement to curb air pollution, and is considered a model for other multinational environmental problems. The Treaty, which calls for a staged, 50-percent cut in ozone-depletion chemicals over ten years, becomes effective 1 January 1989, if ratified by eleven countries representing two-thirds of global use of CFCs. The U.S. accounts for 30 percent of world consumption, the European Community another 30 percent, and Japan 10 to 15 percent.

Environmentalists argue that the Treaty does not go far enough, citing the widening ozone 'hole' over Antarctica. They are seeking a global ban on CFCs - a \$750 million a year U.S. business (refrigerants, plastic-foaming agents, and solvents) in 1986. Senator Chafee of Rhode Island tried unsuccessfully to accompany ratification with a resolution urging faster and deeper CFC cuts in the Treaty or unilateral U.S. actions to reduce consumption. There is some speculation that the 12-member European Community might delay ratification, as Great Britain, France, and Italy were "the least enthusiastic" during the treaty negotiations in Montreal last September. If the required number of countries have not ratified the agreement by 1 January 1989, implementation will be three months after the conditions are met. Our advice - buy sun screen stock!

**IS NORMAN VAUGHAN REALLY MARRIED?** Norman Vaughan continues to get more publicity over a simple old marriage than most people get out of a lifetime of working. The latest to immortalize his and Carolyn's wedding is *Alaska Magazine* for March 1988. But wait a minute, are they really married? It seems that Norman had forgotten -?-to bring along to the wedding the papers that had to be signed to make the marriage legal. Regardless, they had a great party, everyone had a good time, and the missing papers did not deter the honeymoon. If need be, you can always pick up the papers later - this year, next year, the one following - and your true friends will sign anything, any time. But let's excerpt - with our personal embellishments - the *Alaska* article on the wedding, as it was unique. First, the wedding site, the Forks Road House, is about 19 miles off the Parks Highway on the Petersville Road. It is one of those places which can only be reached in winter by dog teams, snow machines or helicopters. That sort of eliminates the riffraff and conventional partygoers from showing up, making it a first-class wedding. By 11 a.m. the roadhouse was jammed and queues were at the bar, and in front of the door to one unisex, overworked head. Kids outside were clobbering one another with snowballs, huskies were howling, and bottles of anti-freeze were passing from one hand to another. There's no place like home!

The bridal altar was a sheet of plywood strategically buried near the top of a 4-foot deep snowdrift. Members of the press corps "gradually sank into the snow off the edge of the plywood as they scrambled to take pictures and record comments from the Ceremony," which was said to be a "more-or-less traditional ceremony." The wedding was buzzed by a bright red Super Cub, Alaska's favorite bush plane. Then they all went inside to what was described as a madhouse. "It took 45 minutes to get a plate of food. Champagne corks burst from magnum-size bottles, ricocheting around the room as the bubbling wine spewed onto the floor and into the glasses. A three-tiered wedding cake, brought in frozen the day before by dog team, was cut and devoured." Who needs a basic stereotyped \$20,000 wedding anyway, when you can have one with so much real fun?

After all these years of mushing, it was Carolyn who drove Norman off to their honeymoon, as she commanded the dog team with Norman riding as a passenger. Probably it was most essential for both of them that Norman's strength be preserved for wedding night activities, and that Carolyn be a bit tired out so she would not stay up all night looking for the impossible!

As we go to press, the Butcher-Iditarod race is history. If you followed the daily accounts in *USA Today*, you know that Storming Norman at 82 was the oldest dog driver in the race, and you also learned that after getting caught in a blizzard, he decided to drop out of the race. Presumably Carolyn was his racing companion again, although we are only surmising this. Antarctic ships and Norman Vaughan are always good copy.

**DAVID HARROWFIELD, EXECUTIVE OFFICER, ANTARCTIC HERITAGE TRUST.** In a past issue, we put in a plug for members to send megabucks to New Zealand to help support the conservation and preservation of the four historic huts in the Ross Sea sector. We had a call from the Antarctic sage, Walt Seelig, saying that we were remiss in not telling his many friends in this country that David Harrowfield was appointed the Executive Officer of the Trust. Consider yourself now so informed.

David first went to the ice in 1975 as a senior laboratory technician from the Geography Department, University of Canterbury, and spent ten days studying the beach formation and the recent glacial history of a small coastal landform at Cape Bird. In 1977-78, he revisited Antarctica as a hut caretaker, working at Cape Royds, Cape Evans, and Hut Point for four weeks doing a detailed inventory and pictorial record of historic artefacts in and around the huts. His field work included the use of archeological techniques for the recovery of artefacts around the huts. In 1979 he became curator of the Antarctic Centre of Canterbury Museum; he also worked as an archivist at the Museum between 1984 and 1986. In the summer of 1981-82, he led an

expedition to Cape Adare to document the site of, and carry out essential maintenance on, the living hut of the Southern Cross Expedition of 1899-1900.

He is the author of an excellent Antarctic book entitled *Sledging Into History* which deals with the explorers of the heroic age, the huts they built, and the ongoing work to restore and maintain the huts. He also authored the chapter on historic huts which appeared in the Reader's Digest *Antarctica*. In 1987 he received the New Zealand Antarctic Society's Conservation Award (a carved walnut Emperor penguin) for his work relative to the historic huts. Most geographers are suspect, but he looks like an honorable man, so get your checks off now, payable to the Antarctic Heritage Trust, to David Harrowfield, Executive Officer, Antarctic Heritage Trust, P.O. Box 13247, Christchurch, New Zealand.

**ROW, ROW, ROW YOUR BOAT, GENTLY TO ANTARCTICA.** Two veteran Antarcticans, Mark Eichenburger, 35, of Dallas, and Jay Morrison, 34, of Cleveland, joined forces with adventurer Ned Gillette, 42, of Stowe, Vermont and Fred Trombley, a 32-year old sailing captain out of Whitman, Massachusetts who had logged 70,000 nautical miles at sea, to row the 28-foot dory SEA TOMATO across the Drake Passage to King George Island in late February-early March. The SEA TOMATO was built on Cape Cod, and is a flat-bottomed dory weighing 5,000 pounds, drawing just under two feet. Its hull is of welded aluminum A pair of draggerboards - whatever they may be - increased the draft by four feet and added stability. The interior of the boat had nine compartments, the largest of which was the watertight, sealed living quarters in the center. There were open rowing compartments at the bow and at the stern, and the other compartments contained space-age communication gear, food, water, emergency supplies, and flotation foam. The SEA TOMATO had six sets of carbon fiber oars of varying lengths - long, medium, and short - for use in smooth, choppy, or rough seas. It also had two short removable masts.

They departed from Pratt Passage, a sheltered waterway in the Patagonia Archipelago, on 22 February and traveled south for two days until they reached the latitude of Cape Horn, 56°S. From there on sails were secured, and they rowed, and rowed, and rowed, until they arrived at the Chilean Teniente Rodolfo Marsh Air Force Base on King George Island on the morning of 8 March. They had sailed/rowed over 650 miles in 16 days. That's making better time than the Postal Service in delivering our mail. Evidently they must have found relatively good weather as the article in the Boston Globe for 13 March said the passage was "a grinding combination of rough weather and strict routine." Anyway, it has all been documented by automatic still and video cameras rigged on struts around the boat. A documentary film produced by someone named Terry Youk, is expected to be released sometime this summer.

A pressure cooker for heating water was the only cooking facility; they lived primarily on instant soup, special protein-rich Logan mountain-climbing bread, dried fruits, nuts and tea. Where was the Bud? Their position, to within 30 miles, was transmitted at frequent intervals to an orbiting satellite, which in turn relayed the message to a ground station in France, which then passed it on to a meteorologist, Bob Rice of Weather Services, in Boston. Rice prepared daily forecasts for them, which were transmitted by telex to the Chilean naval base at Punta Arenas. Navy radio operators then passed the forecast on to the rowers during their daily radio conversations. An onboard satellite navigation system, accurate to 20 meters, allowed the SEA TOMATO crew members to check their position independently. If they knew where they were within 20 meters, how come the position they sent to the satellite was only accurate "to within approximately 30 miles"? Ah, who cares, anyway? Close enough for adventurers, right? Right.

This was just another milestone for Ned Gillette, who has made a career out of adventuring. He is a veteran of some twenty expeditions on every other continent, including a ski trip around Mt. Everest and an ascension of the highest peak in China. He

is a controversial person, and writeups in some of the adventure magazines have not flattered him; in fact, they challenged whether he actually did some of his accomplishments. He is a Dartmouth man, and you really don't expect too much of a Dartmouth man. When Link Washburn went there you could trust them, but nowadays Dartmouth seems to make headlines of a different nature. Gillette was a former member of the U.S. Olympic cross-country ski team, and planned to do some skiing after he reached Antarctica. You who sailed on the HERO in her last years know both Mark Eichenburger and Jay Morrison. Jay has trouble divorcing himself from the HERO, and for a time remained a one-man captain and crew in her Reedsport, Oregon home. So now Mark and Jay, along with Ned and Fred, are in the Guinness Book of World Records.

**ANTARCTIC KIWI RECEIVES BLUE WATER MEDALS.** Gerry Clark is a 60-year old father of four daughters, husband of one wife, whose admiration for sea birds drove him to build a little sailboat which he sailed in Antarctic waters for over three years. He left New Zealand on 21 February 1983 and came back on 6 November 1986. It is not known whether his wife was waiting with open arms or with a firearm, but the sailing world certainly acclaimed him. Michael Fay, head of the New Zealand challenge for the American Cup, met him in Fremantle and turned his men loose fixing up Clark's TOTOMORE because "we can't have a Kiwi boat going out looking like that." Clark has been awarded the Northland Harbor Board's Blue Water Medal in New Zealand, the Tilman Medal of the Royal Cruising Club of Great Britain, and this January the Cruising Club of America's Blue Water Medal. The Queen also named him a member of the British Empire for his Antarctic exploits.

He started out with two temporary crew members, and by the time he got back another twenty crew members had come and gone as miscellaneous and sundry ornithologists and sailors joined him for different stretches. He circumnavigated Antarctica, and spent two summers in the Falklands and South Georgia, where he studied albatrosses. When sailing offshore, he followed the line of the Antarctic convergence because "there is a great upwelling there," and as food came rolling to the surface, birds gathered to feed. He always counted birds, whether they were out to sea feeding or on islands nesting or resting. He also was looking for signs of predation from cats and rats. Leopard seals and Elephant seals tried to sink his inflatable, but he evidently outmaneuvered them or they weren't too clever. Gerry saw "seas of 60 to 70 feet, weathered alone frigid winds of hurricane force, twice lost his mast and sails in storms, rolled the boat a dozen or more times in towering seas, was knocked down scores of times, and ice on deck nearly sunk him." Otherwise, it was your typical quiet, mundane, sail amongst icebergs.

Wonder what his wife Marge might have said or done if he said, as he walked out the front door, "I am just going outside and may be some time. For God's sake, take care of our daughters," and, as an afterthought, just before he closed the door, turned and said, "and by the way, make sure you change the oil in my Holden every 10,000 kilometers." It really took more guts to walk out the front door of his home for a three and a half years' sail than to endure Antarctic waters. In America he would have been told to keep on sailing (into oblivion), but miracles will happen and he arrived back still married, as Marge accompanied him to New York City to accept the Cruising Club award. However, she better not get used to having him around the house, as Angus Phillips in the Washington Post on 31 January 1988 said he was "hunting a new mission." If you want to read about his great adventure, Century-Hutchinson in New Zealand has published his book, *The Totomore Voyage*, resplendent with many fine photos. The book should be out in the U.S. next year, although he hasn't selected an American publisher.

**REPLACEMENT SCIENCE LABORATORY LOOMING.** On the back page of this Newsletter, is a sketch of the science facility of the future at McMurdo. Ground was broken on 9 January 1988.

**LEWIS AND CLARKE SUPERSEDED BY LEWIS AND GEORGE.** Remember that delightful spoof of a Southern lady pulled off by Mimi George when she came (with David Lewis) to tell us all about the Frozen Sea Expedition to the Antarctic? Well, they are off again, this time to the Pacific Northwest and then to the Arctic Basin. Mimi and David are now old married folks. What brought on this rash act we do not know; maybe it was to get a cheaper membership in our Society! They are incorporated - the Inter-Polar Research Society, and their 22-meter auxiliary schooner HAWAIIAN TROPIC CYRANO is in San Diego. Currently they are raising funds and doing some repairs on their boat. They feel there has been a significant thaw in frozen east/west relationships, and want to capitalize on a supposedly existing circumpolar ring of friendship.

If the name of the schooner sounds non-polarlike, it is because she was given to them by Ron Rice of the Hawaiian Tropic Company, a manufacturer of a citrus-based drink. We understand from an eyewitness when the yacht took off from Florida on the start of this junket, that the docksides were graced by a bevy of amply-endowed, bikini-clad beauties (who help publicize the drink). Shades of the departure of some of the ships of the heroic age which were one short jump ahead of creditors!

Who are the intrepid people who will accompany Lewis and George? Well, first of all, there is Dr. Vladimir I. Davidenko, Scientific Secretary of the Institute of Clinical and Experimental Medicine in Novosibirsk; Dr. Ted Mala, president of the Circumpolar Health Union; Caleb Pungowiyi, president of the Bering Straits Native Corporation's nonprofit organ "Kawerak"; Dr. Roger Payne, U.S. whale researcher; Prof. Edith Turner, British anthropologist; Yuri Rythheu, a Chukchi author; Michael McCune, administrator who serves as president of the Board of Directors of the Inter-Polar Research Society and Peter Klika, adventurer. Other folks are involved, but essentially the hard core are those listed above. They are planning to enter the Arctic this year, freezing their schooner in the sea ice near Kotzebue or Teller. In an ensuing year she will winter over on the Siberian side. We don't think there is any termination year for this expedition, and we never really expect to see either David or Mimi again! You can be sure of one thing - wherever David Lewis is, there is going to be some excitement. Good luck! Bon Voyage! (I-PRS, 3451B Vincent Drive, Pleasant Hill, CA 94523)

**72-YEAR OLD NOBEL PRIZE WINNER INVESTIGATING NEW CAREER IN ANTARCTICA.** This past January South Pole Station was visited by Prof. Charles H. Townes of the University of California, Berkeley who was serving as an unpaid consultant to the Polar Atmospheric Science Program. Townes is a well-known microwave and infrared astronomer who has won the Nobel Prize for his invention of the MASER (and by extension, the laser). The purpose of his visit was to look over the station as a candidate site for a sophisticated far infrared astronomical telescope, which he may propose in collaboration with some German colleagues.

Pole may well be the driest inhabited spot on earth, excepting Vostok, and for that reason it may be nearly as good a site for some sorts of astronomical observations as a spacecraft would be. The fact that the sun is below the horizon for six months at a time, and that the stars only describe circles in the sky, and never rise or set, also has much appeal to many astronomers.

There has been a dramatic increase in interest in South Pole as a site for astrophysics, with the real possibility of there being as many as nine experiments being conducted there during the next year, including the flight of balloons to study the new supernova and to do solar x-ray astronomy at the same time. (Courtesy of John Lynch, Program Manager, Polar Atmospheric Science, DPP, NSF)

**ED MACDONALD HAS BROKEN OUT OF HIS LAST ICE PACK.** The old polar icebreaker, Ed MacDonald, died on 19 March, ending an ongoing, long-term bout with leukemia. As we go to print, his obituary has not appeared in local papers, so we will fabricate

from the fifteen letters Ed sent to the Nerve Center. A graduate of the Naval Academy in 1931, Ed must have been around 78 at the time of his death.

He was the Commanding Officer on the BURTON ISLAND to Antarctica in 1947-48, on a combined voyage with the EDISTO, when they tied in survey points from a previous U.S. expedition. This resulted in McDonald (the original spelling of his name) Bay being named after him. The Russian station, Mirny, now occupies part of his bay. He was also Commodore of three ships that surveyed the coast of "Greenland and locations for Dew Line." He joined Operation Deep Freeze and Admiral Dufek after a short vigil in Astoria, Oregon when he mothballed ships. After Dufek retired, he served three more years with Admiral Tyree. He wrote *POLAR OPERATIONS*, a well-known U.S. Naval Institute manual on how to operate in the polar regions, and he also authored *COLD FACTS ABOUT THE ANTARCTIC*, which was the essence of his lecture series when he went to the Antarctic with Lindblad. Ed was very proud of receiving the Patron's Medal from the Royal Geographical Society of London, which he was awarded at their 150th anniversary celebration in June 1980. We think we are correct in writing that the only other American recipients of the Patron's Medal were the late Paul Siple and Bert Crary. Ed wrote that he "had a couple of stiff Scotches before I gave my talk there which was really to express appreciation for all the medal winners."

In March of 1982 Ed wrote, "Doctors say I have contracted chronic lymphatic leukemia but chemotherapy appears to be gaining the upper hand." Later that year, he went on one of his favorite pastimes - a tour abroad with a Naval Academy alumni group. This one went to Japan and China, and when visiting a small hospital, they asked for a volunteer for an acupuncture demonstration. His wife, Jessie Bell, very graciously volunteered Ed, as he had an arthritic right hip. After five minutes of treatment, according to the Navy Publication, Shipmate, "Ed was able to run and leap about like a mountain goat," and then continued with, "Ed, did you feel any other goat-like propensities?" You don't get good stuff like this from the obits in the Washington Post! Incidentally, the beneficial effects of the treatment lasted only twelve hours, and he ended up with his second total hip replacement in ten years.

One of Ed's favorite stories pertained to when Dufek put him in charge of Admiral Byrd's office in the basement of a house on Jackson Place across from the White House. The very first night, one of Washington's finest, making his appointed rounds, saw this mannequin all dressed up in polar garb, thought it was a living burglar, and shot "the hell out of the dummy."

Ed and Jessie Bell moved to Williamsburg (3015 Tanglewood Cove, Williamsburg Landing, Williamsburg, VA 23185) this past year when they started to lose their privacy to progress on Cape Cod. Ed never got to enjoy Williamsburg Landing, as leukemia resurfaced, and he had to resume chemotherapy. Interment was at Arlington Cemetery on 23 March. Later on there will be a memorial service back on the Cape.

**POSTAL SERVICE BANE OF OUR EXISTENCE.** You can't fight City Hall, and when it comes to delivering these Newsletters to those of you in a state with over ten members, which requires separate state groupings, it invariably takes three to four weeks after mailing. If you live in some place like Kentucky, where we have only a couple of members, yours is shot right through. We cited before the case of Walt Seelig, who lives in Potomac - 17 miles from where the Newsletters are mailed, not getting his until 34 days later. Well, they have picked up a little - the last one took only 20 days, still less than a mile a day! There is a new Postmaster General, whose wife was in Antarctica on a cruise ship when her husband accepted the position in early February. Why a very successful, enterprising millionaire in the banking business leaves all that, and San Francisco, too, to take over an outfit with a \$1.7 billion deficit, we'll never know. We think the only salvation is to decommission the whole Postal Service, and dump it in the lap of UPS. What a blessing that would be!

**ICE CHIPS.** *Hal Borns*, Director of the Institute for Quaternary Studies at the University of Maine in Orono, has taken a two-year assignment as Program Manager for Glaciology in the Division of Polar Programs at NSF. Hal, a disciple of old Bob Nichols at Tufts College, will add a little maturity to the office, as he has been involved with the Antarctic since 1960. Hal's specialties are glacial geology, quaternary geology, glaciology, and paleoclimatology. What is difficult to comprehend is how an otherwise perfectly normal human being, ensconced in a choice position in a nice college community, would chuck it all to come to Washington. Wait until Margaret experiences some of the never-ending summer humidity. Will she kill Hal out right??? Stay tuned . . . . . Congratulations to Dorcas *DenHartog*, daughter of Steve (Little America V, '58) *DenHartog*, who performed nobly as a cross-country skier in the Winter Olympics at Calgary. Many of you may have seen her on national TV as she skied a strong first leg on a four-woman relay race, being fifth at the end of her run. Dorcas also did well on an Opening Day Olympics cross-country run, coming in 40th in a very strong international field . . . . . *Big John Stagnaro* is dead; we regret, as we go to press, that we do not have a bio on him, as he deserves the full rites. As an amateur radio operator, he probably had the longest career of any operator handling Antarctic traffic. He was extremely well liked, had legions of Antarctic friends, and his death is being mourned by the entire Antarctic community. We like to think that Big John is still monitoring all of the Antarctic traffic; it's just that he can't plug in phone patches any more. Big John was truly Big John; we always thought he looked like someone who sat in front of his rig, hours on end, with a jug of hot coffee and pastry galore. The Big C got him. Our condolences to Mary, his  
XYL . . . . . Condolences, too, to *Allison* and *Lou DeGoes* in the loss of their son John in a boating accident in the waters off Florida some time over the Christmas holidays. We do not know the circumstances, but John was an expert handler of boats, so it must have been a bad accident. His body was not recovered until almost a week later . . . . . *Colin Bull* (P.O. Box 4497, Rolling Bay, WA 98061-0497 - Tel. 206-842-9660) wants us to know that his retirement check from The Ohio State University isn't all that great, and he wants to handle your polar book business. He will buy your books; he will sell you books. His catalogue #7, February-March 1988, has been upgraded to glossy covered, professional print job - real nice. There are 368 listings, plus an inside cover story on and about Colin and Gill. Save Colin from the bread line - buy now and buy often . . . . . A familiar Antarctic face showed up in Washington in late February - *Michele Raney*, first woman to winter over at the South Pole. She had a great trip back home to Antarctica this past austral summer, and thought that Siple Station was a pretty special place. Another highlight was landing on the Skelton Glacier, as well as going back to the Pole. Her Antarctic visit was very fortuitous, as her arrival coincided with the tragic C-130 plane crash at D-59. She pitched right in and helped take care of the victims back at McMurdo . . . . . *AL* (BAE II) *Lindsey*, Professor Emeritus at Purdue University, has across the bottom of his personal stationery, in bold red capital letters, "STOP CONTINENTAL DRIFT." We were all pleased to hear that his alma mater, Allegheny College, will recognize his many scientific achievements by awarding him an honorary Doctor of Science at this year's commencement exercises. Al's PhD is from Cornell University. Of all the Byrd men from the first two expeditions, Al is probably the youngest looking, the best dressed, the handsomest, and the most scientifically active. What does he drink? . . . . We recently learned of the death of *Kiwi Harry Ayres*, Scott Base, 1957-58, who was a very close friend of Ed Hillary and father of Antarctic Graham Ayres who has spent several austral summers in Antarctica. Harry is usually given credit as the man who taught Hillary how to climb . . . . The last surviving member of Scott's expedition, *William Burton*, died in Christchurch at age 99. He was the chief stoker on the TERRA NOVA. His coffin was draped with a white ensign, the very same one which was flown at half-mast on the TERRA NOVA when she returned to Lyttleton. Burton was born in London, but moved to Christchurch in 1920 after thirteen years in the Royal Navy. His most vivid memory of the expe-

dition was a three-day storm when the crew had to keep the ship afloat by bucket bailing continuously for thirty-six hours. For over twenty years Burton read the lesson each Wednesday at St. Matthew's Anglican Church in Christchurch . . . . . The *Sandwich Notch 60* is New Hampshire's answer to Alaska's Iditarod. It is actually one of a half-dozen 15 to 150 miles "mid-distance races on the northeastern sled dog racing circuit from Quebec to Pennsylvania." Looping 60 miles on the south side of Mt. Washington National Forest, it climbs from 620 to 1560 feet. One of the spectators this year was Ed Moody who the Boston Globe described in its 28 February issue as "a craggy, 77-year old with a fur hat and checked hunting jacket, and the dog driver of Adm. Richard Byrd<sup>1</sup> 1933-35 Antarctic Expedition." . . . . The Brits have a corner on the market when it comes to doing it the hard way. They seem to get some sort of an inexplicable thrill out of suffering; the latest sufferers are taking part in something called the Great British Polar Quest. It is another inane walk to the Pole, except this time *Ranulph Fiennes, Oliver Shepherd, Morag Howell, and Mike Stroud* are doing the walking, and it's to the North Pole. They took off from Ward Hunt Island on 11 March; they are sponsored by British Aerospace Limited, and their representative is Penny Studholme. Fiennes and Shepherd crossed Antarctica on the Trans-Globe Expedition; Stroud was a Scott Footstepper. Suppose the logic behind their madness is to sell books, get themselves into the Guinness Book of World Records, and get recognized by the Queen on her New Year's List. . . . . *Tony Colombo*, stoker on the JACOB RUPPERT, and later on the U.S. Antarctic Service Expedition, wrote about the late Charlie Murphy's kindness to wards him. It seems that Tony was not outfitted with polar clothing since he was a member of the ship's crew, and when ole Charlie saw that Tony was cold, went to his room, and brought out a fine sweater which he proceeded to give to Tony. Tony is now 77, and, most unfortunately, has cancer, as does his daughter. The good news is that the Colombos have five great grandchildren; the bad news is that they seldom see them. Tony wishes to be remembered to any of the old-timers who remember him (Louis P. Colombo, Wahsega Road, Rt. 4, Box 1124, Dahlonga, GA 30533) . . . . . Sill "*Trigger*" *Hawkes*, a well-known Antarctic pilot dating back to Operation Highjump, writes that Dave Bunger of Bunger Oasis is probably deceased. Some Aussies working at their station - Edgeworth David (near or on the oasis)-wanted to talk to Bunger about how it appeared back in February 1947 when he landed there. But Bunger's name disappeared from the periodic listing of retired naval personnel, so presumably is dead. Incidentally, when Trigger first met the late Bert Cray in the early 1950s, he thought he was crazy! But he ended up writing, "He was a good man, a practical visionary." . . . . *Alex McKenzie* recently joined the Society. He is not an Antarctic per se, but he has experienced more Antarctic weather than most Antarcitans, as he was one of the original meteorological planks at the Mt. Washington, N.H. Observatory. Alex knows quite a few Antarctic meteorologists, as many apprenticed atop Mt. Washington. Alex is a nice guy, ran a great reunion of former Mt. Washington observers about six years ago, and it's good to have him aboard . . . . . *Mike* (South Pole '78) *Metzgar* has a new image. Once only a mother or a Ruth Siple could have loved the old one, as he was overweight and had a despicable beard. Now the beard is gone and with it 85 pounds. He is a business tycoon with his family's Pinseeker Golf, living in California (3253 Colorado Lane, Costa Mesa, CA 92626). Mike has two kids (Douglas and Laura) and one wife (Evelyn) in college at Long Beach. He, himself, took a business course in management last winter at Cal State at Fullerton. Aren't you afraid a little bit of knowledge might foul you up, Mike??? . . . . We heard from the internationally renowned climatologist, *Will Kellogg*, the other day. He once visited Antarctica to check out the Clean Air Facility and program at the South Pole, and served as chairman of an advisory group to the Division of Polar Programs. Although he is retired, he never left the saddle, consulting and writing. It appears that this motorcycling Boulderite actually reads these things, so he can't be anywhere near as busy as he claims. . . . . *Mel Havener* (South Pole '57 and Deep Freeze IV) (278 Lantana St., Camarillo, CA 93010) is compiling an inventory of all American Antarcitans who married Kiwis. He has about a dozen on his list.

Artist's sketch of the replacement Science Laboratory for McMurdo Station

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT - MRS. PAUL A. SIPLE

Vol. 87-88

May

No. 6

#### Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree(Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88

ANTARCTIC EXPLORERS STAMPS TO BE ISSUED IN WASHINGTON 12 SEPTEMBER 1988

## MID-WINTER PICNIC

at

STRONGHOLD Comus, Maryland

Sunday, June 19th, 1988

2 PM to sundown

#### Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard

We are planning to hold a Mid-winter picnic at Stronghold, an old-time favorite spot, and hope enough of you will want to attend so we can meet the minimum requirement. *PLEASE send your reservation with a check - \$16 per person - by 12 June 1988 - to Ruth J. Siple, 905 N. Jacksonville Street, Arlington, VA 22205.*

#### Paul C. Daniels

#### Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986

The meal will be catered by Comus Inn and will consist of sweet and sour meatballs, fried chicken, baked ham, breaded fish fillets, au gratin potatoes, 4-bean salad, tropical fruit salad, dinner rolls, coffee-tea-milk, and chocolate cake.

To get there, take Route 270 North towards Frederick. Exit at Hyattstown-Comus, circle under 1-270, follow Route 109 for 3.3 miles to Comus. Turn right on Route 95 and go 2.5 miles. Cross intersection, and 1/4 of a mile farther you will find a road turning off to the right, going upslope. Pass the first house, then turn into the parking lot below the next house - Stronghold. Bring your own lawn chairs, and bring your own libations to see you through until dinner is served late in the afternoon, around 4 PM.

The 1988 Memorial Lecture will be presented in Columbus, Ohio the last week in October by the noted polar historian, Peter Anderson, Byrd Polar Research Center, The Ohio State University, where we will celebrate the 100th anniversary of the birth of the late Admiral Richard E. Byrd. Plan now to be in Columbus late October!

A memorial service for the late Albert Paddock Crary will be held in the Herring-Cole Library at St. Lawrence University in Canton, New York on June 25th at 2 PM. After the service there will be light refreshments. Attendees are requested to notify Mildred (3010 New Mexico Avenue N.W., Washington, DC 20016) so she can alert the University. Interment of ashes will be in the Crary family plot in the Pierrepont Cemetery at 4 PM.

This Newsletter was made possible by our failing to use several book reviews written during the year, so this is basically a pseudo book-review newsletter. It also gives us the opportunity to reprint a popular item, a listing of book dealers handling polar books.

Some people want a Mid-winter picnic back at a very popular spot, Stronghold. If there's a valid reason for having it, your reservations will tell us, and we'll go ahead. If we can't meet a minimum number of attendees, we will cancel. Our last effort at Horsehead Sanctuary turned out to be a bust when only a handful attended, in spite of an exciting place and a great catered seafood meal.

One must remember that the Antarctic Society isn't what it was ten years ago; we are now a truly national organization, not just a local one. Our local membership has not increased in years, in spite of our offering an excellent lecture program. Meanwhile, our Washington-based membership has aged, becoming more and more stay-at-homers.

This is our last Newsletter of the spring, and we'll see you folks in the fall. Have a good summer - we will!

**POLAR BOOK DEALERS.** We are certainly no authority on polar book dealers, but being a prejudiced person by nature, we have our favorites and not-so-favorites. As an Antarctic, you have to feel kindly towards old Colin Bull, even though he was a Brit. He is the only Antarctic scientist who is attempting to feather his own nest through sales of books. We were very sympathetic towards Bob Peterson, as his prices were the best, but his very infrequent catalogs leave one frustrated. Jay Platt puts out great catalogs, and his prices are fairly reasonable, but it seems that an immediate telephone call is often not soon enough, as he has a hungry bunch of buyers waiting for his catalogs. A lot of book buyers favor Bob Finch, but it's against our religion to have to pay for a polar book catalog, so we don't see his. David Belknap has a relatively large polar offering, and his prices seem to be somewhere between Jay's and Finch's. Our advice is, if you see something of interest in any of the catalogs, don't hesitate, call immediately, as he who sends in an order by mail will probably end up getting nothing. Thanks to John Millard, Art Ford, Warren Zapol, and Billy-Ace Baker for bringing to our attention some of the dealers listed below.

**ANTARCTIC CLASSICS COLLECTION** (in association with Bluntisham Books). There are several elegantly reprinted and bound (in the period style of the turn of the century) Antarctic classics which some of you may want to obtain for your personal libraries. *AURORA AUSTRALIS* was the first book printed in Antarctica, prepared on the ice in 1908. This archival facsimile is the first public edition, has 216 pages and is bound in brown cloth-covered board, blocked in scarlet and gold on front and spine. Shackleton, Priestley, Mawson, David, Mackay and others on the expedition made contributions to the publication. Our own John Millard in Toronto, a genuine bibliophile, wrote the introduction. If you happen to be one of those poor souls who has an undying thirst to know more about Sir Clements Markham, past President of the Royal Geographical Society, and champion of Captain Robert Falcon Scott, there is another book entitled *ANTARCTIC OBSESSION*. Obsessed with a goal dating back to 1870 of seeing the British explore Antarctica and reach the South Pole, Markham's confidential and outspoken accounts have been published for the first time, thanks to Sir Peter Scott who gifted the manuscript to the Scott Polar Research Institute. This volume has 208 pages, and is bound in red cloth, blocked in gold on

front and spine. The American prices listed are \$48 for *AURORA AUSTRALIS*, and \$29 for *ANTARCTIC OBSESSION*. If you are interested, contact Archival Facsimiles Ltd., Robert P.S. Easton, 230 East Ontario, Chicago, IL 60611, (phone 312-988-9331), and he will tell you how many greenbacks he wants for the books. Let's hope he types a reply because his penmanship is horrid, looking like a series of waves hitting the beachhead of Normandy.

*A WALK TO THE POLE* (reviewed by Steve Dibbern). Ed Note: We asked Steve to review this book because we knew he had read it, that he had been at McMurdo - even to the Brit's camp at Cape Evans - while footsteps were being taken to the Pole, and that he would be as free of prejudice about the book as any true Antarctic could b'

It is difficult to have a neutral opinion about the Hear and Swan book. *A WALK TO THE POLE*, Crown Publishers, \$24.95, published in the UK as *IN THE FOOTSTEPS OF SCOTT*. Perhaps it was wise to rename it for publication here since the term 'footsteps' will raise the blood pressure a few points for almost anyone associated with the Antarctic, government or otherwise.

I should point out at the beginning that I enjoyed the book; it was interestingly written, and above all the photography alone is worth the entire price of the book. I believe that Mear (the primary author) has successfully recounted the expedition as he saw it, and has admirably tried to also portray the feelings of his cohorts. The problem, and at the same time the main interest, is that he did it so thoroughly that the reader is subjected to a long series of egotistical, whining diary entries concerning the incompatibility of the five main proponents. Surely there has never been a less congenial group of people setting out to do the same task - or were they? Possibly not. If Roland Huntford's books are to be even partially relied upon, maybe they were following more closely in Scott's footsteps than they thought! In regard to personalities, there is an interesting and revealing Psychological Report by Elizabeth Holmes-Johnson, PhD, LCDR USNR, as an appendix.

Incongruent feelings abound in the book. There are many references and innuendos concerning the ease of travel and somehow 'evil<sup>1</sup> level of comfort enjoyed by the \*#!!\$(= AMERICANS. On their winter trip to Cape Crozier, however, they were quite happy to stay several days in a hut in Windless Bight. Then there is the infamous incident on the Beardmore Glacier; they spotted an American geological party (about which they had been forewarned). Drama! 'It was - I was sure, there was no doubt - a figure ... I pondered what this awful event might mean.' (There is even a photo of the disappointment on one of the members face). They describe 'private grief,' being 'on the verge of tears' - 'Then the tents came into view, and I found myself cussing and in tears. I had worked too hard for this.' To wash away their tears they decided to stay several days in the American camp to rest and eat the Americans' food. This incident may help point out the theme of the book. They felt that they were on a 'crusade' which only they had the depth of feeling for and insight to understand, and that everyone else was an illegitimate, somehow 'unclean' usurper of Scott's mantle. But when the chips were down either for comfort, as on the Beardmore, or for safety, as after the sinking of their ship and subsequent flight to New Zealand, they accepted hospitality and then saw fit to bite the hand that fed!

NSF is thoroughly vilified, as well as Dr. Wilkniss personally. This book tells only one side of the story, and I'm sure that the other side won't receive much wide publication. It appears that at least if nothing of value comes from this expedition (other than this attractive book), it will be that

even as the 'footsteps' were still stepping, NSF was attempting to gain a consensus of opinion on what the U.S. government's position should be in regard to this and other such small, marginally equipped, non-scientific expeditions. The larger question of tourist expeditions is obviously also to be dealt with.

I recommend this book to all who are interested in Antarctica. It is an intense study of adversity not only from the elements, but also a badly organized, poorly led and ultimately a paranoid group of people. They chose to vilify NSF and Dr. Wilkniss while ignoring the overwhelming facts of their own failings. To paraphrase Cherry-Garrard's famous book: If you march your Winter Journeys you will have your reward, so long as all you want is ... fame and fortune for an ill-planned stunt gone wrong! P.S. Wilson, Bowers and Cherry-Garrard FOUND their penguin eggs!

**ANOTHER GOOD ANTARCTIC BOOK FROM DOWN UNDER - GOING TO EXTREMES.** The Aussies do a great job of selling Antarctica, and have come up with another pictorial/historical masterpiece - if you are Australian. It follows somewhat the format of the Reader's Digest's *ANTARCTICA*, also published in Australia, although it is much more provincial. There are eight sections, with about forty individual accounts, plus some thirty maps. There is a good cross section of photos from the heroic age, plus modern colored spectaculars. Probably the most noteworthy thing about it is that this one book capsules the whole Australian effort in Antarctica; a secondary feature is the coverage on Sir Douglas Mawson, a nonpareil Antarctic.

The book was written by Jonathan Chester, described on the flyleaf as one of Australia's most experienced and intrepid expeditioners. Basically he is a freelance photographer and writer who saw a marketable item and capitalized on it. The book was printed in Hong Kong, published in Australia by Doubleday. The recommended Australian price is \$39.94, a bit on the high side. It evidently is being distributed abroad by Corgi and Bantam Books. If you have any Australian Antarctic interests, or are one of those who has to own every book on Antarctica, go out and buy it. It will look good on your coffee table, and it will impress your guests, as chances are they have never seen it, nor will ever see it elsewhere.

*NORTHERN LIGHT* - (Rolf Bjelke and Deborah Shapiro). We normally would rather shoot ourselves in the foot than give publicity to an Antarctic adventurer's book, but this one is sort of interesting. It all began when this bimbo sees a strange looking yacht in some harbor in the South Pacific, and rows over to see who's there and where they came from, and where they were going. To make a long story less long, they (Bjelke and Shapiro) combine forces, talent, and other things and eventually sail out of his homeland of Norway on something they call a circumpolar trip. No one is in a hurry, as his life is the water and hers is uncommitted, so they go as far north as they can, then sail as far south as they can. Some two years later they find themselves 320 nautical miles down the Antarctic Peninsula, having covered some 33,000 miles. She is a pretty good photographer, and along the way they get some real fine shots. The book, published in 1985 by Clarkson N. Potter, is 116 pages long, with 150 photographs, and is distributed by Crown Publishers. We don't know the price, as we saw a library copy. If you like yachting, you'll probably like this book.

Rolf is one of those practical guys, and his liaison with Deborah was based on her yachting abilities and compatible personality, rather than on her physical attributes. So they evidently got along just great. Probably the perfect odyssey, sailing off on a timeless cruise with a free-spirited woman who can do it all, and doesn't care if the sail never ends.

**MILDRED RODGERS CRARY REVIEWS OVERFLIGHT.** We had trouble finding someone who wanted to review *OVERFLIGHT*, as nearly everyone who had read it said they didn't care for it, nor did they care to or want to review it. However, we finally persuaded Mildred Crary, a novelist in her own right, to review the book. She has a knowledge of Antarctica as well as a professional writing interest. The review is rather lengthy, but we think you will find many of Mildred's comments right on target and will enjoy her review.

*OVERFLIGHT*, A Novel by Charles Neider (1986), 218 pp., New Horizon Press, P.O. Box 669, Far Hills, NJ 07931. [Paperback edition, Ballantine/Fiction 1988] Coupling his own "unforgettable and deeply traumatic experience" in a near-fatal helicopter crash in 1971 in Antarctica with a real-life crash of a tourist sight-seeing plane in 1979, Charles Neider wrote this suspense novel apparently to make sense of the experience in his life. The plot, based on the coincidence of two plane crashes on the dangerous slopes of an active volcano, Mt. Erebus, concerns attempts by Stevenson, a historian and the protagonist, to cope with survivor's guilt and to find meaning in these experiences.

Neider handles suspensefully a New Zealand tourist plane crash, which Stevenson, the protagonist, survives. Stevenson conceals psychotic behavior so Breslin (USARP representative and the only "heavy" in the book) will not send him home. Visiting the crash site to scatter the ashes of several victims, Stevenson survives a helicopter crash. Awaiting rescue, he hallucinates conversations with Erebus, the ghost of George Vince of Scott's first expedition, his dead mother, and Robert Falcon Scott.

Stevenson concludes his survival of two crashes on Erebus "was too improbable.... The crashes were the result of magic - black, not white." He searches for a "common denominator" - "one which would, furthermore, explain why Amundsen had been so easily successful in reaching the Pole [in 1911] whereas both Scott and Shackleton had had such a terrible time of it." Suspense fans will feel little satisfaction to hear that Mt. Erebus has bewitched him, as he thinks it did Scott, who camped "in close sight of the volcano," as opposed to Amundsen, far away at the Bay of Whales. This explanation puts the novel into the sub-genre of supernatural suspense, a category not high among literary classifications, despite Neider's literary ambitions.

Neider visited Antarctica several times as a guest of the U.S. Navy and the National Science Foundation. He prides himself on writing "a novel which, so far as I know, is at this time (April 1986) the only one with a completely authentic Antarctic background." He comments, "I had a superb opportunity to [write the novel] authentically.... it was one chance in a lifetime to do it first (I liked the idea of an American getting the jump on the British, who had had a long head start), and to do it in such a way that it could not easily be improved on....I was in a position, if I was humble and worked hard, to make it believable."

Has Neider read all the Antarctic-based novels in Bergy Bits' extensive bibliography (compiled principally by Fauno Cordes and supplemented by Rob Flint, in the August 1983 issue of this bulletin)? Has he consulted the polar book stores (listed in the May, September, and October 1986 issues)? To suggest that authors cannot write authentically about places they have never visited would be to rule out all historical fiction, not to mention the Bible's Revelation of Saint John.

Neider's disclaimer says, "All of the characters and most of the events of *OVERFLIGHT* are fictional." However, he uses real events and real living people. His fictional Kiwi Airways of New Zealand tourist flight 50 crashes on Erebus on 29 November 1979, with 248 people killed and one survivor (the narrator).

The real Air New Zealand tourist flight 901 crashed on Erebus on 28 November 1979, and all 257 people aboard perished. Stevenson's second fictional crash on Mt. Erebus, on Wednesday, 12 December 1979, echoes Neider's real experience on 9 January 1971.

Neider unnecessarily brings real people, Dr. Larry Gould and Senator Harry F. Byrd, Jr., into the story and even uses Dr. Gould to promote the protagonist's request to visit the crash site. "Larry's opinions are pure gold with us," says Breslin. Neider's descriptions of people are circumstantial and believable and possibly as little disguised as the two plane crashes, but it would be distasteful to figure out the real people behind Kate (the woman doctor with whom the hero sleeps), the USARP "rep" Breslin, the commander of the Navy Task Force Westcott, and especially the two incompetent pilots, Ogilvie and McIver. Breslin, a bureaucrat serving an apparently unloved NSF, is the closest character to a villain. The pilots who stupidly crash their planes are fictional, perhaps because Neider hopes to avoid legal difficulties.

No such qualms prevent Neider's using long-dead historical figures, such as Byrd, Scott, and Amundsen, as he sees fit. Stevenson puts words in Scott's mouth during a long hallucinated conversation. One historical figure in particular is ill-served by misrepresentation. The protagonist visits a fictional Sir Henry S. Wild whom he identifies as "the leader of the search party which had found Scott's tent in November 1912." He says that Wild, 88, lived "in a small, simple house in a grove of arbutus near a saltwater pond" with his daughter Meg on Saltspring Island one of the Gulf Islands off Vancouver. Although the other members of Scott's party mentioned in *OVERFLIGHT* are given their real names, Wild is a transparent fiction for Sir Charles Wright (who actually discovered Scott's tent). Before his death in 1975, Wright lived much of the year with his daughter Pat on Arbutus Road, Ganges, Saltspring Island, B.C. Neider provides an interesting, detailed, and realistic account of Stevenson's two-day visit with an interview of the fictional Sir Henry S. Wild.

Why, then, does he so thinly disguise Wright as the fictional character, Wild? Because he puts words into the mouth of the old explorer that would substantiate the supernatural elements of the novel. Neider clearly wants us to know who Wild really is and to have Wild/Wright authenticate Stevenson's mystical belief in the haunting power of Erebus, to have the old scientist share his superstition. A passage in the novel indicates that the real daughter may have raised an objection "A little later, when Meg was standing apart from us, he suddenly said, 'I'll tell you something I've never told anyone...' There follow Wild's words about what they found inside Scott's tent: "Scott's left eye...slightly open," "effect... extraordinary," "looked alive," "uncanny," "he looked...haunted," "Haunted..." By fictionalizing the incident, having Wild tell Stevenson something he has never told anyone, and placing the daughter out of earshot, Neider can use our knowledge of Wright's reality to make us believe that Wild/Wright agrees with and validates Stevenson's supernatural interpretation.

Neider unintentionally characterizes Stevenson as a know-it-all: he alone carries along a survival bag on both tourist and helicopter flights. He warns the tourist plane's pilot of the impending crash on Erebus. He knows better than the helicopter pilot that their high altitude will stall the engine and cause the second crash. He directs survival measures after the pilot fails to take charge.

Neider writes, "Aside from sudden changes in weather, the worst enemies in Antarctica are ignorance, stupidity, vain pride." Stevenson's self-pride is based on his own foresight, careful preparation, and fore-knowledge of the dangers in Antarctica. In his definitive work, *THE LAST PLACE ON EARTH*, Roland Huntford meticulously documented Scott's ignorance, stupidity, vain pride, and lack of

judgment and preparation. Both Neider and his fictional counterpart, Stevenson, nevertheless regard Scott as a consummate hero despite these qualities, the very opposite of those both author and protagonist admire. It is as though Neider never read – or chose to ignore – the most recent (1984) and authoritative work on Scott. Stevenson excuses Scott's failures by saying that Scott was "haunted" and "bewitched" by proximity to Mt. Erebus; he thinks of himself also as haunted and bewitched by Erebus.

Stevenson takes a very in-group attitude about his knowledge of Antarctica. Old Antarcticans as well as ordinary readers will be irritated by the condescending tone of such obtrusive explanations as ' 'Kiwi' refers to New Zealand or a New Zealander,' "USARP (pronounced you-sarp)" – how else? – and many others. With misinformed Latinate pedantry, Neider repeatedly uses "sastrugus" for the singular form of "sastrugi," as no Antarctic ever would because these ice ridges never occur one at a time. In any case, the singular form is "sastruga" or "zastruga", from Russian.

Neider inserts intrusive passages in the narrative, some useful, some overly didactic, and some beautifully descriptive. He gives blocks of historical information in asides to the reader. To bring in set pieces of evocative description, showing the reader the colors, prospects, and geological variety of Antarctica, he sends the hero on sight-seeing trips irrelevant to the ongoing action. His beautiful descriptive passages contrast with careless writing, such as this jumble of metaphors: "Actually, although I was alarmed, I was fascinated by nature's inventiveness, her ability to bring a human tragedy slowly but definitely to fruition, to gather the components until they formed a critical mass that exploded like a bag of pus bursting."

The plot requires a fairly detailed knowledge of the topography of the area, including the Ross Ice Shelf, McMurdo Sound, Ross Island, and Mt. Erebus; and Neider gives it to us straight in tour-guide fashion. The information is essential but too complex for a reader to follow. A map (e.g., a simplified version, 10% reduced, of the Molenaar map of the "McMurdo Sound Area, Antarctica") on the inside cover or the back of the dust jacket would not have cost more to reproduce than Neider's self-portrait on the dust jacket.

It is disappointing that an author with Neider's reputation, accomplishments, opportunities, and ambitions has not written a more honest novel about the Antarctic he professes to love.

( © Mildred Rodgers Crary 1987)

**ANTARCTIC TRAVELER PUBLISHES BOOK ON BIRDING.** Aileen Lotz, former Executive Director of the Zoological Society of Florida, and past member of the Board of Directors of the Tropical Audubon Society, has recently published *BIRDING AROUND THE WORLD: A Guide to Observing Birds Everywhere You Travel*. One can get it for the price of \$12.95 paperback and \$20.95 hardcover from Dodd, Mead & Company, 6 Ram Ridge Road, Spring Valley, New York 10977. Supposedly it is the first guidebook for birders who would go to where exotic species "populate the sky, rustle the trees, charm the weary traveler." It covers all seven continents, islands, and the oceans, and is a common-sense book for fun lovers (or is it a loving book for common-sense birders!). Buy this book, and then keep your eyes open downstream for her companion book on North America.

Aileen, incidentally, made her second trip to Antarctica last year, going on Society Expeditions' WORLD DISCOVERER. She wants to write a book on Antarctica, and I'm sure that whatever she attempts, with her command of the written word, will be a good one. Of Antarctica she wrote, "Just making it down there twice was two thrills in a lifetime ... brief words can't ever express the intense excitement and gratefulness I feel for having the opportunity of visiting Antarctica."

*THE HOLE IN THE SKY* by John Gribbin (reviewed by John Lynch). A Bantam New Age Book, May 1988 (\$4.50) - available from Crown Books at a discount.

Gribbin is a PhD astrophysicist with a degree from Cambridge University, who has for many years, written for the British publications, *Nature* and *New Scientist*. He is well-known for a number of popular science books, such as *IN SEARCH OF SCHROEDINGER'S CAT* and *IN SEARCH OF THE DOUBLE HELIX*.

The subject of *THE HOLE IN THE SKY* is depletion of the ozone layer by manmade chemicals, with a focus on chlorofluorocarbons (CFC's) and their role in causing the annual "Antarctic Ozone Hole" as well as global ozone depletion. The book also discusses other problems, including greenhouse gases. I noticed only a few minor errors, e.g. NOZE should be the National Ozone Expedition, not Experiment. In my opinion the book is excellent: clearly written, well focused and more up-to-date than seems possible. The view taken by Gribbin is definitely alarmist, with a clarion call for immediate action, but on this subject I am also an alarmist, and share most of Gribbin's worries.

As the cover of the book says, "The Sky is Not Falling - It's Disappearing!"

*THE PENGUIN PRINCIPLES* by David S. Belasic and Paul M. Schmidt. This is really not an Antarctic book per se, but is "A Survival Manual for Clergy Seeking Maturity in Ministry." It was brought to our attention by one of my ex-roommates at Little America V, Reverend Bruce J. Lieske, who felt that, after wintering over with Bert Crary, Gene Harter, Wild Bill Cromie, Sam Wilson, Pat Unger, Blackie Bennett, Ron Taylor, Walter Boyd, and Muckluck Milan, there was a much greater need to fulfill in the ministry than in becoming an atmospheric scientist. But we do want to quote from the book on a specific question, "Why is a parish pastor like a penguin?" It seems there are six valid answers: "penguins have a way of looking dignified and ridiculous simultaneously; penguins are sensitive to heat; penguins have treacherous enemies; penguins are relatively defenseless; penguins have a homing instinct; and no matter what happens to penguins, they keep their heads high." If you don't like the list, tell the authors - Belasic is a Lutheran minister in Cuyahoga Falls, Ohio and Schmidt serves another Lutheran church in Spokane, Washington.

**ANTARCTIC NOVELS.** Fauno Cordes (355 Arballo Drive, San Francisco 94132) is our official unofficial clearing-house for Antarctic novels; she has a listing of over a hundred..... It seems everyone is writing an Antarctic novel. Moe Morris, the old VX-6 pilot of Deep Freeze 64-65-66 published *ALPHA BUG* (Presidio Press) in 1986 and supposedly published another, *THE ICEMEN*, in 1987. Susan Solomon, the celebrated NOAA ozone scientist, wrote a novel about McMurdo life after her first trip to the area. Mildred Crary has written two-thirds of *OUTSIDE THE LAW*. The late Captain Ed MacDonald also wrote a polar novel about icebreakers.

**CHILDREN'S BOOKS.** There seems to be a growing interest in children, and that has parlayed itself into children's books on Antarctica. From a most reliable source, we understand that Emanuel and Ann Rudolph (Dept. of Botany, Ohio State University, 1735 Neil Ave., Columbus, OH 43210) are prisoners of books in their own home, those books having evidently encapsulated most of their living space. Several years ago they published a bibliography of children's Antarctic books, in English, with over a hundred on their list. Guy Guthridge is interested in enlarging the Rudolph's efforts into an even longer bibliography. So if you have a listing, why not send it on to Guy (Manager - Polar Information, Division of Polar Programs, National Science Foundation, Washington, DC 20550)?

**DISCONNECTED RAMBLINGS ON BOOKS.** You must have read in Peter Wilkniss's Dear Colleague Letter #11 that Stephen J. Pyne's *THE ICE: A JOURNEY TO ANTARCTICA* was listed by the New York Times, 6 December 1987, as one of the sixteen best books of 1987. This vindicates our review in the March 1987 Newsletter when we wrote, "This book could very well win some sort of a literary prize." Then we went on to say, "Hopefully it will then be translated into layman's language..." I have yet to meet a person who has read every page, as reading that book is like walking through waist-deep snow..... *Gil Dewart*, Wilkes '57, Mirnyy '60, has written a very interesting account of his years at those stations, and, hopefully, it will be published before everyone forgets that there ever was a Wilkes Station ..... *Pat Wilson*, whom Brash Ice would describe as a comely blonde from Texas, is about to embark on a children's biography of the late Paul Siple. She has discussed the writing of the book with Ruth, and will send out an outline and an early chapter to potential publishers this spring. Pat feels that children should have more role models, and while cruising on a tour ship to Antarctica, decided that Paul would be an ideal person ..... The late *Bert Crary's* draft on his Arctic and Antarctic career has been read by several polar experts, including Bunny Fuchs and Gordon Robin. Most people who have looked at the manuscript seem to favor editing, but Mildred is fearful that any editing will destroy Bert's scientific intentions. Mildred wants the book published, but doesn't want to sacrifice science for popularity..... *Colin Bull*, the old college dean who lost his faculties and moved to Rolling Bay, Washington, is dabbling at putting Sir Charles Wright's diaries into publishing form; but being part-construction worker, part-landscaper, part-husband, part-book salesman, is so subdivided that it is taking much longer than he anticipated..... A former publicist at NSF, *Eugene Rodgers*, is supposedly writing a book on the first Byrd Antarctic Expedition. He sent out questionnaires to all of the survivors, and the way it looked to us, he was only interested in writing an expose. We think it's lousy when someone gets carried away with his own personal vendettas and does a crucifixion on someone. Why not report on the good that comes out of expeditions, instead of the negatives? .... One of our Society members, *J. A. Van Bekhoven* of Belgium, is also writing a biography on Byrd ..... *Roland Huntford* is currently writing his next polar biography, this one on Fridtjof Nansen. I guess they don't come any better than Nansen, although we were hoping his next book would be on Sir Douglas Mawson. Regardless of what you may or may not think of Huntford, one has to admire the thoroughness of his researching, even if they don't agree with his personal interpretations of history. We read Huntford's biographies with one finger in the references to learn just where he got his information ..... *Charlotte Evans*, who wrote several articles this past winter in the New York Times about the Antarctic, is an interesting soul. We enjoyed the humor which she introduced into her articles. We also admire her adventurism, being willing to go to strange places without a contract, and then gambling on being able to survive by selling articles to papers. Her next port-of-call may be Sydney, Australia ..... While walking along the waterfront in Camden, Maine recently, we looked in the window of a real swanky bookstore, The Owl and the Turtle, where we saw a copy of the latest David Lewis book on the Frozen Seas Expedition..... Whatever happened to Stephen Carter Jackson and the Polaris Press? Is *Fram* still in existence? .... We don't know if this Newsletter will be popular or not. We do know that many of our members can read, that some of them actually read Antarctic books. We had some unpublished reviews, and since we had to get a newsletter out for the Mid-winter picnic, decided to kill two birds with one stone.

**FAREWELL UNTIL SEPTEMBER.** Have a great summer! We will! Summers are wonderful if you can avoid recreational vehicles on the highways; escape with your life when trying to avoid rude Boston drivers; have the patience not to blow your top when idiotic Floridians drive 45 miles per hour in the passing lane on high-speed turnpikes, never, never, never pulling over - how did they ever get licenses? Please don't come to Maine unless you have a home there, as we already have too much traffic. Cheers!

*Richard E. Byrd: An Illustrated Biography*

by

Peter Anderson

Assistant Director, Byrd Polar Research Center The Ohio State University, Columbus, Ohio

on

*Tuesday evening, 25 October 1988*

Cash Bar Reception 5:30 PM )  
Dinner 6:00 PM ) Fawcett Center  
Lecture 8:00 PM ) 2400 Olentangy River Road

All members of Admiral Byrd's family and members of BAE I, BAE II and the US Antarctic Service Expedition are guests, members pay. There will be a great dinner for \$20. check payable to the Byrd Polar Research Center and (125 South Oval Mall, Columbus, OH 43210-1308) so it there by 20 October. Point of contact at OSU is Dr. Elliot, Director of the Center, Phone 614-292-6531.

**MONDAY evening, 24 October 1988**

*With Byrd and Siple on BAE II, 1933-35* by

Dr. Alton A. Lindsey

Vertebrate Zoologist, Byrd Antarctic Expedition, 1933-35

and

Professor Emeritus of Ecology, Department of Biological Sciences  
Purdue University, Lafayette, Indiana

Reception (cocktails) 4:30-6:30 PM ) Lounge  
Lecture 8:00 PM ) Main Faculty Club  
181 South Oval Drive

*A brief aviation movie narrated by BAE II pilot, W.S. McCormick, will precede Dr. Lindsey's talk.*

(For more information on the meetings, see pages 2-3, and on motels, page 14)

## PROBLEMS

There was some question whether this should be my last Newsletter, as there have been some people-type problems that had nothing to do with the Society, which indicated that it might be best for all hands if I terminated. But we will probably blunder on for the time being. I'm building a home in Maine, and spend nearly all of my time there. As soon as this is turned over to the postoffice, it's straight back to Maine where the foundation will be poured next week. We'll be at the Columbus meetings, but then it's straight back to Maine again where the house, a Timberpeg post and beam, will be delivered by two large trucks on 2 November. Then it's rush, rush, rush to get it enclosed before the onset of winter. Although I can work, my right knee has degenerated to the point where I can't drive without great pain, so I don't. That complicates everything. I'm under orthopedic care and trying to restrengthen the muscles around the knee. Trying to build a home in Maine while plagued by a bad knee is not really conducive to being here in the Washington area and writing newsletters, or whatever you may call these things. Supposedly help is on the way, as we have talked to Steve Dibbern about taking over these newsletters. Steve is a real nice guy, is actively involved in the Antarctic, is much better read Antarcticwise than I, and Ruth loves him - a prime requirement. When he comes back from the ice in November, we are all going to get together with a bottle of booze, and we won't let Steve out of the locked room until he promises to take over! I have enjoyed writing these things, and have particularly enjoyed the contacts with so many of you, but the best part has been the close association with Ruth over the past ten years. We don't have much in common outside of Antarctica, as she is all lady and I am a renegade. In spite of it, we have had ten great years being around one another nearly all of the time. I guess it was normal to expect that interpersonal trouble might brew when time and distance increased. Hopefully, for my part, I would like to think that the friendship developed with her and the Society will continue to be a part of my future life, even though I will be sequestered in Port Clyde, a lobster town, population 600!

**THE COLUMBUS MEETINGS.** For the past three years we have been hounding the Polar Research Board to hold a meeting in Columbus, Ohio where we have our single largest group of members (outside of Washington). When The Ohio State University bought the Byrd collection and established the Byrd Polar Research Center, we knew we had to meet there. Fortunately for us, The Admiral's forebears conveniently planned Richard's birth to be in the fall at about the same time the Polar Research Board meets. How fortuitous! And, the piece de resistance is that October 25, 1988 is the 100th birthday of Admiral Byrd.

We thought we had a winner which would bring in Byrd men from all over the country, but our enthusiasm was not sprinkled with much realism. Most of the "survivors" of BAE I are more concerned with whether they can successfully navigate to the breakfast table in the morning, not whether they could get to Columbus. Oh, there's that irascible Norman Vaughan in Alaska who never looks at his driving license to see how old he is, but he is too busy "living" to come to Columbus. We have had a favorable response from a few hearty souls from the second Byrd Antarctic Expedition but as they celebrated their own 50th anniversary a few years ago, they probably

figure they have already said their fond farewells to their mates. However, we have not given up, and have sent pleading letters to many this week, hoping that we will get a few more. We are also trying to get some fringe players from early Deep Freeze days, people who were associated with or knew the Admiral. We're asking any and all OAEs who show up to bring their pictures, albums, or whatever; Ohio State hopes to do some oral histories while they are there.

There will be two dinner meetings, one on the evening of 24 October when there will be an open reception for all, a dinner for OAEs and invited guests, and an open illustrated lecture by Al Lindsey of the second Byrd Antarctic Expedition, a former colleague of Paul Siple back at Allegheny College in Meadville, Pennsylvania. The next morning, 25 October, has been set aside for rejuvenation of the OAEs and making oral history films, as well as viewing visual material brought by members. That afternoon there will be an opportunity to visit the Byrd Polar Research Center, and see some of the material which is in their collection. That night, still the 25th, there will be another dinner meeting, open to all Society members, where Peter Anderson of the Center, will present the 1988 annual Paul C. Daniels Memorial Lecture. It truly is a fine program, and we beseech any and all of you who have the wherewithal to come to Columbus and help make it a real success. There is an indication that both Boiling Byrd Clarke and Katharine Byrd Breyer, daughters of the late Admiral, will be there, as well as Robert Breyer, grandson of the Admiral. And we know there will be a meeting of the Polar Research Board, and hope that all of their members will come and hear Al, as well as Peter.

**CALENDARS.** How did we ever get into calendars? We should have known better, as they require a lot of work at a busy time of the year. If you want to help, get your orders in EARLY! Included with this Newsletter is a form for membership dues, order blank for 1989 Antarctic calendars, and a personal Antarctic history request. We want ALL of you to fill it out, even if you've paid your dues previously. We have 250 New Zealand Antarctic calendars on the high seas, as Betty "Smiles" Monteath mailed them from Christchurch the first week in August. With any luck, we will have some at the Columbus meeting. We think you will like their new calendar, as there are some truly great pictures - we have seen a complimentary copy. The Navy/USARP calendar is somewhat of a mystery, as no one at NSF has seen one to date, but based on the premise that many of you like their encyclopedic format, we sent off a check to Max Hamilton last week telling him to mail as many as the money permitted. There will be no reordering as in past years, so get your order in early. When they are gone, they are really gone. This is supposed to be our annual fund raiser, but since the Kiwi calendar is costly, there is hardly any markup at all. We do make a couple of bucks, hopefully, on the Navy/USARP calendar. However, if Ruth ever charged for gas to the postoffice, we would be losing money!

**WE GO OVER 600.** Our membership is now up to 606, which is both good news and bad news. The good part is that 65 of them are husband-wife memberships where we send only one Newsletter to each couple; the bad part is that it takes an awful long time to stick on 541 labels, fold the newsletters, stick them in envelopes, and lick them. Art Mortvedt of Manley Hot Springs, Alaska, is our favorite member, as he has the highest zip code, 99756; when we see him coming up, we know all the newsletters have been done. Our 600th member is Pe'ggy Dillon, who once worked, as I did, as a meteorological observer at the Mt. Washington (NH) Observatory, and was a cook at the Beardmore Glacier Field Camp in 1985-86. Our 500th member is Lisa Fetterolf, who works for ANS and recently went into McMurdo on WINFLY after having worked at McMurdo during the past austral summer. Our 400th member is Tahoe Wash-burn, distinguished wife of the eminent polar scientist, Link Washburn. We also allow men in our Society, but not at major milestones.

We are worried about our membership getting too large, as it has been growing much faster than old members can die and disgruntled members drop out. So if you wonder why you are in the Society, why don't you take this opportunity to drop out right now, BUT please let us know you are leaving so we can pull your label. One fellow, Bob Chaudoin, a member of the construction crew which built McMurdo, resigned with great grace and dignity last year, sending us a check of fifty dollars for future operations! What a nice gesture. In the past ten years, we signed up 598 new members, resigned 75 delinquents, 34 died, and 192 dropped out, netting 447. In the past two years, we have picked up 171 new members, and are worried about what is happening to our little old Society. The bad news is that the old hard core of the Society (Washington area) is weakening as the national membership increases. We lost five more the past year, dropping our local membership to 158 (26.1%). We need a strong, loyal local group to support our excellent lecture series, and it's not easy to get fifty people out for an evening meeting in downtown Washington. — By states:

Virginia	92	Pennsylvania	12	Rhode Island	5	Delaware	2
Maryland	69	New Jersey	11	Vermont	5	South Carolina	2
California	56	Minnesota	11	Missouri	5	Kentucky	2
Dist.of Columbia	33	Michigan	9	Oklahoma	5	Wyoming	2
New York	30	Maine	8	New Mexico	5	Utah	2
Massachusetts	26	New Hampshire	8	North Carolina	4	West Virginia	1
Colorado	26	Alaska	8	Georgia	4	Tennessee	1
Texas	23	Wisconsin	7	Mississippi	4	South Dakota	1
Florida	19	Connecticut	6	Nebraska	4	Montana	1
Ohio	18	Illinois	6	Nevada	4	Louisiana	1
Arizona	18	Kansas	6	Hawaii	4	Idaho	1
Washington	17	Oregon	6	Indiana	3		

No members in North Dakota, Iowa, Arkansas, or Alabama. We have members in ten foreign countries, but none in Tahiti.

**LARRY GOULD'S HONEYMOON ENDS, PEG DIES.** When Larry Gould came back from being second-in-command to Commander Richard E. Byrd on the 1928-30 expedition, he taught some courses at the University of Michigan. Margaret Rice, once a reference librarian in the Detroit Public Library, enrolled in one of Larry's geology classes. We don't know what she got for a grade, but she must have done a lot of things right, as they got married that year. One might say that it was a perfect textbook marriage, as they were most happily married for all fifty-eight years.

President Stephen R. Lewis, Jr. of Carleton College said in the Minneapolis Tribune, "Always an enthusiastic supporter of Carleton, a person of wit and insight, and an avid reader, Peg Gould had a sharp mind and spoke freely and candidly about matters that took her interest." When Peg turned 80, Carleton's Board of Trustees passed a resolution stating its appreciation, "Her strength and beauty of character have been a light unto her many friends, admirers and successive wives of Carleton's presidents. We wish we could have known her, as she must have been as special as Larry. The hearts of all Antarcticans reach out to Larry, as we know he must feel her loss most deeply. It was the Big C.

**HELEN POULTER DIES.** Helen Poulter, widow of Dr. Thomas C. Poulter, second-in-command of the second Byrd Antarctic Expedition, 1933-35, died on 23 June of this year. So both wives of the second-in-commands of the two Byrd Antarctic Expeditions (BAE I and BAE II) died within a month of one another, both from cancer. We knew Helen, and had the pleasure of visiting her home a couple of times. She had a great sense of humor, especially when it came to cartoons or jokes about the aging. And she had excellent art taste, as in her dining room hung a reproduction of Andy Wyeth's Marshall

Point Lighthouse - where my mother was truly born, and within 100 yards of where I am now in the process of building my first and last home. She also was a very brave soul, as she lived on the San Andreas fault. However, any dangers were put aside when you looked out of her large picture windows overlooking all of San Francisco Bay, one of the great vistas in the whole country, particularly at night with all the lights. But those cracks in the wall were sure scary!

Helen enjoyed good health through 1987, and last September went with her son, Tom and his family to England, Germany, and Denmark. She injured her back early this year, but had successful surgery on it in March. Her cancer from earlier years had reappeared by then, and she was never up and about again. Tom wrote that "She was a strong and remarkable person. She was a major contributor to the growth of my brothers and me, both as kids and as adults. Her devotion to our family enabled my father to focus on his work and made possible his many accomplishments. We will miss her a lot." And so will we in the Nerve Center, as we used to get some pretty funny stuff from her. Wherever she is in Heaven, she is going to cheer the place up, that's for sure.

**STILL ANOTHER CANCER VICTIM, CAROL CAFFIN.** We wish we could reproduce the beautiful tribute that Rev. Carole Graham, Chaplain of St. Margaret's College, paid to Caroline Forrest Caffin, but her husband wrote that it was not for publication. Any Antarctic worth his ice knows who Jim Caffin is, as he has been involved with Antarctic news since the IGY. Carol, his wife, was once a journalist - that's how they met. She evidently had some of the same characteristics of Peg Gould, as she loved to read.

We had the pleasure a year ago last December of visiting with the Caffins at their Chepstow Avenue residence. Everything was going real well, the scones were good, the coffee hot, the conversation pure Antarcticese, when all of a sudden Carol asked me why married Americans going to Antarctica wanted to fool around with Kiwi women. I felt the answer was rather obvious, something to do with the grass being greener in Christchurch. I stuttered and stammered, even though I am single, even though I had just gotten off the plane in Christchurch. She went into a sad tale about this senior Antarctic Navy man and how he openly cavorted with some female news anchor woman. There was no answer I could conceive which would have been legitimate and which would have placated her. When I came on back to the States, about a week after I got here, Art Buchwald published the answer to her question even though he wasn't there to hear the question. I sent it off to Jim to give to Carol, although I never heard a word back! I hope she enjoyed the humor of the article. Supposedly she had a great sense of humor, but I can tell you guys who fooled around in New Zealand, she was not your biggest admirer!

We don't know how long they were married, but it must have been an appreciable number of good years. The Society sends its heartfelt sympathy to Jim, who is one of our At-Large members of the Board of Directors.

**LEFTY MIRABITO CHECKS OUT AT AGE 70.** Probably one of the best conditioned Antarc-ticans anywhere died on 9 May 1988, following a swimming workout. John was a very likable meteorologist who was a Naval officer in the Antarctic, spending austral summers there from 1954 through 1959. His wife, Helen, drove over to the center in Bethesda, Maryland where John was swimming, parked her car and waited for John to come out, and an ambulance drove up beside her. Unbeknown to her, they had come to pick up John who had suffered a stroke.

He was a promising baseball pitcher for the Boston Red Sox in their minor league system when World War II inadvertently happened to occur, and that was the end of his baseball career. He had attended the University of North Carolina on an athletic

scholarship, although he graduated from Wake Forest University. He retired from the Navy in 1963 and went to work for NOAA, where he specialized in joint studies with the Soviet Union on the influences of environmental change on climate. He retired from NOAA in 1981, and went back to college to study Russian, German and Spanish. He also studied the classical guitar.

We saw John several weeks before he died at Arlington Cemetery where he was attending the funeral of another Antarctic, Capt. Ed MacDonald. We also talked with him at the service for Bert Crary last fall. He was a very devout Catholic, and once told me that every Sunday he prayed for Admiral Dufek. I couldn't believe there was anyone left who was still praying for Dufek, but John admired him. So you can see John was very kind, never forgetting those who helped him along the way. It is hard to believe he is gone, as he was in such excellent shape. A lot of Antarcticans played football, but John was one of the few who was a baseball player. It was too bad he had to be associated with the Red Sox!

**AL FOWLER'S REPLACEMENT WALKS ON WATER, TOO.** Al Fowler is being decommissioned (again) into another retirement, as least from the National Science Foundation, on 1 November 1988. This is being done so that he can make one last, large, concerted effort to master the game of golf. If NSF had kept him any longer, he would have been too old to teach! His replacement, Dr. Carol A. Roberts, came aboard on 14 August, a bespectacled, diminutive professional engineer who holds a commercial pilot's license and enough awards to fill the plane. She graduated summa cum laude in electrical engineering from Catholic University where she also picked up her MEE and PhD. Last year she received the prestigious Jerome F. Lederer Award for technical excellence in aircraft investigation from the International Society of Air Safety Investigators (ISASI). It appears from her bio that her earliest employment was with the Army's Harry Diamond Laboratories and the Naval Research Laboratory, both in Washington, DC. She joined the Laboratory Services Division of the National Transportation Safety Board in July 1972, serving as an aircraft accident investigator, specializing in digital recorder analysis. She became chief of the laboratory in October 1979, and ruled that office until September 1985 when she went to NASA Headquarters' Information Sciences and Human Factors Division as its Acting Deputy Director. Her division sponsored research in such buzz areas as automation, artificial intelligence, robotics, communication systems, controls and guidance, and sensor technology. In November 1986 she went back to the Navy, becoming Director, Surveillance and Avionics Division of their Naval Air Systems Command. She was responsible for managing and assessing programs for defense research, exploratory development and advanced development in avionics technological and functional areas (including command, control, communications (C3), inertial/navigation sensor systems, microelectronics, microwave and electro-optic devices, tactical surveillance, combat electronics). If war should ever break out in Antarctica, Dr. Roberts would no doubt be immediately commissioned a four-star admiral in NSF's Navy, as she seems to know how to seek and find, if not to destroy!

**UNIVERSITY OF ALASKA WINS CONTRACT FROM NSF FOR ICE CORING (PICO).** The National Science Foundation has awarded the University of Alaska-Fairbanks an estimated 5.4 million dollar, 3-year contract for the operation of the Polar Ice Coring Office. PICO will occupy central offices and workshop areas on the campus of the University of Alaska-Fairbanks. From this location, PICO will design and construct new ice-drilling and down-hole equipment and provide logistic and administrative coordination for the U.S. effort in scientific ice drilling.

The Polar Ice Coring Office (PICO), currently at the University of Nebraska, provides coordination and close support for glaciological, ice-coring, and other NSF-supported science projects in Greenland, Antarctica, and high altitude localities throughout

the world. These activities include: operational and logistic planning; development, procurement, and operation of ice drilling equipment; and the overall coordination of remote field activities associated with ice-core drilling.

Drawing on current technology, the Polar Ice Coring Office's central mission is to provide state-of-the-art drilling equipment and down-hole instrumentation in support of ice-coring at depths in excess of 3000 meters. In Greenland and Antarctica, PICO supports approximately 15 remote field projects and 75 individuals each year. Under the direction of U.S. scientists, PICO provides on-site management of field camps and ice drilling operations.

These activities are an essential component of the NSF's Division of Polar Program's research projects in paleoclimate and ice dynamics and includes an international collaborative effort in deep coring on central Greenland Ice Sheet. Ice sheets are unique in that they preserve records of annual precipitation, atmospheric temperature and composition, solar activity, and the occurrence of volcanic eruptions. Data from deep ice cores fill a critical gap in the global climate record because they provide the most detailed records through the last interglacial period.

**NORMAN VAUGHAN HITS HEADLINES AGAIN.** There was a rather lengthy article in the Boston Globe early in August about those six P-38 fighter planes and two B-17 bombers which went down on the Greenland Ice Sheet during World War II. But I promptly lost the article, and when I wrote the Army's Cold Regions Research and Engineering Laboratory at Hanover, New Hampshire, whose instrumentation supposedly located the planes, they ignored me. Love government labs! A much shorter article in the Washington Times for 4 August said the planes are down 260 feet! Norman Vaughan is, evidently, an advisor to the Atlanta-based group which located the lost squadron in July, and they plan on tunneling down into the ice and sliding the eight planes to the surface.

Richard Taylor, co-leader of the expedition, said that he and Pat Epps plan on flying two of the planes off the ice, dismantling the others for return to the States. Gordon Cartwright wrote from Geneva that he had talked to the Danish ice expert, Pere Gudmandsson, about the project, and he told Norman that the extreme pressures have no doubt collapsed the fuselages, and if that did not get them, the sheer in the ice movements on the steep slopes of the icecap would have. Norman speculates where ice flows like a plastic and flows in response to the gravitational forces acting on it that the planes "could be twisted beyond usefulness." You know, I bet I know what the late Bert Cray would say to Taylor and Epps, "Good luck, stupid."

For you historians, the saga of Bolero Mission had Tomcat Blue and Tomcat Yellow flights on 15 July 1942, with two bombers escorting six fighters from Greenland to Reykjavik. They ran into bad weather, and an unfriendly German submarine had the audacity to jam the communications to Reykjavik. The planes could not find the airport, and running low on fuel, returned to Greenland where they belly-landed on the ice about ten miles from the coast. All crew members were subsequently rescued, and if my memory is correct, Norman Vaughan did the rescuing with a dog team. That was Norman's World War II destiny, rescuing downed pilots over Greenland by dog team. (Aside - Norman should have been over in the Saar in January 1945, as snow was up to our gazzos when we got captured by the Germans, and he might have been able to keep me out of prison camp.)

**ANTARCTIC STAMPS.** Well, what do you think of them? This prejudiced person's view is that they are not as nice as the Arctic explorer stamps. In our mind they would have been better if they had the same light blue background as the Arctic stamps, because that dark green color is not Antarctica. Second complaint is the portrayal of Richard E. Byrd. That really does not resemble him very closely at all. Supposedly that was painted from a composite of two photographs of him in the National Por-

trait Gallery by a Seymour Stone and someone named Woolf. The designer of the stamp is the same person who did the Arctic stamps, Dennis Lyall. He is a left-hander, and we all know what quirks left-handers are, so I guess that's why Byrd came out looking like he did. And as long as I am complaining, I happen to like open spaces, and I think they tried to put too many things on the stamp. They have the person, the vehicle, the surface traveled over, and a map of Antarctica showing their route. Too much??

The first day of issue ceremonies were held at the National Geographic Society headquarters (Gilbert H. Grosvenor Auditorium) in downtown Washington, D. C. The ceremony was enhanced by the presence of four relatives of Admiral Byrd - daughters Katharine Breyer and Bolling Clarke, grandson Robert Breyer, and nephew Senator Harry F. Byrd. If you want to see a charmer, it's that Robert Breyer. He's handsome, articulate, personable, professional looking - just like the Senator. Some of you Antarcticans may know Bob, as he was in the construction party which helped put up the new South Pole station. He also went to McMurdo 28 November 1979 on the flight carrying VIPs celebrating Byrd's 50th anniversary of his flight over the South Pole. It was the same day that the Air New Zealand DC-10 crashed on the lower slopes of Mt. Erebus.

The ceremonies, presided over by the Senior Assistant Postmaster General, Gordon C. Morison, attended by an estimated three hundred people, were done with characteristic National Geographic class. They gave each attendee a beautiful souvenir program with the first day of cover cancellation. The US Navy Color Guard presented the colors. You know how they pick handsome giants for such honors, all six feet or so. Well, the blonde woman was something, they certainly found the right one! About a dozen of the US Navy Band Sea Chanters sang several numbers, and they were quite good. Then the rector of the Potomac United Methodist Church, an older man who must have been someone's friend, gave the invocation, which was followed by remarks by Gilbert Grosvenor, President of the National Geographic, a short address by Postmaster General Anthony M. Frank, who also presented souvenir sheets to several people, and the benediction by Reverend Edison Amos closed the ceremony. Minimum said about the explorer; and maximum about the National Geographic Society, which was okay as they hosted it. The Society gave each attendee a copy of the latest issue of their magazine, and the designer of the stamps autographed everything pushed in front of him at a table in the lobby. We appreciated the opportunity to be there, it was fun.

**TRACY AUSTIN'S GODFATHER REALLY FIRST AT NORTH POLE.** Gil Grosvenor really shot himself in the foot when he hired Wally Hebert to prove that Admiral Peary actually did reach the North Pole, and it must have killed him to have to publish Hebert's conclusion in the 100th anniversary issue of the National Geographic in September. Gil should have known enough to let the brush fires burn, just as he should have known enough not to come out with that strong statement in an issue several years ago about Peary reaching the North Pole.

So if Peary and Henson never made it, and Cook never made it, that means that old Joe Fletcher, former chief hanco of the Division of Polar Programs at NSF had to be first! The late Bert Crary, who was aboard the Air Force plane when it touched down at the North Pole on May 3, 1952, said there was no big deal about landing there, and that it just happened that Joe was the first one out of the aircraft. Joe downplays his being number one, but long after Joe is gone, people will remember him more for that first step at the North Pole than for any of his research or administration or Fletcher's Ice Island or being godfather to that former California teen-age tennis phenom, Tracy Austin. How old is Joe Fletcher, anyway? It seems to me that he has been bald for many, many decades. We have a hypothesis - polar men and baseball catchers all have a high percentage of baldness. What do you think?

