Seems as though my fellow scientists did not retire when I left them the night before but had fixed up a batch of Antarctic Old Fashions and had had one helluva New Year's Eve celebration. No one admitted to the bright idea of greeting the entry of the New Year with a charge of C-4, but I always suspected that it was Phil Smith who had become an expert in handling the stuff while in the Army in Greenland and during the laying of safe trails through crevassed zones for Snow Cats in Antarctica. He was probably aided by his fellow spelunker, Bill Austin, and undoubtedly the rest of the New Year celebrants were in on the deal (Mario Giovinetto, Chief Collins, and Chief Graf). After drinking a whole batch of Antarctic Old Fashions, they were feeling no pain and decided to liven things up. It's a wonder one of them didn't end up falling through a snow bridge because the camp was right in the middle of a swarm of snow-bridged crevasses.

The loss of the strain gauges was not serious because I already had six weeks of daily readings and the trend line of the rate of crevasse opening was well established. However, we had used the crevasse also to freeze a sort of an ice cream (made from a powder base) because the temperature at the bottom was about -20 degrees Fahrenheit. The stuff wouldn't freeze very well at the surface so we put it down in the crevasse for quick results. With the snow bridge damaged due to the C-4 blast, we decided that the rest of the bridge on either side of the new hole might have been weakened and could have fallen in while one of us was placing or retrieving a fresh batch of "ice cream." So, for the balance of our time at Camp Michigan, we had neither ice cream nor Antarctic Old Fashions.

This is a long way around to telling the recipe (formula is a better word) for an Antarctic Old Fashion. It is impossible to make a simple Antarctic Old Fashion. All the research at LA V was based on a batch quantity. Here are the ingredients: one fifth of Old Methusala (100 proof Navy "bourbon") and seven packages of multi-flavored Life Savers. Pour the Old Methusala into another container and fill the empty bottle half full with freshly melted snow. Then

force the Life Savers, one by one, into the mouth of the Methusala bottle and shake until all are dissolved. (Here it should be noted that painstaking research on the formula by the originators revealed that the final product was vastly improved if only two of the red Life Savers were used. All of our Camp Michigan Antarctic Old Fashions were made accordingly.) The final step in the process is to pour the Old Methusala, stir well, and serve over Antarctic glacier ice. No fruit or other garbage is needed since those flavors are all embodied in the mixture.

I thought that I was rationing two ounces of booze a day to my party, but unknown to me, Bill Austin had conned Capt. Slagle at LA V out of a fifth of Old Methusala which Bill broke out that New Year's eve of 1956 at Camp Michigan on the Ross Ice Shelf.

**PALLE MOGENSEN, 2ND STATION SCIENTIFIC LEADER AT THE SOUTH POLE, SUCCUMBS AT AGE 83.**

Palle Mogensen, erstwhile merchant seaman, former military officer, polar navigator and logistician, died on 4 October 1991 in Alexandria, Virginia, following colon surgery. Mogy, a very outspoken born-again Christian, had been in poor health for quite a few years.

Mogy's Antarctic experience began with the 650-mile oversnow tractor train party which paved the way from Little America V to Byrd Station in the austral summer of 1956-57. He had been selected for this work based on his experience as a military officer with the Transportation Corps in Greenland. It was most fitting that Phil "Crevasse" Smith a young, still wet-behind-the-ears, junior officer on the Byrd trek, currently of the National Academy of Sciences, attended his funeral service. Mogy was selected as the second Station Scientific Leader at the South Pole, and those of us who wintered over with him marvelled at his selection. Although he was only 50 at the time, he was perhaps the oldest fifty-year-old man to ever go to Antarctica. It seems that he had some sort of a respiratory problem over and above the altitude, and because of that he exempted himself from shovelling any snow for the snow melter for the whole year! Shades of his predecessor, the late Paul Siple, who led all camp personnel in the number of hours spent snow mining! After the IGY Mogy went to work in the Washington office of the Arctic Institute of North America.

Mogy was born in Denmark, and went to sea originally at the tender age of fourteen on a sailing ship. He earned a master mariner's license, for both sail and steam, at the Royal Danish Navigation School. He later commanded ocean-going vessels, and if our memory is correct, the Germans caught him in a Chilean port during World War II, and he lost his ship. He had a cousin on the east coast of the United States, and he made his way north to join her. She, Tove, later became his wife, and these two Danes became famous for their Great Danes which always overpowered their house, and inevitably drooled from above on all wearied, suspecting house guests. If you didn't like Great Danes, it was not exactly a fun house to visit.

It should also be noted that Mogy studied at the New York Merchant Marine Academy, and at Harvard (astronomy and navigation). He taught at the Army's Transportation School at Fort Eustis, Virginia. Mogy, according to the obituary in The Washington Post, survived a plane crash in the Arctic and two plane crashes in the Antarctic. Mount Mogensen, 2,790 meters, at 77°34'S, 85°50'W, in the northern part of the Sentinel Range, is named after him.

Underneath it all, Mogy was sort of a nice guy, although totally miscast as a station scientific leader, especially at the South Pole. He drove Hillary and Fuchs bananas when the British Commonwealth Transantarctic Expedition arrived at the South Pole, because every time either one wanted to say something, Mogy had the mike from his portable tape recorder in their faces!

I wonder what happened when Mogy reached the Pearly Gates and presented his credentials as a born-again Christian, and St. Peter said to him, "Wait a minute there, fella, aren't you the same Palle Mogensen who painted nude women at the South Pole and hung them on the garage doors?" But Mogy was so straight arrow in the last decade of his life that he wouldn't have taken them with him, so presumably he got in. Let's hope so, as he sure was religious at the end.

**THE BYRD POLAR RESEARCH CENTER ARCHIVAL PROGRAM'S MISSION STATEMENT.** The Byrd Polar Research Center Archival Program (BPRCAP) is a collaborative effort between the Byrd Polar Research Center and The Ohio State University Archives to collect, preserve, and permit access to historical documents concerned with the polar regions. These collections will include papers, records, photographs and other forms of documentation concerning explorers, scientists, and other figures and organizations prominent in the advancement of knowledge about polar environments. The program's goal is to make rare or unique historical material available in the context of an active polar research environment, for use by the University community, visiting scholars, and the general public.

Ohio State University expenditures on the Archival Program have totalled \$378,292 since 1985. It was determined at an Advisory Board meeting on 23 September 1991 that manuscript material which has some connection with Admiral Byrd and Sir Hubert Wilkins. They have been looking into the possibilities of grant monies in Washington, and the Department of Education has encouraged them to resubmit a Title IIC proposal. It was reported that there had been eleven users of the collections in the Archival Program.

**ASSAULT ON THE KNOWN - TOURISM.** With apologies to Walter Sullivan for plagiarizing the title of his well-known IGY book, tourists will be assaulting the Antarctic Peninsula during the coming season in unheard of numbers. Lawyer-turned-clean, naturalist Ron Naveen, who has lectured on various Antarctic cruise ships, speculates that as many as 5,000 tourists could be on the Antarctic Peninsula during the coming austral summer. If this materializes, it would be about twice as many footprints as last year. The way it looks now, there will be five companies and six ships plying the waters of the Antarctic Peninsula this austral summer.

There is a new kid on the block. International Cruise Center of Mineola, New York has a new ship, the COLUMBUS CARAVELLE, going to Antarctica this year. It's a new ship made in Finland last year, 116 meters long, lots of cabins - 178, each with TV, radio, telephone, mini bar, and hairdryer, ten zodiacs, and will carry 250 passengers. Her maiden Antarctic cruise will be out of Montevideo on 17 December 1991. She can do 17 knots, but cruises between 14 and 15 knots. The restaurant holds 330 persons in one sitting, the music-salon holds 170, the piano-bar 70, and something called the tfintergarden 50. She will make five cruises to the Peninsula, and the prices range from a low of \$4,990 to \$11,670 (depending on your berthing and duration of trip), plus air fare to and from South America, and hotel rooms.

One of the more interesting trips this year will be a circumnavigation cruise around South Georgia. ZEGRAHM has chartered SOCIETY EXPLORER from Society Expeditions for this special cruise. As most tourists know, ZEGRAHM was formed last year by a hard core of Society Expeditions stalwarts. Basically it is the Peter (Harrison) and Shirley (Metz) Show, although for this special trip they have brought aboard such learned lecturers as John Splettstoesser, Arnold Small, and others. Peter and Shirley have recently formed another company, ECO, and they will be taking people to exotic places starting next year. Actually, the world is really too small for Peter and Shirley, so you can fully expect within another decade that they will be lecturing in

space. But no matter where Peter may be lecturing, give him a stage, and his listeners will be rewarded tenfold as he is nonpareil. We don't know what you call a consummate beer drinking person who is part actor, part lecturer, part entertainer, part mountaineer, part albatross, but whatever, it comes out as P-E-T-E-R H-A-R-R-I-S-O-N when you spell it.

Tourists are born, they are not made, and when they are born they universally seem to arrive on earth with deep pockets. There are all kinds of tourists, but the Antarctic species seems to thrive on adventure. Success is measured solely on the number of zodiac landings. You don't really qualify as a bona fide Antarctic tourist until you have been to Antarctica at least three times. One of those repeaters who keeps going back is a former Pan American pilot by the name of Brooks Conrad. This past summer he branched out and went into the Arctic on the Soviet icebreaker, SOVETSKIY SOYUZ. Last year we carried an account of the ship's baptismal cruise as experienced by the indefatigable Peter Wilkniss of the Division of Polar Programs at the National Science Foundation. It seems from all we hear that the cruise on the Russian icebreaker is the baseline now from which all other polar cruises will be judged. In other words, if you haven't made a cruise on the Russian icebreaker, you are just going to be a nobody in polar travel. Eliza Anderson and Beth Marshall, you had better go right out now and buy new wardrobes and book for next summer.

**WATERPROOF/BREATHABLE FABRICS** (by Jack Sawicki). Ads tout "miracle" fabrics that keep water out and let perspiration evaporate. But how well do they work in polar dry-cold environments ?

The U.S. Army recently studied available products by testing water resistance and "breathability." Gore-tex, Sympatex and Thintech were shown to be the best commercial products, with less expensive alternatives lagging far behind in one or both tests. However, even the best reduce breathability by about 50% over the uncoated base fabrics.

What does this mean? I found the current NSF-issue Army nylon/cotton field trousers quite breathable and adequately wind resistant, even in C-130 propwash at South Pole, but the uncoated fabric soaked through when digging snow caves during survival school at McMurdo. While experimental Gore-tex trousers kept me warm and dry in the snow, they did show hoarfrost condensation after energetic skiing at South Pole. Based on both this experience and thermal mannequin test data, I think positive water resistance with increased breathability is required for polar clothing.

The Army report shows one interesting alternative product. Gelman Science REPEL has very high breathability (almost 100% of the base fabrics) and, while water resistance is lower, it still exceeds the Army 35 psi requirements. The manufacturer hopes to have a commercial clothing product by next year. Repel's properties should make it ideal for polar applications.

NOTE: Last year I talked about polar sunglasses. There wasn't enough response to do a Society order; contact Randolph Engineering (1-800-541-1405) to locate a local dealer for their "SP All-Weather Advantage" model.

NEXT ISSUE: Are new synthetic insulations really better than down?

**SWITHINBANK FIVE STAR MEMORIAL LECTURER.** Charles Swithinbank has a certain magnetism which attracts people, and as our 27th Memorial Lecturer on 22 October he played to a full house. What a career Charles has had, starting out with dogs and ending up with satellites, and in between crisscrossing Antarctica in hundred of flights. He is sort of ecumenical, starting out on the British-Swedish-Norwegian Maudheim Expedition, wintering over with the Russians, and going on countless expeditions in between with his fellow Brits and allied -through marriage- Americans. He made the transition to informing tourists and adventurers about Antarctica without missing a beat. In spite

or his successes in an or his Antarctic endeavors, you have the feeling, when listening to this 63-year old scientist whose Antarctic endeavors have seen him in Antarctica in six decades (he was on his way to Maudheim in late 1949), that perhaps it was never better than in the old days. However, he also spoke of how good it was to be in the field with a couple of American women, specifically mentioning Kaye Tate of Montana, one of our members. And he has been in the forefront of so many developments, such as radio echo sounding of snow depths. Even an errant farthest south meteorite surfaced near him. He's a guy who can't fail, and as Mildred Crary said, through tear-filled eyes as she walked out, "He is so lucky to still be alive."

We had 106 people for dinner. It doesn't get any classier than the Great Hall of the National Academy of Sciences - the whole works, flowers, candles, and wine. But there was a downer to the evening when Bob Rutford announced to the audience that he had just talked minutes before to Gentleman Jim Zumberge, that he had had a setback, was still in Los Angeles, and that the doctors were going to have to change some of his medication. Hang in there, Jim!