### **INTERNATIONAL ANTARCTIC CENTRE AT CHRISTCHURCH.**

On 26 August 1988, Dr. Peter Wilkniss of the Division of Polar Programs, NSF, signed a First Letter of Intent for the United States to lease space in a newly proposed International Antarctic Centre adjacent to the Travelodge Hotel in Christchurch. New Zealand has also signed a First Letter of Intent, and they have hopes that other nations, such as Italy and Sweden, may also sign. If everything comes up smelling like roses, and it should in Christchurch, they could be building as early as next year. There is an architectural drawing of what the new complex would look like, and it is really something to behold. Shades of old dilapidated warehouses along docksides in Davisville, Rhode Island! The Centre will have a large circular clear dome over the entrance foyer, where there is some hope that the old Fokker they found last year in the Rockefeller Mountains will be mounted. Wonder if they have given any thought to mounting Larry Gould right next to it, as he is synonymous with the plane and should be there. There are also thoughts of moving, and I can't believe it, the Antarctic wing of the Canterbury Museum out to the Centre. The museum is in such an attractive section of the city, in a beautiful park, with the idyllic Avon River flowing lazily between banks of weeping willows, that it would seem a shame to disturb it. Now Captain Scott can come down off his pedestal across from the Clarendon Hotel and easily ski over to the Canterbury for mid-winter visits. If he had to go to the airport he might get caught in a blizzard and have to dig in!

It seems this would be a good deal for both the U.S. and New Zealand, although the big kicker is that the facilities have to be self-supporting. Right now we pay a nominal leasing fee, plus upkeep, for our facilities at the airport, but they are going to be torn down for International Air Cargo. Early on indications are that our (U.S.) costs won't increase appreciably. The Kiwi offices are in Oxford Tee, 10km from the airport. The Centre was proposed ten years ago by Bob Thomson, recently retired New Zealand Antarctic Division director, so you can see this has been on the back burner for, some time. Original thought that this could hurt the Travelodge proved entirely erroneous, as they will probably stand to gain, possibly getting contracts to operate the dining hall and the sleeping quarters.

### **HOIST YOUR SAILS.**

A lot of you guys and dolls have yachts, and now the time has come to put up your jib or drop anchor, as The Great Antarctic Challenge Yacht Race 1989 is about to begin. It has been organized by the Antarctic Yacht Race Company in conjunction with the Port Chalmers Yacht Club. If you want to be there when the starting cannon is fired, better get your monohull or multihull yacht with a crew of at least six, and bring your entrance fee of \$NZ3,000 to Port Chalmers by 1200 NZST on 15 January 1989. The shortest route around Antarctica at 60°S is approximately 14,000 miles, and someone with a calculator or infinite wisdom has figured you can do it all in eight to ten weeks. You must complete the circumnavigation by 2359 NZST on 15 April - no doubt to allow all to get their income tax return posted by midnight.

"Modern maxi racers have shown that they are structurally designed to meet the stresses imposed under conditions around the Antarctic. Radar to identify icebergs and weather facsimile receivers make yachts better able to forecast possible danger, and the race route is well catered for by both weather facsimile and Navtex stations giving ice and general sea condition information.

"The historical significance of using Port Chalmers as the staging point is but one of several unique features of the race. The race will be the shortest round the world yacht race. The weather and sea conditions encountered will be among the worst, and will also prove the greatest leveller. And another dimension has been added to the race with organisers giving the thumbs up to competitors who wish to use multi-hull yachts.

"This is the first circumnavigation of the Antarctic under race conditions, with the

Antarctic Yacht Race Company Limited (1987) being formed to undertake the nuts and bolts organisation of the event on behalf of the host club, the Port Chalmers Yacht Club. The six-man company is fronted by local yachtsman and tourist hotelier, Bruce Fanning. ... The race was essentially the brainchild of Bruce Fanning and fellow director, Ashley Loudon, who provided the practical knowledge of the race following his own circumnavigation of the Antarctic in 1970-71 on board the 53' ferro-concrete cutter "Awahnee".

"Wharf space is available for 20 yachts at Dunedin and 6 at Port Chalmers should sea trials be required, with space adjoining for containers and working areas, cranes to remove yachts from the water, and a major slipway for taking larger vessels out of the water.

"The local Civil Defence Radio Corps will provide 24-hour radio accommodation via a specially set up radio station for single sideband radio and VHP. All competitors will be equipped with radio, weather facsimile, satellite navigation equipment, and the Argus system. This latter system provides for six hourly readings of a yacht's location, which will be monitored and relayed back to race headquarters, and also may emit an emergency distress signal for immediate contact with Search and Rescue."

**THE NEW, REINCARNATED PETER WILKNISS.** Tourists won't have Peter Wilkniss to kick around any more, as Peter has decided to be Mr. Nice Guy of Antarctica and welcome any and all tourists to Palmer and the South Pole with a warm hand, engaging smile, and a cup of hot coffee. But if I were they, I might hold off on my first swallow until after Peter took his! Not only are all tourists going to be treated like human beings, they are going to be treated like wealthy human beings, given the opportunity to buy thousands of dollars worth of cheap T-shirts. If everything goes as well as they hope, NSF will soon have their new all-weather, ice-reinforced ship without an appropriation from Congress!

NSF is planning to build new briefing quarters for tourists at both Palmer and the South Pole, which will certainly make it more comfortable for the tourists. Not only that, they are going to get high level briefings. This year NSF will have Ted DeLaca Science Section Head, and Polly Penhale, Polar Biology and Medicine Program Manager, at Palmer. So you could say that the tourists are going to get the definitive word right from the horses' mouths.

Politically, this is probably a smart move, although scientifically it won't be a gainer. Harking back to the IGY years, when there were no such things as tourists, it was still much better after all the summer folks cleared out and went back on home. You can't do your best work when you have strangers in your bedroom or kitchen or whatever. So there was credence to Wilkniss's former position. But as the late Bert Crary once wrote me about making data available, "Best that you let anyone who wants them have them, because if you don't, it will invariably turn out that the jerk was a relative of some Congressman and you would end up out on the street pounding soft butter up your rear." So Peter has inadvertently taken the advice of Bert without even knowing Bert's position!

**COSMIC MICROWAVE BACKGROUND RADIATION (CMBR).** We should let at least one ongoing research program have a few lines, and on the advice of John Lynch, we have chosen to write about the Cosmic Microwave Background Radiation program at the South Pole. John described this one as a logistical nightmare. There is going to be a special flight of a C-141 from Port Hueneme to McMurdo carrying science equipment and a giant dewar containing 12,000 liters of liquid helium. This will all have to be transferred at McMurdo onto Herc flights to the Pole, and, supposedly the dewar is 3/8th of an inch oversized! Scientists from AT&T Bell Laboratories "will measure the small scale structure in the cosmic background radiation by using a liquid-helium-cooled

detector that operates at a 3-millimeter wavelength. A 1-meter telescope developed as a part of our balloon-borne program will allow them to make measurements on the order of 1 degree. Measurements will be made in an angular region that is not well investigated, that is complementary to other experiments, and where the predicted fluctuations are expected to be near maximum. A null measurement at the sensitivity level being investigated would necessitate serious revisions in the theoretic predictions and fundamental arguments currently applied to this question. The measurements will also help us better understand the atmospheric fluctuations, useful information for future millimeter and submillimeter wave astronomical investigations." That's pretty exciting, huh?

**U.S. ANTARCTIC FATALITIES.** The recently completed report of the U.S. Antarctic Program Safety Review Board, Safety in Antarctica, has a table on U.S. fatalities in Antarctica. The overall total is 53, which includes three from Operation High Jump, 1946-47. Well over half of the deaths, 32, were aircraft related; six involved vehicles, and four were on ships. Only three deaths involved people working at or near stations. One was when a Petty officer tried to cut open a not-so-empty fuel drum with an acetylene torch; one man was killed in an off-loading accident at the South Pole; another man at the Pole caught it when ice in the intake shaft fell on him. Field activity claimed another three: a scientist getting lost in a mid-winter blizzard at Byrd; a microbiologist falling on the slope of the Asgaard Range in the Wright Valley; and a research assistant dying in a diving accident off Marble Point. Recreation claimed three: two walkers returning to McMurdo Sound from Castle Rock fell into a crevasse; and a man succumbed to methyl alcohol intake. A 39-year old Navy man died of natural causes, suffering a fatal heart attack in his sleep at McMurdo.

If you were not one of the ill-fated fifty-three, you would have to admit that these numbers are most heartening when you consider the total number of people and ships and aircraft and vehicles", plus some pretty strange weather. The most amazing thing is that there have been no deaths from camp fires, which means that most people have been very fire conscious. Five, including a young promising scientist, Ed Thiel, died in an aircraft take-off at Wilkes Station when there was fuel leakage which ignited a spark. Ed was one of four scientists who lost their lives in the Antarctic.

There was a sixteen-year period from 1970 to 1985 when there were only eight fatalities, all single deaths. For the 70's decade, there were only six deaths. We have not seen figures from other nations, but we are certain, in terms of Antarctic man-hours, that our safety record must be unparalleled. May it continue so.

**IT'S BETTER ON ICE.** Paul Adams of Bethesda has been our not-so-secret undercover agent in Auckland for the past two years where he has performed a yeoman clipping service for us at the right price. One of his best ones was one of his last ones. It was about this scraggly looking Kiwi doctor, who was part of the Greenpeace team, finding peace and happiness in the arms of a comely American blonde. He looked about 48, but was only 34; she looked about 28, but was 35. It seems that he found living conditions much more pleasant in highly toxic, filthy, polluted McMurdo than at pristine Cape Evans. It may have had something to do with better mattresses at McMurdo, as we understand he practically lived there. The article in the New Zealand Herald for 23 April 1988 has her dramatic story about how she supposedly was being given the bum's rush out of McMurdo before her contract was up, and as she was about to be expelled from McMurdo for cavorting with the enemy, down swoops the Greenpeace helicopter onto the air strip with the doctor who "has come to rescue her. She begins running toward it. The ground crew also realizes what is going on and starts chasing after her. But they are too late. She climbs on board and just as the first pursuer comes puffing up, the helicopter lifts and is away." This is really great stuff, but apparently it was all a cock and bull story which the woman cooked up for the New

Zealand paper, as in reality the doctor got out, kissed her, and she got back on the Herc and left. The good doctor evidently has not married her yet, as she dropped by NSF recently, still very much single but looking awful matronly. We understand that she's now back in New Zealand. Boy, it was better in the Antarctic back in the good old days when there were no blondes - without blondes, life is free of temptations.

**BOOK REVIEW BY WALT SEELIG OF THE ICEMEN BY MARION E. MORRIS.** Here's an exciting novel for collectors of books on Antarctica. It will also appeal to followers of international spying and intrigue, and it should be as popular and successful as M. E. Morris's first book, THE ALPHA BUG.

The setting for the most exciting action is Antarctica, as exotic a part of the world as you could hope to find, and dear to the hearts of all of us "icemen". A close second to the main theme is the excitement of getting there and back, and trips to the continent itself. All of you who have been to Antarctica will perhaps wonder how come you did not know how much went on behind the scenes, in the cockpit. No, not personality conflicts and so forth, but an operation based on experience and a keen knowledge of aviation and the individual capability of the crew members. Moe Morris, a former VX-6 commander, makes even the trip from Point Mugu to Hawaii seem exciting. Now just imagine what he has to say about landings in Antarctica and flying around the continent in ever-changing, far-from-ideal conditions. Good writing is a must to achieve this kind of success.

Now the plot. It involves an interweaving of stories, joining characters intent on international control, who bring their intrigue to an as yet unbuilt "and never to be built, we are sure" Argentinian station supporting a colony of holdover and neo-Nazis. Russian and Israeli characters converge and eventually cooperate with the U.S. team to offset the threat they pose to world health and safety.

The main character is a young American copilot, Lt. Sheila Kohn, introduced at the very beginning of the story, flying into McMurdo with Commander Marc Bradford on the first flight of the season. She gets caught up in this international intrigue and is the center of a lot of the action. Other characters, mainly in the support area, are also developed, and participate in the plot.

Moe Morris has gone back in time and put an admiral in charge of the Navy support operations just as in the pre-1972 days when he was flying. I can appreciate his enthusiasm for the Navy operations, as I had the pleasure of flying with him in a Hercules LC-320 in the late 60's from Andrews Air Force Base to McMurdo via Punta Arenas. He was a good pilot; and as evidenced in Punta Arenas, a good diplomat. It's a pleasure to find out he's also a good author, with an ability to tell a thrilling story, using beautiful language (Presidio Press, Novato, California, \$17.95).

**SOME PEOPLE ACTUALLY MAKE GOOD.** Reading the lead story on the front page of the Washington Post on 13 September 1988, one learns that Vernon J. Houk, Assistant Surgeon General, said that radon may account for half the total radiation dose to the U.S. population, and cause 20,000 cases of lung cancer per year. Those of us who knew Houk when he was the wintering-over doctor at the South Pole may be reluctant to heed his warning, as he was anything but an impressive young man with a future. He came across down there as the son of a well-to-do California family, a mother's boy, who would probably never amount to anything once he got back to the States. As I recall, he spent the whole winter sitting at the end of the mess table next to the communication shack, wearing civilian shirts and white mukluks, smoking countless cigarettes, drinking bottomless cups of coffee, and bitching about what a lousy job Siple and Tuck had done building the camp. And now this guy is our Assistant Surgeon General? Are we in much worse shape than I thought we were in, or was he a late bloomer, or were we all so blind as to not recognize talent?

Another surprise to many of us was Crevasse Smith at Little America V. The odds favored him getting killed in some crevasse before he ever got off the ice, as he never saw an unfriendly crevasse, and wanted to crawl down into every one of them. How could anyone with that kind of mentality end up being the number two man in our National Academy of Sciences? No way, Jose, but he has. When the pseudo-German scientist Peter Shoeck fell into a crevasse near Roosevelt Island on Crary's first Ross Ice Shelf Traverse, Bert was looking for a replacement (his first choice was Mukluk Milan, but he was committed to go to the outback of Australia on his way home to help study some of the aborigines), and Crevasse's name came up. Bert's reply over the radio was typical vintage Crary, "Don't send him. I want someone who can tell me how to stay the hell out of crevasses, not how to get into them." However, I think he eventually had to settle for Crevasse Smith. So you better be good to that person sitting next to you in the galley at McMurdo, as that person might some day be a very important person while you are still driving a 1961 Buick!

**AL LINDSEY REMINISCES ABOUT IKE SCHLOSSBACH.** One of our speakers at Columbus, Al Lindsey, sent us comments from one of the all-time Antarctic characters, Ike Schlossbach, about his first tractor journey. You young folks may not have heard too much about Ike, as he passed away several years ago. But he was a little bit of everything dangerous - a pioneer submarine commander and a dive bomber pilot, to mention two. He also was with Sir Hubert in the Arctic on the first dive under the ice by a submarine. So you can see that an Antarctic tractor trip might not have been his cup of tea. The following is verbatim from Ike:

Never have I seen anything to beat these tractor drivers. NEVER AGAIN!  
These guys are obsessed with the idea of getting somewhere. They never stop.

I kept asking them to stop for something to eat. "Shut up", they said, "we're underway." Finally it got dark. "How about supper?", I said. "We never stop", they told me. Ha Ha. Well, finally Demas decided to stop. "How about something to eat?", I said, casual-like.

They handed me some frozen lima beans and snow. "What's the snow for?", I said "To harden you", Demas said. Well, I ate the beans and asked for more. Demas gave me another hunk of snow. "You're not depriving yourself of anything, are you?", I asked.

The trouble with these guys is that they read Nietzsche's SUPERMAN all winter.

**WATCH FOR ANTARCTICA ON PBS WEEK OF 10 OCTOBER.** All of you folks should have received a flyer on 3-2-1 Contact Broadcast Schedule on PBS. If you looked at it, you should have noticed that there are going to be five one-half hour television programs on Antarctica, starting 10 October. The time will vary from city to city, so check your local papers for them, as they are outstanding. One program will be on getting there, another one getting around, a third on life on the edge, followed by life under the ice, and the finale on the desert continent. They were all shot during the past austral summer, and are aimed at the 8- to 12-year old population. However, there is a lot of eight to twelve in a lot of us, so be sure to watch them all. In the Washington area, they will be shown at 5:30 in the afternoon; however, in many areas they will be during school hours so the little monsters can see them at school ..... Also watch National Geographic's Explorers program the evening of 12 October.

**DEDICATION CEREMONIES AT CHINOOK KENNELS IN WONALANCET, NEW HAMPSHIRE.** There is going to be a memorial dedication ceremony at the Chinook Kennels, Route 113A in Wonalancet, New Hampshire at 2 PM on 8 October, even though most New Englanders will be glued to their TVs that day, watching the playoff game between their beloved Red Sox

and the Oakland A's. What is the dedication all about? Well, they are going to erect "a New Hampshire historical marker on the Seelys, Chinook Kennels, and their contribution to America." And "the famed Admiral Byrd stone dedicated to "All Noble Dogs' sacrificed on BAE I and II is being moved to the memorial site, and a granite marker ... are being dedicated." Some fellow by the name of Moulton - they're all over New England - first name Dick, will give the dedication. And they hope to have other Antarcticans there, too, such as Ed Moody, Dutch Dolleman, and John Dyer. And, believe it or not, the Governor is coming and talking - it sure must be an election year when an incumbent governor comes to the dedication of a plaque at a dog kennel. But that's New Hampshire.

**SNOWFLAKES.** Old *Bob Nichols*, one of the real good guys, in spite of his avocation for man-hauling sledges, is now legally blind, having muscular degeneration of both eyes. But his wife *Frances* is even worse off. She has been operated on five times for cancer of the bladder, and thirty-nine days of radiation have left her with problems that not only painful but also uncurable. What a terrible plight. My heart really aches for old Bob, as he is such a good soul. Their address is 10901 Johnson Blvd., #604, Seminole, Florida 34642. . . . *Kris Rutherford*, son of you know who, came in second in the Manhattan Island swim race on 27 August, circumnavigating the island in seven hours and forty-six minutes. On August 5th, the 28-year old CPA swam the English Channel in ten hours and forty-four minutes. Bob rode on the boat which accompanied him, making sure that he kept up the good stroke. Finally a good athlete in the Rutherford household! . . . *Murray Wiener* tells about the time when he was on Admiral Richard E. Byrd<sup>1</sup>'s staff enroute to Antarctica when the Admiral got a call from a woman in Dunedin who asked that her name and phone number be given to Byrd. On receiving the message, the Admiral paused for several minutes, attempting to recall the name. Then with a twinkle he said, "I can't recall the lady or the name, but if I knew her in 1928, she's certainly too old for me now!" . . . The new Antarctic Girl Scout, *Julie Hagelin*, comes from Saratoga, California, home base of *Michele Raney*, although it's not known if Julie is as much of a chocoholic as Michele. Julie goes to a great college, Pomona, has a brilliant resume, and appears to be a real nice girl. If she asks you to hit a few shuttles with her, you had better decline gracefully and fast, as she plays #1 on the varsity badminton team. . . . *Debbie Enzenbacher*, supply chief for ANS at the South Pole, is one of my favorite all-time Antarcticans. She is a real nice kid, loves the Antarctic, and sent us an ATS-3 satellite letter in mid-winter in which she said she would like to apply to the Scott Polar Research Institute for further study. Debbie got her master's degree at Chicago on the Antarctic Treaty. . . . The *Swithinbank-Williams-Ferrigno-Chinn* Satellite Image Atlas of Antarctica is finally on the streets, but it's well worth the wait. We doubt if anyone will ever read the text, as the imagery is so spectacular. Congratulations for a job well done . . . *Fauno Cordes*, Mother Superior of Antarctic Fiction, has done it again, coining up with a real fine annotated bibliography on the Antarctic. The bibliography indexes by dates, by titles, by place names, has a reference bibliography, and maps showing the sites of Antarctic fiction. . . . *Kathy Covert*, the third woman, we believe, to winter over at the South Pole, and who returned to the ice with the USGS, has gone to Syracuse University for graduate work in their Department of Geography. She's studying under Mark Monmonier, a cartographic scholar. This person was in that same graduate school forty-one years ago - how to make a guy feel old! . . . *Bill Priester*, 150 East 71st Street, New York, New York 10021, wants to communicate with other collectors of Antarctic literature . . . Motels near OSU campus: HOLIDAY INN (614-294-4848), CROSS COUNTRY INN (267-4646), KNIGHTS INN (261-0523), OLENTANGY INN (294-5211), PARKE UNIVERSITY (267-1111), RED ROOF INN (267-9941), RIVERSIDE INN (261-7141), UNIVERSITY HILTON (267-7461).

EVERYONE, PLEASE, FILL OUT THE ENCLOSED FORM AND RETURN TO US -- even if your membership is already paid.

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

---

Vol. 88-89 November No. 2

---

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988

A MOST TIMELY PRESENTATION BY PROMINENT INVESTIGATOR

Securing Environmental Protection in Antarctica

by

Dr. Bruce S. Manheim, Jr.  
Attorney and Scientist  
Environmental Defense Fund  
Washington, D.C.

on

Monday evening, 28 November 1988

8 PM

National Science Foundation  
18th and G Streets N.W.

Room 543

Light refreshments - coffee and cookies

A lively evening is in store for attendees, as our eminently qualified speaker has been an outspoken critic of some U.S. activities in Antarctica (August 1988 report, *On Thin Ice, The Failure of the National Science Foundation to Protect Antarctica*, published by the Environmental Defense Fund). Dr. Manheim<sup>1</sup>'s presentation on the 28th will cover three topics of great interest to all Antarcticans: Commercial Exploitation Activities

Focus on Environmental Impacts from Human Activities  
Threat of Ozone Depletion and of Global Climate Change

Dr. Manheim is a member of the Antarctic Section of the Department of State's Advisory Committee on Oceans and International Environmental Scientific Affairs. For the past five years he has served as the only non-governmental representative on the U.S. delegation to the Convention on the Conservation of Antarctic Marine Living Resources. He also served as the only non-governmental representative on the U.S. delegation to the first meeting of the Conservation of Antarctic Seals in September 1988.

## G R O W L E R S

We are back on the same old street corner, although somewhat reluctantly, as we are still fighting the battle of putting up a house in Maine, and moaning and groaning about an aching knee which still refuses to let me drive. These Newsletters will appear more irregularly, as we have to get that house up while I am still alive, but there will be something out for each meeting. This one follows close upon the last one, as we moved Dr. Bruce Manheim up to late November in order to attract a larger audience. There will be no December meeting, and, in all likelihood, none until late January.

Where the last Newsletter ran four extra pages, where we are hard put for time, where my place in the Blue Ridge Mountains was just broken into, and where departure for Columbus is only a couple of days away, this will be a real quickie. BE PATIENT. RENEW MEMBERSHIPS. RETURN FORMS. STAY LOOSE.

**CALENDARS.** Each year we get carried away with our own enthusiasm for Antarctic calendars, and order a few more based on last year's sales, not taking into consideration that we always end up pleading that you buy more. This year looks real critical, as some big spenders of the past are going conservative. We can attest to the beauty of the New Zealand Antarctic calendars as they are very nice. As we go to press we have sold about 120 out of our stock of 250. We are hoping to unload a bunch at Columbus and at our November Washington meeting. The Navy/USARP calendars are still an unknown to us. We have not heard word one from Max Hamilton since we sent him a check for "as many as it covers". We have heard that he is back in New Zealand after an overseas trip, and that the calendars are out on the streets in Christchurch. Selling calendars is our only fund raiser, although we feel guilty calling the sale of the New Zealand calendar a fund raiser - all we do on that one is break even. However, if we don't sell out, then we're conducting a deficit fund raiser. Ruth is mailing out the orders for just New Zealand calendars. If you order both calendars, she is holding off for awhile mailing the New Zealand ones, hoping that the USARP ones will arrive soon and she can send them out in one parcel. This used to be sort of a combined Siple/Dalrymple effort, but with me building in Maine, the whole burden has fallen on Ruth's slim shoulders. Please don't bug her. Be patient. And if you haven't ordered your calendars yet, PLEASE help us out - buy NOW. (New Zealand Antarctic calendars - \$8.50 each - NAVY/USARP \$7.00 each)

**COLUMBUS MEETING.** This Newsletter is being sent out prior to the Columbus meeting, because with Dr. Manheim's presentation being advanced to November, we have to get it out in a hurry. There is both good news and bad news about Columbus. The bad news is that we thought there would be more attendees from the 1933-35 Byrd Antarctic Expedition; the good news is that there will be good representation from the Byrd family, and a good cross-section of people from all of Byrd's expeditions. One surprise was hearing that Norman Vaughan, of the 1928-30 Byrd Antarctic Expedition, will be there, along with his bride (who, incidentally, is moving from Atlanta to Alaska). As we go to press, it appears that Al Lindsey, Bill McCormick, Joe Hill, and Ervin Bramhall from BAE II will be there, along with Murray Wiener and Charlie Passel from the U.S. Antarctic Service Expedition. There will even be a crew member from the famous old BEAR OF OAKLAND, Gordon Fountain. Needless to say Ruth Siple will be there, and we hope Jackie Ronne will represent Finn's clan.

**OUR NOVEMBER MEETING.** We are hoping that all of you will make an extra special effort to attend this meeting which we anticipate will be of widespread interest. Down through the years the Society has tried to present as many speakers as possible on policies in Antarctica. We have had Jim Barnes, Bob Hofman, Lee Kimball, Lisle Rose, R. Tucker Scully, Charles Swithinbank, Ed Todd, and Peter Wilkniss in the 1980's, but all of them were pretty well-known to Antarcticans in Washington. Dr. Manheim is known through his works, but it seems that people at NSF do not know him personally, so the evening could be a "shoot out" at the old corral. It will be one of the very few meetings we have ever had where someone has not shown a slide of the ubiquitous penguin, Gondwana, or a Here. And, don't come expecting slides of the McMurdo dump, as there will be none of them, either.

It should be a scholarly, serious presentation by a cum laude biology graduate of Pomona College (which sends to Antarctica this austral summer, Julie Hagelin, the 1988-89 Antarctic Girl Scout). Dr. Manheim's other academic stopovers were at Claremont Graduate School (M.A. in ecology), Vermont Law School (M.S.L. in environmental law), and Georgetown University Law Center (J.D.). How did Vermont creep in there among those other prestigious schools?

**WASHINGTON POST ARTICLE ON ENVIRONMENTAL DEFENSE FUND REPORT.** Although the issuance of the Environmental Defense Fund's *On Thin Ice, The Failure of the National Science Foundation to Protect Antarctica* got nationwide publicity last August, we are going to reprint what the Washington Post ran on it in its 18 August 1988 issue. The purpose of including it in the Newsletter is to refresh your memory about the report, and to fire you all up to attend our next meeting.

National Science Foundation bases in Antarctica are polluting the pristine polar environment in violation of U.S. laws and international agreements, according to the Environmental Defense Fund.

"The environmental practices of the NSF—the federal agency responsible for U.S. scientific research in Antarctica—would not be permitted anywhere in the United States," the group said in a report issued Tuesday.

The findings by the organization, which frequently sues polluters in this country, include disposal of untreated sewage in Antarctic waters, open burning and ocean dumping of other wastes and lack of emission controls on diesel power generators.

The report said McMurdo Sound, adjacent to the largest U.S. installation, is more polluted than virtually any U.S. waterway and that highly toxic polychlorinated biphenyls and heavy metals are being found in the tissues of penguins and seals.

"It is incredible that these practices are observed by the U.S. government in the most pristine environment in the world," said Bruce Manheim, the report's author and an EOF attorney and scientist. "Rather than addressing environmental threats in Antarctica, NSF has ignored them."

Jack Talmadge, head of NSF's polar coordination and information section, said that many of the report's findings are true, but he said the scientific agency is taking steps to improve its environmental practices at its four bases.

The report said the United States is not the only polluter among the 18 nations with bases in Antarctica. It noted, however, that Australia and Japan remove wastes from the continent, and that Poland and New Zealand treat sewage and control incinerator emissions.

The report said that if the United States did a better environmental job in

Antarctica, it would be in a much stronger position to press for more comprehensive pollution control by less-responsible nations."

EDF said the NSF operations, which include '1,000 people at McMurdo during the Antarctic summer months, violate U.S. laws regulating ocean dumping and land disposal of waste materials.

The landfill at McMurdo does not comply with the international Code of Conduct on Waste Disposal adopted in 1975, according to the report, which said NSF officials told a Senate panel last year that it was "in full compliance" with the code.

"We comply with most of the code except that provision," Talmadge said. "As far as we know, we are in compliance" with U.S. laws, he said.

The report said that the NSF, despite a 1978 directive from Congress, has failed to assess the environmental impacts of its activities, including dynamite blasting and construction near Antarctic wildlife colonies.

"In 1980 ... NSF promised to issue pollution control regulations and to mitigate environmental impacts, but neither of these actions has ever been taken," the report said.

Talmadge said the scientific agency, which gets \$125 million a year for its Antarctic activities, is in the process of adopting an environmental protection plan and may ask Congress for cleanup money.

Talmadge said that this year NSF shipped out of Antarctica 160 tons of scrap metal and more than 500 drums of waste oil. He said these materials are no longer dumped into Antarctic waters.

He said the agency is reviewing a recommendation by an internal safety panel that it stop using hazardous materials to ignite wastes in open-air burning pits. He said raw sewage is dumped into Antarctic waters because officials believe it is less harmful than the chemicals that would be used to treat it.

"Nobody here wants to rape Antarctica," Talmadge said. "We want to preserve it."

**ADMIRAL BYRD'S SON SUCCUMBS MOST INGLORIOUSLY.** As members of the late Admiral Richard E. Byrd's family gathered in Washington on 14 September to celebrate the first day issuance of a commemorative stamp honoring Byrd, it was obvious that his only son was not in attendance. People in attendance did not think too much of his absence, as stories about young Dick's life seemed to indicate that he was finding being son of a legend a heavy burden. But the family knew that he was supposed to have been at the National Geographic Society for the ceremonies, as he had been put on the Washington-bound train in Boston the previous night, 13 September. Subsequently a missing person report was filed with the Boston police, but nothing turned up. Finally, on October 8th, the police in Baltimore identified the body of a man found by a custodian in an old mill-district warehouse on October 3rd as that of the Admiral's son.

As we go to press, there remains a near vacuum of information on what happened to Byrd from the time he was put on the train in Boston by his son Leverett until his body was discovered. It is known that he apparently never occupied his bed on the overnight sleeper to Washington, as the bed was not used. His luggage has not been found; neither has his billfold. The clothes he was wearing when he died were not his own, being green workman's clothes. His travel clothes were missing. But he was seen on 27 September by the custodian who later was to discover his body, as on that date the custodian shooed away Byrd and another man from the warehouse. Burt W. Gayleard, the on-site manager for Time Realty, owner of the Hampden

property at 1760 Union Avenue where young Dick was found, was quoted in the Baltimore Sun as saying that Byrd asked, 'Somebody take me to Baltimore, I want to go to Baltimore.' He was trying to sleep when I found him. He didn't have any teeth and he spoke like a vagrant, but he pronounced 'Baltimore' correctly, not like someone who lived here. You know what I mean?" A detective reported that when Byrd was first seen with another person, "they had booze with them in a paper bag." Byrd was finally identified by a Boston Transit Authority ID card which had been pinned to his undershorts.

What a terrible ending for anyone, let alone someone who was born of aristocracy, went to prestigious Milton Academy and graduated from august Harvard, married a Saltonstall (which in Boston is almost as good as marrying a Cabot or a Lodge), fathered four sons, and was The Great Protector of his illustrious father. The elitist New York Times sort of put it all into perspective in the first sentence of Byrd's obituary (9 October 1988) when they wrote, "Richard E. Byrd, Jr., a man who lived his life in the shadow of his father, the admiral and Arctic explorer, was found dead Monday in the darkness of an abandoned warehouse in Baltimore, his emaciated body clad in dirt-blackened clothes, and one scuffed shoe, the police said."

Byrd's marriage ended in divorce, and there were rumblings that he was not close to many members of his family, although, supposedly, he called one or more of his sons every day. He lived alone in a Boston apartment.

His lifelong burden was being the son of the Admiral, and a large part of his life was devoted to furthering his father's accomplishments. Leverett said of his father, "He had all of my grandfather's papers, all of the manuscripts." However, when The Ohio State University took over possession of the Byrd papers, it soon became evident that the detailed journals which the Admiral was known to have kept were missing. Polar archivists around the world are now wondering if they were destroyed, or hidden some place away from investigative historians like Roland Huntford who could make Jesus look like Satan. Young Byrd could have been clever like a fox and destroyed them. Only time will tell.

Presumably young Byrd has found peace and happiness in the family grave in Arlington Cemetery, where he was laid to rest in a very private ceremony on 14 October, attended by his two sisters, four sons, three daughters-in-law, grandchildren, Senator Harry Byrd, Jr. and two of his brothers. The minister, an Episcopal priest, said that the one positive thing which remained consistent throughout his lifetime was his love affair with the internal combustion engine. He was known to have owned and cherished over a dozen old cars. If young Byrd had had his own druthers, he would have probably preferred being the son of Barney Oldfield rather than of the Admiral of the Poles. We all should probably be more careful of those who sired us. Those of you who are still making children, take heed of this.

**NOTHING IS SACRED, EVERYTHING HAS ITS PRICE.** Money can buy everything except happiness and good health, so if you wanted Byrd memorabilia all you had to do was show up at the Colonial Country Club in Lynnfield, Massachusetts – that's Carl Yastremski country – with your wallet on 23 October and you could have picked up some authentic Byrd items. It seems that Massachusetts' law requires that any and all items not specifically bequested in a will have to be converted to cash before the estate can be settled. Byrd had the reputation as a very generous man, and according to Henry Harrison, BAE I meteorologist, gave each member of the wintering-over party a souvenir of his flight over the South Pole. Henry got his wrist watch. So, presumably, Byrd may have given away the most historic items in his own lifetime, and the auction may not have been too great.

According to the 9 October 1988 Boston Globe, the Admiral's medals are to be auctioned off by Sotheby's in London on 10 November. The collection comprises his

Medal of Honor, along with more than a hundred other medals. The article said, "The medals, along with related items, such as scientific instruments and uniforms used by Adm. Byrd will be sold separately in about 80 lots. The collection, which is expected to bring about \$90,000, is being sold by order of the estate of the admiral's widow, Marie A. Byrd." Peter Anderson estimates that the items in the Sotheby's auction will bring somewhere between \$200,000 and \$250,000.

**WATER-FILLED HOLES IN ANTARCTIC ICE ABOUND WITH LIFE.** (Washington Post, 10 October 1988) Marine biologists have discovered that the vast sheets of sea ice surrounding Antarctica are filled with chambers and channels that are teeming with plant and animal life. The water-filled holes constitute a habitat with its own ecosystem that had never before been recognized.

The discovery, just announced by the National Science Foundation, was made last summer, in what is the height of winter in the southern hemisphere, during an expedition in which 47 researchers collaborated aboard an NSF-sponsored research ship, POLAR DUKE. The ship explored the ice roughly between the tip of South America and the Antarctic mainland.

At its maximum, the ice surrounding Antarctica covers an area of about 11 million square miles, roughly three times that of the United States. Its thickness varies from three to six feet. Every summer about 80 percent of the area melts, but is replaced each winter.

Cornelius Sullivan, an expedition coleader who is director of marine biological research at the University of Southern California, said divers found the ice was shot through with cavities ranging in size from microscopic to several inches across. Some were enclosed by ice but others were linked by channels, including passages to the open ocean.

The holes appear to have been created when microscopic cells of algae became trapped in the freezing water. Being dark-colored, they absorbed sunlight and heat, melting a tiny cavity around them. As the algae reproduced by cell division, the hole enlarged. Despite the near-freezing water temperature, the algae, specialized over millions of years of evolution, carry out photosynthesis at nearly normal rates.

Sullivan said biologists also found other life forms thriving, such as diatoms, bacteria and protozoans—including algae-eating amoebas.

If several holes melt together and open a channel to the sea, they are quickly colonized by larval forms of krill, a small, shrimplike crustacean. Krill graze on the algae, scraping them from the solid surfaces of the ice. Fish with a natural form of antifreeze in their blood also live in the icy habitat.

When the ice melts each spring, the young krill are released from the safety of their icy nursery to live in the open ocean where baleen whales, seals and penguins feed heavily on them.

**CRREL-DPP, A GOOD MARRIAGE.** It has always amazed us that there didn't seem to be a closer relationship between the Division of Polar Programs at NSF and the Corp; of Engineer's Cold Regions Research Engineering Laboratory (CRREL). Scientists like Chet Langway, Tony Gow, Steve Ackley, and a few others at CRREL have made a good living out of working in Antarctica, but it appeared to outsiders like myself that DPP wasn't really maximizing the polar expertise that exists at Hanover. However, we were mistaken, as CRREL does supply technical support to DPP in several areas, with a dozen projects identified for the 1988-89 season. Granted some are so old that they predate Scott and Amundsen - drifting snow; another predates the IGY -

the proposed runway at Marble Point; but some are very visionary - such as solar and wind energy at the South Pole. It's good to see old Malcolm Mellor involved, as he knows a lot for a Brit. Also good to see Steve Den Hartog going back to the ice, as he has been cooped up in his laboratory for far too many years. Wayne Tobiasson has spent a lot of time in Antarctica. In fact, he spends a lot of time everywhere except at home. Fred Crory and Sherwood Reed are other CRRELites going to the ice this summer.

The identified projects where CRREL will supposedly help out are 1) solar and wind energy at the South Pole, 2) runway at Marble Point, 3) runway on Ross Ice Shelf, 4) location of blue ice runways, 5) survey of blue ice runways, 6) engineering survey of Palmer, 7) wastewater pits at South Pole and Williams Field, 8) waste management at Palmer, 9) surface vehicles (Caterpillar Challenger 65 and 1.5 ton ACV [air-cushioned vehicle]), 10) deformation of South Pole Dome and its base ring, 11) new concept designs for South Pole and Williams Field, and 12) snow drifting at the South Pole.

The one which excites us the most is the proposal for developing a runway at Marble Point. It seems to this uninformed that McMurdo should have originally been built across the Sound, and that it is inevitable that eventually there must be an all-seasonal air strip on Marble Point. They are going to look into 1) permafrost conditions, 2) sources of rock fill and gravel, 3) ripping and quarrying operations, 4) cut and fill options, 5) site drainage, and 6) location of parking apron and other facilities. Construction plans and schedules will be made for a phased construction program. The first phase would include the construction of a limited length, gravel-surface runway. This limited effort would extend over a two-to-three year period, presuming only four months of work can be done each summer. The second phase would include lengthening of the runway and the construction of other auxiliary facilities. The third and final phase would concentrate on the paving of the runway, taxiway and parking apron, with a low-temperature asphalt. A report covering all three phases will be furnished NSF by next June.

Photovoltaic systems are going to be reviewed, and their performance characteristics compiled relative to possible usage at the South Pole. Wind generators will be reviewed, with particular emphasis on vertical axis and other turbines suitable for a cold climate. The economics of conventional energy-generation at the South Pole will be considered, together with a study of use patterns and energy losses. This study should be of particular interest to Ron Thoreson of the National Parks Service, as after his days with Holmes and Narver McMurdo, one of his duty stations with the National Parks Service was at one of their sites where they had an extensive photovoltaic system.

The South Pole concept design studies are interesting in several aspects. First, the station must remain the Crown Jewel of U.S. Antarctic stations; second, it has to maintain its profile as one of the most unique scientific laboratories in the world. Where else do you have a one-day, one-night year with near perfect weather, with no camp intruders for three-fourths of the year? Nowhere! It's going to be hard to find a better design than the current geodesic dome. Right now they are planning on the current station being useful through the mid-1990's. One of the concepts mentioned as a possibility is of several well-insulated, two-story steel-frame buildings elevated above a platform of compacted snow, which would be raised by a jacking mechanism or by being moved with tracked transporters. As one who lived for several winter months in one of those buildings (Dye II, Greenland), I hope that this suggestion meets an untimely early death before too much money is wasted. It's a lousy way to live. People become elevated moles, never going outside.

**YOU, THE READERS, SPEAK.** As we put this one together, we have about 150 forms

back. We haven't catalogued them yet, but it looks like less than ten percent are unhappy with the format. The biggest complaint is that we are too personal, not enough science. Our answer to that is, if you want science, get it from scientific journals. We feel people make the news, and that Antarcticans are real characters, or else they would be back home in Peoria taking care of crabgrass in their front yard, and working an eight-to-five job at Caterpillar . . . . . Bill *Westermeyer* says it's "too long and too chatty, and who cares about such things as dedication ceremonies at Chinook Kennels? .. far, far too much emphasis on obituaries." Answer: don't knock huskies, as the Japanese found out when they left dogs over winter in the Antarctic, bringing down the wrath of the whole country upon their necks. Real Antarcticans love dogs and ships! As for obits, we can't help it if people die. Our Society includes members from all expeditions - BAE I to date - and in keeping with our policy that people make Antarctica, their deaths are noteworthy . . . . . Alan *Cockrell* writes that the Newsletter "reads like a Moose Lodge newsletter." I really cannot answer that one, as I'm not a Moose Lodger, nor have I seen one of their newsletters . . . . . Leonard *Yarbrough* recommended that we "tone down the male chauvinism - my daughters and wife read it too." Leonard is number three in our lifetime to hit our male chauvinism, joining John Behrendt and Anne Cope. Really there is no hope for me, Leonard; you just can't change the spots on a leopard. Probably you should read your copy, then burn it . . . . . The best one from our stand point is a product of the pen of old *Ron McGregor*, one-time Naval commander in Antarctica, one-time big wig at the Office of Naval Research, and currently gainfully employed polar privateer in the consulting game. We won't quote all, but he did write "there are times when I hate it, times when I love it, but always it is newsy, interesting and the greatest . . . You are acknowledging the greatness of the past, the efforts of the present, and the dreams of the future." I don't mind if people hate it, just as long as they read it! If we are really paying homage to the past, present, and future, then we are achieving our personal aims. We have strived to get inputs from current Antarctic investigators, as we do want more on today's Antarctic world. That is our number one goal, to make it more responsive to the present. Those of you who are present-day Antarcticans, please send us material. . . . We'll leave the last word to Admiral *Kelly Welch* who wrote, "All of us need to hear from an iconoclastic curmudgeon, especially with regard to Antarctica."

**SNOWFLAKES.** Ill times have beset the Antarctic Hostess with the Mostest, *Harriet Eklund*, beloved widow of our founding president. She was never at a party she didn't love, and now, bless her heart, she suffered some nerve damage while on the operating table having a bone transplant. However, even though she is down, she is not out, and remains her indomitable, fun-loving self . . . . . Another one of our favorites, *Teddy Daniels*, widow of our first Honorary President (Ambassador Paul C. Daniels), also has some health problems which they have not exactly diagnosed, and she told Ruth she won't be able to return to her Connecticut home anymore, and will have to live out her life in Cajun country . . . . . A real nice person is *Anna Minevich*, who formerly was translator at the Arctic and Antarctic Research Institute in Leningrad. She has taken an early retirement, although plans on translating English books of interest into Russian. We wish her well, and will miss her, although we will still send her Newsletters just to confuse her English! . . . . Happy Birthday to *Howard Mason*, BAE I, who was 87 on October 29th. He's the only person I know who went north with Sir Hubert Wilkins and south with Admiral Byrd . . . . . Our prayers are with the young woman scientist from NCAR, *Sherry Stevens*, who had a tragic automobile accident in Tasmania, when vacationing after giving a presentation at the recent SCAR meeting in Hobart. She was evacuated to California in a MAC (Military Airlift Command) medical plane. She was in a coma for some time, but is apparently going to make it OK. . . . Real great news is a decision by the *National Science Board* at their most recent meeting to go ahead and ask OMB for additional funds to help clean up the Antarctic environment and advance safety technology!!! . . . . Happy Thanksgiving to all!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

---

Vol. 88-89 January No. 3

---

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

Paul C. Daniels

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Franke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scon McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988

*ANOTHER SOCIETY FIRST - PRESENTATION BY ANTARCTIC ARTIST  
IMAGES FROM A FROZEN CONTINENT*

by

Alan Campbell

NSF Visiting Artist, 1987-88 McMurdo Station, Antarctica  
and Athens, Georgia

on

*Thursday evening, 16 February 1989*

*8 PM*

National Science Foundation

18th and G Streets N.W.

*Room 543*

*Light refreshments - strong coffee, Keebler cookies*

Alan Campbell will have a one-man exhibit of his Antarctic paintings (10 oils, 40 water colors) in the Addison-Ripley Gallery, 9 Hillyer Court (behind the Cosmos Club), Washington, D.C., February 8 to March 4; and will present a slide talk about light and color, art and science in Antarctica to us on February 16. Make an effort to visit the gallery, and also come to hear his presentation. Bill Green, of Miami University wrote, "We need an artistic complement to our science, an aesthetics of the continent, an art and poetry that can help us interpret and recreate the stark geometry of its landscape, the soft, almost preternatural quality of its light, the strange sense of deep, pre-human time that one feels there." Attendees will be given a poster of "Below the Rookery," an oil painting of five Adelies at the water's edge - one looks very pregnant.

Alan is a young 38 who studied fine arts at the University of Georgia (BFA and MFA). He did further studies in Italy (Cortona) and at the University of California in Berkeley. Then he "brushed up" at North Haven Island in Penobscot Bay, Maine where he learned to appreciate the real beauty of light, qualifying him to go to Antarctica!

!!!! TERRA NOVA plays in Arlington, Virginia in mid-February !!!! (see page 6)

This Newsletter was held off on the speculation that Norman Vaughan would be coming to Washington to help lead the Alaskan entry in the Inaugural Parade down Pennsylvania Avenue, but it turned out at the eleventh hour that Norman and Carolyn could not get away. However, we have a real good program lined up for next month, so we left the golden-roofed house in Maine for a week to come to Washington to get out this Newsletter. Building a house is stressful, frustrating, heart-breaking, but exciting. Quality carpentry is pass£, though, and I'm anything but a gracious, forgiving home builder. This hiatus to Washington probably saved a few lives, especially my own. Meanwhile, this column remains a potpourri of some truths, some fabrications, and some offbeat thoughts. It is NOT the voice of the Society, but we still hope you will read it.

**BRUCE MANHEIM'S PRESENTATION.** Our last meeting on 28 November 1988 (Bruce Manheim - *Securing Environmental Protection in Antarctica*), probably should have been held off until spring and presented as a Memorial Lecture, but for the sake of timeliness following the late summer '88 publication of *On Thin Ice*, we scheduled him for our first Washington fall meeting. We asked Manheim to move up his presentation to November so we wouldn't conflict with the three-week continuous Christmas party that goes on in Washington in December. And we also picked a date when Peter Wilkniss would be in town - not easy. What follows is strictly hearsay, as this soul was house-building in Maine. Unfortunately, and we think unwisely, it was decided not to tape his presentation. It would have made a good newsletter.

Feisty, ubiquitous George Llano, who had recently read *On Thin Ice* took \$500 out of his vault and paid his way to Washington to hear Bruce and challenge him on twelve issues. The post-game discussions evidently evolved into the Bruce and George Show until it was decided by Vice President Ned Ostenso that it was time to vacate the building and all hands make their way safely home. Later in the week Bruce sent a most detailed (six pages, single spaced) reply to George, addressing all of his questions. Then George wrote Bruce on 12 December a sort of conciliatory letter which indicated they had many of the same concerns about preserving Antarctica. In a humbling act, George wrote Bruce, "I admit losing contact with reality in not keeping to an impersonal approach. I very much regret this and trust that you may accept my apology." George must be aging faster than I thought! He left the door open for Bruce to continue their dialogue on a one-to-one basis. P.S. One thing I got out of George's letter to Bruce was that he had made some forty-five tourist cruises on the WORLD DISCOVERER, SOCIETY EXPLORER, LINDBLAD EXPLORER, and LAPATIA. George must know more old wealthy women than all the rest of the Society members put together, as don't all octogenarian dowagers go to Antarctica in a last gasp effort to find another husband, or, failing that, settling for a rock hopper?

**OHIO STATE'S BYRD POLAR RESEARCH CENTER OPENS ITS DOOR, ITS HEART.** We went back to Ohio State University for the celebration of the 100th anniversary of the late Admiral Richard E. Byrd's birth. We weren't exactly prepared for the visual shock of Mendenhall, having sort of talked ourselves into believing that down through the years the Institute of Polar Studies, now the Byrd Polar Research Center, might be occupying spacious, luxurious facilities. As we entered the building, we had to plow through hundreds of flyers on the floor, and avoid students sitting like street beggars against the walls. When we got to the Center, it looked like a throwback to the real old days. Entering Peter Anderson's office would have been a cultural shoe!

if I hadn't once worked for the late meteorologist-geographer, Charles F. Brooks, as only his desk exceeded Peter's in piles. How Peter ever finds his way through the day is totally beyond me. However, if you have any doubts about the Center based on its physical appearance, they are immediately dashed when you start talking to David Elliot, who could charm the skin off a snake.

The three days in Columbus were thoroughly enjoyable, and we even got to like Mendenhall. People make events, not buildings, and the Columbus meetings were honored by "a flock of Byrds" (borrowed without permission from Larry Gould's presentation in Winchester, Virginia on the occasion of the 50th anniversary of Byrd's flight over the South Pole). One of the late Admiral's two living daughters, Boiling Clarke, one granddaughter, Ann Stabler, and three grandsons, Robert Breyer, Leverett Byrd, and Harry Byrd were there. The trip to Columbus had to be a bittersweet one for all of them, but especially for Leverett and Harry, as their father had so recently mysteriously walked into death. However, their trip had to be joyful when they saw the excellent exhibit of memorabilia of the Admiral's set up in the University Library.

There were two dinner/banquet-type meetings. Ohio State hosted a large reception prior to the dinner which preceded the lecture by Al (BAE II) Lindsey. One never knows for sure what will happen at a reception, which was particularly true for Bill "Whirlybird" McCormick (BAE II), who was aghast to find the ski from his old autogyro at the entrance to the hall. At the same reception, Robert Byrd Breyer and that chocoholic doctor, Michele Raney, found out they not only come from southern California but from the same neighborhood in the same town. Colin Bull met Joe Hill, also BAE II, and the next noon visited one of his old bookstore hangouts in Columbus, picked up a copy of Joe's Antarctic book, and got him to inscribe it the next evening. The good thing about this-reception was that it was sort of endless, so there was plenty of time for meeting and talking. This was followed by a dinner which verged on catastrophic, as there were twice as many people who wanted to eat as there were plates. Somehow or other they accommodated all out-of-towners, with students and faculty being herded off to McDonald's. Al Lindsey, assisted by Bill McCormick, spoke about BAE II, and Byrd and Siple. Some excellent old films were shown, and an in-depth look at Paul Siple was given by one of his closest friends, Al Lindsey. Of all the ice-party scientists from the two Byrd expeditions, Al is probably the most active scientifically, and certainly the most mobile. However, as he pointed out, even though he wintered over at Little America II, he never really got to know the Admiral very well because he spent so much of the winter at Boiling Advance Base.

The next day the OAEs got together to show some old film, and a non-explorer, Tom Poulter, Jr., stole the show by showing about seven or eight reels of his father's films from BAE II (he was deputy commander and chief scientist). Tom had seen the films many, many times, so he was well versed on the scenes. These films are one-of-a-kind, and have not been seen by the public per se. They are excellent quality and tell an amazing story, constituting a polar treasury of archival material. The late Murray Wiener had an Air Force movie on the construction of the original South Pole station which was new to everyone, but it was much too professional to steal the glory from Poulter's old films. It was great to have Murray there to comment on the film, as he had served as the technical director for the film. Dick Conger, who was Mr. Early-Days Deep Freeze Photographer, closed out the show-and-tell session, with a slide show of a bit-of-this, a bit-of-that.

The evening of the Memorial Lecture brought the two-day party to an end. There was a timed reception, followed by a very nice dinner, and then the presentation of the 1988 Memorial Lecture by Peter Anderson. We have spoken before about the poise, the charm, the sociability of Robert Byrd Breyer, and he demonstrated again his captivating personality when he asked to say a few words on behalf of the Byrd family prior to the dinner banquet. He showed the gathering a beautiful banner of the

Antarctic continent with plane superimposed, which his wife and a friend had made for him to take to the South Pole on the commemorative trip celebrating the 50th anniversary of Byrd's flying over the South Pole. While at the South Pole, Bob and Norman Vaughan held the banner while photographers snapped. Again, Bob asked Norman to join him holding the flag while the audience applauded. He then presented framed copies of the picture to both the Byrd Polar Research Center and the Antarctic Society.

The Memorial Lecture by Peter Anderson went off very well. Peter has done thorough research on the late Admiral, and I dare say that some members of the Byrd family in attendance found out things about their famous relative which they may not have known. Peter has accumulated a wealth of photographs on REB, and one came away from the meeting with the fervent hope that Peter will find time somehow to get his biography on Byrd published.

Everyone had a great time, and the Byrd Polar Research Center were great hosts. Bob Breyer wrote, "This was an absolutely fascinating 2-day event and was a huge success from all appearances. It was certainly good to rub shoulders with so many Antarctic veterans I have met through the years, and to relive the Admiral's expeditions through film, slides, and the spoken word." And the distaff side had a good time, too, as Whirlybird's wife, Mimi McCormick, wrote, "There aren't adjectives enough to tell you how much I enjoyed being a part of this wonderful gathering - the thrill of a lifetime."

Thank you Peter, thank you David, thank you Byrd Polar Research Center, and last, but not least, thank you Woody Hayes for making Ohio State University a reality!

**MR. POLAR TIMES SIGNS OFF AT AGE 78.** When one spoke of the American Polar Society, one was actually speaking of August Howard, for even though their letterhead was a litany of Who's Who in the polar regions, August was the titular head. For the last fifty-four years August has turned out semi-annual copies of the *Polar Times*, which he laboriously put together in his small apartment in Rego Park in the Queens (N.Y.C.). Anyone who had an interest in the polar regions back in the 1930s and 1940s joined his society, and its membership totalled over 2,000 members. Beside: having a ridiculously low fee for membership, August insisted on spending a significant portion of the membership fees in buying commemorative stamps which handsomely decorated each mailing.

The American Polar Society and the *Polar Times* will live on, although by whom and in what format is still being discussed by parties involved. It seems that Milton Brown of the New York Times succeeded Ned Ostenso as president of the Society, and he and Dick (Little America V) Chappell have been working on a survival plan, which they do not wish to divulge at this time. However, we know from talking to other polar people that there is a university with a strong polar interest which, in all likelihood, would be willing to take it over.

We never had the pleasure of meeting August, although we corresponded somewhat irregularly down through the years. Several years ago our Society made him an Honorary Member, so his name will forever be on our masthead. The late Paul Siple was very close to August, and August publicized Paul, as Paul did August. It was natural for August to have a professional interest in Paul's achievements, as he was a publicist with the Boy Scouts of America when Paul was, to borrow a phrase from Pat Wilson, an Eagle on the Ice. August also worked somewhere along in his career for the New York Times, and the *Polar Times* never missed a New York Times polar article.

August never visited either polar region, although he is ensconced on Antarctic maps (Cape Howard on the Weddell Sea and the Polar Times Glacier). August died of a heart ailment on 4 December 1988, while at home with his wife Rose. His health had been

failing since early fall, and in the end there was something very Scott-like in his death. Collapsing into his wife's arms, he simply said, "Let me lay here," and in a few minutes he was gone. Besides his wife Rose (98-20 62nd Drive, Apt. 7H, Rego Park, New York 11374), he is survived by twin children Alan and Doris. Our deepest heartfelt sympathy to the family.

Incidentally, August changed his last name from Horowitz to Howard, so those polar philatelists who have covers signed by August Horowitz, and there are some in circulation, you have a bona fide August Howard, nee Horowitz cover.

**MURRAY WIENER DIES WITH CLASS.** Murray Wiener must have written his own script for dying, although he surely never programmed it to happen so soon in life; he died on the operating table Christmas Eve at the still tender age of 72. The day before he went into the hospital he had shot the best round of golf he had played in a decade, and to cap off the day he and Ruth, his wife, had gone out to a private club in Tucson to have dinner and enjoy an evening of dancing. Originally Murray thought that what he was experiencing was just a little indigestion from eating duckling, but Ruth insisted he should go to the hospital. It turned out it was much more than indigestion, and he died while undergoing open heart surgery.

Those of us who saw him in Columbus in late October on the 100th anniversary of Admiral Byrd's birth saw a handsome man, beautifully clothed, eyes twinkling, full of laughter, enjoying associating with some of the OAEs. He narrated an Air Force film on the construction of the original South Pole station. True, he had experienced a heart attack at age 47, and came out of the service with a 30% disability; but he had been a very active man in retirement, being vice president of a savings and loan institution in his hometown of Green Valley, Arizona. He was married to a former Syracuse University Winter Carnival Queen, who to this day is still a queen - a diminutive vivacious blonde who filled their home with cheerful whistling. Several years ago a former associate of Murray's asked him to help out by trying to sell some wickedly expensive condominiums in Marina del Ray, California. Murray was reluctant to give up his daily golf rounds in Green Valley and trout fishing in the Pacific Northwest during the summer, so he told the guy he would come under one condition, that he would get out after one year, whether he had sold one, ten, or twenty condos. It turned out he sold all seventy before the year was up!

Murray went to Antarctica five different times. His baptism was on the U.S. Antarctic Service Expedition, 1939-41, when he was aurora observer at West Base. Then he participated in Operation Highjump, 1946-47; went down with Admiral Byrd on the ATKA prior to the IGY; and then participated in both Operation Deep Freeze I and II. Wiener Peaks, 76°49'S, 144°30'W, are named for Murray. When Admiral Byrd died in the spring of 1957, it was Murray who was contacted to visit Arlington Cemetery to pick out the burial site for him - and it's a dandy, if a burial site can be a dandy, as it has a great view of Washington. It was most appropriate that Murray's last polar trip should take him to the Byrd Polar Research Center at The Ohio State University where he not only talked about leaving certain items to them, but had a chance to meet and to revel in the companionship of three of the Admiral's grandsons and a granddaughter.

Life was a bowl of cherries for Murray, but he made it that way by hard, industrious work. Orphaned at age twelve, he died a millionaire. Ruth said he never believed in luck, but that one should recognize opportunity and grab it. The two of them believed in the quality of life, not quantity of life, and Ruth feels they had the greatest of life together. Besides his wife, he leaves one daughter, Wendy. (Mrs. Murray Wiener, 165 East Paseo de Golf, Green Valley, Arizona 85614)

**ALZHEIMER'S LINKED TO RICHARD E. BYRD, JR.'S DEATH.**

Dr. John E. Smialek, Mary-

land's chief medical examiner, said that Alzheimer's disease was a contributing factor in the bizarre death of Richard E. Byrd, Jr. His actual death t\*as the result of malnutrition and dehydration, but Dr. Smialek said that he was in "the early, early stages of Alzheimer's, because he did not exhibit a lot of atrophy in the brain." He explained that the disease destroys brain cells, and the resulting loss of tissue causes the brain to shrink. According to Dr. Smialek, microscopic examination of brain tissue revealed the presence of Alzheimer's, the degenerative brain disease that erodes memory and intellectual ability, and causes confusion and loss of concentration and judgment. Family members had thought that Richard's behavior seemed eccentric at times, but apparently they did not suspect Alzheimer's. (The above was taken almost in total from the Baltimore Sun of 28 October 1988.)

**BYRD'S MUKLUKS, PENGUINS, DRESS SABER, ETC. NET OVER 200K AT AUCTION.** Herb (South Pole '57) Hansen sent us a clipping from the Omaha World Herald of 24 October with a QPI release out of Lynnfield, Massachusetts, that belongings of the late Admiral Richard E. Byrd netted his heirs more than \$200,000. About 500 bidders came from across the country, Canada, and England. More than five hundred items were sold. Items worn by Byrd were auctioned off in lots that drew between \$50 and \$1,000. Twelve handguns sold for between \$250 and \$1,300. There were twenty-one log books from Byrd vessels (the BEAR OF OAKLAND and the USS JACOB RUPPERT) which brought a total of \$700. Several stuffed penguins went for \$1,000 each. A volume of tributes, including one from Teddy Roosevelt, sold for \$1,450. The Naval officer's dress saber given to Byrd in 1930 by the State of Virginia went for \$9,500. It seems rather sad that the court and executors decided that these things had to be auctioned off. Byrd's son evidently opposed the auction, as the article quoted Adrienne Serwo, vice president in charge of estate settlements for Boston State Street Bank as saying, "He wasn't happy about it." But as a very attractive wife of a former co-worker of mine once said, "We all have our price."

**TERRA NOVA PLAYS IN ARLINGTON IN MID-FEBRUARY.** Ted Tally's *TERRA NOVA*, which has been gracing theater stages for the past five years or so, is to be put on by the Arlington Players in the Thomas Jefferson Community Theater, 125 South Glebe Road, Arlington, VA in mid-February. They will have a seminar "Tracing the Tracks" following the matinee on 12 February, with our own Gerry Schatz and Dick Conger joining the director, Don Martin, the cast and the staff to discuss the play and the general subject of Antarctic exploration. There is a special price of \$5 for Society members, even for the performance with the seminar. Call Barbara Hyde on 354-3839 for reservations - all seats are reserved - and tell her you are an Antartican Society member. Matinees are at 2:30 PM on February 12th and 19th, and evening performances are at 8 PM on February 10th, 11th, 16th, 17th and 18th.

There should be no need to tell you folks that *TERRA NOVA* is the story of Scott and Amundsen, and that the play has been a big hit in many, many cities. If you have not seen it, why not support the Arlington Players? How can you go wrong for a little old five-spot? You can't!

**MORE ON NORMAN VAUGHAN.** The youngest person at the 1988 Antartican Society Memorial Lecture was 82-year old Norman Vaughan of Trapper Creek, Alaska. He is also the youngest member in our Society. As anyone who has read this column knows, Norman is still going full throttle cavorting around with his new 46-year old bride, prancing around Greenland trying to extricate some old World War II planes buried under 260 feet of ice. still racing in the 1,049-mile Iditarod, and planning on taking a dog team to Antartica to travel up the Vaughan Glacier.

Norman looks like a 55-year old bank president, wears clothes smartly and resembles

a Harvard man, which he was until he became a dropout to go south with Commander Byrd in 1928. You get the feeling, talking to him, that there is nothing he ever wanted to do which he hasn't tried. One presidential inauguration he represented the state of Alaska by driving his dog team down Pennsylvania Avenue, and he enjoyed basking in the platitudes of the multitudes lining the parade route. So the next inauguration he loaded his dog team and sled into a vehicle and headed towards Washington. When he got there, he called up Senator Stevens' office and asked to be put in the parade. As Alaska already had an official entry, he was turned down. But this didn't phase the ingenious Norman, as he was well aware of how entries lined up on side streets and merged into the parade. So he found a nice little quiet side street, waited for an opening, and when his dog team saw a handsome team of horses coming down the parade route, that was all Norman needed. He and his dogs pulled sprightly, and before you could say Norman Vaughan, there he was in another inaugural parade.

Norman does not limit his extracurricular activities to presidents, as he had an affair with the current Pope when he stopped off in Anchorage in 1981. He knew that Pope John Paul II was an ardent skier, and figured he would enjoy a nice little dog sled ride, so he met the plane and volunteered to give his Holiness a ride. First he told the Pope that two of the dogs on his team were named Devil and Satan, and asked him if he wanted them taken out of the traces. The Pope went along with them, probably figuring that a little bit of the dogs was in their leader, and taking the dogs out would not remove all the risks! Norman figures taking the Pope for a short ride made him more or less the official Vatican dog sled driver, so when it came time to come up with the entry money for the 1982 Iditarod race, he wrote the Pope, reminding him of their meeting, and asking if His Holiness would like to make a monetary contribution so that he could enter the race. This was one time when Norman struck out.

Norman is very interesting to talk to, as he has all the enthusiasm of a young stud of eighteen years. He is real gung ho about going back to Greenland and retrieving those bombers and six fighter planes which crashed on the ice cap back in 1942. The first one came in with its wheels down and flipped, but the rest bellied in and were in good shape. Since it's Danish territory, the first plane will be given to Denmark. Norman had never talked to a bona fide glaciologist about the retrieval until he met Ellen Mosley-Thompson at Columbus in October. A sign of the times - a relatively young, very petite woman glaciologist telling an Old Antarctic Explorer what it is really like when you get below the snow surface!

When the Faculty Club dining hall conducted their monthly inventory for October, they came up with a startling revelation, an inordinate number of after-dinner mints were consumed during the period of time when the polarites were celebrating Admiral Byrd's 100th birthday. We have some insight as to where they went, as Norman's heavy hand emptied several large spoonfuls of mints into the pockets of a very embarrassed Ruth Siple! OSU's loss is our gain, as Ruth has a great minty breath this winter.

**SOVIETS MAKE FIRST EVER INSPECTION OF MCMURDO AND SOUTH POLE.** Although Soviets have been to both McMurdo and the South Pole stations many times, their first official Antarctic Treaty inspection tour of Antarctic bases was conducted this past austral summer. They travelled first class in an Antonov AN-74 (NATO-Coaler), which is sort of a sensational aircraft in that it can touch down relatively easily on unprepared landing strips and does not require a long runway. It was described in the March '85 issue of the Air Force Magazine, but because we don't have it at hand, will hold off on describing the plane in detail until the next issue. But it can do fantastic things like landing on snow, being the first wheeled aircraft to land at Vostok, and stopping in less than 2,000 feet, as it did at McMurdo. When it touched down at Vostok, it supposedly only made a foot imprint of a couple of inches; this was on their regular runway, not on hardened runway.

The AN-74 was brought out in the mid-80's, being a newer version of the An-72 which

came out in 1977 and was shown to the world at the Paris show in 1979. It is 87' long, has a wing-span of 84'9", has five wheels, cruises at 36,000', has a maximum speed of 447 mph, and a range of 2300 miles. Slightly better than an R4D or a Ford Trimotor! The designer of the AN-74 planned it to be a wheeled/ski landing aircraft, but the test pilot who flew the plane into McMurdo said the skis had never been placed on the plane.

Twenty-four Soviets were aboard the aircraft, which included a flight crew of thirteen, an inspection party of eight, and three senior scientists. They were taken to the South Pole in a Here, where the inspection team spent eighteen hours. Maybe the highlight of the whole visit was when a very senior Soviet scientist, apparently aware of the psychotic nature of the USARP representative at McMurdo, tried to have some fun with him by telling him that he hated to leave after having an affair with a young American woman at the South Pole. His little joke completely self-destructed the USARP man - at least that is what we heard!

**HOVERCRAFTS BETTER THAN SIBERIAN PONIES, OR SIBERIAN HUSKIES.** It appears that air-cushion vehicles will soon become an accepted way of surface transportation over relatively smooth Antarctic surfaces. During the current austral summer, the one at McMurdo got up to 45 knots on smooth ice! The vehicle is a Hoversystems 1500 TD "Husky", a version of the British Griffon 1500. It is 33.3 ft. long, 12.5 ft. wide, and height (off hover) is 8.8 ft. It has a welded aluminum hull, which incorporates 250% buoyancy in sealed compartments. Empty, it weighs 5,071 pounds, and its payload is 3,307 pounds. The engine is a Deutz's 190 hp, air-cooled, turbocharged diesel. Fuel consumption is between four and six gallons per hour. The design speed over water is 38 mph. The Husky uses a centrifugal fan driven from the front of the engine to feed a loop and finger skirt; the propeller is a four-bladed, laminated wood, fixed-pitch design that turns in an aerodynamic duct.

**B-9 CURRENTLY GROUNDED.** Remember that big berg that broke off from the Ross Ice Shelf about fifteen months ago, the one that was 98 nautical miles long, 25 nautical miles wide? She is still a respectable sized ice cube, being 76 nautical miles long by 19 nautical miles wide on 18 January '89, but she has temporarily gone aground. It really has not moved a great deal, being at 77°08'S, 171°39'W. The Joint NOAA-Navy Ice Center is currently tracking nine bergs, although B-9 is certainly the biggest by far. If a berg isn't fifteen miles long, they just don't bother with them -we think.

**TIM HUSHEN GOES SUB-TROPICAL.** W. Timothy Hushen, whose name has been synonymous with beautiful women, has recently accepted a position at San Diego State University, ending more than a decade (14 years) of internment on the National Academy of Sciences' Polar Research Board where he served in various capacities, retiring as its Staff Director. As we go to print, there is no heir apparent. Andrea Smith will serve as Acting Staff Director until they can fill the position. Tim will be a consultant until the position is filled. Having attended PRB meetings chaired by Link Washburn, Charley Bentley, and Gunter Weller, they all more or less blend together. There are always a couple of talkers, always a couple of sitters, always a couple of absentees, but there was one highlight - the pastries put out when Ruth Barritt was associated with the Board! And who can forget when Tim was going with Judy Nelson and she showed up for their receptions! It never was the same after Tim joined Gentleman Jim Zumberge in Tinsel Town. Tim is married to a California lover, and it looks like she has converted him into a west coaster. Actually Washington can get to be a bore after awhile, as no one can really love its traffic, its heat and humidity, its crime, its drugs, its Redskins mania. We appreciate the help that Tim has given our Society down through the years, and we certainly wish him the best.

**GREENPEACE, AN ANTARCTIC FOLLY?** Seeing a picture of Greenpeace demonstrators being dragged from the path of bulldozers at Dumont d'Urville (Boston Globe, 8 January 1989), one wonders what the real impact of Greenpeace is in Antarctica. We had an interesting letter from old Rob Flint the other day, one in which he spoke of the Antarctic environment, which is dear to him as it is to all of us. He started out saying that he was sorry he could not hear Bruce Manheim's presentation to the Society, as he had talked to Bruce about their common interests. Then he went on to say, "I think that in general the Environmental Defense Fund is the most business-like and well-informed of Antarctic environmental critics." Rob has just finished six years on the Board of Directors of the Sierra Club Foundation - the tax-deductible arm of the Sierra Club. He wrote, "Occasionally people on the club side (the activist and political side of the organization) asked me about the role the Sierra Club should play in Antarctica, and I've always thought that the continent is in relatively good hands with its occupation by scientists opposed to commercial exploitation, and that therefore the conservation dollar could better be spent at home and for tropical forests. The biggest waste of all of conservation dollars, in my opinion, was the Greenpeace Antarctic expedition."

**THE VOICES OF YOU MEMBERS.** It is always good to get those forms back from you folks and to see where we are failing or what you want. To date we have heard from 62% of the Society, or 386 members. For the first time ever, we had three requests for pictures. *Mart Rubin* repeated an old chestnut, "make them less wordy." Well, *Mort*, it's too late to change spots on a leopard. It would not be me to be clear, concise, to the point..... *Steve Corey* wrote, "less emphasis on the drinking habits, at parties, etc. It doesn't prove anything." .... We weren't exactly sure what our writing style was, thinking that it was locker room circa 1947, but we found out from the erudite Antarctic writer-librarian, *Harry King*, of Scott Polar Research Institute, that it was "punchy." He wrote, "May I add how much the *Newsletter* is valued here, not only for its useful information but it is an extremely good read thanks to *Paul Dalrymple's* punchy style." .... There were no comments on this go-round on our male chauvinism! Either we are improving or you folks have given up. *Aileen Lotz* will let me know in her next communication! .... *Charges Swithinbank*, one of our esteemed Board of Directors, probably summed it up pretty much as it is when he wrote on 13 November 1988, "While we do not always endorse your judgments on events and people, the fact is we read them, and the steadily increasing circulation has been a direct result of your timely news, gossip, and scandal."

It was interesting to read two professional writers' opinions on this column. *Harold Helfrich* wrote, "that request for members to resign was the ultimate in toothless snobbery. More legitimate Antarctic news and less of the 'old boy' syndrome (sophomoric!)." I dare say if Harold ever sent out repeated notices to delinquent members that he too would be at the head of the line requesting the uninterested to drop out. This is a non-paying job, strictly for the love of being associated with something Antarctic. The worst part is folding, stuffing, and licking 600-odd envelopes, and we don't need excess deadwood in the pile. As for being sophomoric, everyone reaches their zenith according to Peter's Principle, and it just happens that I found mine in my sophomore year. In my defense, may I present *Arville Schaleben* who wrote, "Excellent in concept, content, composition, completeness - and damn the ice, sail on, sail on, oh polar voice! There is no other likely, out there in the boondocks." I will buy Arville a beer, oops, a milk shake, the next time I visit Milwaukee.

**SNOWFLAKES.** The Satchel Paige of NOAA, *Joe "First at the North Pole" Fletcher*, formerly Director of the Division of Polar Programs, NSF, recently left a high and mighty NOAA administrative staff position to become Director Again of their Environmental Research Laboratories in Boulder, Colorado. Joe will never retire, as he refuses to look over his shoulder to see who is catching up with him. We asked someone who should

know how old Joe was, and they said "70". Joe has looked 70 for the past twenty years. .... *Jerry Kooyman* of the Scripps Oceanographic Institution, has recently returned from Cape Washington (near Cape Hallett) with four baby Emperor penguins who are about four months old. Physiological studies will be done on the unlucky chicks back in San Diego. Wonder if they will get to spend holidays with other Emperors in the San Diego area, namely, those at Sea World? .... A new member, *Ann Bowles*, who describes herself as a "penguinologist" is completing a thesis on "Individual Vocal Recognition in the Emperor Penguin, *Aptenodytes forsteri*." Ann is with Sea World Research Institute in San Diego..... *John Lynch* says that *Eric Siefka* is the No.1 South Pole Citizen, having spent a total of 36 months there (including two winters). Can anyone total more than 36? We doubt it! Several of the Pole Builders who were there with *Siple* in 1957 went back for a second winter, so perhaps should get double credit for that first year because they had to build the station..... *Capt. Paul Derocher*, CO of VXE6, '85-'86, is writing a book on U.S. foreign policies in Antarctica for the Institute of National Strategic Studies at Ft. McNair in Washington. That's a great place. The National War College building is one of the most interesting buildings in all of Washington ..... *Robert Grass*, who was in charge of atmospheric ozone measurements at the South Pole in 1964, has been in charge of the U.S. Dobson Ozone Spectrophotometer Network since returning from the ice. There are sixteen stations in his network, including such exotic places as Caribou, Maine; Mauna Loa, Hawaii; Lauder, New Zealand; Perth, Australia; and Tutuila Island in the American Samoa. Over the years he has modified and recalibrated over 50% of the 95 instruments. - Antarctica has surely been a good stepping stone for many of us .... *Emmy Lou Schenk* wrote an Antarctic murder mystery, "Ice Cave" which appeared in the August 1987 issue of the Alfred Hitchcock Mystery Magazine. Did any of you folks read it? .... There is a hundred-foot long mural entitled "Penguin Rush Hour" inside the concrete walkway to the Silver Spring Metro subway station in the DC area. It is one of nine artworks being put up for a yearlong stay to soothe travelers - 30,000 human riders use the Silver Spring station daily. The artist, *Sally Callmer*, 34, said she chose penguins "because they have a lot of class." She has been working on it since May, using plywood and exterior house paint. I'm sure some of the penguins must look like *Ken Moulton*, *John Katsufakis*, *Bill Cassidy*, *Art DeVries* ..... New addresses: *Sill Sladen* - P. O. Box 367, The Plains, Virginia 22171, and *Afort* and *Joanne Turner* - 701 Crescent Drive, Boulder, Colorado 80303 ..... At long last, *Antarctica* by *Vangelis* is finally available on a Polydor compact disc. This great music is from *Koreyoshi Kurahara's* film, "Antartica." The eight parts are: Theme from Antarctica, Antarctic Echoes, Kinematic, Song of White, Life of Antarctica, Memory of Antarctica, Other Side of Antarctica, and Deliverance; they were composed, arranged, produced and performed by *Vangelis* ..... As we go to the printer, the plane-supported skiers who each paid \$70,000 plus for the privilege of skiing 725 miles on the Polar Plateau have arrived at the South Pole. Two of the eleven Affluent Ones were females, one being a 24-year old divinity student from Harvard University, the other a 39-year old blonde from Capistrano, California who apparently has a well-greased press agent. The divinity student was quoted as saying, "I haven't found God yet, but I have a new meaning for hell freezing over." The skiers were at the Pole for 90 minutes before being flown back to civilization and interviews and pictures. Ho hum, how exciting!

\_\_\_ And, in closing, I will toss this out for an insignificant, worthless record. This hapless soul went over eleven years without missing a Society lecture, attending 65 consecutive ones from March 1977 until *Bruce Manheim's* presentation. I just could not leave those would-be carpenters alone with my house in their hands..... There have been 141 lectures in the 40-year history of our Society. Although we don't know the exact date the Society was organized at *Carl and Harriet Eklund's*, we do know that the first meeting with a program was held on 19 November 1959. If any of you oldies know when the organizational meeting took place, please notify *Ruth* at the Nerve Center Speaking of *Ruth*, she did a fantastic solo job all through the fall handling the calendar mailings, and checks for membership- and refunds. *Merci beaucoup!*

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 88-99

April

No. 4

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90

**Honorary' Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988

*THE ANTARCTICAN SOCIETY AND THE NRC'S POLAR RESEARCH BOARD*

present

OIL SPILL AT PALMER STATION

by

Dr. Ted E. DeLaca  
Head, Polar Science Section  
Division of Polar Programs  
National Science Foundation

on

*Thursday evening, 4 May 1989*

*8 PM*

The National Academy of Sciences  
2101 Constitution Avenue N.W.  
Washington, DC

**PRECEDED BY**

*Cocktails in the Great Hall at 5:30 PM  
and*

*Dinner in The Members' Room at 6:45 PM*

Dr. DeLaca is half-Californian, half-Antarctican. As an undergraduate major in biology, he specialized in aquatic microbiology at the University of California at Davis. He obtained his PhD in ecology at the same university, writing his thesis on the benthic ecology of Antarctica. Prior to coming to NSF in July 1986, he had twelve years of Antarctic research. He has been a college professor at Davis and also at the University of Washington, and also a research biologist at Scripps Institution of Oceanography. He's the Perfect Man to talk about the Pilferage of Palmer.

For those who come for the whole evening, do we ever have a bargain! For only \$25 you get cocktails, then a dinner of chicken with pesto sauce, zucchini and yellow squash, some rice, good old French bread, a drop or two of white wine, and some cool chocolate mousse. Andrea will take care of Board members. The rest of you PLEASE send your checks to Ruth Siple, 905 N. Jacksonville St., Arlington, VA 22205, by Saturday, 29 April. Washington in early May is FANTASTIC. Bring your best friend. *PRIME TIME, PRIME SPEAKER, PRIME SUBJECT, PRIME COST.* Make your reservation now! Don't delay!

## GROWLERS

After four months and three days of intense frustrations and growlings, the post and beam is finally up and standing on the coast of Maine. So now it's time to take a break and growl out another Newsletter. As it was in the beginning, is now, and ere shall be, this column is nothing more than a potpourri of unconnected, disjointed bits and pieces of Antarctic items, which may or may not be truthful, and in no way constitutes the opinions or thoughts of the Society.

**MEMBERSHIP.** Membership has sort of stabilized this year. We have picked up over fifty new members, but we have lost quite a few along the way. The good news is that nearly all of the new members have an Antarctic background, and that many of the drop; were non-participants. We don't need sheer numbers.

Some good old boys (and women) who have gone delinquent are:

Dick Cameron	Jim Fletcher	Art Owen
Bill Cooke	Joan Cosink	Don Siniff
Dagmar Cronn	Bob Harler	Ron Thoreson
Alice Dater	Richard Hayes	Ken Waldron
Stephen Eittreim	Jeff Larminie	Joe Wubbold
Debbie Enzenbacher	Marc Levesque	

We would like to keep these people aboard, as there are some real good ones on that list. But on the other hand, we hate to send Newsletters to deadbeats!