**BERGY BITS.** Congratulations to Gerry Kooyman of Scripps Institution of Oceanography for receiving the National Science Foundation's Special Creativity Award for his innovative research in Antarctica over the last two decades. His development and application of instrumentation and satellite technology has advanced the understanding of physiological ecology, foraging behavior, and demography of Emperor and King penguins and Weddell seals. Would it be correct to say that Jerry got NSF's Seal of Approval? .... Another Antarctic has been locked up, and will serve two years in confinement. Marine biologist Abigail Ailing of the State of Maine is in Biosphere II. Once she sailed to Antarctica in a ferro-cement yacht. She is also a young mother ..... Meanwhile the South Pole will be home this austral summer to as many as 140. Aren't things getting a bit out of hand? Isn't the South Pole a sacred home for a select few, not for the masses? .... Some things are going to change in the Head Shed at NSF, as it is being whispered around the corridors that the aim of the new director is to have the average length of NSF's grants three years. This seems to make a lot of sense, although one program manager in the Division of Polar Programs told me there were pluses and minuses ..... Herman Zimmerman, Program Manager for Earth Sciences in DPP is going down the corridor to accept a position in Atmospheric Sciences as head of their paleoclimatology section ..... And Roger Hanson is leaving DPP to accept a position in NSI in Ocean Sciences, so that position - Associate Program Manager, Polar Biology and Medicine Program - will soon be open for recruitment. It will be hard to fill Roger's position if the job is tailored to his dimensions as he checks in at 6'8" ..... Kitt Hughes, meteorological technician, is going to spend her third winter at the South Pole filling balloons. With this year, Kitt becomes Ms. South Pole. Sharon King will be wintering over again with Kitt, but this will only be Sharon's second winter at the Pole ..... Senator Gore, who seems to be the Antarctic Senator, has asked for a list of experts to testify on the Hill relative to the Antarctic ozone hole. It was big and deep for the third consecutive year, measuring 110 Dobson units on 6 October, 10% lower than the previous low ..... They are going to be dropping a summer camp by air drops at the South Pole. Isn't this where it all started back in 1956???? Every thing goes full circle if you can only live long enough ..... Meanwhile, there are some budgetary issues to be settled relative to NSF and the Antarctic operations. The '92 Appropriation does not include monies for moving NSF from 18th and G Streets to Ballston, although supposedly the money is somewhere in the Post Office appropriation. Heaven forbid if it's under the Post Office, as those poor souls can't even get a letter from the District to Arlington in five days, so how can they ever get the money to NSF within five years? We thought there was a time-proven adage that if something works, you don't fool around and try and change things. The same '92 Appropriation for NSF left out the logistical funding for the Antarctic, which had been included under NSF for years. Evidently it worked all too well, so the Hill decided

that it should now be put under the Department of Defense..... That lawsuit filed by the Environmental Defense Fund against the National Science Foundation to prevent open-pit burning and land-filling of solid and hazardous wastes at research stations in Antarctica was dismissed in August by the U.S. District Court for the District of Columbia. EDF contended that the National Environmental Policy Act applied abroad, but the Court decision preserved the government position that NEPA has no extraterritorial application. EDF has appealed the court's decision. We understand that there was a tremendous number of person hours devoted to preparation of material for the lawsuit..... There's a new position at McMurdo, that of NSF Science Representative, one that will provide on-site direction on science matters, interacting with scientists, establishing science priorities, and things of this nature. Bernie Lettau is the first rotator, currently being in the field at McMurdo..... If you have a valued friend worth a \$39.95 Antarctic Christmas book, we have a recommendation: Antarctica: No Single Country, No Single Sea by Creina Bond and Roy Siegfried, with photography by Peter Johnson. We haven't read it, but the pictures are truly fantastic. You can buy it from Mike Chessler (1-800-654-8502) or write him at 26030 Highway 74, P.O. Box 399, Kittredge Colorado 80457. If you are into polar books, ask Mike to put you on his catalog mailing list, as he has many good buys. Thomas Henderson, USGS, writes that Environmental Systems Research Institute is working on a pilot project to prototype a Geographic Information System for Antarctica. The software and data base would bring together an enormous amount of scientific and mapping data for analysis within a common geographic environment. It will be housed at a new state-of-the-art computing center in McMurdo..... As for Antarctic vanity plates, William Sayles drives around with Pennsylvania plates, "90S BRR." And Bobbie Bermel slinks around town in her poor Lincoln Town Car behind Virginia tags "PINGUIN", having had to opt for the German as someone already had PENGUIN. Colin Bull takes Jerry Huffman to task for having Virginia "RET OAE", saying that he should have "RET OAH" - Old Antarctic Hero rather than Old Antarctic Explorer..... The late Buck (BAE II) Boyd's grandson Francis, who lives at 424 Lansdale Street, San Francisco, CA 94127 (tel. 415-333-0398) is one of the world's best swordsmiths, and has been compared favorably with the 14th-century Japanese samurai sword master, Masamune. Francis is now into Swing-Lock, a folding knife which is virtually as strong as a fixed blade knife. Francis would like to hear from any of his grandfather's former colleagues, as he intends to write a book about his rather illustrious grandfather..... Speaking of Buck Boyd, Jim Lassiter of Lassiter Coast wrote recently about some very spooky landings on the top of Devon Island and Resolute Bay, B.C. (Before Construction), when he was flying the late Paul Siple and Buck. And while we're on old codgers, there is no way to bury Norman (BAE I) Vaughan. Now he has surfaced on the inside foldout cover of Land's End October catalog peddling their "Outerwear." It seems that one of the first things his latest bride, a young thing from Atlanta, did was cast a strong negative note on his old-time favorite, an old blue sweater with holes which was literally falling off Norman. She bought him a Land's End jacket for Christmas, and they have lived happily ever since. So the secret for a good marriage is (1) find a Southern belle who is 40 years younger than you, and (2) make sure she has a piece of plastic and can buy you clothes. Land's End gave Norman quite a write-up, and it was surprisingly accurate. In the article he indicated his long-time wish to go back to the ice and climb Mount Vaughan, projecting that he'll do it in November 1993 when he will be 88 years old. The Brits are contemplating raising the motor sledge of Captain Scott that was lost when it was being driven ashore at Cape Evans and fell through the ice to the bottom of the sea. Peter McKenzie, military historian for Vickers Defence Systems, is planning the recovery. The sledges (originally they had three, two of which died natural deaths in the front lines), were the first British petrol-driven vehicles and were made by Wolseley, a subsidiary of Vickers. Tourism was brought up at the October Bonn meetings of the Antarctic Treaty Consultative Parties, but it was more or less tabled for an in-depth review at next year's meeting in Italy, approximately a year from now.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 91-92

December

No. 4

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976

*Cajun Icebreaker - Greatest Boat Since the SANTA MARIA*  
**United States' Newest Research Icebreaker for Antarctica**

by

Dr. Laney Chouest

President, Edison Chouest  
Offshore Galliano, Louisiana

on

*Tuesday evening, 21 January 1992*

8 PM

National Science Foundation  
1800 G Street N.W.

*Room 540*

Dr. Laney Chouest, an intimidating giant of a man with a flair for the humorous, is The Man behind the new NATHANIEL B. PALMER. state-of-the-art polar research vessel which will soon be plying Antarctic waters. Laney, age 38, is a bona fide doctor who gave it up after four years of worrying about malpractice suits to take over the family operations — his father founded the company when Laney was seven — of Edison Chouest Offshore (ECO), where he now worries about deadlines and breach of contracts. The buck stops at Laney's desk, as he is responsible for all technical work done at ECO. He is totally involved in all phases, including vessel design, construction, testing and operations. Early on he recognized the need for scale in determining true dimensions, so he sired calibrated offsprings who invariably show up in his construction photos of the Cajun icebreaker. Come and see the new ship which we wrote about in our May 1991 Newsletter. It will be a fun and enlightening evening!

SMILE TIME. Just before Thanksgiving one of the environmental watchdogs of a prominent international organization, finding himself alone at their camp, took it upon himself to climb solo a prestigious Antarctic mountain. He got into trouble and had to be rescued by one of the polluting countries! What a touching holiday story!

We still have a few 1992 New Zealand Antarctic calendars. See page 2.

That never-ending three-month stressful holiday called Christmas is in our midst; my campaign to whip it all out has again fallen on deaf ears. We are going back to Maine, pray for snow and cold weather, put logs on the fire, watch the tide come in and go out, and hope that we can survive until it is all over. In an effort to improve our communication with you people who have news for us, we are putting fax machines in the Nerve Center and in my post-and-beam on the coast of Maine. Having a 96-year old mother and a 100-year old aunt living next door, my time is not always my own, so, hopefully, the fax machines will help to make things easier. 'Tis the season to be jolly – a real myth, don't you believe it – but, regardless, we are bound by the rules of the game to wish you all a Happy Holiday season. However, in reality what I really want for all of us is good health and a lot of fun in 1992. Life is very, very short, so go for quality times while we still have some of our faculties.

**THE SHIP'S STORE - CALENDARS, POSTCARDS, NOTEPAPER.** As this issue goes out, we have less than twenty 1992 New Zealand Antarctic calendars with fantastic pictures of Antarctica. However, unless Hedgehog House can get their act together and print readable dates on their calendars, we are not going to sell any more in future years. But if you want an excuse for a calendar with super pictures, our offer of \$10 per calendar is still a bargain.

For the first time we are offering a package of the 1991 Hedgehog House Antarctic postcards, 5" x 7", twelve different scenes, all very beautiful. We are selling them for \$7.50 per package. We think you will love them, as they are truly GREAT.

We are also selling 1991 Hedgehog House notepaper. There are only four in a package (Adelie penguins at water's edge on snow-covered Paulet Island, Gentoos nesting on Petermann Island at the southern end of the Lemaire Channel, King penguins, and Chinstrap penguins). The size, folded, is 6" x 4". They are classy, only for your best friends, too good for relatives. Price is \$3.50 per set, and we don't make a nickel on them.

**NEW SCIENCE LABORATORY AT MCMURDO DEDICATED TO ALBERT P. CRARY.** There was only one logical choice when it came to dedicating the new science, engineering, and technology ceanter at McMurdo – it just had to be Bert Crary. He was everything – a hard-working, tireless field scientist whose expertise crossed many disciplines; he was an indefatigable researcher who actually published the results of his years and years of work in the field; and he became, in spite of himself, a top-notch administrator at the National Science Foundation. It got a bit scary when NSF never said whom they were going to honor when they dedicated the laboratory, and as months went by one wondered if they were going to screw it up.

The plaque at McMurdo says it's the "Albert P. Crary Science and Engineering Center," and it was so dedicated by Dr. Walter Massey, Director of the National Science Foundation on 4 November 1991. But we notice in the 3 November 1991 issue of THE ANTARCTICA SUN TIMES that they are referring to it as the Science, Engineering and Technology Center (SETC), and they show a logo with that name, and in the bull's eye a sketch of the center. The name "Crary" does not show at all. This writer thinks one of the great tragedies of this modern era is that everything has to have an acronym and SETC is a bummer. It is this soul's opinion that the facility should be called "The Crary Center", and leave it at that.

The plaque at The Crary Center reads as follows:

Albert P. Crary Science and Engineering Center  
dedicated 4 November 1991  
Albert P. Crary, 1911-1987

Pioneer in polar geophysics and glaciology, skilled and admired administrator of polar research expeditions, the first person to set foot on both poles. 1952-1955 - chief scientist for arctic ice island T-3. 1955 - established U.S. glaciology headquarters for the International Geophysical Year. 1957 - deputy leader of United States science during the International Geophysical Year and science leader at Little America, Antarctica. 1960-1968 - chief scientist, United States Antarctic Research Program. 1969-1976 - deputy, then director, Division of Environmental Sciences, National Science Foundation.

The National Science Foundation News of 18 November 1991 issued the following press release on the new Antarctic Research Laboratory:

Antarctica's role in global change will be studied in a new \$23 million research laboratory opened Tuesday [November 5, 1991] at McMurdo Station, the National Science Foundation (NSF) announced November 18, 1991. NSF, through its U.S. Antarctic Program, funds and manages scientific research at McMurdo, two other research stations, and at other remote sites in Antarctica.

"The new lab and its highly sophisticated scientific equipment will enable the Nation's scientists to do research procedures not formerly feasible in the Antarctic," said Walter E. Massey, director of NSF, during ceremonies at the site. "We will learn more about the ozone hole, its effect on antarctic life forms, and the role of ice sheets in global change, among other investigations to be conducted here," he told dignitaries, scientists, and construction workers assembled to dedicate the 46,500 square foot facility.

Dr. Massey was joined at the ceremony by Delia M. Newman, U.S. Ambassador to New Zealand. Also present were John A. Knauss, director, National Oceanic and Atmospheric Administration; and Dallas L. Peck, director, U.S. Geological Survey. E.U. Curtis Bohlen, who headed the U.S. delegation to the recently completed international negotiations for environmental protection of the Antarctic, represented the Department of State.

The laboratory contains specialized equipment that will extend science beyond field collections and observations that were typical of earlier work in the south polar region. Replacing structures at McMurdo that were built as early as 1959, it has a computer facility, environmental rooms, and five large areas in which to conduct experiments. Work on portions of the new facility will be completed in 1992 and 1993.

Other research will involve geology and geophysics, weather studies, and ocean sciences as well as engineering and the application of new technologies to the operational support of science. Researchers selected from U.S. universities, Federal agencies, and firms will conduct the studies. Analysis of poorly identified waste materials that accumulated at the station during its early years is one of the first tasks for the lab.

Situated 800 miles from the South Pole, McMurdo is the largest research station in the Antarctic. It has the world's southernmost seaport, and it has landing areas for both wheeled and ski-equipped airplanes. The United States has used the site since 1956 as a hub for research projects throughout the Antarctic.

"McMurdo is the undisputed gateway to the vast antarctic interior," said Massey.

The lab is named the Albert P. Crary Science and Engineering Center. Crary, who died in 1987, was a prominent geophysicist and glaciologist who was the first person to set foot on both the North and South poles.

I think our Society should have a lecture on Bert Crary, and no one in our ranks is more qualified than Charlie Bentley who sits in the Albert P. Crary Chair of Geophysics established at the University of Wisconsin. Charlie was Bert's closest colleague in this country, and knew him better than anyone. Whether it was by design or accident, Charlie happened to be at McMurdo when the scientific laboratory was dedicated to Bert. Mildred's first word of its' happening came in a phone call from Charlie at McMurdo, although she knew it was in the works because NSF had asked her for photos of Bert. A benevolent move by NSF would be to take Mildred and Frank, their son, to McMurdo so they could properly baptize the building in Bert's name by pouring some Budweiser or Old Methuselah over the portals.

**ENVIRONMENTAL PROTOCOL.** (State Department - courtesy of Ray Arnaudo) The United States and the twenty-five other Antarctic Treaty Consultative Parties concluded, by consensus, the Protocol on Environmental Protection to the Antarctic Treaty in Madrid on October 4, 1991. The Protocol was opened for signature in Madrid on that date and, thereafter, in Washington until October 3, 1992. Twenty-three of the Antarctic Treaty Consultative Parties, including the United States, signed on October 4, along with eight of the Contracting Parties that are not Consultative Parties (see below). The Protocol is the result of two years of negotiations and incorporates a comprehensive approach to environmental protection in Antarctica, including mineral resource activities.

The Protocol designates Antarctica as a natural reserve, devoted to peace and science, and incorporates an indefinite ban on mineral resource activities there. It specifically prohibits all activities relating to Antarctic mineral resources, except for scientific research, with the proviso that this prohibition cannot be reviewed for at least 50 years after entry into force. It also sets forth general legally binding obligations upon human activities in Antarctica to protect its environment and to accord priority to scientific research there. These require the prior assessment of impacts of activities undertaken in Antarctica, including non-governmental activities, and action to respond to environmental emergencies.