**ALAN CAMPBELL BIG ATTRACTION.** Although our priorities kept us in Maine, we understand that Alan Campbell took Washington by storm. Not only was his art show highly successful, but his presentation before the Society resulted in the largest turnout that we have ever had for a meeting at the National Science Foundation. He ran out of posters for attendees, but those who got left out were given rain checks redeemable at the gallery where his paintings were exhibited. Our Honorary President bought one of his watercolors, a lovely one of Hughes Glacier in Taylor Valley. Alan is going to submit a proposal to NSF to visit the Antarctic Peninsula during the upcoming austral summer. Sure hope he makes it, that there will be another Washington showing, and that he will talk to us again so I can see and hear him. We asked Charlotte Evan the roving, free-wheeling, free-lancing writer whose name shows up occasionally on Antarctic articles in the New York Times, if she would write something on the exhibit for the Newsletter. She wasn't too enthralled to get the request after the show was closed and Alan had left town, but she decided to cooperate rather than fight, so we are indebted to Charlotte for the following:

When Alan Campbell, a Georgia artist, told people he had been selected by the National Science Foundation to go to Antarctica during the 1987-88 season, he heard a lot of "white paint" jokes.

Just how off base those were was illustrated at the Addison-Ripley Gallery in Washington in February - in blues and purples and pinks and aquamarines and golds and grays and, well, one could go on.

There was 321, the LC 130 Hercules that had been buried in the ice for 16 years, aloft over the trans-Antarctic Mountains. It was painted from photographs Alan took from the open ramp of the escort plane on the flight

back to Williams Field. There was the Polar Star at work in McMurdo Sound, a red cigar dwarfed by the Royal Society Range.

There were lots of penguins, of course, including a striking dark vision of a rookery at midnight.

"The main reason we put on the show," said gallery co-owner Chris Addison, "was to promote the idea that art is an adventure, and Alan is the definitive type who takes an idea and draws it out, like a story. People really responded to that."

Some thirty paintings were sold, he said. Penguins were popular, not surprisingly, and so were the historic huts – things that defined Antarctica as a place where adventurers had established a foothold, he said.

Mr. Addison's parents bought one of the largest paintings in the show, a lushly-hued view of icebergs at Cape Hallett. Typically, he said, they collect much more conservative art, "so to commit to something like that was a big deal."

Alan is back in Athens, Georgia now, dividing his time between painting and scheduling additional exhibitions.

Would he like to go back to Antarctica?  
Does the Polar Star break ice?

**HONEYMOON ENDS AT PALMER.** When the STATEN ISLAND left Lyttleton on 5 January 1963 to conduct a survey of Palmer Peninsula (later to become the Antarctic Peninsula) Capt. Price Lewis, John Crowell, Waldo Schmitt, and Edwin McDonald (later to become Edwin MacDonald) were entrusted to find the proper site for a permanent biological station. One of their specific directives was to find a site with "richness in biological matters." They did their work well, and found just the right place on Anvers Island, a site that was to become Palmer Station. Marine biologists have flocked to Palmer since the early 1960's, and the National Science Foundation has spent some 80 million dollars on the station and its research. Palmer Station has been leading a charmed life, ideally situated so that originally only purposeful scientists and visitors ever got there. Everything was rather serene, peaceful, and quiet as it should have been, but in the 1980's something was happening, cruise ships were becoming more and more prevalent. They occasionally carried some pretty influential U.S. citizens, and a decision was made at NSF that tourists would be briefed on Palmer activities as long as they did not affect the day-to-day operations of the base.

On 28 January 1989, everything which had been so carefully established and nurtured at Palmer was jeopardized when the Argentine supply/tourist ship BAHIA PARAISO visited the station. There were 81 tourists aboard, including 46 convincing Americans who talked the captain of the ship into visiting Palmer, evidently against his wishes (according to Chicagoan Karen Schmidt, one of the tourists), as it was not a scheduled stop. Ted DeLaca of the Division of Polar Programs, NSF, said the visitors "hotly debated the potential effects of tourism in Antarctica and what the environmental consequences would be if a ship went down and spilled oil." They spent three hours at the station, then returned to the ship, which weighed anchor and began pulling out. Supposedly the captain was forewarned about some undersea rocks, which one source said did not appear on Argentine charts, but others say they do. Within two miles of Palmer, the ship found the rocks, and the rocks won out, ripping open a 30-foot gash in the double-hulled, 435-foot long ship. Karen said that "dishes started coming at us. A very scared voice said something in Spanish. Since the waiters were leaving, we got the message and left." Sounds like combat, doesn't it? But from that minute, Palmer's honeymoon was over, and all hell was to break loose.

In addition to the 81 tourists, there were 236 crew members. Although people are bad enough, what the ship was carrying was even worse - 250,000 gallons of diesel fuel, a tank of jet fuel for helicopters, over 200 canisters of compressed gas (propane or butane) and about 100 55-gallon drums of an unspecified petroleum. The ship listed about eight degrees for the first two days, then took on an increased list to about eleven degrees, with an occasional dip to twenty-five degrees. Its captain predicted, with the same wisdom he conned the ship, that the BAHIA PARAISO was going to break up and sink. Probably wishful thinking on his part! On the fourth day, 31 January, the ghost ship floated free, and, as a derelict bounced along the coast. It floated free for several hours until at 2100 hours local time, it turned over against the shore. Dead!

The U.S. response to the accident should be roundly applauded. Karen Schmidt said that the base couldn't have been nicer to them. It also helped that two cruise ships, the Society Expeditions' EXPLORER and the ILLIRIA were in the immediate vicinity. In fact, the EXPLORER was due to drop anchor at Palmer half an hour after the BAHIA PARAISO departed. The EXPLORER transported 132 tourists and crew members to the Chilean base, Teniente Marsh on King George Island. The ILLIRIA transported another 80 to the same destination. One unfortunate incident happened which involved our October Society lecturer, Bruce Manheim, who was a passenger on the EXPLORER. It was claimed by the ship that NSF staff members sent a telex to the ship requesting that no one aboard mention the wreck in calls home. Manheim took exception to this, interpreting it as a gag order, and called a news conference when he got back to Washington. Jack Talmadge of NSF denied any knowledge of the telex being sent. Regardless of what did or did not transpire, I'm personally very disappointed in Manheim - it was a low blow! -as I think the whole station and NSF responded nobly and fast to a very delicate and critical tragedy, one where they put aside the loss of treasured programs and thought only of personnel and preserving what was left of their once-great environment.

Scientists from Palmer noticed a large oil slick leaking from the ship on the second day. According to DeLaca, the oil appeared to be centimeters thick on the surface of the water, turning waves brown and washing up on the rocky shores. After the ship capsized on the fourth day, larger amounts of oil spilled from the tanks and from the cargo on deck. DeLaca and his colleagues immediately attempted to curb some of the lost oil. He said, "We collected as many of the containers as we possibly could because we felt that they would confuse any salvage or containment effort ... pose a hazard to navigation in the area ... and act as little time bombs for future ecological damage." DeLaca estimated that they were able to retrieve about 130 of the large cylinders and 25 to 30 of the 55-gallon drums, though many floated away out of the recovery range. The salvage operation is still going on as we write this Newsletter, and it will be a long, long ongoing process with both Argentinians and Americans involved. Just how long it will take is anyone's guess, as the elements will determine that. The good news is that all leaks have been stopped, the ship has been stabilized, and they are still pulling oil out of the tanks.

The National Science Foundation launched a fuel containment recovery mission from the U.S. consisting of 52 tons of oil spill cleanup equipment supplied by the US Navy, and a 15-member team of experts representing the NSF, the US Navy, the National Oceanographic Atmospheric Administration (NOAA), and private contractors. A US Air Force C-5B transport left Norfolk Naval Air Station on 1 February and flew to Punta Arenas, Chile, where the NSF research vessel POLAR DUKE finished transporting the gear to Palmer. Global Associates/Phillips Gartner and Company, Inc., of San Ramon, California provided the following equipment: a 24-foot boom-handling tow boat; air compressors; 2,000 feet of inflatable boom; portable and shipboard communication devices; a 30-kw generator; a skid-mounted, portable, diesel-powered jetting pump that can pump about 500 gallons per minute (GPM) at 200 pounds per square inch pressure; a 350 GPM pumping system; a six-inch submersible hydraulic pump system; a 12-foot wide Rapid Deployment

Skimmer System, and a shop van. The floating boom was set up almost immediately by the first salvage ship to arrive, the Chilean vessel YELCHO. Other equipment was a 36-foot boat for skimming the fuel off the water; chemicals to absorb the fuel; floatable bladders to contain the contaminants once they were collected; a tug boat to move the equipment on the water; a special vehicle with a movable flatbed for loading and unloading the boats and containment equipment.

AS for wildlife damage, the returns aren't in from the outlying precincts, and probably won't be for years. One of the first to be affected was krill. According to DeLaca krill swimming near the wreckage were swimming erratically and attempting to jump out of the water. Several thousand dead and dying krill washed ashore along a 100-meter stretch. A colony of about 24,000 penguins is also at risk, especially hatching penguins. DeLaca was quoted as saying the oil affects the birds' insulation and buoyancy as well as causes a toxic effect when ingested (as penguins are prone to do while preening). Scientists did consider screening the penguins away from the water, but realized that this was impracticable, as it would have required thousands of pounds of food organisms and a heck of a lot of effort to feed them. Researchers estimate that the spill might cause the penguin mortality rate to reach 40%. The young skua population has been wiped out. There are around 760 pairs of adult skuas in the area, and when they carried the oil-coated krill to their nests, the results were disastrous. Skuas who normally fiercely defend their nests stopped doing it; some even started attacking the chicks and eating them. So there will be no skuas at Palmer with 1989 birth certificates. A fair number of cormorants will also be lost.

There are two bird projects at Palmer which have been seriously affected, one from the Point Reyes Bird Observatory, one from the Antarctic Marine Living Resources (the U.S. contribution to the International Committee for the Conservation of Antarctic Marine Living Resources).

The spillage crippled two crucial experiments that sought to gauge the impact of the ozone hole. Precious little is known of the long-term effects of ultraviolet radiation. Some worry that, among other things, it harms the tiny sea creatures and organisms which sit at the bottom of the ocean's food chain. Only two sets of experiments have tried to investigate this, and both are based at Palmer. Dr. Deneb Karentz from the University of California at San Francisco has been trying to measure the effects of ultraviolet radiation on the growth and reproduction of plankton, algae, and other creatures at Palmer. Intriguingly, she has found various amino-acid-like compounds which the organisms seem to be able to use to protect themselves from the radiation. The pollution from the ship wreckage will make her attempts to study the compounds hard, if not impossible, for now. Dr. Osmund Holm-Hansen and his team from the Scripps Institute for Marine Resources in San Diego, did similar work last spring. This spring it will be difficult. It may well take plants and animals much longer to recover from a spill in the cold Antarctic than it would elsewhere. Nobody knows, because there has never been a serious pollution in such conditions.

David Bresnahan, one of the older, and presumably wiser, but not necessarily so, Special Projects Managers, is at Palmer supervising the cleanup operations. In late February, Peter Wilkniss took a team of international reporters and top ranking diplomats from several nations to Palmer so they could see for themselves just what had transpired, and the concerted efforts being put out by all involved in trying to recover from an environmentally tragic accident. NSF's whole operation appears to have been top-drawer. Because of the great interest by all Antarciticans in what transpired, we have asked Ted DeLaca to be the speaker at our next meeting (see cover sheet). So be sure and come to the meeting, and hear it straight from the man who knows all firsthand from being on site at Palmer.

(This material was put together from various and sundry newspaper clippings, from NSF press releases, and, especially from the Oil Spill Intelligence Report, Vol.XII, No. 7 published on 13 February 1989). Additional information on Palmer on page 10.

**EDWARD EVANS GOODALE, 1903-1989.** (by George Toney) A generation of IGY and USARP Antarcticans mourn the passing of Eddie Goodale, who died on January 18, 1989 in Bangor, Maine after a long illness. According to his devoted widow, Eleanor, Eddie had spent the last four and a half years in a nursing facility; a rapid decline in his physical condition set in in early January.

Recent Antarcticans recall Eddie as the kindly, paternal majordomo of the Christchurch advanced headquarters for the U.S. Antarctic Research Program, where he held sway from the IGY, 1957-58, until his retirement in 1968. There he greeted the neophytes arriving from the States and preparing for flights to the ice, and the field-tested veterans returning from work at the bottom of the world, and hungry for the flesh pots of New Zealand.

Eddie had begun his lifelong affair with the cold regions as a young man of twenty years, when he performed voluntary work at the Grenfell Mission in Labrador in 1923. He later attended Harvard University, but succumbed to the lure of adventure and joined the first Byrd Antarctic Expedition in 1928, wintering over at Little America.

In the peak of condition, Eddie relished the unremitting grind as a dogdriver hauling supplies and construction materials from the ice barrier to the base site. He threw himself into the construction of the base with equal vigor. But another Eddie was also manifested in his off-duty pursuits. In later years, he reminisced about the stringent limitation imposed on the transport of non-essential personal gear on the crowded expedition ships. Eddie's one indulgence was his copy of the Oxford Book of English Verse which stood him in good stead through the dark period.

During World War II Eddie served first as special consultant to Chief of the U.S. Army Air Force, and later assisted in the establishment of Search and Rescue bases. He joined the staff of the Air Transport Command, heading up its Search and Rescue organization in 1946. In this capacity he participated in the air rescue of the crew of a B29 bomber which had crashed in north Greenland. For this feat he received the Air Medal and a citation from President Harry Truman.

Following the war Eddie joined the U.S. Weather Bureau where he remained from 1947 to 1955, active in the establishment and operation of a network of weather stations in the Canadian Arctic and northern Greenland. Among his functions was the recruitment of cooks, mechanics, radio operators, and weather observers to man the tiny camps scattered through what is now known as the Queen Elizabeth Island, and at Thule. Eddie's genealogy and respect for the varied motivations of the men he interviewed by the dozens for hazardous and isolated jobs earned him the enduring respect of the U.S. Weather Bureau polar clan.

The IGY gave Eddie the opportunity to revisit his Antarctic haunts, to his great delight. In 1955, as the representative of the U.S. National Committee for the IGY, Eddie sailed with Admiral Byrd on the GLACIER when the icebreaker carried the Admiral on his last trip to Little America. Eddie next took part in the installation of the Byrd IGY station in the interior of Marie Byrd Land. His Christchurch period followed in 1958.

In retirement Eddie and Eleanor wintered, fittingly, in Winterport, Maine, on Penobscot Bay; summers were spent at Winter Harbor on Frenchman's Bay. In the picturesque Down East towns and shores they pursued a leisurely, well-tempered existence that has made New Englanders notable in a frenetic world. Eddie, who had survived decades of robust hardships in remote harshness, indulged himself in the quieter and contemplative pursuits bred in him by his scholarly physician father and his gentle mother.

Eddie was born in Boston on April 7, 1903 to Dr. Joseph Goodale and Adelaide Evans. Surviving him are his wife, Eleanor (R.D. #2, Box 214, Winterport, Maine 04496), and, in California, a daughter Evelyn, two granddaughters, one grandson, and a great granddaughter.

Early this month, not six weeks after Eddie had gone, Eleanor received in the mail an envelope from the White House. Inside, resplendently adorned with a golden Presidential seal, was the following tribute:

"The United States of America honors the memory of Edward Goodale. This certificate is awarded by a grateful nation in recognition of devoted and selfless consecration to the service of our country in the Armed Forces of the United States."

(signed) George Bush  
President of the United States

(George Toney, a graduate of a small but excellent college in Maine, Bowdoin, was rescued from the throes of high school teaching by Eddie Goodale who showed him the way to the Arctic. Later, George was the first scientific leader at Byrd Station, 1957, and worked in the Office of Polar Programs at NSF in the 1960's. But he became unscrewed and left NSF for the law profession, and now serves as just another lawyer in Washington.)

**IF YOU LIKE BIG ICE CUBES.** George Prodanck of the Navy/NOAA Joint Ice Center keeps us informed on how B-9 is doing. This illustrious iceberg leads a checkered career, almost bouncing off the Ross Ice Shelf in early August 1988, and presumably getting hung up on an undersea ridge this past February, which prevented it from going any further east and south. In the last month the winds/currents seem to have dislodged it, and it's moving now in a more northerly and westwardly position. George said the short two-week fall season ended about two weeks ago, and that new sea ice has again formed around it. B-9 is 76 nautical miles long, 19 nautical miles wide. If you are interested in where the berg is, on 15 March it was at 76°58'S, 173°47'W. Back on 13 October 1987, she was at 78°10'S, 161°25'W. The farthest north she has ever been was in November 1988, when she got to 76°20'S.

Incidentally, George is interested in knowing who has been fooling around with his berg. It seems that a Dutch registered ship, part of an official Italian expedition, having aboard a USGS scientist from Menlo Park (presumably Guy Cochran) spent a considerable amount of time near his berg. If any of you folks know Guy, or whoever was there, George would like to talk to him/her. His address is 4301 Suitland Road, FB #4, Room 2301, Washington, DC 20395, or telephone 301-763-5972, FTS 763-5972, Telefax 301-763-4621.

**STATE DEPARTMENT INSPECTION TRIP SUCCESSFUL.** The Coast Guard's icebreaker POLAR SEA has recently completed a short inspection trip, 9 February-25 February, when they visited Scott Base, Terra Nova, Gondwana, Cape Bird, Leningradskaya, and Dumont d'Urville. For the first time ever, our State Department inspection included half a dozen historical monuments, half a dozen SSSIs (Sites of Special Scientific Interest), and a few SPAs (Specially Protected Areas). Confirming what Peter Wilkniss had told us, the new Italian base at Terra Nova Bay is evidently a masterpiece, being strictly state-of-the-art. At the present time, Terra Nova is only planned as a summer station. There were about 80 to 100 people there when the party made their inspection. At Gondwana, they found a skeleton crew of five, although about thirty scientists were working in the field. Gondwana will probably be completed in 1991, and will house thirty to forty people. Greenpeace had already touched down at Dumont d'Urville before the POLA SEA arrival. The French downplayed what happened, saying a few people laid down in front of their vehicles working on the airstrip-to-be, they were removed without much fanfare, and the work went on. We are indebted to Ray Arnaudo of the State Department

for giving us this information over the phone. His only regret about the whole trip was that no arrangements had been made to get a key to Scott's Hut at Cape Evans. A slight disappointment was that ice conditions did not allow them the opportunity to visit Cape Adare.

**WOMEN ON THE ICE: A HISTORY OF WOMEN IN THE FAR SOUTH.** (Melbourne University Press, 1986) (Review by Mildred Rodgers Crary). A few men may still object to the presence of women in polar regions on the grounds of hardship and male privilege, prerogative, and privacy. But as early as 1817 – before Nathaniel B. Palmer was the first to sight the Antarctic continent – Antarcticans of a different opinion had even smuggled women aboard on scientific explorations as well as whaling and fishing voyages to the far south.

A compact, succinct, and nevertheless fascinating account of women's role in antarctic history, *Women on the Ice*, by Elizabeth Chipman should be on the shelves of every polar library worthy of the name. It is the product of extensive and meticulous scholarship by a woman whose early and lasting involvement in explorations of the southern continent dates back to the International Geophysical Year, when she, then 19, went to work for the Australian Division of the Department of External Affairs. An appealing introduction tells of her own antarctic adventures.

We learn from Chipman that a castaway, rescued by Captain John Balleny from Campbell Island, whose name went unrecorded, was the first of her sex to see the Antarctic continent in 1839. We learn the name of the next woman on record to visit antarctic waters (in 1906-1907), the presumed wife, Betsy Rasmussen, of Captain Adolfo Andresen (called his "companion" by Chipman's source). We learn about the Russian Professor Marie Klenova, the first woman scientist ever to work on the continent and in antarctic waters (beginning in 1955) and about the Russians' continued use in Antarctica of women scientists and support staff from 1955 on; the Russians had long employed women stewardesses, crew members, and whalers on their factory ships. We learn of the first baby born in the Antarctic (a son named Antarctic, to a Russian stewardess on a whaling factory ship, January 11, 1948) and the first to be born on the Antarctic continent but outside the Antarctic Circle (Emilio Marcos Palma, to Silvia Morello de Palma at the Argentine station Esperanza on the Antarctic Peninsula, January 7, 1978). We learn of the first two women to winter-over on the Continent with the Ronne Expedition (1947-1948), Edith Ronne and Jennie Darlington (though Chipman fails to mention the first baby conceived in Antarctica, the Darlingtons').

Chipman's book, enriched by much material on sub-antarctic island history, also has an index and an impressive, eight-page bibliography attesting to her careful research of both primary and secondary sources. An appendix, "Antarctic Women Speak," contains revealing excerpts from personal recollections of their experiences by 34 modern women who have worked in the Antarctic. This material corresponds to the anecdotal accounts of Barbara Land's *The New Explorers: Women in Antarctica* (Dodd, Mead, 1981) but barely overlaps its subject coverage on just four of the modern women; and Land's book includes only a few pages of the historical information so copiously provided by Chipman, Chipman's account is more scholarly and much more complete than my own article ("It's About Time!" in the *Antarctican Society* bulletin of November 1978). Another particularly useful appendix, "Chronology of Women in the Far South," traces the records of women who have sailed south with their men, worked as captains' wives, mistresses, sailors, whalers, scientists, and been shipwrecked, sometimes drowned.

Though Chipman's book is full of fascinating hints, more detailed accounts would have made it easier reading. However, with the language limitation on source material, such accounts would have given it more imbalance. If there is any fault to be found with this book (other than a few typographical errors), it is that Chipman of necessity

writes from the point-of-view of English-speaking nations; and so proportionately more emphasis is given to achievements of English, Australian, and American women. However, she has called on Spanish-, French-, Danish-, and Russian-language sources wherever available in translation, used reports in English-language texts of activities of women of other nations, and sought out information, some of it admittedly anecdotal, on women whose presence in Antarctica is not noted in historical records.

Many photographs but only one map illustrate the 224-page book. More and better maps would have contributed to the reader's enjoyment and understanding. *Women on the Ice* can be ordered for \$29.44, including postage, from the Australian Book Source, 1309 Redwood Lane, Davis, CA 95616- (916) 753-1519.

(Mildred Rodgers Crary is a novelist, formerly a writer at NSF. She is an occasional book reviewer for this column. She was married to the late Mr. Geophysics of the Antarctic, Bert Crary.)

**SOCIETY MEMBER SERVES TIME.** Taking a break from the Underwood, we picked up the Health section of the Washington Post for 14 March 1989 and found that one of our members had been locked up. We never really knew anything about Abigail Ailing, as all she put on her application form was "conservation/future." It turns out that Abigail is an understater, as she is involved in Biosphere II, a futuristic, closed ecosystem. Last week she entered the module through an airlock where, for five days, she will live in a sealed environment that generates its own air and rain. The enclosed environment, about the size of a one-car garage, "has the wonderful smell of a rich, tropical rain forest", she told reporters over a videotape hookup. As we understand it, she will monitor systems inside while outside people monitor her inside systems. Don't feel sorry for her, as she will be dining on 2,500 calories per day from 29 types of fruits and vegetables, as well as two aquarium fish that she will kill and eat as part of the test. Abigail must have been the designated pinch hitter, as the Arlington Journal for 3 February indicated that biome design coordinator, Linda Leigh, had been pencilled into the starting lineup for the five-day test.

Biosphere II is going to be a big deal, because in September 1990, four men and four women are going to walk into a 5-million-cubic-foot enclosure, closing the door behind them for two years. They will live and work in a two-and-a-half-acre self-supporting environment that will include seven subcommunities, or biomes: tropical rain forest, savannah, marsh, salt-water ocean, desert, small farm, and human habitat. No polar? Why not? There are fourteen candidates from several countries who are hoping they will be one of the final eight. One might think that these people volunteered to get away from folks like Howard Cosell, but unfortunately this is not so, as they will have telephone, computer and video communications linking them with worldwide networks, access to the AP news service and the latest books on computers, not to mention television, radio, and telecopier. Heck, they could even talk to the folks at the South Pole, should they want to have contact with a polar biome. Four hours a day will be devoted to maintenance, which includes growing and harvesting food and repairing mechanical and electronic devices; another four hours to scientific research. That's eight hours. What about the other 16? Any play? Each biospherian will have a small, two-story apartment, which sort of indicates that the eight finalists (four men, four women) will be singles. Now what happens if some guy gets disoriented while going from the tropical rain forest to the desert, and by some sheer misfortune accidentally crawls into one of the apartments of a woman biospherian and she comes down a bit pregnant? Will all male candidates have vasectomies, or will they grow pills for the women? Probably high tech will protect all parties from such an earthly thing happening, so I guess we shouldn't even think about such a horrid thing.

The purpose of this program is to gain insight into running a future U.S. space station

or a trip to Mars. Biosphere II will have 250 animal species ranging from goats to insects, and 3,800 plant species. Sounds like a nightmare. Who gets to clean out the stable, and what do they do with the stuff? And how does Greenpeace monitor them? A private company in Texas, Space Biospheres Ventures, largely funded by Texas oilman Edward P. Bass, expect the 30-million dollar project to pay for itself in sales of biospheres to government and researchers for space colonization, preservation of endangered species or other projects. Does "other projects" include the South Pole? Imagine having goats and fresh fish at the South Pole, along with your very own tropical rain forest. Maybe we can get Abigail to write something for us about her experience; we certainly will be following the experiment with more than passing interest because of her participation. Even if she doesn't make the final eight, Abigail will be assigned to Mission Control for the two-year closure. Go for it, Double A!

**CALL TO QUARTERS FOR VXE-6.** VXE-6 is going to hold a big reunion in Point Mugu, California on 26-27 May. We tried to get information for you, calling the contact (OAE Rep, VXE-6, 805-989-7585). The fellow who answered the phone knew nothing about nothing, although he did know there was going to be a reunion. A Lt. Commander was supposed to call us back - he/she did not. But if you want to go to a VXE-6 reunion, contact them yourself at that telephone number, or write to Naval Air Station, OAE Rep, VXE-6, Point Mugu, CA 93042-5014. Good luck!

**REQUEST FOR PICTURES OF BERT CRARY.** The Ohio State University Press will be publishing the late Bert Crary's book on his polar activities, and Mildred Crary is very much interested in obtaining pictures of Bert which any of you may have taken of him in the Arctic or Antarctic. If they are photos, of high quality, they could very well end up in the book - which Mildred is currently editing. Along with the pictures, she would like a release from the donor saying that the photo could be used in Bert's book. She is also interested in any maps, charts, diagrams, or whatever, that may have an association with Bert. Mildred's address is 3010 New Mexico Avenue, Washington, DC 20016

**MORE ON PALMER'S OIL SPILL.** We understand that a team of experts have been sent to Palmer to take measurements and analyze samples. They are Michael Fry, bird physiologist from the University of California at Davis; Langdon Quetin and Jeffrey Hyland, marine scientists from the University of California at Santa Barbara; William Stockton, intertidal ecologist, University of California at Santa Cruz; Timothy Targett, fish ecologist, University of Delaware; David Karl, microbiologist, University of Hawaii; Kenneth Dunton, multi-cellular algae specialist from the University of Texas; and Chuck Kennicutt and James Brooks, hydrocarbon chemists from Texas A & M University. They arrived at Palmer on 6 March, and are expected to be there for a month.

We were told that NSF has already put 2.2 million dollars into the recuperation efforts. A figure of 50 million dollars is being bantered around the corridors of NSF as the amount of money it will take to remove all vestiges of the wreck at Palmer. That means that everyone in this country, including babies, will have to dish out between 20 and 25 cents to pay for it. Maybe we shouldn't try to mix brotherhood with science. Leo Durocher, the sage of Ebbets Field, said that good guys finish last. Maybe he knew something!

**SOMEONE IS A BUM.** We hear that vandals have stolen the plaque from the top of Observation Hill. What kind of an arm hole would do that? Is there no pride in history? I can't imagine anything worse. The culprit should be flogged, then have his/her head shaven like the French did to women who shared their beds with the Germans during World War II, or POWs did to those who stole their Red Cross rations.

Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988

THINK

BOULDER

FOR

FALL

MEETING

**GROWLERS**

This is an abbreviated, spring pollen issue of the Newsletter, unique in that there is no meeting to announce, as we close up shop so that RJS can have a respite from the Society, and yours truly can stay in Maine for the whole summer - although winters are better because there are relatively few tourists. This has been a rather hectic year for this person trying to erect a house in Maine with an aching knee and taking Amtrak to Washington to write these things periodically. Next year shouldn't be so bad, for with any luck The House will be done by Labor Day.

**AMERICAN POLAR SOCIETY GOES BUCKEYE.** At long last, The Ohio State University has formally announced what most of you folks already knew - the American Polar Society has moved out of an apartment in New York City, that of the late August Howard, to the Byrd Polar Research Center at Ohio State University. The new generation August Howard is Peter Anderson, erstwhile Deputy Director of the Byrd Polar Research Center, biographer-in-waiting of Admiral Richard E. Byrd, foremost authority on the history of Antarctic aviation, avid Ohio State University football fan, and keeper of a very cluttered office desk. Peter was the only logical heir apparent to succeed August, although there is some skepticism among some of us as to how Peter is ever going to find time in his year to publish The Polar Times.

Peter has many optimistic plans for the future of the American Polar Society. Once upon a golden time, the Society had over 3,000 members. Now its membership is down to about 1,600, and Peter, for some unknown reason, wants to build it back up to over 3,000. More members, more work, Peter, you aren't getting any younger - are you really sure you want more members? The governing hierarchy of the American Polar Society has decided that annual dues must go up to five dollars immediately; and a further increase may not be too far off. Howard was going broke putting out two issues a year at two dollars.

We had completely forgotten, if we ever knew, that Howard never published The Polar Times from June 1948 to December 1954. Peter wants to resurrect the polar news for those years, and put out issues for that period. Antarcticwise, the continent was in a quasi-coma insofar as the United States was concerned, as

Operation Windmill, Operation Highjump, and the Ronne Antarctic Research Expedition were all over by June 1948, and Operation Deep Freeze followed the reissuing of The Polar Times. It seems like a good period to let lie dormant, unless you are an Arctic fan.

Basically The Polar Times will keep its old format, and its success depends on people sending in any good polar clippings they might find in newspapers or journals to Peter. He plans on including a listing of new polar books. Peter also wants to have American Polar Society meetings at various times at different locations around the country. He is thinking of indexing, and possibly binding issues. There are also thoughts of making The Polar Times quarterly. Anyway, there are a lot of thoughts swirling in Peter's head, and he optimistically thinks he can get out the first issue by January 1990.

If any of you have any thoughts on the American Polar Society and its The Polar Times, why don't you communicate your feelings directly to Peter (Mr. Peter J. Anderson, Byrd Polar Research Center, The Ohio State University, 125 South Oval Mall, Columbus, Ohio 43210-1308). He will listen to you, although I'm not real certain how much attention he will pay to you. We have been trying unsuccessfully to get pictures from our conclave in Columbus last October, and are still waiting. And now that he is also Secretary of the American Polar Society, plus Editor of The Polar Times, we will never get those pictures!

**SIR HUBERT WILKINS' MEMORABILIA.** There aren't too many Antarcticans around who really knew Sir Hubert Wilkins, as most of his crowd have already checked into that Snow Chapel in the Sky. His late years were spent working for the Quartermaster Corps as a polar expert on clothing, and it was my good fortune to have a desk right next to his, even though a window wall separated us. He went to Antarctica in the austral summer of 1957-58 to help me move my instrumentation out of Little America V preparatory to its transfer to Amundsen-Scott at the South Pole. This was my only opportunity to be in the field with him, as I never spent any winters on military maneuvers in the Arctic (as was his bent). Some people said that Sir Hubert was the most humble of all polar explorers. This may or may not be true, as I never personally knew any of the others, but I don't think that Sir Hubert suffered from any inferiority complex. An example was when he told Shackleton that he would not go on his last expedition unless he could go as his chief scientist, which is pretty heady stuff. On the other hand, Sir Hubert never could distinguish rank, and was equally at home talking to enlisted men as to high-ranking officers.

This is all prelude to the fact that while in Columbus, Peter Anderson allowed me access to the secured area where all of the Sir Hubert Wilkins' memorabilia are kept. It was sort of fun going through old trip reports of his days in the Quartermaster Corps. Sir Hubert never wrote a complete sentence in his lifetime, and his scribblings are almost as bad as Chester Pierce's and Pat Unger's (both doctors who inherently aren't allowed by their profession to write legibly). But there was one mammoth thrill for me when I opened a cardboard carton, and there were most of Sir Hubert's medals - must have been twenty. All of his major awards were there except one. Never in my life had I seen so many medals, and to think they were awarded to an ex-colleague! They will certainly make a wonderful display, and since the Byrd medals are scattered to the winds, the Sir Hubert medals must represent the single largest collection of polar medals in this country.

**"I MUST TAKE EXCEPTION TO THE REMARKS".** That was the beginning of a letter recently received from a non-member (how do all these characters end up reading our Newsletters, anyway?) who said that this column implied that the tourists who skied to the South Pole rode in Cadillacs. Why don't these tourists publish their own newsletters, and leave the rest of us alone? This guy had the audacity to write, "Having been to the South Pole as a member of Sir Hillary's expedition while assigned to Operation Deep

Freeze, I feel that I am in a position ...." What a bunch of malarkey. First, Operation Deep Freeze was an American enterprise - Hillary was/is a New Zealander. Second, you never call a knight by his last name, it is always Sir Hubert, Sir Vivian, or Sir Edmund, never Sir Hillary. Third, Ed Hillary wintered over at Scott Base in 1957, and all he was doing was laying out a series of caches on the polar plateau to help Fuchs' party on their way down to Scott Base. It was NOT an expedition. Fourth, this character was never a member of Hillary's team. I was at the South Pole when Hillary pulled in to the station, and I knew all members of his party quite well; and to this day, I remain a very close friend of Murray Ellis. It could have been that this guy was one of the horde of writers and photographers who were flown up to the South Pole by Admiral Defect to cover the arrival of Fuchs and his men. There were so many of them that the only ones whom we at the station got to know specifically were those correspondents from the larger newspapers or press services.

Anyway, this guy writes and tells us what a great, heroic thing this was when that party of chaperoned skiers reached the South Pole this past austral summer. I think the final word of their accomplishment was best summarized in a single photo which appeared in a national magazine this spring, showing the 39-year old blonde from Santa Barbara standing beside the South Pole station identification sign in a very brief two-piece bikini. Even at the South Pole in near undress, she did not look all that great, and when a woman does not look overly attractive at the South Pole, her best years are well behind her. Ordinarily, the South Pole makes queens out of beasts! But who really cares besides the skiers themselves? To them it was a big deal; otherwise, they would not have spent all that money and all that time, just to do a little cross-country skiing. Having lived at the South Pole for a whole year, I steadfastly refuse to believe the Polar Plateau is an entirely hostile place to be in mid-summer. The only mind-boggling thing to me about their whole endeavor was how come a 24-year old Harvard female divinity student was among them. It seems like a strange thing for a divinity student to do.

**WHATEVER HAPPENED TO SCRUPLES?** Stephen and Annette Waylett of Moscow, Washington, and their lawyer, Andrew Schwam, must have a hard time looking at themselves when they brush their teeth each morning, as they won a lawsuit from Washington State University for \$105,000, claiming that they were sent to Palmer station in 1983 under false pretenses. They were supposedly told that their program - meteorology - would lead to an engineering degree in two and a half years. AFTER they got back, the naive Wayletts, he with a bachelor's degree in geology, she with one in history, suddenly realized that their backgrounds did not qualify them for a master's degree in engineering. They claimed the university had enrolled them because they couldn't get any other applicants, and needed bodies to keep a 150K NSF grant alive. Me thinketh the university must have had a poor lawyer, or else the judge must have had it in for polar regions.

What makes the whole deal more ridiculous is that Stephen was a Navy navigator who had been actively involved in resupplying Antarctica. While doing this, he met scientists, and decided that he wanted to be one of them. He gave up his Navy career. Stephen now claims, "I was absolutely had. The dream of being an engineer has been killed. You go to the university to fulfill your dreams, but this one became a nightmare. I ended up holding an empty bag." Well, it turned out that the bag wasn't quite so empty as it should have been, as they now have over a hundred grand to put in it, plus memories of a year at a beautiful spot.

**REMEMBER THE NAME, NEELON CRAWFORD.** Neelon Crawford is a Canadian Scot photographer who lives with his Samoyed dog in downtown Manhattan, who shot some 5,000 pictures in Antarctica during the past austral summer. He has the most beautiful photograph that you have ever seen of the South Pole Station, and this is just the beginning. There is to be a series of approximately twenty of his best photos which will be put onto copper plates and then reproduced like etchings. He is also going to have a series of Antarctic

posters, about half a dozen, and about 200 black and white photos are to be mass produced. There will be a traveling exhibit of his pictures, but this has not been firmed up, so we can't give you places and dates. His pictures will be available in the Smithsonian Museum shops, as well as in the ship stores in Antarctica, and will also be marketed through his gallery (10 East 23rd Street) in downtown Manhattan. We have high hopes that Neelon will speak to our Society sometime in the fall - he has indicated a willingness - and when he does, we hope that there will be photos for sale at the meeting.

Neelon became interested in Antarctica when he met two glum Brits in a bar in Cuzco, Peru. He got into conversation with them, and after finding out that they were just returning to civilization after two years on the ice, asked them why they looked so sad. The reason given was that they were upset over leaving their dog teams behind, for during their stay on the ice, they had trained these dogs and became very closely attached to them. So, as they were drinking away their sorrow in a bar, along came this Yank photographer who was so impressed by their devotion to their dogs that he immediately felt a strong urging to go to this place called Antarctica. Neelon is interesting to me because he knows Port Clyde and Monhegan Island in Maine. In fact, his father had painted fishing boats in Port Clyde harbor. Small world!

**SCIENCE AND TECHNOLOGY IN THE DEEP FREEZE.** The above will be the title of a "dog and pony" national traveling exhibit for the Science Museum Exhibit Collaborative in 1991. David Crittenden, Director of Education and Project Director, Antarctic Exhibit, Science Museum of Minnesota, is the driving force behind a very large and extensive exhibit which will hit such places as the Museum of Science in Boston; the Science Museums of Charlotte; the Museum of Science and Industry in Chicago; the Center of Science and Industry, Columbus; Ft. Worth Museum of Science and History; California Museum of Science and Industry, Los Angeles; Franklin Institute, Philadelphia; and the Science Museum of Minnesota, St. Paul. They have a distinguished list of advisors/consultants: Peter Anderson, Charlie Bentley, Lee Kimball, Stuart Klipper, David Parmelee, Susan Soloman, John Spletstoeser, Gerald Webers, and Rachel Weiss.

They have a rather grandiose plan if it all comes to fruition. One can walk across Antarctica on a large map of the continent on the floor; there will be sensory chambers where people will be allowed to experience simulated Antarctic environmental phenomena; there will be a meteorite exhibit against a backdrop of blue ice (no doubt complete with a stuffed Bill Cassidy on a snowmobile?); fossils and geologic material; stereoscopic viewers so that people can examine geographic features in 3-D; an ice room with real cores; satellite-generated pictures; a 4-D exhibit of the life cycle of an iceberg; a replica of an old hut from the Heroic Era; all kinds of working models that kids can put their hands on; and on and on and on, ad infinitum. They're going to have everything except Art DeVries hauling in an Antarctic cod through the floor, but then you have to hold back a few kickers.

**SEE CALYPSO LOG FOR APRIL 1989.** In case you haven't seen it, the current issue of the Calypso Log is devoted to Antarctica. There are sections on life in the ice; Antarctica from space; Marine mammals of Antarctica; Antarctica - highest, coldest, darkest driest (why not whitest?); Antarctic scientists; A global community; Krill - Keystone of the Antarctic ecosystem; Cleaning up Antarctica. The last section brought back memories for one old Antarctic in the Division of Polar Programs that Cousteau must have seen the light. When the CALYPSO originally came into Palmer in the early 1970s, they dumped everything overboard right there in the harbor. The people at Palmer went out to the ship and told them that that was a no-no. However, they evidently thought they were above the Antarctic Treaty, and continued to dump in the harbor. C'est la vie!

**WHEN SWITHINBANKS TALKS, PEOPLE LISTEN.** Several years ago we got a call from a colleague at the USGS saying that Charles Swithinbank was coming there on business, and

that we should get him to talk to our Society. Unfounded skepticism reigned throughout, as the period was late August, when Washington is at its ugliest worst with high temperatures and horrendous humidities; plus, all people with kids have escaped to the beach for a last breath of good air before putting them back in school. Still, we figured we could somehow alibi our way out of it if no one showed up. That night we witnessed the drawing power of Swithinbank – we had to push the walls back to get all the people inside. Subsequently, after we had confirmed that he was married to a Mt. Holyoke woman, we made him one of our Board of Directors. He has been a great Board member, and writes all kinds of good things for the Newsletters. We have been remiss in not sharing all of them with you, but we do want to include segments from one letter written on 2 April 1988 on blue icefields, and one of 4 April 1989 on tent-sharing in Antarctica.

My own particular interest in blue icefields is not related to luring climbers to Vinson Massif nor hauling rich Americans to the South Pole. It dates from the Norwegian-British-Swedish Antarctic Expedition of 1949-52, during which Valter Schytt and I studied their provenance. Blue icefields discovered since then have proved to be something of a bonanza for meteorite hunters and planetary geologists. My logistic interest in blue icefields dates from flying a total of 130 hours in December 1967 in VX-6's C-121J (Super Constellation) Phoenix 6 (USN #131624). Gordon Robin and I shared 94 of those hours in the copilot's seat while engaged in radar sounding of the ice sheet. Phoenix 6 had no skis, just wheels, so we could only operate from the sea-ice runway at McMurdo. Some of our flights were of 12 hours' duration and it occurred to us that McMurdo might be weathered in by the time we got back there. The pilot, LCDR J.K.(Jake) Morrison, said that in that case his orders were to 'ditch' (if that is the word) wheels-up somewhere on the Ross Ice Shelf. The machine would be a write-off, and in theory at least, the crew would simply walk-off. But by then I had seen with my own eyes several extensive blue icefields in the Transantarctic Mountains quite big enough to take that bird safely wheels-down, and I loved the dear old thing. But orders, I was reminded, were orders, even in VX-6. Earlier I had flown in Soviet Ilyushin-14s and we made wheels-down landings at Molodezhnaya, so I knew that there were no practical problems.

My interest in a better way to get people into the Ellsworth Mountains dates from years of responsibility for getting glaciologists and geologists into that interesting area. Doing it with Twin Otters based at Rothera even today often wastes a couple of months during which fuel is laboriously relayed ahead to provide for three 400-mile (round trip) flight legs of depot-hopping. Long weather-related delays are routine. The ratio of fuel used to weight of payload delivered is about 20:1. Obviously there were better ways of doing it. Last season we proved the point with 12 round-trip flights of a DC-4 direct from Punta Arenas to the Ellsworth Mountains. Since governments were only interested in funding proven methods, someone else had to lead the way. The Chilean Air Force plans to follow next season with its own wheeled C-130 aircraft. I myself would prefer a Boeing 767; do you have any friends who can lend me one?

. . . . .

When I was young, I would have considered it ludicrous that geriatric glaciologists like me should still be allowed to do Antarctic field work, particularly in exceptionally windy areas near the South Pole. But I am no longer young, and have seen the light. It was a very successful and immensely satisfying field season which involved working in the open under much more difficult conditions than in many an earlier field season.

First we flew in a Twin Otter all over the countryside between Beardmore and Reedy Glaciers to inspect the many blue icefields. Having selected the two

best, we then camped on them and did optical levelling to determine the degree of slope. Denny Hartog, that other fossil from the heroic age, had not yet arrived to help me, so Bill Coughran (Station Manager at South Pole) put up a list to see if anyone might volunteer to serve as camp (and survey) assistants. Forty people signed up. So I had a vast selection and the ultimate joy (after almost 40 years of enforced misogyny in the Antarctic) of sharing a tent with one of the fairer sex. Actually two of them, one at a time, in different camps. I consigned the young and handsome Denny (for his protection) to the all-male tent.

We made 13 landings on wheels and concluded, as I expected, that you could operate any kind of aircraft there (such as a C5B) if you wanted to, I have spent the last month writing a report for CRREL entitled Ice Runways near the South Pole. We will watch with interest to see whether the idea is taken up.

All in all, it was great to see the old place again. It was my sixth season through McMurdo. The operation has changed; more efficient in many ways, but also more impersonal. The South Pole was a happier place, though with a summer population of 60-100 at various times, nobody could identify everyone by name. I saw Roland Huntford yesterday. He is still working on Fridtjof Nansen; it will be a colossal biography when eventually we see it. Spring is in the air, and in July I expect to visit Spitsbergen to regain a polar (rather than an austral) perspective. Six months later it will be south again with the penguins .....

**ANTARCTIC FICTION HITS BIG TIME WITH FAUNO CORDES.** We have a couple of interesting members in our Society, one of whom happens to be a nuclear medicine technologist who is all wrapped up in Antarctic fiction. She answers to the name of Fauno (Cordes) and she lives in Tony Bennett's town. We have known Fauno for half a dozen years, and have published her preliminary Antarctic fiction list. Now Fauno has hit the big time, as AB BOOKMAN'S WEEKLY for the specialist book world published her complete bibliography in its 21 November 1988 issue - no doubt in honor of my 65th birthday! There is a text with the annotated bibliography which she began accumulating over four years ago.

Let's take a closer look at Fauno. We knew that she was a perpetual graduate student, but we didn't know about her professional background. She is interested in hematology and lymphology, and has coauthored more than two dozen papers on leukemia. If she wore dog tags, they would show that she is Chief Nuclear Medicine Technologist, Mt. Zion Hospital and Medicine Center, San Francisco.

Fauno's interest in Antarctica began "on a dark, foggy day in San Francisco" when she was down on her hands and knees browsing through a low shelf of the Melody Land Bookshop, and ran across a copy of *We Were There with Byrd at the South Pole* by some guy named Charles Strong. She recalled that she owned an Antarctic fiction book, Edgar Allan Poe's *The Narrative of Arthur Gordon Pym of Nantucket*. Later she read, reread, and reread Charles Neider's *Edge of the World: Ross Island, Antarctica, and, on an impulse, wrote Neider asking him if he ever considered writing an Antarctic novel. He answered in the affirmative, and then suggested to her that she could benefit society by putting together an annotated bibliography on Antarctic fiction. She considered this an edict, and jumped in with both feet, arms aflailing. Being one of a kind, she established her own ground rules, the Cordesian Bylaws for Antarctic Fiction. Basically they are: Thou shalt read all tales thyself; Thou shalt only consider those in English and French, throwing out all minor languages; Thou shalt consider the sub-Antarctic islands as Antarctic; Thou shalt categorically dismiss historical novels, autobiographical poetry, and penguin stories for little monsters.*

So she went to work, and her earliest entry is *Mundus Alter et Idem* by Mercurio

Brittanico, published in 1605. It qualified, as it had an imaginary map of the Antarctic continent. Here are some of her evaluations/revelations:

Most widely read: Samuel Taylor Coleridge's The Rime of the Ancient Mariner  
Most astonishing: George Griffith's Olga Romanoff or the Syren of the Skies  
Most perplexing: Rudyard Kipling's The Jungle Books  
Most intriguing murder tale: Thomas Keneally's Victim of Aurora  
A realistic work: James Fenimore Cooper's The Sea Lions.

Our congratulations to Fauno for a tremendous piece of work which I am certain is a major contribution to Antarctic literature.

**BARRY LOPEZ WRITES ON ANTARCTICA IN HARPER'S FOR MAY 1989.** Once upon a golden time, there was this fellow from Finn Rock, Oregon, who wrote a book called Arctic Times, which won for him the U.S. National Book Award. Barry describes himself as "a man who writes and travels," and he believes in personally sampling a range of environments and experiences. So it was only natural that he should eventually go to Antarctica, and in the past austral summer spent several weeks with a scientific field team led by Paul Mayewski twenty miles upwind of the South Pole. Barry is planning to take the spirit of digging snowpits, drilling ice cores, and taking samples and translating them into observations on the subtle nuances and rhythms of the natural world. Traveling into the Dry Valleys, he experienced the full impact of the Antarctic environment ... "I did not feel insignificant on these journeys, dwarfed or shrugged off by the land, but superfluous. It is a difficult landscape to enter, to develop a rapport with ... it is indifferent, utterly remote, even as you stand in it. The light itself is aloof ... Science helps me solve the complexities I'm faced with as a writer." Some of his perceptions sound like Alan Campbell. Is he an Alan Campbell with typewriter, or is Alan Campbell a Barry Lopez with paint brush?

Barry's article in the May 1989 Harper's, "Our Frail Planet in Cold, Clear View: the South Pole as global laboratory" is rather interesting. When he philosophizes about the South Pole, he is quite good in his observations. Some things were beyond my interpretation, such as, "In remote Antarctica a reflective mind can easily develop a great fondness for the human race, a wistful sense of its fate, and not dwell on its capacity for violence, for evil, for duplicity and self-aggrandizement." Antarctica - human race - what's he talking about?

One thing I strongly feel Barry is remiss on is his statement that perhaps Bowers and Wilson were already dead when Scott wrote "For God's sake look after our people." No way, Jose, as they both were in much better shape than Scott. And if you ever saw Scott's diary, that famous passage had to be pre-written before other entries, as it was in bold letters, strongly written - much in contrast to other entries which presumably preceded it.

Barry wrote "two men from Amundsen's group, Helmer Hanssen and Olav Bjaaland, probably came within 200 yards of the pole; Scott's group, making a small but critical error at the end, technically missed the pole by about half a mile." Where did Barry find this stuff? It certainly is not in Huntford, and if anyone would have uncovered it, Huntford would have. Strange.

**VOL. 16, ANTARCTIC BIBLIOGRAPHY, YOURS FOR \$36.** If you had read 47,795 pieces of Antarctic literature by 1 July 1988, you will have read everything published on Antarctica in this country. And if you want the latest volume of Antarctic Bibliography, you can buy it for \$36 from the Government Printing Office in Washington, DC 20402. You have to cite the number assigned to the volume - SN 030-018-00027-3.

**FLAK HITS BROADSIDE.** Enroute to the postoffice to mail the last Newsletter I made the mistake of hand-delivering a copy to this giant of a man, Ben Gault, who lives

across the street from Ruth Siple. He is about six feet six inches, probably a strong 265 pounds, a retired professor from West Point. When he read my comments about Bruce Manheim, he marched across the street and peered down on me, saying, "I am a big believer in free speech, and I want you to know I don't agree with what you wrote about Manheim." I jumped up on the sofa so I could look him straight in the eye, and replied "Yes, you sure are a big believer, but you're too late, they're in the mail!" Then Ruth forwarded Bruce's letter of 30 March 1989, which follows:

I understand that your most recent newsletter expresses disappointment in EDF's press conference on the Bahia Paraiso shipwreck. Although I do not have a copy of the newsletter, you apparently wrote that EOF held that conference to respond to an "NSF gag order" issued to passengers on the Society Explorer. I assume your information was based on the March 5, 1989 Boston Globe article on this subject. Unfortunately, had you checked with me before going to print, I could have advised you that the Globe article was incorrect in this respect.

Indeed, EDF did not hold its press conference to respond to NSF's "gag order." Rather, it was held to release exclusive video tape and photographs of the Bahia Paraiso incident, and to express our concerns about the failure of a number of nations to comply with environmental rules. For your perusal, I have enclosed copies of the press release and statement distributed at this conference. As you will see, they contain no reference whatsoever to NSF's "gag order." Moreover, I did not mention the NSF telex in any of my remarks.

Bruce wrote another letter to me on 26 April, and he is still quite upset with what he refers to as NSF's "gag order." He thinks and writes as a lawyer, an environmental lawyer; I think as a commoner who is happy as a jaybird that NSF responded so quickly and did such a great job. There is room for both of us in this world. He gets the last laugh, though, as his stuff gets published in such places as The Christian Science Monitor, and mine only goes to a bunch of you old Antarcticans! And he gets to join people like Lee Kimball on the platform of the Aquarium in Boston talking about environmental issues. But the only thing I would trade with Bruce would be my years for his, as I would never, never want to be a lawyer.

**SNOWFLAKES**... Several years ago we read in the Sporting News that Gentleman Jim Zumberge is the only college president to have appeared at all five major New Year's Day bowl games. Well, someone had to be the first, so it might as well be old Jim. He went to the Orange Bowl, the Cotton Bowl, the Sugar Bowl, and the Fiesta Bowl while chief honcho at the University of Nebraska, and to the Fiesta Bowl and the Rose Bowl while head of the University of Southern California. It would be interesting to see who Jim would put on his All College Team, as well as to know how many of his teams were on probation! .... We regret to report that quite a few members of our Society have lost their faculties. Among the more prominent are Colin Bull, ancient ex-Dean of the School of Mathematics at Ohio State University, and Ike Taylor, nearly-as-old former Dean at the University of North Carolina Medical School. Colin is infamous for many things, most of which we can't print in this family paper; Ike is noted as the first doctor to winter-over at McMurdo, as well as having sired two musicians, James and Livingston. We understand that at least one of them is famous, although we don't seem to recall that either ever sang with Lawrence Welk. Another ex-Dean is Howard Hiatt, who was with the Harvard School of Public Health. Howard went to the ice a couple of years ago on Rusty Schweickart's Blue Ribbon Panel, studying safety in Antarctica..... Paul Adams used to send us all kinds of goodies when he was house-swapping in Auckland, and now he's living in Hawaii (55-116C Naupaka Street, Laie, Hawaii 96762), where he has a Kiwi catalog business called Uniquely New Zealand. If you're interested in New Zealand-developed and manufactured products, drop a card to Paul asking for his catalog. When he was living in Auckland, he interviewed manufacturers of low cost, low weight, unusual items - those which one wouldn't ordinarily find advertised in the U.S.

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 89-90

September

No. 1

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988

!!! HAPPY 30th ANNIVERSARY TO THE ANTARCTIC SOCIETY !!!

THE SOUTHERN LIGHT PORTFOLIO: ANTARCTIC PHOTOGRAPHY

by

Neelon Crawford

A R T I S T

New York, New York

on

Wednesday evening, 1 November 1989

8 PM

National Science Foundation  
18th and G Streets N.W.

Room 540

Light refreshments - strong coffee, Keebler cookies

Neelon is a 42-year old artist who participated in the NSF Antarctic Artists and Writers Program in Antarctica in January - February 1989. His great collection of Antarctic photographs will be exhibited by his New York City gallery - Jayne H. Baum Gallery - and then it will go on national tour sometime in 1991-92. So this evening will be a preview of a coining attraction. Neelon is well-known nationally, has made movies for the Museum of Modern Art, and is also hung in the Metropolitan Museum of Arts. He has done some sculpturing and has painted in oil. He has travelled extensively and worked in both South America and Asia, including three trips to China to photograph steam locomotives, and he has done a lot of photography on World War II aircraft. A more complete bio on Neelon will be in the next Newsletter. Be sure to come and see his fabulous Antarctic pictures!!!

1990 New Zealand Antarctic Calendars NOW available! See page 3.

Give a home to A Lonesome Penguin! See page 3.

Come cruising to the Antarctic with Ruth and Paul!! See page 7.

GROWLERS

Here we are again, back on the same old street corner for the 12th year, waiting impatiently for some young innocents who like to do volunteer work for a not-for-profit organization to surface and take over the Newsletters. This is the 68th Newsletter generated somehow by the team of Siple and Dalrymple. There has been some real good stuff written in the past dozen years, but unfortunately our Honorary President looks upon these sheets as family reading and censors out the best material. However, fortunately, in her naivety we do sneak some things through her censorship.

As it was in the beginning, and maybe shall ever be, these Newsletters do not constitute the official voice of our Society, being only a potpourri of some facts, some stories, some fabrications put together, hopefully, in a vein that will make you want to read these pages. You can help us out a lot by sending us material on your Antarctic interests/activities. We particularly want to hear personal thoughts from current Antarcticans, feeling that Antarcticans are a special breed of non-conformists whose very nature makes them interesting and good copy. HELP!

**RAISING DUES????** We feel that our dues are ridiculously low, and only through the generosity of our Honorary President who does so many things at no cost to the Society, have we been able to get by for ten years with our current dues structure. Our costs have escalated in recent years, and this soul feels that we should have a flat rate of ten dollars per year for Americans and Canadians. However, our illustrious president, Bob Rutford, believes in democracy, and says that we should solicit you folks for your feelings before we raise them. So consider yourself solicited. Over half of you have already paid for this current year, and many of you have paid for additional years. If you want to beat the proposed increase, we'll give you a chance to renew/extend now for one or more years at the current rate. Make checks payable to the Antarctic Society.

Curren:

Propose:

Foreign	\$14	Foreign	\$15
Husband-Wife	\$10	Husband-Wife	\$12
Local (within 50 miles of B.C.)	\$ 7	US/Canada	\$10
Out-of-town	\$ 6	USAnt.Serv.Exped.	\$ 4
BAE I - BAE II - US Ant.Serv.Exped.	\$ 3	BAE I - BAE II	Free

**MEMBERSHIP.** We now total 636 members, including 78 husband-wife memberships. Last year was a particularly good year, as only two availed themselves of the opportunity of dying; 95% of our members renewed; and we picked up 72 new members. However, we feel we're not in the total number game as much as we are playing Marine Corps, looking for a few good men/women. We got raked over pretty good last year when we suggested that those who were lukewarm towards us might want to drop out. Those who criticized us probably never had to fold and stuff and seal over 600 Newsletters when they could have been having a good time climbing Old Rag Mountain in Virginia.

**1990 ANTARCTIC CALENDARS.** We have good news and bad news. We have 300 New Zealand Antarctic calendars in the Nerve Center, waiting for you good folks to buy for your Christmas gifts. We have zero USARP Antarctic calendars, because Max Hamilton never answered our pleading letter of 6 May, asking when they'd be publishing their calendar and its cost. At this late date it is doubtful we will buy any 1990 USARP calendars.

The New Zealand Antarctic calendars are for sale at the same price as last year, \$8.50., which includes mailing. However, if you buy at our next meeting in Washington, we'll sell there for \$7.50 (we save a buck on not having to mail). The New Zealand Antarctic calendars are quite good. To be truthful, we don't think this year's calendar is up to the very high standards of past years, as there are more people, a plane, and creatures this year than ever before. However, most will probably find this calendar has a wider appeal, as it has a good cross section of penguin and bird photographs, scenes from tourist ship stops, an adventure picture, several from subantarctic islands, and others from the interior of the continent, plus one from Cape Evans. The most spectacular picture is one of a climber standing atop Mt. Shinn, and there is an excellent one of the Beardmore Glacier. For the first time, they have a two-page centerfold of Adelies at Cape Royds with a grounded iceberg in the background. One Adelie's name is Gisela, the others we did not recognize. So order early, order multiple copies, as we want to unload and get out of the calendar business so we can relax over the holidays.

**THE LONE EMPEROR IS FOR SALE.** Our lecturer for the upcoming meeting is Neelon Crawford, and his photographs of the Antarctic are truly sensational – Eliot Porter, move aside. Neelon has taken the best of his collection and made Antarctic posters, and we have chosen one to test the waters to see how you folks respond. The one we are offering is called The Lone Emperor, and it's fantastic; one solitary Emperor standing all by himself near the water's edge, either admiring the spectacular scenery in the foreground or just daydreaming. Across the open water rides a heavily sculptured berg. The dark blue sky in the background is in stark contrast to the pure white snow surface in the foreground. This color lithograph is 18" x 24", and would be great framed. We will mail them first class in solid tubes, and, prayerfully, even the Postal Service won't be able to damage them. Cost per poster is \$8.00, which is a bargain – we bought in quantity. If we have a good sale, we might offer additional Neelon Crawford posters as they become available. There are two additional one out now which you can purchase directly from Neelon – one of The Geographic South Pole (showing the station billboard, "The Geographic South Pole. 9301' Elevation, Ave. Temp. -56°, Ice Thickness in excess of 9000 feet."), and one of The Amundsen-Scott South Pole Station (a beautiful panoramic view of the whole station, looking down from above). If these turn you on more than The Lone Emperor, contact Neelon Crawford at 10 East 23rd Street, New York, NY 10010 (tel.212-475-7808) and he will quote you costs.

**THE NEW WALT SEELIG.** There were many of us who felt that Walt Seelig would never relinquish his NSF chair in Christchurch. We figured he would die on the job, that they would bronze his body, and prop him up at the gate to the C-130 parking lot at Harewood. He was sort of an institution in Christchurch, returning each year like an Antarctic tern or penguin. But he finally retired on his own, and someone at NSF decided that this should be a full-time, year-round assignment. The position was then advertised. We don't know how many candidates there were, but it appears they have picked the perfect man – Dr. Charles "Chuck" Paul. Physically he sort of fits the mold of Ken Moulton, being over six feet tall and having a very distinguished appearance.

Chuck has an outstanding professional background, and one can't help wondering if he isn't overqualified for the position. He has a PhD in civil engineering from Cornell University, and has an extensive background in mapping, surveying, remote sensing, air photo-interpretation, plus a few dozen other categories. He has been in over 90 different countries, but unbelievably has not been to New Zealand, the creme-de-creme of countries. Chuck's research has extended from the deepest ocean trenches, such as the Marianas, to some of the furthest out planets, such as Jupiter. He has been involved in astronomical surveying of mountain peaks in the Rockies, and has also done surveying in the Arctic for the now defunct Coast and Geodetic Survey. In recent years he has been Deputy Director of A.I.D.'s Forestry, Environment and Natural Resources Office, where he fell victim to an hereditary government disease, whereby increased knowledge and smarts leads one away from science and into administration/management. A.I.D.'s loss has now become DPP's gain in New Zealand.

Dr. Paul leaves behind in A.I.D. 12 years of experience for development and support of the mapping sciences in economic development. He was responsible for leadership in the creation of three multi-donor funded regional remote sensing centers in the developing countries. He has personally designed and supported the development of nine national mapping centers to carry out natural resource surveys in developing countries, stretching from Peru to the Philippines. He has served on temporary duty to 26 US A.I.D. Missions for the design and implementation of projects using remote sensing and geographic information systems. In 1985 he chaired the first meeting of the Economic Summit states to address the coordination of remote sensing activities to derive food estimates for Africa, which laid the foundation for A.I.D.' ongoing Famine Early Warning System (FEWS). He has been recognized internationally for his commitment to economic development through the acquisition of data about natural resources, the environment, and agricultural development.

Chuck was born in Panama, son of an Air Force officer stationed there. His undergraduate degree was obtained at the University of New Mexico in civil engineering. He was in the Navy for a short period of time, and the aforementioned time with the Coast and Idiotic Survey, three years, saw him in Arctic waters on the SURVEYOR. He has also worked for the Jet Propulsion Laboratory in Pasadena, and here in Washington at NASA's headquarters. Chuck has one wife, Carolyn, a Tar Heel from North Carolina, who will accompany him to Kiwiland and keep him out of trouble. The Pauls have one offspring, a son, who conducts biomedical research at Duke University. Chuck also has one sailboat, and professes a lust for sailing which he hopes to pursue on occasion in New Zealand. He enters his assignment in Christchurch with much anticipation, eagerly looking forward to the international aspects of his assignment. Chuck appears to be one nice guy, and we are sure he will do just fine. We wish the Pauls the very best.

**DAVID ELLIOT'S REPLACEMENT FINALLY UNEARTHED.** We never knew for certain whether Ohio State University was actually looking for a replacement for David Elliot or not as it seems their Search Committee has been kicking this around so long that they just didn't want to replace David. But at long last they have found their man in a mere youth, Dr. Kenneth C. Jezek, a geophysicist with the U.S. Army Cold Regions Research and Engineering Laboratory (CRREL) in Hanover, New Hampshire. We really don't have much information on Kenneth, as all we have at our disposal is the sterile press release from The Ohio State University of 23 August 1989 announcing his appointment. We called up Charlie Bentley, his mentor at the University of Wisconsin, to see what he could tell us about his protege, but both Charlie and Marybelle were away from the hearth for a week, so we found out nothing.

It appears that Kenneth received his doctoral degree in geophysics from the University of Wisconsin in 1980. It must have been a non-Antarctican type degree, as our

Antarctic listing from the Dissertation Abstract Center at the University of Michigan does not show Jezek. He worked as a postdoctoral at The Ohio State University's Institute of Polar Studies from 1980 to 1981. Then he went back to Madison for the next two years where he worked in the Geophysical and Polar Research Center. From 1985 to 1987, he was manager of the Polar Oceans and Ice Sheets Program for the National Aeronautics and Space Administration. From there he must have gone to CRREL. While there he also served as an assistant professor in the Thayer School of Engineering in Dartmouth College. His appointment as Director of the Byrd Polar Research Center at The Ohio State University carries an asterisk aside his name - tie will be an associate professor of geology and mineralogy. This must be the reason Kenneth went to The Ohio State University; why else would a young, budding scientist want to get into the administration/management jungle at such a tender age?

**SNOW EAGLES.** If you are an Eagle Scout and want little male eaglets, don't go to Antarctica. There has not been a daughter born to an Antarctic Eagle Scout! The late Paul Siple had three daughters; Dick Chappell has two daughters; Mark Leinmiller has two daughters. Eagle No. 4, Douglas Barnhart, was recently married, and they can expect girls, too. Meanwhile, Eagle No. 5, the exuberant, popular Lou Sugarman, has indicated a desire to really become polarized, so he is applying for a one-year Rotary Club Fellowship to study at the Scott Polar Research Institute in Cambridge. He will never have a son. Right now Lou is a senior at the University of Michigan, finishing an English degree with honors. He writes, "With another term or two of work, I will also be earning a. Biology degree." For recreation, he is going to learn Japanese this year.

Last summer Lou was on a literature study survey in England. Twice a day he attended class, reading "a tremendous amount: Thomas Harvey novels and poetry, Yeats plays and poetry, and James Joyce." What a terrible, frightening experience for such a young man. Better he than me! They moved to a new cottage or bed-and-breakfast every week or two, and saw all the cathedrals, castles, and ruins along the way. Someone should have told Lou that when you have seen one cathedral, you have seen them all; he would have saved a lot of time, and then he could have fully enjoyed the English countryside. But the summer wasn't a total waste, as the thirteen students were given a week without classes in London.

We met Eagle No. 6 this week - Robert Scot Duncan of Gulf Breeze, Florida. For those of you who may never have heard of Gulf Breeze, how about Pensacola? There were only 77 applicants this year, and Scot owes it all to his mother who found out about the opportunity by scanning through one of his Scouting magazines. When the late Paul Siple went as Eagle No. 1, there were literally thousands of applications which winnowed down to 88 candidates.

Scot is a 19-year old Eckerd College (St. Petersburg, Florida) sophomore who is multi talented with many interests. He just isn't certain what he wants to be, but he has a great interest in the physical sciences. He mentions geology as a possibility, something which he will be able to observe firsthand in Antarctica in a few short weeks. His application showed that he wanted to become an environmental journalist, although right now this 4.0 student is totally wrapped up in his forthcoming experiences where he will have the chance to work with half a dozen different investigators on various studies.

Scot is a member of the Sierra Club, the Florida Ornithological Society, the Florida Audubon Society and the Alabama Ornithological Society, so you can see he likes birds. He has a younger brother, 12 years old, who is also into Scouting, and who presumably will follow Scot's Antarctic activities with a great deal of brotherly admiration and pride. Scot's family is very much interested in his going to the ice, although the matriarch of the family wonders if he will fall into a crevasse. Mothers sure worry

about useless things, don't they?

Scot was in Washington for the first time in his life to attend the recent NSF Antarctic orientation. Before he went home he had nearly a full day to visit such places as the Capitol, the East Wing, the Mellon Gallery, the Air and Space Museum, and the Natural History Museum. At the end of the afternoon, a bit leg weary, he said he just had to sit down on a bench and look at all the tall buildings, and at people scurrying nowhere along the streets. He felt a long way from Gulf Breeze.

We who put this Newsletter together feel a special kinship to the Scouts. Ruth, of course, was married to the first one and raised their three daughters. I knew Paul professionally, and I wintered over with Eagle No. 2, Dick Chappell, at Little America V in 1957. Ruth and I knew all the finalists for Eagle No. 3, and got to know the winner, Mark Leinmiller, and a runner-up, Scott Miller, real well in ensuing years. We both met Doug Barnhart, but never got to know him. However, we did get to know Lou Sugarman, Eagle No. 5, real well. His Scout Leader, Hal Joerin, became a Society member and comes from Michigan to attend many of our local lectures.

There is a small-town charisma about Eagle No. 6. We are both certain that the Boy Scouts of America picked a most worthy young man, and are looking forward to following his career as we have the others. Incidentally, Eagle No. 2, Eagle No. 3, Eagle No. 4, and Eagle No. 5 were on the committee which picked Scot. Go for it, Scot. Enjoy every minute, and best wishes for the time of your life.

**YOUTH WILL BE SERVED.** One of the many good things about Antarctica is its openness, its equal opportunistic character. Women probably have as good a chance as men to make good in Antarctica. Parkas are great equalizers, and numbing cold sort of freezes out sexual fervor.

The latest group to gain entry into Antarctica are high school overachievers who qualify for candidacy through the National Science Foundation Science and Engineering Education Directorate's Young Scholars Program. It's designed to excite students entering grades 8-12 about science careers, and in 1989, 4,500 junior and senior high school students were involved in 136 Young Scholar projects. The U.S. Antarctic Program supports more than 90 research projects per year in atmospheric, oceanic, earth, and life sciences. Dr. Bassam Shakhshiri, Assistant Director for Science and Engineering Education at NSF said, "NSF has assumed a leadership role in national efforts to persuade best students to enter science research careers, and the Antarctic trip is just one example of its efforts to nurture the curiosity of our youth."

And the 1989-90 winners are...Kevin C. Engel of West Salem, Wisconsin and Catherine Ann Blish of Saratoga, California. Kevin will be working at the South Pole with the research team of Dr. Robert Morse of the University of Wisconsin studying gamma ray astronomy. Catherine will be working with Dr. Neil Sullivan's University of Southern California, Department of Biological Sciences team doing research on the photobiology of algae living in sea ice. Kevin has entered the University of Wisconsin at Madison and Catherine is a freshman at the University of California at Davis. Kevin was valedictorian of his high school class, and a member of their concert and jazz bands, as well as the Drama Club. Catherine was an honor student, and an athlete (track and field, plus volleyball).

There must be something magical about Saratoga, California, as Dr. Michele Raney, first woman to winter over at the South Pole, lives there, and last year's Antarctic Girl Scout, Julie Hagelin, comes from there. Michele, a chocoholic anesthesiologist, returned to the ice a couple of summers ago, and Julie wants to return some day as a biologist. Catherine had better watch out; she is working for a man who evidently has a life-time job in the laboratory at McMurdo, and she might catch the fever from Neil.

**COME SOUTH WITH RUTH AND ME.** That's enough about young kids, how about us old-timers? As some of you may have already heard from Society Expeditions Cruises, Ruth Siple, Boiling Byrd Clarke, Mort Turner, and I have been invited by them to lecture on an old explorers' nostalgic expedition cruise to Antarctica in February (Cruise WD2004, 10 February-4 March 1990). There will also be some younger lecturers, namely Peter Harrison, ornithologist from England; Stephen Leatherwood, biologist, from San Diego; and Shirley Metz, skiing adventurer extraordinaire, Santa Barbara. This is more than a dream come true for Ruth, Boiling, and me, as all three of us have always wanted to see the spectacular scenery of the Antarctic Peninsula. And this expedition cruise of some twenty-three days has a lot of great extras, as it visits the Falklands, South Georgia, South Orkneys, Elephant Island, the Antarctic Peninsula, and then many of the fiords of southern Chile, ending up in Puerto Montt on March 4th. The cruise should make Shackleton, Byrd, Siple and Wilkins converts out of those who believe only in penguins, seals, and whales. We are trying to collect a lot of the old films, have several on hand already, and are going to get more. This is the first time that a daughter of Admiral Byrd has gone to Antarctica, and having Boiling there with Ruth Siple will be a double-header victory for those travellers with a bent for U.S. Antarctic history. Siple remained a loyal supporter of Byrd throughout his lifetime, and Byrd reciprocated in his feelings towards Paul. I know we're going to have a great time on the WORLD DISCOVERER, and if any of you have the wherewithal and inclination, why don't you join us? Please! After all, nothing much happens anywhere in February, it's sort of an in-between month with lousy nondescript weather, so cash in your bonds, trade in your Jaguar for an Escort, cut off the kids' allowances, and come. You can't take your money with you, so why not enjoy it with an all-inclusive Antarctic trip on a real safe ship, one of the two with an ice-strengthened hull - the other one being the Society Expeditions' EXPLORER? For every Antarctic Society member who we can talk into coming, Society Expeditions will make a sizable donation to our treasury. If you want to find out more about the trip, you can contact either Ruth (905 N. Jacksonville St., Arlington, VA 22205), or me (Paul Dalrymple, P. O. Box 325, Port Clyde, ME 04855), or Society Expeditions Cruises, Inc. (Mrs. Susan Zehnder or Ms. Victoria Underwood: 3131 Elliott Avenue, Suite 700, Seattle, WA 98121).

**SPLETT'S GETS MARRIED, OR IS HE MARRIED?** Speaking of Society Expeditions, one of their key lecturers is old John Splettstoesser, veteran of eight austral summers on the ice, and lecturer on twenty Antarctic Expeditions Cruises. While lecturing on his first Antarctic cruise, he met this auduboning woman who lives about twenty miles from me in Rockland, Maine. Well, to make a long story somewhat shorter, Spletts married her one day last year when things were rather quiet and neither had anything special to do. Her name is Drake, they were in the Drake Passage, and the stars were in the right position, so they did it. That night Bezie probably said to John, "Are you sure we're married, John? After all, this ship is owned by one nation, foreign registry by another, the captain is from still another country, and we are out of American waters." And John probably answered, "For Heaven's sake, Bezie, will you stop worrying? I'll check with the captain first thing in the morning, or maybe day after tomorrow, or sometime before we get off the ship." Where John made his mistake was in not taking her name, as Drake is a much better name to have in Maine than Splettstoesser. We have allowed a few Finns to settle in that area, but Germans are strictly verboten.

If any of you are travelling to the Antarctic this austral summer on Society Expeditions' EXPLORER, you will be travelling with both John and Bezie, as John will be lecturing, and Bezie will be assistant cruise director on all six of their Antarctic cruises.

**AILEEN LOTZ HAS IT MADE.** Speaking of Antarctic expedition cruises and Beazie Drake-Spletstoeser's abiding interest in birds brings to mind a professional writer, Aileen Lotz, who went on two expedition cruises to Antarctica and became so enchanted with its bird life that it resulted in her undergoing a change in life. She confesses that going to Antarctica on cruise ships changed her whole life, with "good things have happened ever since ... What was better was finding another good life."

We have mentioned Aileen's Birding Round the World, which is now being offered in England. She has a new book due out this month, published by John Wiley & Sons - it's Birding Around the Year: When to Find Birds in North America. She is also the editor of a special issue of Birding Magazine devoted to world birding which is scheduled for completion in October.

This past summer Aileen went birding in Outer Mongolia and eastern Siberia, and wrote that it was a wonderful experience, camping for five days on the Gobi, seeing species few people have ever seen. The avian highlight was seeing the Relict Gull, only rediscovered in 1937. She also saw countable Swan Geese, the progenitors of all barnyard geese in the world. She is now in southern Africa seeing the Jackass penguin and a few hundred other birds.

I must confess that Aileen was not my biggest admirer by any means, and I called her "My Severest Critic." She keeps a "to do" file on me which includes underlined rash statements which she feels she should throw back or throw up on me at some future date. But we don't care; we are just happy as jay birds that she actually takes the time to read these things. I find her letters extremely interesting, and I am envious of her worldwide travelling. Would be nice to meet her.

**MISSION CONTROL BIOSPHERER SURFACES AS AN ANTARCTIC SAILOR!** While covering the theme of Antarctic cruises and people, we had a great letter from Abigail Ailing who, you may recall, was inside the 5-day test module experiment conducted by Space Biospheres Ventures, March 8-13 (see our Newsletter for April 1989). She is not a biospherian candidate, but she will be working in Mission Control during the 2-year closure of Biosphere II.

Two weeks prior to the March 1989 experiment she had just returned from an Antarctic expedition on a ferrocement, Chinese Junk design, 3-masted sailing ship, RV HERACLITUS. They left Ushuaia, Argentina on New Year's Day, 1989, crossed the Drake Passage, arriving at Deception Island on the 10th. On the 15th they moved south to the Gerlache and Bismark Straits to work with a population of humpback whales, and to do some polar diving. Their last port of call was Palmer, arriving there on January 27, one day before the BAHIA PARAISO went aground. Leaving Palmer they sailed back across the Drake Passage and went on to the Falkland Islands.

Abigail wrote that they were "not the first ferrocement vessel to enter Antarctic waters, but for sure it is the first Chinese Junk design!" They had a real international crew of fifteen persons (7 men and 8 women) representing the United States, Yugoslavia, Hungary, Belgium, Australia, Britain, and West Germany. Our Society sure has some interesting members, and Abigail is certainly one of the most interesting. When you read our incoming mail, you end up with a real inferiority complex, but we love to hear from such people so we can fantasize about their lives.

**SIR PETER SCOTT DIES.** Bill Sladen is the logical person to write the Society's official obituary on the late Sir Peter Scott, as they were very close friends and professional colleagues. However, Bill has so many irons in the fire, plus an upcoming trip to the Soviet Union on behalf of swans, that he cannot possibly do it for this issue. So we will just abstract from the Reuter obituary in the Washington

Post of 31 August 1989, and add a bit about his birth from his mother's autobiography, Sir Peter was the only offspring of the late Captain Robert Falcon Scott and Kathleen Scott, being born on 14 September 1909. He became one of the world's leading naturalists, and was hailed as one of the most versatile Britons of this century. He was an ecologist, painter, writer, ornithologist, glider, yachtsman, war hero, broadcaster, and television personality. Sir Peter was considered one of the finest painters of birds in this century. A founder in 1961 of the World Wildlife Fund, now known as the World Wide Fund for Nature, he devoted his life to protecting the earth from the ravages of the 20th century. He also founded the Wildfowl and Wetlands Trust. Naturalist Sir David Attenborough once described Sir Peter as the patron saint of wildlife, saying, "I think he has done more than anyone else to arouse the world ... to the fate which may overtake the natural world."

Sir Peter, who was knighted in 1973, built his home at Slimbridge on the Severn estuary in western England and set up the world's largest wildfowl sanctuary there. He inherited his artistic talent from his sculptor mother whose works of art stand in many prominent museums and halls throughout England. Scott married writer Elizabeth Jane Howard in 1942 and they had a daughter. A divorce followed in 1951. He later married Philippa Talbot-Ponsonby; they had a daughter and a son.

According to the obituary, Sir Peter never fulfilled one of his greatest ambitions: to convince the scientific world that the Loch Ness monster existed and that a family of relics from the dinosaur era lurked in the murky depths of the Scottish lake. He even painted pictures of the Loch Ness monster and invented the scientific name of "Nessiteras Rhombopteryx."

In Lady Rennet's (formerly Kathleen Scott) autobiography, *Self-Portrait of an Artist*, she wrote, "I used to say I wanted a baby but not a husband, and I've got it, but with a difference." And her entry after the birth of Peter, "I fell for the first time gloriously, passionately, wildly in love with my husband. I did not know I had not been so before, but I knew now." Peter's mother was most unusual, and she wrote her own epitaph for a tiny gravestone - "Kathleen. No happier woman ever lived." Historians will have a hard time deciding whether mother, father, or son was the greatest, but they won't have any trouble deciding who gave the most to the preservation of the environment.