Detailed mandatory rules for environmental protection are incorporated in a system of annexes, forming an integral part of the Protocol. Five specific annexes have been adopted for ratification with the Protocol itself, setting forth strict requirements relating to procedures for environmental impact assessment; conservation of Antarctic fauna and flora; waste disposal and waste management; the prevention of marine pollution and area protection and management, respectively. Additional annexes may be added following entry into force of the Protocol.

The Protocol also establishes a Committee on Environmental Protection to provide advice and recommendations to the Antarctic Treaty Consultative Meetings. Finally, the Protocol incorporates a number of provisions to ensure effective compliance with its requirements, including compulsory and binding procedures for settlement of disputes over those relating to mineral resource activities, environmental impact assessment and response action, as well as over the detailed rules included in the annexes.

(The 23 Antarctic Treaty Consultative Parties signing the Protocol on October 4 were: Argentina, Australia, Belgium, Brazil, Chile, China, Ecuador, Finland, France, Germany, Italy, Netherlands, New Zealand, Norway, Peru, Poland, South Africa, Spain, Sweden, the Soviet Union, the United Kingdom, the United States and Uruguay; the 8 Non-Consultative Parties were: Austria, Canada, Colombia, Greece, Hungary, Democratic People's Republic of Korea, Romania, Switzerland.)

**SIXTEENTH ANTARCTIC CONSULTATIVE MEETING (ATCM XVI).** (State Department - courtesy of Ray Arnaudo). ATCM XVI was held in Bonn, October 7-18, directly following the signing of the Environmental Protocol in Madrid. Treaty parties hailed the conclusion of the Protocol as a demonstration of the Treaty system's ability to respond to new problems and all parties agreed to move quickly to implement it.

The Meeting approved a fifth Annex to the Environment Protocol which extends and strengthens the existing system of protected areas. Parties also agreed to meet on the issue of tourist and non-governmental activities before the next ATCM (ATCM XVII). In all, thirteen recommendations were passed. However, no agreement was reached on the creation of a secretariat for the Antarctic Treaty. It was agreed to meet annually, rather than biennially, and Italy offered to host ATCM XVII in November, 1992 in Venice.

**TENTH MEETING OF THE COMMISSION ON THE CONSERVATION OF ANTARCTIC MARINE LIVING RESOURCES**

(State Department - Courtesy of Ray Arnaudo). The tenth annual meeting of the Commission on the Conservation of Antarctic Marine Living Resources (CCAMLR) was held in Hobart, October 18 - November 1. Parties agreed upon a cap on the krill fishery which we have been seeking for several years: 1.5 million metric tons (mt) in the major fishing area (area 48), with more restrictions to be specified if the catch should ever exceed the highest historic catch of 620,000 mt. We also passed two new conservation measures to limit incidental take of birds in the trawl and longline fisheries, as well as one requiring countries to notify CCAMLR before beginning new fisheries. The total harvest of krill was about 350,000 metric tons in 1991, a decline of about 5 percent from the previous year. The harvest of finfish increased to almost 100,000 mt, due to an increase in the catch of Myctophids, small fish used in fishmeal production.

**IF I WERE AN ICEBERG . . . .** The ultimate iceberg will be the one that will carry Scott, Wilson and Bowers to their watery grave, but in all likelihood it will be cloaked in total secrecy as no one will know precisely where, when, or how it will come about. But there seems to be a lot of information on A-24 which broke off as a 70-mile by 50-mile berg back in 1986, and still lives a somewhat enchanted life in the South Atlantic between the southern tip of South America and South Georgia. Right now it is only 55 miles long by 35 miles wide, weighs approximately 100 billion tons, and is still large enough to be its own weather maker and scare away ships. The lower temperature of A-24 in contrast to the less cold water in which it is now located creates a lot of fog and mist, so it is shrouded in nasty weather much of the time.

A-24 packs a little bit of Antarctic history, as Robert Headland, curator of the Scott Polar Research Institute in Cambridge, says that Bunny Fuchs's old base, Shackleton, is on it. And if Shackleton is on it, perhaps the old American base, Ellsworth, is on it, too. The two stations were only fifty miles apart. The U.S. operated Ellsworth in 1957 and 1958, then turned it over to the Argentines who operated it through 1962. For those who wintered over at Ellsworth in 1957, it was a hair-raising experience as the camp had a succession of personnel problems throughout the year. The head carpenter who built Shackleton was the late Ralph Lenton, who was a member of our Society for many, many years. When Ralph built the station, it stood 195 feet above sea level. The shelf was 1,300 feet thick, and was floating on 3,000 feet of water. Even at the time it was built, Fuchs was apprehensive that the shelf might calve off and send it to sea (see page 33 of Fuchs's THE CROSSING OF ANTARCTICA), but it held on for thirty years. Presumably the iceberg could survive until March 1992.

Besides Shackleton Station, and possibly Ellsworth, the iceberg has a bunch of hitch-hiking penguins. Presumably they are Adelies, and when the berg melts, they might swim over to the Falklands. Won't they be shocked when they meet up with those dirty, raucous, bad-smelling, hopping Rockhoppers. They will think for sure that pollution has reached Antarctica!

**BLUE ICE RUNWAY AT MCMURDO LOOKING GOOD.** Malcolm Mellor died much too soon, because if he had lived one more year, he would have seen NSF upgrade their snow and ice equipment from a Swiss Army knife to a laser grader and a snow blaster which seem to have revolutionized the preparation of blue ice runways for landing sites for large aircraft. There is a new laboratory at McMurdo in the Crary Center, called the Snow and Ice Mechanics Laboratory. The Cold Regions Research Engineering Laboratory (CRREL) at Hanover runs it from the engineering standpoint, so it is sort of CRREL South. George Blaisdell of CRREL is the chief hanzo on the project, and Peter Wilkniss thinks he is the greatest thing since pistachio icecream. So CRREL has some staff at McMurdo, an office, access to the computer, and use of some of the environmental chambers.

The laser grader, which is ordinarily used for grading roads, is evidently working miracles with ice. It's an external laser separated from the blade by several hundred feet, and Peter told us it is so powerful that it goes through ice like butter. It works in bands, and does a thousand-foot section at a time. Then the snow blaster takes chunks of ice and eats them up like crazy, chewing them and spitting the stuff away.

There are a couple of snow and ice specialists running the equipment, and NSF has assigned Dwight Fisher, a former VXE-6 pilot who has an engineering degree, as the NSF manager overseeing the whole project. One of the current problems is obliterating the large blisters of considerable size - some larger than a medicine ball - so that a 180,000-pound plane like a loaded C-141 can land on the ice runway. Right now such a landing is contemplated for some time in February.

**IT WAS BOUND TO HAPPEN SOMETIME.** The first LC-130 Here to land at the South Pole this austral summer had, sic, an all-female crew. Just what is this Antarctic world coming to? First, an all-female wintering-over camp at one of the German stations, now an all-woman flight crew. My eyesight must be failing, or else they are making women differently lately, because I looked at a picture of the crew and thought they were all men! Antarctica is the most unisexual continent on earth, after having been the most masculine. If you just wait long enough, everything comes around, like with the width of men's neckties.

The aircraft commander was Lt. Rhonda Buckner, who is on her fourth and final season of flying on the ice. Lt. Patricia Turney was co-pilot, and the other members of the crew were Susan Wells, Tami Tudor, Jane Alstott, Nancy Kelson, and Tammy Trefts. When I think of what a typical VXE-6 pilot should look like, I can't help but hark back to the days of the swashbuckling Harvey Speed with a crew cut, talking brashly around a cigar firmly locked in his jaw. Probably not one of Buckner's crew was even born when Harvey was flying Gus Shinn's old QUE SERA SERA! The torch has been passed on, and may it continue to burn brightly, no matter who is in control.

**MOUNT VAUGHAN ANTARCTIC EXPEDITION.** There is only one way you could get rid of Norman Vaughan, ageless dogteam driver from the Byrd Antarctic Expedition, 1928-30, and that would be to shoot him. When he married that young southern belle from Atlanta a few years ago, I started to compose his obituary in my mind, as I thought she would be the undoing of the old coot. But Carolyn has been the elixir of life for old Norman, and he's acting like a young pup. I don't want to see Carolyn for fear she will look like a worn-out, exhausted old gal.

Now Norman is getting fired up to assault Mt. Vaughan (10,320 ft.) in Antarctica in 1993 when he will be 88 years old (see page 136 of the November issue of the National Geographic). He is lining up backers, one of whom is Land's End in Dodgeville, Wisconsin. Evidently they can't afford the cost of a typical centerfold, so Norman's is their poor man's centerfold advertising their Squall jacket. Their December cata-

logue will be mailed to 12 million people, so Norman will end up in a lot of women's bedrooms this winter, presuming that women take Land's End catalogues to bed with them while errant husbands watch pro-football on TV.

Norman has several major obstacles confronting him. Besides money, there is the problem of how to circumvent the newly initiated protocol barring dogs from Antarctica, as Norman wants to go back to the Bay of Whales and dog sledge it all the way to Mt. Vaughan. Someone at NSF told Norman over the phone, "If you want to do it, do it." That's all the encouragement Norman needed, and he's full throttle right now. Perhaps Norman can make the dogs look like penguins. And if Ice Cops do apprehend him, what are they going to do anyway with an 88-year old renegade and his dogs? You can't shoot dogs, as the world is full of dog lovers. That leaves Norman, and capital punishment seems too severe for a man who has only gone to the dogs. Probably they would slap his wrist by castrating him and sending him home, but at age 88, would that matter?

Norman will be in the Iditarod again this winter, but this time he will know where he is, as Trimble Company presented Norman with a global positioning system which will tell him within two feet of where he is at all times. That should be known as the Mother-in-Law Detection System. Incidentally, if Norman pulls off this Mount Vaughan Expedition - and he has been successful doing equally crazy things in his life, as this past summer he was part of a group which excavated a B-17 bomber from 250 feet below the snow surface in Greenland - he will be not only the first American to drive dogs in Antarctica, but the very last, too. Norman, just what are you drinking up there in Alaska? Bottle it, market it, the world will buy it!

**ELIOT PORTER, MOVE OVER - HERE COMES STUART KLIPPER.** When it comes to panoramas of the Antarctic, Stuart Klipper of Minneapolis is in a class by himself. When it comes to wardrobe, Stuart is in a class by himself, too, as he wouldn't come up to Goodwill standards. But put a Linhof Technorama camera with a Schneider 90-millimeter Super Angulon lens in his hands, turn him loose in some beautiful scenery and he's devastating. The camera covers a 105-degree angle of view, and he ends up with the most beautiful colored prints you ever saw - 38 inches by 12 inches. He had sent me proof sheets of his photos which were in his exhibit last winter at the Museum of Modern Art in New York City, and one in particular of many tabular icebergs caught my fancy. I called up Stuart and asked him how much, and he came back - \$500. I thought Rocky Marciano had hit me!

Then we got to talking about BEARING SOUTH, a portfolio book (10 3/4" x 13 1/2") with twenty-eight Klippers. That's a great bargain - only \$850! I asked him if he really sold those things, to which he replied that fifty copies were put together, but only forty were being offered to the public. It seems that the largest libraries buy, including the Mormon Library in Salt Lake City. Stuart feels his portfolio being in their library is like having religious insurance, that he is going to benefit from divine guidance and protection while in the field, while also assuring him the right aperture opening and shutter speed. One has to protect one's flanks at all times. BEARING SOUTH has many panoramas from a yachting trip which he took to the Peninsula back in 1987. Edna's Breastworks (family version) in the Lemaire Channel is in one panorama! I was so anxious to see the book that Ruth and I went to the Library of Congress, but, alas, it was the day after Thanksgiving, and no one was home.

Stuart is fifty years old, was born in the Bronx, but for the last twenty-five years the world has been his address. He has been everywhere worth going, and a few places not worth going to (in the low latitudes). The first of next year he will be in Antarctica for the third time, going to the Dry Valleys. When he gets on the ice and puts on a parka, his appearance must change for the better by about 100 percent. Stuart is a nice guy, he is a fantastic photographer, and we wish we could get a [Klipper without an arm and a leg. Oh well, there's always the lottery.

**DATES FOR OPENING OF "ANTARCTICA" AT IMAX THEATERS.** As we go to press, the new film ANTARCTICA was being shown at the Air and Space Museum in Washington, B.C., and at the Museum of Science and Industry (57th and Lake Shore Drive) in Chicago. By the time this Newsletter reaches its destinations, it will have opened on 8 December in the Omnimax Theatre in Vancouver, B.C., and at some place called Dreamland in Australia. Other cities which will be showing ANTARCTICA, along with their opening dates, are:

Norwalk	18 January 1992
San Diego	3 February 1992
Denver	13 March 1992
Edmonton	1 April 1992
Los Angeles	23 June 1992
Richmond,VA	1 August 1992
Jersey City	1 October 1992

**SOVETSKIY SOYUZ** (by Brooks Conrad). The trip on the SOVETSKIY SOYUZ grows larger and larger as I think back on it and collect all the gems that came our way .... what a group (they'd been EVERYWHERE) .... what an itinerary .... what planning .... what execution! Wunderbar! However, we got off to a shaky start. Our first day on board (out of Provideniya), not yet in the Bering Strait, was the start of the military coup. For about two days, we didn't know but that Moscow might scrub the whole venture .... or, the Soviet crew might defect as a unit to Alaska. Either way, we'd been dead, scrubbed. When the coup imploded, the Soviet crew threw a post-coup party for all... and the chief engineer sold his communist party card/financial record to one of the group who offered him \$100.

We were 73 expeditioners from 14 nations. The Soviet crew was genuinely happy to see us on board and to show off their magnificent vessel. We had an open bridge 24 hours a day. The chief engineer personally conducted tours to the nuclear control room and to the reactor room, both of which we photographed at will. Where the bow plates meet on the SOYUZ, each side is two meters of steel. It was really 'something' to see that baby ice-snouting through new ice 3 to 4 feet thick at better than 10 knots (this through Vilkitski Strait past Cape Chelyuskin, the top of Asia)...or, at other times, through multi-year ice eight feet thick, at 6 knots.

For landings we had four zodiacs and two helicopters...the Soviet pilots were flawless on/off the ravioli-sized chopper pad. The scenery was varied...from desolate to majestic, but all impressive. The weather had the same range. At the start on the eastern end, we had beaucoup sun and temps of 65-70F, Provideniya to Wrangel. Later, the temps never got below about 30F...but the wind chill factor brought them down to perhaps 12-15F.