Incidentally, Peter Scott gave the Antarctic Society's Memorial Lecture in 1971, addressing our group on 3 March 1971 on "Antarctica - Past, Present, and Future." He struck a chord for tourism that evening, saying, "But in the summertime it is a marvelous and beautiful place and this is the time when tourists should be able to go, as we went. More of them will go in the future, and some sort of code of conduct must be developed, particularly for example, when visiting penguin rookeries or seals." He was very far-sighted. Sir Peter died of a heart attack 29 August 1989 in Bristol, England at the age of 79.

**JOE FLETCHER GOES TO THE BANK.** On 13 September, Joe Fletcher, Director of NOAA's Environmental Research Laboratories, presented a paper at the Alaskan Science Conference on the role of the polar regions in global climate change. Forty years previously he had presented the same topic to the same conference. Hopefully, in forty years Joe had learned something, so he didn't just dust off the same old paper and re-present it! The White House believes in old Joe, as they had him in town the very next day to appear at the annual civil service award program in Constitution Hall. When Joe walked out the door, he was worth a lot more than when he walked in, as President Bush had given him a check for 20K for extended exceptional performance in the government. Joe was at one time the Director of the Division of Polar Program at NSF, and, if my memory is correct, Peter Wilkniss picked up one of those fat check last year. Must be something about that position which begets money.

**SNOWFLAKES.** There has been an Antarctic archaeological find of some probable significance. It seems that the late Dick Byrd had entered into some sort of an agreement with this person in Massachusetts to preserve/display, or whatever, some of the Admiral's memorabilia in a museum. No one knew anything about this until the fellow ran into hard times, and in the course of an investigation, the material was uncovered. Just how significant a find this is has not been ascertained at this time, but the whole collection is back in the hands of the Byrd family, and grandson Leverett is currently going through the material. Apparently the journals of REB are still missing, but one of Ed Moody, dog team driver on BAE II, was in the collection..... Records are made to be broken, and Amundsen-Scott South Pole Station had a new all-time maximum wind speed on 24 August of 55.3 miles per hour (48 knots). That must have kicked up a little snow Old Fred "Muckluck" Milan, physiologist at Little America V, suffered a stroke last year, but was not paralyzed. It has affected his speech somewhat, although he had sort of a mumbling way of talking anyway, so you don't notice it too much... J. Murray Mitchell (1106 Dogwood Drive, McLean, VA 22101), climatologist par excellence, is in the hospital as we go to print with a gall bladder operation scheduled for 18 September. Murray had to have some additional chemo on his neck earlier this summer. He's one of the world's really nice guys, a sweetheart of a person. I've know him for forty years . . . . Mike Benkert, retired Coast Guard admiral who once commanded icebreakers in Antarctic waters, is battling cancer here in McLean, Virginia. When they made Mike, they threw away the mold. I've always said that I would go anywhere with Mike, as he was a two-fisted fighter and lover; he wanted to live to see the next day and somehow would bring you home. But this is the first time he has run into anything which intimidated him . . . . Ralph (BAE II) Smith, a pilot on the expedition who had sort of dropped out of sight, died this past summer at age 84 in Lake Wales, Florida. He was the first pilot to land a plane in Borneo; and in 1951, he won the North American Clay Target championship. He had the wisdom not to waste his joy years on marriage, postponing it until he was 61, so he never had to experience firsthand the pains of seeing kids go through their teens . . . . Vernon Houk, medical doctor at Amundsen-Scott in 1958, despite dire predictions by those of us who wintered over with him, has gone on to fame at the Center of Disease Control in Atlanta. This past summer, Science Magazine of 21 July 1989 had a picture of Vernon in an article on Agent Orange. A fellow winter-overer was shocked at how darn old he looks now, saying he would never have recognized him. Then he asked, "What about Kirby Hanson? Would I know him?" Well, the answer to that is that Kirby is very recognizable, as he has stayed in shape, does a lot of daily running, plays a fast game of tennis, and looks exactly the way he did thirty-one years ago. But old Houk sure looks terrible. Ho, ho, ho. . . . Alice Dater, beloved member of our Society and widow of Antarctic historian Harry Dater (past president of our Society and former editor of our newsletters), has moved to Billings, Montana (St. John's Lutheran Nursing Home, 3940 Rimrock Road, Billings 59102). She has a son in the local area who visits her daily. Alice, a real sweetheart of a woman, is not able to recognize people on the telephone, but does enjoy cards and photographs. . . . Kay rate of Bozeman, Montana recently joined our Society. She confesses to 49, and the highlight of last season was being hand-picked by old Charles Swithinbank to join his survey crew at the base of Mt. Howe on the Scott Glacier. When you're as old as Swithinbank, anyone 49 years old must look like a mere child. Kay has applied to go back to the Antarctic this year as either a bus driver, hovercraft operator, or cargo GFA. . . . Rudy Honkala, veteran of years at Wilkes, Casey, and Palmer, has seen the light and retired to Bethel, Maine. It is good to note that all kinds of Antarcticans are retiring to Maine; this is partly because New Hampshire is completely sold out, and Florida is for the - - - -!

\*\*\*\*\*

*Support our campaign to raise Society dues!! .... Order your 1990 Antarctic New Zealand calendar today - BUY!! .... Make a Lonesome Emperor happy in your home - BUY again!!*

This is the last, we trust, hit-and-run Newsletter, as, hopefully, The House will be completed by the holidays. We dash down from Maine, type out some wild words, and then rush right back the same week. This trip is no exception, although we hope not so many errors sneaked through as they did in our last Newsletter. For the newcomers, this so-called Newsletter is the voice of only one member, not the Voice of the Society. We aim for some degree of authenticity, but we don't let it get in the way of a good story. Please send us items for future newsletters, and, if you move, please send us your new address right away. Bulk mail such as ours is not forwarded. Enjoy this turkey!

**MEMBERSHIP AND NEW DUES.** Our Society keeps growing, and we now total some 650-odd members. We seem to gain about 45 new members each year in spite of an attrition rate of about 5%. The good news about our increases is that more and more are coming from the ranks of people on the ice. There was a time when we had only a scattering of members from Antarctic support personnel, but things have changed.

As indicated in our last Newsletter, we were anxious to get your feelings relative to raising dues. A dozen concurred, no one opposed, so we are raising them a very modest amount to cover increases in administrative costs. At least one of us has high hopes of going computerized and of reducing some bookkeeping on memberships and dues, but changes do not come easily sometimes. Our new streamlined dues eliminate the differential between local and out-of-town, and provide free rides for members of the ice parties of the first and second Byrd Antarctic Expeditions, as well as the U.S. Antarctic Service Expedition. People who are in some sort of physical trouble, like old Bob Nichols and Alice Dater, have been put on our complimentary membership list. Our new dues are \$10 for individual members, \$12 if you come in as husband/wife, and \$15 if you live outside the U.S. or in Canada.

People keep asking if their dues are paid up. If you DO NOT get a bill from us, you are paid up. No one slips through on us - there are no free lunches. We appreciate members renewing for multiple years, as that cuts our work load in the Nerve Center. We entered this coming year with money in the till from 55% of our members. Great!

**CALENDARS.** Last year we sold 250 New Zealand Antarctic calendars and 200 USARP Antarctic calendars, and we sweated out getting rid of them, but we did, thanks to your fine support. This year we ordered 300 New Zealand Antarctic calendars, and held off on the USARP Antarctic calendars until we could see one. Ruth was not impressed at all when the sample of the USARP one finally came, but she asked Ken Moulton to come over to the Nerve Center to give her a second opinion. After that both John Splettstoesser and I saw the calendar. The unanimous feeling was that we shouldn't buy any USARP ones this year as the pictures weren't so hot - no pun intended - and some of the verbage wasn't so great either. We regret disappointing those of you who always buy USARP calendars, but on the other hand we didn't want to sell what we felt was an inferior calendar.

In the meantime, we do have a good supply of the 1990 New Zealand Antarctic calendars. As we go to press, we have sold about 150, so have another 150 waiting to be ordered. One nice feature of the New Zealand calendars is that they allow the environment to sell itself, and anyone who likes beauty can enjoy them. They are also clean-cut, with dates uncluttered with extraneous information, such as when

Lower Slobodia acceded to the Treaty. If you want to help us out and buy some more for your Christmas mailings, we would appreciate your business. Our price is a good one, practically what we pay for them. Ruth feels pressured by the calendar business - preparing them for mailing and taking them to the post office. If she had her way, she would close up our Ship's Store. Buy her out so she can get on with Christmas!

**HERMAN FRIIS, POLAR ARCHIVIST, VICTIM OF PARKINSON'S** (obit by Walt Seelig). It is with sorrow that we announce the passing of Herman R. Friis who died on 23 September 1989 at the age of 83. Herman, warm and friendly, will be remembered by Antarcticans, mainly in the final segment of his career, as the Director of the Center for Polar Archives at The National Archives. He assumed the position in 1967 and held it until his retirement in 1975, when he was presented an Exceptional Service Award by the Archives. In that same year he gave the Antarctic Society Memorial Lecture. Friis Hills in the Dry Valley region of Antarctica were named in his honor.

His interests in the polar regions, which led him to become a specialist in Antarctica was an outgrowth of his studies at the University of California where he earned his degrees in geography; B.A. at UCLA and M.A. at the University of California at Berkeley. He then held teaching and research fellowships at the University of Wisconsin, followed by a year as an Assistant Professor at the University of Southern Illinois.

His work at The National Archives began in 1938, when he came to Washington as Assistant Chief, Division of Maps. He joined the U.S. Army Air Corps in 1942 and served in the China-Burma-Indian theater, earning the Bronze Medal. He went in as a lieutenant, was discharged in 1946 as a major. Among the many papers and slides that he presented to The National Archives upon his retirement, there is a vivid account of those years when he served with the Office of Strategic Services in China. Returning to the Map Division of The National Archives in 1946, he also lectured in the Department of Geography at Catholic University from 1947 to 1952, and was a guest lecturer at American University. In 1962 he became Chief Archivist in the Technical Records Division, and then Director, Center for Polar Archives in 1967. He visited Antarctica twice: as a guest of Naval Support Force, Antarctica, November-December 1960, and as an exchange scientist with the Japanese Antarctic Research Expedition II, 1969-70. On the return trip the Japanese icebreaker was beset, and all hands were put onto reduced rations until the vessel finally broke (Friis) free.

Herman was the author of a number of papers which dealt mainly with historical geography and exploration, mapping, and surveying. After retirement, he continued to research and write on these subjects. Herman was a member of the Advisory Committee on Antarctic Names. He was a member of a number of societies: Association of American Geographers, American Polar Society, American Society of Surveying and Mapping, Society of American Archivists, the Explorers Club, and the Cosmos Club. Herman leaves three children - Cynthia Friis, Patricia Radley, and Eileen Zarefoss; two grandchildren; and two great grandchildren. He will be greatly missed by his family and many friends.

(Ed. note. Herman was blessed when he was Director of the Center for Polar Archives by having two loyal subordinates, the late Gerry Pagano, and Alison Wilson, working for him. Gerry was directly responsible for a lot of the leg work in getting polar acquisitions from OAEs into the Center. Although the Center is no longer in existence, Alison remains the sole polar contact at the Archives. However, she is contemplating retirement in a few years, which will extinguish the polar torch which Herman lit at The National Archives.)

**FIRST CO OF VX-6 DIES.** Gordon Ebbe, first commanding officer of VX-6 during Deep Freeze I in 1955, died at age 73 in a nursing center in Colorado Springs on 2 August 1989. Gordon was in the Navy from 1938 until 1966, and retired as a commander. He flew extensively in the Arctic, particularly in the Point Barrow area, and was a

logical choice to be the first head of the Antarctic Development Squadron during Deep Freeze. According to Moe Morris, VX-6 pilot in the early 60's, Gordon "was the most experienced cold weather aviator" we had when Deep Freeze came along.

Gordon was born smack in the middle of Wisconsin, in a berg named Marshfield. He got his bachelor's degree in mechanical engineering at the University of North Dakota, and was accepted into Navy flight training, receiving his commission in 1938. He served in the Pacific in the war that ended all wars, receiving the Distinguished Flying Cross with gold star, and the Air Medal. In 1950, Gordon was married to Tony Snyder in the Naval Hospital Chapel in Oakland.

Gordon maintained a strong interest in both the Navy and the Antarctic while retired in Colorado Springs. He was very active in the Navy League and a frequent lecturer on the early days of Deep Freeze. He was a very accomplished photographer, and had an excellent Antarctic slide collection. He also was a clipper, clipping everything on Antarctica that he came across, so Tony has a huge Antarctic scrapbook. She does not know exactly where it should repose, but wherever it ends up, it will make a valuable archival addition. Moe wrote he was "a picture of health before he had his stroke and then the big one, .... was certainly a proud supporter of anything Antarctic." Gordon is survived by his widow, a son Thomas, and a daughter Kristin, plus three grandchildren.

**THE DECIMATION OF MEN OF EARLY DEEP FREEZE AND THE IGY.** You know, there are still some hale and hearty survivors of BAE I (Larry Gould, Henry Harrison, Howard Mason and Norman Vaughan), and quite a few from BAE II (Clay Bailey, Dick Black, Ervin Bramhall, Steve Corey, Joe Hill, Al Lindsey, Whirlybird McCormick, Ed Moody, Olin Stancliff, and a few others), but those in power positions in early Deep Freeze and the IGY have succumbed very, very early. In the preceding section we read of Gordon Ebbe's recent death. The Navy men of note in those days, Admiral Richard E. Byrd, Admiral George Dufek, and Admiral David Tyree all checked out many years ago. Ed MacDonald, the old icebreaker captain, joined them last year, as did John Mirabito, head Naval meteorologist at McMurdo. Dave Canham, senior Navy man at McMurdo the year they built the station, succumbed several years ago. A young ensign on Canham's staff, Jack Tuck, who was Naval leader at the South Pole during its first year, is also gone. Then there was the wearer of two hats, Finn Ronne, who died about eight years ago.

However, it wasn't just the Navy men who have bit the dust. The Antarctic Chief Scientist for the IGY, Harry Wexler, died in his early 50's; Hugh Odishaw, who wintered over in Washington, went about five years ago; the senior scientist on the ice during the IGY, Bert Crary passed away two years ago. The first scientific leader of a U.S. IGY Antarctic station to go was Willis Tressler, followed shortly thereafter by our Society patron saint, Carl Eklund. Then in 1968, the builder of the South Pole, Paul Siple, died. Another IGY station scientific leader to go early was Jim Shear. Who would have thought that easy-going Jim would die young, as he never worked hard, never worried about anything. The only station scientific leader from 1957 who is still alive is George Toney. Has he survived because he got out of polar operations and into law? It looks thataway.

It seems that the guys who lived through it all are those who experienced it from behind their stateside desks, serving on various USNC-IGY panels. It's not that those like Alan Shapley, Dick Goldthwait, Bill Field, Line Washburn, and Frank Press, are so darn young, as they aren't, but it seems to me that the Antarctic has taken a deeper toll of those who had weighty responsibilities during early Deep Freeze and the IGY. The only Ancient and Honorable who seems to be hale and hearty is Larry Gould, but he is sort of a Super Human anyway.

That brings up the paralyzing thought - who is ever going to write about these guys?

One big plus is that Bert Crary had his manuscript on his polar experiences ready for press when he died, and his writings on the IGY should be the definitive word on the Antarctic and its people. One might say, "Straight from the horse's mouth." The Ohio State University Press will eventually publish Bert's memoirs, although they have apparently lost some staff because of reduction of funds, and have fallen behind the projected publishing target date. So Bert's book is probably at least a year away.

Only the Lord knows when Peter Anderson will publish his biography on Admiral Byrd. Then Peter, supposedly, will publish something on polar aviation. What Peter needs is winning one of those multimillion dollar lottery tickets so he can retire and just concentrate on his books. Otherwise, he will probably take a lot of drafts with him to his grave.

**THE LATEST ON OLD HARRY SWINBURNE.** The last time we checked in with Harry Swinburne his dear Christchurch wife had deserted him, running off with some active commercial airline pilot. No doubt United. Harry was distraught because she still had some good years left and he loved her, but he also had spent a considerable amount of money setting her up in a travel agency and that went down the drain. In case you may not recall just who Harry is, he was the first Naval captain permanently assigned as Commander, U.S. Naval Support Force, Antarctica (when the billet was downgraded to Captain in 1972).

Well, it seems that after his wife ran away, the Lord gave Harry something much worse to occupy his mind -- declining health. He wasn't prepared for what happened to him, as this 66-year old man, who was sort of a lumberjack, hadn't been sick a day in over 45 years. About nine months ago he came down with a sore throat, then began to lose weight, and you can guess the rest. On 29 June the doctors told him he had the Big C Ten days later he had a full biopsy. They recommended surgery, followed by radiation therapy with a 10% to 30% chance with both, and about half with just radiation therapy.

When he first found out that he had cancer of the tongue, throat, larynx, and lymph glands, old Harry was ready to cash in the chips right then and there. However, this wasn't like the real Harry who had been a World War II fighter ace, and was the first pilot in the world to fly a helicopter in actual combat during the Korean conflict (132 missions over or behind enemy lines). He wrote us on 3 October 1989:

Surgery was totally unacceptable to me. I've lived the most exciting and rewarding life of anyone I know, and I wasn't going to end it as a pitiful shell of a man. They planned to remove my right jugular vein, part of my jaw, my tongue, my larynx and part of my throat, plus the lymph glands. NO WAY! (I like to eat and talk.)

Well, I've completed my radiation treatments, which included 12 treatments with neutrons, 20 with photons, and 14 with beta rays (electrons). The good news is that I've had my first checkup and they say "All is progressing according to plan." Some of what took place is both bad and good. I certainly looked like a well-done Maine lobster on the outside (all now healed), and raw hamburger on the inside (all healed except for a little sore throat). I lost all taste and all saliva. The taste is definitely returning, and I believe I sometimes have a little saliva. I'm learning to eat without it, but it will definitely return in part.

So, if your wife or husband runs off with some pilot, don't think that things can't get worse, as they sure did with Harry. Murphy's Law caught up with him. Our hearts and prayers go out to Harry in these troubled times, and if anyone can lick the odds, he appears to be that person. He has a great spirit, is putting up a tremendous fight. Give it hell, Harry. For those of you who may have lost his address, it's 4969 North Cascade Place, Oak Harbor, Washington 98277.

**SWINTHINBANK'S SECOND LAW.** In our last Newsletter we commented on Antarctic Eagle Scouts begetting daughters, and one of the members of our Board of Directors, Charles Swithinbank, replied that he wasn't surprised at all, citing his infamous Second Law, "All Antarcticans who reproduce within twelve months of returning home get girls." He said that this became very obvious to him within a year of returning from the Norwegian-British-Swedish Expedition of 1949-52. He claims he was more or less celibate until 1962, when his daughter was born within twelve months of returning from a summer with USARP. Charles said that after he fathered a girl he started "tracking the reproductive activities of Antarctic colleagues." I don't think he was keeping a running tally on at bats, hits, runs, home runs, and things of that nature, but he was noting the end results, and they "served to reinforce my hypothesis." From here on let's turn it all over to Charles's letter of 23 September so we won't lose track of anything.

Being a scientist, one must question why. Two well-known facts put me on the right track: (1) White males are often sterile for the first few months after returning from the Persian Gulf; (2) Human male genitalia are located externally (i.e., outside the abdominal cavity).

Our Creator generally had good reasons for his architecture. In the case discussed above, it is because in order to function properly, male productive cells must be maintained at a temperature of at least 1°C below that of the abdominal cavity (a fact that any physiologist will confirm).

Arabs have known about this for about a million years; hence they wear air-conditioned garments. White men frustrate the Will of Allah by wearing trousers, i.e., their genitalia get hot. The disfunction persists for a considerable time after returning to milder climates.

It was Vilhjalmur Stefansson who pointed out that, far from living in a cold environment, most polar explorers maintain a tropical environment inside their pants because they can't risk lowering their core temperature.

Now you see what lateral thinking will do. But how do you explain it all? Really it is very simple. On returning home we are often randy but almost always sterile. It is well-known that male reproductive cells which carry female chromosomes are tougher than the rest; they recover more quickly from environmental abuse. Hence the firstborn are girls.

Among the many advocates of Swithinbank's Second Law is Valter Schytt who was with Charles at Maudheim on the Norwegian-British-Swedish Expedition. He fathered three girls and no sons.

Charles feels that there must be some graduate student out there in the cold, cruel world who would like to study this question. But for him, he ended, "After a lifetime spent trying to answer silly questions like 'Why is there ice in Antarctica?', it is wonderful to be able to take up research of real importance to human condition.'

Hey, Muckluck Milan up there in Fairbanks, you were head of the U.S. Program on Circumpolar People for quite a few years. You must have some thoughts on all this. What do you say? I would hate to ask Murray Hamlet about it, as Lord only knows how he might reply!

Those of you who fathered something within a year after returning from twelve months on the ice, why don't you send us your end results, so we can substantiate or refute Swithinbank's Second Law?

**HOLMES AND NARVER RETURN TO THE ICE, BRINGING EG&G WITH THEM.** The National Science Foundation announced on the morning of 3 October 1989 that the new contract for operational support in Antarctica has been awarded to the Antarctic Support Associates (AS2)

created by the marriage of Holmes and Narver of Orange, California to EG&G in Wellesley Massachusetts. My first reaction was one of sorrow for losing Bob Becker, because if he is as nice and as efficient as he has always appeared to be, he will be sorely missed. I never could figure out how a guy in his position with all his responsibilities could smile so much and act like he was having a ball.

The American system only looks at the bottom line, who can do the job at the best price and that's the way it should be. The contract amounts to about \$250 million dollars for six years. Then there is something like a pro-baseball option clause; if NSF is satisfied with the performances of the player, they can extend the contract for two 2-year additional terms. ASA is going to establish headquarters in Denver, and they will take over support services on April Fool's Day 1990. Let's hope no one gets fooled. We still have some old Holmes and Narver members - Mike Pavlak and Dick Wolal immediately come to mind. Maybe some old hands will be returning to the ice. Who knows? We'll just wait and see.

**15TH ANTARCTIC TREATY CONSULTATIVE MEETING, PARIS, 9-21 OCTOBER 1989.** This meeting seemed to have created a lot more ink than its predecessors. We understand that one writer who was covering the meeting misunderstood something at the beginning, and never straightened him/herself out for the rest of the session. Cousteau certainly made his presence known, both here in Washington prior to the meeting and then in Paris during the meeting. It is strange how a few short years can change one's stripes. We understand that when Cousteau originally came into Palmer he dumped everything overboard. Representatives from NSF went to the CALYPSO and explained that this was a violation, a no-no. However, he supposedly kept on doing it. Now look who is the knight on the shining white horse trying to save Antarctica!

The item which created the greatest interest was the one on a comprehensive approach to environmental measures. Australia called for a new Antarctic environment agreement and the French wanted to declare Antarctica a nature reserve. The Australian-French efforts for a comprehensive convention designating Antarctica as a "natural science, land of science" was viewed as prejudicial by the majority of the ATCPs who support the Antarctic Mineral Convention (the Wellington Convention). A compromise package emerged which calls for a special Antarctic Treaty Consultative Meeting in 1990 to explore all proposals for protection of the environment and another calling on governments to convene a meeting in 1990 to explore and discuss all proposals relating to CRAMRA (Convention on the Regulation of Antarctic Mineral Resources Activities). It is expected that both meetings will be convened in Chile in June 1990, and that they will be back-to-back.

Tourism and non-governmental expeditions were another agenda item, and several nations circulated working papers. The Federal Republic of Germany's paper stressed the importance of liability of tourist operators. Chile made four recommendations dealing with increased authority for tourist agencies, liability, insurance, and timing of tourist visits to avoid interference with scientific research activities. Argentina wanted stricter regulations of non-governmental expeditions than of commercial tourism. The next result was sort of predictable, that a comprehensive review of the issue was necessary, and that such a review would most appropriately take place in the context of a review of comprehensive measures to protect the Antarctic environment!

It must be frustrating to attend meetings where twenty-three consultative parties sit around and try to reach unanimous decisions on touchy subjects. In retrospect, the most amazing thing about all this may be how quickly the Antarctic Treaty came into force almost thirty years ago; the disheartening thing must be the lack of unanimity when the Treaty works so well. It purrs like a Rolls Royce, but it's treated like an Edsel.

**EAST BASE BECOMES SACRED TERRITORY.** One of the things which transpired at the recent 15th Antarctic Treaty Consultative meeting in Paris was the endorsement of East Base, Stonington Island, as an historic site. The camp was the eastern half of the U.S. Antarctic Service Expedition, 1939-41, and was led by Dick Black. Finn Ronne and Carl Eklund were two of the better known Antarcticans at the station. Finn was to bring his own expedition back to Stonington Island in 1947-48, and they reoccupied the facilities. With Finn on his expedition was Harry Darlington, another veteran of East Base.

Probably future visitors to the station will only associate it with the fact that here trod the feet of the first two women to ever winter over in Antarctica - Jackie and Jennie. Enough has been written on that year - three separate books - to fodder the continuation of the saga of the expedition forever and ever. Wonder if the bed where Jackie slept is still intact? Should that be considered a national monument? As everything in camp is frozen in perpetuity, it will be preserved if it is still there. Only the memories and tales will change, enhanced by time, enriched by the imagination of those who visit there. I'm glad of one thing, that both Jackie and Jennie were good-looking young chicks. It would have been awful if the first two women to winter over on the ice had been ugly old hags!

**ENVIRONMENTAL FUTURE OF ANTARCTICA.** Martha Muse, President of the Tinker Foundation, has assembled an all-star array of protagonists and antagonists on the Antarctic environment to discuss problems and issues. With Bob Rutford and Bruce Manheim sharing the same dias, they better have the cops right outside the front door. Lee Kim-ball, our Society's Man of the Year in 1987, is on the program, as is that tennis imposter, Sayed El-Sayed, penguinologist Frank Todd, travel administrator Werner Zehnder, and several others whom we aren't certain about. I presume if one showed up at the French Institute, 222 East 60th Street, New York, and went to the Edward Larocque Tinker Auditorium at 9 AM on 10 November, you could gain admittance. It's to be an all-day session, supposedly lasting until 4:30. Sure would be fun to be there, also interesting and enlightening.

**BIG BIRD IN ANTARCTICA.** A C-5B Galaxy has made its presence known in Antarctica, and things will never be the same again. One took off in late September from Point Mugu with 100,000 pounds, including 75 passengers and four fully assembled helicopters, destination Christchurch. Then in early October, specifically the 4th and the 6th, it made two round trips to McMurdo, carrying 150,000 pounds on each trip. The point of doing this was to get those helicopters and people there fully assembled, starting operations much sooner in the season than they could have otherwise. The plane landed on a 78" thick sea ice surface, which bent but never broke. The ice deflected downwards two to three inches, but after the plane took off the ice returned to its former height!

People at NSF are pretty excited about all this, as it could mean that this old bird could be taught to fly large loads onto blue ice runways, thinking particularly how nice it would be if they could land on the blue ice near Mt. Howe. This site is only 165 miles from the South Pole, and if they could land there with materiel for the new South Pole Station, it would certainly expedite getting materiel there. If you are as ignorant as I am about planes, here are some stats for you to mull over: it's 247.8' long, has a 222.8' wing span, has a fuel capacity of 332,500 pounds (weight counts, not gallons!), carries a payload of 261,000 pounds, and has a maximum landing weight of 635,850 pounds. Trigger Hawkes, eat your heart out!

**THERE'S A HOLE IN THE BUCKET, DEAR LIZA, DEAR LIZA.** There have been a couple of fuel leaks, one at the South Pole, another at McMurdo, but things are great at de-

activated Siple! At Amundsen-Scott, personnel noticed a discrepancy between normal usage and measured depletions of stored fuel. On 21 August they discovered and repaired a significant but apparently intermittent leak in a pipe joint that had been inspected many times previously. The surface did not show any evidence of long-duration leakage or of a large quantity of fuel dripping onto it. They estimated loss of about 44,000 gallons of diesel fuel. A press release out of NSF on 28 September said they felt the fuel would move downward to about a depth of 50 meters. That seems awfully deep to this innocent, considering the very high density of the firn and ice at relatively shallow depths at the station.

Personnel at McMurdo discovered on 11 October that there had been leakage from several large flexible fuel tanks (bladders) at Willy Field. A preliminary assessment was that 50,000 gallons of aircraft jet fuel, diesel fuel, and automotive gasoline may have escaped. They had an unusual high amount of snow at McMurdo during the past winter, and it is projected that the excessive weight of snow and ice on the tanks may have caused the leakage. An ironic aspect is that these flexible tanks were being phased out, and NSF had already ordered seven 20,000-gallon steel tanks to replace the flexible ones. These new tanks will arrive aboard the annual supply ship in February 1990. When the NSF press release of 12 October 1989 came out, they wrote that the leaked fuel is contained within an area about 180 feet by 60 feet, and that they were cleaning it up. The pooled fuel was being pumped out, and the remaining snow-ice-fuel mixture was being pumped into a fuel tanker sled for a yet-to-be determined disposition. The environmental impact at both the South Pole and McMurdo is expected to be minimal.

**HEALTHY, WEALTHY AND WISE.** Congress is looking very favorably upon Antarctica as a great place, and towards that end have sent a bill to President Bush that will enable NSF to launch a hundred million dollar five-year initiative aimed at improving health, care, and safety for U.S. scientists and support personnel, as well as lessening the environmental impact of programs. This new U.S. Antarctic Program initiative is part of Veterans Administration, Housing and Urban Development, and Independent Agencies Appropriations Act cleared by the Congress on 31 October 1989. More than half of the \$10 million (included in the NSF FY90 budget) and \$30 million of the total will be for environmental activities. It is our understanding that they are going to start trying to clean up McMurdo from the sins of the past thirty-odd years. When they get through, it will look just like La Jolla, or maybe even Carmel.

They are also going to improve medical facilities and provide field parties with safety experts who have medical training. Does that mean there will be a Michele Raney running shotgun on the back of a Bill Cassidy's snowmobile? Maybe the key to getting to Antarctica will be EMT (Emergency Medical Treatment).

**BELATED BIO ON ANTARCTIC ARTIST NEELON CRAWFORD.** Unfortunately, but characteristically, our infamous Postal Service found a way to deliver Neelon Crawford's bio to the wrong address, so our September Newsletter went out with relatively little information on him. Neelon spent his early childhood in New York City, pour soul, but, fortunately, he traveled extensively with his father, Ralson Crawford, an artist. It was somewhat natural for him to pursue the arts when it came time for college, and he became an art major at Antioch College, studying photography, drawing, oil painting, sculpture, and stained glass window fabrication.

Neelon graduated from Antioch in 1969 and moved to San Francisco, where he made film and screened them at museums and universities. By the time of his first Cineprobe at the Museum of Modern Art in 1973, he had completed more than fifteen films. Then he picked up a passport and took off for South America, photographing and filming in

Ecuador, Peru, Bolivia, and Colombia. Neelon returned to New York City where he supported himself as a freelance sound recording engineer for motion pictures and television. In 1976 he returned to Ecuador for eight weeks. The Museum of Modern Art presented in 1977 a second Cineprobe selected from more than forty of his completed films.

During 1980-81, he traveled to Egypt, Isle of Man, South Africa, People's Republic of China, Thailand, and India. This travelling was a strong catalyst for expanding the content of his photography. In the People's Republic of China he photographed ancient Buddhist sculpture and modern steam locomotives. In 1981 he began making photogravure etchings. Two years later he made a three-month trip through New Guinea, Indonesia, Malaysia, Thailand, Burma, India, and Pakistan which yielded a whole new body of work.

1984 and 1985 brought his second and third trips to the People's Republic of China. Neelon received special support from the Chinese government's Xinhua News Service for his photographing the production and operation of steam locomotives. In 1985 the influence of computer image manipulation entered into his work. He developed a system for making 4x5 computer-generated paper negatives from which he made silver prints. The resulting photographs led to both photogravure etchings and paintings.

After all this apprenticeship, he was deemed worthy by the powers-that-be to go to the Antarctic, and that is where he went in January 1989. He worked in and around McMurdo, was at the South Pole, and also traveled by icebreaker along the coast to Cape Hallett.

Neelon is fast at work in his studio in New York City (10 East 23rd Street, NY 10010, telephone 212-475-7808) preparing The Southern Light portfolio for exhibit at the Baum Gallery. Then the exhibit of photogravure etchings of the Antarctic will be exhibited internationally. We hope to be able to keep you posted where and when.

**NEELON'S THE LONE EMPEROR.** As you may recall, we have advertised the availability of Neelon Crawford's The Lone Emperor poster. A clutch of Emperors arrived at Union Station in Washington on 1 November, and they were put in the basement of the Nerve Center. Mailing tubes will arrive in mid-November, and then they will be shipped out.

If any of you have not ordered your penguin for Thanksgiving, send us a check and we'll mail one on ice. This is truly a fantastic poster, one of great beauty. We bought 100 Emperors, so we have a good supply of them. We also have a few posters of the Amundsen-Scott South Pole Station, but their price is higher because we bought only a few. The Lone Emperor poster is \$8. Amundsen-Scott South Pole poster is \$9.

**TRANS-ANTARCTICA.** We weren't going to mention this endeavor, as they are big-time highly-funded, highly-visible, and have their own 800 number, but we just could not let this one pass by - they flew 15 dogs back to Chile for R&R! How times have changed! I wintered over two consecutive years, and while transporting my program from Little America V to the South Pole, I requested several days in Christchurch for a tune-up for my chassis. You would have thought I asked for the moon. It only goes to show I was born 32 years too soon, and I should have been born a dog.

**BLIND SIDED.** We were appalled when we saw the cover of Ice Cap News for Sept.-Oct 1989 and found that they were informing their legions that they could purchase a 1989 New Zealand Antarctic calendar from us for \$8.50. Russ Ott, how could you do that to us without asking? We only order what we think we can sell to our own members - no more, no less. The only saving grace is that they showed 1989 instead of 1990. Too bad we don't have a lot of old ones left over we could unload on them!

*COME SAIL WITH US TO ANTARCTICA ON THE WORLD DISCOVERER NEXT FEBRUARY-MARCH 1990!*

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 89-90

- Dr. Claude Lorius, 1986
- Dr. Louis J. Lanzerotti, 1987
- Mr. Peter J. Anderson, 1988

Jackie Ronne, a distinguished alumna of Columbian College, George Washington University, is famous for holding or co-holding with Jennie Darlington many Antarctic firsts by dint of being the first women to winter over in Antarctica. Jackie got a preview of coming attractions when Finn took her on a skiing honeymoon. Three years later she found herself sending out expedition news release\* three times a week to the North American Newspaper Alliance; taking tidal measurements; and running the seismic equipment, all the while living with Finn in a 12'x12' "ballroom." But Finn never promised her a rose garden. The station was officially declared an historic site at the Paris meetings in October, so will be preserved into antiquity.

Jackie has been to Antarctica three times, the last in 1971, when she and Finn were at the South Pole on the 60th anniversary of Amundsen's arrival, the first married couple at the South Pole. Ronne Ice Shelf was named for Jackie (see "Geographic Names of the Antarctic"). A past president of the Society of Women Geographers, 1978-1981, Jackie is an international traveler who has lectured in Europe, Asia, South America, and North America . . . . The film she will show us is the official movie of the Ronne Antarctic Research Expedition. *Come and see and hear Jackie!*

*BRASH ICE: We goofed on numbering pages, so there is no introductory page, per usual, what you read may not be all that it seems to be. But close!*

**TERRA NOVA RETURNS AGAIN.** Like the swallows at Capistrano, TERRA NOVA seems to come to the Washington area every winter, and it appears to be on schedule, as the Washington Stage Guild will put it on between 24 January and 25 February in Carroll Hall at 924 G Street N.W. This is opposite the Martin Luther King Library, and there is a Metro stop, Gallery Place, within half a block of the Hall. Performance will be Wednesday through Sunday at 8 PM, with a matinee every Sunday at 2:30 PM. Tickets are \$12 per person on Wednesdays, Thursdays, and Sundays; \$15 per person on Fridays and Saturdays. If you are a student or a senior citizen, tickets are one-third off. If you can get a group of ten or more together, tickets will be half price. Call 529-2084 for reservations, and pay at the door.

As TERRA NOVA has played in both Washington and Baltimore, we can't imagine that there are many of you who haven't already seen it, but if you happen to be one, it's well worth the price. The play has been performed in just about every major city in the U.S. and in New Zealand. As it's the story of Scott and Amundsen going to the South Pole, there are very few characters and hardly any stage changes, so you can concentrate on the spoken words. The last time I saw TERRA NOVA Amundsen beat Scott to the South Pole, but we won't tell you about the tragic ending.

**POLAR RESEARCH BOARD MEETING** (by Shere Abbott, West Falmouth). The PRB met on 2-4 October 1989 at the Academy's Arnold and Mabel Beckman Center in Irvine, California. The focus of this "working" meeting was on the elements of and the need for, a bi-polar research plan. At its previous meeting in Washington, Peter Wilk-niss (NSF) had asked the Board to consider development of such a plan to follow on a recommendation of the "Colwell" report to the National Science Board on the role of NSF in the polar regions, and to establish targets for U.S. polar science for the 1990s. The plan will likely focus on the polar regions and global change. The Board also spent part of a day discussing the need for an environmental research agenda for detection and measurement of environmental change in the polar regions, as the basis for the Board's contribution of an intellectual framework to address concerns about possible degradation of polar environments.

Although moans and groans were voiced before the meeting about the meeting site, particularly from PRB staff, participants agreed that the relaxed California atmosphere (some Board members were particularly fond of the Jacuzzis) provided an appropriate venue for creative developments! The Academy complex, a modern version of the eastern marble house on the mall, was the meeting equivalent of a desert spa. The next PRB meeting will focus on Antarctic and SCAR issues, and will be held on 2-3 April 1990 in Washington, D.C.

**A POOR MAN'S ANTARCTIC GAZETTEER.** Back in 1981 the U.S. Government Printing Office published "Geographic Names of Antarctica", a 959-page book listing 11,604 approved geographic names, and each feature had a short description about where it was and who it was named after. Everything was in alphabetical order so you could find any feature almost instantly. It is a great publication. Now comes along a companion piece. The forthcoming volume, due out almost any day, will list 12,362 approved names, plus 2,546 unapproved variant names (which aren't supposed to be used). So 758 new names have been approved and will be shown in the new gazetteer. Now the kicker is this, only the names and coordinates will be shown - there will be no description, no information telling which Smith or Jones or Brown the feature may be named after. We don't think a price has been set, but we should know by the next Newsletter.

**WHATEVER HAPPENED TO THAT BIG OLD ICEBERG, B-9?** Remember that berg that broke off the Ross Ice Shelf about twenty-seven months ago, that was approximately 98

nautical miles long and 25 nautical miles wide? Well, that old berg, B-9 on the charts, broke up in August when it ran aground at Cape Adare. There are three sizable bergs surviving. As of late December 1989, B-9A is about 30 nautical miles long and 19 nautical miles wide, and it's at 69°18'S, 160°30'E; B-9B is the biggest remnant, being 55 nautical miles long, 19 nautical miles wide, and it's at 69°30'S, 161°00'E; B-9C is the smallest of the three, being only 17 nautical miles long, 7 nautical miles wide, and it's at 69°55'S, 161°40'E. All of these are off the Gates Coast, in the vicinity of the Soviet station, Leningradskaya, and will probably continue to drift westward.

These large bergs are really the environmentalists' best friends, as what oil company is going to waste untold millions of dollars putting in oil drilling platforms in Antarctic waters when one of those large bergs can come along and completely wipe them out? Bergs are like gorillas, they are going to go just where they want to go.

**ADMIRAL MIKE BENKERT IS DEAD, BUT HE'LL NEVER BE FORGOTTEN.** Mike Benkert is not a household Antarctic name, but this former Antarctic icebreaker captain was truly one of the most unique characters that ever went to the ice. In spite of himself, he made admiral in the Coast Guard; he did it on sheer ability, not for being a quiet conformist. Mike was a man's man, and I have long said that if I ever got myself into a bad predicament, it would be Mike whom I would want by my side, as I just knew he would get me home safely, come hell or high water. What a fighter, but he finally met his match. Big C struck him down in mid-December.

I met Mike back in 1952 when, in a desperate move to replenish an empty school wallet, I joined the Weather Bureau's Atlantic Weather Project on the North Atlantic. My first patrol was on the COOS BAY, and its young, brash, crew-cut executive officer was William M. Benkert. Nothing was dull on the whole patrol, as we followed Iceberg Dorothy (named after Mike's wife) in the Davis Straits. Releasing a 500-gram weather balloon in bad weather was always an ordeal, as often you would lose them into the sea. But if you timed the pitch or roll of the cutter just right, you could usually get it airborne before it got caught in a downdraft, that is, if Mike didn't shoot it down first. He took great delight in laying atop the inflation shack with a BB gun and shooting them down just as they got airborne!

Some men are fighters, some are lovers, but Mike was both. Mike never was a diplomat; diplomacy with him started with a left jab and ended up with a punishing right uppercut. Back in the fifties the Coast Guard used to visit Argentina on the way back from station duty so they could bootleg some good but cheap Canadian whiskey back home. We would stay overnight, giving everyone an opportunity to go ashore and get a good meal at one of the clubs. One evening Mike went to the Officers' Club, met up with this woman and was having a good time. Late in the evening this man came along and tried to cut in on him on the dance floor. This didn't set well with Mike, and to settle the matter expeditiously and convincingly, if not judiciously, he cold cocked the guy. When the guy came to, Mike not only found out that he was the Marine Corps Commandant at the base, but that he also happened to be married to the woman. Shortly thereafter an edict came down that no Coast Guard cutter with Benkert aboard would be allowed into the harbor.

However, Mike found other ports just as inviting. If Mike had a motto in those days, it had to be that in-port periods were golden privileges which should never be wasted, but enjoyed to their utmost. Once in Bermuda he ran into some opposition at the Coral Beach Surf Club, as they turned him down from entering the bar because he was in uniform. He demanded to see the manager; he came, and Mike explained that he was just out for a quiet evening, wanted to have one or two drinks, then move on, and resented not being served. Rather than make a scene, the manager reluctantly agreed

to let Mike come in, but did ask him to leave after he had had two drinks. Well, Mike had actually lied when he said he was just out for a quiet evening, as Mike never had a quiet evening back in those days. Within ten minutes, Mike found himself right in the middle of a barroom brawl, and they had to call the police and take Mike away. Now the in-port period was becoming something worthwhile for Mike, and the next day he recruited the best men he had on the cutter; they got dressed in civies, revisited the Surf Club, and Mike's Revenge was, shall we say, invoked. This was Vintage Benkert. It just did not get any better for him - the hunt, the pursuit, the kill, the thrill of victory - it was all there in one form or another.

Be had a run-in with the Russians when he tried to circumnavigate the Arctic back in 1967. As I recall, he was skipper of the EASTWIND, and was denied permission by the Russians to take a particular course through the Kara Sea. But Mike had a bad hearing problem when someone told him he couldn't do something, and he proceeded to get the icebreaker caught in ice, and had to be rescued by the Russians! But Mike told me afterwards that in spite of everything, he came out of it all with a rather complete map of the submarine topography of the entire Kara Sea!

His Antarctic operations were rather mundane. However, the people in Valparaiso, Chile liked him so much that they made him Honorary Mayor for a day. When Mike spoke to our Society several years ago the title of his presentation was "A Sailor's Viewpoint of Antarctica", and as you can well imagine, he just loved Wellington. Mike drew the ire of the State Department on an Antarctic inspection cruise, when, after being delayed by weather from setting the inspection party ashore at a particular base which they wanted to see, he suddenly ordered the ship underway to the next station. One of our members, Col. Ernest Dukes, said that all was forgiven because they all liked Mike so much.

Mike had one job which I thought was the perfect job - the right man in the right position, that of being in charge of the waterfront in New York. A great place for butt kicking! But then he got sent to Washington, and like all admirals who lose their ships, was put into miscellaneous titled positions. His were concerned with merchant vessel inspection, merchant marine safety, marine environment and systems, et cetera. He ended up in the Coast Guard as Chief, Office of Merchant Marine Safety. Someone told us once that if he had stayed in, he stood a good chance of becoming Commandant. That would have been something horrible, as his kind of Coast Guard had long since disappeared. He then became president of the American Institute of Merchant Shipping and served in this exalted position until 1984, when he became president of Petroferm Marine Inc. chemicals. He was vice chairman of the International Chamber of Shipping, and headed several U.S. delegations to the International Maritime Organization.

One could never really get the better of old Mike, but I came close several years ago. We were having lunch on his piece of plastic at Duke Ziebert's when we got to talking about Antarctic features, and he said there was a mountain named after him. He had not seen it, but expressed an interest in seeing a picture of it. I told him I would try and see if one was available, and, if so, would try to get him a copy. It turned out that not only was one available, but I was able to get a very large print. But, and here was the kicker, Mt. Benkert looked about the size of a pimple on a snowfield, which sort of left Mike speechless, although outwardly he appeared most appreciative.

There is going to be a Memorial Service for Mike at the Ft. Myer Chapel at 3:30 PM on Wednesday, 7 February, when Admiral Wallace, another admiral, and the Coast Guard chaplain will speak. Mike won't be able to make it, as he has been cremated and his ashes strewn at sea. Following the service, there will be a reception at some nearby place (which had not been determined as we go to print). It's kind of too bad that they have two admirals speaking at his memorial service, as Mike was

such a common person that it seems only proper that one of the speakers should be some old hardened chief petty officer who served with him. Let's hope the reception will be pure Benkert, but without a brawl breaking out!

**ARCTIC AND ANTARCTIC REGIONS (AAR) DATABASE.** The National Information Services Corporation (Attn: Fred Durr, 335 Paint Branch Drive, College Park, Maryland 20742) has published an Arctic and Antarctic Regions Database on CD-ROM. The database contains over 147,000 citations compiled by the Science and Technology Division of the Library of Congress. All forty years of this database are on one compact disc. It includes abstracts of articles from thousands of different journals, monographs, reports, case studies and more. It covers aspects of the life, physical, and social sciences; and related engineering, biology, ozone, navigation, legal, conservation, military use, and management of the polar caps and surrounding areas. In other words, it has anything and everything you'd ever want to know about the coldest parts of the world EXCEPT who reached the North Pole first.

Title: Arctic & Antarctic Regions  
Software: NISC customized Dataware CD-Answer software  
System: IBM PC/XT/AT, PS/2 or compatible; 512K RAM; MS-DOS CD-ROM  
Extensions 2.00  
Options: CGA, EGA, or VGA Monitor; Printer; WP; dBASE output  
Format: High Sierra/ISO 9660  
Price: \$595.00 for annual subscription; volume discounts for  
multiple disc or Title orders; CD-ROM Drives available  
for purchase directly from NISC  
Available: July, 1989  
To Purchase: NISC USA, (301) 454-8040

**ARCHIVES II.** As many of you know, the National Archives has a major paper problem. They reached their records' storage capacity of approximately 900,000 cubic feet in the late 1960s when many of you OAEs were submitting your journals, letters, and manuscripts to them. A study was done on the present and future space needs, and after an exhaustive search they have selected the University of Maryland in College Park as the site for Archives II. Criteria used for selection included cost (zero dollars for use of the land), size (to accommodate 1.7 million square foot structure with room for expansion), accessibility (spaces for parking, access to subway), and suitability (no environmental impacts).

President Reagan signed Public Law 100-440 in September 1988 which authorized the National Archives to construct and finance Archives II. The National Archives in Washington will continue to serve as the central focus for programs for the public. All special media records and all textual records not remaining in Washington will be transferred to the College Park facility, including all of their polar holdings. Construction of Archives II is scheduled to begin in 1990, and will be completed in late fall of 1993 (in time for the Maryland Homecoming football game). It will have an idyllic setting on 33 acres with tree buffers on all sides. The building will be six stories high, and will provide spaces for offices, a theatre, conference rooms, a cafeteria, and a day-care center. And, believe it or not, an urban forester - must be a concrete specialist - "has been hired to conduct a tree preservation project to ensure that significant specimen trees are preserved as part of the site design." Wonder what a "significant specimen tree" is in the Washington area? The last one we heard about was a cherry tree which some young whippersnapper cut down on his old man's lot, didn't cover his tracks, got caught, and had to tell the truth.

Archives II is being financed through the sale of National Archives Facility certi-

ificates of participation. It seems that the National Archives has acquired the equivalent of a home mortgage at a fixed rate of 8.53 percent interest which will be paid off in thirty years. The cost per square foot is \$17.04, a bargain in today's Washington scene. The actual value of the sold certificates was \$301,702,000, the amount authorized by Congress to construct Archives II.

As most of you know, Alison Wilson has been on the polar scene since prior to the IGY, which in itself makes her a bit of archival material/history. We have referred to her as the last polar link in the National Archives, and questioned what would happen should Alison ever decide to retire. She has reassured us that she is in good health and of sound mind, and that the polar holdings were never in better shape than they are today. At Alison's request, she has been assigned to the Records Relocation Branch which is responsible for describing and preparing records for the move to Archives II. She is particularly concerned that the polar records in RG 401 and the federal record groups should be adequately described before she retires.

The records and papers which many of you people put in the National Archives' Center for Polar Archives are now, as a result of the October 1988 reorganization, part of the Civil Reference Branch of the National Archives. And there is an archivist in charge of the polar and scientific reference, Dr. Marjorie Ciarlante. Her doctorate is in History of Science, and, according to Alison, she is well qualified polarwise and scientifically.

So there is good news at the old corral on Pennsylvania Avenue, things are in good hands, there is no need to panic. Over half of the material in RG 401 has been described, and Alison writes, "My hope is that the descriptions, which will eventually be used in the Archives computer description program, will assist both archivist and searcher." One good thing about the move is that, if you go all the way out there, you should be ready for an ice cream, and there is a campus ice-cream bar associated with their Agriculture School which dishes out great ice cream.

**NATIONAL SCIENCE FOUNDATION RELOCATION NEWS.** What is "stark, ugly concrete and glass box, low drab ceilings, bleak lobbies, dull paint, dingy spaces, shabby carpet, mismatched institutional furniture, glare on computer screens, inadequate ventilation, overheated and overcooled offices, poor conference areas, 1950 telephones, elevators that need to be coaxed?" Well, if you answered the NSF facility at 1800 G Street NW, you are in complete agreement with Gifford H. Albright, Professor of Architectural Engineering at Penn State University. If he describes the NSF facility in those terms, Heaven knows how he would portray the Pentagon! But NSF won't have to put up with this much longer, because in the spring of this year they will announce the site for their new building. They have hopes that the building of some 350,000 square feet can be ready for occupancy by the end of September 1992. The new building will be designed as an "intelligent" building, and will be flexible enough to accommodate future changes in both technological and organizational requirements.

One can't help but wonder where they are going to find a suitable location, as they want locational amenities, access to government and scientific organizations, and access to transportation. That sounds like the Ellipse in front of the White House.

**THE ED THIEL EARTH SCIENCE LABORATORY TO BECOME HIGH-CLASS RESTAURANT.** After talking about Archives II and the relocation of NSF, we have a somewhat lesser building plan, the conversion of the Thiel Laboratory into some sort of a private, ritzy restaurant at McMurdo. We don't quite fathom just what is going to happen, but it seems that McMurdoites are, or have been, clamoring for a more sophisticated, private type restaurant, and this will be it. They are even going to have pizza!

Perhaps they should contact Tom Monaghan of the Detroit Tigers and Domino's Pizza, as he could no doubt give them a little car/snowmobile or whatever to make deliveries in downtown metropolitan McMurdo. NSF refers to the creation of this restaurant as "humanizing McMurdo Station." Lord knows McMurdo needs all the humanizing it can get, but at the expense of old Ed?

**THE FAT LADY HASN'T SUNG YET.** We are pretty certain that most of you who saw the cover of TIME magazine for 15 January 1990 couldn't resist digging deep into your pockets for \$2.50 to read all about Antarctica, especially when the last Antarctic cover on TIME was over thirty-three years ago (31 December 1956)! The bottom line of the current TIME article on Antarctica generally supports the United States' position relative to mineral regulation. (We understand that the European edition of TIME at the time of the Paris meetings in October was not so favorable.)

It was real unfortunate that the many fine accomplishments at the Paris meetings were masked by the onslaught of publicity which Cousteau was able to generate for his side. Cousteau must be more of a curmudgeon than a nice guy. The Dayton Daily News for 9 October 1989 had a headline "Cousteau Scuttles Guest on 'TODAY'." Cousteau had agreed to leave after his interview so that R. Tucker Scully of our State Department could talk about the U.S. position on the Antarctic, but according to NBC spokeswoman Peggy Hubble, Cousteau refused to leave. That beautiful doll back in the studio in New York, Deborah Norville, told viewers, "We're having a little difficulty getting Mr. Scully hooked up there in Paris", and they took a station break. Then Deborah came back and spoke of "how strong the feelings run on this Antarctic issue. Capt. Cousteau refused to move over so that we could talk to Mr. Scully." They needed a guy like Mike Benkert to lay a couple on the side of his head. Then they could have carried him away!

Nothing is really settled yet, and probably won't be for some time. When you get right down to dotting the i's and crossing the t's, no one really wants to disturb the environment; they are nowhere near so far apart as the Paris media made them out to be. No one has found any minerals down there yet which justify mining, and we can't possibly imagine attempting to put oil rigs where icebergs assume their natural right-of-way. This writer recalls a very fine lecture which Geoffrey Larminie gave our Society on 21 April 1983 about oil drilling off the coast of Alaska, and even in relatively shallow water near shore where they had known quantities of oil, it was still a losing financial deal for the companies.

**EVERYTHING ISN'T ALWAYS AS IT SEEMS TO BE.** If you bothered to read the press releases on the 8-million-dollar crossing of Antarctica by the six-man international team, you might have noticed that the Russians made the continuation beyond the South Pole a reality by giving them fuel from their depot at the South Pole. That fuel came from good old Uncle Sam, although presumably we have some Russian redeemable credit slips, should any of our ships or planes find themselves at a Soviet base where there is fuel. It seems that the Russians came to us and said that they were committed to support the crossing, as one of their men was on the trek, and wanted to fly fuel to the South Pole. It was decided that it would be best for everyone if the U.S. just let them have the fuel, and then get it back later from the Russians. But you would never know it was that way from what you read in the paper, but as Walter Cronkite used to sign off, "And that's the way it was ... "

**STORIES ABOUT THE EARTHQUAKE.** When the earthquake so unceremoniously disrupted the World Series, my first thoughts were that Tom Poulter's former home built in the Los Altos Hills, overhanging a precipitous drop-off, would end up a bunch of

rubble far below. Tom was the senior scientist on BAE II, and his widow passed away just a year ago last June. But we have heard from young Tom - who really is not so young anymore - that the house survived. I now believe in miracles, because when we visited Helen Poulter several years ago I dared not breathe too deeply as there were so many cracks in the walls. Tom, who works for BTI, was flying his own plane from Tulsa to Nashville when he heard about the quake from air controllers, so he turned around and headed home. Descending through 8,000 feet into Grand Island for refueling, either a bird struck the plane or the plane struck the bird. Either way the creature didn't have flight clearance for that height, nor was it carrying navigational lights. Whether the bird was scared up there by the earthquake is not known, but Tom is going to put a bird decal on the nose of his plane signifying one kill.

Rob Flint, the only person I know who has wintered over in the interior of West Antarctica (Byrd), East Antarctica (Vostok), and in the middle (South Pole), was sitting at home writing a computer check to reregister his car. Everyone in his family of four picked out a doorway away from windows, except bride Susan whose feminine instinct prevailed and who headed for the dining room to catch falling china. When Rob saw tidal waves of gigantic proportions in his swimming pool, his immediate reaction was that this should be recorded on film, so he ran to get one of his video cameras. Batteries in both were dead, so he stood there helplessly for 20 to 30 minutes, watching the sloshing, recording the images biochemically in his brain. Rob said that the shock waves that devastated the Marina District had to go directly under them. The general noise of objects rattling and the house frame groaning masked the noise of falling objects. The banging of objects in the house was just like some giant had picked up the whole house and was shaking it. Rob described it as a tangible sensation, being able to feel the giant but not being able to see him. The above was gleaned from Earthquake News, October 1989, Published Irregularly by the Flint Family, with inputs from all members of the family, although Susan's horse refused to write anything or be interviewed, evidently thinking it was much ado about nothing.

Art Ford enjoys earthquakes since he took out earthquake insurance several years ago, although he thought a 7.1 was overdoing his enjoyment a bit. He ran outside to see the old homestead being twisted about, and his beloved Model A bouncing up and down the driveway. He said that it gave him a keener appreciation for a wood framed house. One of his friends walking home fell down and thought he had a stroke or a heart attack and lost his balance. Then he saw cars bouncing around. You know, hearing Art tell about cars bouncing all over the place, Rob writing about water sloshing back and forth in a swimming pool, that guy falling over, losing his balance, wonder what would happen to someone like Dolly Parton if those things were unbridled and set in motion? Couldn't they become dangerous flying objects?

Ms. Antarctic Fiction, Fauno Cordes, escaped unscathed, although the building in which she works in the Mt. Zion Hospital and Medical Center cracked like a hard-boiled egg. She was in the garage of a brand new building across the street when it struck, so was in the right place at the right time. When she was allowed back in her building two days later, she found that a 25-pound lead brick used as a book-end to support some binders on the back part of the top of her filing cabinets ended up against the right front leg of her desk. Fauno wrote, "I have great respect for a building that can throw lead bricks."

While we are talking about quakes, may I put in one of my own quake stories? One peaceful midsummer day at the South Pole in 1957 the late Herfried Hoinkes of the University of Innsbruck and I were out for a stroll, probably about three quarters of a mile from camp, when we heard what we thought was an explosion. We looked back towards camp where all looked peaceful and serene, but we decided that it

might be best for us to head back, just on general principles. When we got back in camp, nothing had happened, no one had heard anything. It was quite evident that we had been directly above a snow quake - or were we above Amundsen's tent and the Snow Gods were warning us to move on? How common are snow quakes in the Antarctic? I know I never heard another at the South Pole, and I was outside at least twice a day every day of the year to attend to my instrumentation 500 feet from camp. They must be most infrequent.

**ANTARCTICANS.** Norman Vaughan, 83 years young, and his bride Carolyn are getting ready for yet another Iditarod race. He has written a book, "With Byrd at the Bottom of the World," which is being published by Stackpole Press in November 1990. A famous Alaskan artist, Jan Van Zyle is doing the cover illustration.

We inadvertently left Doc Abbot's 14th Non-Christmas card back on the coast of Maine, but to show you that we actually read it, his big news was that a tornado came along and lifted the whole roof off his house last spring when they were at home. It must have been a hair-raising experience, even for a retired Deep Freeze admiral.

Meanwhile, another living retired Deep Freeze admiral, Kelly Welch, loaded his CMC motor home, the Gold Bug, and headed for Alaska in late May. He and Mary did the whole ball of wax - from Banff/Lake Louise and Jasper to Pepe's North of the Border Mexican restaurant in Barrow. They were "mini-charged" by a female elk while IDing a strange bird; heard a real pro recite poems at Robert Service's house; had a bald eagle cross their bow 100 feet up and ahead; and then experienced a sickening stomach sensation when the Gold Bug's transmission screamed in pain, but fortunately they were right next to a phone booth. Kelly rides Sam several times a week. We must point out that Sam is a horse. There is an Antarctic friend of ours who calls his wife Sam, so it is essential that you know the Sam which Kelly is mounting is his faithful horse. Kelly is a docent at the Arizona-Sonora Desert Museum (ASDM), a living museum which is regional in scope (Arizona, Sonora, a bit of southern California and a bit of Baja California). Leading a group of tourists on a recent Sunday, Kelly noticed that one guy not only looked something like a penguin but walked like one. He took a closer look, and, lo and behold, if it wasn't Richard L. Penny whom he hadn't seen since McMurdo in 1971 when he was the resident "penguinologist." Incidentally, the Aussies have asked Rich to go back to Casey which will enable him to do some 30-years' follow-up research. Kelly and Rich were members of a pacifying party of OAEs who were sent to Tonga to stroke the king. It seems that His Highness, or Rotundness, actually - he weighs 400 pounds - had asked to go to 90°S, and the State Department evidently sent some guys over with films to show him that it was only a bleak, endless snowfield, a good place to live, but a lousy place to visit. After he saw their film and listened to their tales, Tonga looked better to him, and he decided to drop his request to visit. Where's Tonga????

And speaking of our friend with wife Sam, Tom Frostman, former meteorologist at Plateau Station, resigned as Director of a very prestigious summer camp in Durango, Colorado, and is now Director of Field Services for Prevention Research Institute (PRI) in Lexington, Kentucky. Their mission is alcohol abuse prevention, and they develop and deliver educational programs to help anyone reduce their risk of developing alcohol-related health and impairment problems - at any point in life. Tom, whom I have known personally for over twenty years, is an outstanding person, and it is good to hear that he is excited and proud to be in this program, which he says "I am confident that ten years from now the entire country will understand and begin to adopt PRI guidelines." Maybe the program should be tried out in Antarctica. I'm serious.

Charlie Bevilacqua, the old Seabee Chief Petty Officer who was in charge of the construction of the original McMurdo station and the South Pole station, doesn't have

a drinking problem, but he seems to have a bad addiction to skiing. Although he is actually a good old boy from Ken Moulton's hometown, Meredith, New Hampshire, Charlie has gone ape over skiing in Colorado. He spent fifty-three days in 1989 skiing at Copper Mountain, Keystone, Vail, Winter Park, Breckenridge, Loveland and Arapahoe Basin. But the highlight of his year was going to Pensacola where he had the opportunity to once again sit in QUE SERA SERA, the first plane to land at the South Pole. He flew to the Pole in that old crate back on 22 November 1956. As most of you know, the plane is permanently enshrined in the Naval Air Museum in Pensacola. If old Charlie doesn't start acting his age, he might become permanently enshrined in some avalanche, or at the bottom of some lake, as he also does other crazy things, such as water skiing and scuba diving.

Speaking of the ancient and honorable, Larry Gould is enjoying some degree of notoriety as he matures out of adolescence. On the 60th anniversary of Larry discovering sandstone on the slopes of 15,000-foot Mount Nansen (7 December 1929), Larry was interviewed by the Arizona Republic in Tucson. As he recounted his experiences on BAE I when he was senior scientist and second-in-command, Larry told the reporter, "I have earned the right not to remember anything." The article said that Larry was "a founding father of the School of Renewable Resources" at the University of Arizona. It seems to me that he should be hung (his portrait, that is) in the foyer as a prime (or primeval) exhibit of a choice renewable resource. Even if he isn't hung there, he certainly will remain a cherished Antarctic fossil. Maybe not as important as a marsupial, but nevertheless a most important one in Antarctic history.

Ed and Priscilla Grew continue to humble me with their fantastic Christmas letters, to say nothing of spectacular Antarctic scenes shot by Ed on their Christmas cards. They have lead a charmed life, although now I guess they are actually living together part of the year. Whoever does the composing in the Grew family is wasting time doing Christmas letters - he or she should be writing books. . . . And speaking of Christmas cards with polar scenes, it's always great to get another "field shot" from Bill Field. First and foremost it means that old Bill is still alive; second, it means that he is still active out there in the polar regions, even if he is slumming in the Arctic; and third, they make a wonderful collection which someday I will sell to a collector and make a fortune.

This guy at Texas, by the name of Sayed El-Sayed, is trying to project himself as the second coming of John Newcombe. There was a closeup picture of him recently in a newspaper in Texas, showing him playing at the Royal Oaks Racquet Club, dressed fit to kill with a forehead sweatband and sweatbands on both wrists, and the caption underneath shrieks out "Tennis Anyone?" If that is a challenge, the Society will put its money on Boy Scout Dick Chappell of Little America V fame, as they are about the same age. Either Sayed doesn't have classic form - but what else can you hope for with a body like his? - or the photographer caught him in a terribly awkward position. It almost made me want to go up in the attic and break out my old Head Red

As we watch our membership grow, we sort of looked forward to who would be No. 400 (it was Tahoe Washburn); who would be No. 500 (it was Lisa Fetterolf); who would be No. 600 (it was Peggy Dillon). Tahoe is the other half of the Washburn Geological Survey Team, and the other two women worked for the contractor in Antarctica. In fact, Lisa is still there. When she joined the Society she was just another beautiful young woman who dreamed of going to Antarctica, enjoying a very successful career as a writer for the Department of Defense in the Pentagon. But then one thing led to another, and she ended up as a summer employee at McMurdo. Then she went back to McMurdo for the next summer, and ended up wintering over. She just came back home to Springfield, Virginia, but only long enough to reintroduce herself to her parents and get resupplied, and is now on her way back for another winter at McMurdo! What is she doing? She's in supply at the Water and Power Plant, far,

far away from her old word processor. There is an Antarctic man in her life now, and we assume that this is what keeps Lisa going back to McMurdo. When we met this cameo-complexioned creature, we never dreamed that she would become a grizzly old McMurdo veteran. Antarctica does strange things to completely innocent human beings.

Debbie Enzenbacher had a great 1989 after wintering over at the South Pole in 1988. For nine months she bummed around New Zealand, Australia, New Caledonia, Bali, Java, Indonesia, Thailand, Cambodia, Hong Kong, China, Nepal, India, Taiwan, and Japan. Debbie is really something. She found Jakarta to be the exact opposite of the Antarctic - crowds, poverty, pollution, traffic jams, sweltering heat, exotic foods, etc. She found that hiking in the remote villages of Nepal brought relief from all the woes of travel, and she entered a dreamlike state surrounded by the Himalayas, which she thought was "Heaven on Earth." In China, Debbie took in the famed Beijing opera, Shanghai acrobatic circus, the Great Wall, the start of the silk road in Lanzhou, and more. Whatever money she may have had left from Antarctica, Japan sucked it up, being "the most expensive place I have ever travelled." We don't know how much weight Debbie put on, but she wrote glowingly and repeatedly of the food, such as "hot spicy food predominated, and overall Asia provided gastronomical delights." Let's hope this svelte German ancestry girl didn't come back looking like an Italian mother! Wonder why more Antarctic winter-overs don't do what Debbie did, as it sounds like a great way to decompress one's self back to stateside living. Debbie has hopes of continuing her education - she got her master's at the University of Chicago, doing her thesis on the Antarctic Treaty. We think very highly of Debbie, as she is a most unusual and unique person, and we wish her the very best, and hope she stays in touch with the Nerve Center.

Charlotte Evans, who writes occasionally for the New York Times and other publications, is sort of a free spirit like Debbie. Charlotte was in the Antarctic two austral summers ago, and has recently written an article in the Smithsonian's Air and Space Magazine on flying operations in Antarctica. Charlotte sort of goes with the wind, which is a nice carefree way to enjoy the world. We met her at a bus stop in Wellington when Antarctica was only a place on her Most Wanted List.

Rev. Bruce Lieske, a reformed Little America V meteorologist, who took up the cloth after spending a year with the likes of the late Bert Crary and Gene Harter, Muck-luck Milan, Wild Bill Cromie, the impossible Sam Wilson, and others, including me, celebrated the completion of his new church building in Lebanon, New Jersey in late October. The church sits on a hill with a spectacular view of the surrounding countryside. The chancel has a large clear glass window, and the whole right side of the worship area is glass patio doors. So it is a major challenge for the guy we called Mier Bruce to come up with good enough sermons so the parishioners won't long to get back outside in the pleasant countryside. Wonder how many winter-over types became ministers? It would be out of order to tell my old roomie "Give 'em Hell," but I guess it would be okay to wish that his coffers will be full, his parishioners non-bickerers, his wife's organ playing always in tune, and that the church will stand proudly as a living testimony to his ministry.

Gordon Fountain, crew member of the famed BEAR OF OAKLAND on the second Byrd Antarctic Expedition, never lost his love for the high seas. He has already made three trips with Capt. Heinz on the WORLD DISCOVERER to the Antarctic, and is signed up to go on the EXPLORER up the Orinoco River and through the Caribbean next May. He must be robbing banks ..... Remember Harry and Jennie Darlington of "My Antarctic Honey moon" fame? Well, they found a way to produce a boy, and that kid, Skipper, has grown up, visited Antarctica with the Chileans, and now is a highly visible international scientist studying the global ozone problem. Incidentally, the Darlingtons are Mainiacs in the summer", spending time at their place in Northeast Harbor, which is about as prestigious as you can get in Maine. Susan "Ozone Hole" Solomon

spent some time in 1988 in Greenland, and some last year in Norway studying the ozone depletion. Somewhere in between we understand that she picked up a gold medal from her bosses at NOAA. If she wears it under the ozone hole, will it turn green? She was writing an Antarctic novel. Has anyone seen it?

Bill Sladen, our only Double Memorial Lecturer, wants you guys and dolls who shoot down swans to cease doing it - right now! Bill, who is head of the Swan Research Program at the plush Airlie Conference Center outside of Warrenton, Virginia is striving to shut down Virginia's experimental swan hunting season. He says that shooting a tundra swan is like throwing a brick through a stained glass window, except that you can put a stained glass window back together again. The Soviet Vice Chief of State, V.N. Senin wrote Bill, "We know that you are against the swan hunt. Of course, we are too. Swans are completely protected throughout the USSR." Bill cries, "In all the world, there is no place else where swans are hunted. Why here?" Bill has argued with federal and state officials until he turned blue in the face, but to no avail. In December he went to Oxford University to debate the issue publicly with a scientist from the U.S. Fish and Wildlife Service. Bill says it's very difficult to oppose when you phone the Audubon Society and they say, "Well, we can't oppose it biologically. We're against it, but ..." Sladen said instead of exposing swans to hunters, Virginia should celebrate the great birds' arrival by taking children to see them, and establishing swans as "an emblem of our troubled wetlands." .... "But why hunt swans?", he asked. "I guess it's the influence of the big hunting lobby. But I really can't answer it."

Roy Cameron is bemoaning the fact that somehow his Antarctic life has gotten away from him, and he now goes to such places as Poland and Yugoslavia. He wrote, "I would rather be in a tent again in the Antarctic than in Poland." His work is taking him more and more into international environmental problems. As a member of the USDA's National Agricultural Research Advisory Board, he is involved in the global climate change controversy - economist vs environmentalist. One thing about old Roy that I appreciated, whenever he was in town on TDY and we had a meeting, he came to it, although he found us a rather unfriendly lot..... Peggy Dillon, our No. 600, was a cook at Beardmore Station in 1985-86, and once was a meteorological observer at the Mt. Washington, N.H. Observatory, is now dreaming of returning to Antarctica while covering the city hall beat for The Valley News in the Hanover, N.H. area.

The long-awaited book by Gil Dewart, "Antarctic Comrades: An American with the Russians in Antarctica," has been published by The Ohio State University Press, selling for \$20. Review in next Newsletter, as we just received it today..... In closing, Geza Thuronyi has dropped his membership. He is one of those quiet men, very quiet men, who works behind the scenes and is hardly ever seen. But his ballpark is the Library of Congress, and his game the preparation of the Antarctic Bibliography. He is retiring, he will be missed, and we wish him only the very best.

Division of Polar Programs, NSF will be glad when this austral summer season is over. as the weather has been bad; there has been poor radio communication because of increased solar activity; and maintenance problems have reduced flying hours of the Hercs considerably. And lastly, the POLAR DUKE, according to Capt. Lenie on the ILLIRIA, ran full speed ahead into an iceberg and stove in its bow, necessitating its going into a shipyard to have several plates welded on! The good news is that it occurred above the waterline. Could it be that Joseph Hazelwood has returned to the high seas and is now on the POLAR DUKE?

Our annual dinner meeting with the Polar Research Board will be Monday, 2 April 1990. in Washington, D.C. MARK YOUR CALENDAR NOW! .... All New Zealand Antarctic calendars have been sold -- THANK YOU! .... Ruth, Boiling and I are off to the Antarctic on WORLD DISCOVERER in three weeks. See you all later!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 89-90

March

No. 4

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Cary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

Paul C. Daniels

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988

*1990 Paul C. Daniels Memorial Lecture*

**HOW THE BIOMASS PROGRAM REVOLUTIONIZED ANTARCTIC BIOLOGICAL RESEARCH**

by

Dr. Sayed Z. El-Sayed  
Department of Oceanography  
Texas A & M University  
College Station, Texas

on

*Monday evening, 2 April 1990 7:30 PM*

The National Academy of Sciences  
2101 Constitution Avenue, NW  
Washington, D.C.

*Cocktails in The Great Hall at 5:45 PM  
and*

*Dinner in The Members' Room at 6:30 PM*

The National Research Council's Polar Research Board and the Antarctic Society are combining forces to bring you Dr. Sayed Z. El-Sayed as our annual Memorial Lecturer for 1990. Sayed, who was born in Alexandria, Egypt, came to this country in 1952 as a Fulbright Graduate Fellow in marine biology at the Scripps Institute of Oceanography in La Jolla, California. He went on to the University of Washington where he earned his PhD in 1959. He has been in the Department of Oceanography at Texas A & M since 1964, becoming full Professor in 1973. An El-Sayed sighting in College Station is very rare, very rare indeed, as his bag is always packed because he never turns down an opportunity to go back out to sea to continue his research studies. He has been into BIOMASS since its inception, and editor of its newsletter since 1979. El-Sayed also dabble! somewhat in tennis. We've been after him a long time, and have finally captured him. PLEASE COME!

This is our annual bash, and for twenty-five dollars you can have cocktails and an unknown dinner, but all our dinners at the Academy have been very good. Trust us! Shere Abbot takes reservations from Board members. We handle our Society members. Send your checks, payable to the Antarctic Society, to Ruth Siple, at the above address. AS SOON AS POSSIBLE — NOT LATER THAN 28 MARCH 1990! Thank you!

This will be a topical Newsletter, devoted to the Antarctic cruise which Ruth and I just came off this week. It's imperative to get a Newsletter out immediately, announcing the upcoming Memorial Lecture dinner meeting on April 2nd, so we are rushing this one tout de suite. Then we will dash off to Maine, pump out the basement, do a little work on the new house, and return here for the Memorial Lecture and a regular Newsletter.

There have been many magazine and newspaper articles on tour ships, but I never felt that any actually described the lecturers and the totality of the whole experience. As in other Newsletters, I have tried to feature people. I feel it was an honor to be invited on the cruise; and when I look at the list of our Society members who have been, or are, lecturers, such as Gentleman Jim Zumberge, Bill Sladen, Charles Swithinbank, Ron Naveen, John Spletstoesser, George Llano, Mort Turner, Bob Dodson, Dick Cameron, Hugh DeWitt, Mike Kuhn, and Bob Nichols (and I'm sure there are others), I feel we are a select group of people. I have no qualms at all about devoting a whole Newsletter to our recent wonderful experience, as I think the story merits being told.

**ADDENDUM TO WHAT FOLLOWS.** We saved this space to summarize the material left over after we ran out our ten pages. We didn't write about the fun times on board. The ship's crew put on a variety show, and what they may have lacked in talent, they more than made up for in fervor. A boy/girl dance team was actually fantastic, but the men in the kitchen doing a ballet from Swan Lake was a bit rough! .... We had two great barbecues out on the fantail, one in Grytviken, one in the Chilean fjords with a moon. Never having been on a cruise ship before, I am not a good judge about cruise food, but I thought it might be better. However, they are selling adventure not food. And it couldn't have been too bad - I put on seven pounds. We had two reporters aboard. One, Angela Wigglesworth, has a son who will make her famous, He, Mark, just won some sort of an international competition for conductors, and will be touring the world shortly, guest conducting symphonies. Angela is sort of a sweet person. Another writer, Avril Mollison, was a close friend of the late Sir Peter Scott, and he had talked her into going to the Antarctic. Avril is a former actress, turned travel writer, who is very well-known to the Brits, and evidently knows the right people, as she told me she had lunch with Vice President Bush once upon a time. Too bad she hadn't dined with Bert Cray, as he would have been more enlightening! .... Most evenings we had "recap" before dinner when any lecturer so moved could say what he/she wanted to say. "Recap" should really be called "Peter Harrison Show Time." Early on the cruise, he culled out the real beauties among the women cruisers, and they served as his Gentoo, his Adelie, his Wandering albatross, or whatever, and he would bring them on stage. One of his skits could never be shown on TV! .... We played four of Admiral Dick Black's poems at "recap", and they went over really well. After I praised Peter, he said that the success of a cruise depended on team work, that we were all part of a family, and this was the way it should be. Even though it was my first trip ever as a lecturer, and even though I may never be invited back, they really did make me feel I was part of the Society Expeditions' Family. It was a good feeling.

\*\*\*\*\*

We regret to announce that Jane McIlvaine McClary, wife of Nelson McClary, Ronne Antarctic Service Expedition, died in late January; and that Al Armstrong, designer of many buildings at McMurdo in 1956-57, died in early March.

**WHAT AN ANTARCTIC CRUISE IS ALL ABOUT.** Last August Ruth Siple, Bolling Byrd Clarke, and I were invited to go as lecturers on a late austral summer expedition cruise of the WORLD DISCOVERER to the Falklands, South Georgia, the South Orkneys, Elephant Island, King George Island, Deception Island, the Antarctic Peninsula, Cape Horn, and the Chilean fjords. Society Expeditions hoped to make our cruise one of nostalgic memories of the halcyon days of Richard E. Byrd and Paul A. Siple. We three were picked because we were all remnants of that era, and had the foresight not to die early, thus making us valuable survivors of a somewhat golden era. None of us had ever been to the Antarctic Peninsula, and all three of us were ecstatic about the opportunity to see that part of Antarctica. The cruise was all-inclusive of the best that Society Expeditions has to offer, and that made it all the more exciting. Bolling, daughter of the late Admiral Richard E. Byrd, had never before been to the Antarctic; Ruth was guest of the government at the dedication of the new South Pole station in 1975; and I had wintered over at Little America V in 1957, and at the South Pole in 1958, conducting the U.S. micrometeorological programs at those stations. And in 1986, I returned as a Visiting Fireman to McMurdo and the South Pole.

We knew that Peter Harrison of England was going as a bird lecturer, that Stephen Leatherwood would be covering the mammal world, that Mort Turner would be geologist-in-residence on the ship, and that the intrepid Shirley Metz would be talking about Antarctic adventurers, including her recent ski trip to the South Pole. And, after we got aboard, we found out that two German geographers would also be lecturing for the benefit of a small brigade of German-speaking tourists. Later on, Wayne and Susan Trivelpiece, penguinologists from Copacabana Station on King George Island, joined us for the last third of our trip. So there were enough lecturers aboard to satisfy the most information-hungry tourist.

We would be greatly remiss in this story if we didn't tell you that the Society Expeditions people in Seattle are just wonderful to work for, and that they run a better than first-class operation. Each of us was given a beautiful new red parka with hood, a backpack for going ashore, an excellent piece of carry-on luggage, a nice passport wallet which could hold airline tickets and paper money, nice luggage tags, and a personalized name plate for identification. By the time we reached Miami, coming from all four corners of the world, we were color coordinated, carrying the same carry-on luggage, and looking very much like a traveling professional sports team, although somewhat aged and jaded.

Ruth and I hired some people to come to the airport in Miami to send us off in style, as we wanted to feel loved before we took off. So my ex-South Pole meteorological friend, Kirby Hanson, and his beautiful wife Lisa, evermore a doll, plus Aileen Lotz, birder extraordinaire who got her birding inspiration from going on a cruise ship to Antarctica, answered our ad in the Miami papers for a supporting sendoff party. It was quite a sacrifice, if not a hardship, for Aileen to come to see this person off, as she initially took deep exception to my cryptic remarks about women in general, and at one time had a contract out on my head. But since then she has learned to tolerate my writing style, even though deep inside it probably gives her an upset stomach from time to time! Incidentally, trying to locate a woman whom you have never met, in an airport as large as Miami is quite a feat. The only picture I had ever seen of Aileen was one sitting atop a hill on Paradise Bay with an empty champagne bottle over her head. However, we did meet when she recognized a wandering albatross and said, "Are you looking for someone?", and I replied, "If you are Aileen Lotz, I am no longer looking for anyone." Actually Aileen is not a bad sort at all, especially considering she is a birder, and she, Kirby, Lisa, Bolling, Ruth, and I had a farewell dinner together at the airport hotel restaurant. It made a nice sendoff, and it's always good to get together with old friends like the Kirby Hansons and to meet new friends like Aileen.