We saw our share of wildlife...but especially those magnificent Lords of the North, the polar bears. What a succession of them we had the privilege to see! What wonderful creatures... the poise, the grace and confident bearing. How beautifully the females mothered their cubs. We saw one mother with two cubs...the second had fallen a bit behind and, in playing 'catch up', he put on an aquatic show from floe to floe that would have warmed the heart of an Olympic diving coach. He had everyone on board at the rail, shouting to one another, between pix, "that's a 10, for sure!"

We had a surprise dividend. Toward the end, we digressed from the Northern Sea Route and nuked on up to Franz Josef Land...a very hard place to get to, of course. The scenery was awesome (a la Antarctic in many respects), majestic. Full ice caps on many islands of Franz Josef...and 'plain old glaciers' galore. The panoramas reminded me much of Svalbard and Greenland. We checked out an abandoned Soviet base. Earlier we had visited several working bases. One of our landings in Franz Josef was at Cape

Norway on Jackson Island, where the Norwegian Nansen wintered over after leaving the FRAM on foot in an aborted effort to reach the pole. It was out of here that we made our farthest north penetration, to 81-12 North. From this point we sailed across the Barents Sea to Norway's Nordkap, then retraced to terminate at Murmansk.

**POLAR QUARTERMASTER** (by Jack Sawicki). Waterfowl down has been the preferred insulation for Antarciticans since 1956, when Eddie Bauer down parkas and trousers were provided for those wintering at the South Pole. Since the 1950s several generations of down garments have been issued to NSF personnel. The current NSF clothing issue includes an excellent parka containing approximately one pound of waterfowl down manufactured in Canada under the Metro Snow Goose label.

Quality down (i.e., with a "fill power of 600 in<sup>3</sup>/oz), quilted between tightly woven fabrics, is the most efficient natural insulator by weight. Unlike furs and woolens, down gear is also easily and compactly stored due to its compressability and recovery characteristics. Quality down is quite expensive, and most garments constructed with it are too delicate to be machine washed and dried. Down readily adsorbs moisture from perspiration and external sources and is nearly impossible to dry in the field. This is a significant problem, especially in survival situations.

Because of these drawbacks, the Army and others have been searching for a down substitute since World War II. In the 1960s, nonwoven batts of 6 denier (25 micron diameter) polyester staple fibers were introduced as DuPont Dacron, and rapidly accepted for use in sleeping bags and clothing. While these materials were washable, much cheaper and more water resistant than down, the warmth/weight ratio and service life of these fiberfills was much lower. Over the next 20 years, fiber manufacturers continued research. 5.5 denier hollow staple polyester fibers were introduced in 1973 as DuPont Hollofil, increasing the warmth/weight ratio slightly and soon becoming the standard for military and civilian cold weather clothing. In the same period, a continuous filament fiberfill, Celanese Polarguard, was introduced, that was soon adapted by the Army for sleeping bags due to its greater durability. Silicone treatment of both of these fibers increased water repellency and compressability. However, neither could compete with down for light weight and warmth.

In 1978, the first insulation mixing smaller diameter (1-10 micron) microfibers with larger diameter fibers, 3M Thinsulate, was introduced. The addition of microfibers increased the thickness/warmth ratio of the product, reducing bulk, and became very popular in clothing for street- and ski-wear. However, down's far superior warmth/weight characteristics still made it standard for extreme cold weather clothing.

In 1985, DuPont introduced the next improvement in synthetic insulation, Thermoloft. This mixture of 5.5 denier and smaller staple polyester fibers challenged down as insulation, nearly equaling its performance in clothing. For this reason, Thermoloft was utilized in the first generation of experimental clothing Arthur D. Little (ADL) produced with ITT Antarctic Services for the NSF in 1988.

In the 1980s, Albany International (formerly Fabric Research Lab) performed a research program for the Army that described on a microscopic level what down was- and determined why it was so warm. Basically, down was a mixture of microfibers of a diameter that most effectively blocked radiant heat loss, and macrofibers that, like polyester batts, reduced convective heat loss. Albany worked to develop a mixture of synthetic fibers that copied these characteristics, introducing it in 1990 as Primaloft. Primaloft was used in the second generation of experimental clothing ADL produced for the NSF in 1990. A competing product using the same principles, 3M Litaloft, was introduced soon after. Both products have a superior warmth/weight ratio than down, although Albany claims Primaloft has superior water resistance due to its silicone finish Primaloft is commercially available in clothing from L.L. Bean and Climb High, and Litaloft is available in sleeping bags from L.L. Bean and Sierra Designs.

**SICK BAY REPORT - GENTLEMAN JIM, PETER ANDERSON, MORT TURNER, AL FOWLER, FRED MILAN.**

Gentleman Jim Zumberge appears to be making a fine comeback from all those radiation treatments on his brain tumor last August-September. We talked to him the day before Thanksgiving, and he sounded like his old self, although he admitted that he was weaker on one side than on the other. Knowing that at one time he was a physical fitness nut, we asked him if he was able to get out and go walking, and swimming, and he replied that he was doing both. He sounded very optimistic about the future, and, naturally, we all hope and pray that his optimism will prove with time to be well-founded. Jim is such a nice guy that we can't afford to lose him.

There are conflicting reports on Peter Anderson. Bill Zinsmeister, the fossil finder of note, wrote on 9 November that he had recently visited Peter and that he was "making excellent progress - he could talk quite well and was gaining mobility on his right side. It is quite apparent that he was on the road to recovery. He mentioned that he had enjoyed the cards, letters, and visits, and would appreciate more." But we talked to Peter on the first of December, and he sounded like a real disheartened man. He moved in with his daughter the day before Thanksgiving, but is confined to a wheelchair, and, by his own admission, never expects to leave the wheelchair. Whatever therapy he was receiving is now passe", and he sounded down in the dumps. Hang in there, Pete!

Mort Turner challenged a kidney stone, or the kidney stone challenged Mort last summer, and he almost came out second best. He was on the third day into a summer field season when the stone broke loose and got stuck. So a small local hospital loaded Mort up with morphine and Joanne drove the body back to Boulder. Things would have been pretty good except for a bacterial infection "that nearly did him in." In early November Joanne wrote that it was "not all over yet," but that Mort was finally back working again

Another hospital victim was Al Fowler, the old icebreaker captain and former deputy to the head shed in the Division of Polar Programs at NSF. He was operated on 25 November in George Washington University Hospital for a benign tumor which was attached to the pituitary gland. So that shot the devil out of Al playing golf on Thanksgiving Day, although they did send him home from the hospital the following day. He apparently is doing quite well, and anticipates that he will be able to go back to work later in December. If they took a slice out of that tumor, does that mean that Al will lose his slice on the golf course, or will he just end up with a worse hook?

We feel real sorry for our old friend, Fred Milan, who was physiologist at Little America V in 1957. Old Muckluck, as he was affectionately called, was really bipolar, and probably knows more about the rectal temperatures of Eskimos than any man alive. He served with distinction as head of the U.S. Committee on Circumpolar People. Fred has suffered a series of strokes over the past couple of years, and he told me last year over the phone, "Redbeard, know what I really miss most of all? It's my afternoon cocktail. The doctors have taken alcohol away from me, and I sure miss that cocktail."

**BERGY BITS.** We had a letter in late November from Grover Murray, telling us that in mid-October he and his wife had visited Larry Gould (Dr. Laurence M. Gould, 9451 E. Rosewood Ave., Tucson, AZ 85710), and found him "to be in better health than he was a year ago." Grover said that Larry "is still up and about, although he is a little forgetful at times." Grover went on to say, "Our visits appear to be stimulating, especially when we talk about Antarctica. If there is one message I could ask you to give members of the Society, it would be for those who have known Larry to write him from time to time." ... Polar philatelist Peter Barretta, who has been a mainstay of our Society here in Washington for years, has been having all kinds of health problems the past year, none of them good. Pete comes from Meadville, PA, hometown of Ruth Siple, but Pete led an exciting life. The Barretta family was involved in peddling booze back during prohibition, and Pete actually rode shotgun on the back of the wagon. What other newsletters have such great stuff?

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 91-92

January

No. 5

**Presidents:**

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-62
- Mr. Gordon D. Cartwright, 1962-63
- RADM David M. Tyree (Ret.), 1963-64
- Mr. George R. Toney, 1964-65
- Mr. Morton J. Rubin, 1965-66
- Dr. Albert P. Crary, 1966-68
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-71
- Dr. William J. L. Sladen, 1971-73
- Mr. Peter F. Bermel, 1973-75
- Dr. Kenneth J. Bertrand, 1975-77
- Mrs. Paul A. Siple, 1977-78
- Dr. Paul C. Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82
- Dr. Mort D. Turner, 1982-84
- Dr. Edward P. Todd, 1984-86
- Mr. Robert H. T. Dodson, 1986-88
- Dr. Robert H. Rufford, 1988-90
- Mr. Guy G. Guthridge, 1990-92

!!! ANNOUNCING T H R E E MEETINGS! MARK YOUR CALENDAR !!!

### BREAKING THE ICE

Getting to Know the Southern  
Ocean

by

James M. Gorman

Free-lance Writer, Piermont, New York

on

*Wednesday evening, 26 February, 8 PM*

National Science Foundation, 1800 G Street NW, Room 540

\* \* \* \* \*

**Honorary Members:**

- Ambassador Paul C. Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard
- Mr. Amory H. "Bud" Waite, Jr.

Joint Dinner Meeting with The Explorers Club - Washington Group

### THE ANTARCTIC

Exploration is in the Eye of the Beholder

by

Dr. Peter E. Wilkniss

Director, Division of Polar Programs  
National Science Foundation

on

*Saturday evening, 14 March*

Cash Bar - 6:00 PM      Dinner - 6:45 PM      Lecture - 8:00 PM

The Cosmos Club, 2121 Massachusetts Avenue NW, Washington, DC  
(Powell Auditorium) (Free Parking for Attendees)

*Dinner reservations, \$28 per person, MUST be made by March 7th!  
Make checks payable to The Explorers Club - Washington Group.*

*Mail to: Marcia Halliday, Explorers Club-Washington Group,  
P. O. Box 2321, Reston, Virginia 22090 (703-818-4667)*

If you get this so-called Newsletter, it will be a miracle, as the odds are highly in favor of its being aborted. The writer's last two trips to Washington have resulted in his 96-year old mother, who lives next door with her 100-year old sister, going into the hospital – and this without her even reading the Newsletters! Since then her health has gone downhill from miserable to whatever it is near rock bottom. The end is imminent, and it behooves this intrepid soul to maintain a watchful eye over the home front, and attempt to write the Newsletter on the shores of Muscongus Bay in Maine. This is a possibility which we knew would eventually happen, so we now have fax machines.

**SOCIETY MEETING EXTRAVAGANZA PAR EXCELLENCE.** Our meeting of 21 January 1992 at which Dr. Laney Chouest spoke on the new Cajun icebreaker, the NATHANIEL B. PALMER, turned out to be the most spectacular regular meeting (non-Memorial Lecture) that we have ever had. Laney is evidently the last of the big spenders, and he felt as long as he had to come to Washington, he was going to turn our meeting into Mardi Gras time. So he picked up the and Marine Engineers, the Office of Naval Research, and the Division of Oceans Sciences' Advisory Committee to NSF, as well as staffers to the Senators from Louisiana, that he was going to tell all to the Antarctic Society about this great ship he had just built, and that he jolly well expected they would all show up to hear him. After that he called a caterer, telling them what he wanted for goodies and beverages, and then he added before he hung up, "Oh yes, I want a four-foot Emperor penguin with some chicks carved out of ice for the centerpiece!"

We understand that it was a real blast. It's too bad that our late founding father, Carl Eklund, and our late first Honorary President, Ambassador Paul Clement Daniels, could not have been there, as they would have thought for sure that the Antarctic Society had indeed become of age when they started popping the corks from the wine bottles. When there are spirits involved, you just had to know that both were there in spirit. It resulted in our largest-ever attended regular meeting, with Society members being outnumbered by more than three to one! And here I sat on the coast of Maine drafting this Newsletter!

There is a funny postmortem story on the carved ice penguin and chicks. Everyone eventually went home, and our president was left standing there with the four-foot Emperor with chicks. As he drives a motorcycle, he felt that he had absolutely no chance of eluding Washington's finest carrying a penguin in front of him on his bike while trying to maneuver out of the District. So he was left with no alternative but to place the carved ice penguins outside the front door of the National Science Foundation, hoping against wickedly impossible odds that it would not be liberated by some unsuspecting midnight traveler. What he should have done was lug the thing two blocks over to 1600 Pennsylvania Avenue, push the door bell, and when George came to the door, shove it into his arms and yell, "This is for Millie," and run like hell. The liberator(s) who took it did leave the base, so if you want to carve your own ice penguins, contact Guy Guthridge and maybe he'll let you have one slightly-used mount for an ice penguin.

**OUR UPCOMING SPEAKERS - GORMAN AND WILKNISS.** If you want variety, come to our meetings. The last one featured something new – our distinguished speaker, Dr. Chouest, called time, blowing an early whistle, and turned the rest of the evening into hosting a reception for all the attendees. It's impossible to beat that, but we will have a joint dinner meeting with the Washington Group of The Explorers Club at the prestigious Cosmos Club, former all-male bastion located on Embassy Row. It's the one place I know in Washington where a tried-and-true Antarctic, Larry Gould is hung in their Rogues' Gallery. They made him their Man-of-the-Year (or was it Person-of-the-Year?) back in 1981.

So if you go to the Cosmos Club on the evening of 14 March, Peter Wilkniss will be there to tell us all we ever wanted to know about Antarctica. Usually when the Director of the Division of Polar Programs addresses us, it is more like a State of the Union presentation, updating the administration's progress and crystal-balling the future, but from the title of his upcoming lecture, it looks like Peter may throw the script away and talk about exploration. Whatever Peter wants to talk about is okay with us. He has weathered some pretty stormy days with adventurers, environmentalists, tourists, lawyers - you name it - lining up to take pot shots at him over the past seven years. Peter has broad shoulders and seems to have survived all shootings. In fact, it seems to this innocent abroad that Peter has grown with the times, has changed when change seemed best, and history may show that Peter was one of the best-ever directors of the Division of Polar Programs. So come and hear whatever Peter is going to say!