We took a late evening flight out of Miami for Santiago via Lima, traveling in a great plane, a Boeing 767. All of the stewardesses were young and beautiful, with piercing dark eyes, and I said to myself, "This is sure a great way to travel to the Antarctic."

Tony Berg of Society Expeditions, who was to be the Assistant Cruise Director, was chaperoning us to Santiago, as well as on to Punta Arenas. I roomed with Tony in Santiago. We were all treated royally, staying at the relatively new, modern Sheraton San Cristobal. We were taken on a three-hour bus tour of Santiago, and outside of a wasted stop at a museum, it was great, especially atop San Cristobal Hill, where there is a spectacular panoramic view of the city. That evening most of us ate at an outdoor buffet under the stars with strolling musicians; then I drank beer with Tony until early in the morning. Everything was golden.

We had early breakfast, and then were bussed to the airport for a three-hour flight to Punta Arenas. What a flight, flying over the snowfields and glaciers of the southern Andes! There were 138 of us fighting for windows with views so we could get pictures. It seemed that half of our group came armed with camcorders, and when those folks get filming, they want a continuous sequence. However, no one was pushed out onto the wing of the plane, although there were several I thought should have been. Finally we arrived at the small airport at Punta Arenas, which really doesn't turn one on for the great adventure ahead.

As the WORLD DISCOVERER was disgorging passengers from its previous cruise and getting the ship shipshape for us, we were bussed again. The most exciting thing in town was visiting the local post office, where we soon discovered that at a postcard booth the prices varied according to whether there was a guide along with you. One could safely say the postal market was somewhat unstable that day. However, we ended up at a great restaurant next to an old race track where we had a fantastic meal. The atmosphere was so good that fellow travelers even started talking to one another. I found out quite innocently that the woman across the table from me actually had my father for a college professor, and that another woman, who was to become a good friend on the trip, lives across Muscongus Bay from me in Maine! We had all kinds of good things to eat, and they had a group of local musicians and dancers who entertained us. Everyone had a ball, and it put us all in a great mood to go on board the WORLD DISCOVERER late that afternoon.

It's always a thrill going up the gangplank of any ship, and it was especially so going onto the WORLD DISCOVERER. The first person we saw was Joanne Turner, wife of Mort, who had been lecturing on the geology of Antarctica for several cruises. Going to our cabins (Ruth and Bolling were rooming together, and I, as odd man out, had a room all to myself), we found bottles of champagne on ice. Our first reaction was that everyone must have gotten a bottle, courtesy of Society Expeditions, but upon inquiring around found that it was not so. It wasn't until the last day aboard ship that the Cruise Director, Micheline Place of Paris, told Ruth that our bottles of champagne were sent as welcoming-aboard presents from Mildred Crary. There was supposed to be a note with one of Bert's favorite comments, "The sun has now passed under the yardarm," but Micheline had lost it! It was a most kind gesture on the part of Mildred, but too bad we didn't know whose bubbly stuff we were consuming. It would have been more intoxicating!

The first night we were aboard they had introductory comments from all of the lecturers, and it was at this time that we learned the acts of life. Society Expeditions has a franchise lecturer in Peter Harrison, one whom they should insure for a million dollars, as this guy is the most fantastic person I have ever met - he's pure dynamite! He was on his sixty-sixth Antarctic cruise, and has seen more sea birds than any other man alive (or dead), and what a lecturer! He is also a great actor, has unbridled enthusiasm, has unlimited knowledge about all birds, and the

patience of Job when it comes to answering the same old questions, time after time, from 138 inquisitive passengers. There is no one more important, not even the ship's Captain, on an Antarctic cruise than the expedition bird man, and when Peter is aboard all other lecturers better realize they are going to be second best, at best.

Another veteran lecturer was Stephen Leatherwood of San Diego, who told us all we needed to know about all mammals. Steve was on his seventh expedition cruise, and he is great, too. He is more your classic classroom-type lecturer, has an excellent voice, and comes across most professionally. So we had two major leaguers who were head and shoulders above the rest of us. Tourists are really interested in penguins, whales, seals, albatrosses, and in other creatures which breathe and can either fly or swim. If you have authorities in those areas, the rest of the lectures are only there to fill in time spaces on the program.

Mort Turner gave a multitude of lectures, covering the whole Antarctic waterfront. He enjoyed the cruises and the lecturing, and would like to go back, although his wife Joanne is not so enamored about rock and rolling with the waves. Shirley Metz, who wrote a check for 100K which allowed her to ski, escorted, the last 700 miles to the South Pole in 1988-89, was there to tell her stories. Shirley is a forty-year old woman who is masquerading in an eighteen-year old body. She is fantastic when going ashore, as she can do anything, and do them easily - a physical marvel. As a lecturer she comes on pretty strong, and is often as wrong as she is right in her statements. She is evidently close to the owner of Society Expeditions and, presumably, could well remain a fixture with Society Expeditions. She is an environmental activist and says she is on Senator Gore's staff. This sort of put her in juxtaposition to my stand which is one solidly behind the State Department's position for an Antarctic Treaty-controlled continent. I went on the cruise intending to talk on the Antarctic Treaty and the mineral discussions, but after Shirley got up in her first lecture and expounded her philosophy, there was no way I could get up and talk on the same subject without appearing to knife a fellow lecturer.

Those who knew me in yesteryears will be amazed, if not shocked, to hear that my very first lecture was given on "Women of Antarctica." This was one we originally had pencilled in for Ruth to give, but I stepped into the breach and did it for her. We had voluminous material from many of the famous Antarctic women, including a most complete photographic coverage of the late Mary Alice McWhinnie through the courtesy of her sister, Vivina Ortner. We also had slides of Jackie Ronne, Ellen Mosley-Thompson, Mary Siders, Dagmar Cronn, Dotte Larsen, Aileen Lotz, and, even Shirley Metz. You can never go wrong talking about women before a mixed audience, as women won't bite as long as you mention them, and men don't care one way or the other. The one lecture in which I was most interested personally was on Antarctic literature, as I love to talk about Antarctic books, especially some of the classics I picked out what I thought were the best in about twenty-five different categories. We had one day when the ship was rolling a bit, and since this presentation had no slides, I gave it as a foul-weather presentation so people could hear it in their cabins. Many passengers had not read any Antarctic books at all, and I dare say only a handful had even heard of Cherry-Garrard's *The Worst Journey in the World*. In a way I gave that lecture for my own personal gratification, although the exposure to Antarctic books may have stimulated some reading. As the trip progressed I found out that many of the group had started reading Antarctic books given to them as going-away presents.

Larry Gould was a big hit on the cruise, even though he was back home in Tucson. There were a couple of ex-Carleton Collegeites who knew Larry when he was actually quite young, and they delighted in listening to a video we had of Walter Sullivan of the New York Times and Larry Gould talking. Then we had a perfectly delightful

50-minute tape of Larry talking about his fifty years of Antarctic exploration and research which we played. This was vintage Gould at his very best.

Probably my best attended lecture was one on my IGY days at Little America V, 1957, and the South Pole, 1958. Originally I had no intention at all of talking about those two years, but a press release from Society Expeditions indicated I would be talking on IGY. We kept the Cruise Director alerted on what we would be willing to talk on, and I gave her a choice of separate lectures on each year, or a combined one on both years. They decided to get rid of me fast by having me do the combined one, but once I got hold of the microphone, I pulled a Cousteau and wouldn't give it up, and talked a horrifying 85 minutes! Only two people walked out, although it's quite possible that many slept through it. The lecture room, on the deck above the bridge, had pulled curtains, and the temperature was always just right for sleeping. It was probably the best sleeping lounge on the whole ship.

I also gave a lecture on the late Sir Hubert Wilkins, the first man to ever fly in the Antarctic, the first man to ever go under sea ice in a submarine, and I don't think many people had ever heard of him. When it was announced over the P.A. system, the Expedition Director called this famous explorer, Herbert Wilkins! Hopefully by the time we got through, people knew who he was, and had stayed awake to see the historic movie of the epic flight off the beach at Deception Island. I'm probably about the only survivor alive who ever worked with Sir Hubert, which must make me one of the Ancients.

One thing about this cruise was that it must have set a record for words on Byrd. Bolling was along to talk about her father; there was an Arts & Entertainment video biography on the Admiral; there were the two official films from the National Archives on the two Byrd Antarctic expeditions; there was the video of Bud Waite talking about rescuing Byrd from Advance Base; my talk on Paul Siple; the Gould-Sullivan video; and the cassette of Gould - all of which had a wealth of material on Byrd.

Lectures on the whole were very well attended. When Peter Harrison talked, one had to get there real early, as all 130 seats were sure to be filled. All lectures were piped into the individual cabins, so people could listen to them in their beds if they were so inclined - no pun intended. Lectures were always featured on sea days, and we had a lot of sea days when we went long distances - the cruise itself covered 5,477 statute miles. There were long hops between Punta Arenas and the Falklands, between the Falklands and South Georgia, between South Georgia and Elephant Island, and from the Antarctic Peninsula to Cape Horn. When there were lectures, we got them in heavy doses - one in midmorning, one in late morning, one after lunch. When all was said and done, one lecture stood out head and shoulders above all others - the story of The Totorore Expedition by Peter Harrison. Suspense drama, near death - one hell of a story as only Peter could tell it. One should never follow Peter as a speaker, as no mere mortal can approach him. He has that flair for the theater which puts it all together. What a minister he would have been He would have filled the greatest cathedrals. And beer would have filled the communion cups! Peter is going on a lecture tour this fall; if he comes to your area, be sure to hear him. You will be in for one great evening of entertainment.

To me the cruise was Peter Harrison, although I was not one of his evening bar friends who closed it down each night. I admired him more from afar. He gave five lectures - Facts and Figures on Our Feathered Friends, Birds of the Falklands, Penguin Power, Ocean Nomads, and the Totorore Expedition. When the lecturers were asked to give summaries of the cruise, my top four memories all involved Peter Harrison. When he went ashore, no matter where he went, he was like Pied Piper, with legions of his admirers following him like Arnie's Army used to follow Palmer on the golf courses, trailing him everywhere, hanging on to every word. Peter

looks like a bird person should look like, wearing an old heavy knit sweater and a peaked cap - no red parka, no waterproof pants- just an ordinary bloke out for a stroll.

For me there is a special Peter Harrison story. We were on South Georgia, anchored in the harbor of Stromness, made famous by Shackleton's epic walk across the mountains. In the early morning they made a decision to go to Fortuna Glacier, and said that those who wanted to do something different and were in good shape could go with Peter over a cliff and down into a cove where there were thousands of pairs of King penguins. I was one of twenty-six who signed up to go, but after we got ashore and I looked up that vertical ascent, I wanted no part of it. I was hoping some others would back off from doing it so I wouldn't be the only quitter, but no one did. I looked pleadingly at Abby, a buxom bassoon player with two bad knees who could hardly lift her legs out of the zodiacs, but she was committed, and I was forced to go to save face. It turned out to be a great experience, and we had a fantastic time, once we got down onto the beach. But Peter made it all possible. He is an expert mountain climber and he set up the rope, and was up on top belaying the line. Peter said it was the first time that any group had ever been on that beach, as it was only discovered by a helicopter last year. The WORLD DISCOVERER'S sister ship, the SOCIETY EXPLORER, had tried to get a zodiac in on the beach a short time before we got there, but they totalled the whole zodiac (something like tearing up a twelve-thousand dollar bill). Right next to the beach was Fortuna Glacier, and it was quite a sight to see a file of King penguins walking down off the slope of a big glacier. I ranked all twenty-one landings that we made - it was a 23-day expedition cruise -and Fortuna Glacier got the highest rating - AAAA. I owe Peter one for making it possible for me to get there.

The best part of the whole trip was a six-and-half-hour stretch on 24 February when we were in Paradise Bay, and then went through the Neumayer Channel and part of the Lemaire Channel. I'm sure this was the highlight for all of the passengers; it was also as far south as we were to go - 65°07.5'S. I shot over a hundred exposures that day, which seemed to be the norm for most people that day. If Society Expeditions wanted to make a lot of passengers real happy, they should revise this particular cruise to include additional time south of the Lemaire Channel. Several landings along the Chilean fjords could be dropped without any great loss. We were lucky to have good weather when in Paradise Bay and in those channels, as the scenery there is truly spectacular. We were happy to hear that the SOCIETY EXPLORER got all the way south to Stonington Island, although inwardly we wished it could have been us.

In case anyone is interested in the rest of my A stops, Gold Harbour on South Georgia and New Island on the Falklands both ranked as AAA stops in my personal log. Gold Harbour had a long straight beach which was guarded by the combatant Fur seals which necessitated our setting up patrols to protect the cash-paying customers from getting bitten in their rears, as a Fur seal will attack you in a flash if you give him the slightest opening. What made the stop a good one for me was crossing the shallow stream of glacial milk and coming to a pool of water at the base of a glacier where penguins were floating on small cakes of ice. It was photography at its best, although at this, crucial spot my camera was malfunctioning terribly. Never, never buy a Pentax unless you like to cry, as it will drive you crazy. New Island was just great because of thousands of Rockhoppers and a handful of Black-browed albatrosses. It was my first baptism to both, and what a baptism. One has to have a great tolerance for guano, as the odiferous aroma is an ever potent reminder that stuff really does stink. But when you see all those birds, you almost become oblivious to it.

Prion Island off the coast of South Georgia got a AA rating, as it was the home of a large number of Wandering albatrosses. There's no way a sane person could ever be noncommittal about a Wandering albatross, as the bird is so majestic. How such a graceful creature in flight can be such a fumbling ass in landings and takeoffs

is beyond my imagination. It is said that they create their own protective zone, because if you get too close to them, supposedly they will nail you with a mixture of a concoction which will ruin you for a day or more, the stench being impossible to wash away. My other AA stop was outside of Puerto Montt in the lake district of southern Chile, where volcanoes and lakes and forests and snow all come together in some spectacular scenery.

I had three A stops on my score card - Carcass Island in the Falklands for the Magellanic penguins, Salisbury Plains on South Georgia for King penguins, and Elephant Island for its Chinstraps. Elephant Island was not a routine stop for me. As a Shackleton lover, it meant much to me to go to the very same island where he had lead his men to safety. The wind shifted as we approached Elephant Island, so we had to go to the opposite side from Wild Point, but at least we were able to get zodiacs ashore - which isn't always possible at Elephant Island because of its notorious bad weather. We came in on a small beach in the gathering darkness of twilight; the tops of the ragged peaks were enshrouded in clouds. We were never able to see how majestic the island really is. The same kind of weather had been experienced in South Georgia, a low overcast veiling the high peaks. But as my ex-mother-in-law was prone to say, "Be thankful for small favors," and I was for the opportunity to set foot on Shackleton's Elephant Island.

If I could borrow a word from the current generation, it was sort of "neat" to visit Cape Horn late one evening. This was a classic example of how Society Expeditions treats its customers, as they took all ashore who wanted to go ashore, even though it was getting real dark and the landing area had large, rounded, slippery boulders. They set up lights, and all who wanted to climb to the top to sign the registry of Cape Homers were given that opportunity. I really can't say enough about how Society Expeditions treats its passengers. Just fantastic!

I was never really certain in my own mind just how ships like the WORLD DISCOVERER operated, and I was amazed to see the great efficiency of the zodiac crews. The boat drivers were just superb, outstanding. They made it all possible with a quiet efficiency which put passengers at total ease. And they did it all fast, getting people ashore in minutes, with no panic, making it seem like a cakewalk. I also came back with a great appreciation for the tourists. Not only do they all have deep pockets - prices for the cruise ranged from a low of \$11,790 to over \$21,000 - they all were great respecters of the environment. One didn't have to yell at anyone to back off from birds or seals. I never saw anyone abuse the environment on any of our stops. They were great.

If one has the impression that cruise ships are always visiting scientific bases, cast those thoughts aside, as on our 23-day cruise, we saw only one active scientific station, Arctowski, the Polish station. And the main reason for stopping in there was to pick up U.S. penguinologists, Wayne and Susan Trivelpiece, who return to the ice faithfully each spring - now twelve years - to resume their exhaustive studies on penguins. We took them back to Puerto Montt, and they earned their fare by giving us some very interesting lectures on their research program. Sue is another Mt. Holyoke grad, a la Betty Burrill, Mary Swithinbank, and Barbara Todd. The Trivelpieces say that Arctowski is a mighty fine station, and they enjoyed its hospitality every weekend when they came in from their research station at Copacabana Beach to get a shower and do their laundry. It might be great during winter when the surface is snow-covered, but in summer it is sort of gray and bleak, the ground bare of snow. Anyone who has been in the interior of Antarctica where it never melts, can't really appreciate any station in the banana belt of the continent.

We visited a couple of old whaling stations, Stromness and Grytviken. If you have seen one old whaling station, you have probably seen one too many, two is overkill.

There is no beauty in seeing old machinery and equipment rusting away, old buildings collapsing. Someone said they were going to clean up the mess at one of the stations. Someone on the staff of Society Expeditions said he felt one should be maintained as a national monument. The Brits have a station near Grytviken, and quite a few of their station personnel came aboard that evening to share their experiences with us. Shackleton is buried nearby in a small cemetery. He seems out of place. He should be in Westminster Abbey, but his wife wanted him buried at Grytviken, so his body was brought back from Montevideo for burial there. She was probably not the first Antarctic wife who didn't want her husband back home!

We had a good time at Signy, where the Brits have a base. We didn't visit their station, but their personnel came out to our ship, and then went ashore with our people to help them see a couple of colonies of penguins. The Adelies had all taken off for the winter season, and their empty rookeries were a very sad sight. It looked like a war-torn battlefield, with dead carcasses of young Adelies who never made it. It seems that only about half of the chicks born really live to see the water, and it's a terribly sight to see these dead penguins scattered all over the rookery, one every square yard or so. It was something I was totally unprepared to see, as I, in my naivete", had imagined that once they got to be good-sized, they were home free. Certainly not true at all.

It was great talking to the Brits at Signy. Rather an impressive bunch of young kids. There was an initial shock in seeing how young these people were, but after being on board the WORLD DISCOVERER with the youngest passenger being 29, anyone in his early twenties would seem like a baby! The Brits don't allow women to winter over, nor do they allow married men to winter over, so you have sort of a highly selective group of people. They also come down for two years, not one, which, again, sets them off as something different. There were three PhD's among the wintering-over crew, and two doctoral candidates, so you can see they have highly qualified men at their base. I felt quite in sympathy with the young Brits, and sort of wished I might be staying there, wintering over again myself. Old age is pure hell, it just disqualifies you from so many of life's happinesses.

We made a stop at Paulet Island which was interesting in a way, not for what we saw, but mainly for what we didn't see. Nearly all of the penguins had taken off for the winter, and here there were these immense rookeries, barren of birds. The only thing missing was a sign at the beach - "Will the last Adelie to leave please turn out the lights?" The stone-built winter quarters of the shipwrecked crew of Captain Larsen was a grim reminder of what must have been a rather gruesome winter; and we saw the all-white Snow petrels nesting in rock caves high up on the rocky outcrops. If you haven't walked down a steep slope covered in guano, you really haven't missed anything. You wonder, as you slip and slide in the stuff, if any bird in the whole world is worth it, but we only go this way once in this lifetime, so I guess it was all worth it.

We made the mandatory stop in the bay at Deception Island so the weak-minded, strong-hearted souls could put on their bathing suits and go into the water. There was a very strong wind coming off the land, with a wind chill factor of 13°, but quite a few braved the elements and went in. I saw only one woman who really did any swimming, this beauty from Ashland, Kentucky by the name of Beth Gallaher. She even swam around like a seal. A vicious rumour was circulating on board that this remarkably constituted woman was seventy years old, but if she is seventy, she is the best looking seventy-year old creature in existence. Whatever she is eating or drinking should be bottled and sold. She also was one of two fashion plates aboard. Her main competition was this lovely creature from the Lake Tahoe area, Eliza Anderson, who never wore the same outfit twice. At the Captain's Table the first night aboard I sat next to Eliza, who came resplendent in a lace dress. I thought I had died and gone to Heaven, and had to pinch myself to make sure I was alive.

If there was a disappointment in the whole expedition cruise, it had to be the fjord coast of Chile. Maybe we just expected too much; maybe it was there and it was masked by fog and low-lying clouds; maybe after seeing Antarctica we were off an emotional high, and nothing less than the sublime would have moved us. We did have one nice stop, at the foot of the Romanche Glacier in the Beagle Channel. There is a more or less permanent waterspout of giant proportions coming out of the glacier which is spectacular. We say "permanent", as it was described in the Glacial Atlas of the Southern Hemisphere published in the late 1950's. They took us right up to the base of the glacier, and every time a hunk of the glacier above us would break off, cascading hunks of ice downward and seaward, the zodiacs in the immediate area would turn and hightail it back out into safer waters. Right along the water's edge were some truly magnificent hanging gardens of lush tropical-looking vegetation. Truly fantastic! But after that landing, all the rest in the fjords was downhill.

We made landings at an Indian village of Puerto Eden, and also in the Lyng Channel, with one final stop at the city of Castro on Chiloe Island. No one got really excited about any of these stops, as we were really outside the Antarctic realm. A very common comment heard from many of the passengers was, "I wished we could have passed up those stops and gone further south when we were on the Antarctic Peninsula." As for me, I wish that we could have possibly had a night in the lake district of southern Chile. When we disembarked at Puerto Montt, they took us on a bus ride outside of town to the area around Mt. Osorno and Lake Llanquihue where we had lunch at a beautiful hotel resort. If we could have stayed there one night, it would have been the perfect piece de resistance of a fantastic trip.

We didn't see very many whales. I thought they would be fairly numerous around South Georgia, but we could cruise all day and not see any. We saw some Humpback whales in Admiralty Bay, also in Gerlache Strait (where they put on a restrained exhibition of the fine art of breaching), and some Minke whales in Girard Bay. Steve Leatherwood said he saw a Blue-fin whale early one morning, and I guess you have to go along with Steve's word - experts see a lot more than commoners do. There was a fantastic display of thousands of Dusky and Southern Right Whale dolphins in the Gulf of Penas off the coast of Chile. The water was just boiling with them for a distance of at least a mile; those darn Duskyies were jumping amazing heights out of the water. As for seals, memories are almost exclusively of the nasty tempered Fur seals. No one was bitten, but only because of strict patrol of routes traversed by passengers. They must be the pit bulls of the seal world!

We were fortunate in seeing hundreds of spectacular icebergs; and the Captain of our ship was just super throughout. I can't imagine a finer skipper than Capt. Karl-Ulrich Lampe. In a way he had to be, to counteract an old sourpuss who was the Chief Mate on board - a man who hated being in polar waters, just longed for the tropics, although it's hard to believe this guy could be nice anywhere. Our Captain took the ship right alongside some magnificent bergs. He never rushed anything; when he got among beautiful bergs or alongside whales, he slowed the ship down and went around them several times, allowing ample photo opportunities. One thing which amazed me was the number of bergs with solitary hitchhiking penguins on top, apparently just going along for the ride. You wonder how they got there.

We came straight home from Puerto Montt, flying into Santiago on an evening flight, then an all-night flight back to Miami, and then on home. The rumor on the flight from Santiago to Miami was that Miss Universe was flying in first class. But we were one up on her; we had seen the real Miss Universe when we were in the Lemaire Channel and Paradise Bay. It doesn't get any better than that!

*A Photographic Re-Enactment of WORLD DISCOVERER Cruise WD2004*

*CRUISING WITH PETER HARRISON*

OT

*SCENIC WONDERLANDS*

by

Dr. Paul C. Dalrymple  
Port Clyde, Maine

on

*Thursday evening, 3 May 1990*

*8 PM*

National Science Foundation  
18th and G Streets N.W.

*Room 543*

*— Light refreshments - strong coffee - pleasant people —*

We have to wrap up the year with some sort of an innocuous program, and we would like to show you the exciting scenes and birds and mammals which Bolling, Ruth, and I saw with our own eyes on our cruise through the Falklands, South Georgia. Elephant, Signy, Paulet, King George, Paradise Bay, Neumayer Channel, Lemaire Channel, Drake Passage, Cape Horn, Beagle Channel, Straits of Magellan, and the fjord coast of Chile. Come and see the glories of Antarctica as experienced by tourists. You will see seven different kinds of penguins (Rockhoppers, Magellanics, Gentoos, Kings, a solitary Macaroni - which we shot from at least twenty positions, - Chin-straps, and Adelies), as well as nesting Black-browed and Wandering albatrosses. There are 87 slides of majestic icebergs. We hope to have another rare Byrd with us, as Bolling Clarke is going to try to get here for the meeting just to keep us honest. She will be the one in emerald green.

In mid-March Secretary of State Jim Baker sent a letter to Postmaster General Anthony Frank asking him to support the issuance of a commemorative postal stamp to make the 30th anniversary of the Antarctic Treaty, urging him "to approve issuance of a stamp on or about June 23, 1991." Now we'll wait and see if the Postal Service can do anything in 463 days. It should be touch-and-go if they can make that date.

The last two years have been rough commuting from building a house in Maine to writing these Newsletters and mailing them in Arlington. The good news is that we'll put the screened-in porch on when we go back to Maine next week, and then THE HOUSE is done. With building up until Christmas, then going on the Antarctic cruise, followed by the hospitalization of my 94-year old mother, this has not been the easiest year to get out Newsletters. Several members have written saying they have not received Newsletters this year, yet they are on our mailing list. You can read of our discontent with the Postal Service below. It is ATROCIOUS! You all have a good summer, but please don't come to Maine, as our roads aren't that good, and tourists just shoot up the prices for us locals. We hope to get back to you early in the fall, and may, just may, have a meeting during Orientation Week in early September.

**DELINQUENTS WHO ARE ON THE BRINK OF ERADICATION FROM MEMBERSHIP.**

Fred Alberts	John Guerrero
DeeWitt Baulch	Osmund Holm-Hansen
Adib Barsoum	Susan McDowell
Hal and Margaret Borns	Daniel Morrison
Ray Godin	Donald Scott
Ed and Priscilla Grew	Bryan Small

Single membership - \$10/year-; Married/Pseudo Married couples - \$12/year.

**BRING BACK THE PONY EXPRESS - PLEASE.**

Of all the government operated adventures is there anything worse than the U.S. Postal Service? We doubt it. Inefficiency personified, and now they want to raise the rates again. Gad, it was better back in the era of the three-cent stamps when they had no computers. We rushed out the last Newsletter announcing the 2 April Memorial Lecture, and mailed them the morning of 12 March. The earliest any Washington area member got theirs was nine days later; most got them between two and three weeks later! It's not funny - it's just plain ludicrous. If anyone ever tried to run a personal business the way the Postal Service is run, it would fold in the first month. But they have us right across the barrel and just laugh at us poor souls. Just once I'd like to be given the opportunity to kick the Postmaster General's butt. It would surely relieve a lot of frustrations.

P.S. Recently Ralph Nader received a letter "addressed to President Bush, proper] addressed to the White House. He returned the letter to Postmaster General Anthon} Frank with a cover letter pointing out that 'this episode does not instill confidence in the Postal Service's ability to distinguish the most famous address in the United States from a random misdelivery' ... "

**NATIONAL GEOGRAPHIC SHOULD BE ASHAMED.**

While we are complaining, the National Geographic should be ashamed of itself for its new film, "Antarctica at the Crossroads." It is one of their so-called Explorer films, and presumably many of you have seen it on TV. It seems it's open season on the Antarctic, and every Tom, Dick, and Harriet is out to save Antarctica from the perils of mankind. Everything is so one-sided that it's ridiculous. There is no attempt at all to

show how the U.S. is cleaning up and modernizing such large and old facilities as McMurdo. Recent pictures I have seen of McMurdo have been revelling in depicting a relatively clean camp which anyone could be proud of, but in the National Geographic Society's film they showed shorelines with abandoned equipment rusting away which had to be taken at some old whaling station. The narrator does not tell you where, implying that it's an American base. This is ROTTEN!

There was no mention in the film of the fact that NSF has an initiative expected to total 100 million dollars over the next five years which focuses on safety, health, and the environment. Over half of the current 10M funding is to clean up the debris of past operations and to make present-day operations conform with current regulations, attitudes and technology. The very same ship which took Cousteau and those school kids to the Antarctic on that publicity junket in December, the EREBUS, was chartered for a whole month by NSF to help clean up their operations on the Antarctic Peninsula. There was not one word in the film about any of the many good things the U.S. has done in recent years to sanitize the American bases. For Heaven's sake, National Geographic, give the Devil his just dues. McMurdo was built back in 1955-56, and there was hardly a town/city/hamlet in our country which then was environmentally clean or worried about their disposals. But people now are demanding much more of Antarctica than they are of their own hometown where they live and breathe. Why is Greenpeace so concerned about a few acres on Ross Island when the corridor from Washington, DC to New York City is one mammoth, elongated junkyard (as viewed from the windows of Amtrak)? Gentoos are just more photogenic than ghettos, and it's easier to raise monies for wildlife than it is for humans.

Antarctica captivates people. We recall the late Paul Siple saying back in the 1930's that people who have been there would never forget the experience, and would hold a strong affinity for the continent. That still pertains today. There are many good Antarctic ambassadors, but, unfortunately, there are many short-term "wonders" who are out to save the continent. One piece of literature from an environmental activist came across our desk here in the Nerve Center which I could not believe. People are getting into it who couldn't pass a first-grade examination on Antarctica, yet they are out there on the streets preaching the demise of Antarctica. And it has to hurt when some organization like the National Geographic comes up with such a totally irresponsible film on the Antarctic. The showing we saw was at the National Geographic, and the audience was full of school kids who must have gone home to their parents that night and told them that the U.S. was about to begin mining and oil exploration in Antarctica, ruining it for penguins.

The scientists, themselves, come out as bad guys/dolls in the National Geographic film. Where do they get off condemning them? If there is any one group of people interested in saving Antarctica in its purest form, it has to be the scientists who work there, as it's truly their home away from home. Probably more of them respect and love Antarctica more than they do their hometowns. It's popular to take potshots at Antarctica; it doesn't take much of a mentality to criticize anything - a book, a contract proposal, your in-laws, the Postal Service! But when someone is doing something good like our government is doing, cleaning up its Antarctic bases, let's give them credit for doing it. We should cut off Greenpeace support and send them packing. We understand that their protest demonstration at McMurdo this past season attracted only about one percent of the camp's personnel. That's a pretty convincing message as to how the people at McMurdo really feel about them.

**NSF REPORTS DETAIL ACTIONS AND DEADLINES TO IMPROVE U.S. ANTARCTIC ENVIRONMENTAL**

**PRACTICES.** "The National Science Foundation, which manages the United States Antarctic Program, has issued a unified plan for implementing recommendations made by the Foundation's Office of the General Counsel to bring U.S. activities into compliance with environmental law.

Major actions will include removing from the continent all hazardous and toxic wastes from U.S. bases, installation of equipment to prevent and clean up fuel spills, implementation of waste treatment at NSF's McMurdo and Palmer stations, development of cradle-to-grave waste management plans for each of the United States' three major stations in Antarctica, and cleanup of previously contaminated areas near U.S. bases and abandoned field camps.

In addition, NSF will develop a comprehensive permitting and enforcement program governing the discharge of all pollutants by U.S. nationals in the Antarctic pursuant to the Antarctic Conservation Act. NSF will continue its ban on ocean dumping, except pursuant to permit, and finalization of environmental assessment regulations for antarctic activities.

The planned actions, described in two reports issued by NSF, flesh out deadlines and schedules for carrying out environmental improvements proposed under a multi-year safety, environmental and health initiative for Antarctica. NSF recently received approval from Congress and the President to implement a \$30 million environmental improvement program under this initiative over a four-year period beginning in fiscal year 1990.

'A National Science Foundation Strategy for Compliance with Environmental Law in Antarctica', a report prepared by NSF's Office of the General Counsel at the request of NSF director Erich Bloch, assesses which environmental laws govern United States activities in Antarctica, and makes recommendations to improve compliance.

'We considered not only actions needed to bring the United States Antarctic Program into compliance with today's requirements, but also steps to meet standards undergoing development,' said Robert M. Andersen, deputy general counsel of NSF and head of the Antarctic Environmental Compliance Task Group. 'We analyzed what should be done in addition to what must be done.'

**RETROGRADING AT U.S. ANTARCTIC BASES.** There are large retrograding and back-loading programs going on in Antarctica which John Q. Public does not hear about because media personnel seem to want to write about the other side. In 1988-89, 1,424,487 pounds were retrograded from McMurdo, and during the past austral summer another 1,836,979 pounds were shipped back on the MV GREEN WAVE and the MV EREBUS. The breakdown on this year's retrograde shows 86,500 pounds of explosives, 12,800 pounds of recycleables, 267,890 pounds of old rolling stock, 680,675 pounds of scrap metals, 3,600 pounds of radioisotope thermal generators, 22,700 pounds of radioactive wastes, 184,134 pounds of hazardous waste, and 578,680 pounds of other scrap.

At McMurdo they introduced separate containers for plastic, metal, and burnable trash, and began macerating McMurdo waste water (from toilets, showers and the kitchen) before allowing it to enter Winter Quarters Bay (a dilution system is going to be installed). NSF chartered the 180-foot supply ship EREBUS for a month to take away construction debris and other accumulated trash from Palmer and old Palmer. The EREBUS also visited East Base to survey the 50-year old abandoned base. It is interesting to note that they planned to go ashore there on the 50th anniversary of the late Admiral Byrd stepping ashore on 11 March 1940 but weather conditions prevented them from going ashore until the next day (which happened to be the 43rd anniversary of the late Captain Finn Ronne stepping ashore there to

establish his research station).

While we are talking about good things, all U.S. Antarctic stations are planning large Earth Day celebrations on 22 April 1990. At McMurdo booths will be set up in the big garage explaining the importance of environmental protection and what they are doing about it. The Navy will hold training on workplace environmental concerns. And there will be contests to choose the best ideas for improving the McMurdo environment, one for wintertime, one for long-range. And there are many other environmental initiatives which will be done, at McMurdo and the South Pole and Palmer.

**GENTLEMAN JIM EYES 9TH EDITION OF HIS GEOLOGY TEXT BOOK.** Jim Zumberge announced on 7 February that the time had come for him to hang it up as a university president and to start enjoying life in his Wyoming cabin. At age 66, he contemplates some teaching and some writing, including the ninth edition of his geology text book. If he keeps working on that book, who knows, he may finally get it right. No matter what he does, he will probably find it a great respite from fund-raising, where he supposedly devoted 80% of his university time. Recently he saw the University of Southern California top its goal of \$567 million dollars, which should mean many more fleet-footed running backs for the Trojans. Incidentally, it is believed that Jim holds the record for having been to more major college football bowl games on New Year's Day than any other university president. At least he was cited for it in Sports Illustrated about six years ago.

The Los Angeles Times called Jim "a former Antarctic explorer," although he was strictly a scientist. He also was an Antarctic innovator with great foresight. This writer recalls being at Little America V in 1957 when Jim arrived on the scene to initiate his studies on Roosevelt Island. We who had wintered over with something less than full support from the Navy were given a quick lesson by Zumberge on how to get along with the Navy. When he packed his instrumentation for a trip, he included a footlocker with choice alcoholic beverages which were suitable for the delicate palates of discerning Navy throats, and Jim soon owned the whole damn camp.

After being the life of one of our Saturday night parties, Jim was still able, with a few short hours of sleep to perform admirably playing the Wurlitzer and singing hymns in our chapel service. His versatility was amazing, and it was obvious that he was destined to go much farther than to Roosevelt Island. His love for Antarctica never waned, and in the Los Angeles Times interview it was said that he "would play the accordion and dance on tables during three expeditions to Antarctica." He also probably danced on all walls and the ceiling!

Zumberge came from Minnesota, and was a geology professor at the University of Michigan and Duke University before becoming the founding president of Grand Valley College in Michigan. From there he became dean of the College of Earth Sciences of the University of Arizona; then Chancellor at the University of Nebraska in Lincoln; then on to the presidency of Southern Methodist; and finally, in August 1980, the ninth president of the University of Southern California. Being a geologist, being at Michigan, being a university president, being at the University of Arizona, he was sort of a Latter Day Larry Gould. And both are great speakers, and, as nearly all of you know, both served as past chairmen of the National Academy of Sciences' Polar Research Board, and as past presidents of SCAR (Scientific Committee on Antarctic Research). The only thing which prevents Jim from being the Dean of American Antarcticans is Larry Gould's reluctance to give up his hold on the reins. Larry just might decide to live on forever, which we all hope he does. I'm sure Zumberge would be honored to walk in Larry's shadows for the rest of his life.

Jim told a very funny story about himself to an Antarctic Society gathering about a dozen years ago. It seems that after he became president of the University of Nebraska, an Arlington, Virginia friend told him that when he visited Washington, he should stay at his home. Jim graciously thanked his friend for offering his hospitality, but said he would decline, as he had this nasty habit of getting up very early to go jogging. Jim's friend said that would be no problem, he would give Jim a key, and he could get up at any weird hour when he might feel so inclined, and that he would pay no attention to him. Jim decided that this beat paying a hundred dollars a night for a room, and subsequently stayed with his friend. And as advertised Jim got up in the wee hours of the morning and went running in the dark. He didn't carry a ball of yarn with him, and it soon became apparent that Jim had no idea where he was, nor did he know the street address where he was staying. Fortunately for him, there was a garbage collector starting his rounds, and Jim hailed him, asking him if he could take him to a pay phone. To compound the situation, Jim had no money, and had to borrow a dime from the garbage collector to put through a collect call to his secretary back in Lincoln in the middle of the night. She finally answered the phone, and Jim quickly said, "Don't ask any questions, just tell me where I stayed last night," and she was able to tell him.

Then Jim went back to the garbage truck, told the guy the address, and asked him if he would mind driving him there. At this point in time, the garbage collector would have driven Jim anywhere just to unload him. After they got to his friend's house, the garbage collector looked at Jim and said, "Buddy, you're one of the queerest persons I ever met in my life. I don't know what you do for a living, but you are as crazy as those people to go to the Antarctic." A true story, but naturally much better when told by Jim.

Forrest Shumway, Chairman, Board of Trustees, USC, said he regretted Zumberge's decision to retire because administrators with his combination of credentials are "rare birds." He evidently was really a rare bird on campus, as one professor, according to the article, offered students "\$5 for a Zumberge sighting and rarely has to pay the wager." One long-time faculty member who didn't want to be identified said, "No one knows him well enough to hate him. He doesn't evoke strong feelings on either side." But during his administration the student body increased 6 percent, to 29,157; full-time faculty increased 18 percent, to 2,196; the endowment grew from \$154 million to about \$460 million; annual operating budget doubled to \$1.3 billion. Since his presidency the University of Southern California has started or completed twenty new buildings, including the Norris Cancer Hospital. And the university began programs in neuroscience, molecular medicine, and urban planning. Examiners from the Western Association of Schools and Colleges accredited USC in 1987, said the campus appeared to "lack intellectual excitement and vitality," but praised the school for making "striking improvements overall." Sounds to me like a college presidency is a no-win situation, and that Jim earned every single cent of his \$205,000 salary. However, Jim doesn't really have to live within that paltry salary, as he is also paid for serving on several corporate boards.

Zumberge was quoted as saying, "As a scientist, my world was a thing world. I'd knock on rocks, look at a piece of ice, or measure a lump of snow. They didn't talk back and I didn't have to impress them. But as I moved from the thing world to the people world, I had to be more conscious of interpersonal relations." Jim won praise for trying to shed USC's image as a party school that is ideologically conservative. One big issue during his administration, in addition to USC being put on probation by the National Collegiate Athletic Association, was efforts to improve the surrounding neighborhood, and to link the campus to the downtown business district. Jim established a council of area residents and businesses

to discuss the development. When you think things are bad, give them to a committee.

Jim has one wife, Marilyn, four grown children, and lives in the university's official presidential mansion in San Marino. It is expected that it could take up to a year for his replacement to be discovered or unearthed, as the case may be. Then the Zumberges hope to move to Pasadena. As many of you know, Jim underwent surgery in 1985 for prostate cancer, but he claims that he has fully recovered and that his decision to retire was not prompted by health concerns. Whatever Jim does, even if nothing, he will do it with class. He is truly Gentleman Jim. But he should stop and smell the roses.

**OBITUARIES.** ALBERT ARMSTRONG was a man whom we wish we had taken the time to get to know better, as he was quite a man in his own right. His Antarctic connection was that he designed some of the original buildings at McMurdo, including the dispensary. He was in his mid-nineties, and each year he would order at least four Antarctic calendars for women in his life. Albert claimed they were relatives, but we thinketh he did not really have that many relatives. We used to talk to him occasionally over the phone, and he was very enthusiastic about the Antarctic. Thanks to the Navy at McMurdo, they provided us (for him) with a set of black and white photographs of buildings at the station, which made him extremely happy. Once upon a time he had a magnificent voice, and actually sang in operas. He had a very keen memory, and he reminisced about Baltimore at the turn of the century as if he were talking about yesterday. Ken Moulton was a good friend of his, and frequently visited with him. We have lost one of our nicest members.

EDWARD FIREMAN was a physicist at the Smithsonian Astrophysical Observatory in Cambridge, Massachusetts, and was only 68 years old when he died of a heart attack on 28 March 1990. We never knew Dr. Fireman, but he was a leading authority on the analysis and dating of extraterrestrial materials and space debris. He devised a method for measuring the age of Antarctic ice samples taken from deep cores and subsurface layers. These age determinations contributed greatly to refining the record of the earth's climate over the last 200,000 years. His analysis of radioactive isotopes in meteorites revealed how long these objects had been exposed to cosmic-ray bombardment while travelling through space.

Edward's laboratory experiments, which usually entailed grinding up, pulverizing and heating small samples of material to release measurable traces of gas, were conducted in a labyrinth of glass tubing, vacuum pumps, and Bunsen burners. Recently he had participated in a search for solar neutrinos, using unusual devices placed at the bottom of the 800-foot deep Homestead Mine in South Dakota. With the earth above acting as a natural filter, Fireman's detectors measured the flux of other radiation that might be mistaken for elusive neutrinos, highly energized particles that originate in the sun's core and penetrate deep into the earth.

He was quite a man. He is survived by his wife Rita (57 Clifton Road, Newton Centre, Massachusetts 02159), two sons, and a daughter, plus the usual assortment of brothers/sisters, and a bevy of grandchildren.

JANE MCCLARY, wife of Nelson McClary of the Ronne Antarctic Research Expedition, may be better known to most of you as Jane McIlvaine, her name when she wrote "My Antarctic Honeymoon" for Jennie Darlington. This book created quite a stir among Antarcticans in the mid-1950's, as it presented another side to what happened on the Ronne Expedition. As it was the first time women had ever wintered over on the ice, it was bound to be popular, and when there was a little spice and vinegar on the expedition, it made the book all that much more popular. And when the Brit, Kevin Walton, came out with his book on what happened over the hill on Stonington Island at their base, one might say there was a trilogy on the year's happenings.

In the course of researching material for the book, Jane McIlvaine met Nelson McClary, and subsequently married him.

There are a couple of stories about that book which are sort of funny, and one I must share with you. A lot of us went to the Antarctic back in 1956-57 on the US CURTISS, an old seaplane tender which had survived a direct kamikaze hit in World War II, and it was great cruising from San Diego to Port Lyttleton, then on down to McMurdo, and finally over to Little America V. We had many distinguished scientists aboard, including the director of the U.S. program, Larry Gould. One day Larry came across Paul Humphrey, then of the Weather Bureau, leaning over the rail with a book in his hands. Larry walked up to him and said, "What are you reading, Paul?" And Paul answered, "My Antarctic Honeymoon." Then Larry asked if he could see it, and Paul handed it to him. He proceeded to riffle through its pages, and just when Paul thought he was going to get his book back, Larry tossed it overboard, saying, "You shouldn't be reading books like this, Paul!"

Jane McClary was a very well-known author. Her "A Portion for Foxes," a romance set in the hunt country, appeared in 1972 and eventually was translated into ten languages. And her "To Win the Hunt," a charming and informative book on the peculiarly intense pastime of riding to hounds in Ireland, is full of accounts of the wondrous happenings that make up everyday life in the countryside of yawning ditches and big banks, impervious hedges and stone walls where foxes are pursued in the Emerald Isle. Jane also wrote a number of children's stories.

We had the pleasure of meeting Jane and Nelson at the home of one of our past presidents, Bob Dodson, several years ago. She was a most attractive woman, to say the least, and was most stylish. She sort of personified "class". And, as with so many of our members, she died of cancer, age 70 on 30 January 1990. Survivors included her husband, (Box 326, Middleburg, Virginia 22117), and two sons. Previously, in 1971, she had lost a daughter at sea during a transatlantic sailboat crossing.

GILES KERSHAW, although not a Society member, was a well-known Antarctic flyer who was a friend of the adventurers, and would always fly them anywhere for a price. But the 41-year old pilot was killed on 5 March when he was piloting a gyrocopter-type aircraft off the yacht SOL on a private expedition. He crashed on the Jones Ice Shelf, east of Adelaide Island, off the west coast of the Antarctic Peninsula. It is believed that he was on a photographic mission when the craft got suddenly flipped over by a strong gust of wind. There were no other casualties. It is our understanding that his widow, Anne, requested that he be buried at Rothera, the British base on Adelaide.

Giles was born in India, but he went to school in England. From childhood he had a tremendous interest in aircrafts and flying, and longed for an aviation career. When he tried to enter the Royal Air Force, he was turned down because of eyesight. But with the support of his parents, he took his private pilot's license, and later worked his way up to a commercial license.

In 1974 he answered an advertisement for a pilot from the British Antarctic Survey and he flew with them until 1979. Then he co-founded Adventure Network, and became quite famous for his support of the Transglobe Expedition. Giles developed a technique of dragging the heels of his skis with the utmost precision along the surface of the snow. Then he would climb back up and look back at his own tracks to see the depths of the impression, revealing the hidden traps.

Giles had been a captain with Britannia Airways, and at the time of his death, was first officer on Boeing 747s with Cathay Pacific. The Times for 8 March 1990 said that he was the first man to fly round the world over both the North and South Poles, during the Transglobe Expedition in 1980-81. We seriously doubt this, as there had to be many military pilots in the late 50's and 60's who flew over both

Poles. Perhaps Trigger Hawkes or Peter Anderson could enlighten us. But regardless, the most daring and competent of modern-day polar flyers is dead. He will be missed.

**AN ELEVEN-YEAR OLD DREAM COMES TRUE.** Back in November 1988, I wrote a piece in these pages about the ending of the all-men era at the South Pole, and proposed that it would be a great idea if men and women were alternated annually at the Pole. My reasoning was based on having a great time there with all men back in 1958, and felt that women should not be denied the same privilege of enjoying a year at the South Pole without men around to harass them. After all, women can do all that men can do, so why discriminate against them?

Well, now there is an all-woman camp in the Antarctic. Buried under eight meters of snow at this very minute are nine German women manning (womanning) Georg von Neumayer Base. Isn't that just great! There are two geophysicists, two meteorologists, two engineers, a radio operator, a cook, and a doctor. They are living and working in twin tabular containers, each 50 meters long. They are all in the prime of life, between 27 and 34 years old, all are single, and they have been described in the press as "extremely ambitious." We bet they are! For everything to come full circle, though, won't they have to send down in an ensuing year a token male cook? After all, the great chefs of this world are MEN.

We read all this good stuff in the English edition of The German Tribune which Tony and Ingrid Malva-Gomes kindly sent us. The article featured the wintering-over doctor, Monika Puskeppeleit, who was triggered for Antarctica by watching a documentary film on McMurdo station in 1979. The nine women came to know one another through the Alfred Wegener Polar Research Institute in Bremerhaven, and they jointly applied to crew an Antarctic research station for a season. They completed a survival training course in the Alps, including working their way out of crevasses and climbing rock faces. They were so impressive in their training that the Research Ministry in Bonn said, "Send them." The authorities admit, though, that they are worried that inter-personal conflicts might arise. However, I am sure that some of them will even survive the whole winter, and then the survivors can jointly write a book about men being a superfluous commodity in Antarctica. Monika feels that the psychological evaluation of behavior by people in cramped quarters has been neglected. If she really wants to do such a study, she should do one on those crazy Boston drivers who are plain lunatics.

Monika is taking her water colors, her flute, books (from Plato and Karl Jaspers to George and others) and recorded music (from Bach to BAP). She knows she is going to miss her jogging, the spring, and windows, but she said, "It will be a dream come true as far as I am concerned." And I could add "ditto" to that!

**ED MOODY'S SLEDS ARE A HOT ITEM.** Ed Moody, former dogteam driver and logistical expert with Admiral Byrd at Little America II on BAE II, has hit the headlines in Maturity Magazine (December 1988-January 1989) and the Boston Sunday Globe (11 March 1990) for his dogsled making in Rochester, New Hampshire. Ed is now 79 years young, has been making sleds for some 67 years, and people, including Ed, say that his sleds are Stradivaris. They are in the Iditarod, a Swiss count uses one, a Dutch airline pilot (don't pilots fly?) has one, and there are some in Japan. These masterpieces are not exactly a labor of love, as Ed was quoted as saying, "Heck, I don't like to work, I like to travel. I'd rather be out with my camera, or hunting or fishing." Though proud of his work, Ed says that he would not have built sleds for a full-time living. "It's old men's work," Ed said cantankerously, "There's no way I could have made a living at it." So he has worked as a logger, a plumber, an electrician, and a carpenter, and he is just as proud of those

accomplishments as he is of making sleds. Ed really prefers racing dogs to building sleds, and he has driven dogs in more places than any living man he knows. Like all of those old Byrd dogsled drivers, Ed spent much of World War II in Greenland on search and rescue missions (for downed planes crossing the North Atlantic).

Ed perfected his four main sled designs years ago. He now uses nylon cord as a fastener rather than leather thongs, and laminates the bottom of sled runners with plastic. Asked what distinguishes his sleds from others, Ed says it is white ash he uses in their construction. Other sled builders "aren't picking the right kind of wood," he says. "Picking quality wood is getting to be a lost art." Ed bends his ash in wide copper pipes that fill with steam from a stove he made from an old beer keg. To waterproof the wood, he soaks it first in Danish oil, then coats the whole sled in polyurethane.

He has ten sleds on back order, but he spends a lot of time repairing his old sleds. Ed's pride shows through despite the crusty, utilitarian picture he paints of his craft. "There's no money in it," he says, "so you might as well have the satisfaction of building something that looks good." I have one question for old Ed - "Why in hell do you sell them for only \$500 when you could get \$1250 without batting an eye?" His name must be worth \$500 alone, and then it's not illegal in this country to make a little money on the side. In this era when school kids have to have \$200 sneakers or else they won't leave the house, certainly \$1250 for a great dogsled seems cheap to me. Ed, get with it, this is 1990!

**ANTARCTIC BOY SCOUT DOUG BARNHART (1984-85) TALKS ABOUT PAST AND PRESENT.** While we were gathering lecture material for our Antarctic cruise, we thought we should prepare one on Scouts of Antarctica, as they are a most unusual lot and have been overachievers, starting with James W.S. Marr who went south with Sir Ernest Shackleton on his last expedition. So we wrote all of the American Scouts, including the girls, and got excellent responses, one of which we would like to share, in part. Doug Barnhart's response made us feel good about the program, and when he talks about his and his wife's future plans, we got an even warmer feeling about the kind of young people they are sending to the ice. We are proud of ALL of them!

Each of us can greatly impact the fate of our fellows and therefore we have a great responsibility to act justly and wisely. Numerous experiences convinced me of this. These experiences ranged from practical problems of travelling in nations where few of the ship's crew spoke the language to moments of reflection while looking out over the polar plateau. That heartfelt realization is the greatest benefit that I derived from my adventure, for it will serve me wherever I am.

That early involvement with research has helped determine my career path. I am currently a second-year medical student at The Johns Hopkins University. My career goal is to become an academic physician which will involve research and teaching as well as seeing patients in a clinic. This interest in research was fostered by my involvement in the Antarctic research program. My career has been influenced by the people that I met and the things that I saw while enroute to Antarctica, especially in South America. The needs of the people in those countries are great, and my brief experiences there have challenged me to seek a career in which I could help improve the health of people like them. My wife and I are currently contemplating being medical missionaries. How this will amalgamate with my academic interests remains to be seen, but I believe a good combination will be found.

#### **IS IT SWITHINBANK'S SECOND LAW OR IS IT JUST PLAIN OLD JOCKEY SHORTS?**

In a

recent Newsletter we presented Swithinbank's Second Law which succinctly says that all offspring of Antarctic wintering-over males who are born within one year of their stay on the ice will be female. Now a Doubtin' Thomas has surfaced, and his name is Art Ford, veteran Antarctic researcher of at least twelve austral summer seasons. He has raised the very serious question as to whether it is due to jockey shorts. He wrote, "As medical researchers pointed out long ago, the relevant male core temperature can be kept sufficient for female progeny merely by wearing jockey shorts. Having been a participant on a 1986-87 British Antarctic Survey/U.S. Geological Survey study of the Black Coast of the Peninsula, and issued BAS clothing in Cambridge, including jockey shorts, I know that such technology exists in the UK, at least now." Art Ford is sort of a Latter Day Paul Siple, as he too was an Eagle Scout, and like Paul, fathered only daughters, although both of Art's daughters were conceived, packaged, and delivered prior to his going to the ice. It's interesting to note that there were no Ford offspring after he started going to the ice!

Swithinbank has submitted more supporting material for his Second Law, this from Nature in an article about the sex lives of North American salamanders, which are profoundly affected by the temperature of the water in which they breed. Charles wrote, "As in human populations in cold places, 'raising the temperature leads to greater male participation'. Too right it does! Participation, yes, but not paternal chromosomes. The highlighted sentence indicates the important thing, that the incorporation of paternal chromosomes is sensitive to temperature." This Newsletter with all this good stuff is getting to be just like the New England Journal of Medicine!

#### **ABOUT PENGUINS AND OTHER BIRDS.**

A mysterious disease or poison has killed more than 60 percent of the extremely rare Yellow-eyed penguins on the coast of New Zealand's Otago Peninsula during the first two months of this year. And the magnificent Royal albatross may also be in danger. The bizarre ailment has killed only breeding adults, while the survivors are not only healthy, but vibrant. All of the dead penguins had empty stomachs, raising fears that something had gotten into the food chain. Walter Sullivan wrote in the New York Times on 20 March that radio beacons attached to Wandering albatrosses have revealed that circular foraging flights by the birds sometimes exceed 9,300 miles (more than eight times the distance that had been assumed), and that in some cases they cover 560 miles a day! One monitored flight lasted 33 days, and males were seen to sit on an egg for at least 55 days before the old lady returned. What do you think, guys, was she really after food all of those days or was she having a spree? You know once the egg is hatched, foraging trips then last only two to four days! This was all written up in the 22 February issue of Nature. The Wanderers weigh about 25 pounds fly up to 50 miles an hour, and can sustain a speed of 35 miles for a distance of 500 miles. They would put Art Ford's Model A to shame.

#### **SNOWFLAKES.**

That amazing wonder from BAE I, Norman Vaughan, has done it again. At age 84, he not only entered the Iditarod this winter, he finished! All 1,157 miles. And he didn't come in last, either. A couple of years ago he hoped to take a dogteam to the South Pole so he could celebrate his 85th birthday there on 19 December 1990. Anyone who could con the Pope into driving with him and his dogteam with two dogs named Devil and Satan should never be counted out. By the way, what has your grandfather done lately? Alan Campbell, the NSF Visiting Artist, 1987-88, returned to the ice, or at least to Palmer Station and the Antarctic Peninsula, during the past austral summer, spending August through November

in that region. He took 10,000 slides - Holy Cow!, painted many water colors, and did additional oil paintings. He will be having another Antarctic exhibit at the Addison-Ripley Gallery here in Washington, probably sometime in 1991. Based on what he did around McMurdo, this exhibit should be most sensational . . . . . IMAX is shooting an Antarctic film which will be shown all over the world at the various IMAX and OMNIMAX theaters - something like thirty-five in the United States, sixty-five in the whole world. They have already shot an Australian station, and hope to have the film ready for showing by June 1991. Their operating budget is about 3 1/2 million dollars, but NSF is NOT involved in the funding at all; the U.S. sponsor is the Chicago Museum of Science and Technology. Since it is IMAX, Washingtonians should be seeing it as one of the feature films in an Air and Space Museum theater. Another local site will be the Planetarium in Richmond. Should be just SUPER . . . . . The Science Museum of Minneapolis is preparing a major Antarctic exhibit. David Chittenden is in charge of the exhibit which is targeted to open in June 1991. It will travel to seven other science museums over the following two to three years. We believe some of the staff at NSF are acting as advisors. Any traveling dog and pony show on Antarctic science which goes to various museums should be good publicity, and, hopefully, will help to educate people on what Antarctica is really like and what goes on there . . . . . We understand that Jim Caffin may be coming back as editor of Antarctic, the bulletin of the New Zealand Antarctic Society. If this is true, it's the best news we have had in a long time. I don't think there is anyone in the world who knows as much as Jim does about what is going on in Antarctica. He seems to have connections with all of the nations working there, and knows who is doing what to whom and when, as well as how . . . . Look for a hatchet job in Eugene Rodgers' forthcoming book, "Beyond the Barrier", which is being published by the U.S. Naval Institute Press this spring. We are quite upset about it . . . . If you want a source of real bargains of polar books, try Chessler Books (P.O. Box 4267, Evergreen, Colorado 80439). For example, Huntford's "Amundsen's Photographs", \$17.50; Land's "The New Explorers", \$4.00 (I recently paid \$7.50); Lopez's "Arctic Dreams", \$10.00; Lewis and George's "Icebound in Antarctica", \$10.00. You just can't beat their prices. Scientists at Harvard are building a pilotless airplane for research flights through the ozone hole in the upper atmosphere over Antarctica. It will have a wingspan of 60 feet, and be capable of flying as high as 85,000 feet. Its fuselage and wings will be made from strong, lightweight composite material like graphite. The craft will be battery-powered and guided by remote control from the ground at McMurdo. First flights, fall of 1991 . . . . Sill Westermeyer corralled me at our last meeting and asked why I had never mentioned his "Polar Prospects: A Mineral Treaty for Antarctica." Well, we just don't do a real good job covering the waterfront, and were certainly remiss here, as the publication of 218 pages is just excellent. We presume you might be able to get a copy directly from William Westermeyer (Office of Technology Assessment, Oceans and Environment Program, U.S. Congress, Washington, DC 20510, or call Bill at 202-228-6548). . . . Daniel Morrison has proposed that Cerveja Antarctica become the official Society beer at all of our functions. It seems it is brewed by Companhia Antarctica Paulista in Sao Paulo, Brazil. The only problem is that it's not imported into the U.S. So he offers an alternative, Polar Beer out of Venezuela which is widely available in the U.S. Daniel wrote, "In either case, you would have a respectable beer with a good name and would be making a small contribution toward resolving the Latin American debt crisis." . . . . A local loyalisi by the name of Judith Reusswig will appear on Jeopardy the evening of July 4th. Judy is a good-looking, blonde 4th-grade teacher in the Washington area, and will be resplendent that evening - like she is all evenings - but this time in a beautiful green dress. She wasn't a big winner, but at least will be getting a new Panasonic TV for her efforts. Yes, the MC asked about her trip to Antarctica.

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 90-91

October

No. 1

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988

SEE THE OFFICIAL FILM OF THE RONNE ANTARCTIC RESEARCH EXPEDITION

## HIGH HEELS TO MUKLUKS

by Jackie Ronne

Ronne Antarctic Research Expedition, 1947-48  
Stonington Island, Antarctica

*Currently*

Woman-At-Large

Bethesda, Maryland and Boca Raton,  
Florida

on

*Tuesday evening, 23 October 1990*

*8 PM*

National Science Foundation  
18th and G Streets N.W.

Room 540

*- Short business meeting precedes presentation -*

Jackie Ronne, a distinguished alumna of Columbian College, George Washington University, is famous for holding or co-holding with Jennie Darlington many Antarctic firsts by dint of being the first women to winter over in Antarctica. Three years after Finn took her on a skiing honeymoon she found herself sending out expedition news releases three times a week to the North American Newspaper Alliance; taking tidal measurements; and running the seismic equipment, all the while living with Finn in a 12'x12' "ballroom." ... Jackie has been to Antarctica three times, the last in 1971, when she and Finn were at the South Pole on the 60th anniversary of Amundsen's arrival, the first married couple at the South Pole. Ronne Ice Shelf was named for Jackie (see "Geographic Names of the Antarctic"). A past president of the Society of Women Geographers, 1978-1981, Jackie is an international traveler who has lectured in Europe, Asia, South America, and North America. Come and see and hear *Jackie!*

*- LIGHT REFRESHMENTS -*

Order 1991 New Zealand Antarctic calendars, \$9 each (see pages 2-3)

The team of Ruth Siple and Paul Dalrymple find themselves winning by default putting together the Antarctic Society newsletters for yet another year, this being our 13th. We sure wish someone would surface who would want to take this over, but in today's society everyone seems overly committed to killing crabgrass, taking care of their sailboats, or spoiling their children and/or grandchildren. So this hapless soul will drive spasmodically, periodically, some 700 miles from Port Clyde, Maine to Washington to put some words on paper which most of you will never read, some will challenge, and others will wonder about. The good news is that the retirement home in Maine will be completed by the time you get this Newsletter; the bad news is that we spent so much money on it that there is no furniture in it. With Peter Wilkniss putting all the good news on Antarctica in his "Dear Colleague" letters, with the environmentalists flooding your mailboxes with all the bad news, all that's left for us is to write obituaries, do book reviews, and come up with a few weird stories. So if you people continue to die, keep on writing books, and do strange things, we will continue to put out these things until we are run out of town. There is nothing I want to do more than sit on the porch and watch the tide come in and go out every day, so hopefully I can make these things so totally unacceptable that I will be asked to remain in Maine. That will be a happy day! Until then, remember the Newsletters do not represent the Voice of The Antarctic Society; they are just the highly prejudiced views of an ancient Antarctic who is living out his life with fond memories of splendid bygone years.

**MEMBERSHIP.** We now total 641 members, which is our all-time high. Seventy-seven of those are married teams, or at least they are husband and wife combines. Fortunately our membership growth is under control. We will be sending out dues slips to those who owe for the current year, so if you don't get a bill, you are in good standing. As this is strictly a volunteer, nonpaying labor of love, Ruth and I would greatly appreciate it if when you get your bill, you will pay as soon as you can, and make it for multiple years, as it saves us a lot of paper work. Right now about half of our members have already paid for this year which helps tremendously. It's bad enough to drive all the way down from Maine to write newsletters without having to keep sending out dues notices. So please pay early and pay for multiple years.

**CALENDARS.** Although we don't have them in hand right now, we fully expect to have the New Zealand Antarctic calendars within a month's time, as they have been on the high seas for weeks. We aren't handling the USAP-Navy calendars any more, as the quality of the pictures was getting poor; there was a lot of misinformation on the calendar; they were always late getting printed and into our hands; and the only two people who seemed to moan our dropping them were Michele Raney and Karen narrower. Both Michele and Karen are great folks, BUT! And we have cut back on the New Zealand calendars, so we won't have to act like street corner hucksters

trying to peddle them in December. With a rather large increase in price, we purchased only 200 (vs. 300 last year), so if you want one or more, it behooves you to get your bucks to Ruth ASAP. The price this year will be \$9 each for mailings, \$8 each if you pick them up at one of our local meetings in Washington. We have NOT seen this year's Antarctic calendars, but generally you can trust Colin and Betty Monteath to come up with some excellent scenic shots.

**A ROCKY ROAD TO BOULDER.** In the past ten years we have scheduled some of our meetings where clusters of Society members live (Palo Alto - 1983, San Diego - 1986, Columbus - 1988), and have been thinking Boulder for many years. To have a meeting outside Washington, we have to attach ourselves to a Polar Research Board or a SCAR meeting to assure success. When we started pushing for a Boulder meeting, PRB had no member from the University of Colorado, so officially they had no host to invite them there. When they got a member, the National Academy of Sciences requested that as many of their Boards as possible utilize a conference center in Irvine, California which they had contracted for meetings. So PRB went there last year. Then this year, everything opened up so they could go to Boulder for their fall meeting, and we got excited. But on the way to the Forum, PRB decided that they should utilize their meeting in Boulder to inaugurate an annual Arctic after-dinner speech, saying that their Washington annual meeting could be on the Antarctic. For a time they considered having both an Arctic and an Antarctic evening in Boulder, but seemed to prefer having the non-Arctic evening devoted to another purpose. And when we could not guarantee any great numbers - we do have thirty members in Colorado, twelve in Boulder - we all decided it was best at this late date to scrub plans for this fall. It sort of hurts, as we wanted to go there, but perhaps Mark can find another Boulder meeting where we can attach our coattails and have a speaker meeting.

**WILD ICE: ANTARCTIC JOURNEYS IS AWESOME.** Ron Naveen, full-time naturalist, writer, photographer, and the founder of Oceanites (which publishes The Antarctic Century Newsletter that all Antarctic Society members receive gratis) announces that his tome, WILD ICE: ANTARCTIC JOURNEYS, is about to hit the streets. Ron, along with Colin Monteath, Tui De Roy, and Mark Jones, have produced a spectacular blend of photography and text - 175 photographs, 224 pages - taking us on a breathtaking trip from the Convergence to the Pole. They've got more than 60 Antarctic trips among them, and it shows. In vivid color - and with more pinks, magentas, and yellows than you thought possible, WILD ICE glimpses everything from mating albatrosses and Chaplinesque penguins to bubbling lava inside Erebus. Many of the photos were previewed in Ron's presentation to the Society last December. The book is laced with quotes from Shackleton, Gould, Amundsen, Cherry-Garrard, Barry Lopez, and Annie Dillard. (Editor, who is Annie?)

WILD ICE is the lead item in Smithsonian Institution Press's fall catalog, and will be hitting the stores during the month of October for an almost unbelievable \$30. By special arrangement with Pizzi Press in Milan, Smithsonian has taken the care to produce the best photo reproductions we've seen this side of the Corcoran and East Wing Galleries. Even HRH Prince Edward has jazzed about WILD ICE; he has chimed-in with a foreword. No doubt, it will be a hot item for your Christmas shopping list, and your Local B. Dalton is going to be swamped. On the upside, Ron assures us that he and Oceanites will be able to keep up with your demands. Sales (\$30 cover price plus \$5 handling) through the Oceanites Foundation, 2378 Rt. 97, Cooksville, MD 21723, will assist the continued publication of The Antarctic Century Newsletter.

**WANT TO EXHIBIT YOURSELF?** If your answer is yes, then you just may be the person(s) The Science Museum of Minnesota is searching for their upcoming national traveling exhibit on Antarctica. They really do not want you, yourself, but they may want something in your attic or your basement with an Antarctic connection. It appears that they will take anything which is interesting and tells a story, as a recent letter to us says they are after "used clothing and gear, historical objects and artifacts related to expeditions, objects shattered or otherwise damaged by extreme cold, photographs (preferably slides or negatives from which prints could be made), artwork, journals or diaries (which could be copied), cartoons, stamps, coins, medals, and other Antarctic memorabilia." Also, they want to hear from readers who would like to share interesting anecdotes about living, working, traveling, or exploring in Antarctica. Oh, how I wish I had saved all those great stories written for these newsletters which never got by the censorship of Madam Siple!

I think rather than send a bunch of memorabilia around the country, they should just provide a comfortable rocking chair for Larry Gould and turn him loose to tell it like it was/is. Larry would be better than a thousand pictures, and the audience would remember him much longer than they would if they saw some old snowmobile which Bill Cassidy drove into the junk pile. And someone out there must have on tape Bert Crary's epic response to the chaplain at Little America V in 1958 when the chaplain, seeking a sermon topic, asked Bert what he was thinking when he was tossed into the Ross Sea when the shelf calved while he was making a hydrographic station on the barrier edge.

Responses should be sent to Ms. Kathy Glover, Exhibit Department, Science Museum of Minnesota, 30 East Tenth Street, St. Paul, Minnesota 55101 - tel (612)221-4715.

**PETER WILKNISS WAS IMPRESSED.** In mid-summer someone sent us a short clipping which said Peter Wilkniss would be lecturing to passengers on a cruise ship in the Arctic. Three years ago if anyone had said that Peter would be lecturing on a ship with passengers, you would have said they were out of their cotton-pickin' mind. You would have sooner believed that the Pope had just become the new Archbishop of Canterbury. But it turned out that once the facts were in, it was very believable. Peter was invited by the Russians to go to the North Pole on the 75,000 hp nuclear-powered icebreaker, ROSSIYA, this past summer. Seven foreign nations were represented on the ship: Australia, Canada, France, FRG, Saudi Arabia, Switzerland, and the United States. Wonder why Saudi Arabia and Switzerland? Have I missed something? Does the Persian Gulf freeze over nowadays? Does Switzerland now have a coastline and ports?

But the ROSSIYA did have tourists, tour operators, media personnel, technical experts, medical personnel - about 50 western passengers. And they were all treated royally, being quartered in one- or two-person staterooms, normally occupied by icebreaker personnel. They had lectures, with Peter giving two talks in English and German on the polar regions and the U.S. Arctic research program. He also gave a special talk to the Russian crew with a Russian translator, Sergeij Karpekin, Deputy Director of Foreign Affairs, doing the translating. Some of the Russians gave lectures, as did some of the passengers. The Russians were proud to show off the fabulous capabilities of the ROSSIYA, and the westerners were "intrigued and appreciative." And to show you there isn't that much difference in a polar cruise on a Russian icebreaker and a Society Expeditions cruise ship, they did have a barbecue, and the crew did put on a show. It really is a small world!

"The ship was under the command of Captain Anatoly Lhamekov, ... and he was assisted by a 'Staff Captain' and regular ships crew. The engineering department numbered about 50, including nuclear reactor specialists. Special ice experts called hydrol-

ogists worked closely with the Captain using their long-range radar reconnaissance and continuous personal observations and scouting in front of the traveling ship. Two MIL-2 helos (with one pilot each) worked around the clock in difficult ice conditions and dangerous weather conditions, i.e., fog. Only radio beacon and dead reckoning by the hydrologist are used. MIL-2 carries a COSPASS SARSAT beacon. Operations are determined - using full power when necessary. However, all ramming is avoided and backing down and trying a different approach is exercised regularly and masterfully.

' ... The ship's 75,000 hp are derived from 2 nuclear reactors (pressurized water) that produce super-heated steam driving two turbines. Six generators are driven by the turbines, two each powering the three electric motors that turn the huge fixed-blade propellers. One oversized rudder is used. The ship's progress in heavy ice is assisted by an air-bubbling system driven by 6 turbo compressors. This way water flow is created in tremendous amounts to create continuous lubrication between the hull and the ice. When used differentially the air-bubbling system also can be used for ship positioning, i.e., parking against ice floes. ...

"Two more of the ROSSIYA type are being planned. The OCTOBER REVOLUTION, maybe with 105,000 hp, is being constructed in the Leningrad shipyard. The URAL, last of this class, maybe having 150,000 hp, is planned for duty in 1995.

<sup>1</sup> ... ROSSIYA has nice accommodations for the crew of about 130, including theatre, comfortable 'salons', pool, sauna and exercise room. A simple hospital is also available. On this voyage ROSSIYA carried 210 people, including the 50 passengers and the service staff."

**MORE TOURIST SHIPS ON THE HORIZON.** On 20 June 1990, in Kobe, Japan, the newest cruise ship destined for Antarctic waters was launched down a slipway. It supposedly is the first expedition-class vessel to be built since 1974. This 6,700-ton ship, the FRONTIER SPIRIT, will be taking her sea trials next month under the command of Captain Heinz Aye, veteran Antarctic captain. The 164-passenger ship has anti-pollution devices that supposedly make her environmentally friendly, including refrigerated storage of garbage for return to port for processing, waste compactors, grinders and smashers for glass, and an oil separator for the bilge. Novel features include live video feed from the bridge to each cabin, allowing passengers to tune in to action topside; video cameras below water level, capable of 360 degree rotation, for glimpses of fish, marine life, and corals; a marine laboratory with aquarium; a helipad, and a glass-enclosed observatory with tiered lounge offering panoramic views: a scuba center equipped with the latest gear. All deluxe cabins have verandahs, so it will be just like staying home in Peoria. Come to think of it, with all that modern technology, why doesn't the FRONTIER SPIRIT just sail empty to Antarctica, and pump all that good stuff back to land-based tourists in the comfort of their own homes? I guess the answer to that is that they would miss the personal contacts with lecturers such as our own Ron Naveen and Colin Monteath, who will be lecturing on at least one of the ship's two scheduled cruises into the McMurdo area late this austral summer. It appears that the ship is owned and operated by Salen Lindblad Cruising, with other money being invested by Mitsubishi, NYK Line, and Hapag Lloyd. Incidentally, the ship carries a super ice-class rating, one below icebreaker, and it should be able to negotiate six to eight feet of pack ice.

Antarcticans are holding their breaths wondering about the environmental impact of the 460-passenger OCEAN PRINCESS of Ocean Cruise Lines of Fort Lauderdale, which will start making round trips from Buenos Aires on 22 December of this year. They have three "wine and caviar cruises" to Antarctica this season, at the unbelievably low rate of \$3,895 per person, double occupancy. Lars Eric Lindblad has resurfaced with Ocean Cruise Lines.

Society Expeditions is in the process of upgrading their fleet and will have two new ships on line by June 1992. The first, the SOCIETY ADVENTURER will be making her baptismal cruise next July, with her first Antarctic cruise scheduled a year from this November. Next year Society Expeditions will have all three of its ships in Antarctic waters - the SOCIETY EXPLORER, the WORLD DISCOVERER, and the SOCIETY ADVENTURER. The new ship will be larger (395 feet long), faster (17 knots), and carry more passengers (160). It will have an ice-hardened hull rated at 1A1 Super, and staterooms will feature bathtubs in each cabin, television, VCR, in-cabin satellite telephone, refrigerator, and safe. Everything you take a cruise for, to get away from, they are now going to put right in your stateroom. Do you think it would be possible to get a room without a telephone, or would that be an extra? However, on the plus side there will be a fully staffed and equipped "hands on" laboratory, complete with whale and marine mammal sounding equipment, microscopes, and fresh-and salt-water aquariums. The SOCIETY ADVENTURER will have 14 Zodiacs, four launches, one glass-bottom boat, snorkeling gear for one and all, and extensive diving equipment for up to 20 divers. However, we assume most of the diving and snorkeling equipment will be for passengers when they are up the Amazon and not up the Antarctic! Society Expeditions plans to phase out the SOCIETY EXPLORER in 1992, which will make a lot of EXPLORER loyalists extremely unhappy because they love the little ship (238 feet long, holding only 98 passengers, capable of going only 13 knots). Then when the sister ship to the SOCIETY ADVENTURER comes onto line, they will phase out the WORLD DISCOVERER in a subsequent year. Incidentally, Abercrombie & Kent of Oak Brook, Illinois has taken over sales and marketing for Society Expeditions which is a major change.

**ANTARCTIC FEVER STRIKES DOWN EX-GIRL SCOUT.** Julie Hagelin of Pomona College and Saratoga, California, the Antarctic Girl Scout for the 1988-89 season, has what could be a severe case of Antarctic fever. This fall she is doing an independent study on penguin feathers, using a Scanning Electron Microscope comparing feathers of different genera and species to see if the birds can be classified by differences in their feather structure. Julie says no one has done this before, and thinks it will be interesting. Jerry Kooyman at Scripps Institute of Oceanography has offered her a position in his lab next summer, and she is really excited about working with him and his staff. While at McMurdo in 1988, Julie helped their group study Emperor penguins and Weddell seal diving behavior and physiology. And, get this, she is considering writing a counterpart to the late Paul Siple's A BOY SCOUT WITH BYRD. After sixty years, there has to be a lot of new material on scouting in Antarctica. Last summer she worked with a group of Stanford biologists studying exotic plant species in the National Park on the Big Island of Hawaii. Her early career really has many similarities to that of Siple.

**1990-91 ANTARCTIC YOUNG SCHOLARS.** Talking about young folks and Antarctica, the National Science Foundation has announced the four new selectees for the Antarctic Young Scholar Program. And they are: Elizabeth Buckley of Westerville, Ohio, Jason Rashkin of Douglaston, New York, Anne Engh of Mankato, Minnesota, and Cashman Andrus of Scott, Louisiana. All are 18 years of age, and it looks like they are all from small cities or towns. And there is one other similarity, they all were either editor of their school paper or won some sort of a literary competition. Elizabeth is headed for the University of Chicago, but will work in Antarctica with Mark Dragovan's Princeton University's team studying cosmic radiation to test theories of the creation and early history of the universe. Jason will be entering Tufts College this fall after working in the Antarctic this austral summer with Langdon Quetin and Robin Ross of the University of California-Santa Barbara, Marine Science Institute doing research on the physiological ecology of adult and

larval krill. Anne is bound for Iowa State and next June will join Peter Kareiva of the University of Washington on the POLAR DUKE studying the spatial dispersion and foraging movement of sea birds. Cashman is a freshman at MIT, and he will be working with Mark Kruz of the Woods Hole Oceanographic Institution in exposure-age dating of the Antarctic ice sheet. Exposure-age dating - wonder how significant this really is to taxpayers? It must have some significance, but I can't for the world imagine what it is! Glaciologists have it made, their work will never get done. There is always another deep core waiting to be drilled somewhere. Anyway, these Young Scholars are all in for most interesting and rewarding experiences. Best of luck to them all!

**OLD ANTARCTICAN REFUSES TO FADE AWAY.** Norman Vaughan, 84, veteran of many dog sled races, and marriages, finally was recognized for one of those feats, being named 1990 Musher of the Year by Team & Trail newspaper, an internationally distributed publication aimed at the fraternity/sorority of competitive mushers around the world. He claims he has covered more miles behind a dog team than any other musher who has ever lived, which is somewhat of a dubious honor at best, right?! Norman is not so much a winner as he is a competitor, having never won a major race, or a long-term marriage, but he sure competes, whether dogsledding or ..... This past spring Norman finished the 1100-mile Iditarod race for the fourth time, taking ten more days than winner Susan Butcher. But when you are eighty-four years old, one normally considers it a victory if one makes it to the head in time. Old Norman actually did the whole darn Iditarod by himself.

For years critics have told him that he should hang up his jock strap and retire to the warmth of the fireplace, but that's not for Norman. Reputedly he spent the summer back on the Greenland Ice Cap trying to retrieve those planes which bellied in during World War II. Norman is sort of my idol, as he still looks twenty years younger than his true age; wears clothes like a Harvard man - which he was until he dropped out of school to go south with Byrd in 1928; and he had the gumption to write a book, WITH BYRD AT THE BOTTOM OF THE WORLD, coming out this November, by Stackpole Press.

**AN UNFLATTERING BIOGRAPHY OF ADMIRAL BYRD.** In late spring a former National Science Foundation public information officer, wrote a biography of sorts (BEYOND THE BARRIER, Eugene Rodgers) on the late Admiral Richard E. Byrd, although in reality it is only a two-year biography - the period of the first Byrd Antarctic Expedition, 1928-30. When I visited a meteorologist who was on that expedition, one Henry Harrison of Asheville, North Carolina, about four years ago, he showed me the questionnaire which the author had sent to all survivors of that expedition. It did not take any genius to detect that this person was out to do an expose, as he only wanted to find out negative things on Byrd. Subsequently I visited another member of that same expedition, Howard Mason, in Seattle, Washington, and he more or less confirmed my thoughts. Most of the members who got the questionnaire never responded to him, and some who did respond supposedly answered only the less poignant questions.

The author makes a big issue of the drinking which went on at Little America I on the 1928-30 expedition, making it sound as if Commander Byrd was the inventor of alcoholic beverages, and that he led the camp operations through one long, continuous drinking binge. I feel from comments made to me by several members of that expedition that this was not so, although drinking has been part and parcel of Antarctic living for years and years, as it is in our own home towns, wherever. And who among us are so pure and clean that they can cast stones at those who may have had too much to drink at an inappropriate time? And how about BAE II? On that

933-35 expedition, Charlie Murphy, of all people, was instrumental in pouring ALL of the camp booze down through a hole in the floor into the Ross Ice Shelf, creating the infamous Golden Stalagmite. Even if there were an error in judgement on BAE I, it was not perpetuated on BAE II, so the author should have given credit to Byrd men for recognizing and eliminating the problem on that expedition.

Byrd certainly was not worshipped by all of his men, although the rank and file held him in very high regard. Some of the aviation faction were Byrd antagonists, and a lot of the author's negative, unkind comments seem to have been gleaned from them. However, not all airmen were anti-Byrd, as mechanic Pete Demas was a staunch Byrd supporter. The biggest Byrd detractor was Bernt Balchen, but he was no angel, according to a former colleague of mine, polar explorer Sir Hubert Wilkins, who dropped Balchen from his Antarctic flight plans. Byrd was a mere mortal, probably not really cut out to be an expedition leader, and certainly a poor choice to spend a winter in isolation in the interior of Antarctica. But the bottom line is what an expedition accomplishes, and that expedition had many accomplishments, both in geographical exploration and discoveries, as well as scientific findings of note.

People who knew Byrd and his modus operandi will tell you that Byrd changed drastically from the first expedition to the second expedition, particularly so relative to his handling of men. If one is going to do a biography on a polar leader, one should do it on the person's whole career. One learns in Antarctica by his mistakes, and to judge a person by his baptism to Antarctica is being harsh on that person. The character defamation seems so unfair and unjust, much ado about nothing.

Byrd was a good organizer, a good fund raiser, a good judge of men, and he rewarded those who served him well. I have talked to a lot of the Byrd men who were with him on BAE II, as well as on BAE I, and invariably somewhere in the conversation they mentioned that Byrd helped them get a job after the expedition, helped them get into school, helped advance their careers.

Byrd died a somewhat inglorious death in the twilight zone. He was still young enough to have a role in Antarctica during the planning of the International Geophysical Year, but he was not a scientist; he was old careerwise as a Navy officer, but the new young guard had to do things their own way. It was sort of a no-win situation which was not enhanced by an unsympathetic admiral who was seeking his own glory. And it was all compounded by Byrd being in failing health and a sick man as the IGY approached. He actually died before the IGY officially began, but I have always felt that his soul was with his disciple Siple at the South Pole, and that he did experience the IGY in Antarctica.

**SECOND OPINION, STEVE DIBBERN'S.** I'm not one of the people who has particularly enjoyed the current craze of hero debunking..... I suppose I am interested in what life was really like on those earlier expeditions, and I don't really think that official tracks like Byrd's did a very good job of telling that. They were written for a purpose and we have to look at them in that light.

.... I feel the book serves some purpose in opening up to the reader the life at Little America which I do feel has been cleaned up in previous publications for public consumption. At the same time it was annoying to have the source diary material telling an interesting (if occasionally self-serving) story only to be followed by a series of suppositions. It was very much as though he wrote one book and then decided that he needed to make it a true exposé and went through and added a sentence of innuendo at each critical point to make the book saleable. My point is that his suppositions frequently do not appear to flow with the rest of the literary style.

I tried to reread parts of the book without the author's "insertions" and found an informative, if sometimes controversial book that discussed the problems and foibles

of a man with a really BIG ego leading an expedition of diverse men into a very demanding environment; dirty laundry if you will, without the nasty cutting edge of condemnation.

.... I didn't like the book, and I didn't take away from it what I think the author wanted me to, but I did learn a lot from it.

**ANTARCTIC COMRADES: AN AMERICAN WITH THE RUSSIANS IN ANTARCTICA. GILBERT DEWART.**

The Ohio State University Press. 1989. (Reviewed by Garry D. McKenzie). The interests and talents of scientists are often a surprise to their colleagues and to non-scientists. Dewart has captured the essence of the polar plateau, Russians, Antarctic research, Antarctic exploration, and his position as an exchange scientist in a timely, exciting and quite readable book. Several quotes illustrate his talent and the topics: "With the summer sun slanting its weak rays across the still-frozen snowscape, death changes the color of its shrouds from black to white, but it is no less dead." "I learned many things about these contradictory and sometimes maddening people, but the most important is the most obvious—that they are indeed people like ourselves, in some ways very much like ourselves." "The seismic shooting turned out to be very difficult here, as the wind had kicked up again and there was a great deal of blowing snow ..., not to mention the usual frostbitten hands and faces." "The ghostly tide of white powder was still running ankle deep, softening the outlines of the rocks, drifts, and buildings, wiping out the footprints of the homeward bound with its currents and eddies." and, "In Antarctica, my companions and I were in the deceptively quiet eye of this political hurricane ...."

This book chronicles life in East Antarctica with a Soviet research team in 1960, during the height of the Cold War. The detail and insight to Soviet science (many dedicated and honest scientists), life in the USSR (through the microcosm that existed at Mirny, Antarctica), and research in remote and harsh environments make for good reading by historians, research administrators, scientists, teachers and those who enjoy accounts of polar exploration. Comprehensive, with interesting observations and facts about Antarctica that even those who have been there will appreciate (such things as blue outs and green moats) the book holds your attention with accounts of a difficult traverse to the coldest research station on earth (Vostok), a major fire that claimed the lives of "exemplary men, possessed of that special spirit of comradeship and self-denial that makes an expedition really work" (understandably the shortest chapter), the reaction of Dewart's comrades to the shooting down of Francis Gary Powers' U-2 spy plane, and analysis of the similarities and differences between the Americans and the Soviets. They have unusual approaches to safety, preventive maintenance, and use of equipment (if it works well, don't use it). The availability of tools, and the comfort of workers, ability to party and drink, and variation in quality of food also make interesting reading.

One gets the impression that Dewart knew much more about the Russian people than many diplomats during the Cold War, and that he was one of only a few people who was able to develop close ties to Russians at many levels. We learn about the lives of the working people, the nature of Soviet society, which the author believes has many analogies to a feudal society, the impact of the second World War (veterans estimate that one-sixth of prewar Soviets perished) and Stalin, and the idea that in some areas the war did not really end until 1952, when martial law was lifted. We learn how they accepted Gil Dewart as a scientist and a friend, and the impact that he had on the Soviet station with his bright clothes ("In Russia, men do not wear such bright colors"), his beard (beards became acceptable and a contest was held), his music (jazz became a regular component of the music from the Communications Center), and his Sunday issue of the New York Times.

In addition to what we learn about life in Antarctica and the USSR, we also learn about the life of a geoscientist, including his association with Cal Tech and MIT, work with Big Oil in Louisiana, research at Wilkes Station and the International Geophysical Year, and jobs and experiences of a world-wide traveler. We get a sense of his patience and tolerance in the face of Murphy's Law and its Russian counterpart (Law of Universal Contrariness) and understand the need for these qualities in polar exploration and research. There is no hint of frustration with the delays associated with weather, vehicle breakdowns (is repair the most common word in the Russian language?), and difficulty in taking gravity readings on snow that is perturbed by wind load on nearby tractors. His nicknames also reveal the character of the Soviets and the author: Gil was known as the "finger doctor" because he had bandaids (new to them), the "Corporal" because of his military experience, and "Dyadya Gil" because of the bond developed with a young sled dog.

.... The book is a highly recommended addition for personal and professional libraries; it is good reading even without buttered tea or vodka.

**ENVIRONMENTAL DEFENSE FUND (EOF) NOTIFIES NSF OF INTENT TO SUE.** The Environmental Defense Fund on 21 September 1990 put the National Science Foundation (NSF) on notice that it intends to file a lawsuit to prevent open pit burning and land-filling of solid and hazardous wastes at U.S. research facilities in Antarctica. The notice represents the first time legal action has ever been threatened over pollution in Antarctica. EOF is required to give NSF 60 days notice prior to seeking legal action. The letter of 21 September allows EOF to file its lawsuit when summer operations begin in Antarctica in November 1990.

In August 1988, EOF urged NSF to cease open pit burning and landfilling practices in Antarctica and a panel of experts established by NSF to review operations at its research stations there called for termination of open pit burning. In response, NSF released a "legal opinion" in December 1989 which concluded that virtually no U.S. environmental laws apply to Antarctica and asserted that international rules are not binding regulations. Stay tuned for the fireworks!

**SNOWFLAKES.** *Ron La Count* failed a physical examination and is no mo in the Division of Polar Programs at NSF. No one who ever knew Ron could be very neutral about the guy, as he had strong ways of affecting people. I don't think there ever was anyone just like Ron in the history of the U.S. Antarctic programs, and I trust that there .....*Abigail Ailing* has been selected to be one of the live-in biospherers for the next two years. Unfortunately, we missed her on the Diane Sawyer-Sam Donaldson program. *Shere Abbot*, she of the Academy's Polar Research Board, tells us that she was in school with Abigail at Yale. *Shere* wonders what happens to Abigail's one-year old baby during the two years she will be locked up. You may recall that Abigail sailed to Antarctica early in 1989 on a Chinese junk-design, three-masted ferrocement ship, studying a population of Humpback whales. Abigail is only thirty, so she is packing in a lot of living in her early years..... *Dutch Dolleman* died on the 8th of September in Manchester, New Hampshire. We never knew this Dutchman who was born in the Netherlands, but educated in this country. He served at East Base with *Dick Black* on the U.S. Antarctic Service Expedition, 1939-41, and was in the construction crew which built, and wintered over at, *McMurdo* in 1955-56. *Dutch* was an expert handler of dogs and trained people in the military on search and rescue techniques..... There is a rumor floating around Washington that our outgoing president, *Bob Rutford*, will be the new incoming chairman of the Polar Research Board Remember when this position was filled by nice quiet guys like *Link Washburn* and *Charlie Bentley*? You were never quite certain in those days who was the real chairman, but now we will know!

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET

ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 90-91

November

No. 2

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Franke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988

ANTARCTIC PROTECTION ACT OF 1990 PASSED BY CONGRESS!!!

*THE INTERNATIONAL GEOPHYSICAL YEAR (ICY) AT WILKES STATION*

by

Ralph Glasgal

Chief Auroral Physicist, Wilkes, 1957

and

President, Glasgal Communications, Inc.

Northvale, New Jersey

on

*Tuesday evening, 27 November 1990*

*8 PM*

National Science Foundation

18th and G Streets N.W.

Room 543

Ralph is going to narrate his own film of the scenic wonders of Antarctica's Banana Belt, including traveling to Antarctica, penguins at Hallett, real live scientists at work, life in camp, and great footage of our Founding President, the late Carl R. Eklund. To the best of our knowledge, this is the only full length film shot by a U.S. scientist in Antarctica during the 1GY. It's an excellent film - we have seen it.

Ralph holds a degree in Engineering Physics from Cornell University and a master's degree in Electrical Engineering from New York University. He is the founder and president of Glasgal Communications, Inc., a leading data communications systems integrator. Ralph has authored books on advanced techniques in data communications, holds one patent, and publishes the annual Network Products Directory, widely recognized as the bible of the Dataconnect Industry.

Ralph has journeyed to Greenland, Spitzbergen, and the Palmer Peninsula just for the fun of it. He has also authored Music on Ice, a semi-serious magazine treatise on the musical tastes of early Antarctic explorers. Glasgal Island off Wilkes Coast is named after Ralph. It is amazing, after a year with Eklund, Honkala, and Cameron, that he could overcome such influences and become such an outstanding man!

These mailings are erroneously referred to as newsletters. They have to be called something, so "newsletters" is about as flattering a name as can be given, considering the nature of the writings. But this one more or less qualifies as a newsletter, as most of the items are newsworthy about Antarctica: The Antarctic Protection Act of 1990; a campaign to save the GLACIER; the opening of the International Antarctic Center in Christchurch; the new opportunities presented by the Pegasus airstrip; an upcoming International Symposium of Policy Makers at McMurdo; the honoring of an Antarctic by The Nature Conservancy; and reviews of two brand new books, one by an 84-year old survivor of the first Byrd Antarctic Expedition, the other a splendidly illustrated book by a British publishing house.

Unfortunately, there are two obituaries, one of a very dear, special friend who was probably the kindest, most gentle, and most revered man ever to set foot on the South Pole, and the other of a long-standing Antarctic. So this is one newsletter for which we won't: have to fabricate stories, stretch the truth, or write tongue-in-cheek style about people. It's going to be hard to write honestly, but we will try! Bear with us!

**NEW OFFICERS AND BOARD OF DIRECTORS.** Occasionally we change the Home Guard, so at our last meeting those in attendance unanimously voted to go along with a fine slate of nominees. Our aim is to try and vote in those who show up at our meetings, because we figure if they come out after dark in downtown Washington, they are the kind we want to run our Society. Seriously, all nominees are people who normally come to our meetings.

Our new incoming president is Guy Guthridge, a long-term employee in the Division of Polar Programs at NSF, where he is Manager, Polar Information Program Office; and our new vice-president is Walt Seelig, past mayor of Christchurch, New Zealand, ardent fisherman, and long-time member of our Society. Ruth Siple occupies a non-voting position, also a thankless position, that of treasurer. A relatively new member becomes secretary, Jack Sawicki. His credentials are that he owns two Siberian huskies, is very cooperative, is an expert on polar clothing, and lives within a half mile of the Nerve Center.

The Board of Directors are, in alphabetical order: Dale Andersen, the underwater diver from NASA who has worked many austral summers in the Dry Valleys; Pam Davis, loquacious, effervescent, cooperative Antarctic lover who in a few short months will be a graduate student at the Scott Polar Research Institute in Cambridge, England, where she will be an undercover spy for our Society on what goes on in those hallowed halls; CDR Orland French (USCG Ret), a debonair retired icebreaker navigator (NORTHWIND) who adds a little class to our group; Ron Naveen, ex-lawyer who went clean and became a naturalist, photographer, and writer (see WILD ICE, new Smithsonian publication on Antarctica); Judy Reusswig, whose sole reason for being on the Board is that she is a good-looking blonde who thinks this column is interesting, but she has also been to Antarctica twice as a tourist/adventurer/whatever; and Si Roman, retired NOAA meteorological technician who was at the South Pole back in 1963-64. Si is a good old beer-drinking boy who comes to all our meetings and keeps his mouth shut, making him a most worthy member of our organization. Boat rockers we don't need!

**ANTARCTIC PROTECTION ACT OF 1990 (H.R. 3977).**

Section 1. Short Title. This Act may be cited as the "Antarctic Protection Act of 1990".

Sec. 2. FINDINGS AND PURPOSE.

(a) FINDINGS—Congress finds that—

(1) the Antarctic continent with its associated and dependent ecosystems is a distinctive environment providing a habitat for many unique species and offering a natural laboratory from which to monitor critical aspects of stratospheric ozone depletion and global climate change;

(2) Antarctica is protected by a series of international agreements, including the Antarctic Treaty and associated recommendations, the Convention on the Conservation of Antarctic Seals, and the Convention on the Conservation of Antarctic Marine Living Resources, which are intended to conserve the renewable natural resources of Antarctica and to recognize the importance of Antarctica for the conduct of scientific research;

(3) recurring and recent developments in Antarctica, including increased siting of scientific stations, poor waste disposal practices, oil spills, increased tourism, and the over-exploitation of marine living resources, have raised serious questions about the adequacy and implementation of existing agreements and domestic law to protect the Antarctic environment and its living marine resources;

(4) the parties to the Antarctic Treaty have negotiated a Convention on the Regulation of Antarctic Mineral Resources Activities which the United States has signed but not yet ratified;

(5) the Convention on the Regulation of Antarctic Mineral Resources Activities does not guarantee the preservation of the fragile environment of Antarctica and could actually stimulate movement toward Antarctic mineral resource activity;

(6) the exploitation of mineral resources in Antarctica could lead to additional degradation of the Antarctic environment, including increased risk of oil spills;

(7) the Antarctic Treaty Consultative Parties have agreed to a voluntary ban on Antarctic mineral resource activities which needs to be made legally binding;

(8) the level of scientific study, including necessary support facilities,

has increased to the point that some scientific programs may be degrading the Antarctic environment; and

(9) the planned special consultative meeting of parties to the Antarctic Treaty and the imminence of the thirtieth anniversary of the Antarctic Treaty provide opportunities for the United States to exercise leadership toward protection and sound management of Antarctica.

(b) PURPOSE.— The purpose of this Act is to—

(1) strengthen substantially overall environmental protection of Antarctica;

(2) prohibit prospecting, exploration, and development of Antarctic mineral resources by United States citizens and other persons subject to the jurisdiction of the United States;

(3) urge other nations to join the United States in immediately negotiating one or more new agreements to provide an indefinite ban on all Antarctic mineral resource activities and comprehensive protection for Antarctica and its associated and dependent ecosystems; and

(4) urge all nations to consider a permanent ban on Antarctic mineral resource activities.

Sec. 3. DEFINITIONS.

For the purposes of this Act:

(1) the term "Antarctica" means the area south of the Antarctic Convergence as defined in section 303(1) of the Antarctic Marine Living Resources Convention

Act of 1984 (16 U.S.C. 2432).

(2) The term "Antarctic mineral resource activity" means prospecting, exploration, or development in Antarctica of mineral resources, but does not include scientific research within the meaning of article III of the Antarctic Treaty, done at Washington on December 1, 1959.

(3) The term "development" means any activity, including logistic support, which takes place following exploration, the purpose of which is the exploitation of specific mineral resource deposits, including processing, storage, and transport activities.

(4) The term "exploration" means any activity, including logistic support, the purpose of which is the identification or evaluation of specific mineral resource deposits. The term includes exploratory drilling, dredging, and other surface or subsurface excavations required to determine the nature and size of mineral resource deposits and the feasibility of their development.

(5) The term "mineral resources" means all nonliving natural nonrenewable resources, including fossil fuels, minerals, whether metallic or nonmetallic, but does not include ice, water, or snow.

(6) The term "person" means any individual, corporation, partnership, trust, association, or any other entity existing or organized under the laws of the United States, or any officer, employee, agent, department, or other instrumentality of the Federal Government or of any State or political subdivision thereof.

(7) The term "prospecting" means any activity, including logistic support, the purpose of which is the identification of mineral resource potential for possible exploration and development.

(8) The term "Under Secretary" means the Under Secretary of Commerce for Oceans and Atmosphere.

#### Sec. 4. PROHIBITION ON ANTARCTIC MINERAL RESOURCE ACTIVITIES.

Pending a new agreement among the Antarctic Treaty Consultative Parties in force for the United States, to which the Senate has given advice and consent or which is authorized by further legislation by the Congress, which provides an indefinite ban on Antarctic mineral resource activities, it is unlawful for any person to engage in, finance, or otherwise knowingly provide assistance to any Antarctic mineral resource activity.

#### Sec. 5. INTERNATIONAL AGREEMENT.

(a) It is the sense of Congress that the Secretary of State should enter into negotiations with the Antarctic Treaty Consultative Parties to conclude one or more new international agreements to—

(1) conserve and protect permanently the natural environment of Antarctica and its associated and dependent ecosystems;

(2) prohibit or ban indefinitely Antarctic mineral resource activities by all parties to the Antarctic Treaty;

(3) grant Antarctica special protective status as a land of science dedicated to wilderness protection, international cooperation, and scientific research;

(4) ensure that the results of all scientific investigations relating to geological processes and structures be made openly available to the international scientific community, as required by the Antarctic Treaty; and

(5) include other comprehensive measures for the protection of the Antarctic environment.

(b) It is the sense of Congress that any treaty or other international agreement submitted by the President to the Senate for its advice and consent to ratification relating to mineral resources or activities in Antarctica should be consistent with the purpose and provisions of this Act.

#### Sec. 6. ENFORCEMENT.

(a) IN GENERAL.—A violation of this Act or any regulation promulgated under this Act is deemed to be a violation of the Antarctic Marine Living Resources Conven-

tion Act (16 U.S.C. 2431-2444) and shall be enforced under that Act by the Under Secretary or another Federal official to whom the Under Secretary has delegated this responsibility.

(b) PENALTY.—If the Under Secretary determines that a person has violated section 4—

(1) that person shall be ineligible to locate a mining claim under the mining laws of the United States; and

(2) the Secretary of the Interior shall refuse to issue a patent under the mining laws of the United States, or a lease under the laws of the United States related to mineral or geothermal leasing, to any such person who attempts to perfect such patent or lease application after the Under Secretary has made such determination.

#### Sec. 7. AUTHORIZATION OF APPROPRIATIONS.

There are authorized to be appropriated—

(1) to the Under Secretary not more than \$1,000,000 for each of fiscal years 1991 and 1992 to carry out the purposes of this Act; and

(2) to the Secretary of State not more than \$500,000 for each of fiscal years 1991 and 1992 to carry out section 5 of this Act.

**PERSONAL COMMENTS.** This Act was a compromise bill spearheaded by the Massachusetts politicians, Senator Kerry and Representative Conte, with the final version being more or less Conte's (as we understand it). It was approved by the Senate on the evening of 24 October, and the House unanimously passed it at 11:15 PM on the 26th. As Congress was trying to end up business so they could get home for a final weekend of campaigning before voting, Antarctica didn't create much of a stir. Ruth and I were watching on TV - a most disheartening experience on how democracy works - and the chambers were in almost utter disarray with members talking to one another as Conte tried to summarize the benefits of the bill. In desperation Conte interrupted himself, saying, "If they don't shut up, we'll send them to the Antarctic and leave them there." It didn't really disquiet the representatives, and later on in his five-minute presentation Conte said if all the House members were to go to Antarctica, all the hot air they were blowing would melt all the snow and ice in Antarctica! One got the feeling that anything on Antarctica would have passed unanimously at that late hour, as the Congressmen were more concerned with the budget and getting on home. There are five working days when the representatives can make minor changes in the wording, but if last night's TV interest is any indication, none of the members will take advantage of the opportunity to put their imprint on the Act. Then it will go to the White House, and by the time you people get this so-called newsletter, it will all be law!

This person feels that the Act is probably a blessing in disguise, because even though our position going to the Santiago meetings in late November had been one in support of the Wellington Convention, there could not have been much hope at the State Department that their position would ever be acceptable to either France or Australia, and probably not even to New Zealand. And with the Antarctic Treaty requiring unanimous agreement among the twelve Contracting Parties, weren't we more or less whistling up a dark alley in thinking all twelve would endorse the Wellington Convention? With the U.S. position now determined by the Act, it would seem that the environmental wolves will now be sidelined, and that the Santiago meetings can proceed without undue fanfare.

The Act is a political confirmation of something Antarctic purists can appreciate. It makes certain no one from Peoria can go prospecting in the Transantarctic Mountains without facing Leavenworth when he/she gets back home. If anything great is ever found in that ice, don't you think heads of state will find a way to get it out? In the meantime, let's rejoice in seeing a popular viewpoint enacted as a national law.

**SAVE THE GLACIER, IF IT ISN'T TOO LATE.** Remember Captain Brian Shoemaker, the former Commander of the U.S. Naval Support Forces in Antarctica? Well, Brian is now Executive Director of the HERO Foundation in Reedsport, Oregon, and he needs your support in trying to obtain the old red bucket, the icebreaker GLACIER, for the Antarctic Center in Reedsport. They were well on their way to obtaining the ship when several key State of Oregon officials retired, and now the Pacific Missile Testing Center at Point Mugu in California wants it, where her destiny would be Davey Jones' Locker. The GLACIER and the U.S. in Antarctica are synonymous, as it was the biggest and the best when the United States needed it in early Deep Freeze to establish scientific bases in Antarctica. The GLACIER has explored more of the ocean and coastline of Antarctica than any other ship, and now they want to use it for a missile target? Where's justice?

General Services sort of torpedoed efforts of the HERO Foundation to get the GLACIER when they cited a letter from the Coast Guard Commandant, Admiral J. W. Kime, that environmental hazards associated with the ship made it an albatross, citing eroded asbestos coatings and exposed polychlorinated biphenyls (PCBs). Brian said that the Coast Guard is stating erroneous information, citing a 1987 survey report by a Navy contractor to the effect that the ship is certified free of contamination, and that "no PCB materials or items" were found on board. So the Governor of Oregon, playing it safe like a true politician, turned his back on helping the HERO Foundation obtain the GLACIER, and refused to sign the transfer document. The Foundation wants the GLACIER to go along with the HERO. It's too bad Ike Schlossbach isn't alive; if he were, he would round up some more of his kind and they would slip into Bremerton some night, attach a tow line, and be off with the icebreaker!

Brian wants you Antarctic Purists to sit right down at your word processors and knock off letters to Governor Neil Goldschmidt of Oregon (254 State Capital, Salem, Oregon 97310), advising him that you have seventeen relatives of voting age residing in Oregon who will vote early and often against him at the next election unless he comes to his senses and signs off on accepting the GLACIER. Or you can call the Governor, (503) 378-3111, although I think you would be better off saving your AT&T dollars, because all you would get would be some flunkey answering the phone who would only frustrate you. Brian also wants us to contact the Public Affairs officers in the White House (202-456-7639), in the Navy (202-697-6724), and in the Coast Guard (202-267-1587). You can contact Brian directly at (503) 271-2605. His address is: Capt. Brian Shoemaker (USN Ret), Executive Director, HERO Foundation, P.O. Box 73, Reedsport, Oregon 97467.

Brian reports that they held a very successful "First Annual Antarctic Festival" at Reedsport in May, with 120 in attendance, some 25 of whom were OAEs. Each May they will hold these Antarctic festivals, so if you are within commuting distance of Reedsport by car, boat, or plane, why not drop in next May and have some fun with whoever else shows up? In the meantime, SAVE THE GLACIER!

**INTERNATIONAL ICE CENTER (IAC) AT CHRISTCHURCH FIRED UP AND OPERATING.** Peter Wilkniss was one of 200 invited guests who recently took part in the opening ceremonies associated with the inauguration and start-up of the new International Antarctic Center in Christchurch. The keynote speaker was Mike Moore, Prime Minister] of New Zealand. The landlord, the Christchurch International Airport, Ltd. (CIAL) paid for a reception, and the United States Antarctic Programs (USAP) hosted a luncheon for thirty invited guests.

The USAP occupies space in two buildings of Phase I, the administration building, and the warehouse and Antarctic passenger terminal complex. CIAL is actively pursuing Phase II, a public "Antarctic Experience" and Conference Center which may be realized in 1991. Phase III will be a housing/hotel facility for USAP participants.

**PEGASUS MAY RESTRUCTURE USAP OPERATIONS.** On 9 November, a C-141 will land on the new blue-ice runway named Pegasus, eight miles from McMurdo, about a third of the distance from Hut Point to Black Island. If all goes well, Charles Swithinbank and Malcolm Mellor will become Antarctic demigods; if it's a disaster, they might as well pack up their parkas and start selling vegetables at roadside stands. It has long been an Antarctic dream that blue-ice ablation areas in Antarctica become airfields. Joe Fletcher, when he was director of the Office of Polar Programs (now Division of Polar Programs) evidently made a firm proposal for their utilization back in 1972. And, as most of you know, Swithinbank and the late Giles Kershaw did a lot of reconnoitering and locating blue-ice airfield sites in Antarctica in 1986. Since then the Cold Regions Research and Engineering Laboratory (CRREL) has been extending Swithinbank<sup>1</sup>'s research to cover sites of potential interest to the United States.

The Pegasus site is just inside the snow accumulation area, allowing for a thin snow cover over the ice in order to limit ablation problems. Mellor and Swithinbank feel that if there is a four-inch snow cover over the ice, there will be no significant solar radiation penetration, and that melt cavities will not occur. The folks in DPP are very enthusiastic about Pegasus becoming an all-season runway. If that happens, it will extend the scientific working season in Antarctica by allowing people to remain on the ice until late summer; will allow monthly flights into McMurdo throughout the whole year; will make the McMurdo area attractive to scientists in midwinter on short-term studies; and, naturally, bring in fresh fruit and vegetables, mail, and other goodies throughout the year. So Pegasus could result in a whole new ball game at McMurdo. There are minor problems, such as how to get the cargo over the eight-mile distance from the strip to the station. Personnel could, no doubt, be transported on hovercrafts, at least until they complete a monorail. And they shouldn't have any real problem finding a way to get the goodies into camp.

**INTERNATIONAL SYMPOSIUM OF ANTARCTIC POLICY MAKERS AT MCMURDO, NOVEMBER 1991.** Peter Wilkniss has been reading Antarctic books, and it did not take him very long to figure out that the year 1991 is sort of an Antarctic anniversary year of international importance which should be celebrated. One hundred and seventy years ago, Nathaniel Palmer was in the South Orkneys, and Bellingshausen circumnavigated Antarctica. One hundred and fifty years ago, James Cook discovered Victoria Land, Ross Island, Mt. Erebus, and the Ross Ice Shelf. Eighty years ago, Edward Wilson, Birdie Bowers and Apsley Cherry-Garrard made their epic midwinter trip to Cape Crozier; Amundsen arrived at the South Pole on 14 December; the Japanese went to the Antarctic for the first time; and Mawson took off on his own expedition to Antarctica; not to mention Scott taking off for the South Pole from Cape Evans on 1 November. And, forty years ago, 1961, the Antarctic Treaty came into effect. Then, ten years ago, the Transglobe Expedition arrived at Scott Base.

Peter had hoped for an Antarctic Science Conference at McMurdo, but lost out to his former homeland, Germany. So he is settling for an international symposium of Antarctic policy makers, and is thinking November 1991. He feels, and with much justification, that the time would be ripe for these high rollers to see Antarctica, not only for what it is, but also for its heritage. He would want the distinguished guests to see the Scott and Shackleton huts, to see the entire historic area of McMurdo Sound, and to visit the South Pole. He foresees the activities being hosted by the United States, New Zealand, and Italy, with opening and closing sessions being held in Christchurch. Peter also would like to dedicate the new U.S. Science Laboratory building at McMurdo at the same time. He feels he can make it interesting and worthwhile enough to justify politicians coming to Antarctica for the conference. And, besides, November is sort of a drab month when no one really wants to stay home.

**BILL BENNINGHOFF IMMORTALIZED IN HIS OWN LIFETIME.** Bill Benninghoff has been a Big Man in polar biology for more years than he would care to admit. He has been all over the Antarctic - everywhere from Cape Hallett to the South Pole, with way stations at such places as Cape Crozier and Lake Bonney. And he has been very active on the SCAR Working Group on Biology, serving as its secretary for countless years. But his fame and notoriety apparently are well-known to non-polarites, as the Michigan Chapter of The Nature Conservancy has just dedicated some terrain in the Upper Peninsula of Michigan as the Benninghoff Tract. Never having been in Upper Michigan, we don't know just how much of an honor it is, but his wife, Anne, thinks the Tract has some great assets - "well developed 'string bogs' ... knolls with hardwood forest, lakes, and of course, special flora and fauna taxa. It is in the Two-Hearted River watershed (Heminway country) that flows to the Tahquamenon Falls, and the streams are known for superb fishing." So it looks like Bill and Anne are set for life with fireplace wood and plenty of fish fillets, but what does one do with string bogs?

They had a big shindig when they dedicated the Benninghoff Tract on 7-8 October 1990. A wetland biologist, Richard Futyma, talked on "The Last 10,000 Years or The Postglacial History of the Eastern Upper Peninsula" (Ed. Now which one was it?); Barbara Madsen informed all on "String Bogs or Patterned Peatland Development in Upper Michigan"; Fred Rydholm, an historical conservationist spoke on the history of the Upper Peninsula; as well as the perfunctory talks associated with the actual dedication. Bill was even allowed to say something, "Response!"

If you want to walk on Benninghoff, all you have to do is find T48N, R10W, McMillan Twp., Luce County, in Upper Michigan. We would like to love Benninghoff, as he is a good guy, but every time we have asked him to give a Memorial Lecture he just says, "This is not the time. I'll have something to present in a couple of years." Bill, if you don't come up with a Memorial Lecture SOON, we are going to find your Tract, and you know what we are going to do on it.. In the meantime, congratulations on an honor well deserved!

**WITH BYRD AT THE BOTTOM OF THE WORLD** (Norman D. Vaughan with Cecil B. Murphey). This book was published in September by Stackpole Books, P.O. Box 1831, Harrisburg, PA 17105 (tel. 1-800-READ-NOW), and is without a doubt the last book ever to be published by a member of the 1928-30 Byrd Antarctic Expedition. As Norman has pointed out, Byrd's one-year ban on members of the ice party authoring a book has now expired, so now, sixty years later, Norman tells his remembrances of what happened on that expedition! It is vintage Vaughan, like sitting down with him in some lounge and listening to his stories. Essentially the book consists of stories about himself, those he was associated with, and impressions of people. The bad news is that the book is not indexed, so you have to read the whole book to find out his thoughts about a particular person. The good news is the book is not long, only 196 pages!

It's an honest book, even to the point of telling how he goofed up four marriages. He got duped by Ike Schlossbach telling an enamored story about the second Byrd Antarctic Expedition which Norman, for some unknown reason, put into this book on the first expedition. Sort of like this column, Norman didn't want the truth to get in the way of an interesting story, so he stuck it in!

There haven't been many books written by members of the Byrd expeditions. Probably the best known are Larry Gould's COLD, Paul Siple's A BOY SCOUT WITH BYRD, followed by Art Owens' and Joe Hill's books. It is refreshing that Commander Byrd is pictured by Vaughan as a most kind and generous person, and also as a good camp leader.

The drinking problem referred to in a book on the first Byrd expedition published last spring was never mentioned in Norman's book as having existed. Norman was a young Harvard dropout who never drank, and he did write about his reluctance to join

a social club at Harvard because of its drinking initiation ritual. So if drinking really was a problem on the expedition, it would appear that Norman would have brought it up. Norman is not one to pull punches.

If you are an Antarctic historian, you probably would enjoy owning this book. It's not going to be a classic, but it's good, easy, interesting reading by one of the true characters of the Antarctic.

**THE EXPLORATIONS OF ANTARCTICA** (Professor G. E. Fogg and David Smith). This is a most unusual book because of the evocative paintings of David Smith which profusely illustrate the book. In addition, there are seven maps and 48 historic photographs and engravings. David Smith spent nearly a year painting in Antarctica, and Lord Shackleton says he is the finest recorder of that continent in this century. Well, we don't know if we are willing to go that far, as this fellow, Alan Campbell, is no slouch. But Smith's paintings are certainly interesting, and the Grytviken whaling station was particularly pleasing.

There is one universal problem associated with British and Aussie books on Antarctica, and that is you come away with the godawful feeling that not only does the continent belong to them, but the only good stuff done in Antarctica has been done by them. The overall tone of the book was set by Lord Shackleton in the introduction when he wrote, "The most important, and highly cost-effective, scientific work has undoubtedly been done in the seventh continent by the British Antarctic Survey." It's pretty hard some times to find a humble Antarctic Brit or Aussie, although there must be one somewhere, (Swithinbank does not really count as a Brit, as he is married to a Yank, and has spent so much time with Americans in Antarctica that he has a warped sense of national pride which is not in accordance with that of his fellow countrymen.)

Regardless of its nationalistic tones, the book is an excellent one, particularly for its coverage of the Antarctic Peninsula and the British Antarctic Survey bases. It should be a "must book" for all tour ships working the Antarctic Peninsula, as it contains much descriptive material and many interesting anecdotes on stops made by tour ships. There is a lot on the sub-Antarctic, too, especially South Georgia. And for the uninitiated, there is excellent coverage on the early exploration of Antarctica. This book would make an excellent gift. Even if the recipient is illiterate, he/she can still enjoy the beauty of Antarctica as captured by the strokes of David Smith. BUY! (Cassell Publishers, London, distributed in the states by Sterling Publishing Co., Inc., 387 Park Avenue, New York, NY 10016-8810). In the UK it is selling for 16 pounds-9 shillings, but what's money if it's not to buy books?

**J. MURRAY MITCHELL, JR., 1928-1990.** Our Memorial Lecturer in 1978, past member of the National Academy of Sciences' Polar Research Board, past member of the National Science Foundation's Division of Polar Program's Advisory Committee, past VIP who visited the Clean Air Facility at the South Pole, J. Murray Mitchell, Jr., died of lymphoma on 5 October in Georgetown University Hospital. Cancer was detected in Murray several years ago, but he never gave in, continuing his research on climate change while living at home. His only concession to his plight was selling a considerable spread of land which he had once bought in Boulder, Colorado, hoping that one day he and his family might live in the canyon where the land was. Instead he decided he wanted to remain in the Washington area close to his doctors. Besides, his wife, Pollyanne, was an easterner and Boulder never really appealed to her.

Alan Faller, a mutual friend of ours, wrote, "If you did not know Murray as a friend, you have missed a true friend; if you did not know Murray as a gentleman, you have missed a great experience of life; if you did not know Murray as a scientist, you have missed a thoughtful, careful, and important contributor to the study of climate change."

His master's thesis at MIT was concerned with long-term trends in the temperature at his beloved Blue Hill Observatory. This work foreshadowed many aspects of his later scientific effort from the establishment of "benchmark stations" for the study of long-term climate trends to a detailed heat-budget analysis of the energy sources and sinks in his McLean, Virginia home.

Once upon a time it was unpopular, if not unwise, to call one's self a climatologist. Yes, there were several "closet climatologists" among the meteorologists, but only Helmut Landsberg and Murray Mitchell wore the banner proudly. Murray joined the old Weather Bureau back in 1955 as a research meteorologist. From 1965 to 1974, he was a project scientist with the Climate Change project of ESSA (Environmental Science Services Administration). Then he became NOAA's (National Oceanic and Atmospheric Administration) Senior research climatologist, and was a science advisor to NOAA's Environmental Data Information Service before retiring in 1986. Murray was also a Visiting Scientist at NCAR (National Center for Atmospheric Research), and was an active member participating on the US-USSR Bilateral Agreement on environmental protection. His awards included the Commerce Department's Gold and Silver medals, and a 1980 NOAA Administrator Award. In retirement he became interested in climate on other planets and their correlations to climates here on earth. As great a scientist as Mitchell was, and he was great, it is as a true gentleman that he will be remembered by those of us who were fortunate enough to have known him.

**HENRY (HARRY) FRANCIS, 1930-1990**, (info provided by Steve Den Hartog and John Twiss). Harry Francis, who died of colon cancer while at home in Charlestown, New Hampshire on 7 October, was a Mountain Man who wore many hats during a rather illustrious career. One of those hats, naturally, was a polar balaclava, and he served as the late Bert Crary's deputy at Little America V in 1958. Following the IGY, he joined the Office of Polar Programs at the National Science Foundation, and was a special assistant to both Tom Jones and Bert Crary from 1960 to 1963, representing the Foundation in Antarctic policy discussions. In 1963 he moved onward and upward in the Foundation, serving in key high level positions in International Scientific Affairs, International Cooperation and Information Program, Division of Environmental Sciences, and National and International Programs. Remembering his halcyon days at Harvard, Harry left the Foundation in 1971 to go home, becoming the Assistant Secretary of Environmental Affairs in Massachusetts. Four years later he became Commissioner of the Metropolitan District Commission for Massachusetts.

Then his life improved even more, becoming Executive Director in 1976 of the Student Conservation Association. Later he became its president, and under his stewardship the Association prospered, providing thousands of young volunteers to various public and private organizations. By the late 1980's, more than 14,000 participants had been part of the Student Conservation Association programs, both here and abroad. In 1989 Harry formed Youth Opportunities Inc., an organization to aid high school dropouts in remedial education, job training, and placement.

Harry was born in Cambridge, Massachusetts, attended Hawkin School in Cleveland, graduated from Phillips Exeter Academy and from Harvard (1954), and also studied at the University of Grenoble when he could break himself away from climbing in the Alps. He led a Harvard Mountaineering Club expedition to the Hindu Kush in Pakistan, and climbed all the biggies in both North and South America. One could very well say that wherever Harry went, whatever he did, he scaled great heights as an overachiever. And it is most proper that Harry had his own mountain in Antarctica, a massive, ridgelike mountain, 2610 meters high, in the Admiralty Mountains. Harry is survived by his wife, Sharon, and his son, Christopher of Boston.

WE ARE HAVING PROBLEMS WITH THE POSTAL SERVICE DELIVERING OUR NEWSLETTERS WITHIN A MONTH. FOR YOUR INFORMATION, THIS ONE IS BEING MAILED ON 31 OCTOBER .... 1990!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 90-91

December

No. 3

**Presidents:**

Dr. Carl R. Eldund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Sayed Z. El-Sayed, 1990

## BRASH ICE

This is a Newsletter without a meeting announcement, because December is a lethal month to do anything in Washington. The few December meetings we have held bombed out in attendance.

The year is almost over, and we give thanks for that. It ended somewhat ingloriously when a tall, majestic spruce broke off ten feet above the ground and crashed onto the hood of my car parked beside my new garage in Maine. My advice to all is to check your insurance to make sure it covers acts of God like trees being hurled earthward. This innocent soul was not covered, and he cried all the way to the bank.

Another piece of hard-earned advice — when you drive an out-of-state car in the northeast, you are fair game for getting a speeding ticket. I have speeding tickets for driving a Maine car in Massachusetts, and another for a Massachusetts car in Maine. So, to play it safe, have a set of plates for each state you drive in.

And have you ever seen so darn many unmarked state troopers on the highways as there are now? Driving from Boston to Washington after Thanksgiving was like tiptoeing through a mine field during the war. But there is some good news — most of those people from Florida who were given licenses are now back down south. Floridians seem to take great delight at getting in the passing lane on the Jersey Turnpike and driving below the speed limit, not pulling over for love or money.

I'm already overflowing with that great Christmas spirit, and it's only November! I will be totally destructed by mid-December, a basket case by Christmas. If only Christmas could be declared a religious holiday one year, a love-thy-neighbor holiday the next year, and then a commercial holiday for merchants the third year, all could become somewhat tolerable ... maybe ... perhaps ... unlikely. Merry Christmas and Bah Humbug! Choose one!

- This Newsletter is being mailed on 3 December 1990 -

**75th NEWSLETTER OF SIPLE AND DALRYMPLE - THOUGHTS AND MEMORIES.** This is the 75th so-called, but misnamed, Newsletter of the team of Siple and Dalrymple, thrown together somewhat indiscriminately over the past thirteen years. We have published a total of 850 pages, and it is really time to turn this all over to someone young and charitable. But where is that person or team??

Some say we should bury the Newsletters; others say we should bind them. The old geology professor and Robert Falcon Scott lover, Bob Nichols, once offered a substantial contribution to bind them in a leather cover. Then John Twiss offered a couple of years ago to personally pay for binding a complete set. This week Peter Wilkniss suggested that we should get a set bound, but he never opened his wallet! We just drop these big names to show that we do have some supporters.

The fun part about writing the Newsletter is the total lack of censorship. Once Ruth used to gasp and say she couldn't type this or that paragraph, but she has apparently given up in recent years, or else the writer has mellowed. There is self-satisfaction in writing tongue-in-cheek material, where more is implied between the lines than is typed on the lines.

What do we do best? Hard to tell, although what we prefer to do is write humorously about Antarcticans and about things going on down south. We think we do a good job on reviewing new Antarctic books. We are especially happy with those who review books for us. In this issue we are particularly proud and happy to have a rather lengthy but more worthy review of an old masterpiece (The Worst Journey in the World) by another masterpiece, Mildred Crary. Be sure to read it. If you think Mildred is wordy, this is the abridged edition - the original is some sixty pages in length!

The most touching writing in the whole thirteen years was the fabulous story of the doctor who saved Jerry Huffman's life when his car caught on fire in a trial run at a West Virginia race track. It was a whole issue of a Newsletter, a fantastic story, and I thought there would be an outpouring of letters to Jerry from the story, but it resulted in hardly a trickle. I could not believe it. Here was a nice guy who was well liked in the Antarctic, who had served many PIs (Principal Investigators) well throughout the years. It was a classic example of "What have you done for me lately?"

The most tragic story during our thirteen years had to be the DC-10 crash on Mt. Erebus, and I think we did a fairly good job of covering it, as we had almost immediate access to the New Zealand papers on that one. The most timely piece was the Antarctic Treaty Act which we published in the last Newsletter a week before President Bush signed it into law!

It is always good to write about young people on the way up. Because of the late Paul Siple, we have followed the Scouts who have gone to Antarctica with a great deal of interest, even some of the Scouts who were runners, like Scott Miller, who is a very distinguished scientist at the famed Bishop Museum in Honolulu. The enthusiastic Louis Sugarman is a very special person, and we have enjoyed watching his life's progress since he returned from the ice. Scout Douglas Barnhart is a most unusual person who is so entwined with the benefit of mankind (personkind). And Scout Julie Hagelin at Pomona College has a most promising future ahead of her.

Anyway, we have walked down many a path over the past thirteen years. We feel enriched by those who have blessed our lives by their presence, particularly remembering the cluster of old Antarcticans from the Second Byrd Antarctic Expedition of 1933-35, who at their 50th reunion in Washington in 1983, gathered at Ruth's home after laying a wreath at the foot of the monument of the late Admiral Richard E. Byrd on the Avenue of Heroes at Arlington Cemetery, to tell stories and anecdotes about the old days. It doesn't get any better than that, fans, and we are so thankful that we have been a part of so much of it.

**MEMBERSHIPS AND DUES.** Our membership has more or less stabilized in the past year, with attrition and new members cancelling one another. As of now, we total 641 members, and 84% have renewed for this year. We are sending out a third and final notice to the ninety-nine delinquents, and that will be our last mass-begging for dues. One member last year jumped on us for welcoming those who wished to drop their memberships. That guy probably never spent a perfectly beautiful day stuffing envelopes for a large organization where there was no compensation. Don't knock anything until you have tried it! Fourteen members from last year have gone inactive, and we do appreciate their letting us know early and up front that they were dropping out, as it does help us. So, if you aren't renewing, please return the form with that box checked - it will help us out a lot.

**MANAGING WASTE AT MCMURDO** (Guy G. Guthridge). McMurdo's function as the logistics hub of the U.S. Antarctic Program is well-known. McMurdo also is the waste management hub.

Camps supported from McMurdo send their waste—all of it, including human waste—back to McMurdo for disposal or recycling. How many camps? This austral summer, 67 of America's 111 research projects in Antarctica are operating through McMurdo, and McMurdo handles their trash.

Handling of the waste at McMurdo is undergoing a minor revolution. A good bit of the activity you see is in fact devoted to that task: most obvious are the recycling bins. In the old days these were called trash cans. Now they are labeled and color-coded for glass, metal, plastic, recyclable paper, and—yes—plain old trash.

Then you see the hazardous waste yard, where a crew toils daily to identify drums of used lube oil and other chemicals, puts the old drums in new and slightly larger salvage drums (also called overpacks), and inventories them. Old batteries are handled here, too. In February, when the cargo ship comes (there's just one a year), the drums and batteries are carried down to the ice wharf and put aboard for the long trip to final disposal or reclamation in — where else? — California.

Marching up the hill from the hazardous waste yard, you come to the famous McMurdo dump. "Dump" is a word that the EPA says can mean "waste management facility," and that's what the McMurdo dump is. There's a big shiny pile of empty number-ten tin cans, another pile of ferrous metals, one of aluminum, one of cardboard, and, finally, the trash trash—unsorted materials, but none hazardous. As in the hazardous waste yard, all this stuff in the dump piles up over the course of the year until the ship comes in. Then the sorted materials are taken down to the wharf and sent back to the good old USA. Greenpeace is fond of taking pictures of the dump in December or January, just before the ship comes: then the dump is good and full and of course shows how we're "polluting" Antarctica.

The unrecyclable, non-hazardous trash at McMurdo's dump is what gets burned every six weeks or so. It consists mainly of cardboard, paper, and kitchen waste. The sorting and recycling program is going so well that the 3 November burn comprised a volume of about a third of what you would have seen in years past. But a lot of people would like the burning to be stopped altogether, so we have a team of garbologists from Argonne National Laboratory examining McMurdo's waste stream from cradle to grave. One possible result will be to bale the stuff that now is burned and either incinerate it at McMurdo or send it out of Antarctica.

**DEJA VU.** Charlie Bentley, who, we believe, is the first American since the late Paul Siple to spend parts of five consecutive decades in Antarctica, was talking to Peter Wilkniss recently about his need for explosives on the Ross Ice Shelf where Charlie is still trying to get it done right. Peter told Charlie not to worry, he

was going to send a D-8 tractor out there with a 20-ton sled carrying explosives. When old Charlie heard that, he really did start to worry, and he fairly yelled back to Peter, "Hey, man, we did that back in 1957 and the damn D-8 went into a crevasse. Put the explosives in a plane and fly them out." But the die had been cast, and the next today as the powers-that-be wonder how to get the explosives out of the crevasse and then retrieve the D-8. Fortunately no lives were lost, but the Antarctic has struck again!

**MALCOLM MELLOR NOT A SAINT ... YET.** In the last Newsletter we were all excited about a C-141 landing at Pegasus airstrip eight miles out from Hut Point. Well, they never got to fly the C-141 there, but they did land a ski-equipped Herc. Then they put the Herc onto wheels, and it sunk deeply into the snow. So there are a few bugs to be worked out. When in doubt, you are supposed to punt, but in this case Malcolm supposedly got into another plane and flew over to the Russian station at Molodezhnaya to see how they were doing it. The Russians evidently do it with ease, landing wheel aircraft on blue ice, but according to a U.S. transportation expert, the Russians can do it because their planes have much lower tire pressures than ours. Meanwhile, the Russians flew one of their geophysical research aircraft into McMurdo, and a half dozen Americans joined the twenty-three Russians aboard to make two long calibration flights, one of some ten hours into Marie Byrd Land, and the other of about five-hours duration. Herman Zimmerman of the Division of Polar Programs was one of the Americans aboard, and he expressed general satisfaction with the aircraft's performance. It wasn't exactly a new plane, but it could fly.

**ALL ABOARD FOR TAKEOFF.** As we go to press, battle lines are drawn up at the Antarctic Treaty Consultative Meetings in Chile, but when they conclude, Peter Wilkniss is going to take fifteen of the Heads of Delegations to Palmer Station for a three-day visit in mid-December. They will fly to King George Island on a C-109, where the EREBUS will pick them up and carry them on to Palmer. Incidentally, the Chileans wrecked a C-130 this austral summer on the gravel airstrip on King George. Wouldn't you like to own a concession stand in Antarctica that dealt with C-130s, both new ones and rebuilt? You'd make a fortune in no time at all. Guy Guthridge, our illustrious new president, told the Society at its 27 November meeting that there were aircrafts from five different nations on the airstrip at McMurdo in mid-November. There is a relatively large scientific program working out of the old Beardmore Camp, which is totally supported by a couple of New Zealand helos. There are seven principal investigators, so presumably there must be seven different satellite field camps. David Elliot is the chief scientist. We strongly feel that all personnel who work in the Trans-Antarctic Mountains should forfeit their salaries while working in such majestic scenery. Do we hear a second? So moved.

**YOU AIN'T SEEN NOTHING YET.** Filmmaker John Weiley and three cameramen, an audio technician, and a safety specialist are in Antarctica right now filming the greatest Antarctic film ever to be produced. It's going to be a 38-minute, \$3.5 million Omnimax film which will be shown around the world in 75 giant-screen theaters, starting this fall. The film title - what else? - "Antarctica." Because of the giant size of the screen (76-foot diameter), Weiley was quoted "because it's 10 times bigger than an average movie, you're getting as much shoved into your eyes as if you were watching a 380-minute movie." We don't exactly understand that, but this fellow Weiley is an Australian, and they sort of live in their own dream world, so perhaps size does translate into time when you've had enough beers. So right now they are hauling around a 100-pound, 70-millimeter camera shooting the ultimate in Antarctic movies. This should be fantastic.

**GLACIER STATUS** (Capt. Brian Shoemaker). In November 1988 the Congress of the United States awarded the USCGC GLACIER to the State of Oregon. The intent of the Congress was that it be turned over to the HERO Foundation and that the foundation was to preserve it as a National Icebreaker Memorial dedicated to the thousands of scientists, officers and enlisted personnel that have served on all U.S. icebreakers in the Arctic and Antarctic and to eulogize all of the ships that were used to map the coastline and seas surrounding Antarctica. Things were on track for two years in this respect, but today the ship is in jeopardy of being sunk for Navy target practice as was reported in the last issue of the Antarctic Society Newsletter.

Of all the U.S. icebreakers that have sailed to Antarctica since the 1930s only GLACIER and NORTHWIND are left. NORTHWIND, destined for the city of Biloxi, Mississippi, is to be sunk for a reef to attract fish. GLACIER is in limbo because the state of Oregon, in an about-face, refuses to accept the vessel, citing it as a liability due to contaminants aboard. We have argued this point; however, the State still refuses to accept the vessel and has been actively campaigning to have the Coast Guard turn the ship over to the Navy to use as a target vessel.

The battle with the State has been ongoing for about a year and is stalemated. We have jointly asked the Coast Guard to delay transfer to the Navy and have established a Joint Glacier Board with the State to recommend the disposition of the vessel. The State has said that the decision of the joint board is not binding and the HERO Foundation anticipates that after the board reports, the State will once again pursue a course to have the ship sunk as a missile target. The Joint Glacier Board could, however, recommend that the ship be preserved in lieu of sinking it with missiles, and that the National Park Service endorse the project as part of their National Maritime Initiative. This option would create a national initiative to save the GLACIER, but would leave its final resting place open for question. Although the HERO Foundation has worked long and hard to bring GLACIER to Reedsport, it would support this initiative. The goal is to SAVE GLACIER, and then determine her final berthing.

To this end we need the help of all Antarcticans. Please write your Congressman, Senators and the Secretary of the Interior, Manuel Lujan. Ask that the ship be preserved under Sec 106 of the National Historic Preservation Act of 1966. Inform them of the intent of Congress under Public Law 100-629 of 7th of November 1988 that directs the Secretary of Transportation to transfer the GLACIER to the State of Oregon to be converted into a national maritime museum. The intent today is as succinct as it was in 1988 - SAVE GLACIER as part of our national heritage of polar exploration. Destroy GLACIER and we destroy an important link to our past.

The HERO Foundation is most appreciative of your support for this most important project, but advises that this is only the beginning of a number of crusades which we will have to face in the not-too-distant future if we are to preserve our Antarctic Heritage. There are planes to be saved, equipment to be salvaged, records to be preserved, money to be raised, etc. We cannot do it by ourselves - we old Antarcticans must be proactive on these issues in order to preserve our past, and to inspire our nation to continue to scientifically explore Antarctica in the future.

**THE WORST JOURNEY IN THE WORLD, ANTARCTIC, 1910-1913**, by Apsley Cherry-Garrard (New York: Carroll & Graf Publishers, Inc., 1989) (Review by Mildred Rodgers Crary). With hard-cover editions of this classic book out of print, the availability of a quality soft-cover edition for \$13.95 should be welcomed by readers whose curiosity has been stirred by the recent controversy over Robert Falcon Scott's explorations. Sober criticism of Scott by historians like the late L.B. Quartermain, for many years president of the New Zealand Antarctic Society, and the impassioned but scholarly analysis by Roland Huntford have allowed readers to see behind the hero's mask; but

Dennis Drabelle, in *The Washington Post*, and others have dismissed the real-life Scott that Quarter-main and Huntford presented to us and have preferred to cling to the illusory heroic image, regardless of the facts.

Why does Scott live on as a hero when we now know so many disillusioning things about him? Because of Cherry-Garrard's magnificent book, more than any other reason: it is "one of the great works of literature to issue from Polar exploration" (Huntford); "one of the classics of polar travel... one of the great travel-books of all time" (Quartermain); "as descriptive narrative... without a doubt a literary achievement that will always stand high in the annals of exploration..." (Seaver). The book is not only a travel book but a creative work, complete with plot, hero (or heroes), heroic deeds and actions – in short, what is now called a non-fiction novel – but not a history book.

In his account of the DISCOVERY expedition Scott himself began – in what Huntford calls "a sustained reworking of reality" – the process of "prettifying" his own image by careful deletions and rewriting. Kathleen Scott continued the censorship "with the connivance of Sir Clements Markham, and Reginald Smith, the publisher...." Huntford goes on, "For publication [of Scott's Last Expedition], his diaries were purged of all passages detracting from a perfect image; particularly those revealing bitterness over Amundsen, criticism of his companions and, above all, signs of incompetence. ..."

At the time Cherry-Garrard began writing his masterpiece, England hungered for a hero. The circumstances of the deaths of the five men of the Pole party inspired their countrymen to view the episode as romantic, heroic tragedy notwithstanding Scott's loss of the race to Amundsen. Cherry-Garrard was commissioned to write the Official Narrative and had access to expedition documents as well as some diaries. But the limits of this commission threatened his personal view (i.e., the facts interfered with the fiction), and so he took the book over as his own and, in 1923, published it himself.

With the help of George Bernard Shaw, his neighbor and close friend, he wrote a heroic work of fiction. Of his closest neighbors, the Shaws, Cherry-Garrard said, "they taught me to write." The rumor persists among Antarcticans that a manuscript in Shaw's handwriting exists. I am indebted to Paul Dalrymple for a copy of a handwritten letter by Shaw that clearly establishes his assistance but modestly downplays its importance.

How could the firsthand knowledge, information, and material available to Cherry-Garrard be shaped into a convincing story of heroism? Cherry-Garrard did not merely assemble diary notes and historic data; he used literary means to create the story. He attributed heroic – and only heroic – qualities to his hero, placed him in difficult situations and exaggerated the difficulties he faced, depicted heroic actions to overcome these difficulties, surrounded him with heroic companions and supporters, avoided or suppressed negative aspects of the hero and the story, and attributed unworthy motivations or villainy to potential competitive heroes, such as Amundsen and Shackleton.

Cherry-Garrard began with the brilliant sentence, "Scott used to say that the worst part of an expedition was over when the preparation was finished," He did not say "Captain Robert Falcon Scott"; he did not in any way identify Scott; he did not use the sentence to define Scott's role but instead made it invoke Scott's authority. With absolute assurance, he assumed Scott's name was universally known and thus required no introduction. This rhetorical device raised Scott to the hero level; the information ostensibly conveyed (what was said about an expedition) was actually of minor significance in comparison with the subject, Scott. The sentence's position at the first of the book gave it importance far exceeding that of a similar sentence

buried somewhere in the text. By means of many such subtle literary devices he re-inforced this initial assumption.

Cherry-Garrard's hero encountered well-nigh insuperable difficulties, never seen before or since. Not only were Scott's difficulties exceptional; they were supernatural — "bad luck," an "unknown factor" which went beyond considerations of weather, weakness, shortages of supplies. Scott's party faced the horrors of the pack ice and killer whales, the cold, the ferocious blizzards and disastrous thaws. Yet Amundsen crossed the same ice shelf and went up a wholly uncharted glacier at almost the same time; and Shackleton, earlier on the same route taken by Scott, came within 100 miles of the Pole and turned back, losing not a single man. If Shackleton had been as foolhardy as Scott, he might have reached the Pole, died on the way back, and earned unequivocally the honor of being the first at the Pole, leaving flags for Amundsen — in that case, second at the Pole — to find. And as a dead hero, he would also have gained the tragic hero status that Scott later attained.

Cherry-Garrard surrounded the hero with heroic companions. Bowers and Wilson receive the highest praise; even Gates is elevated to heroic status by Scott's description of his death in the final notes though Gates's mother accused Scott of being her son's murderer. Cherry-Garrard not only suppressed the negative aspects but in many places directly turned Scott's faults into virtues. To exalt Scott, Gerry-Garrard resorted to denigrating, both explicitly and by implication, the accomplishments of other explorers, especially those who led expeditions in competition for the South Pole; he furthered Scott's claim for glory with inglorious references to Amundsen and Shackleton. There is no mistaking the deprecatory intent of his choice of words in the midst of a passage ostensibly doing "full justice to Amundsen": "feint," "the secret of Amundsen's slick success," "Quite commonplace choice [use of skis and dogs]," "very ease of the exploit," "single business of getting to the Pole and back...." Shackleton, then holder of the "Furthest South" record, also aroused Scott's competitive feeling; Scott measured his progress against Shackleton's. Cherry-Garrard turned these comparisons to Scott's advantage: "We did not go quite so close to the land as Shackleton did, and therefore, as had been the case with us all the way up the glacier, found less difficulties than he met with. Scott is quite wonderful in his selections of route...."

Sheer reiteration of praise of Scott wears down even a skeptical reader's resistance until, after the loss of the Pole party, he reads, "the Empire — almost the civilized world — [was] in mourning... Scott's reputation is not founded upon the conquest of the South Pole. He came to a new continent, found out how to travel there, and gave knowledge of it to the world: he discovered the Antarctic, and founded a school. He is the last of the great geographical explorers...." These exaggerated — even untrue — claims, coming at the end of the book, slipped from Cherry-Garrard's pen with a fluency and ease bearing no relationship to the facts; in his mind Scott had become the fictional hero that he had created.

"Then Atkinson read the lesson from the Burial Service from Corinthians. Perhaps it has never been read in a more magnificent cathedral and under more impressive circumstances — for it is a grave which kings must envy...." A lyrical passage, no longer realistic but heavily literary, follows: "I do not know how long we were there, but when all was finished, and the chapter of Corinthians had been read, it was midnight of some day. The sun was dipping low above the Pole, the Barrier was almost in shadow. And the sky was blazing — sheets and sheets of iridescent clouds. The cairn and Cross stood dark against a glory of burnished gold...." Cherry-Garrard recorded it all in his diary and knew well what day it was, but "I do not know how long we were there" and "midnight of some day" take the moment into timelessness. Then, in much more than simple description, his language soared as he evoked the sun dipping low above the Pole of Scott's obsession and, against a blazing, iri-

descent sky of burnished gold, the cairn marking the tent-tomb and the Cross marking the godlike hero's sacrifice. Cherry-Garrard imbued the scene with symbolic meaning far transcending the literal words of a mere historic account. Knowing what we now know about Scott, we read the book for its literary, rather than factual, value.

**EMBARRASSING ERRATA.** Many copies of our last Newsletter went out with a grave mistake relative to the title of a book being reviewed by this writer. The correct title of the fine book by Tony Fogg and David Smith is *The Explorations of Antarctica, The Last Unspoiled Continent*. Some of you have Newsletters with *Exploitations* instead of *Explorations*, so please make the change if you keep these Newsletters. Our humble apologies to the authors and the publisher!

**CALL FOR HELP ON THE HERO** (Capt. Brian Shoemaker). The HERO Foundation has a grant from the Goettel Trust to equip the R.V. HERO as an educational display for school groups to tour. The ship is in very good shape, having received a new coat of paint topside and throughout most of the interior this past summer. There is a new pier for the vessel, and sewer and water have been attached to the ship by the city of Reedsport. We have a small cadre of local Antarctic enthusiasts trained to handle tour groups and demonstrate equipment. Most who visit are impressed with their 'Antarctic Experience'.

To accommodate the student groups, we have teamed up with the Children's Television Workshop which has provided us with their five-part TV series on Antarctica and their workbooks that complement the TV program. These are distributed to each school before their visit to the R.V. HERO so that the children are well schooled on Antarctic affairs by the time they visit the ship. Aboard the HERO we reinforce what the kids have already learned and give them a hands-on experience of what it's like to conduct research aboard a scientific vessel.

The tours, thus far, have gone extremely well, and we have high hopes of being able to provide the weeklong TV series to all schools in Oregon together with a visit to HERO.

However, we do need some help from some old HERO scientists and sailors. We need to equip the labs on the ship with scientific displays that are genuine - we have some, but they are not very representative of what took place on the ship while it was in service. If any of you old HERO scientists have any old specimens of plankton, krill, penguins, seals, etc. that are gathering dust, we could sure use them. We also need action photographs of people conducting science in the labs, operating the trawls, fishing, working with seals, etc. We are also open to suggestions.

Please write HERO Foundation, Box 73, Reedsport, OR 97467, or call (503)271-2605/4704.

**VETERAN ANTARCTICAN SUCCUMBS AND GETS MARRIED.** Ken Moulton, who holds the not-so-dubious honor of having gone to Antarctica in more different years than any other American in history, finally married Mary Ann Messier. The event was in keeping with Ken's profile, being very low-key, honorable, and most official. Mary Ann, originally from Olympia, Washington, works at the National Science Foundation, and promised in her vows that she would never disturb Ken when he is watching his beloved Red Sox on the tube. Ken made even a greater sacrifice when he vowed not to be obnoxious during the Christmas season. Right now the bridegroom is recovering from a hernia operation, and looking forward to another season of senior league softball next year. With his gimpy knees, he is the Bill Buckner of an Annandale, Virginia team. Congratulations, you two! Ken and Mary Ann are living at 4419 Chase Park Court, Annandale, VA 22003.

*IF YOU ARE MOVING, PLEASE SEND US YOUR NEW ADDRESS. BULK MAIL IS NOT FORWARDED OR RETURNED TO US. THANK YOU!*

Dr. Richard B. Alley  
Earth System Science Center  
The Pennsylvania State University  
University Park, Pennsylvania

on

*Monday evening, 11 March 1991*

*8 PM*

National Science Foundation  
1800 G Street, N.W.

Room 540

Dr. Richard B. Alley, glaciologist, 33 years young, is a trusted member of the National Science Foundation Division of Polar Programs' Advisory Committee for Polar Programs. This committee will be meeting in early March, and Dr. Alley has graciously consented to tell us at that time what is going to happen to 1600 Pennsylvania Avenue when push comes to shove with the Antarctic Ice Sheet. Dr. Alley was quoted in The Washington Post, 3 February, as saying, "I believe the greenhouse is coming, and I believe it is going to be a serious problem ... By the time we can with confidence say it is here, it will be too late."

Dr. Alley studied under Ian Whillans at The Ohio State University, and Charlie Bentley at The University of Wisconsin, neither of whom were successful in diverting Richard to a field of exact science. His research focuses on ice-sheet stability, glacial deposits, and the physical properties of ice cores. Dr. Alley is currently active in the Greenland Ice Sheet Project II deep coring, and in the Siple Coast Project in Antarctica. Come to the greenhouse!!

**First Day Issue Antarctic Treaty Airmail Stamp - 21 June 1991  
Washington, DC**

You folks are getting a temporary respite from my manual Underwood this month. We had a meeting in late January when R. Tucker Scully of the State Department presented what transpired at the recent Special Consultative Meeting in Vina del Mar, Chile. He broke the Society's attendance record for a non-Memorial Lecture with ninety people. Because of the universal interest in the meeting in Chile, we are presenting his entire lecture for your edification. Incidentally, Tucker's presentation was our Society's 150th lecture. Starting with Ambassador Paul Daniels' lecture October 2, 1963 on "Antarctic Treaty" we have had fifteen lectures on or about the Treaty. Since 1982, we have had eight - Rutherford, Swithinbank, Scully, Chapman, Barnes, Kimball, Manheim, and Scully again. Enjoy!

Preamble to R. Tucker Scully's presentation to the Antarctic Society on  
31 January 1991

The Eleventh Antarctic Treaty Special Consultative Meeting (SCM XI) took place 19 November to 6 December, 1990 in Vina del Mar, Chile. Delegations participated from the twenty-six Antarctic Treaty Consultative Parties (ATCPs): Argentina, Australia, Belgium, Brazil, Chile, China, Ecuador, Finland, France, Germany, India, Italy, Japan, the Netherlands, New Zealand, Norway, Peru, Poland, the Republic of Korea, South Africa, Spain, Sweden, the U.S.S.R., the U.K., the U.S.A., and Uruguay.

Ten of the thirteen other (non-Consultative) Parties to the Antarctic Treaty also participated - Austria, Canada, Colombia, Czechoslovakia, Denmark, Greece, Hungary, the People's Democratic Republic of Korea, Romania and Switzerland - along with observers from the following international organizations: the Commission for the Conservation of Antarctic Marine Living Resources (CCAMLR); the Scientific Committee on Antarctic Research (SCAR); the Commission of the European Communities (EC); the Intergovernmental Oceanographic Commission; the International Union for the Conservation of Nature and Natural Resources (IUCN); and the Antarctic and Southern Ocean Coalition (ASOC).

PROTECTING ANTARCTICA: PROGRESS IN CHILE

by

R. Tucker Scully

Director, Office of Ocean Affairs  
Department of State

I will try tonight to discuss the most recent meeting in the quickening pace of international negotiations within the Antarctic Treaty system. The Vina del Mai meeting was the 11th of the special Antarctic Treaty consultant agreements. Pursuant to the Antarctic Treaty, there are regular meetings of the consulting parties that have taken place over the 30-odd years of the Treaty's history on a biannual basis, approximately every two years.

In addition, when the Treaty parties have identified particular issues of concern or particular issues that require some sort of priority attention, they have frequently resorted to the technique of a special meeting, to create a negotiating forum devoted to a particular set of issues. This is the case in the meeting that took place recently in Vina del Mar, Chile. It is the 11th of the special consultative meetings. There have also been 15 of the regular meetings. So that over the 30 years, if one looks at the average, there has been a meeting almost every year – a negotiating session almost every year on the average – since the Treaty entered into force in 1961.

The precursor to the meeting that took place in Vina del Mar was the Fifteenth Antarctic Treaty Consultative Meeting in Paris in October of 1989. That meeting saw the coalescence of a wide variety of strands of concern regarding the Antarctic environment. The meeting in Paris – which itself was an extremely productive meeting – focused its attention on the environmental needs, the needs for environmental management in Antarctica. It adopted a number of very significant measures aimed at ensuring that human activities in Antarctica do not cause adverse impacts.

Building upon the wide range of measures and recommendations to protect the Antarctic environment, the feeling that emerged from the Paris meeting in October of 1989 was that it was time for the Treaty parties to take an overall look at how best to achieve integrated measures to ensure across-the-board that human activities did not pose unreasonable risk to the Antarctic environment.

Therefore, a major item for discussion at the Paris meeting was one entitled "The Comprehensive Protection of the Antarctic Environment." And though significant steps were taken in that direction in Paris, it was agreed that a special meeting should be held, one of the special consultative meetings to create a specific negotiating forum to address those subjects.

Obviously one of the issues that was a primary motivation in seeking the development of such a forum was the differences that emerged among the Antarctic Treaty consultative parties over the Antarctic minerals convention, an agreement that had been negotiated the year previous, in 1988, and concluded by consensus. But following its conclusion, which had become the subject of controversy, several nations which had originally participated in its adoption reversed their views and chose to seek an alternative to the convention, to seek a ban on mineral activities in Antarctica instead of pursuing the convention which was a mechanism for deciding whether or not mineral resource activity should ever take place. So the issues for the meeting in Vina del Mar were, in a formal sense, comprehensive measures for the protection of the environment. They also involved, obviously because of the emphasis placed upon the question of minerals, discussions on the future fate of the Antarctic minerals convention. And, in fact, a number of the proposals put on the table for discussion in Vina del Mar did address that subject.

So it was against that background that the meeting, lasting approximately three weeks took place in Chile. To be more specific about the terms of reference, the meeting in Paris which set the terms of reference, and, in effect, set a rough agenda for the Vina del Mar meeting, called for an objective for the Treaty parties, which was described as the further elaboration of a comprehensive system of protection of the Antarctic environment.

Now the term "further elaboration" was used to make the point that there already is a large body of environmental regulations which had evolved and been elaborated within the Treaty system. The recommendation looked not only to the elaboration, but also to the maintenance and implementation of such a comprehensive system, drawing attention to two of the needs that were perceived at the time of the Paris meeting, and then items that were identified for important work in Chile.

With respect to implementation, one of the primary questions that has been raised about the Antarctic Treaty is the degree and the effectiveness with which it is being enforced, which compliance is being achieved with regard to these measures, and the consistency with which governments who have committed themselves to these measures carry them out.

And secondly, the question of maintenance raised, and was essentially a symbol for, the question of whether or not it was time for the Antarctic Treaty consultative system to develop more formal machinery. And specifically, whether it was time for the system to develop a secretariat which would provide a full-time institution, a full-time mechanism for providing for the needs, and providing for the information that the Treaty mechanism, in its annual meetings, generated.

So the terms of reference for the meeting in Chile identified a number of issues that would be set forth in the program of work that was also elaborated for the meeting. Specifically, the terms of reference for the Vina del Mar meeting identified three areas of emphasis: first, the need to develop further principles for environmental protection, based upon those principles which had already been articulated within the Antarctic Treaty system; second, to initiate and carry out a review of those existing environmental protection measures that were already on the books, with a view to identifying where such mechanisms should be strengthened, where such measure should be clarified, in terms of the nature of the legal obligation, and then, how to ensure more effective compliance with such regulations and measures; and third, the need for new institutional and legal arrangements to ensure the maintenance, integration, consistency and comprehensiveness of the system of Antarctic environmental protection.

A number of specific proposals, aimed at comprehensive protection by Treaty parties were articulated. Prior to the meeting, there was a draft for the comprehensive protection of the Antarctic environment, sponsored jointly by Australia, France, Belgium, and Italy. That four-power draft convention included provisions dealing with Antarctic mineral resources and called for a permanent ban on Antarctic mineral resource activity which France and Australia, particularly, have advocated.

Secondly, there was a draft protocol to the Antarctic Treaty dealing with comprehensive measures for environmental protection submitted by the government of New Zealand. That proposal also included, as did the four-power convention, the proposed prohibition on mineral resource activities, a proposed permanent ban on such activities as an alternative to the Antarctic minerals convention.

Finally, there was an outline of a draft protocol submitted jointly by the United States, Argentina, Norway, the United Kingdom, and Uruguay. That draft protocol to the Treaty was a document that included institutional provisions and principles, and then foresaw, as annexes or appendices to the text, the specific sectoral, specific sets of measures to deal with environmental protection with respect to particular kinds of activities - marine pollution, waste disposal, the environmental impact assessment procedures and the question of agreed measures for the conservation of flora and fauna.

So there were, circulated among the Treaty parties prior to the convening of the meeting in Vina del Mar, three formal proposals: one in fairly exact Treaty language tabled by New Zealand; the draft convention, tabled by the four-powers, led by Australia, was labelled an indicative draft; and then an outline, which indicated the types of provisions that would be suggested, but not in Treaty language, by the five-powers: U.S., U.K., Argentina, Norway, and Uruguay.

At the beginning of the meeting itself, three additional proposals were put on the table. Two were the Treaty texts, based upon the outline submitted by the five-power. One of those was the United States' text. The United States decided to take the

outline, which we were cosponsoring, and convert it into an actual, formal proposal, in Treaty language. That was tabled at the opening of the meeting.

U.K., one of our cosponsors, did the same thing. And the government of India put forward a proposal on comprehensive measures in the form of a suggested series of components, in outline form.

Now, let me try to describe briefly, as a lead-in to what the results of the meeting were, the differences and the issues that emerged with regard to these various proposals. As I have mentioned, there was a very significant difference in the approach with regard to what has become one of the more visible issues relating to Antarctica of late, Antarctic mineral resources.

The convention tabled by the four powers, Australia, France, Belgium, and Italy, called for a permanent ban on mineral resource activities, and therefore, was premised on the replacement of the Antarctic minerals convention. The same was true for the protocol drafted by New Zealand. The five-power proposals, including the specific texts that were developed on the basis of that, did not address mineral resource activities, and thus rested on the premise that the Antarctic minerals convention was the appropriate legal instrument to deal with the question of whether or not mineral resource activities in Antarctica should ever take place.

So the issue of minerals, then, was one of the major differences between the drafts, and indicated one of the issues that was under particular discussion at the meeting in Vina.

There were, however, a number of other very significant divergences in approach between the texts that were submitted. One was in the form of the proposals themselves. The four-power proposal, as a separate convention, implied that a separate, legal framework was required to deal with environmental protection in Antarctica.

The proposal submitted by New Zealand, a draft protocol to the Antarctic Treaty, and by the five powers, including the United States – again, on protocol to the Antarctic Treaty – rested on the premise that the Antarctic Treaty mechanism itself, offers not only a necessary, but a desirable basis for achieving environmental regulation in Antarctica, a mechanism which can be improved. And there are certain steps, i.e., for example, the establishment of a secretariat that should be taken to improve the operation of the Antarctic Treaty mechanism. So there was that difference, in that there was a separate convention proposal, and then there were proposals for a protocol supplementing the Antarctic Treaty.

With respect to specific differences between the texts that were put forward, I would cite two primary differences: the first is that the convention approach, taken by the four powers, called for the application of a set of decision-making procedures, collective decision-making procedures at the end of the day for all activities in Antarctica. Those provisions, therefore, would, in fact, have meant, taken to their logical conclusion, that scientific research activities in Antarctica could have been subject to some form of collective decision-making.

The approach taken in the proposals put forward by the five powers, and largely reflected in the text put forward by New Zealand, was that the decision-making competence of the parties should not extend to the prior authorization of scientific research activities; that the freedom of scientific research, guaranteed under the Antarctic Treaty, should not be affected by new agreements. While measures needed to be applied to ensure that proper regulations were applied to science – and in particular, logistic support activities – there was quite a difference in approach between the convention approach on the one side, and the protocol approaches on the other, in that the protocol approaches did not foresee the application of prior authorization to science.

The second major difference between the two approaches (where the differences were between the convention approach and the various protocol approaches) was the question of institutions, and what sort of new institutional evolution should be reflected within the Antarctic Treaty system to perfect its ability to deal with environmental protection.

Now, the convention approach called for a number of new institutions. There were common elements with regard to the need for a secretariat, there were also common elements with regard to the need for some sort of advisory body on environmental matters. These common elements existed in all the drafts.

The convention approach suggested by the four powers called for a standing committee on the protection of the Antarctic environment, which would, in fact, be a new institution with decision-making powers, that would be additional to the regular consultative meetings (which is the mechanism called for in the Antarctic Treaty), perhaps meeting more frequently, and, if necessary, operate on a more full-time basis than the biannual set of meetings that have taken place under the Treaty mechanism.

On the other hand, the proposals put forward by the proponents of a protocol supplementing the Treaty, called for the Antarctic Treaty mechanism, the regular consultative meetings, to remain the sole decision-making mechanism within the Antarctic Treaty system, and called for the consultative meetings to take place on a more regular basis, specifically to take place on an annual, rather than a biannual basis.

So, there were significant differences in approach between the proposals that were put on the table. It was clear from the outset that there were quite a number of common elements, and quite a number of common objectives, but there were very significant differences on how to get there.

I should mention one other element, because it relates to the way in which the work was organized, and to the work product of the meeting. There were different approaches to the protocols themselves. The five-power approach, the U.S., U.K., et cetera, called for a protocol with specific annexes, and those annexes would include the mandatory measures that would apply the human activities in Antarctica to achieve environmental protection. That approach was premised on the basis that the question of achieving comprehensive measures, the question of achieving a comprehensive system for environmental protection was, in fact, an ongoing process. It was not an activity that one could ever say that at any given point in time was completed.

It reflected the fact that one started with a wide and broad body of measures which needed an effective system for continual updating, continual assessment of effectiveness, et cetera, and therefore, a system of annexes. The binding, legally-mandatory measures which could be updated and assessed on a rapid basis, would be the most effective approach in terms of achieving the objectives of the Vina meeting.

The New Zealand approach, on the other hand, called for the inclusion of all of the measures in the text of the protocol itself. The New Zealand approach was one which looked toward the rapid updating of measures; and in some ways, the range of measures that was included in the New Zealand protocol was broader than that which was included in the proposals made by others. But the New Zealand proposal did suffer the difficulty of a series of practical, and in some cases, legal problems with respect to how government would implement such an agreement. It was more difficult to rapidly bring up-to-date a mechanism which requires the amendment of the Treaty, and an amendment of the agreement itself.

So there were substantive differences that were minerals; there were substantive differences that were environmental protection measures; there were differences in the forms of the proponents; and participants in Vina del Mar would have incorporated these measures.