We don't know as much about Jim Gorman as we do about Peter, but from his credentials Gorman doesn't have to take a back seat to anyone. This mid-forty Nutmegger from Hartford, Connecticut, who now lives outside New York City, has been a science writer since 1974. He has been on the staff of The Sciences, Natural History, and Discover, and his works have appeared in such publications as Sports Illustrated, The New Yorker, Audubon, Omni, The Atlantic, and Connoisseur, plus various newspapers, including the New York Times. Jim has also written several books, one entitled "First Aid for Hypochondriacs." Then there is one called "Digging Dinosaurs," another "A Dinosaur Grows Up," and "The Total Penguin." His "The Man With No Endorphins" was selected by the New York Times Book Review as one of the notable books of 1988, and by the Library Journal as one of the best scientific/technological books of 1988. "Digging Dinosaurs" also won honors for Jim. Not only was it a Book of the Month Club selection, it was chosen by the Library Journal as one of the best books of 1988, and won the New York Academy of Sciences' Children's Science Book Award in the category for older students (such as Norman Vaughan). "The Total Penguin" – wonder what this one is all about? – was a Book of the Month Club Award winner too. It looks to us like this guy is either one hell of a great writer, or he has a lot of relatives or good friends in influential places swinging votes.

Jim is currently working on a book about the Southern Ocean, and he will be telling us about a three-month trip to the Antarctic last year aboard a U.S. Coast Guard icebreaker which took him from Australia to McMurdo, to the Ross Sea, and on and on until he ended up in Chile. Besides talking about the trip, Gorman will also present his thoughts on conventional nature writing, and tell us why he is writing this book. Something besides money? He will read us a short section from this book. Jim sounds like a real winner, so don't miss him. Perhaps he, himself, is The Total Penguin. Come and find out on February 26th at our usual meeting place on the 5th floor at the National Science Foundation.

**EXPLORERS CLUB COSPONSORS LECTURES ON THE POLAR REGIONS.** The Explorers Club Washington Group, for the second year in a row, is cosponsoring with the Smithsonian Institutions' Resident Associate Program a Campus on the Mall course entitled

Pioneers of the Polar Regions: Exploring the Arctic and the Antarctic. By the time you get this, you will have missed Ted DeLaca's "Polar Exploration" on January 16th, and Alfred McLaren's "The Submarine in the Arctic: 300 Years of Exploration and Scientific Discovery." But hopefully you will get this in time to hear John Lynch lecture on "Ozone Depletion and Global Warming" on 30 January; Bill Sladen on "Polar Ornithology" on 6 February; Noel Brodbent on "Human Survival in the Arctic" on 13 February; Randall Updike on "Dynamic Earth Processes in the Arctic" on 20 February; Jack Talmadge on "Politics of the Polar Regions" and Jack Childs on "South American Antarctic Geopolitics: Conflicting Claims, Collective Concerns," both on 27 February. And it looks like a triple-header on 5 March with Polly Penhale talking on "Antarctic Ecosystems," Ann Hawthorne showing slides, and Donald Watkins on polar medicine. If you are a member of the Explorers Club, the eight-week session costs \$86, but if you aren't a card-carrying Explorer, you have to fork out \$126. We have no idea if you can buy your way in for single lectures, but Bill Littlewood (phone -301-493-4727) can tell you.

**U.S. ANTARCTIC CONNECTIONS AT WINTER OLYMPICS IN ALBERTVILLE.** Dorcas Womsavage, daughter of Steve Den Hartog, Little America V, 1958, has again made our women's cross-country ski team. Denny, who just came back from Antarctica where he was involved in surveying blue ice runways, will be following his daughter to Albertville. We remember in the last Olympics that Dorcas had a great run on her leg of a relay-team race, and had the U.S. in one of the top three places when she finished. Subsequent racers fared less well, and she never got a medal. But Dorcas did pick up a husband, Paul Womsavage, on 14 September 1991, getting married at McKinney Park on Clark Point overlooking Lake Winnepesaukee in New Hampshire. The bride and groom live in Park City, Utah, which we presume must have snow at times. Dorcas is now 26, and we wondered if she would be over the hill at that age, but Denny assured me that cross-country skiers still have their wax well into their 30s, so go for it, Dorcas.

Another Antarctic, Norman Vaughan, age 86, is going to be in his second Olympics, his first since 1962. Sled dog racing was a demonstration sport at the 1962 Olympics at Lake Placid, and the late Admiral Byrd's old dog team driver was chosen. They couldn't have had a better man as Norman has been demonstrating ever since he came out of his mother's womb.

We don't know exactly what this is all about, but old Norman has been invited to the Winter Olympics in Albertville as the "guest of honor at the 'Grand Prix de Savoie'." It sounds to me that Norman is going to be the Grand Prize for contestants from the Savoy. Now, who would want an 86-year old musher who sleeps with dogs, who doesn't shave, who has a total knee replacement, and who is probably pretty well spent since he married that young chick from Atlanta a few winters ago? Norman is a nice guy, but is he really Grand Prize material? I hope old Norman never dies, as then I will have no one to kick around anymore.

**SICK BAY.** We talked to Gentleman Jim Zumberge on 18 January, and he was his usual affable self. At the time of the call, the Rutfords were visiting the Zumberges. It appears that Jim is making excellent progress recovering from his series of radiation treatments on his brain tumor.

Ed Todd wrote Ken Moulton that the operation for prostate cancer appears successful for the most part, saying there are no signs that cancer had spread to other organs. On the down side, Ed said the recovery period is longer and more complicated than he had been led to believe. The operation disrupted his internal plumbing, and it may take several months for him to regain full control. No one said life was a bed of ros

Al Fowler writes that he has recovered completely from the removal of the pituitary tumor, saying, "It's a miracle the way they do it without leaving a mark."

Rudi Honkala, multi-year Banana Belt Antarctic - Wilkes, Casey, Palmer - recently was perusing the Readers Digest December issue, when he decided to read the article about "Health Symptoms You Must Not Ignore" in which there was a description of TIAs (transient ischemic attacks). As he read the article, he realized that what he was reading pertained to his wife Barbara. So he scheduled a physical for her two days later, when a CAT scan revealed a meningioma, a tumor on the brain midway between the left ear and the top of her head. Three days later she was admitted to the hospital, and after five hours of surgery a tumor, the size of a baseball, was removed and, fortunately, it was benign. Since then Barbara has been back in the hospital twice, once supposedly for a viral infection, the other supposedly for phlebitis. The prognosis is for a complete recovery. And all because Rudi read an article in Readers Digest!

Review and update on Mort Turner. As you may recall, when Mort was in the field last July a kidney stone lodged in his right ureter. Since there were other stones in the kidney, this one was pushed up, and they had to go to Denver for the Lithotripsy procedure to break them up small enough to pass. Mort, being ornery, failed to let one large piece succumb, and it got stuck. Finally an operation through the kidney removed all pieces of the stone, and that should have been the end of the ordeal. But he picked up a staphylococcus infection in the hospital, and it took ten days of high-powered antibiotics to get it under control. There is scar tissue in the ureter, which has now been treated twice. They won't know until sometime next month (February) if Mort will have to have another operation to remove it.

Roy Cameron also had surgery last November for a large bladder stone, and he conjecture that it may have been from too many cups of coffee when he was in the Antarctic. Roy has been spending more time in Eastern Europe. He was the Coordinator for a Water Quality Workshop for Central and Eastern Europe, and will be editing the Proceedings. Antarcticans pop up everywhere.

Meanwhile, Jerry Huffman has completed a year of experimental therapy for his Hepatitis C condition. Now he is going through a three-month period with no medication. In March they will do a liver biopsy, and that will tell if Jerry goes into remission or whether some more treatment will have to be considered. Probably the root of all of Jerry's problems is that he has eaten too many mud pies in his life.

Looking at who has been or is in Sick Bay, you thank God that you never worked in the Division of Polar Programs, as people struck down this past year look like a DPP roster of yesteryear (Todd, Fowler, Turner, Huffman). And it wasn't too long ago that Walt Seelig had some heart problems, and Ken Moulton had a hernia operation in 1991, and arthroscopic surgery on one of his knees.

**DEATH OF A FAMOUS POLYARNIK, PROFESSOR TRESHNIKOV.** One of the nicest members among many truly nice members in our Society is Anna Minevich, former translator at the Arctic and Antarctic Research Institute in Leningrad. Anna spent part of last year in London enjoying newly-acquired grandmother duties. Her daughter gave birth last winter to a son, Edward-Alexander, who goes by the Russian diminutive, Sasha, and from all reports grandmother and grandfather enjoyed getting to know Sasha last summer when they were in London.

Anna sent us greetings recently, "Happy New Year! Best wishes from St. Petersburg, a city with a glorious name and deplorable present, but we are optimists and we hope that the coming year will be different and better." Anna included the obituary of Alexey Fedorovich Treshnikov from IZVESTIYA, No. 276, 21 November 1991, page 6.

On the 18th of November we learned of the death of one of the most famous polar explorers, Alexey Fedorovich Treshnikov, Academician, Laureate of the State Prize, Hero of Socialist Labour, President of the USSR Geographic Society.

He was born in Samara District to a peasant family almost 78 years ago. He achieved a lot, he greatly contributed to Soviet science. Treshnikov graduated from the Leningrad State University as a hydrologist meteorologist, and he devoted all his efforts to the exploration of the polar regions of the Earth. He travelled a lot, mostly to remote places. In the late 40s he participated in the Lomonosov Ridge discovery expedition in the Arctic Ocean. In the middle 50s he became the Head of the Arctic Drifting Station NORTH POLE-3, and immediately after that he headed the Il-d Soviet Antarctic Expedition; during that year Vostok Station was established. He was the author of numerous scientific and science-popular books. In his later years he had developed a great interest and concern in environmental issues.

Treshnikov had many followers and students in science and many friends in his life. His name has become a legend in itself. Many people will remember this remarkable person.

**IF YOU THINK YOU ARE CONFUSED, LOOK AT GREENPEACE.** The following form letter came out of Greenpeace USA on 13 December 1991. Having had a checkered thirty-five-odd-year career with the government bureaucracy, we thought we had read some pretty bad gobbledygook in that period. However, we think Greenpeace outdid themselves with this masterpiece of a letter which should win hands-down all awards of gobbledygookness in 1991!

We are currently reorganizing the legal structure of Greenpeace activities in the United States. In this process, a separate nonprofit corporation named Greenpeace Action will acquire most of the operations and activities previously owned by Greenpeace USA.

Also in this process, both corporations will be changing their names. On January 1, 1992, Greenpeace USA will change its name to Greenpeace Fund. At the same time, Greenpeace Action will start doing business under the name Greenpeace.

This change of name will not affect, in any manner, the financial or legal obligations of the corporation now known as Greenpeace USA. However, all correspondence, notices, bills, and other communications from "Greenpeace Fund" after January 1, 1992 will come from the entity now known as Greenpeace or Greenpeace USA. As of that date, the entity now known as Greenpeace USA will not be responsible for or bear any liability associated with activities of the organization doing business in the United States under the name of "Greenpeace." Similarly, all correspondence, notices, bills, and other communications to Greenpeace USA should be directed to "Greenpeace Fund", not to "Greenpeace."

If you have any questions or need any further information, please feel free to call Venita Pinkney-Boyd at (202) 319-2556.

**PROTOTYPE "TELESCOPE" UNDER ANTARCTIC ICE PROVIDES SCIENTISTS WITH NEW VIEWS** (NSF Press Release, 16 January 1992). An innovative prototype astronomical observatory located under Antarctic ice may provide a new window on the universe. The experimental observatory will detect ghostly particles called neutrinos, allowing scientists to obtain better views of such objects as supernovae and gravitationally collapsing stars.

Designed by National Science Foundation (NSF)-funded scientists at the University of Wisconsin, the University of California, Berkeley, and the University of California,

Irvine, the "telescope" consists of a string of photomultiplier tubes that captures and amplifies light flashes passing through transparent ice as the result of neutrino collisions.

Neutrinos are weakly interacting particles that are virtually unaffected by passing through matter or magnetic fields. As a result, these particles can travel through regions of the universe obscured by gas or dust and therefore unobservable by ordinary telescopes. "Unlike some other neutrino detectors, this one has a virtually unlimited potential for growth," says researcher Francis Halzen of the University of Wisconsin. "First results from this prototype indicate that ice is an excellent medium for the construction of a neutrino telescope."

The National Science Foundation's Division of Polar Programs provided a crew and hot-water drilling equipment to penetrate the Antarctic ice to a depth of one kilometer. Housed in high-strength glass vessels designed to withstand up to 500 atmospheres of pressure, a string of eight-inch photomultiplier tubes was lowered into the ice.

The "telescope" works by using these photomultiplier tubes to observe the light "footprints" of subatomic particles. Neutrinos reveal their presence when a small percentage of them collide with atoms in the ice and cause them to emit bursts of "Cherenko" light," a radiation analog of a sonic boom that is produced when particles travel faster than the speed of light in an ice medium.

**LONG DURATION BALLOONS** (John Lynch). The second of two long duration balloons (LDB) is currently drifting slowly around the South Pole at an altitude of 130,000 feet, carrying a 3,500-pound solar gamma ray and x-ray spectrometer. The balloon was launched on January 10 from Willy Field, and it is expected that it will be cut-down by command on about January 23. The payload will then be recovered by aircraft, refurbished and launched again from Antarctica during the 1992-93 season. The original plan was for two circumnavigations, but a late launch due to weather delays will probably mandate the earlier cut-down. The experimenters are from the University of California, Berkeley, UC San Diego, and CESR, Toulouse, France.

The first LED experiment was launched December 16, went around the Pole almost 1 1/4 turns and cut-down on December 26 at 83.1°S, 104.4°E. There were some difficulties recovering the payload due to the high altitude of the plateau at the recovery site, and some very interesting stories about many takeoff attempts in an LC-130. Eventually VXE-6 gave up the recovery attempt, left the payload and some additional equipment which had been flown in on the LC-130. About January 9 one of the charter Twin Otters made two flights to the site and recovered the high-value equipment. The experiment was designed to measure the isotopic composition of cosmic rays with nuclear masses around that of iron (Fe, Co, Ni, etc). An unusual feature of the instrument is a superconducting magnet nearly one meter in diameter. The experimenters are from Utah University and Boston University.

Both of the projects were funded by NASA; balloon launch services were also provided by NASA through the National Scientific Ballooning Facility, and, of course, NSF/DPP provided logistic support and the facilities in Antarctica.