On the other hand, I think there was quite a significant convergence in view, quite a convergence in the objective of seeking to ensure that the Antarctic Treaty system and mechanism were updated, and improved as a mechanism for dealing with the increased scale and kind of human activities in the area south of 60 degrees south latitude.

Now, the organization of work – and I'll touch only briefly on this – at the meeting involved a threefold division of labor. Two formal working groups were created: the first, chaired by Dietrich Granow, head of the German delegation, looked at the legal agreements, the specific proposals that were put forward, in terms of their basic provisions – the environmental principles they included, institutional arrangements, any provisions relating to decision-making, questions relating to compliance and enforcement, questions relating to dispute settlement, how disputes over the observance of provisions might be dealt with, and questions relating to the issues of, at least in some instances, liability or responsibility for damages that might be caused as a result of activities in Antarctica.

A second working group, chaired by Robert Puceiro of Uruguay, dealt with the review of specific measures that had been called for, in terms of reference, in the previous meeting in Paris. That group essentially dealt with the annexes that were proposed by the United States and others, and the equivalent provisions that were included in the New Zealand text.

That working group considered four specific proposals: 1) measures to deal with marine pollution, based in large part on measures that had been adopted at the Paris meeting; 2) measures in waste disposal, how to handle wastes generated within Antarctica, again based on a number of important steps that had been taken at the meeting in Paris; 3) how to deal with the question of environmental impact assessment, which has become one of the important procedural devices for ensuring that activities, or those making decisions about scientific and non-scientific activities in Antarctica examine the potential consequences of those activities before decisions are made about them, building upon Environmental Impact Statement (EIS) procedures, and 4) the question of measures to protect fauna and flora.

The Antarctic Treaty parties developed a very far-reaching set of provisions back in the mid-1960's to deal with habitat protection, to identify protected species, to ensure that the scientific and other activities that were taking place at that time did not result in unwarranted and unacceptable impact upon the critters and their habitats in Antarctica. Because of the nature of activity, changes in the nature of activities, the scale of activities, there was perceived a need to significantly update and revise what are known as the agreed measures for the conservation of Antarctic fauna and flora. So the fourth major area dealt with specific measures to improve and deal with measures to protect fauna and flora.

So there were two working groups: the first on the actual proposed new agreements; the second on the measures, but concentrating on the kinds of things that were suggested for inclusion in annexes. The third component in this division of labor was informal discussions which were episodic, over dinners and things of that sort, of Antarctic minerals and how the consensus that had existed among Antarctic Treaty parties in 1988 over the question of minerals might be restored. And this was a much less structured and much less formal kind of discussion, but those discussions at the heads of delegation level took place during the course of the meeting as well.

I don't think I'll try to describe to-ing and fro-ing, or the specific nature of the discussions in the working groups. But let me return to the differences that I have mentioned with regard to the specific proposals.

As a result of the discussions, and in certain instances it took place suddenly, and in certain instances it took place by accretion during the course of the meeting, a number of elements of convergence began to arise, began to emerge during the

course of the meeting.

First, it was clear that there was a strong preference in terms of form, that a new agreement to deal with environmental protection in Antarctica be a protocol to the Antarctic Treaty, rather than a new, separate convention. The primary reason for that, in addition to the substantive differences, was that it was a very strong view that the Antarctic Treaty – with the accommodations that it contains on the issue of sovereignty, with the consensus decision-making system – has evolved and operated successfully, and with its provision on freedom of scientific research, should in no way be affected by a new, supplementary agreement. And therefore, a protocol was seen as a more appropriate way of not only achieving that, but also of achieving the commitment not to seek to be amending, not to seek to be undermining what has been probably one of the most successful international cooperative mechanisms that has existed in the post-WWII era. So, early on, a convergence of view toward a protocol emerged.

Second, there was a general view – and here I think it was not as clear a sentiment – that a protocol with annexes that could be rapidly updated would be the most effective means of achieving the objectives of an effective system, of an implementable system for environmental protection in Antarctica. So, a convergence of view began to emerge with regard to a protocol with annexes.

With respect to the other two issues that I have mentioned as being of particular concern, the question of decision-making, prior authorization – particularly with respect to science and to institutions – a convergence of view began to be hammered out in the discussions as well.

With respect to decision-making, it was recognized that there was a potential contradiction between subjecting scientific research or activities essential for scientific research, to prior authorization, to prior collective decision, and the freedom of scientific research provisions in the Treaty. This did not mean that science would be unregulated. It did not mean that there was not a strong commitment to ensure that activities related to science would be subject to strong controls.

But what I think it meant was that there was a fear, a widespread fear, that if one began to subject scientific research and science priorities to political decisions, one would create a situation which ran counter to the very success, to the very purposes of the Antarctic Treaty itself.

So there was, as I say, this strong view against that kind of a decision-making provision. And what emerged was a view – a preponderant view – that the elaboration and effective implementation of environmental impact assessment procedures would be a potential basis for consensus, and a basis upon which those who were concerned over or seeking some way of additional control over science-supported activities, could, in fact, reach agreement with those who were afraid that the Treaty could be undermined.

So what emerged was a general view that if one gave proper attention and proper commitment to the fact that activities that involved the possibility of significant impacts would be subject to environmental impact assessment procedures by those who were undertaking the activities – not only government science programs, but also tour operators and others active there – and that could be a basis for resolving the differences over decision-making.

With respect to institutions, I think there are two general problems. One is related to decision-making. There were difficulties with the idea of dividing decision-making authority between the consultative mechanism and subsidiary bodies, or in giving to advisory bodies, scientific bodies, political decision-making authority.

And on the other hand there was, particularly among some of the Latin American countries, a reservation over establishing costly and extensive new machinery. Those two strands I think came together with a view that what would be needed for the Treaty system at this stage would be a scientific advisory body. Let me qualify that, not a scientific advisory body, but an environmental advisory body, not duplicative of SCAR, but to provide advice on how to implement, how to assess the effects of environmental regulation, and a secretariat that would serve the information needs and the data support functions for an effective system of environmental protection. So there was a consensus towards these kinds of institutions, or a convergence towards these kinds of institutions.

Now that convergence, however, was impeded by the other issue that was being discussed in full, and remains impeded – the issue of Antarctic mineral resources. Those who were pushing for a permanent ban on Antarctic mineral resources, or those, in other words, who were seeking an alternative to the Antarctic Minerals Convention, pushed and sought very strongly – or called very strongly – for the inclusion in a new environmental protection and a written agreement of such a ban.

Those who did not take that view, of course, resisted. And that dispute, that difference, represented in many ways a greater gap than the gap that existed in terms of the measures and in terms of the new instrument that might be needed to deal with environmental protection.

The result of the meeting was, in this sense, one in which both sides – if that's the right word – both sides achieved a significant part of their position. Those who were pushing the protocol with annex approach achieved, largely in terms of the negotiating text that now exists, their objectives. Those who were pushing for a permanent ban on mineral resource activities, who at least wished to see that issue linked to the comprehensive measures agreement, achieved their objective in the sense that there was no consensus, there was no agreement at all of the mineral resource issue. There was acceptance of the premise that the issue should be resolved in the same time frame as resolving the issue of whether or not one needed a new protocol or a new convention to deal with environmental protection measures in Antarctica.

Now, the Antarctic Treaty has relied frequently in the past – because it operates by consensus – on a somewhat strange style of negotiations. Because it often appears that – and this is not, hopefully not too bad a pun, but – progress, in a formal sense, is very glacial in the meetings, et cetera. And somehow, after the meetings, which appear to be unproductive and frequently contentious, strangely documents appear that seem to draw a large degree of support.

And this is what happened in Vinadel Mar. The meetings were sometimes contentious, sometimes excruciatingly boring, but never in the formal sense seemingly very productive. And yet, just before the end, out of somewhere came a draft text which nobody agreed to, had no formal status, and yet everyone sees as the basis for agreement in the reasonably near future.

The consensus system places a great emphasis upon the "if you don't ask me to say yes, I won't say no" philosophy and style of discussion. And what, in fact, happened, as had been the case often in the Antarctic Treaty mechanism, is that while the formal discussions which have a certain ritualistic character where governments are essentially reciting their instructions for their own capitals, the informal discussions resulted in an individual taking a lead to take a shot at a negotiating text. And in this case, one of the old Antarctic Treaty hands, Ambassador Rolf Trolle Andersen of Norway, was, I guess, cajoled, in an informal sense, to do so. And Rolf produced – the weekend before the meeting ended – a draft protocol with annexes, a non-paper which is now known as the Andersen Text.

The Andersen Text was discussed in an informal session. It was then revised and laid on the table. And though it has no status, it was recognized. And in the report of the meeting, recognized as a basis for future work. And I think most people at the meeting in Vina believed that an agreement is possible on that basis, in the reasonably-near future.

Now the reasonably-near future could be 1991 in that the parties committed themselves to pick up the cudgels, to take up the work of Vina del Mar again, in Spain in April. So another negotiating session on this subject will take place in Madrid in April.

Also, later in the year, a regular meeting of the Treaty parties, one of the regular biannual meetings, will take place in Germany in October. And I think there is some view among parties that in the remainder of this year, that by October, it might well be possible to include a protocol supplementing the Antarctic Treaty.

The Andersen Text is, I think, a fairly clever and fair blending of the various proposals that were on the table. Let me summarize, simply, the kinds of provisions that are in it, and then refer to the cloud that may be hanging over it. The Andersen Text sets forth a set of environmental - a set of legally-binding, environmental principles. I won't go into these principles in any detail. But they are based, in large part, in one of those ironies that arise in international negotiations from the principles that were included in the Antarctic minerals proposal. These principles are already being used as models in other international forums. They are an extremely, I think, innovative and forward-looking set of principles which recognize - and I think this is an important element - that scientific research is, perhaps, the most important environmental value of Antarctica. Scientific research, itself, in Antarctica is of immense environmental importance, both to understanding the place, but also in terms of global processes. It's one of the important, and in the long run, may be one of the most important things that began to emerge at this meeting. What one has seen in some of the discussions in recent times is somewhat of a divergence, and somewhat of a bifurcation in perspective between scientists and those who are representing environmental perspectives.

The Andersen Text establishes a set of legally binding principles to ensure that the protection of the Antarctic environment and dependent and associated ecosystems, are fundamental considerations in the planning and conduct of all activities in Antarctica. These principles include: 1) obligations to meet specific environmental standards, with an additional general obligation to limit, insofar as is practicable, all adverse impacts; 2) obligations to accord priority to scientific research in Antarctica and to preserve its value for such research, including research essential to understanding the global environment; 3) obligations to ensure that human activities are planned and conducted on the basis of information sufficient to enable prior assessments of, and informed judgments about, their possible environmental impacts; and 4) obligations to undertake environmental monitoring.

The agreement, with respect to institutions, deals only with the establishment of what is called a Committee on Environmental Protection, a standing committee on environmental protection, which would be an advisory body. Again, not to duplicate the work of SCAR, but to provide advice to the Treaty parties on a regular basis with respect to environmental protection measures, how they might be updated, how they might be operating, and how effective their operation might be.

The secretariat issue was not included and was not addressed in the agreement itself, in this non-paper, this negotiating text. But there was a consensus that a secretariat should be established. Since the secretariat should be designed to serve the Treaty system as a whole, with a consultative mechanism as a whole, and not simply to serve the function of providing support for the environmental protection aspects, the secretariat should be established and should be addressed at a regular consultative meeting.

While the issue of the secretariat was not dealt with in the draft agreement, there was a commitment to get at that issue and to resolve it, beginning at the regular meeting in October. So there was a commitment to establish these two new forms of institution for the Antarctic consultative mechanism.

One of the innovative aspects of the Andersen Text is the provision for inclusion of bonding measures in annexes, legally-binding measures, specific measures for protection of the environment in annexes. There were four areas in which four candidate annexes were identified. In all of those annexes (marine pollution, waste disposal, environmental impact assessment and fauna and flora protection) the remaining issues are largely drafting issues, simply wording issues. And it is quite clear that those annexes will be ready for conclusion when the text of the agreement or the text of the protocol itself is ready for conclusion.

But the annexes do several things. First, they provide a mechanism for rapid updating and rapid amendment. And there is a provision that an annex can, itself, include provisions for accelerated entry into forced acceleration implementation of new measures, as necessary. This deals with one of the long-standing problems of the Antarctic Treaty consultative mechanism - adopted measures have taken an awfully long time to become effective, because every country must implement them before they become effective.

A system envisioned for the annexes that have been elaborated is a one-year tacit acceptance procedure. In other words, if no objection is received within a year, they are presumed to have achieved the acceptance of all and enter in the force on that basis.

There could also be a mechanism for emergency provisions to allow measures to be adopted even more rapidly. But that's the approach that has been taken, to allow the mechanism to operate more effectively without requiring an amendment, without requiring an overall change in the political mechanism itself.

The agreement includes new provisions with regard to compliance, spelling out clearly the obligations of States to ensure compliance with measures. It spells out that these measures are designed to be mandatory and apply to all activities. They are designed not to be limited, as has been the case with some measures in the past national programs, and they are designed to apply to all individuals, all activities, across-the-board.

The Andersen Text provides for a compulsory dispute settlement, again, with regard to the mandatory measures that are included in the annex. This represents a substantial evolution of the dispute settlement procedures that exist in the Antarctic Treaty, which are voluntary, optional, rather than mandatory, rather than compulsory.

It calls for response action. It obligates parties to undertake response action in respect to the threat of pollution, the threat of environmental damage deriving from activities in Antarctica. It obligates the parties to undertake contingency planning

The Andersen Text calls for annual reporting to provide a better record, a public record of measures taken to ensure compliance and other steps under the agreement; and calls for a system in which the parties would address and develop measures to deal with liability in addition to the provisions relating to response action.

It will include not only principles on environmental impact assessment, but will include specific obligations to deal with the issue of the decision-making. It would include a flat requirement that activities be subject to prior assessment of their environmental impacts. Again, that will be included in the body of the protocol itself. The specific procedures may be in the annex, or they may be all rolled into the protocol itself. But the agreement - the Andersen Text - rests on the premise that the environmental impact assessment procedures will be a major aspect for

dealing with the issue of decision-making.

Finally, the issue of mineral resources is linked in this non-paper body inclusion of a provision which calls for a prohibition on mineral resource activities. That provision, however, is formulated in such a fashion as to make clear that it is incomplete. And it holds open three options: 1) that mineral resources activities be prohibited permanently; 2) that mineral resource activities be prohibited in accordance with the Antarctic Minerals Convention; and 3) that mineral resource activities be prohibited on the basis of some middle ground between the two.

In other words, it does not resolve the issue, but as I mentioned earlier, establishes the linkage that would require the issue to be resolved prior to resolving the agreement itself. Whether or not that provision stays in, it does represent that linkage on the mineral resource issue.

Let me say that there was not a consensus, and it was clear that there was not a consensus from the outset in Vina del Mar on how to resolve the issue, how to restore consensus on the mineral resource issue. Several of the participants in the negotiations entered the discussions by indicating that there simply was no flexibility on their part to move toward a middle ground. So while there was exploration, and while there was a lot of informal discussion, much of it had a somewhat hypothetical ring in the sense that it was clear from the beginning that there was not a sufficient basis to finding a middle ground.

On the other hand, I think it is clear that the elements of a middle ground are beginning to emerge. And in my view, those elements would be the agreement on a moratorium on mineral resource activities for a significant period of time. But a moratorium would mean an agreement that mineral resource activities would not take place for that period time, coupled with something that would ensure that at the end of that moratorium – because a moratorium, by definition is, if you will, a self-destructing mechanism – to deal with the situation of what would happen if interest ever emerged in mineral resource activities. We're not there yet. But there was clearly some – quite a bit of – discussion of that possibility as a middle ground.

There was not, however, sufficient flexibility on all sides to be able to begin to move in a concrete fashion toward that middle ground. Whether or not, and when, that disposition will emerge, I think is the cloud that hangs over the disagreement, which, otherwise, I think, could easily be concluded in 1991.

The parties will meet again. However, I don't want to leave with the impression that everything is beautiful. With regard to the agreement, there are issues. There are issues relating to the environmental impact assessment. There is still an issue as to whether institutions – the advisory institutions – might have some role in suspending activities on the basis of a review of an environmental impact assessment.

But in my view, those issues are resolvable, and will, I think, tell the tale whether or not the Treaty parties can find a solution to that most visible, most hypothetical issue, from an environmental point of view – the question of Antarctic resources.

I should end, perhaps, on a personal note. I'm reasonably confident that the Treaty parties will be able to do it. The Treaty system has worked too well, and there is too much of a stake in the broader issue of ensuring that Antarctica continues to be managed in the way – in the rather innovative way that it has been – not to succeed in this operation. But nothing is certain in this world..... Thanks.

Ray Heer III, son of a former DPP Program Manager at NSF, transcribed the presentation. Tucker thinks and talks legally, and to the layman it's a bit "heavy", So Ruth and I have made some minor editorial changes, and bear full responsibility for any inadvertent changes in meaning.

Everything Comes Around - Greenpeace Invited To Talk!

Greenpeace On The Ice

by

Susan Sabella Antarctic  
Campaigner for Greenpeace,  
USA

1436 U Street N.W.  
Washington, DC 20009

on

*Thursday evening, 11 April 1991*

8 PM

National Science Foundation  
1800 G Street N.W.

Room 540

Susan Sabella graduated with honors from Boston College in 1984, obtaining her Bachelor of Arts degree in French. She began working for Greenpeace USA in 1986, and has been a member of Greenpeace's Antarctica campaign team for the last three years.

In the austral summer of 1985-86, Greenpeace International undertook its first annual expedition to the Antarctic. The following year, Greenpeace established World Park base, a small year-round facility at Cape Evans, Ross Island. World Park base and the annual Expedition have been essential to the success of Greenpeace's Antarctic campaign. Greenpeace Expeditions have visited some 30 Antarctic installations, many several times, as part of a program to document environmental conditions and impacts on the continent. The Expedition has also engaged in protests against Japanese whaling in the Southern Ocean and the construction of a hard-rock airstrip at the French station Dumont d'Urville, and has documented the operations of fishing vessels around South Georgia Island.

Susan's talk will focus on Greenpeace activities in Antarctica. She will acquaint you with World Park base, and share with you some of the experiences of Greenpeace's Antarctic Expedition.

If you move, please let us know, as bulk mailings are not forwarded!!!

This column remains bits and pieces of information about Antarctica and its people which appeal to the writer, and, hopefully, which may also appeal to you. We strive to write the truth, but when the truth gets in the way of a good story, out the window goes truthfulness. After all, our only objective is to get you to read these things. We continue to live in luxury in the quiet solitude and beauty of coastal Maine, just coming to the shores of the Potomac to attend our meetings and write these newsletters.

**MEMBERSHIP.** We have lost a lot of members this year, but, fortunately, nearly all of the practicing Antarcticans have renewed. We can live without the marginally interested members, as we have a good hard core of six hundred and would like to keep it around that figure. Sure, we would like to keep people like Jay Shurley, Eric Siefka, and Peter Webb, but we have to expect a few losses of good people, too. We used to keep delinquents onboard longer than we do now, but with the increased cost of mailing newsletters, we close the doors after three notices. What we would like to do would be to recruit more of the young Antarcticans. And what would really make us smile would be to have inputs from them for our newsletters. Our Society is only as good as you members make it.

**AN EDITORIAL.** Hardly a month goes by without someone contacting us for our opinion of where they should bequeath their Antarctic diaries, papers, clothing, paraphernalia, even Antarctic medals. Once upon a time we could recommend, with a clear conscience, that journals should probably go to the National Archives, and that museum-type items should go to The Ohio State University. But now we find ourselves in a quandary, as the National Archives is trying to discourage private polar donations. This comes directly from Marjorie Ciarlante, professional archivist who has the responsibility for polar papers at the National Archives. And Ohio State evidently has little or no interest in polar memorabilia. Recently they turned down what probably amounts to the best private polar collection in existence from the Byrd expeditions, that belonging to Supply Officer Steve Corey of the Second Byrd Antarctic Expedition.

It is most unfortunate that there is no Antarctic center somewhere here in the United States. A small country like New Zealand has a wonderful Antarctic wing in their Canterbury Museum in Christchurch, along with a splendid polar library, but our country does not even have the proverbial pot . . . . The best laid plans always seem to go asunder in a hurry. One of the reasons the Corps of Engineers transferred from Wilmette, Illinois to Hanover, New Hampshire was to be near the famed Stefansson Collections in the Dartmouth College Library. They moved, all right, but the Stefansson Collections did not survive!

Everything looked and smelled like roses at Columbus with the establishment of the Byrd Polar Research Center at The Ohio State University, as they had obtained the Byrd Papers from the family, had picked up Sir Hubert Wilkins\* papers, medals, and memorabilia from Lanny Ross. But the roses actually turned out to be buffalo chips, and the smell was more like guano for those of us interested in the preservation of all things Antarctic. The new director who came onboard (at the Byrd Polar Research Center) was more interested in academia and research, not in history. So polar people getting ready to die, who want to bequeath whatever they may have to

someone besides their son-in-law, have a real problem.

Brian Shoemaker is trying to establish a National Antarctic Center in Reedsport, Oregon, and he just might win by default, as there is evidently no one on the horizon who wants to contest it. We have been to Reedsport - it's a quiet, sleepy, little port. It's not a very exciting place, but it has a small cadre of dedicated, hard working people who have taken the HERO to their bosom, and now want to bed the GLACIER. Brian is willing to put on dark glasses and sit cross-legged on a street corner in Portland with a tin cup, selling pencils, to pick up funding for his proposed National Antarctic Center, and he might make it, too. We know of one Antarctic, Al Lindsey, the erudite Purdue professor who was on the Second Byrd Expedition, who has already given Brian much of his private collection.

There is a great Arctic museum on the Atlantic, although it is still a pretty well-kept secret - the Peary-MacMillan Museum on the campus of Bowdoin College in Brunswick, Maine. Both of those admirals went to this elite private college with high academic requirements and even higher tuition fees. The Peary-MacMillan Museum is located in one of the many beautiful stone buildings at the end of a verdant grassed quadrangle lined with towering elms. Brunswick is a class town, with a wonderful doughnut shop run by a bunch of religious freaks, at least one respectable restaurant, and it's The Gateway to some of the most picturesque Maine coastal scenery to be seen. The Peary-MacMillan Museum fits right into this college atmosphere as if the school was built around it. We need an Antarctic counterpart.

If you have any aims on being an Antarctic historian, you should seriously consider shooting yourself in the foot (or somewhat higher), as it could save you a lot of grief. Tom Jones and the late Bert Crary were given a small stipend to write something about the history of the Antarctic IGY, and it turned out to be fraught with difficulties. The papers of the Chief Scientist, Harry Wexler, are in the Library of Congress; the papers of the admiral in charge of Deep Freeze at the time, George Dufek, are at Syracuse University; and Bert Crary, Deputy Chief Scientist, had deposited his in the National Archives. Unfortunately, this is what any Antarctic investigator is going to be confronted with, multiple resting places for Antarctic papers. If Antarctica is worth researching, then shouldn't the papers and journals and memorabilia of scientists and administrators be preserved in some central depository?

In many ways it is a pity there isn't a sense of feeling for Antarctic history at the Byrd Polar Research Center at The Ohio State University, as the horses are all in place for it to become such a center. We send artists, photographers, poets, and writers to Antarctica, so why couldn't the National Endowment for the Arts or the Humanities fund a bona fide Antarctic historian or archivist for a real polar museum at Columbus? It would seem that something like this would be an attraction for holding polar seminars in Columbus, bringing dollar bills into the city and state.

**AN EQUAL OPPORTUNITY SOCIETY.** Down through the years our Society has tried to present lectures that cover all aspects of Antarctica - science, adventure, management, conservation, tourism, philately, et cetera. Our upcoming Greenpeace lecture will present still another viewpoint of Antarctica. We have had Jim Barnes, and we have had Bruce Manheim, and now with Susan Sabella, we must be almost ready for Jacques Cousteau! We thought you people might be interested in seeing the list of lecturers and lectures relative to the Antarctic Treaty and the preservation of the continent in, sic, its pristine state. So here they are:

2 Oct. 1963	Honorable Paul C. Daniels	Antarctic Treaty
15 Mar. 1966	Roger Tory Peterson	Impression of Antarctic Wildlife and Conservation *

11 Oct. 1966	Honorable Paul C. Daniels Sir	Does Science Contribute to World Peace?
3 Mar. 1971	Peter M. Scott	Antarctica, Past, Present, and Future *
9 Feb. 1972	Frank Mahncke	Antarctic Treaty Inspection Visit
8 Dec. 1972	Robert E. Benoit	Environmental Monitoring and Conservation in Antarctica
2 Feb. 1978	Norman Wulf	The Antarctic Treaty and Antarctic Resources
1 Apr. 1982	Robert H. Rutford	Antarctica in the National and International Context *
31 Aug. 1982	Charles Swithinbank	Nationalism and Internationalism in the Antarctic: One Man's Perspective
L2 Oct. 1983	R. Tucker Scully	Future of the Antarctic Treaty System *
L6 Nov. 1983	Albert S. Chapman	1983 Antarctic Treaty Observer Mission
24 Jan. 1984	James N. Barnes	Full Protection for the Antarctic: A Viable Option
19 Mar. 1985	Lee Kimball	We Have Met the Enemy and They Are Us Diplomats Meet Scientists at the South Pole The Antarctic Treaty System Meets the United Nations
28 Nov. 1988	Bruce Manheim	Securing Environmental Protection in Antarctica
31 Jan. 1991	R. Tucker Scully	Protecting Antarctica: Progress in Chile
11 Apr. 1991	Susan Sabella	Greenpeace on the Ice

**\*Memorial Lectures**

**BILL SLADEN TO BE ANOINTED.** William J.L. Sladen, a five-decade Antarctician who surely will become a six-decade Antarctician, will have received The Explorers Club Medal for 1991 by the time you receive this newsletter, as the highest award bestowed by the Explorers Club is to be given Bill on 23 March 1991. The letter from the president of the Explorers Club, Nicholas Sullivan, said they were honoring Bill for "your many, many years of research and exploration in the Antarctic." Sullivan's letter ended with "I am personally delighted that your long year of ornithological and geological research in Antarctica will receive the recognition it so richly deserves." I wonder which long year he was writing about. We went through ten pages of Bill's publications and found out that he had published in ornithology, general ecology or behavior, botany, physiology, biochemistry, microbiology, pathology, and nutrition. But nary an article on geology! Do you think the Explorers Club really got the man they wanted to honor?

Bill is one of our ex-presidents, and our only double-header Memorial Lecturer. He has been pretty well acclaimed by his homeland, as King George VI presented him with an MBE (Member British Empire), and Queen Elizabeth II gave him the Polar Medal. And there is a Mount Sladen on Coronation Island in the South Orkneys. As mountains go, it isn't very high, only 890 meters, but due to its location this pyramid-shaped mountain is quite conspicuous.

Bill wintered over at Hope Bay in 1948, and, as many of you know, he came back to camp from studying penguins at a rookery to find a building a burning inferno, with several people trapped inside with no hope at all of getting out. Bill also wintered over at Signy Island a year or so later. Following a summer season on the icebreaker STATEN ISLAND in 1958-59, Bill became a principal investigator for the United States Antarctic Research Program, studying penguins in the austral summers of 1962, 1964, 1965, 1966, 1968, and 1970. His film, "Adelie Penguins of the Antarctic", shot in 1955, was one of the very first color movie films outlining the life history of a bird species.

In 1948 Bill started the first organized, addressed bird-banding program for Antarctica. He was the first to design and use the flipper band (1952), now used in all penguin research. He also started the USARP Bird Banding Program with U.S. Fish and Wildlife bands involving 13 new band designs from albatrosses, Wilson petrels to penguins (1968). In 1961 he did physiological research on temperature regulation in penguins. He was the second to use the new technique of radio-telemetry for physiological work on Adelie and Emperor penguins at Cape Crozier (1971). He was the very first to report DDT in Antarctic penguins and seals (1966), thus proving global pollution by this much-used insecticide. He and his Johns Hopkins University graduate students banded over 40,000 Adelie penguin chicks at Cape Crozier between 1962 and 1970. That's like banding everyone in Madison Square Garden twice.

We would be remiss if we didn't recognize Bill's research in the Arctic, as he is sort of Mr. Snow Goose for all of his research with the Russians on Wrangel Island, NE Siberia. And he has made 13 trips to Alaska to study the tundra swan. Enough of this stuff. Let's just end it by saying that old Bill is just blatantly over-qualified as a polar scientist. Disgustingly so!

Bill has been married several times, and, as a matter of fact, is sort of a newly-wed again. He married Jocelyn Anne Arundel Alexander on the 22nd of December 1990 at "Wairunga" in Hawke's Bay, New Zealand. Only Bill Sladen would get married in Hawke's Bay. But I think the interesting thing is that he apparently got married on a stud farm, a sheep stud farm, of an old Antarctic associate, Tony Parker. There is sort of a famous or infamous statement which Tony made to Bill back in the 60's when Bill wondered if it was all right for him to leave his farm in Hawke's Bay to work with Bill on Cape Crozier banding birds. Tony replied, "Don't worry, Bill, my Rams will go on Ramming regardless." Could this have had an influence on Bill selecting that site for his marriage and honeymoon?

It has been quite a few years since the Explorers Club has recognized any Antarctic. There have been many bi-polar people honored, such as Lincoln Ellsworth, Richard E. Byrd, Sir Hubert Wilkins, Bernt Balchen, and Wally Herbert. Larry Gould is bi-polar, although we feel he was honored for his Antarctic connection. Finn Ronne was certainly a tried and true Antarctic. The Explorers Club has even awarded medals to expeditions - the Commonwealth Trans-Antarctic Expedition and Transglobe. A medal for Transglobe? Holy Cow! You really don't find many bona fide scientists among the Explorers Club medalists. The only true Antarctic scientist honored before Bill Sladen was Larry Gould, and his field work was limited to one expedition. So Bill represents sort of a breakthrough, a scientist who actually worked in Antarctica for five consecutive decades. I think both the Explorers Club and Bill Sladen are to be congratulated. Now if Bill could only find a way to keep the same wife for a couple of consecutive decades, that would be a real accomplishment!

**PORK BARREL BATTLE SENDS THE NATIONAL SCIENCE FOUNDATION TO ARLINGTON.** The Division of Polar Programs is moving west, about four miles west from 18th and G Streets N.W. to what is referred to as the Ballston section of Arlington. A decade ago Ballston was absolutely nothing, just an aging department store jammed into a small triangle between Glebe Road and Wilson Boulevard. A place to avoid. Then they put in a subway stop, and as soon as that happened, along came bulldozers and cranes, and mammoth buildings started replacing small nondescript stores. A building-in-waiting - Stafford Place - will start going up this spring, and NSF with its 1,450 employees will occupy approximately 400,000 square feet, sometime in 1993.

Whenever any government office moves, it moves only after a political tug-of-war between power giants on Capitol Hill. Senator Charles Robb of Virginia described it

as "heavy-duty politics." The battle lines were drawn up with Robb and Senator John Warner fighting for Virginia, and Barbara Mikulski holding out for Maryland. There were some extenuating circumstances insofar as NSF was concerned, as Mikulski heads the Senate Appropriation subcommittee that reviews its budget, and agency officials were reluctant to offend her. And if you have seen Mikulski on television, you know that she is one tough cookie.

Stafford Place is actually quite well located, being only a mile from our Society's Nerve Center! However, much better facilities will be available to NSF visitors in a 200-room Ramada Renaissance Hotel adjacent to Stafford Place, so don't come here! The building will be hexagonal, with a central atrium that rises twelve stories and admits natural light to the interior of all floors. The exterior of the building includes a precast and glass facade that has a granite base on the first and second levels. There are two main lobbies on opposite ends of the building, and these interior lobbies will have hard finishes, such as granite, marble, or brick.

There will be a 3,000 square foot exercise facility on the second floor so NSFers can either build up a head of steam or cool off hot heads, depending on how they got out of bed that day. There will also be a 12,000 square foot Data Center on the third floor, which must mean that good data is four times better than having a good body. Stafford Place is designed as an "intelligent building with state-of-the-art equipment and systems designed to meet NSF's technological needs, both now and in the future."

A centralized lunch room/vending area will seat about 200. And there will be 600 secured-parking spaces in an underground garage. One saving grace is that 1-66, a multi-passenger expressway from Washington to Dulles has an entrance/exit within a couple of blocks of Ballston, so between the subway and 1-66 commuting might almost become tolerable.

If you like figures, Stafford Place will cost tax payers \$31.98 per square foot average over 20 years. Occupancy is scheduled to begin in January of 1993, and be completed not later than 26 July 1993. On the down side, it cost area residents Eskimo Nell, a polar restaurant polynya in Arlington which was famous for its Key Lime pie. Everything comes at a cost, there are no free lunches.

**DRAFT OF SUPPLEMENTAL ENVIRONMENT IMPACT STATEMENT FOR USAP (U.S. ANTARCTIC PROGRAM)**

Sidney Draggan of DPP has a draft environmental impact statement of considerable size (1" thick, 2.1 pounds, 378 pages) out on the street for review. Basically it is a Game Book for the continued operation of the U.S. Antarctic Program in Antarctica. A lot of time and effort must have gone into this most comprehensive document. There are six chapters: Purpose and Need; Description of Current USAP Facilities and Operations; Alternatives, including the Proposed Action; Affected Environment; Environmental Consequences; and Preferred Alternative, Mitigation, and Monitoring. As this publication is of some merit, let's not confuse anything with personal comments, but go directly to the published abstract.

Four alternatives are evaluated for continued operation of the United States Antarctic Program (USAP). Each alternative involves actions to improve USAP activities and facilities with respect to safety, and environmental and human health protection. The National Science Foundation proposes to implement the third alternative that involves completing an ongoing, five-year Safety, Environment and Health initiative. In addition, that alternative involves streamlining USAP operations by reducing the number of support personnel and by consolidating facilities and activities, in particular at McMurdo Station. Implementation of this alternative includes completing an ongoing materials and waste (solid and hazardous) management study and imple-

menting the study's recommendations where appropriate and feasible. The alternative's source reduction program coupled with a decrease in support personnel would reduce and limit the amounts of material taken to Antarctica in support of scientific research. Also, increased emphasis would be placed on retrograding (removing) wastes from all coastal stations and inland stations and sites, including Amundsen-Scott South Pole Station. Impacts to air and water quality associated with current operations would be reduced under the proposed alternative. Modifications to wastewater discharges would be completed, and wastewater discharges (and surface water runoff, if any) and their effects would be measured and studied. Land-use plans for USAP facilities would be evaluated and updated on a regular basis, following formalized guidelines. USAP would continue to review its policies and procedures related to antarctic tourism and update them as the need arises. Systematic investigation of deactivated stations and other former sites of United States antarctic activity would be undertaken. The results of these investigations would be used to prioritize remedial actions and to implement cleanups at those sites where the costs and the risks are fully justified.

**DENNIS S. PEACOCK BECOMES NEW HEAD, POLAR SCIENCE SECTION, DPP, NSF.** Dr. Peter Wilkniss didn't have to look very far to find a new Polar Science Section head; he found his man down at the other end of the 6th floor corridor at NSF in Atmospheric Sciences - Dr. Dennis S. Peacock. Dennis, a cosmic ray scientist, was Head of the Upper Atmosphere Research Section in the National Science Foundation, and was responsible for the programs in aeronomy, magnetospheric physics, and polar terrestrial research.

Dennis was born in London, England back in June 1941, which would have made him a wax baby about the time of Mrs. Miniver. His mother sure picked a hell of a time to bring him into the world, particularly considering that they lived near the docks, an area heavily hit for months on end. Dennis's father was in the British army in Burma. His Bachelor of Science was obtained with 1st Class Honors in the Physics Department of Imperial College of Science and Technology in London in 1963. Dennis's resume also showed a degree from the Royal College of Science in 1963, and a Diploma from Imperial College in 1968. That was also the year he obtained his PhD from London University. He must have gone to the Antarctic shortly thereafter, as there is a study by Peacock, Csoeke-Poekkh, Gold, and White on "Solar and Magnetospheric Studies at Byrd Station, Summer 1970-1971." So he had some exposure to Antarctica in, what shall we say, his late, late formative years. He came to the National Science Foundation in April 1975, becoming director of its Solar Terrestrial Research programs.

Dennis doesn't really look like most of the young males Wilkniss has been hiring of late. First, he is blond; second, he is clean-shaven; third, he is relatively tall. We doubt if Peter ever hires anyone taller than himself, although Dennis is certainly a six-footer. He looks more like a hard-up college professor - which he has been from time to time since 1964 - than a top level government senior scientist. In other words, Dennis does not strike one exactly as a clothes rack. He appears to be a real human being, one who would probably enjoy coming to your backyard barbecue and eating plain old hamburgers, and quaffing down a cold beer. However, he is not entirely normal, as he is also into collecting antique furniture, which is sort of off-the-wall, right? For sports, the word is out that tennis is his game, but there hasn't been a great English male tennis player since Fred Perry, so we wouldn't worry too much if we ever saw him across the net.

**COMMERCIAL FLIGHTS TO MCMURDO???????** Late on the afternoon of 11 March, Peter Wilkniss, talking before the National Science Foundation's Advisory Committee for

Polar Programs, said, "I fully expect that within two years commercial flights will be landing at McMurdo." This seemed so far-fetched to me that I had to hang around and ask Peter if I had heard what I thought I had heard, and he told me that indeed I had heard him correctly.

Wilkniss's premise is based on his belief that blue ice runways will be used in the near future at McMurdo. But if the present is a prelude to the future, there is many an engineering problem to be solved before blue ice runways become safe runways. We tried to contact Malcolm Mellor, an aged cohort from decades ago, to see if he would give us his expert opinion on the problems, but he is on vacation - probably sailing in the Aegean Sea as is his bent from time to time.

Tourism is here to stay in Antarctica, and the FRONTIER SPIRIT more or less left an indicator of how things could be in the future when they established their own base on land at McMurdo, and left a small expeditionary force there with a helicopter. It is only a short step now for ships with helicopter capabilities, like the FRONTIER SPIRIT, to be spiriting tourists in helicopters into the Dry Valleys. Nothing henceforth will be totally sacred for the scientists.

This is all rather mind-boggling. Evidently there are no restrictions whatsoever on what tour companies can do as long as they are self-supportive. Thousands of tourists have seen the splendors of the Antarctic Peninsula, hundreds of adventurers have climbed the highest mountains in Antarctica, tens of adventurers have crossed the continent, and now sights seen only by field scientists will be seen by people from Peoria and International Falls. It is all rather scary when one thinks of flying tourists into the Dry Valleys in helicopters, as one learned Antarctic told me that the rule of thumb is something like 15 hours of maintenance for every hour of flying. I think I would rather take my chances in a school of piranhas.

It was only a couple of years ago that adventurers were screaming about not being given an opportunity to do things in Antarctica, when actually there was no one to stop them, just that Uncle Sam wasn't promising to rescue them from some idiotic adventure. If Antarctica is open to commercial flights and helicopter flights, can't we expect some real bad accidents?

What's the value of a life, anyway? The U.S. has always put a very high priority on the lives of its scientists and support personnel on the ice, and our track record in Antarctica is very, very good. Other nations have not been as protective of their people as we have, but we think the overall safety record of all countries in Antarctica has been quite good. Has anyone written or seen any articles on total fatalities in Antarctica? Because of the DC-10 crash on Mt. Erebus, tourism deaths must exceed those of science and science support.

Talking about commercial flights into McMurdo brings back memories of an aged Maine Congressman by the name of Robert Hale who came to Antarctica with the first group of Congressmen to visit Antarctica back in November 1957. As Hale came from my home state, Maine, I was more or less interested in what he had to say about Antarctica. After seeing McMurdo, he gave an interview in which he said something to the effect that he could foresee the day when there would be a hotel at McMurdo to handle tourists who would want to visit the area. We all wondered just what Hale had been smoking, but he was just ahead of his time.

All of this talk about exploitation of minerals, which are still to be found in worth while quality or quantities, may be inconsequential to the problems associated with tourists walking everywhere in Antarctica. Greenpeace, Environmental Defense Fund, Antarctica Project, Cousteau Society, and the rest, may have a new whipping post. Wouldn't it be hysterical if the National Science Foundation came out as a Knight on a Flying White Horse!

**SOCIETY EXPEDITIONS RUNS UPON HARD TIMES.** Society Expeditions, the premier Antarctic tour company, had more than its share of bad luck in the past austral summer. First the WORLD DISCOVERER actually discovered something, an uncharted rock off Cape Evans. It made a lasting impression on the ship, cutting a couple of short gashes into its hull, one of six inches, one of twelve inches. The ship was never in jeopardy, but when they encountered severe icing conditions in Commonwealth Bay, they decided that digression was the better part of valor and retreated to Port Lyttleton, where the ship entered drydock for repairs. As the cruise was curtailed four days early, they took the passengers on a four-day tour of South Island, seeing Arthur's Pass, Queenstown, and Milford Sound. Then they were given the option of accepting 12 1/2 percent of the cost of the cruise or 25 percent off on any Society Expeditions cruise within the next two years. So the passengers were very well treated. They had a fantastic visit at the Italian base at Terra Nova where they feasted on pizza, wine, and cookies, though not necessarily in that order. One passenger told me the highlight of the cruise for her was being at Cape Hallett with its majestic mountainous backdrop scenery.

Shortly thereafter a Society Expeditions' LAN Chile chartered flight with some 72 people aboard skidded off the runway in the rain at Puerto Williams on Navarino Island, resulting in the death of twenty passengers, seventeen of whom were Americans. The plane had taken off from Punta Arenas, 300 miles to the north, and was delivering a second load of passengers for the Society's EXPLORER. One of our original planks in this Society, Bill Littlewood, and his wife Bente, had just come off the EXPLORER, and had just flown into Punta Arenas on the preceding flight.

One of the victims was a former NOAA employee who got interested in the Antarctic when she processed Weather Bureau employees going to Antarctica for the International Geophysical Year (IGY). Some people say this woman, Pearl Kamber, was actually the secretary of Harry Wexler, Chief Scientist for the Antarctic during the IGY. Pearl had saved up her money to go on the trip, was scheduled to go next year, then got a call from Society Expeditions saying they had room on the EXPLORER in late February, and unfortunately she switched reservations.

The runway at Puerto Williams is 3,500 feet long which was described as adequate for the British-made BAE-146 aircraft which went off the end of the runway. But by U.S. standards it is a short runway, where 6,000 foot runways are typical for commuter strips. A Chilean LAN airline spokesman told an Atlanta Journal staff writer that the strip at Puerto Williams "is not unsafe. Thousands of flights go in and out of there every year."

Lynwood Hall, 38, an artist from Moultrie, Georgia, described the crash in a conversation with Lyle V. Harris of the Atlanta Journal. "There was a real shrill noise and a series of jolts and one big bounce and the plane stopped. I looked out the window and the water was rising up to the windows. With the jolt being so severe, I did not realize we had overshot the runway. We went over a cliff.

"The next thing we knew water was coming into the plane. The plane was tilted down towards the nose and started to sink. They opened the doors and the water just gushed in. One of the flight attendants opened the door and just froze. A couple pushed her out instinctively.

"There were people in their 60s and 70s and they did not know how to respond or react (Ed note. Watch it there, buddy, you're treading on thin ice!). It was a process of climbing and swimming over the backs of the seats to get out of the doors on either side of the fuselage. Freezing water was gushing in. Your survival instincts kicked in and you just wanted to live. Some of the stuff in the overhead compartments was floating, and it was difficult to get out.

"The plane filled up in a minute or less. Once you got out you had to swim to

either wing and you had to swim through this messy fuel to get to the wing. I was the last passenger on the wing.

"I was waiting on the wing and the plane was sinking fast. The water was over my knees, and at that point I was really freezing. I was shivering and cold. I just had on a pair of cord pants and a cotton sweater and a shirt. It was the most frightening moment of my life. We were seconds away from death. It was your worst nightmare come true."

Hall was the only survivor of the crash who opted to continue on the cruise. He said it was a tough decision to make, but as an artist he wanted to do a series of paintings on the trip, so decided to go ahead. Incidentally, all seven Chilean crew members survived the crash and lived through it all.

**STUMBLING INTO HISTORY.** David Elliot, geologist at Ohio State, trying to investigate ancient volcanism in Antarctica, was rudely interrupted in his field investigations this past austral summer when he stumbled. Evidently David is not too well coordinated, but all turned out well. The Washington Post for 14 March 1991 quoted David as saying, "You don't stumble on dinosaurs every day, especially in Antarctica. It was quite unexpected. Our minds were on volcanic rocks and not on vertebrates. When we saw the bone, it took a moment or so to realize what we were looking at." Two heads are better than one, especially when the other head happens to rest on the shoulders of William Hammer, a paleontologist, who just happened to be down the street or over the ridge or down the valley, or whatever, fifteen miles away. He was contacted, and quickly confirmed that the remains were dinosaurs, and began digging the bones out of the side of the mountain. David described the working conditions on the 12,500-foot slope of Mount Kirkpatrick as "really quite pleasant, except there was no oxygen." So there are 4,000 pounds of fossil bones and rocks slowly steaming across the Pacific headed towards Hammer's laboratory. Hammer isn't sure what kind of dinosaurs he has, but until a better name comes along, how about Elliotstumblinsaurus, and we can call them ESSes.

Hammer and Company think they have found the remains of at least two different dinosaurs, and said the fossils may be a snapshot of a drama of death played out 200 million years ago, when Antarctica was warm, mild, and part of the southern super-continent known as Gondwanaland. One fossil appears to belong to a large plant-eater about twenty-five feet long, complete with skull, shoulder, ribs, blade and limbs. In other words, this dinosaur was about the size of an average modern-day NBA basketball player! The other fossil is believed to be a carnivore. All they have is a single canine tooth, which the dinosaur might have lost while attacking or feeding upon its plant-eating victim.

It seems that Elliot and Hammer were surprised to find dinosaurs in Antarctica because there is so little rock exposed from the age when dinosaurs cavorted - dinosaurs do cavort, don't they? The article said that it was relatively easy to find 220 million-year old mammals like reptiles that predate the dinosaurs, but finding the dinosaurs themselves had been impossible until now. Hammer said, "Finding rocks of just the right age in Antarctica was almost more of a surprise than finding the dinosaurs."

The Golden Voice of Antarctica, Larry Gould, ended his book "Cold" with, "And I had rather go back to the Antarctic and find a fossil marsupial than three gold mines." Marsupials, yes, but dinosaurs, never. You were sure lucky, Larry, that you and your dog teams never ran into one of those dinosaurs out there in the Queen Maud Mountains, as they surely would have spooked your teams!

(John Noble Wilford also wrote about the dinosaur finding in the New York Times, 13 March 1991.)

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Sayed Z. El-Sayed, 1990

## TO PICNIC OR NOT TO PICNIC

There have been some inquiries - two - about having a midwinter picnic this summer, an old-time feature of our Society. Presumably we have an excuse for holding one on June 22nd because, on the day before, the Postal Service will supposedly - if they are on time! - issue the new fifty-cent airmail Antarctic Treaty stamp here in Washington, and we could picnic and sell cachets the next day IF we had enough interest. Our Society has met at various places, such as Dick Black's Rippon Lodge, at Stronghold on Sugarloaf Mountain, and at Bill Sladen's Horsehead Wildfowl Sanctuary. But Dick sold off most of Rippon Lodge's spread, Sladen left Horsehead, and Stronghold has become a popular mecca for wedding receptions which pay a lot more than we were paying. However, there is a possibility that we could meet in Mildred Crary's backyard in the District if we could get a show of hands from you folks who are interested. I think we would need to have at least forty committed souls to make it worthwhile. So, if you are interested in a midwinter picnic on June 22nd, please call Ruth Siple, 703-522-2905, or drop her a card at 905 North Jacksonville Street, Arlington, Virginia 22205.

We have 156 members in the Washington area, approximately a fourth of our total membership of 597. However, there are thirty husband-wife memberships in the 156; there are many members whom we have never seen at a single meeting; and when you get right down to the nitty-gritty, the number of participating Society members in the Washington area is probably around a hundred. That is enough to warrant a midwinter picnic. Now it's a matter of whether there is enough interest.

BRASH

ICE

This is probably our last Newsletter of the 1990-91 season, as we usually go into safe hibernation in coastal Maine during the summer. But we might, just might come to Washington for the issuance of the 30th anniversary Antarctic Treaty stamp on June 21st, and could possibly put out a short

Newsletter, although it sounds like a lousy idea now that I think it over. Summers are to be enjoyed, and they are mighty short in Maine. Actually, it is nicer in winter when no tourists are around and each day is crystal clear.

Those of you who regularly read the Newsletters know that our sole object is trying to take various and sundry items of potential interest to some segment of our membership and garnish it a bit to make it either readable or absurd. In a way, we are in sort of an enviable position, as being retired, I have no commitment to anyone. I have always said the worst thing that could happen would be that you members would impeach me, which, in turn, would be the best thing that could happen, because then I wouldn't have to drive to Washington six or seven times a year. It's close to 700 miles one way. I have earned two speeding tickets in less than two years. Both Massachusetts and Maryland are unfair nowadays with state policemen driving regular cars, and the next ticket puts me back on a bicycle.

Have a great summer! You Floridians, please stay in Florida. Those of you with RVs, please stay the heck out of Maine, as you make driving Route 1 a miserable experience. In my next life I would love to have a pickup truck and shoot at tires on RVs. It would be a great way to have fun and get some revenge!

**MORE THOUGHTS ON NATIONAL CENTER FOR POLAR REGIONS.** Our so-called editorial in the last Newsletter certainly brought a lot of worms out of the woodwork. We heard from various people from coast to coast; there are actually people out there who care about Antarctic archives and memorabilia! We think the most logical place would be an educational institution with a polar interest, located in an interesting environment where people might want to go for a visit. To me, that would spell Boulder. Another possibility would be Columbus, but who really gets turned on by the flatlands of Ohio?

Alison Wilson of the National Archives, who is the last of the surviving survivors from the IGY, called us to straighten us out on the National Archives' position relative to accepting polar archival material. They have sort of a double-edged sword philosophy, one being that they are still encouraging people to give them their holdings, the other being they are not out on the street soliciting. The point of contact at the National Archives in Washington is Geraldine N. Phillips, Head, Textural Projects Branch Division, National Archives, Room 5E, Washington, DC 20408. Recently they picked up two windfalls, one being donations from the files of A. Lincoln Washburn, the other being from old Andy Assur. Link's has gone into the regional center in Seattle, Andy's to the regional center in Boston. It seems that there are eleven regional offices in the United States, and the concept of giving your papers to regional offices near you certainly has a definite appeal.

Art Ford, who is sort of an old Antarctic dog himself, writes that geologists are a private breed who take care of their own. He says the real problem lies not with pack rats like himself, but with wives who are going to outlive their husbands and will get their Antarctic revenge (when they die) by cremating their life works. Upon their retirement Art says the USGS accepts all their field notes, slides, and journals in their Geologic Division at the Denver center. But Art bemoans that there is not a "good, permanent center for Antarctic materials." He says, "The problem is that permanent requires some kind of 'permanent' source of funding for archival costs."

Dean Freitag, former Technical Director of CRREL, wrote that this institution in Hanover, New Hampshire had recently gotten approval for construction of a major

addition for their library, tripling their space. Dean wrote that Librarian Nancy Listen is quite interested in getting archival-type documents. Her address is Ms. Nancy Listen, Librarian, CREEL, 72 Lyme Road, Hanover, NH 03755. Hanover would actually be a great place for a polar museum, as you have this great picturesque New England hamlet located on a river with beautiful rolling countryside. You have a prestigious Ivy League college, and the sole military cold regions research laboratory. With the Corps of Engineers, you never can tell how they are going to spend their monies, so they just might put up a building which could actually turn out to be a museum! Hanover has all the credentials except location, as one has to be lost to end up in Hanover, unless you are a Man of Dartmouth.

While others are bemoaning the lack of funding, it looks like Brian Shoemaker is taking the bit in his mouth and running in Reedsport, Oregon. They are planning to build the Admiral Richard E. Byrd National Antarctic Center, and they already have the centerpiece for the foyer, a life-size statue of Admiral Byrd donated by Felix de Weldon, the famous sculptor who did the statue of Byrd on the Avenue of Heroes at Arlington Cemetery, as well as the bust of Byrd at McMurdo and the famed Iwo Jima monument in Arlington. Reedsport is such an unlikely site for a museum (unless you live in Oregon). Art Ford wrote, "Reedsport is a wonderful place, but perhaps a little out of the way." That's being kind, Art, as it is actually nowhere. But you know, Brian might just pull it all off through sheer dint of personal drive and enthusiasm, plus defaulting by perspective outsiders. And if he does it, all the more power to him, and God bless Oregon.

The stumbling dinosaur-finder, David Elliot, says the root of the whole problem is money, especially at The Ohio State University. He wrote, "I see no immediate prospect of a sufficient and necessary level of support through the University budget, and I think the only stable financial base for the archives and museum will come about through a private endowment." When you look at Antarcticans who can raise money, you think of Gentleman Jim Zumberge. He has been combing this country for years, getting deep into pockets of innocent bystanders in the name of Southern Methodist and Southern California. He must know all the big rollers in this country, and couldn't he raise enough monies in a road trip across the country to put up a great Antarctic museum? Sure he could! And couldn't we name it after Gentleman Jim? Sure we could! Money buys everything ... except happiness.

The longest letter was from Kenneth Jezek, Director, Byrd Polar Research Center, to our President, Guy Guthridge, with information copies to me, Bob Rutford, Peter Wilkniss and Raimund Goerler. Jezek wasn't very enthusiastic about my comments about the Byrd Polar Research Center, so we will give him space to tell how he perceives it from the Director's Chair, although we won't quote all of a rather lengthy letter:

As part of the Center's efforts to provide proper access to a growing collection of polar documents and artifacts, I have formally established within the University the Byrd Polar Research Center Archival Program .... The program is dedicated to acquiring historical materials related to polar research and exploration, preserving and archiving those materials, and making them available to scholars interested in using the collections .....

Success of the archival program relies on involvement by individuals skilled in the preservation and organization of historical materials. One of our members, Dr. Raimund Goerler, is the University Archivist and he has proven to be invaluable in opening the collections to wider use .....

Because I feel the best way to stimulate scholarly use of the materials is to encourage graduate student involvement, I have approached the Dean of the College of Mathematics and Physical Sciences (CMPS) and the Dean of the College of Humanities to sponsor graduate student thesis research using

Our collections. So far, the Dean of CMPS has agreed to fund half of a student stipend - this is a considerable commitment considering that college's primary interests.

As my background includes only limited training in the history of science, I concluded the most effective method to gather advice on the status of the archives program was to establish an Advisory Board..... The Board is tasked with providing, among other things, advice on developing an acquisitions policy, a distribution policy, providing recommendations on the care and maintenance of the collections, and reviewing the financial health of the program. It is with the advice of the Board that collections are now identified for purchase or acquisition (even donated collections require funds for shipping, preservation, cataloguing and archiving thus requiring some selectivity on our part). As I am sure you can understand, the Center has only limited resources and we must be selective in the acquisition of materials.....

As is pointed out in your Society's editorial, securing funds for research in the humanities is difficult. Most of the revenues generated in the Byrd Center come from research grants related to the physical or life sciences, and until we can arrange to support a full time curator and historian, it will be difficult to accelerate the archives program development beyond its current rate of growth.....

As we go to press, another letter from Ohio State, this one from Emanuel Rudolph, Professor Emeritus, whom we knew when he was fledging at Wellesley College. It seems that Ohio State is saying, "Hey, we want to be the national polar center; our only problem is that we don't get the funding that we sorely need from either the University or outside." We can sympathize with that, but when a collection like Steve Corey's becomes available at no cost, if I were Jezek, I would have fired up my Ford or Mazda or whatever, and driven to Winchester, Massachusetts on my own and picked it up and taken it back to Columbus. All of us who have been gainfully employed at one time or another through polar research should be willing to spend a few shekels out of our own pockets to help the cause, whatever it might be. Action speaks much louder than words on paper.

Corey's collection is nonpareil for the Second Byrd Expedition. As Supply Officer tie had it all, and then some. Nothing had been sold off, it was all there - the beautiful furs, dog harnesses, dog whip, knives covered with blubber, flags that flew over Little America II, the flag that flew on the Citroen which went out to Advance Base to rescue Byrd, aviation helmet, and much more, even a bag of Antarctic rocks with L.M. Gould stamped on its canvas cover. This was all headed for the town dump when Steve called up Ruth Siple and said he was getting rid of it unless someone came and got it, that he had given up on Ohio State.

Steve Corey is no dummy, he's a very bright and intelligent man, and his mind and body are in great shape. He's the glue which holds together the members of the Second Byrd Expedition, and it was Steve, along with Dick Black, who put together the 50th reunion of their expedition here in Washington in the 80's. If one values contact with members of the 1933-35 expedition, you play ball with Steve, you don't antagonize the guy. After all, isn't Ohio State really the Byrd Polar Research Center, and wasn't the Second Byrd Antarctic Expedition a very important part of Byrd's life?

Now for Rudy's words!

I was shocked by your editorial in the April Antarctic Society Newsletter concerning archives and artifacts. This because some of us here at Ohio State worked very diligently to get scarce University funds to purchase and

help curate the collections either purchased or donated. Thus far some progress has been made, and a true commitment to continued interest and support. These are tough times for university financing, particularly for state universities (for example our university's budget was cut \$18 million from this year's planned budget).

To say that there is little interest here for a polar archives/museum is just not true. We wish that we could be the "national" center for all sorts of manuscripts and artifacts that relate to American Polar exploration. All we need is more money and a little time to accomplish that.

Ken Jezek is interested in developing that aspect of the Byrd Center. I can say so with conviction because when I showed him your editorial he was fighting mad. I assured him that you probably over-stated the case to get a response. I hope that is correct, and that you will support our efforts. Already some progress has been made by people who have limited experience with polar materials. What we desperately need is a full-time person with the right background, who we can afford, to work on what we have and what we can obtain. We are working on that.

I want to assure you and Ruth that the Byrd Center is moving forward on all fronts. The field/laboratory research does well because good people can obtain funding from granting agencies. University and Byrd post-doctoral Fellows are supported and do wonderful work. The Goldthwait Polar Library is ever expanding and improving; it will host the international polar library group next year. The archives are slowly improving; with more funds that would go faster. A general finding list to the Byrd Archives has already been prepared. We just need money and good support from interested people like you! Please get the word out.

**SOMEONE NICE, BETTY GILLIES.** For a change of pace, let's be happy, let's write about one of the good guys, Betty Gillies of Rancho Santa Fe, California. Everyone who was in the Antarctic during the IGY knew two ham operators, Jules Madey of Clark, New Jersey, a high school phenom, and a wonderful woman pilot in San Diego by the name of Betty Gillies. She is quite a famous aviatrix, and then competed very successfully in the annual Powder Puff Derbys where women pilots flew across America. During World War II she served as a WAF pilot, ferrying planes to England. If you want to read about Betty, pick up Issue No. 7, 1990, of the Smithsonian Studies in Air and Space entitled "United States Women in Aviation". She is one female ham radio operator who is on the map of Antarctica, as Gillies Rock (83°07'S, 96°25'E) is named after Betty for having run phone patches for field parties in the Thiel Mountains, Pensacola Mountains and elsewhere in Antarctica.

Betty is no longer a spring chicken, and does not enjoy the luxury of having good eyesight, but does have someone who reads to her. We understand she would like to hear from any Antarctic, especially those of us for whom she ran phone patches. I remember her fondly, remember the conversation where I surprised her by knowing about the construction of the baseball stadium being built in San Diego for a future major league team. She must have run patches for John Annexstad, Nolan Aughenbaugh, DeeWitt Baulch, John Behrendt, Bob Benson, Charlie Bentley, Rodger Brown, Dick Cameron, Dick Chappell, Johnny Dawson, Steve Den Hartog, Bernie Fridovich, Ralph Glasgal, Charlie Greene, Kirby Hanson, Rudy Honkala, Red Jacket Jorgensen, Muckluck Milan, Palle Mogensen, George Toney, Paul Tyler, Pat Unger and Buck Wilson, and other IGY members of our Society. Even if she never handled any of your traffic, why don't you just write this lovely person out of the courtesy of your heart? Her address is: P. O. Box 625, Rancho Santa Fe, California 92067. Once we tried to relocate the prominent hams from the IGY period, and found it to be almost an impossibility.

Never understood how anyone like a Paul Blum, W2KCR, could just vanish after handling all of those ham grams so faithfully. So it makes it doubly enjoyable when someone like old Art Ford brings to our attention Betty's address. Incidentally, in line with the above, Betty's wonderful records dating to the IGY were gratefully accepted by the Canterbury Museum in Christchurch, New Zealand. Betty, you were one of the very best, you served Antarcticans faithfully and untiringly through the Antarctic night and your own nights, and it was always a delight to hear your strong signal coming through, as we knew talking with you would be enjoyable and that the phone patch would be superb. Enjoy good health!

**HARRY SWINBURNE DIES.** The man who wrote us on 3 October 1989, "I've lived the most exciting and rewarding life of anyone I know" has now gone to his final reward, having died from cancer on 14 March 1991. Harry was Deputy Commander and Chief of Staff, and, later, Commander of the U.S. Naval Support Force Antarctica, being the first captain to assume that exalted role after a string of admirals. He wrote straight from the hip, and his letters of the past six years have highlighted many of our Newsletters.

He led a most interesting life, and we can't just write him off as another Antarctic leader, as he was far more. He was a fighter ace while serving with VF-45 aboard the USS SAN JACINTO (CVL-30), shooting down seven Japanese planes, and sinking three enemy ships. During the Korean conflict, he was the first pilot in the whole world to fly a helicopter in actual combat. He flew 132 missions over and behind enemy lines while supporting the 3rd ROK division.

He was Assistant Air Officer of USS ESSEX (CVS-9) at the Bay of Pigs fiasco. He was Air Boss on the ESSEX when she sailed 70 miles up the Elbe River to Hamburg, Germany during the Berlin crisis. And he assumed command of VA-65 aboard the USS ENTERPRISE (CVAN-65) the day before the Cuban missile crisis. He was an instructor of Naval Warfare at the Marine Corps School at Quantico, Virginia from 1963 to 1965. Also served as Action Officer in charge of 44 African countries in the Joint Chiefs of Staff in the Pentagon for three years.

Harry has all kinds of awards - the Legion of Merit, three Distinguished Flying Crosses, the Meritorious Service Medal, eight Air Medals, two Presidential Unit Citations, the Navy Citation. He suffered only two defeats in his life. The one that hurt the most was probably when his second wife, a Kiwi from Christchurch, deserted him for an active commercial airline pilot. This completely devastated Harry. The other defeat was something he fought tooth and nail, the Big C. He had cancer of the tongue, throat, larynx, and lymph glands. At one time he had received 12 treatments with neutrons, 20 with photons, and 14 with beta rays (electrons) - and this was a year and a half ago. Until he came down sick, Harry had never been sick for a day in his whole life. The Big C is certainly an equalizer. But he led the good life for many years, an exciting life, and he will be truly missed by all of his family (two daughters, three granddaughters, two brothers, two ex-wives), and his many friends. Incidentally, Harry donated his body to the University of Washington School of Medicine, so even in death, Harry is still serving mankind.

**TRANSANTARCTIC MOUNTAINS REVEAL SOUTHERN BEECH FOREST.** Do you believe in Christmas? I mean, do you really, really believe in it? If you ask Peter Webb of Ohio State University, David Harwood of the University of Nebraska, and Barrie McKelvey of the University of New England in Australia, they all should shout, "Yes, we do!" Because it was on Christmas Day 1990 that they discovered some truly great leaves on a cliff side in the remote and barren Transantarctic Mountains in eastern Antarctica. And the best part was that they weren't brought there by some wise helicopter pilot from his home town in Minnesota. The leaves are final evidence that a low alpine forest thrived three million years

ago in a place researchers believed was too harsh to support plant life. Peter said, "These are not leaf impressions, these are actual leaves. The preservation is phenomenal. It really is good - so good that, when you put one under a microscope, you can see the cell structure of the leaves.

Back in 1985 the same three investigators found wood fragments and twigs on the mountains adjacent to the Beardmore Glacier. So they went back this year, and there, in a 100-meter thick deposit of silt and material deposited by ancient streams and lakes, were thin layers of leaves that had dropped from the trees and were rapidly covered and protected for at least three million years. The wood samples recovered from this expedition and the previous one, along with the leaves themselves, have been identified as coming from the Southern Beech tree. The wood will still float and burn.

Peter said that it is possible to separate out individual leaves and retrieve cellular material that has been preserved. "We can do a better job of getting at the species level now. It is much more accurate if it is done based on the individual cell structure." He declined to speculate on whether DNA samples could be obtained from the leaves. Work on DNA analysis of other ancient tissues has allowed scientists to compare extinct species with modern counterparts, providing a better picture of how species evolve.

The southern beech still grows in southern South America and on islands off the Antarctic coast. Harwood believes that the climate that allowed the beech to grow in Antarctica was similar to that now in northern Scandinavia or southern Chile and New Zealand. So, there really is a Santa!

**NORMAN VAUGHAN JUST WON'T ACT HIS AGE.** A couple of years ago we had a letter from a member overseas saying that he had heard that Norman Vaughan, dog-team driver with Admiral Byrd on the First Byrd Antarctic Expedition, had died. Of course that had to be erroneous, as Stormin' Norman is never going to die. He married that young Southern lass from Georgia several years ago, and I'm sure that gave him a new lease on life. Then last year he wrote his autobiography (With Byrd at the Bottom of the World). This year Norman, age 85, bride Carolyn, fortyish, and twelve of his best dogs took off for Europe where they entered the ALPIROD International Dog Race over some of the most taxing terrain in the Italian and Swiss Alps.

On the way to the Alps, they dropped in to see Gordon (Mirny '57) Cartwright and Kathleen Holman in Geneva, who were still in the States on their Christmas safari. But they got back in time to find the Vaughans still encamped in their front yard. So, according to Gordon, they "had three wonderful days here in Geneva and the Jura getting to know Carolyn and catching up on Norm's peripatetic life. They are a perfect pair; tremendously motivated; undaunted by problems; and beautifully balanced in their different talents." So they just "had a great time recalling various outlandish experiences we shared as virgin staff in the newly-born PICAQ (Provisional International Civil Aviation Organization) in Montreal, 1946-52, and my first experience with huskies." Gordon wrote that the ALPIROD is ideal for testing some of the macho high altitude skiers, but an irrational course for 12-dog teams with sledges. Norman and Carolyn decided to break off the first extremely difficult legs and rejoin later on the last legs. I never knew anyone that old to be that active, but then again, I never knew any man that old who was married to any woman that young, either!

There are still a few other survivors of that First Byrd Antarctic Expedition, as Larry Gould remains the ageless patriarch of the group at age 94 out in Tucson. Meteorologist Henry Harrison lives in Asheville, North Carolina, and radio operator Howard Mason lives in Seattle. We have met all four, and there are no similarities among any of the four, except all are very nice people. May they live eternally!

**POLAR QUARTERMASTER, ANTARCTIC SUNGLASSES (JACK SAWICKI).** Starting with this issue, Environmental Physiologist Jack Sawicki will include news of various developments of personal clothing and equipment of interest to Antarcticans. Jack is a graduate of Georgetown University (MS, 1980) who has concentrated on the engineering development of protective clothing. One of his recent projects involved designing an advanced Antarctic Integrated Clothing Ensemble (ICE) for NSF via an ITT Antarctic Services contract.

After several years without a source, sunglasses specially designed for polar exploration are again available. You'll remember references to similar glasses in Amundsen's SOUTH POLE, Stefansson's ARCTIC MANUAL, and Hedblom's POLAR MANUAL. The glasses are "aviator" shape, with plastic-covered paddle ear- and nose-pieces and brow-bar (which keep the glasses from freezing to the skin). The heavy-duty frames (24-carat gold electroplate over nickel-silver) have a 5-year warranty, and are available in three lens sizes: 57mm (S); 61mm (M); and 64mm (L). The unique feature is the amber lens, which are made of polished kalichrome glass with an Inconel double-gradient front mirror and an anti-reflective back-coating. The transmission curve has a very steep cut-off below 480nm and above 680nm, providing 100% ultraviolet and infrared protection and eliminating about 99% of the scattered blue light from sky, snow, ice and white-out. On my trip to the South Pole I found these lenses far superior to Ray-Ban G-15, Vaurnet Skilynx and the Air Force Grey-3 - I could see the outlines of snow-bridges on crevasses and fine detail of mountains miles away that were invisible with other lenses. The lenses are currently available with the above frames on special order in piano (non-prescription) grind for around \$40, depending on quantity. If you're interested, drop me (Jack Sawicki) a postcard at 700 North Illinois Street, Arlington, VA 22205.

**MULTI-DECADE ANTARCTICANS.** In our December Newsletter we let fly one of those loose comments about old Charlie Bentley being the first five-decade Antarctic, and the first American in terms of longevity to spend parts of five decades working on the ice. He arrived in Antarctica, we believe, late in 1956 and is still active. But Bob Rutford is apparently still reading these Newsletters, and he pointed out that there were at least two more - George Denton and himself. George first went there back in 1958, so he was only a year or so behind Charlie, although he must be numero uno in terms of summer months in the field. Bob went to Antarctica back in 1959 and is also a five-decade man, but wasn't he a visiting fireman in at least one of those decades (the '90s)? Dick (Wilkes '57) Cameron was down as a lecturer on a cruise ship last year, and that would make him a five-decader. Another five-decader has to be Gentleman Jim Zumberge, the unemployed college administrator, who first went there back in October 1957 when he was the chief cook and bottle washer at Camp Michigan. You know Gentleman Jim, Bob, and George are all great guys, but there is an asterisk aside of each name in our files which indicates they were only summer folks. Now old Bentley, he wintered over twice, which gives him some stature!

There may be other five-decadars we have overlooked. Possibly George Llano is one, as we know old George was down there in December of 1957. Perhaps Tony Gow, as we are pretty sure he was down there with the Kiwis in the 50s, and he might have been down last year with Malcolm Mellor's group - but maybe not. Art DeVries went down very early in the 1960s, so just misses qualifying. Sayed El-Sayed covers a lot of years, but we don't think he is a five-decader. Colin Bull was there in the 50s and the 90s, but he must have missed the 80s when he was outside the realm of polar research. Marty Pomerantz owns a piece of the South Pole, but we don't think he is a five-decader. Mort Turner comes close to being one, too.

But when you talk about real Antarcticans, how about Charles Swithinbank, who is only 63 years old and has been in Antarctica in six different decades! That's quite a

record, especially when neither your father or mother was a penguin. Or were they? Charles goes back to the Maudheim expedition in the late 1940s, and was on WORLD DISCOVERER during the past austral summer. He bids well to become a seven-decade man. The late Bert Cray said his being the first scientist to have worked at both Poles was "his dubious honor," so what does six decades make Charles? He certainly is an anomaly, if not an Antarctic freak!

Bill Sladen is another six-decade possibility, as he was there back in the 1940s. But you know some of those years in the banana belt of Antarctica should not really count, as it is pretty lush there. If you haven't felt -60°F, you are not a true Antarctic. It gets almost that cold in Fort Kent, Maine every winter!

Let's stir up a little interest and controversy with families. Take the Siple family - they have eight consecutive decades. Paul was there in the 20s, the 30s, the 40s, the 50s, and the 60s. Ruth was there in the 70s, daughter Jane was there in the 80s, and Ruth was back in the 90s. And to reinforce the family title, son-in-law Hugh DeWitt was there in the 50s, the 60s, the 70s, and the 80s. How about that for family ties and interconnectors!

Who is the oldest Antarctic to go to the ice? Larry Gould was 83 when he went back in November 1979. While Larry may have been the oldest, he was also the youngest in heart. And what about husbands and wives, father and son, father and daughter, et cetera? Were Christine and Dietland Muller-Schwarze the first husband and wife to work in Antarctica for the U.S.? Were Dick and Andy Cameron the first father and son to winter over in Antarctica? Were John and Kristine Annexstad the first father and daughter to run snowmobiles in pursuit of the elusive meteorite? Were Cam Craddock and his son the first father-son geological team to work together? Was Buck Wilson and his daughter the first father and daughter on the ice? Was Lisa Crockett the only offspring of a member of either ice party with Byrd to go to the Antarctic in a working capacity? You can carry this to all sorts of ridiculous lengths. If you have an Antarctic first that we can print, why not send it along? As a matter of fact, send those we can't print, too, and we'll just put them in the file for future archivists.

**OPERATION VOSTOK.** We got the feeling from Peter Wilkniss and Nadene Kennedy that Operation Vostok was not only an operational success, but it was a huge, huge social success, too. It started back on 3 October 1990 when Peter picked up his ringing phone and found the caller was from the Arctic and Antarctic Research Institute in Leningrad. They were calling Peter to see if the U.S. could give them assistance in resupplying Vostok, and in rotation of their wintering-over personnel. As the United States has a vested interest in much of the international-type work going on at Vostok, as we collaborate with them on a common program - deep core ice drilling, as they have much technology to share with us on how to prepare safe wheeled-aircraft landing strips on snow surfaces, as both countries are working together planning the Weddell Sea Ice Camp, there were many reasons for Peter to agree to help out the Russians with what is now referred to as Operation Vostok.

The Russian ship PROFESSOR VIESE arrived at McMurdo on 29 January of this year and departed on 3 February. What happened between 29 January and 3 February would evidently fill a book, but from our side everyone had a hell of a good time (and you can bet the Russians did, too). The leading Russian was D.S.A.N. Chilingarov, Deputy Chairman of the USSR Goscomhydromet, and he was accompanied by Boris Pikhanov, international affairs and translator, plus Vasily Kaliazin, Deputy Operations Manager for SAE (Soviet-Antarctic Expeditions?). The first day, a C-130 with Wilkniss, Chilingarov, and Pikhanov aboard, took the twenty-two relief personnel to Vostok. Two days later two more flights were made to Vostok. The planes also took 13 tons of vital cargo to the station. And when the Soviet ship left McMurdo on 3 February, they took 22 U.S. Antarctic personnel back to New Zealand.

Among the various activities staged or produced while the Russians were at McMurdo was a soccer game. We never heard who won, but we do know one who was a loser, the captain of the PROFESSOR VIESE, one Andrey Tokarsky. He severely dislocated and fractured his ankle in the game. Was it Budweiser or was it Smirnoff? So he had to be air evacuated to Christchurch. The head Russian was a great big man, and one evening while attending some function or whatever, he took off his coat and hat, put his hat up his sleeve, and hung it on a hook. In the great American tradition of Love Thy Neighbor, someone liberated his fur hat from the sleeve. The Russian was a real friendly giant and took it calmly and without fanfare, saying the same thing could have happened to him back home at any time. But it disturbed Peter immensely, and he promised the person who took it a free trip to the South Pole, a sightseeing trip to Dry Valley, and everything but his wife - all without any action being brought against the person - but the hat was never returned. But talking about glasnost, perestroika, and all that good stuff, it was all hanging right out at McMurdo when the good ship PROFESSOR VIESE was in port.

At the end of the visit both Wilkniss and Chilingarov signed a Memorandum on Soviet-American Cooperation in Antarctica. As we write these words, Peter is winging his way to Moscow to again meet with Chilingarov to "get acquainted with the activities of the USSR Coscomhydromet subdivisions in Moscow in Antarctic and Arctic affairs, and to discuss issues of cooperation between the parties." Let's hope that during the meetings Peter doesn't inadvertently break his ankle playing soccer with his hosts!

**R/V NATHANIEL B. PALMER.** At long last, NSF will have its own multi-purpose, ice-capable, Antarctic research vessel; the hull of the NATHANIEL B. PALMER will be launched in Galliano, Louisiana the end of May. Sea trials are scheduled for October-November-December, but they could be running late by a month. The construction of the ship by Edison Chouest Offshore has been going very smoothly, and one of the reasons, if not the main one, the construction company and the operating firm are one and the same. So when changes have taken place, they have been expedited, which has made the National Science Foundation very happy. The vessel will actually be operated by Antarctic Support Services of Englewood, Colorado, under contract with NSF's Division of Polar Programs, to support the U.S. Antarctic Program.

The R/V NATHANIEL B. PALMER is ice classed to the new ABS rules, ABS-A2. She will be able to break three feet of level ice at three knots, will have stringent track and station keeping abilities, will be acoustically quiet, and will be able to support multi-disciplinary long range programs. The ship is 308.5 feet long, overall, with its length at waterline being 279.75 feet. It has a 60-foot beam, both maximum and at design waterline, and draws 30 feet of water. She can carry two helicopters. She will have a crew of 26, and there will be berthing for 37 scientists in one- and two-person staterooms. There are 4,000 square feet of laboratory space located on the main deck, with a total of eight laboratories with 5,440 square footage. There is an oceanographic staging hangar on the starboard side with its own boom and winch system. She can stay at sea for 75 days.

They built the NATHANIEL B. PALMER upside down, which seems odd. Then they bring in four giant cranes and flip it all over! They don't expect that the vessel will be in yards more than 60 days a year. She will have two complete crews, with changes every ninety days or so. Scientific instrumentation and equipment decisions being made by NSF for this vessel include a CTD system, a Doppler current profiler, a 3.5 and 12 KHz precision depth recording system, single and multi-channel seismic systems, and a multi-beam swath mapping system. The Oversight Committee consisted of Bob Densmore, Sharon Smith, Dave Nelson, Denny Hayes, Tom Rogers, Dolly Deiter, Tom Robertson, and Ed Karlson. What exactly is an Oversight Committee when it comes to a ship? Does it mean exactly what it says? It seems to this innocent that they don't need "oversight" as much as "specification".

**THE BOSS WOULD FLIP IN HIS GRAVE IF HE ONLY KNEW.** If Sir Ernest Shackleton should wake up on South Georgia and hear about the Weddell Sea ice flow station which is to be established next February, he would immediately drop dead again, this time in total disbelief. Something from which he and his men were trying to escape, the Russians and we are spending four million dollars to establish and maintain, a station on the floating sea ice in the Weddell Sea! This will not be a one-time project, either, nor will it be the first in a series, but something in between.

Maybe Shackleton would do it all over again if he had the kind of support that will be available for the new camp. There will be eighteen pre-fabricated Soviet-style buildings made of plywood - if my notetaking was accurate - which are container size, 20 feet long. There will also be some inflatable huts. There will be thirty people, fifteen from each country. Ten from each country will be scientists. They will enjoy the luxury of having two helicopters, a rescue craft (inflatable), a camp doctor. Plus all Russians will have emergency response training.

The science program centers on the structure of the western boundary current, and scientists will be doing both local and regional studies. The camp will be established by the Russian ship FEDEROV in February 1992 at about 72°S, 54°W, and they will drift northward about 4.5 to 5 km per day. Plans are for the same ship to retrieve the camp at about 65°S, 50°W between 25 May and 26 June. Our new ship, the NATHANIEL B. PALMER, will make a transect near the drifting camp sometime in April, and camp personnel will be exchanged by aircraft. Did you hear that, Sir Ernest? They are going to exchange personnel after two months by helicopters? None of those manhauling dories like the JAMES CAIRD and the DUDLEY DOCKER for our generation. You guys back in 1915 just didn't know how to do anything, did you?

**MIA, 7200 PENGUINS, KING GEORGE ISLAND.** The Washington Post for April 8, in an article by Christopher Anderson, said that Wayne and Susan Trivelpiece had noted that 20% of the 18,000 breeding pairs of penguins which normally return to the island did not this year. Having seen pictures of them in the field, I would say the missing 20% constitute those penguins who have had their stomachs relieved of their contents by the Trivelpieces in the name of science, and have decided that any haven except King George is preferable!