**ANTARCTIC BIOSPHERIAN YEARNS FOR MARS.** Abigail "Gaie" Ailing, whose credentials are impeccable, being a State of Mainer with Antarctic experience, is the bionaut in Biosphere II who is in charge of the ocean. She was quoted in an 18 December '91 press release as saying, "The ocean is seasonally green due to algae plankton and particulates, which are largely larvae of corals, sponges, and crustaceans. In normal reefs, the area is washed by the vast resources of the open ocean; hence you normally do not see such a rich micro-biotic community." So it is actually better than a normal coral reef.

As you followers of Biosphere II know, there are many, many problems with the experiments. Walter Adey, the Smithsonian Institution scientist who designed the ocean, said, "It was screwed up." According to Adey the project was rushed and the end result a great disappointment. The ocean he wanted, he says, "was a highly productive, highly diverse system. The one we got is low-productivity, low-diversity." Adey was quoted in the Washington Post of 8 January 1992 as being all torn up about Biosphere II, saying it is shaping up as a disaster.

But getting back to Gaie, a 32-year old youngster who has a young son - she says, "I'm really thrilled to be here. We are going to love where we live." Ailing said she hopes, when she gets out (of Biosphere II), to work on her ultimate goal of going to Mars. From what one reads in the referenced article in the Washington Post (by Joel Achenbach), anything to Mars should be an improvement on Biosphere II. A Californian by the name of Lou Hawthorne was hired by the University of Phoenix (in Greece?) to make an educational documentary on Biosphere II. He became disillusioned "Eighty percent of Biosphere 2 is beautiful, impressive, legitimate and exciting, and 20 percent is an outrageous, blatant hoax."

**TOURISM APPROACHING THE CROSSROADS?** Those of you who receive Ron Naveen's Oceanities newsletter "The Antarctic Century" saw in the December 1991 issue five pages of comments on Antarctic tourism. Now that there is a common meeting of minds on mining in Antarctica, it appears that the next hot issue is going to be how to handle tourism in the polar regions, especially Antarctica. There will be an international meeting in Alsace, France this coming April on tourism in the polar regions, sponsored by CIFFEN, a non-profit organization concerned with wild life in natural spaces.

Tourism in Antarctica this current austral summer has seen some ominous signs. Perhaps the biggest is that one of the very best, Society Expeditions, has run into financial problems and is "working on a solution to those problems." Society Expeditions has been charterer for voyages of the SOCIETY EXPLORER and the WORLD DISCOVERER, but after this season these two ships will no longer be operated by Society Expeditions. This is a major switcheroo, as they have been the big kid on the block since Lindblad went out of business several years ago. And they have enjoyed well-earned successes until beset last year with financial difficulties.

Clipper Adventure Cruises (7771 Bonhomme Avenue, St. Louis, MO 63105-1965) have chartered the WORLD DISCOVERER for the spring, summer, and fall of 1992, and so they will be taking her back to Antarctica. There have been so many rumors floating around that it has been difficult to separate facts from fictions, but in official communiques which we have received there has been no mention of the deployment of the SOCIETY EXPLORER next year. However, don't be surprised if she isn't back in Antarctic waters next year.

One of the big problems many of the Society Expeditions' faithful face is that they bought discounted coupons in past years for downstream cruises on their ships. Presumably some way has to be found to reimburse these people. One frequent traveler with Society Expeditions, hearing of their folding their tents after the current season, brought eighteen members of her family with her on an Antarctic cruise this past season! One passenger was only a year and a half old! Can you imagine having your whole clan with you aboard an Antarctic cruise ship?? And we understand that they ended up with everyone still talking to everyone!

One of the newest and best of the cruise ships, written about last year in this so-called Newsletter, sailed to Antarctica this season with only twenty-five passengers. Another ship, we understand, cancelled a whole cruise. Are these signs of the economy, or has tourism in Antarctica peaked?

And it's rather hard to tell the home team. Take the indefatigable twosome of Peter Harrison and Shirley Metz. We understand they are part of ZEGRAMS and that they are ECO. Also they have lectured for both Society Expeditions and Clipper this year. So even though you know the players, you don't know which T-shirt they are wearing (unless you undress them personally). One staffer at Society Expeditions sent out her farewell letter announcing her retirement, yet while the mailmen/mailwomen were delivering her letters, she was back working at her old desk in the Society Expedition off, but for Clipper! Sort of like the Marx Brothers and Who's on First.

If you know anything about Antarctic tourism, you know that ships to the Peninsula always go into Deception Island so the passengers can go for a swim in the thermally heated waters of Pendulum Cove. But seismologists started getting bad signals from that area, and so this month all cruise ships have been told that they must not stop at Deception. Let's have another blast!

**BERGY BITS.** Another five-decader is Ed Zeller, so where do we stand now? There is Charlie Bentley, Bob Rutford, George Denton, Dick Cameron, Gentleman Jim Zumberge, Mort Turner, and George Llano. Additional possibilities - Sayed El-Sayed and David Elliot. - There is a small technicality as to whether Charles Swithinbank is truly a six-decade Antarctic. For whatever it is worth, we have given him official credit, as he is such a nice guy, and he was so close to Antarctica on 31 December 1949 that it seems close enough. He was on the factory ship THORSHOVDI in the Scotia Sea, halfway between South Georgia and the South Orkneys, at 51° South, enroute to Maudheim where he was to winter over in 1950 and 1951. We always figured Charles was a dead cinch to make seven decades, and he may, but unlikely with the U.S., as he had some troubles with the doctors when he took his Antarctic physical last summer. The German-owned ICEBIRD got entrapped in an unseasonably thick ice pack in early January when it was returning from Scott Base. The ship was soon surrounded by Emperor penguins, who were contemplating whether they wanted to take possession of the ship as a derelict. Sixty-two bored people aboard the ICEBIRD were offering no resistance . . . . . Gentleman Jim has three sons who work in the physical sciences, and one, Mark Zumberge, is at Scripps Institution of Oceanography at San Diego. Evidently Mark is one of those Doubting Thomases - along with ten scientists and a support crew of a hundred, for the past three years they have been trying to find a kink in Isaac Newton's 300-year old law of gravity. The good news from all those scientists working for three years is that, yes, we do have gravity, and, no, you will not be falling off into space. If you want verification on this, look in the current issue of the Journal of the American Physical Society, under Physical Review Letters. This must have been funded by the government, and as a taxpayer, if you don't approve of such studies, perhaps you should contact his father. Sounds to me like there was a paternal flaw in bringing up the kid . . . . . Walter Froehlich died last November. He may not be a household name in your abode, but he was the Science Editor of the U.S. Information Agency, and operated International Science Writers. Once he accompanied an international delegation to Antarctica. He was only 69 years old at the time of his death, and lived in Chevy Chase, Maryland . . . . . Lisa Fetterolf is back on the ice at McMurdo for at least her third winter-over. When she joined our Society six years ago, our 500th member, she was a sweet young thing with a cameo complexion and aspiring hopes in journalism. She dreamed of Antarctica and had to get there, which she did in due course. But now she writes like an O.A.E., saying, "McMurdo doesn't seem to be the same place it was less than 5 years ago." She writes about how impersonal all things appear to be now, that rules have been made "seemingly for no reason." But she also admits some things are better, citing the food (but bemoaning the fact that food cannot be taken out of the galley); citing less duplication between contractor and the Navy, resulting in less animosity; citing a real effort to allow Space-A travel which is based on the number of months

spent on the ice. This has resulted in Lisa going on a turnaround flight to the South Pole, and flights to both Scott's quarters at Cape Evans and Shackleton's at Cape Royds, as well as another to Lake Bonney. She evidently spent two days in the Dry Valleys, as she wrote that she did a lot of hiking and climbing and picture taking, saying it was worth the four-year wait. Lisa is a good kid, and we're happy that she has finally gotten to see something besides downtown, metropolitan McMurdo.

.... Did you see where Diane Ackerman has a new book out - "The Moon by Whale Light" published by Random House late in 1991? Most of you no doubt remember her article on Antarctica which appeared in The New Yorker several years ago. Her new book consists of four essays - bats, crocodiles, penguins, and whales. Rick Bass's review of the book in the Washington Post of 28 November 1991 was sort of a mixed bag, writing, "I could never perceive a direction, intent, voice, or even tone. Rhythms - for me - also seemed absent. They would start, but then fall away. There was no deep weave." But he softened as the review unfolded, writing, "I'm being harsh. The best thing about 'The Moon by Whale Light' is its research, its rat-a-tat-tat listing - almost an enumeration - of interesting facts about whatever species is being investigated. I also found original turns of phrases, unusual perceptions, that stayed with me for days afterwards." Besides being a journalist, Diane is also a poet. Sounds to me like a book you'd want to borrow from the library, not purchase for your own library..... The other evening I put the video of the Memorial Service at the Cosmos Club for the late Bert Crary into the VCR and watched it. A copy of this should go to the Crary Science and Technology Center at McMurdo, as it tells a lot about Bert as both a polar scientist and as a man. Future Antarcticans who never knew Bert could then listen to the beautiful tributes by such people as Charlie Bentley, Frank Press, and Mort Rubin. What this country needs are more audio histories about our polar greats, and with Peter Anderson apparently delegated to the sidelines, where is there an interest? When is it too late in life to get into something new, as it seems like this could be a possibility for old fossils like Colin Bull, Jim Zumberge, Link Washburn, Dick Goldthwait, Ken Moulton, Walt Seelig, Ron McGregor, and others? ..... Barry Powell has announced that he will retire in November 1992 as Executive Secretary of the Convention on the Conservation of Antarctic Marine Living Resources (CCAMLR). Anyone interested in applying for this position should get in contact with Ray Arnaudo in the State Department (phone 202-647-3262; fax 202-647-1106. There is some concern at the National Science Foundation, we understand, over a New Zealand proposal to put up an electronic radio receiver at Arrival Heights, which had been set aside as some sort of an electronic-free area. The U.S. blew up seventy-five pounds of decaying chemicals somewhere outside of McMurdo. This was in no way a violation of the Antarctic Treaty, as there are emergency exclusions to cover such needs. Steve Den Hartog wonders if there isn't overkill in the crevasse rescue course. Denny is an experienced mountaineer in his own right, but said that what he was subjected to this year was okay "for people attempting 8000-meter peaks, but simple ice exposure like climbing Mt. McKinley, or trying to do Antarctic research does not require the HI TECH." He went on to say, "A regular rope or two and double rope rescue techniques are simple and more likely to be used or remembered by field workers whose primary interest is not to survive where others fear to tread, but rather to accomplish a job." It appears that a wheeled runway at Mt. Howe (87°5'S, 150°W) may be unrealistic on account of the wind. A planned three-week study at the site was cut to six days by innumerable transportation delays. The wind blew constantly directly across the only possible runway heading at speeds of 10 to 35 knots during the entire stay. So using Mt. Howe as a possible site for transshipment of fuel and cargo to the South Pole may not be very feasible. The Mill Glacier site is twice as far from the Pole, but is much more usable. Investigators went on home to rework their figures to see how the added distances change the economics..... Bill Benninghoff's mother, Edith, recently celebrated her 102nd birthday, and got honorable mention on the Paul Harvey radio show. Her picture in the Coldwater, Michigan Reporter for 13 December shows her looking quite spry, as son Bill hovered nearby with a bandaid on his finger.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET

ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

---

Vol. 91-92

April

No. 6

---

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Carrwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubín, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guthridge, 1990-92

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzarotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Sayed Z. El-Sayed, 1990

*Come hear our last lecture of the 1991-92 season!*

Probing the Ionosphere from Antarctica, or,  
Not All Rain Makes You Wet

by

Dr. Theodore J. Rosenberg  
Institute for Physical Science and Technology  
University of Maryland

on

*Tuesday evening, 28 April 1991*

8 PM

National Science Foundation  
1800 G Street N.W.

Room 540

Dr. Ted Rosenberg, he of Rosenberg Glacier (75°44'S, 132°33'W), is a member of the Advisory Committee of the Division of Polar Programs, National Science Foundation, as well as a seated member of the Polar Research Board, National Research Council. His research interests encompass ionosphere-magnetosphere physics and emphasize the study of energetic electron precipitation, auroral x-rays, cosmic radio noise absorption, magnetic storms and substorms, and wave particle interactions at ULF and VLF frequencies. There's nothing like a nice spring evening in downtown Washington, DC. Take advantage of it and of this outstanding speaker. Be there!

This Newsletter was made possible through the good cooperation of Guy Guthridge and Bernie Lettau at NSF; Ron Naveen of Oceanites John Spletstoeser, Chairman of the International Association of Tour Operators; Dr. Josep Portell, son-in-law of the late Ambassador Paul Clement Daniels; Capt. Brian Shoemaker, USN (Ret); Garry McKenzie of Ohio State University; Bill Sladen of Airlie; Chet Langway of SUNY-Buffalo; and Charles Swithinbank, UK. We thank you all, and count our blessings that there is Ruth Siple to put it all together so it looks nice. And God bless whoever came up with fax machines!

*Before Dr. Rosenberg speaks, we will have our annual five-minute business meeting!*

The lecture announced herein is our last for the current season, although we may put out another Newsletter in midsummer. Ruth had a close call last month, when she decided to go to church and pray for us sinners. But she should have been more worried about Sunday morning drivers, as one plowed into her and totalled her car - she was stopped behind another car, waiting for the red light to change. Fortunately there was no damage to the chassis of Ruth, and she remains her indomitable high-spirited self. The moral to this story is that if any of you actually feel in need of a little religion, just turn on your television and listen to preachers like Dick Vitale and Jim Valvano.

Happy Easter!

**MARK EICHENBERGER SWEEP TO SEA.** A former seaman on the HERO, Mark Eichenberger, lost his life in a most unlikely way for him, as this still relatively young man, 38, truly a Man of the Sea, got swept overboard by tumultuous waves when he was trying to cast off the mooring lines and get his ship, the EREBUS, away from the docks in a vicious midsummer storm. This all occurred in the harbor of Punta Arenas at the southern tip of Chile on 21 December 1991. Mark had just completed a rough trip northward across the Drake Passage after having been to Palmer Station where the EREBUS, under charter to the National Science Foundation, had carried supplies, scientists, and support personnel.

Mark was the son of American missionaries, and spent most of his childhood in Peru, most of his adulthood either at sea or in South America. Although he worked for NSF contractors in the Peninsula area for years, he will no doubt be remembered by most people for being one of four who rowed a specially-built aluminum rowboat, the SEA TOMATO, from South America to Antarctica a few years ago.