Wayne and Susan have discovered that both Chinstraps and Adelies are missing, which confuses the issue, as the Adelies chase fish under the ice, the Chinstraps in open water. So it cannot be attributed to the extent of sea ice coverage. In the past five years there have been two harsh winters, three mild winters, and both species have declined. The dropoff is not a one-year anomaly, as this year was the third consecutive year in which the population has dropped off in large numbers. Wayne said, "When it happened again this year, after another mild winter, we knew that it wasn't just a fluke. A major pattern has been broken." There is a possibility that there has been overfishing of krill by the Japanese and Soviet trawlers who harvest krill in the King George area. Even though there is a Convention of Antarctic Marine Living Resources (CCAMLR), it seems that counting krill is a difficult and inexact process. And you sort of have to believe Wayne and Susan, as they are right in the beginning of a new long-term funded study, and they did not have to come up with something new to get funded for next year!

**GREENPEACE CAPTIVATES.** About seventy-five Society members and guests showed up with their brass knuckles on the evening of April 11 to do battle with Susan Sabella of Greenpeace who was supposedly going to tell us how it should be in Antarctica. But when the evening was over, Susan not only walked out of the room with all of her tee tin and her nose still straight, but Society members had their arms around her shoulders. Greenpeace does not play the game fair - they sent over a charmer, a very intelligent,

engaging young woman on the rise. When I congratulated her afterwards on doing a splendid job before what could have been a hostile group, she asked what I had expected, and I replied, "For one thing, I thought you would have horns."

Our illustrious, smooth-talking president, Guy Guthridge, told me afterwards that he felt two things were most significant about her presentation. One was Susan's statement that Greenpeace was pleasantly surprised by how fast the Antarctic Treaty nations had taken up on the issue of cleaning up the Antarctic environment. And the second was that Greenpeace does not necessarily take credit for hastening things along.

Susan admitted that naming the station at Cape Evans - World Park, Antarctica - left much to be desired, and that it had even caused some misgivings at Greenpeace (in addition to the outside world). One attendee at the meeting asked her why Greenpeace had to build their station in the shadows of such an historic site as Captain Scott's 1910 hut, and Susan told us that the station never was intended to be a permanent station, that it would all go as soon as possible. Let's hope that will be the case, as it was a grave mistake by Greenpeace to put it so close. It seems that they could create a lot of goodwill among Antarctic history buffs if they did close it in the near future.

Maybe Susan got something out of the meeting, too. Jackie Ronne, she of Antarctic nobility, asked why, after World Park cleaned up all their water through a series of elaborate filters, the clean water was dumped back into McMurdo Sound instead of being recycled and used again at the station. Susan admitted that this was an excellent suggestion, one that they could incorporate into their station management.

**CORRECTIONS.** If you people knew how fast we throw these pages together, you would never read them, as our overall time from the first word on paper to delivery to the postoffice for mailing is somewhere around a hundred hours, including sleep time! What I am saying is that we spend our time writing, not following up for verifications. So we have to eat crow periodically, and crow is now being served.

First, on the number of people who were on the Lan Chile plane that went off the runway at Puerto Williams and continued on the cruise. Our figure of one came from an Atlanta newspaper article, and must have referred to a specific group of Georgians. Polly Penhale came back from Palmer on the SOCIETY EXPLORER, and she told me that the correct figure was 35. Polly told us an interesting item about one couple that survived the crash and still went on - they were 81 years old and were celebrating their 50th wedding anniversary. Can you possibly imagine anyone being married that long and still wanting to celebrate together?

I was overly kind to the WORLD DISCOVERER when I said the incisions in her hull created by her doing her own discovering of some uncharted ledge or rock(s) off Cape Evans were on the order of inches. I misunderstood my informant, as another passenger on the ship said the holes torn were several feet in length. Even though the holes were substantial, the ship was never in any real danger.

Billy Ace Baker down in Pensacola reads everything, knows everything about Antarctica, and he picked up a real beaut in the November Newsletter when we inadvertently credited James Cook with discovering features which he never did see and which should have been credited to James Clark Ross. Always hard to distinguish one James from another!

Pollyanne Mitchell, widow of J. Murray Mitchell, says it is just not true that she did not find the Boulder area appealing, that she thinks Boulder is truly a beautiful place and that she values deeply the friendship of many people who live in Boulder.

*If you move, PLEASE send us your new address! Bulk mail is not forwarded.  
Don't fight global warming. Sit back and enjoy it.*

FOR THE UNITED STATES OF AMERICA

**SOCIETY'S ANTARCTIC TREATY COVERS FOR SALE, NOW.** We have been sitting on a shoebox full of covers with the Postal Service's 10th anniversary stamp of the Antarctic Treaty, waiting for the appropriate time to do something with them. When the Postal Service announced they were going to acknowledge the 30th anniversary of the Antarctic Treaty with a 50-cent Air Mail stamp, we decided that several hundred of the beautiful covers from 1971 should be doctored up with the new anniversary stamp and pictorial cancellation. Philatelic brains Peter Barretta, Bill Littlewood, and Janice Harvis concurred, and so we sent 400 envelopes off to the Postal Service for "servicing." Originally we had hoped to be able to do it ourselves, but the Postal Service vetoed that idea, and said they would do it themselves.

We now have some 200 covers with the 1971 stamp to offer, as well as 250 combination covers with both the 10th and 30th anniversary stamps on them. We aren't very happy with the heavy-handed pictorial cancellation used on the new stamp, as there's a lot of ink and a lot of little black boxes floating around which only cover space. But let's look at it from the good side. Your Society is making 1) the only public offering of both first day cancellations on a single envelope, and 2) the pictorial cancellation with the "Antarctic Treaty Station" which is most unique, was used only for a limited number of covers (the generic "First Day of Issue" shows up on all commercial covers in stamp stores). From a collector's point of view, according to Littlewood, the most important factor is the cancellations themselves, and they are very vivid.

These covers are unique, and there aren't too many available. Until we can get a feel for sales, we will restrict availability of the 1971 Treaty stamp cover to three per member, of the combo covers to five. People buying the combo cover can, for an additional 50 cents, get an uncanceled 1991 50-cent U.S. Air Mail Antarctic Treaty stamp in a small cellophane envelope inside their souvenir cover.

1971	8-cent Antarctic Treaty stamp 1st Day Cover cancellation @ \$3.50	_____	_____
	(see top of cover page)		
	Same as above, but 3 covers	10.00	_____
1971	8-cent Antarctic Treaty stamp 1st Day cancellation, PLUS		
1991	50-cent Antarctic Treaty Air Mail stamp 1st Day cancellation?	4.50	_____
	(see bottom of cover page)		
	Same as above, but 5 covers	20.00	_____
1991	50-cent Antarctic Treaty Air Mail stamp	@ .50	_____
		Total	_____

The above is just a billboard of costs. Feel free to use it in any form you may want in ordering - as long as you include your check.

Make checks payable to the Antartican Society, and send your order to 905 N. Jacksonville Street, Arlington, VA 22205.

This is an Accidental Newsletter, as we aren't supposed to be writing one at this time of the year, but the 30th Anniversary Antarctic Treaty stamp brought us to Washington, and after we got here we found out there was going to be a very important vote in Madrid relative to a protocol for the Antarctic Treaty, so we decided we should put some words on paper before we headed back to coastal Maine. Naturally it is somewhat sad to see that the accord was not approved, but hopefully, this Administration knows what they are doing, and, hopefully, things will get done properly in due course. As in the format of all our Newsletters, what you read here is the sole voice of one member of our Society, and does not constitute any formal position of the Society on any subject matter which may accidentally show up on these pages.

**PROTOCOL TO ANTARCTIC TREATY ON ENVIRONMENTAL PROTECTION.** As we go to press, Assistant Secretary of State Curtis Bohlen and R. Tucker Scully, Director, Office of Ocean Affairs, Department of State, have not returned from the Madrid meetings where they voted on the comprehensive environmental protection protocol. Subsequent paragraphs which follow report on the meeting (as covered by the New York Times, Sunday, June 23, 1991; USA Today, June 24, 1991; Christian Science Monitor, June 24, 1991), as well as a couple of companion pieces (OP-ED article from the New York Times, Thursday, June 6, 1991, and the viewpoint of the President of the Scientific Committee for Antarctic Research from New Scientist, 30 March 1991).

We talked to Ray Arnaudo in the Department of State this morning (24 June 1991), and this important member of Tucker's staff remains optimistic that in due time, in the not-too-distant future, the United States will find ways and means of enacting some accord which other nations will accept. The United States apparently is not so much opposed to a 50-year ban on mining in Antarctica as they are that there is no satisfactory provision in the accord for allowing mining after the period of the ban, should any strategic or economically desirable minerals be found. They feel that this should be addressed now and not after such minerals are found, as nations might be more rational ahead of the act than afterwards. But this is just my interpretation.

Things are perhaps not as bad or as hopeless as they may appear from the various newspaper articles which follow. Ray did say that the decision level has gone above the level where normal Antarctic policies are determined, and that this is at the highest level of the government. So if you see Secretary of State Baker at your church, or should you be sitting next to him on Metro, be sure to tell him to stop traveling abroad and get to work on the Protocol to the Antarctic Treaty on Environmental Protection. Incidentally, this is not a short document at all, as we understand that a draft version of it last week was some fifty pages long.

USA TODAY, 24 June 1991, relative to their reporting on the Madrid proceedings, wrote "The new mining ban which was to be signed would prohibit mining and oil exploration for at least 50 years. The ban would continue after that until 75% of signatory nations decide to life it. U.S. delegates favored an easier method to lift the ban."

As the non-signing occurred on Saturday, 22 June 1991, those papers published only Monday through Friday, like USA TODAY, paid only token recognition to the accord's nonconcurrence.

Christian Science Monitor, Monday, June 24, 1991, said, "The U.S. scuttled plans in

Madrid to celebrate the Antarctic Treaty's 30th anniversary with a new accord, saying it needed more time to study a pact that would ban mining on that continent. Washington objected to a clause saying a ban could not be lifted after 50 years without the vote of all nations with full voting rights."

**U.S. OPPOSES ANTARCTIC MINING BAN NOW** (New York Times, Sunday 23 June 1991).

An agreement to protect the Antarctic from mineral exploitation for at least 50 years suffered a setback today when the United States said it would not endorse such a ban now.

Among the 26 Antarctic Treaty nations with full voting rights that had subscribed to the agreement when it was drafted here in April, only the delegation from the United States returned to the Spanish capital this week without Government approval. That disappointed many of the 39 Treaty members and environmental delegates who had hoped for a formal signing on Sunday, the 30th anniversary of the coming into force of the Antarctic Treaty.

"June 23rd is a totally artificial date as far as a decision is concerned," said the chief American delegate, Curtis Bohlen. "It would be a mistake to rush into one."

"My Government has decided that this is such an important question that it needs more time to consider," Mr. Bohlen said, adding that the delay does not necessarily imply that the accord will ultimately be rejected by the United States

... The draft accord, which would become a protocol to the Antarctic Treaty, would impose a 50-year moratorium on all mining in the world's largest wilderness. After that the ban could be reconsidered, but only with the consent of all 26 treaty signers with full voting rights

When the meeting opened on Monday, the American delegation submitted a proposed amendment allowing any country to dissociate itself from the ban if an amendment it proposed was not put into effect within three years.

Environmental organizations expressed dismay over what they called the "walkout" clause, which they said undermined the principle of consensus .....

The Australian delegate, Lyn Goldsworthy, expressed fears that the United States could undermine the delicate consensus achieved in April. "We're incredibly concerned that the U.S. may undo a very carefully negotiated position," she said. "You must remember that countries with important differences on other issues, such as Britain and Argentina, buried those differences in April for the common good."

The chief French delegate, Jean-Pierre Puissochet, said of the Americans today: "They were alone. I heard no voice sharing the U.S. view." Mr. Puissochet also accused the United States of trying to railroad the delegates by waiting until this week to propose the amendment.

But Mr. Bohlen denied taking a unilateral stance, adding that the United States could not accept the April text because it did not guarantee the right to modify the mining ban in future. "We want to be sure there is a fail-safe amendment process," he said. "Besides, our policy has been very consistently opposed to a permanent mineral activity ban."

Environmentalists' reactions to the outcome of this week's meeting ranged from anger to despair..... "The U.S. got 99 percent of what they wanted this week," said Paul Bogart, a Greenpeace official. "The fact that they didn't accept it shows the Administration is not interested in protecting the environment. The

two shouldn't even be in the same sentence. What we're seeing is a foreign policy extension of domestic policy of energy: the continued reliance on an addiction to fossil fuels," he said.

**WHAT'S THE HURRY IN ANTARCTICA?** (New York Times, Thursday, June 6, 1991).

Antarctica: remote, forbidding, unspoiled and, except for some scientists, tourists and fishermen, uninhabited. Environmentalists would like to keep it that way – forever. Others, tempted by the possibility of oil and mineral deposits, are loath to rule one-tenth of the earth's surface off limits to commercial exploitation.

Two months ago in Madrid, the 26 voting members of the 30-year-old Antarctic Treaty, including the U.S., tentatively settled on a compromise. It would prohibit mining for 50 years, after which the ban could be lifted only if all present members of the treaty concurred.

There is one big threat to final agreement – the U.S. Government; forces inside the State and Interior departments oppose final ratification. They believe that the 50-year ban is too long and the requirements for lifting it too severe.

That position is risky, ecologically and politically. Viewed from afar, Antarctica seems a self-contained ecosystem, so distant from the industrialized world as to be irrelevant. Yet trifling with Antarctica's fragile environment could have profound global consequences.

The frigid waters of the Southern Ocean, for example, absorb carbon dioxide far more efficiently than warm waters elsewhere. Carbon dioxide is the main contributor to the so-called greenhouse effect – the feared warming of the earth's atmosphere. Any warming of the ice cap and the adjacent waters by industrial activity would decrease the ocean's ability to act as a "sink" for carbon dioxide. A related danger is that oil spills and pollution would kill the photoplankton that play a major role in converting carbon dioxide into oxygen.

Antarctica's marine system is also unusually rich in nutrients. Because the Southern Ocean is a force in establishing global tides and currents, these nutrients supply much of the food chain. Scientists concede that some of their fears are speculative. But that is reason enough to provide far more time to assess the consequences of commerce.

In two separate measures last year, the House and Senate directed the Administration to work toward an "indefinite" ban on commercial activity in Antarctica. President Bush signed the measures and vowed to take a "leadership" role. For the Administration to reverse itself now would infuriate Congress, damage Mr. Bush's credibility and anger allies – who set aside their own commercial ambitions in favor of the 50-year ban.

Multinational oil and mineral companies have shown little interest in Antarctica's inhospitable terrain. Perhaps in 50 years they will. And perhaps by then ways will have been found to minimize the impact of ports, towns, storage facilities, waste disposal sites, roads, airstrips and pipelines. But even in that unlikely event, the decision to invade Antarctica ought never to be made lightly or quickly.

**UNACCEPTABLE THREATS TO ANTARCTIC SCIENCE.** (Richard Laws, President, SCAR)(from New Scientist, 30 March 1991). It should be clear to all that, for whatever reasons (particularly economic ones), imminent damage to the Antarctic environment from mining is a myth. There will not be any strong pressures for commercial minerals-related activities in the Antarctic for a long time, if ever. But if Antarctic

minerals should in future become essential to the world—despite their enormous cost—then whatever action is taken now to ban mining, a consensus will be found to reverse it.

This is likely to prove disastrous if the Antarctic nations do not leave in place realistic and practical regulations to control commercial minerals activities, should they take place. It will be extremely difficult to impose such regulations afresh if real pressures for exploitation arise. Thus, apart from tourism, research and its supporting logistics remain the only activities that are likely to be regulated in the Antarctic Treaty Area in the foreseeable future.

The blame for the wrecking of the Convention for the Regulation of Antarctic Minerals Resources Activities (CRAMRA) lies with a number of vociferous, well-financed environmentalist groups. These groups succeeded in influencing governments through their lobbying and campaigns before and during the Chile meeting. They make much claim for the "ecological fragility of Antarctic life forms and ecosystems." Such a claim, however, is questionable.

..... Where there is a permanent scientific station, the impact may be relatively large, but it is extremely localised. Even airborne pollution is very limited; for example, 10 years after the building and occupation of one fairly large station, monitoring showed accumulation of heavy metals in lichens—but only to 250 metres away, even downwind.

I would maintain that the "footprint" of a scientific station, in terms of significant pollution, is on average probably no more than 2 square kilometres. It is impossible to portray these stations objectively on a map of the Antarctic because realistically, instead of a number of large black dots, they should be microscopic. However, there are about 50 occupied scientific stations, and therefore about 100 square kilometres of the Antarctic may be "significantly" affected, while 99.999 per cent remains virtually unaffected by the impact of human activity.

**ANTARCTIC TREATY 30TH ANNIVERSARY STAMP, CEREMONIES, AND PEOPLE.** By this time you all have probably seen the new 50-cent U.S. Postal Service Antarctic Treaty Stamp issued at the State Department on 21 June. We think the stamp is really beautiful, but there are many of us Antarcticans, including old Bob Allen, Long-Time Keeper of Antarctic Photography for the U.S. Geological Survey, who think the Postal Service in their Philatelic Release #42 of Stamp News perpetuated a fraud upon unsuspecting citizens when they wrote "The Antarctic Treaty stamp, designed by Howard Koslow of East Norwich, New York, features a dramatic view of McMurdo Sound, the operational and scientific hub of American activities in Antarctica. Observation Hill on Ross Island is in the background." Bob was so upset that he went directly downtown to raise a little hell about it, and he convinced the Postal Service that it had to be a scene from the Antarctic Peninsula. We agree with Bob, as there are two published photos in coffee table books of Antarctica with almost identical pictures. Meanwhile Bob Rutford says he can show you a McMurdo picture similar to the stamp! But it sure isn't Observation Hill, and the Postal Service told Bob Allen that they would come up with a corrected release on the stamp!

The stamp finally came out with the USCG GLACIER superimposed at sea. The artist originally had put in a Scandinavian icebreaker, but people in the State Department thought it should show an American ship, so the GLACIER was put in. Now the question is whether the GLACIER was the appropriate ship to put onto an Antarctic Treaty stamp, as some could argue that the Coast Guard is part of our military hierarchy, and as such should not be shown on an Antarctic Treaty stamp! But isn't the Coast Guard under the Department of Treasury, not under the Department of Defense, and don't icebreakers kill ice and not people? Anyway, the stamp is real pretty.

The ceremony was well attended by the Antarctic community. There was a large flock of birds there, including both of Admiral Byrd's daughters, Boiling Clarke from Media, Pennsylvania, and Katharine Breyer from Los Angeles. In addition, two grandchildren, the very personable Robert Byrd Breyer, former master builder who led the construction crew in putting up the current South Pole station, and his sister, Louise, of Williamsburg.

Two people who had a very special interest in the Antarctic Treaty stamp were the immediate family of the late Ambassador Paul C. Daniels, architect of the Antarctic Treaty and our Society's first Honorary President. They were his widow, Teddy Daniels of Lafayette, Louisiana and Lakeville, Connecticut, and his daughter, Jean Portell of, hic, Brooklyn, New York. How could a daughter of Ambassador Daniels actually live in Brooklyn.

There were also lesser lights, and one of the lesser lights was good old Si Roman, former NOAA employee who is on our Board of Directors. He recognized the magnitude of the occasion and brought with him in a nice brown bag six bottles of ice-cold Brazilian beer "Antarctica". What a way to baptize an Antarctic stamp, and to think old Si got it through the detection system at Foggy Bottom. So thanks to Si, Bob Breyer and I both walked out with a cold one to celebrate later! And then there was sort of an unofficial, unannounced short-dress, short-skirt contest which was won handsomely by a good two inches or more by the heir apparent to this column, a Scott Polar Research Institute-bound lassie whose initials are P.B.D. The not-so-saddened runnerup was the Staff Director of the Polar Research Board. As Billie Jean King once said about a healthy unknown tennis player by the name of Epstein who had an unfortunate occurrence at Wimbledon, "If you have them, flaunt them."

If you were there for stamps (covers), there was Brian Shoemaker of the HERO Foundation in Reedsport, Oregon. This old pilot had conscripted another of the ancients and honorables, Bob Newcomb, former navigator on the GLACIER, to lick stamps and put them on the HERO Foundation cacheted envelopes. Of all the philatelists licking stamps, Bob had it programmed best, and was a human dynamo machine. Brian's cachets were certainly colorful, showing an architectural drawing of the proposed HERO Foundation facility at Reedsport; the HERO, which they currently have; the GLACIER, which they are trying to get; a Tucker Sno-Cat from the Commonwealth Trans-Antarctic Expedition, which is promised; and, not to leave anything out, QUE SERA SERA, the first plane to ever land at the South Pole, which is currently sitting behind some hangar in Pensacola, Florida. Brian is selling his cacheted envelopes as a fund-raiser for the HERO Foundation. In the words of the legendary Antarctic, Larry Gould, "I like any color as long as it is red." Larry would love Brian's cachets - they are nice ones!

When you think about polar stamps in this country, there are many names which come to mind, including our own Peter Barretta, Bill Littlewood, Mort Turner, Carl Fisher, Charlie Burroughs, and John Kennaley in the Washington area. But the Queen of Polar Philately in this country has to be Janice Harvis of Cinnaminson, New Jersey. She has some sort of hypnotic power over her husband Herb, and this nice guy goes along with her act and aids and abets her addiction to polar philately. So the Janice and Herb Show was in action with their American Society of Polar Philatelists' cachets, a tastefully, subdued outline of Antarctica with a listing of the signatory nations, the consultative nations, and the acceding countries. My only question is, "Don't the Ross Ice Shelf, the Filchner Ice Shelf, and the Ronne Ice Shelf belong to Antarctica?" Their artist left them off, although it's not a big deal one way or the other.

**BERT CRARY, TRIPLE THREAT SCIENTIST.** When you think of U.S. Antarctic scientists you think of Larry Gould for the 1920s, Tom Poulter for the 1930s, Paul Siple for the

1940s, Bert Crary for the 1950s, and then the picture gets fuzzy with multiple choices. But we are proposing to you that perhaps Bert Crary may well be the best choice for the century, as Bert was truly triple threat - he was an indefatigable field worker who was cross disciplined in nearly all of the geophysical sciences, he was a thorough researcher who analyzed and published his results in near record-breaking time, and was a successful administrator during the International Geophysical Year (deputy Chief Scientist for the Antarctic), and immediately afterward was Chief Scientist for the United States Antarctic Research Program at the National Science Foundation.

How often do you find a man who is proficient as a field investigator, as a research analyst, and as an administrator? Not very often, and we don't know of another Antarctic in the United States who could/can match him. We know of no one who has had the impact that Bert Crary has had; the U.S. programs in Antarctica were developed with his blessings as he was the first chief scientist on the Antarctic at NSF. Even in this position, he was not chained to an administrative desk, as he still found time in the early 1960s to lead the first U.S. oversnow scientific traverse to the South Pole. Maybe he was never happier than when he was in the field working his butt off with a bunch of young studs, as no matter who was with him, he was the most experienced, he was the strongest, he was the most eager.

Larry Gould is certainly Antarctica's most legendary living American, and no one who has ever heard Larry lecture or talk on Antarctica will ever forget the thrill of hearing this golden-tongued orator. Larry sort of disappeared from the Antarctic scene after the 1928-30 expedition, resurfacing twenty-five years later when the IGY came along. The late Paul Siple certainly dedicated a lifetime to Antarctica; he was there in the 1920s, the 1930s, the 1940s, the 1950s, and the 1960s; and he was the Army's foremost authority on polar clothing and survival. Siple was very versatile as a geographer, had multiple scientific interests, but he really wasn't as much of a field scientist as Crary, nor was he directly involved in determining national Antarctic research programs. Neither Gould nor Siple could touch Crary for his versatility as a scientist. He was an IGY team all by himself; he had worked in meteorology, he had worked as a seismologist, he had worked in geodesy, he had worked as a glaciologist, he had worked as an oceanographer, he had worked in gravimetry, et cetera. About the only Antarctic honor which Bert never achieved was being president of the Scientific Committee for Antarctic Research (SCAR), but this may have been too far removed from the front lines where the real action was for Bert. Also there was a pretty good incumbent there for many, many years - Larry Gould.

When the IGY came along, someone with infinite wisdom, we know not who, appointed Bert Crary as the Deputy Chief Scientist (to the late Harry Wexler, Chief Scientist). The appointment was made early on, and was a wise choice. Bert had no Antarctic experience, but he had a good track record in the Arctic. The position called for someone from the "outside", as it meant that he could occupy the slot without being shackled as a member of an old boys' syndrome. Siple, a most loyal Byrd supporter, was sort of suffocated by the Navy at the South Pole; if he had been appointed Deputy Chief Scientist, there would have been open warfare with the Navy. Another camp leader, Carl Eklund, our Founding President, was an Antarctic man who came without the Byrd label, and as a hale and hearty good fellow lead his own men in the Banana Belt through a fun-loving year. The only camp which had any problems was Ellsworth, where the late Finn Ronne wore uneasily both hats, scientific and naval leader. He and his men were on the radio to Bert for arbitration throughout much of the winter, and it will be very interesting to see how Bert reviewed those episodes in his polar autobiography which Mildred is now fine-tuning before its forthcoming publication by The Ohio State University Press. And insofar as George Toney and Byrd Station were concerned, their only major problem all winter was how to divide one case of beer among all persons in camp for the whole year.

Bert was so laid-back, so easy-going, that nothing much administratively floored him. There was a problem early on when Captain Willie Dickey, senior Navy officer at Little America V, approached Bert about the Navy's discontent in supporting the scientists, and told Bert that he wanted the civilians to share KP duties with the Navy. Without batting an eye Bert came back, "Sounds like a damn good idea to me, Willie. Why don't you and I initiate the program tomorrow?" That ended that hairbrained idea right then and there. What an administrator!

No one ever worked harder in the field; no one ever worked longer hours; Bert worked himself to near exhaustion. He was relatively young then, he was a bull, but you can't help but wonder if it didn't come as a cost to his health. My favorite picture of Bert was one in a now defunct magazine, LOOK. When they sent a photographic team out to capture the flavor of the first Ross Ice Shelf traverse, one photographer caught a candid picture of a very tired looking, bearded Crary with a can of beer tilted to his ear. The custom then was, as I'm sure it is today, to slowly tilt a can of beer before opening to make sure it wasn't frozen.

If one of those so-called polar biographers like the guy who undressed Byrd were to read diaries of camp personnel who wintered over with Bert, he/she would get a very unrealistic picture of what Bert was really like, as he was such a character that you had to write about him. To get approval to send a message to your home office meant a visit to his room after dinner, and no messages got approved until you had had a beer with Bert. However, this was a working opportunity for him to find out how your program was going, what you planned to do in the upcoming days and weeks, how you yourself were doing personally. He never wasted a waking minute. Our every-other-Saturday night bash always found him talking first to Navy chiefs whose help he needed in getting some camp function accomplished.

Bert was the same way back in the States. Shortly after Charlie Bentley married the lovely Marybelle, there was a glaciology meeting of some kind in Madison. The Bentley: hosted a very wet party, with hardly a sober soul at the end of the evening. But I remember distinctly Bert siding up to the very professorial Heinz Lettau and saying, "Heinz, I sure would like to see that Little America report get out." It was just the incentive to get the necessary help from Lettau that I desperately needed for our micrometeorological report. And it got results. When Bert spoke, people listened.

There are infinite numbers of Crary stories, and it's too bad they haven't been chronicled. When the IGY was in the planning stages, there was a meeting in Stockholm (or some other Scandinavian city). Bert sort of looked like a rugged Russian, and, naturally, had that big black paint-brush mustache. There were many Russians at a dinner, and after the evening was over, this waitress came up to Bert and said, "When you get back to Moscow, will you tell your people that we are in sympathy with you?" Bert assured her that he would! -- And there's the story about when he was in Edinburgh and wanted to find a shop where he might be able to get a piece of a tartan that the Crary clan was authorized to wear. He found out about this little place off Princess Street where some little old woman had every tartan ever conceived. Bert went to the address, knocked on the door, and when he said he was a Crary, the woman slammed the door in his face, screaming something about the Crarys being the scourge of all Scotland. --- I also understand that he lost his partial on his traverse to the South Pole, and his reaction was, "I probably lost it in the bilge; when we get to the Pole, we'll probably find it."

If Bert had been a Brit, he would have been knighted just after the IGY. Didn't they knight Bunny Fuchs for leading a bunch of machines and veteran polar people across Antarctica? Anyone who led a camp with the likes of a retired Marine Corps colonel (Carl Wyman), a German God-knows-what whose only regret was that The Fuehrer never awarded him the German Cross (Peter Schoeck), an irascible fugitive from Montana mines and the sidewalks of New York (Wild Bill Cromie), a meteorological technician

plucked out of a midwestern bar at the last possible second (Sam Wilson), a Weather Central chief who never once stuck his nose outdoors during the four sunless months and ran a Stateside office (Bill Moreland), plus yours truly, deserved the very highest of honors. There is a Chair for Crary at the University of Wisconsin, and there are some mountains and an ice rise named after him, but there should be something that more people could see, as he was a real human being, a man's man, yet also a very soft and understanding person.

He was about the nicest guy you would ever want to meet, and to have wintered over with Bert was the ultimate. But I think anyone who was ever associated with Bert in any capacity would say that their association with him was the ultimate. He was probably the most unpretentious polar scientist of nobility who ever trod on snow and ice. So many of us owe so much to Bert for what he did for us, for showing us the way, that there should be some permanent recognition of who he was and what he did to inspire future generations. As a person he was so unassuming that people who may have just met him casually or socially probably never realized that he was such an outstanding scientist and man.

**HENRY HARRISON, NO.1 AMERICAN METEOROLOGICAL SOCIETY (AMS) CERTIFIED CONSULTING METEOROLOGIST, DIES AT AGE 87.** The glue that held members of Byrd Antarctic Expedition I (BAE I) together, Henry Harrison, died at age 87 in a retirement home in Asheville, North Carolina on 21 April, 1991. We in the Nerve Center felt a special kinship to this fine gentleman, and have over fifty letters and cards from him in our files. It is a shame that his late years were saddened by a masquerading biographer of Byrd abstracting from Henry's polar diaries in such a vein as to make Henry look like a Byrd antagonist. Nothing could have been further from the truth, as Henry was a staunch Byrd supporter throughout his whole life.

Henry's early years were spent in Worcester, Massachusetts. He later came to the Washington area, and went to work for the U.S. Weather Bureau in the mid-1920s. He was an airway forecaster at the New York Air Mail Terminal at Hadley Field, New Jersey, before being selected to go south with the Byrd Antarctic Expedition of 1928-30. Upon his return to the States, he became an airway forecaster for the Weather Bureau in Cleveland, Ohio; then later a flight dispatcher with United Airlines. During World War II he was an Army lieutenant colonel, and was Chief of Staff Weather Officer for the Yalta Conference and head of the Far East Air Force Weather Service. Returning to United Airlines after the war, he was Manager of Weather Service (1948) and Director of Meteorology (1956).

He was with United Airlines for 33 years, and made many contributions to aviation meteorology. He wrote papers and developed research on such subjects as prefrontal squall lines, upper air phenomena and multiple route flying, which paved the way for successful operation of commercial jet aircraft. He worked in developing airborne weather radar and forecasting of hail storms. He became the recognized authority on mountain wave effect, which causes turbulence near mountains; he did important research in clear air turbulence and its relation to the high altitude jet stream. His study of fog dispersal through aerial seeding also commanded much attention. He was the first meteorologist in this country to be certified as a consulting meteorologist by the American Meteorological Society.

Henry Harrison was the recipient of The American Institute of Aeronautics and Astronautics' Losey Award (1953), The University Recognition Medal by the University of Colorado (1958), The AMS Award for Applied Meteorology (1960), The Flight Safety Foundation Award (1960), The Front Range Squadron Award, The W.A. Patterson Award (by United Airlines) in 1966, The Edgar S. Gorrell Award of the Air Transport Association (1972), and The AMS Special Award (1984).

Henry was a sportsman, too, and baseball was his true love. His cards and letters

are sprinkled with his thoughts on baseball, tennis, golf, football, and basketball. His early-day heroes were Walter Johnson and Ty Cobb, a couple of pretty fair country players. But with inflated player salaries, Henry wrote in 1981 that golf was the only game with which he could "relax".

Henry and aviation mechanic Benny Roth had a harrowing experience shortly after arriving at Little America. They were standing on the barrier on 31 January 1929 when part of it calved off and they were catapulted into space. Henry grabbed a line and was hung out to dry dangling over the edge of the barrier. Benny was less fortunate, and ended up in the Bay of Whales, becoming the best high diver and cold water swimmer in camp. He grabbed hold of a cake of ice, and somehow managed to survive in the 28° water until he could be rescued. In the process of rescuing Benny, probably the first Jew to ever winter over in Antarctica, they almost had another tragedy, as too many jumped into the rescue craft and one guy, Malcolm Hanson, had to jump overboard himself so that the whole lot wouldn't go under! Meanwhile, Doc Coman dropped a looped rope to Henry in which he could put his foot, and it all led to another day and many more aviation forecasts, to say nothing of countless bridge hands. Henry was Byrd's bridge partner through the long Antarctic night, and kept a running total of how they fared.

Henry used to publish and distribute BAE I News to all members of his expedition, although he stopped doing it a couple of years ago when his health started to fail. Henry may have died from Alzheimer's disease, although results from an autopsy won't be known for several more weeks. The remaining members of BAE I are the legendary Larry Gould, who will be 95 on 22 August, radio operator Howard Mason in Seattle, and the irascible Norman Vaughan in the boondocks of Alaska with his young bride and teams of huskies. Henry is survived by his wife, Grace (1617 Hendersonville Road, Asheville, NC 28803), one daughter, three grandchildren, and countless friends in meteorology and climatology, to say nothing of many, many Antarctic friends. Harrison Nunatak, 72° 29'S, 96°05'W, on Thurston Island was named after Henry. Henry was one of the real nice guys, and we'll miss him.

**ANOTHER ANTARCTIC ARCHIVAL POSSIBILITY, CRREL.** We recently received a letter from Librarian Nancy C. Listen of the Cold Regions Research and Engineering Laboratory (CRREL) in Hanover, New Hampshire, relative to their new Technical Information Analysis Center. Ground for the building will be broken in the spring, 1992, and they expect its completion in the summer of 1993. Nancy has discussed the issue of archiving Antarctic material with CRREL management and "they have agreed we would be pleased to provide a depository." She went on to say, as nearly all of you know, that "CRREL has done Antarctic work in certain areas and is considered the world's foremost collection of cold regions scientific and technical information."

There are many things that I like about CRREL serving as an Antarctic repository. First of all, I'm a provincial New Englander, and I don't really consider anything west of the Hudson River a viable option - it's all sort of a wasteland where people not fortunate enough to live in New England have to exist in order to feed and clothe their families. So the location is great! And who could afford to fund a facility for achieving anything except our military, and CRREL is military. The "build it and they will come" philosophy could very well apply to CRREL's Technical Information Analysis Center being an Antarctic repository.

As a former Corps of Engineers employee, I saw with my own eyes how many people at CRREL worked almost entirely independently of any real military mission, so with their ingenuity they could possibly snowball the Corps' Washington headquarters into anything! Being a repository is close enough to CRREL's overall missions that it could very well be a great marriage. Hanover is also a great place to visit, and even if Tony Gow doesn't invite you to his home for a cookout, there are some good places to

eat locally. I also like their Technical Director, Ed Link, a personable young man who I think is a good one.

There really is nothing as unwelcome as an old retiree coming back to harass the troops, but if this does become a reality, perhaps on Armed Forces Day or Flag Day or the Corps' Birthday, they could have open house and people could all visit CRREL and see their diaries and journals and memorabilia.

**KIWI EVACUATED BY AMERICANS FROM MCMURDO ON 4 JUNE 1991.** Peter Harding, an engineer at Scott Base, was suffering from ulcerative colitis, so a decision was made to have him evacuated in midwinter. The only planes capable of flying into Williams Field in midwinter are the ski-equipped C-130s based at the Point Mugu Naval Air Station in California. Two planes took off from California on 31 May, but only one was in fit enough condition to go to the ice after reaching New Zealand. Actually it would have been pretty hard to put the guy into two separate planes, so one plane did the job very nicely. It was the first midwinter landing in Antarctica in nearly 24 years, the seventh overall - the first evacuation was at Byrd Station in April 1961. Evidently the early June flight was routine, with cold temperatures, clear conditions; the turn-around time on the ice a mere ninety minutes. The patient arrived safely in Christchurch, and was softly ensconced in a hospital bed shortly after Commander Wayne Reeves landed his C-130 in Christchurch. Another victory for C-130s and international cooperation.

**SNOWFLAKES.** Can you believe that Larry Gould (9451 E. Rosewood Ave., Tucson, AZ 85710) will be 95 on 22 August? How time flies! It seems like just yesterday that he was the Cosmos Club's Man of the Year, except it was called the 18th Annual Award! But it was ten years ago! .... It turns out that Mort Turner is another five-decade Antarctic, because he first went to the ice back in November 1959 and has been there every decade since. So the confirmed are Charlie Bentley, George Denton, Bob Rutford, and Mort. The jury is still out on Sayed El-Sayed and David Elliot Ken and Mary Ann Moulton have seen the light, and have bought their retirement dream house in Nobleboro, Maine. If you don't know where it is, you will never find it, as all it is is a gradual bend in the road near Damariscotta, which is just beyond Wiscasset, which is beyond Bath, which is beyond Brunswick, which is north of L.L. Bean in Freeport - who everyone knows Moe Morris, former VX-E6 pilot, turned author, is something else. Before General Schwartzkopf had even hit the States, Moe had a biography about him out on the streets, "H. Norman Schwartzkopf, Road to Triumph." In case you want to read it or contribute to Moe's private retirement fund, you can buy the paperback for \$4.99 at your favorite book dealer. Publisher is St. Martins' Press Charlie Bevilacqua writes that Operation Deep Freeze I and II will be having their third reunion in April 1993, in Gulfport, Mississippi. Then a week later Deep Freeze IV personnel will reunionize in Nashville. Anyone wanting more info can call Charlie (617) 933-4525, or Jim Bergstrom (703) 978-6541. And I'm sure Mel Havener can give you all the details (805) 987-8158).

**FAMOUS ANTARCTIC CHEF DIES.** Sigmund S. Gutenko, who was 86 years old and a veteran of the U.S. Antarctic Service Expedition 1939-41, and the Ronne Antarctic Research Expedition 1946-48, died on May 27, 1991, at the Veterans Affairs Medical Center, Perry Point, Maryland, of complications from diabetes. He had been there for six months. Prior to that he had lived in Valdosta, Georgia for the past 18 years. He was buried in Arlington Cemetery with full military honors. (Obit to follow in next Newsletter)

If you move, please send us your new address.

Have a good summer!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 91-92

September

No. 2

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guthridge, 1990-92

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

Paul C. Daniels

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Sayed Z. El-Sayed, 1990

*1991 Paul C. Daniels Memorial Lecture*

Antarctica, 1950-1990

The Changing Scene

by

Dr. Charles W. Swithinbank  
Antarctic Superstar  
Cambridge, England

on

*Tuesday evening, 22 October 1991*

*7:30 PM*

The National Academy of Sciences  
2101 Constitution Avenue NW  
Washington, D.C.

*Reception in the Great Hall at 5:45 PM*

*Dinner in the Great Hall at 6:30 PM*

The National Research Council's Polar Research Board and the Antarctic Society are combining forces to bring you the renowned Dr. Charles Swithinbank as our annual Memorial Lecturer for 1991. This former Head of the Earth Sciences Division, British Antarctic Survey, Scott Polar Research Institute, is the only scientist to have worked in Antarctica for six decades. He is still active, working on interpretation of satellite photography for Antarctica, and is an expert on landing sites (blue ice runways) all over the continent. *Don't miss Charles, as he is truly outstanding!*

This is our 10th Memorial Lecture gala at the National Academy of Sciences. The cost this year is \$35 per person. Shere Abbott takes reservations from Board members - Ruth Siple from Society members. Please send checks, made out to Antarctic Society, to Ruth (905 N. Jacksonville St., Arlington, VA 22205).

1992 Antarctic Calendars (New Zealand variety) SOON TO BE ON SALE (see page 10)

The team of Siple and Dalrymple are now into their 14th year of Antarctic Society dictatorship, and this is our 80th Newsletter (the Society's 99th). We also do miscellaneous and sundry other things, such as communicating with a lot of OAE's (old Antarctic explorers), answering all kinds of mail, selling down through the years calendars, cachets, scarves, belt buckles, postcards, posters, books and mugs. Ruth is the workhorse of the Society, and does all the leg work graciously without fanfare or compensation. She also is the lightning rod for yours truly. There is a certain amount of enjoyment in being able to write tongue-in-cheek anything you want about Antarcticans without censorship or reprimand. We have not seen any loaded pistol in recent years, so we must be softening. However, as long as we are writing these things, don't put too much stock in their authenticity, as our motto will always remain "Don't let the truth get in the way of a good story." Happy reading!

**GOOD NEWS - BAD NEWS.** Our membership is down (31 members) to 610, which is encouraging news when one has to fold and stuff envelopes. The real good part of it all is that our membership has a higher proportion of old Antarcticans who once served on the ice, who are now looking for anything about the land of snow and ice that they once called their own. We still would like to have more of the current crowd, but perhaps they are so involved with their own Antarctic activities that they don't need a fix from some Newsletter.

Our dues notices were mailed on 9 September, and we hope that those who receive them will renew for multiple years as it materially helps us in the Nerve Center if we don't have to send out six hundred notices every year. Dues remain the same - single - \$10, husband/wife - \$12, foreign (except Canada) - \$15. It helps, too, if those of you who got bills pay up front at an early time, so we don't have to send out second and final notices. There was a time when we used to keep after delinquents, but no more. It has been our experience that when people don't reply to second notices, they just are not going to renew. So we will no longer badger delinquents. And one other reminder - if you move, PLEASE let us have your new address, as bulk mail is NOT forwarded.

**BAD TIMES BESET GENTLEMAN JIM.** It was devastating to all Antarcticans around the world to hear that Gentleman Jim Zumberge has a brain tumor which was diagnosed originally as being terminal. A biopsy was performed on 21 August, the results of which showed a low grade tumor. Jim has to go through six weeks of five-a-week radiation treatment, and completed the first two weeks on 6 September. We talked to him on the 7th, and Jim's spirits are very high and he remains cautiously optimistic. His home address is: 3201 La Encina Way, Pasadena, California 91107.

They don't make nicer guys than Gentleman Jim. Since Day One we have always called him Gentleman Jim, and he certainly merits the nickname. Anyone who ever came in touch with Jim was enriched by the occurrence. We met him early on in his Antarctic days, when he came to Little America V in October of 1957, prior to setting up his field study program at Roosevelt Island. It was obvious to those of us who labored throughout the winter, without getting too much support from Navy personnel, that we weren't using the right bait, because when Zumberge hit the camp, my diary shows that he brought a footlocker full of booze to bribe the Navy. He had them in his hip

pocket for the rest of the summer! And what an entertainer! He made our Occasional Saturday Night party into a memorable event which lasted interminably, and then a few short hours later was finally making music flow from the Wurlitzer organ in the Chapel. Prior to Zumberge's arrival, Boy Scout Dick Chappell had tried to get hymns out of that same organ, but it wasn't until Jim got there that we actually found out that the instrument could really make music.

We have been after Gentleman Jim for a Memorial Lecture for many years, and he always had a valid excuse, like the Olympics being held in Los Angeles to fund-raising for the University of Southern California, but upon his retirement as President of the University, we finally had him where we wanted him, and he had agreed to be our Memorial Lecturer on 22 October of this year. Now he has been waylaid on the road to the forum, so we will have to wait for another year to hear Jim, but he's worth waiting for. In the meantime Jim, keep up the fight; our thoughts and prayers will be with you.

**PETER ANDERSON, NOTED ANTARCTIC HISTORIAN, IS HOSPITALIZED.** All polar people were saddened to hear the news in mid-July that Peter Anderson of the Byrd Polar Research Center at The Ohio State University suffered an aneurysm on 20 July, and is in pretty bad shape in the Riverside Methodist Hospital (3535 Olentangy River Road, Columbus, Ohio 43214). As we draft this Newsletter on 8 September, Peter has recently spoken a few words and is now able to recognize people. The prognosis is that he will remain in this hospital into December when he will be transferred to another hospital. His right side was affected more than his left side, and it is our belief that Peter was in a coma for some time. It seems that he was at home on 20 July, did not feel well, went to the hospital, and they operated on him the following Monday.

When something happens to a person like Peter, it only points up the fact that this country is woefully weak on true Antarctic historians. They are just not out there. We don't truly know of a bona fide U.S. Antarctic historian outside of Peter. He certainly is this country's foremost authority on the late Admiral Richard E. Byrd, as well as on polar aviation and polar fliers.

The Polar Times temporarily folded their tent when the Editor, August Howard, died three years ago, and Peter was the heir apparent to keep the semi-annual publication alive. The Byrd Polar Center and Peter took it over, and it was our understanding from talking to Peter this past spring that he was going to put out the first issue since December 1985 sometime this summer. So with Peter's hospitalization, the Polar Times goes on hold, as well as Peter's biography on Byrd. ... All of us send very best wishes to Peter for continued recovery in the weeks and months ahead.

**MALCOLM MELLOR, POLAR AUTHORITY, SUCCUMBS AT TENDER AGE OF 58.** Malcolm Mellor has been kicking around polar regions for years, and was a veritable gold mine of information on various polar things, but his career and life came to an abrupt halt when he suffered a heart attack on 24 August. His first trip to Antarctica was with the Aussies back in 1957, and his most recent trip to the ice was last year when he was fighting the good fight trying to make an air strip at McMurdo which would sustain wheeled landings of aircraft.

Malcolm was polarwise, and never was a shrinking violet when it came to expressing himself. In a letter to us of 3 April 1991, he wrote:

So far the runway experiments have had limited resources: Budget, \$15.95 plus tax; Equipment, Swiss Army knife; Work Force, not to exceed two, including minorities and handicapped. Now it looks as though Peter might buy us some toys.

We do realize that if God had meant real aeroplanes to go to Antarctica

in February, he'd have made the sea ice last longer. And if he meant there to be progress in Antarctic aviation, he wouldn't have invented VXE-6.

Incidentally, he ended that letter with a P.S. "The creep tried to get rid of me this year - heart disease - but I finally got a waiver."

We understand that when Malcolm took his Antarctic physical last year the physician found that several of his arteries were being clogged - one as much as 30%. Malcolm was an active man, and thought that if he ran more, rowed more, exercised more, ate a better diet, all could be remedied. This past August he took another Antarctic physical, and found that things had become considerably worse. Malcolm became very despondent, and in typical Mellor fashion started studying everything he could get his hands on relative to his condition. He made the decision that he should undergo heart surgery, and he knew if all went well, which he truly expected, that in five weeks time he would be in good enough health to go back to Antarctica with the Russians this austral summer. So he scheduled himself for surgery on Tuesday, August 27th. Saturday, the 24th, after mowing his lawn, he dropped dead.

A memorial service was held in Hanover on 10 September. People who may want to contribute to his favorite charity should send donations to the Howe Library in Hanover.

**IMMORTALITY KNOCKS.** Certain editions of Sports Illustrated on 12 August 1991 carried an account of a softball game played at Little America V on 25 August 1957 when the Navy Seabees upset the IGY scientists in a Return-of-the-Sun game played at  $-41^{\circ}$ . Jay Feldman, a free-lance writer for Sports Illustrated found out about the game through a contact with Blackie Bennett, erstwhile professor at Michigan State who left a lot to be desired as a softball player. I was the camp resident sports nut, organized the game, painted the softball international orange, and was the genius manager of the scientists' team - at least for one inning. Jay contacted me about the game about nine months ago. I told him that an account of the game had been forwarded to the Baseball Hall of Fame in Cooperstown, and that it was on file there. Jay contacted Cooperstown, they provided him with a copy of that account, and so eventually his article appeared on the pages of Sports Illustrated. Of all the unlikely guys to see the article, Phil "Crevasse" Smith, Executive Officer at the National Academy of Sciences, waylaid in a plane with mechanical trouble, picked up the magazine for want of any others, and found the article, and then forwarded a copy to me. Here is the article as it appeared in some issues of Sports Illustrated:

#### *EVERY HIT WAS A FROZEN ROPE*

*The crucial stat was on the thermometer—41 below—during an Antarctic ballgame.*

In August of 1957, when a portion of the sun finally appeared above the northern horizon after four months, a festive mood overtook the men at the Little America Station in Antarctica. Little America, at  $78^{\circ}11'$  south latitude and  $162^{\circ}11'$  west longitude, was one of seven Antarctic bases the U.S. staffed in conjunction with the International Geophysical Year (IGY), a multinational research project.

To IGY micrometeorologist Paul Dalrymple, the arrival of "spring" meant one thing—baseball. Dalrymple was the resident sports nut. Each day he posted the baseball scores he got on his shortwave radio. He also wrote a sports column in the base newspaper, The Penguin Post, under the byline Scroungy Redbeard.

To celebrate the return of the sun, Dalrymple organized a softball game between the two groups stationed at Little America, the IGY scientists

and the Navy men. "Of the 109 people at Little America, only 23 of us were scientists," says geophysicist Hugh Bennett, now a professor at Michigan State. "The Seabees were there to support us, so from their viewpoint, we were pampered. There was a bit of friction. They used to refer to us scientists as Sandcrabs."

On the afternoon of Sunday, Aug. 25, with a black bat, a ball painted international orange and trail markers for bases, the Sandcrab Tigers and Navy Seabees took the field at Seal Stadium, a firm expanse of snow near the base. The weather was clear and calm—and -41°. The intrepid few who started off wearing baseball gloves quickly discarded them for heavy horsehair work mittens.

At 2 p.m., IGY weather technician Sam Wilson stepped into the batter's box. Because of the frost on his glasses, when Seabee pitcher Eugene Black peered in for the sign from his catcher, Hector Lett, he could barely see his receiver, let alone decipher a signal. A brief conference ensued, and the Navy battery decided to stick with fastballs. Wilson went down swinging.

Later in that inning, physiologist Fred Milan took a mighty cut-at the ball, which came to rest two inches outside the batter's box. Starting for first, Milan slipped on the snow and fell. Lett, attempting to field the ball, fell on top of him. Milan struggled to his feet but was bowled over by Black, who came barreling in after the ball. Sensing the futility of trying to get up, Milan—to the delight of the 12 or so spectators—scrambled to first base on his hands and knees, just beating the throw. At the end of their half of the inning, the scientists had a 3-0 lead.

Pitching for the scientists, Dalrymple struck out two, and at the end of one inning the score was 3-1. Bert Crary, the IGY's chief scientist in Antarctica, announced, "O.K., we quit." Dalrymple wouldn't hear of it, and the game went on.

The Tigers scored three more in the top of the second and appeared to be headed for the Antarctic championship. But when Dalrymple went out for the bottom of the inning, he had nothing left. After Scroungy Redbeard had been driven from the mound, weather observer Gene Harter took over, but he was unable to put out the fire. "One of their most effective hits was a short fly," remembers Tiger shortstop Dick Chappell, now a biology professor at Hunter College in New York City. "The fielders had trouble running in the snow to get to the ball, and then we had to dig to find it. As much time was spent digging for the ball as throwing it."

In centerfield, Bennett's glasses had frosted over, and when Seabee first baseman Red Grain smashed a deep fly his way, Bennett couldn't find the ball, and Grain circled the bases. Dalrymple summoned meteorological observer Ben Remington to take over as Tiger pitcher. Capping the Navy comeback, leftfielder John Hriscina, a muscular 19-year-old, greeted Remington with a shot to right center, which the hapless Bennett again lost in the frost. By the time Bennett ran the ball down, it had rolled to the edge of Crevasse Valley, a steep drop-off of several hundred feet, and Hriscina had an easy home run.

When the inning ended at 2:45 p.m., Navy was ahead 11-6, and the game was called on account of darkness and frostbite. "At minus 40, it doesn't take much to produce frostbite on any exposed skin," says the now-retired Dalrymple. "I never saw so many frostbites at one time."

Nevertheless, the participants greed the game had been fun. "It was extremely cold," says Bennett, "but we were very happy to be out there acting foolish."

**ANTARCTICA COMES TO IMAX.** If you live near any of the fortyish IMAX theaters in

this country, seventyish internationally, be on the lookout for the film ANTARCTICA being presented on their immense screens. The Air and Space Museum in Washington will start showing ANTARCTICA in the 6 PM time slot beginning 2 October. The Museum of Science and Industry in Chicago (Henry Cross Space Theatre, 57th and Lake Shore Drive) will offer it for the first time on 18 October, and it will run there through the middle of 1992. If it's an IMAX film and Antarctica, you can't go wrong. It should be super superlative.

It's a Heliograph Production co-produced by John Weiley and David Flatman. Quoting from our Newsletter of last December, the 38-minute film, being shown on a 76-foot diameter screen, will give you the mostest of Antarctica. Filmmaker John Weiley said, "Because it is ten times bigger than an average movie, you're getting as much shoved into your eyes as if you were watching a 380-minute movie." It cost three and a half million dollars to be produced by the Chicago Museum of Science and Industry, with some financial support being provided by the Australian Film Finance Corporation.

**ANTARCTIC PHOTOGRAPHERS AND ARTISTS.** Neelon Crawford, 44 year-old artist who participated in the NSF Antarctic Artists and Writers Program in Antarctica in January-February 1989, returned to the ice on a WINFLY flight in mid-August in time to be at McMurdo for the full moon on 25 August. Neelon is a multi-media artist who has made movies, sculptured, and painted oils, but is probably best known for his photography. He was looking forward to doing landscape photography as the sun returns above the horizon at McMurdo. Neelon has a contract pending for a book, although as we go to press, it is not confirmed.

Another artist returning to Antarctica is Stuart Klipper, Antarctic Class of 1989, who will be working with field parties in the Dry Valleys in January. Last February The Museum of Modern Art in New York City had an exhibit of some of his photographs. Stuart also participated in an independent sailing expedition to the ice back in 1987, so he has seen Antarctica from both the adventuring side as well as the scientific side. And he is about to publish a book on photographs from the high latitudes.

Jody Forster of Santa Fe, New Mexico, is going to be shooting some large format photographs around Palmer this austral summer. Our illustrious president says Jody shoots "stunningly detailed landscapes," so we'll be looking forward to his 8"x10" prints later next year.

Rebecca Johnson, personable, lissome blonde from South Dakota, a writer of children's books, will be going to the ice under the aegis of the National Science Foundation. Rebecca is also part artist, if an illustrator can be considered an artist, as she illustrates some of her own books. She recently authored The Greenhouse Effect by Lerner Publications which has a picture of one of Tony Gow's cross sections of ice. She is going to tell the kiddies of this country all they should know about the ozone hole and Antarctic scientists. But how in the world will Rebecca ever be able to explain Art DeVries to kids???

**SO YOU DON'T LIKE THE STATION AT MCMURDO.** Well, if you are a student in "a post-secondary institution" - presumably this means Alcatraz, Leavenworth, or their equivalent - and call yourself a student of science, architecture, engineering, or "planning and allied disciplines," time has come for you to put your thoughts and ideas onto paper relative to an idealized McMurdo. Registration opened on 6 September 1991 and closes on 29 May 1992 for Environment 2, whereby one can submit a design for a "New Town of Science" at McMurdo which hopefully will have an umbilical cord to the pristine character of the Antarctic continent. The stated objectives are, 1) to minimize the environmental impact upon the vast polar region, 2) to meet the research needs of the scientific community and maximize their comfort, and 3) to utilize

state-of-the-art technologies and capabilities.

If the above is true, as put forth on a large poster calling for designs, it would seem that all a student would have to do to win would be to submit a cover sheet with name, address, and telephone number (so they would be able to contact you when you won the first prize of \$1,000) plus three enclosures: the first, a plain white sheet with nothing on it, showing the original pristine character of the Antarctic at McMurdo, maximizing the minimizing of environmental impact; page two, a picture of Marble Point with a superimposed all-seasonal runway; page three, a picture of the inside of some Beltway Bandit facility around Washington, Silicone Valley, or Route 128.

However, you also have to submit research papers up to 35 double-spaced pages on: 1) habitat construction, 2) communication, power and energy systems, 3) waste control, 4) environmental/life support, and 5) human behavioral factors. You know this sounds as if the Division of Polar Programs has to come up with a viable environmental protection plan for the future, and rather than put this requirement on their high-paid bureaucrats, they are farming it out to fresh young minds not already confused by seeing McMurdo. A "jury" will select the winners. Doesn't a jury consist of a group of people with no preconceived opinions? So won't it be the blind judging the blind?

There are various awards: First place is worth \$1,000, plus a trip to McMurdo; second place, \$750, plus two trips to McMurdo – no, not really, only the winner gets a trip to Antarctica; third place is \$500. And "\$250 go to winners in each research paper category."

If you really want information, contact the American Institute of Architectural Students, 1735 New York Avenue N.W., Washington, DC 20006. Telephone-202-626-7455. Fax-202-626-7421.

**INTERNATIONAL ANTARCTIC CENTRE IN CHRISTCHURCH BOTH GLAMOROUS AND FUNCTIONAL.** The International Antarctic Centre located at Christchurch International Airport is fast becoming an important adjunct to nations participating in the Ross Sea Sector of Antarctica. It not only serves as a logistical and operations center, but in the future will act as a hub for an Antarctic environmental and research data base system, and have a visitor information and exhibit center. Stage One was completed in September 1990, and provides administration and communication facilities, cargo and cold weather clothing storage, and a departure terminal area.

In March 1991, the Board of Directors of the Christchurch International Airport Ltd. gave approval to proceed with the second stage which will involve an expenditure in excess of six million dollars to provide a public area and a visitor center. The top floor will consist of an appropriate foyer, an exhibition area, a theme restaurant/cafeteria, and a retail outlet specializing in Antarctic related merchandise – sort of an L.L. Bean South. An important component will be a teaching laboratory – an educational resource for school teachers and kids. Construction will begin in November of this year, with public opening next September. They are anticipating 180,000 visitors a year, which comes out to about 500 per day. Admission will be charged. The only way they will get 180,000 visitors a year will be if they open the doors to sheep.

Science and Environmental Minister, Simon Upton, and Minister of Conservation and DSIR, Denis Marshall, jointly announced in April of this year that the New Zealand government will provide financial support for the establishment of an International Environmental and Information System (IEIS) at the International Antarctic Centre. The ministers said that IEIS will feature an Antarctic research data base, a geographic information system, an environmental data base, and an international geosphere-biosphere program data base. The IEIS will be on the cutting edge of data handling and geographic information technology so as to assist the scientific community and other potential

users in making the best use of environmental information. This all sounds like the consolidation of all the World Data Centers that were formed for handling data from the IGY. And can't you see caveats attached to contract grantees that P.I.'s have to submit their data to IEIS in order to get final payments on contracts! Exciting things are happening at old Harewood.

**MIDWINTER RESCUE OF 172 CREW MEMBERS FROM SOVIET ICEBOUND RESEARCH SHIP.** The research ship, MIKHAIL SOMOV, got stuck in the ice in July, some thirty-five miles from the base of Molodezhnaya, and things got a bit sticky all around. Seems there were 222 Soviet scientists and technicians aboard the ship, and they could not be returned to the station, as it was already filled to capacity. One of our informants told us the Soviet economy was in such disarray that a bunch of old Antarcitians had to come to the rescue and come up with rubles to get a plane to fly to the ice. Even then, they had to make it a cargo flight to Cape Town to pay for that part of the flight. Be that as it may, the long-range Ilyushin-76 flew to the ice where technicians at Molodezhnaya had built a landing strip. Helicopters had taken most of the crew members off the MIKHAIL SOMOV, although fifty remained on the ship. The 172 taken to Cape Town were going to be put onto ships bound for the Soviet Union.

**DSIR IS NO MORE, CROWN INSTITUTE IS IN.** The long-standing Department of Scientific and Industrial Research (DSIR) in New Zealand has been replaced by something called the Crown Institute. Peter Wilkniss described the Crown Institute as sort of an autonomous thing, and said that at this time there was no one administering it. As most of you know, DSIR was responsible for the Kiwi Antarctic operations. Hugh Logan, Superintendent, Antarctic Division, has left his position with them, and Dave Geddes, a former Kiwi navigator, is now serving as sort of a logistical manager.

**HEATHER BOWEN OF SAN DIEGO 1991 ANTARCTIC GIRL SCOUT.** Heather Bowen, a real redhead from San Diego, was selected from forty finalists from 22 states to be the 1991 Antarctic Girl Scout, and, again, they have come up with a real winner. Heather, seventeen years old at the time of selection, is a senior at James Madison High School in San Diego. Last year Heather won the Sweepstakes Award at the Greater San Diego Science Fair, and was a winner at the International Science and Engineering Fair in Tulsa, Oklahoma. She was a semi-finalist in the Fiftieth Annual Science Talent Search for the Westinghouse Science Scholarships. Her science project entitled "Fiber Optic Heart/Respiration Wave Form Monitor," was voted the best one in the state of California. Heather was a Bausch & Lomb School Science Winner, and has also received a host of other awards in science and engineering. Plus, she is her class valedictorian, and plays on the girls' tennis team and badminton team. She has done canoeing, backpacking, outdoor survival, horse riding, and other activities.

While a senior in high school, Heather elected to take additional chemistry and calculus courses at the University of California, San Diego. She is also in the process of developing a project to introduce concepts in physics to younger Girl Scouts for her Girl Scout Gold Award. Seems like the only unanswered question is whether Heather has time to help her mother do the dishes, or whether she can bake a cake from scratch.

Heather will be on the ice from mid-October to mid-December, and will be quartered at McMurdo. However, she will get to spend several days at the South Pole Station, so she will see some white snow while in Antarctica, and, perhaps, some real Antarctic temperatures. Heather is the second consecutive Antarctic Girl Scout from the state of California, being preceded by Julie Hagelin of Saratoga and Pomona College in Claremont.

**LETTER FROM MARION E. "MOE" MORRIS, FORMER VXE-6 PILOT AND COMMANDING OFFICER, DEEPFREEZE '64,'65,'66.** It is very kind of you to inquire about the movie status of The Last Kamikaze. The production company renewed the option so they are still serious. The last time I talked with them, they were in a search for the screen-writer. Apparently, they want one of about a dozen prominent ones who do that sort of story. By contract, I am a technical consultant on the film, and I have been working on a screenplay to submit.

So, we'll see. It took four years for Flight of the Intruder to make it to the screen; several scripts were turned down by the Navy before they would cooperate—my story, however, requires only minimum Navy input. We need a couple Japanese Zeros, of course, and there are two flying in the states. Also, I correspond with a gentleman in Tokyo who is restoring one. He just sent me a picture and it is all done except for finding an engine. Also, I received info that Mitsubishi, who built the original aircraft, are building two brand new ones from WWII plans. Thus, things are proceeding and I would be really pleased if it comes off. I do know a major studio had expressed strong interest, their caveat being it has to be a big budget picture with name-draw stars. They say that if they can get the people they want, the money will be no problem.

Tempering all of the above is the realization that among all the Hollywood wheat, there is a lot of chaff!

If they drop the option, I've asked my agent to go after a Japanese film company. Japan has bought translation rights to the book and is quite enthused about it. A bit of trivia: Hungary and Poland have also bought translation rights—maybe, I'll be big in the former Soviet bloc!

**NEWS FROM BRIAN SHOEMAKER ON HERO FOUNDATION, REEDSPORT, OREGON.** August 2nd was a big day for the HERO Foundation - together with the City of Reedsport they were awarded \$639,000 in grants. The money is to be used to build the first Antarctic Science and Exploration Exhibit Center just ashore from the Antarctic Research Vessel HERO in Reedsport, Oregon.

The center will be constructed in Reedsport on the shore of the beautiful Umpqua River where the ARV HERO is permanently moored. There will be 7,000 square feet of exhibit space and a viewing tower from which visitors can look down on the HERO. Exhibits are to feature field research projects in Antarctica with emphasis on current research. The theme is to emphasize the here-and-now as well as future field projects.

Construction is to begin in early 1992 and the building and exhibits will be open to the public late summer 1992. The HERO, however, is already on display, and tours are conducted daily during the summer from 10 AM to 4 PM. The orange sails are up all of the time - literally glowing in the sunlight.

Now that we have your attention we want to squelch the rumor that we have rented out the HERO to the Oregon Department of Corrections. There are 10 prisoners aboard during the day - all skilled artisans renovating the ship and turning it into scientific display vessel - capturing the essence of the work that was accomplished aboard ship in the Antarctic.

HERO has needed an interior overhaul for a long time. These men are very capable mechanics, carpenters, cabinet makers, woodworkers, etc. They work 7 hours a day fixing up the ship, and on occasion have filled in as tour guides when traffic flow was heavy. At night they go back to Shutter Creek Correctional Facility. Labor cost runs at \$1.75 per day each - so the price is right.

We are very proud of this dedicated work gang. They have literally transformed the HERO. They view the ship as "our ship", and we consider them part of the HERO crew.

**MEMBERSHIP APPEAL - BRIAN SHOEMAKER.** We want to thank all Antarcticans who have joined the HERO Foundation to support the development of the National Antarctic Center. We invite those of you who have not yet joined to do so. The larger and more active our membership, the better chance we have for success. The obvious support of a nationwide group of Antarcticans does more than anything to help raise funds and secure donations of material. You are also the best informed group of people in the nation on Antarctic affairs - historic, scientific and political. We need your expertise, your ideas and your labor. Join us, bring Antarctica to America.

Ed. note. Twenty-five to five hundred dollars will make you an Emperor Penguin member. Five dollars to twenty-five dollars will make you an Adelie member. If you don't renew, a leopard seal will gobble you up. Send checks to HERO Foundation, Box 73, Reedsport, Oregon 97467. Phone (503) 271-2605/3603. Fax (503) 271-4704.

**U.S. SUPPOSEDLY WILL SIGN PROTOCOL ON ENVIRONMENTAL PROTECTION IN MADRID ON 4 OCTOBER.**

It took Mt. Rushmore and the Fourth of July for President Bush to see the light at the end of the Antarctic tunnel. He finally came around to a decision that it was better to join the 38 nations that had earlier approved the accord than to buck the tide. But as that great American philosopher, Lawrence Berra, was prone to say, "It ain't over until it's over," so we won't celebrate until we hear that all nations have signed the accord. Restrictions on mining is just one of many items addressed in the comprehensive measures accord. Other items being covered are waste disposal and management, open burning phaseouts, new standards for marine pollution, environmental impact procedures, establishment of a committee on environmental protection, conservation act on both fauna and flora, and the power of one nation to take another nation to court over some violation.

If this all passes, one of the more visual changes will be the banning of dogs from Antarctica. The Brits are married to dogs in Antarctica. Without dogs, they may have to open up their wintering-over stations to women! And it will kill Norman Vaughan's dream of driving a team of dogs to the base of Mt. Vaughan when he reaches age 90 in a few more years! One of the bad aspects of no more dogs in Antarctica will be that the last chapter will be Will Steger's dog sledging journey across Antarctica. Can you imagine a whole continent without a single animal? What would Scott and Amundsen and Mawson say - a continent with no dogs, no Siberian ponies, no cattle, but hundreds and hundreds of women? Time marches on, progress is served.

**ANTARCTIC VANITY PLATES.** We have wondered what Antarctic vanity plates were on our national highways. One of the best has to be Jerry Huffman's, former Station Projects Manager, Division of Polar Programs, who now lives in Waynesboro, Virginia (in the famous Shenandoah Valley). His plate is RET OAE, which naturally stands for Retired Old Antarctic Explorer. There is sort of a Huffman sequel - once he put on his car one of Max Hamilton's ANTARCTICA SP 90° plates, and stuck on the upper corners fabricated decals for both the year and the month. He got picked up for speeding in some foreign country like Montana or North Dakota. The arresting officer never questioned the plate, and wrote him up for a speeding violation! . . . . Dotte Larsen, whale spotteress supremest, drives behind a New York plate FLUKE which is most befitting. Send us your vanity plate names, and we will publish a complete list.

**1992 ANTARCTIC CALENDARS ABE \$10 EACH.** As we go to press, we have not yet received our April-ordered and paid-for two hundred Antarctic calendars from Betty and Colin Monteath, but we expect them momentarily. The price is up slightly from last year, but it's still a good buy at \$10. Order early, checks payable to Antarctic Society, at 905 N. Jacksonville Street, Arlington, Virginia 22205.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET

ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

Paul C. Daniels

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scon, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976

*A Brit Talks About The Rymill Expedition*

The British Graham Land Expedition  
And After

by

Kevin Walton  
Retired Engineer

Malvern, Worcestershire, England

on

*Tuesday evening, 26 November 1991*

8 PM

National Science Foundation  
1800 G Street N.W.

*Room 540*

*Light Refreshments*

Kevin Walton is an Antarctic of repute whose considerable Antarctic experiences may have been exceeded by his son Jonathan. Nothing like having your own offspring upstage you! Kevin is well-known for his books - Two Years In The Antarctic and Portrait of Antarctica, a coffee table picture book. Although he was not on the British Graham Land Expedition, Kevin is going to tell us all about the men who were on that most unusual expedition, the cheapest of all Antarctic expeditions - on a three-year budget of less than 20,000 pounds! That expedition proved that "Graham Land" was a peninsula and not an archipelago.

Kevin participated in the British expedition to Stonington Island in 1946 and 1947, and got to know neighbors Finn and Jackie, Harry and Jennie, Nelson, Bob, and other members of the Ronne Antarctic Research Expedition.

Kevin was a war hero who served with great distinction during World War II, and is highly regarded as a sailor. He was known as a man who could do anything, fix anything. Kevin was awarded the distinguished George Cross for rescue work in the Antarctic.

I came down from Maine to the Nerve Center in Arlington, Virginia to attend our Society's 27th annual Memorial Lecture, write this Newsletter, bring the membership up to date, balance the exchequer, and do a thorough investigation on whether there had been any blatant sexual harassment within our ranks. Imagine my surprise, shock, and chagrin when I found out that I was the only culprit, although I think Pete Burrill had something to do with whipping the names of the non-Byrd and Ronne women off the map of Antarctica and should deserve at least honorable mention. I have written so many beauts over the past thirteen years - such as, if I were predestined to be stuck in a tent in Antarctica by a raging blizzard with no hope of survival that I hoped my tent-mate might be Gisela Dreschhoff rather than someone who looked like Art DeVries - that I think I should go through all issues, summarize the best, and fully expose myself!

Readers of this column should know by now that what we write is strictly tongue-in-cheek with a little honesty camouflaged ever so lightly. Relax! Enjoy!!!

**MULTIPLE YEARS RENEWAL PLEA SEEMS TO BE WORKING.** Our plea to help out the Nerve Center by renewing for multiple years seems to be working; after one mailing, we have 80% of our total membership of 613 members under contract. Sixty-four per cent of those mailing in dues since the last Newsletter have opted for two or more years, which helps us out materially. There are still 115 delinquent members, and those people will get a second dues notice with this mailing. If you are one of those folks, could you please renew as soon as possible for two or more years, and, if you are going to go inactive, please return the form with that box checked so we can get out of this pleading business. If you have not received a dues notice, you are already paid up.

**1992 NEW ZEALAND ANTARCTIC CALENDARS.** If you ordered one or more of these calendars and have not received it/them yet, fear not. We have not received the shipment from Hedgehog House, even though they were shipped last July. We did get a sample copy via airmail, and there is both good news and bad news. The good news is that the photographs are by far the best ever; the bad news is that the artist who put it all together has the dates of the month in very small print. As we go to press we have fifty unordered 1992 New Zealand Antarctic calendars, selling for ten dollars each, which includes mailing. So if your interest is in having beautiful Antarctic scenes and don't need a calendar to tell you what day it is, buy. Besides the twelve monthly pictures, there is a centerspread of a King penguin rookery on Macquarie Island. If you want to see something really spectacular, you should see January with King penguins between the beach and the kelp at Sandy Bay, Macquarie Island. Fantastic! If your forte is not penguins, but icebergs, July offers a most unusual small iceberg impregnated with layers of moraines, photographed near Dumont d'Urville. Unbelievable! What makes the Hedgehog calendar great is that there is not a single picture of a red-clad scientist nor of a Herc landing or taking off, nor of a field party out on some mountain ridge. Antarctica is sold on its own merits.

**PROTOCOL ON ENVIRONMENTAL PROTECTION.** As all of you know, we're sure, the U.S.

initialed off on the Protocol on Environmental Protection in Madrid on 4 October. As we go to press, Tucker Scully has just returned from the Antarctic Treaty Consultative meetings in Bonn, and he told the Polar Research Board on 21 October that the State Department will be working on the Protocol between now and the end of the year; then it will be sent to The Hill for Congress to ratify when they come back from their holiday campaigning and overseas junkets. Sometime next year, probably on the last night before they adjourn when everything seems to get passed, the U.S. will pass it along from Capitol Hill to 1600 Pennsylvania Avenue. Tucker has promised to keep us informed, and we are hoping to have a synopsis from his office on the pertinent parts of the Protocol for an upcoming Newsletter. There is much, much more to the Protocol than the political 50-year ban on mining in Antarctica. The mining ban is only the tip of the iceberg named Environmental Protection.

**IMAX STRIKES OUT WITH ANTARCTICA.** The highly anticipated IMAX film ANTARCTICA is currently playing on a part-time basis at the Langley Theater in the National Air and Space Museum in Washington, D.C., and at miscellaneous IMAX theaters around the world. We had thought that this was going to be the greatest thing since peanut butter chiffon pie, but the movie, to this innocent watcher, was a big disappointment, outside of some truly spectacular underwater photography of seals and penguins. It really does not offer much which Antarcticans haven't already seen on documentary films shown on PBS.

I think IMAX went askew with a bad game plan. If one wanted to sell the beauty and splendor of Antarctica to an innocent public, they should have used as their centerpiece the truly fantastic scenery offered on the Antarctic Peninsula in and around Paradise Bay, the Lemaire Channel, and the Neumayer Channel. It doesn't come any better than that. The film also shortchanged us on Dry Valley scenery. Wouldn't it have been fascinating if they had an underwater photographer on the bottom of Lake Vanda when both a male and a female were going in to join that celebrated swimming club!! That would have spiced it up a bit. And why didn't they arrange for a flight into the crater of Mt. Erebus, so we could see into its bowels, particularly where the companion film being shown with ANTARCTICA is RING OF FIRE! And is a hovercraft more spectacular from above than from within?

We understand that the director of the film was a Scott worshipper, but does that give him license to using all that footage of the ill-fated Scott expedition? That's ancient history, it's passe'. Let's be concerned with what is going on now. There was surprisingly little about ongoing research studies in Antarctica, although the deep core drilling footage was sensational. The penguin footage was just excellent, especially showing the entire sex act between two, hell we say extremely friendly penguins. And they also had some great shots of penguins blasting out of the sea and diving in at reckless speeds.

Antarctica is a silent continent, as pointed out by the omnipresent Antarctic George Denton in a film produced by a private company for NSF about fifteen years ago. But when you walk out of ANTARCTICA your ears are ringing with vibrations from a heavy sound track. The noise associated with a blizzard could only be equated with being on the tarmac of a large international airport as jets blast down the runways. We know that noise is a sign of the times, that silence is no longer golden, but Antarctica is more like Vangelis's ANTARCTICA soundtrack which is playing as one enters the theater

There were two rather lengthy segments on choppers flying one behind the other over Antarctica, shooting up valleys. How much better it would have been if no other plane flies in the camera eye, that it was just Antarctica. If they were going to have some low altitude flying, why not skimming up the Beardmore, showing those crevasses below, tributary glaciers on the sides, and mountain peaks looking down on the glacier? Those guys blew it.

Now for the party line as printed in the brochure handed out at its world premier.

ANTARCTICA is a film that dispels many popular beliefs about the world's southernmost region. Once dismissed as a vast frozen wasteland, the icy continent is displayed in the new IMAX/OMNIMAX film as it truly exists - resplendent in white, teeming with wildlife and powerfully beautiful.

Scientists from around the globe congregate in this pristine wilderness, where changes in the global environment are easier to spot and indigenous creatures still exist as they have for centuries, uncrowded by civilization. ANTARCTICA presents highlights of many current polar research projects, including studies of climatology, biology and glaciology.

Filming, which took place on location during two Antarctic summers, was a tremendous challenge to all involved. Extreme cold, days of 24-hour sunlight, the continent's high elevation and erratic weather were constant sources of physical and mental stress. The movie could not have been made without the invaluable assistance of the National Science Foundation and the Australian Antarctic Program, groups which provided the film crew with logistical support including a base, transportation and other basic necessities.

Directed by veteran filmmaker John Weiley and co-produced by Weiley and David Flatman, ANTARCTICA is a Heliograph production. Malcolm Ludgate and Tom Cowan were the film's cinematographers, and Ludgate was responsible for underwater photography. Chicago's Museum of Science and Industry is executive producer and worldwide distributor of the film and, together with the Australian Film Finance Corporation Pty., Ltd., provided financial support.

The script was written through the collaborative efforts of Les A. Murray, Michael Parfit and Weiley, and edited by Nick Holmes. Nigel Westlake composed the movie's musical score.

Better see it now while it's still playing, as we doubt that it will have a long run.

**GENTLEMAN JIM COMPLETES SIX WEEKS OF FIVE PER WEEK.** As we go to press, Gentleman Jim Zumberge is holed up in Jackson Hole recuperating from the toll taken by going through six weeks of five-per-week radiation treatments. Jim admitted that they weren't all fun, and that they slowed him down a bit. When we spoke to him a week after he had completed the series of treatments, he was already planning on what he going to do to his place in Jackson Hole when he got there on the 20th. Jim has the right positive attitude about everything, no doubt spawned by years and years of money-raising for universities.

When Jim found out that he couldn't come to present the 1991 Paul C. Daniels Memorial Lecture, he asked if someone could read his letter to me of 24 January 1981 entitled

HOW TO MAKE AN ANTARCTIC OLD FASHION (by Jim Zumberge)

Dear Scroungy,

I enjoyed your "Bergy Bits" of January '81. If you are going to start printing polar recipes, you might remember the one for an Antarctic Old Fashion, which so far as I can tell was developed at LA V. In any case, that is where I learned about it. We used it frequently at Camp Michigan, the summer tourist headquarters for sand crabs on the Ross Ice Shelf during the IGY. Antarctic Old Fashions were banned, however, after the New Year's celebration on the night of 31 December 1956. We had been reading strain gauges in crevasses all day long, surveying the strain network on several successive days, and generally trying to catch up on the program of the Ross Ice Shelf Project which was behind time due to a spell of bad weather and a late start the previous October. We were all dead tired as 1956

drew to a close, but before hitting the sack, I issued to each of the six members of the party one two-ounce bottle of medicinal Navy brandy. Ordinarily, we would have followed our usual practice of drinking half before getting into our sleeping bags and the other half the next morning when rising. Because we slept in unheated tents, an ounce of brandy gave one the feeling of warmth before crawling into a cold sack, and in the morning it gave you courage to get out. But it was New Year's eve and we all figured, what the hell, let's drink it all tonight. So we toasted the end of the old year and the coming of the new with a full two ounces of 100 proof VSQ. After wishing the rest a happy new year, I retired to my tent.

Shortly after midnight, I was awakened by the darndest explosion you ever heard. I was groggy from sleep, and hearing no further sound, I decided that I had been dreaming and went back to sleep. The next morning after breakfast I went to the crevasse right next to the camp where I had rigged a whole series of strain gauges about 80 feet below the surface. As I approached the hole in the snow bridge to make my descent, I noticed a black smudge some 15 feet away on through for our entrance. As I entered the crevasse and prepared to let myself down by rope along a steeply inclined snow ramp formed by an older collapsed snow bridge, I stopped dead in my tracks. The black smudge I had seen was the result of a charge of C-4 set off the night before, and the blast not only woke me up but collapsed a huge mass of the snow bridge which plunged 80 feet to the bottom of the crevasse and wiped out my entire strain gauge installation.