John Splettstoesser was holed up in a hotel in downtown Punta Arenas during this freak midsummer storm which also cost the lives of two other seamen, and raised havoc with small boats in the harbor, washing many of them ashore. John knew of the tragedy, but had no idea until several weeks later that one of the victims was Mark. To the best of our knowledge, his body has never been found. Our efforts to contact his parents in Huntington Beach, California, have been unsuccessful.

If there is any consolation in a life being snuffed out in its prime, perhaps it is that he gave his life on his own playing field, one that he knew intimately and loved, fighting the elements which hitherto had never stopped him. Most of us won't be that fortunate in our last scenario.

**ANTARCTICA GETS MULTIMILLION DOLLAR CLEANUP** (NSF Media Advisory, 17 March 1992). An unprecedented \$30 million cleanup operation to remove debris accumulated over decades by man's exploration and incursions to this remote continent has reached a mid-point with this season's hi-tech collection and removal of almost 6 million pounds of refuse from Antarctica by the National Science Foundation (NSF). From the discards of turn-of-the-century explorers to those of today's scientists, the NSF focus is on creation of a "pack-in, pack-out" management system for most waste generated by U.S. Antarctic activities.

This season's cleanup effort centered on McMurdo Station, which, in addition to its own population of 1,200, receives waste generated by the 140-person U.S. research station at the geographic South Pole, as well as about 60 science projects at other locations. This season, officials estimate about 6 million pounds of refuse accumulated over decades and including one and a half million pounds of metal, as well as asbestos, PCBs, and barrels of human waste—have been sorted, labeled and containerized for removal and return to the United States.

Looking to the future, the NSF program also calls for reducing the amount of material shipped in, and for expanding the existing recycling program. A more efficient incinerator is being installed. The purpose of this unprecedented, 5-year, \$30 million effort is "to protect the vital research underway and to preserve the fragile environment of this unique continent."

In addition to cleaning up the dump, NSF has:

- o Developed a waste-sorting system in residential areas and at work centers which process 85 percent of McMurdo's domestic waste including cardboard, wood, glass, aluminum, other metals, batteries, and food-contaminated waste.
- o Banned all open burning. A temporary incinerator that began operation in April 1991 is being replaced by a new commercially-built one.
- o Processed and removed from the continent as hazardous waste 14 transformers filled with oil that possibly contained PCBs; developed plans to remove another 13 transformers that do not contain PCBs.
- o Installed maceration and dilution equipment for handling sewage and re-located a sewage runoff pipe 17 feet below low tide level.
- o Detonated 76 pounds of outdated, unstable laboratory chemicals and more than 3,000 pounds of obsolete explosives at a remote site on the Ross Ice Shelf. The site is located three miles from the nearest inhabited area and ten miles from the sea, where the nearest wildlife is found.
- o Crushed and removed from the continent 36 containers of clean metal waste. Each container holds 2,560 cubic feet of debris.
- o Begun operating a "tub grinder" in January 1992 to process construction waste.
- o Removed from the continent 1,500, 55-gallon drums of contaminated fuel, organic solvents, acids/bases.
- o Completed removal of asbestos from a storage building formerly used as a seawater distillation plant.

**NSF DEFIES SUPERSTITION, LAUNCHES NEW ICEBREAKING RESEARCH VESSEL ON FRIDAY THE 13TH.**

Officials from the National Science Foundation (NSF) and Antarctic Support Associates (ASA), and executives from the Louisiana-based Edison Chouest Offshore (ECO) corporation met on March 13th in Port Fourchon, Louisiana, to dedicate the nation's first commercial icebreaking research vessel. Former Louisiana Congresswoman Lindy Boggs christened the ship at the dockside dedication ceremony.

Christened the NATHANIEL B. PALMER, the ship, according to NSF Director Walter E. Massey, "is a floating research laboratory for NSF-supported scientists in Antarctica." It has more than 6,000 square feet of research space, including laboratories and specialized computer and electronics facilities required to conduct Antarctic research. The vessel also has state-of-the-art acoustical systems, including equipment for seismic recording, bathymetry, and precise navigation. Scientists using the ship will be

able to perform multi-purpose oceanographic, geological, and geophysical research.

In addition to its research function, Massey said the ship will transport scientists, their research equipment and supplies into and out of ice-laden Antarctic waters. Up to 37 scientists can be berthed onboard the ship for up to three months. The ship is equally capable of breaking through 3-foot thick ice and of navigating through 16-foot waves in rough, open seas.

The 308-foot vessel's maiden voyage will transport U.S. scientists to and from a research station located on a mile-long ice floe in Antarctica's Weddell Sea. The scientists are part of a U.S.-Russian team gathering data on global climate and ocean currents in order to understand the effects of global warming.

(Ed. Note. Launching the ship on Friday the 13th would have no doubt met with Nathaniel B. Palmer's personal approval, as an article about Palmer quoted one of his officers saying, "Captain Palmer had no superstition as to Friday being a bad day to sail.")

**ICE CAMP NEWS AS OF 27 MARCH** (Bernie Lettau). The joint U.S.-Russian Ice Camp project in the Weddell Sea has just completed the first third of the scheduled drift. Between March 9 and March 22, a series of Twin Otter flights from Punta Arenas via King George Island exchanged six scientists, brought in some much-needed equipment and took out water samples for further analysis at home.

On March 23, the ice station crossed 70°S, drifting northward fairly precisely (at least for the last two weeks) at 53°40'W, at average speed of just under 7 km/day. The camp ice floe rotates very little; typically one to two degrees per day, with an accumulated rotation of less than fifteen degrees since the camp was occupied. Temperatures at noon have characteristically ranged between -20° and -25°C, with the nighttime minimum about five degrees colder.

Early scientific results include the first observations that the mixed layer is much deeper than the usual 300 meters in the central and eastern Weddell Sea. Thicknesses up to 700 meters have been measured. The separate ice shelves of the southwestern Weddell Sea appear to produce individual streams of high density water with differing characteristics, which ultimately mix to form Antarctic Bottom Water. The upper ocean shows a step-like structure with sharp discontinuities separating meter-thick homogeneous (with respect to temperature and salinity) layers. Seals are occasional visitors to the holes that have been cut through the ice.

**RON NAVEEN'S MARCH 23RD PERSONAL REPORT FROM THE FUNNY FARM.** I'm just back from a five-week stint on the Antarctic Peninsula, directed at interviewing Capt. Pieter Lenie, icemaster on the ILLIRIA, for a forthcoming issue of The Antarctic Century Newsletter. Lenie is alive, he is well, and he remains his usual cranky self, all the time bemoaning that NSF took away HIS ship, the HERO.

It was a good year for krill abundance, meaning lots of whales and lots of penguin chicks. From their study site at Lenie Station, Admiralty Bay, Wayne Trivelpiece and Doug Wallace report good breeding seasons for the resident Chinstraps and Gentoos, and for Adelies in particular. From Torgersen Island, Mark Chappell reports more than 8,000 breeding pairs of Adelies. And from both sites, good breeding success for South Polar Skuas. Robin Ross reports that her krill work is proceeding nicely at Palmer.

What's not so sanguine, however, is the tourism situation, with my concerns running in a number of directions, and mostly focused on people management. Although we must await a final accounting, it appears that

between 4,000 and 5,000 tourists visited the Peninsula this past season. The Society Expeditions ships, the EXPLORER and the WORLD DISCOVERER were basically full, but mostly because of the company's failure to take delivery on its new vessel, the ADVENTURER. In early March, Society went belly up, the WORLD DISCOVERER going on long-term lease to Clipper Cruise Lines (St. Louis), the EXPLORER to be sold outright to Abercrombie & Kent (Oak Brook, IL). Contacts on both these ships report a good season managing passengers. Same for the ILLIRIA, on which I spent some time, save for one adventurous parasailor and, after I left the ship (and according to sources), a rowdy group of French and Japanese passengers who kept ignoring the penguins' personal space. The FRONTIER SPIRIT rarely carried a full load, and rumors abound that its owners/operators will soon be changing her M.O. to more of a love boat-casino operation.

The large behemoth, OCEAN PRINCESS, again was jammed this season, 300+ passengers per trip, enjoying the shopping mall-casino atmosphere. Another huge vessel, the COLUMBUS CARAVELLE, made its Antarctic debut, mostly with German passengers. In contrast to the EXPLORER, WORLD DISCOVERER, and ILLIRIA, which are primed for 90-120 passenger groups, these larger vessels carry three times the passenger load and, potentially, three times the impact - but, at much cheaper, per-cabin costs. And while the smaller vessels offer the potential of 12-14 landings on a typical Peninsula trip, the larger vessels are lucky if they make six landings a trip. Some of us thought that the point of Antarctic tourism was maximum intimacy with the Antarctic environment; the new ships are proving that low cost still beats a plethora of shore time.

No doubt, the Treaty Parties will revisit the tourism issue at their November 1992 meeting in Venice, Italy. However, sparks undoubtedly will fly well before then. On April 21-23 in Colmar, France, the French NOO group, CIFFEN, will hold a symposium on "Tourism in Polar Areas." Yours truly, along with Antarcticans Swithinbank, Heap, and Spletstoeser will be there, as will Stonehouse and his team, and Boris Culik, whose work on penguin/human interactions is being used by some to suggest closing down penguin colonies to tourists.

So, why is it a funny farm? Too many tour ships with, perhaps, too little supervision, as well as too many people doing too many stupid-people-tricks. This season, in addition to the parasailor, there was supposed to be a motorcyclist taking a specially designed (and pollution-free) cycle over the plateau to the Pole. By early February, Palmer was inundated with more than 13 private yachts. And what about constructing a tourists' mecca at Nelson Island? It's nice to be home for a while.

**NELSON ISLAND, A PROSPECTIVE TOURIST HAVEN.** There is an aging Brit by the name of Bernard Stonehouse who has a grandiose plan for developing Nelson Island as an Acapulco South. Whether this is just a pipe dream, we're not certain, but he seems to think that Nelson would be an ideal island on which to build a tourist hotel where tour ships could disembark passengers so they could stay there and observe the Chin-straps or whatever. But there's a fly in his ointment, as the Argentines proposed that part of Nelson Island should be set aside as a Site of Special Scientific Interest (SSSI), which was subsequently approved. As we understand it, people do not need government permission to visit such a site, but they should have a legitimate reason. Now the question is whether tourists are illegitimates. A Chinstrap would nod "yes," a cruise director would nod "no."

Stonehouse has been described to me as a "pretty good wheeler/dealer", and he spent most of the past austral summer at Half Moon Island, where he reportedly got along famously with the Argentines. But it's one thing getting along with some camp personnel, and an entirely different thing getting that nation's blessing to develop Nelson as a tourist center, when they themselves have sort of done the same thing on King George Island, just to the north of Nelson Island. Supposedly The World Wildlife Fund is backing Stonehouse, although to what extent we do not know. The area which they are looking at is supposedly Harmony Point.

We presume it is inevitable that someone will put up a hotel for tourists unless some sort of legislation is enacted which would prevent it. With the mineral rights final] being resolved, tourism seems to be the issue on the front burner. When Congressmen from the United States visited Antarctica in late 1957, the Representative from the State of Maine gave an interview at McMurdo in which he envisioned a hotel for tourists being built in Antarctica. The old codger, long since deceased, was pretty clairvoyant, although at the time everyone thought he was out of his cotton-pickin' mind.

Nelson Island seems to be sort of an innocuous choice, as there are no scientific stations to be disturbed, and it might result in fewer visits by tour ships to such stations as Palmer, Arctowski, Rothera, and others in the area. And tourists who slept in a hotel there might come away with a sense of having actually bedded down on a piece of Antarctica. The more virile ones might be able to announce nine months later that they conceived "on the ice." It has all sorts of interesting possibilities

We understand there are other Brits who favor development of South Georgia as a tourist center. This island is north of 60°S, so is outside the jurisdiction of the Antarctic Treaty. The island is certainly spectacular, has a lot of majestic scenery, and the King penguin is probably the most photogenic of all penguins. Anyone who gives a hoot about Antarctic history has to have a warm spot for the accomplishments of Shackleton in crossing the island. The bad part for tourism is that those who go to just South Georgia might feel that they have been shortchanged for their bucks, as they were only in sub-Antarctica.

**A LETTER FROM THE GOVERNOR OF OREGON, BARBARA ROBERTS.**

Dear Antarcticans:

As you know, the United States has a long history of involvement in the Antarctic. As a country, we can be proud of the many accomplishments achieved while on research and exploration missions on that continent. But nowhere in the United States is there a National Antarctic Center where the public can get a sense of that history.

Reedsport, a coastal community in Oregon, became interested several years ago in creating such an education and information center. That dream is on the way to becoming a reality - The Richard E. Byrd National Antarctic Center.

The cornerstone of the four-part development plan, the Antarctic Merchant Marines Memorial, is nearing completion. This memorial consists of the research vessel HERO and a small museum, the Discovery Center. The remaining three parts of the center would consist of the Glacier National Icebreaker Memorial, the Antarctic Science and Exploration Institute, and the Antarctic Aviation Memorial.

As Governor of the State of Oregon, I support designation of the Richard E. Byrd National Antarctic Center in Reedsport as the United States National Antarctic Center. I also affirm my support for the Richard E. Byrd National Antarctic Center as a crucial component of Reedsport's Umpqua Riverfront Revitalization project.

We have the opportunity to create something here that will educate and inform generations to come of the service and dedication of Americans who explored Antarctica

and who set the standards for research there. I commend those individuals and organizations who have kept the faith, and urge the Antarctic Society to continue its support for this project.

Cordially,

Barbara Roberts  
Governor

SUNSET AT THE SOUTH POLE, 23 MARCH 1992 (Steve Warren, South Pole Station Scientific Leader). In March the Sun moves one degree to the north every two-and-a-half days. The Sun's width is half a degree, so at the South Pole it takes thirty hours for the Sun to set: thirty hours from the time the bottom of the Sun touches the horizon until the upper rim finally disappears. This is the most leisurely sunset anyone on Earth experiences. The lower half of the Sun has been hidden by blowing snow, but we've had spectacular views of the upper arc.

We can still see the Sun today because of refraction with the temperature-inversion: the air temperature today is  $-62^{\circ}\text{C}$  at the surface, 450 meters aloft it is  $-34^{\circ}\text{C}$ .

The Sun no longer looks round; it's a stack of three orange pancakes. The tops and bottoms of these cakes ripple with the wind. The left and right edges flash alternately yellow and green. Behind me, on the night side of the sky, the past-full Moon shines high and bright.

We were treated to a fine show on the 21st. The entire Sun was still above the horizon, but it was giving us a farewell display that isn't supposed to happen until the upper rim sets. Green flashes came and went for an hour or so. From the green-fringed shimmering upper arc, green flakes would cleave off, rise, then disappear; sometimes two or three flakes would be following one another as if on a conveyor belt as the top one disappeared another would rise from below. Then came the most amazing shocker that stunned us all, wide-eyed and gaping: a triangular green cap perched on top of the orange disk; this little green pyramid was visible to everybody, not just those with binoculars. What a treat! There were some wide grins on those orange-glowing faces at the skylab window!

(Ed. Note. As an ex-masquerading micrometeorologist who wintered over at the South Pole, I wonder what the people at the Pole are drinking nowadays. The green flash is one of the most elusive phenomena on earth to catch. I have never seen it. We aren't saying that Steve and the folks at the South Pole never saw the green flash, but the account is written so vividly and in such detail that we wonder if they are trying to pull a little wool, or green light, over our eyes! What do you say, Will Kellog?)

**LIME DISEASE IN THE ANTARCTIC** (Matthew P. Houseal, M.D., Amundsen-Scott South Pole Station - from The New England Journal of Medicine, Vol. 326, No. 5, 30 January 1992, page 351). The Amundsen-Scott South Pole Station closes in mid-February, leaving 21 people behind to conduct research and operate the base for the 8 1/2 months until the first flight of the next austral summer. A large shipment of food is delivered just before the station closes. One of the items is fresh limes. These are stored in an outside walk-in "refrigerator" that is heated  $65^{\circ}\text{C}$  above the ambient temperature (to  $5^{\circ}\text{C}$ ). Because of the extremely low water content of the ambient air at the South Pole and the degree of heating by the refrigerator, the relative humidity plummets. In this environment, limes quickly desiccate and in a few weeks become unfit for consumption. To avoid this, station personnel get together shortly after the station closing for a lime-squeezing party. This year it

took 12 people a total of four hours to squeeze the juice out of 120 pounds of limes. The juice was then frozen for use later in the winter.

The day after the lime-squeezing party, I was consulted by one of the participants because of a pain in his right elbow. He had been a prolific lime squeezer, gripping and rotating a juicer with his right hand while holding the lime half in his left. Examination revealed an acute lateral epicondylitis. The syndrome resolved with conservative treatment. This is the only case of lime disease ever seen at the South Pole.

**PENGUINMANIA REACHES NEW ZENITH.** Is there any Antarctic who hasn't been smitten by penguins? Many of us have even carried this love into our homes with all sorts of penguin memorabilia. Everything in Karen Ronne Tupek's home is in penguin motif, and when Karen crawls into bed every night, she is probably dressed up as a penguin, or at least has a penguin nightgown on. But she now has to take a back seat in the bus, way in the rear, as penguinologist Bill Sladen has the piece de resistance. He has a bathtub in his home out in Airlie, Virginia which has a tile mural of Emperors, Rockhoppers, and Adelies. The backdrop is all those fantastic snow-covered Antarctic mountains - truly beautiful!

The designer, Firedrake Studios, 482 Swanton Road, Davenport, California 95017 (Tel. 408-426-5091, Fax 408-427-1717), has a one-page color ad out with Bill shown in the tub with a parka on, with a balaclava, and a telescope, surrounded by hunks of ice. They evidently thought, and with great wisdom, that Bill's body would never sell any murals, so they put clothes on him.

Don't tell us you are into penguinmania unless you tell us you have a tub like Bill's as you're a nothing unless you have one like his. IT'S THE ULTIMATE! When you order yours, better specify that you don't want Bill coming with it.

**ARTISTS ON ICE - ANTARCTICA:** Images from a Frozen Continent. An art show currently at the Concourse Gallery, Upper Arlington Municipal Center (Upper Arlington is near Columbus, Ohio) should please anyone with an eye for Antarctica, as two talented artists, Alan Campbell and Stuart Klipper, are exhibiting. Both have been lecturers at our Society meetings in Washington, and each is hung in Ruth Siple's home. We feel akin to both, as Alan learned all he needed to know about lighting while painting on North Haven Island, which lies just offshore from where this intrepid soul lives. And for anyone who dresses like Stuart, he has to be the idol of those of us who hate neckties and suits. We have seen some of Alan's paintings and some of Stuart's photographs, and they are truly superb. Their exhibits will be at the Concourse Gallery through 15 April.

Garry McKenzie has been deeply involved in the art exhibit, and has high hopes that this show will appear in other galleries across the country, including the Smithsonian, under their SITES (Smithsonian Institution Traveling Exhibition Service) program. We have given quite a bit of ink in the past to both Stuart and Alan, but will repeat the party line on them as presented in the Quarterly Publication of the Upper Arlington Cultural Arts Commission.

Photographer Stuart Klipper, who has exhibited in the San Francisco Art Museum and the Minnesota Museum of Art, has works currently being toured by New York's Museum of Modern Art. His photographs are in MOMA's permanent collection.

Curator Peter Galassi, the Department of Photography, the Museum of Modern Art wrote, "Antarctica is a perfect subject for Stuart Klipper. For more

than two decades he has traveled and photographed with indefatigable zeal, as if to recreate single-handedly the fascination of expeditionary work." Klipper's panoramic photographs in this exhibition were made by him with a Linhof Technorama camera. The camera allows Klipper to make three-foot wide prints that are, continued Galassi, "stunning at once for their breadth and for their subtlety of description."

Alan Campbell was selected to participate in the U.S. Antarctic Program because of his level of professional experience and well-known emphasis of color and light in his paintings. Discussing his Antarctic paintings, Campbell asserts, "The works are not scientific illustrations, but my own free interpretation of the elusive and, at times, surrealistic sights, sounds, and sensation of this most magical and mysterious of places."

When asked about his adventure, Campbell responds, "I have painted the turquoise blues and greens of an ice cave in the Canada Glacier, spent days with 5,000 Adelie penguins in the rookery at Cape Royds, slept on the floor of the huts of the early explorers Shackleton and Scott, watched Killer whales in 2 a.m. sunlight from the stern of an icebreaker, and sat in a place so quiet you could hear your heart beat. These are experiences that elude easy description."

**AFTER ALL THESE YEARS, CHET LANGWAY HAS FINALLY MADE GOOD.** Chet Langway had some visibility when he was at the Cold Regions Research and Engineering Laboratory at Hanover, but then he went to Buffalo, and when anyone goes to Buffalo, it's like going into the Bermuda Triangle. Buffalo is only heard from when political humorist, Mark Russell, tapes one of his shows from there. But we were aware that there was a Langway somewhere, as his nephew was/is quite a hockey player with the Washington Capitals, once being named the top defenseman in the entire National Hockey League. Later he became really famous when he divorced his wife and married what a Washington reporter called "an erotic dancer." Meanwhile, Chet was there in Buffalo maintaining a low profile, but a decidedly widening low profile, because when he did make it to Washington to some meeting, it was obvious that Chet wasn't missing any meals.

But all this time the University of Bern knew about Chet, and they recently gave him an honorary degree of Doctor of Philosophy. Translation of the Latin text read "Distinguished and learned author Chester C. Langway, pioneer in the discovery of information about the history of the earth that is contained in the polar ice, who has moreover in cooperation with researchers at the University of Bern developed significant basic findings for our understanding of climatological and environmental processes."

Langway (a professor at SUNY-Buffalo since 1975) found the strongest response to his ideas and plans in Europe in the Laboratory for Geophysics at the University of Copenhagen (Prof. W. Dansgaard), and in the present-day Division for Climatological and Environmental Physics of the University of Bern. A productive cooperative relationship of long duration began, whose high point was the drilling of the polar ice shield at the radar station Dye 3, Greenland. The results of this cooperation are:

- the reconstruction of the climatological history of the North Atlantic and the Antarctic for the last 100,000 years;
- determination of pre-industrial concentrations of the greenhouse gases carbon dioxide and methane;
- the discovery of natural variations of these gases synchronous with transitions between ice ages;
- observation of variations in the concentration of radioisotopes originating in the cosmos, which are caused by solar modulation of cosmic rays.

These findings have contributed materially to our present understanding of the earth as an interactive system of chemical, physical and biological processes. Langway's willingness to cooperate beyond the borders of the continents made it possible for the University of Bern too to contribute to this research, which has led to significant new scientific findings.

From now on we will have to refer to Chet as the famous ice man who just happens to have a millionaire nephew who skates on the stuff.

**BERGY BITS.** Dorcas Den Hartog Wonsavage didn't exactly have a spectacular Winter Olympics, although every competitor in the Olympics was a winner in his/her own right. Dorcas came in 44th in the 15K cross-country skiing, 45th in the 30K cross country skiing. Probably getting married slowed her down a bit..... Norman Vaughan, the Irrespector of Age, finally decided to show some personal acumen when he came back from being a guest musher at the Winter Olympics, and dropped out of this year's Iditarod race after being in it for about a week. After seeing the bright lights of Albertville after dark, that long sledging trip in the wilds may have lost some of its appeal to old Norman who is still young at heart at age 87..... When students were at Cape Evans this past austral summer, helping clean up the place, they found Apsley Cherry-Garrard's long Johns frozen at the bottom of a bathtub. A winsome-looking Nicola Hill was quoted as saying, "They smelt of salt and had the initials C.G. written on them. It looked like the boat had just come and they had just left." .... Under the good new category, we understand that a large group of Greenpeace personnel were at Cape Evans removing all their huts and equipment from the area. Congratulations to Greenpeace, although, to begin with, they should never have selected such hallowed territory for their camp. Do you want to have a good T-shirt while making a worthwhile contribution to preserve Antarctic historic huts? Buy one of the Antarctic Heritage Trust T-shirts for \$20 (Freeport 1453, Antarctic Heritage Trust, P.O. Box 14 091, Christchurch, New Zealand. John Spletstoeser has now lectured as a naturalist on Antarctic geology and history on thirty-four Antarctic cruises since 1983, and during that time has actually seen several tourists under sixty years of age. Honest! His bride from the Late Pleistocene, Beezie, has made twenty-three cruises, lecturing on birds and birds and more birds. Our beloved whale spotteress, Dotte Larsen, was evidently snake-bitten about five years ago, and has been plagued ever since with miscellaneous and sundry problems with limbs and joints and whatnots. Last November, without even trying, she fell and broke her pelvis and a finger, and damaged her lower spine. If Dotte doesn't watch out, Professor Bill might try and trade her in for a model with functional parts. Dotte is a real sweetheart, and we sure wish her a fast return to the whales. Although the following will never be a big seller on coastal Maine, you should know that the British Antarctic Survey, Natural Environment Research Council, High Cross, Madingley Road, Cambridge CB3 0ET, UK, has recently published An Annotated Bibliography of Antarctic Invertebrates (Terrestrial and Freshwater) by William Block. It covers a span of 168 years (1822 to 1990) and has 1400 entries, most of which contain abstracts, some of which may actually be interesting to someone somewhere on a particular day. Takes all kinds, you know..... James Barry Burnham has been unearthed. He was the only scientist from the first two years at the South Pole whose whereabouts were unknown. But he is alive, lives in Tolland, Connecticut, works in Farmington, Connecticut, and met his wife, Joan, sky diving. Beware of men who sky dive, as they are bound to be unstable. I guess it must also apply to women sky divers! Jim was discovered by his ex-working partner at the South Pole, Charlie Greene, when Charlie and Jim were traveling on the same plane last winter..... Lady-in-Waiting, Pam Davis, is happy as a clam at high tide in Cambridge, and may never leave the Scott Polar Research Institute. She is the Grand Dame of the shell on which she rows, being twice as old as the other women. But Pam, you have class and quality, and that counts, so you always be a winner.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 92-93

July

No. 1

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

Paul C. Daniels

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Sayed Z. El-Sayed, 1990  
Dr. Charles W. Swithinbank, 1991  
Dr. Susan Solomon, 1992

THE BELLS TOLL FOR THREE GREAT ANTARCTICANS

James H. Zumberge, April 15, 1992  
Emanuel D. Rudolph, June 22, 1992  
Richard P. Goldthwait, July 7, 1992

*Our 1992 Paul C. Daniels Memorial Lecture*

Antarctic Ozone Depletion:  
Global Change in the Last Place on Earth

by

Dr. Susan Solomon NOAA  
Aeronomy Laboratory  
Boulder, Colorado

on

Tuesday evening, September 22, 1992

7:30 PM

The National Academy of Sciences 2101  
Constitution Avenue N.W.  
Washington, D.C.

*Reception in the Auditorium Gallery at 5:30 PM*

*Dinner in the Great Hall at 6:30 PM*

*Lecture in the Auditorium*

The National Research Council's Polar Research Board and the Antarctic Society are combining once again to bring you the Society's annual Memorial Lecture in the hallowed halls of the National Academy of Sciences.

Susan Solomon truly needs no introduction as she has been prominently featured by the media for her investigative research on the ozone problems in both polar regions. She is a member of the Polar Research Board, and just this year was elected to the National Academy of Sciences, which is considered one of the highest honors that can be accorded to an American scientist or engineer. She is a great choice to be our first-ever female Memorial Lecturer.

Come one, come all! Let's make it a gala evening! !!! MARK YOUR CALENDAR NOW !!!

The cost of the reception and dinner is \$37.50. Please make your check payable to the Antarctic Society, and mail it to Ruth J. Siple, 905 N. Jacksonville Street, Arlington, Virginia 22205. Checks should be received by September 18th.

If summers are scored on a 1-to-10 scale, this one has to be about a minus 10. It all started one night when my fixed bridge came out with my partial, leaving me standing there looking most pathetically at most of my lower teeth in my hand. I was devastated. Trips to a periodontist followed. In late April my mother almost died - the doctor sent me into her room at the hospital to say my goodbyes, but she wasn't ready to go. The scenario wasn't quite right. However, she was called on June 2nd, and went very peacefully after a lovely morning sitting on her beloved porch enjoying cool breezes off the ocean, and admiring her window boxes full of freshly planted petunias.

By then I was commuting to Boston to see an implantologist of national repute, but we weren't exactly on the same wave length. My blood pressure was up, and he sent me back to coastal Maine to get that in order so he could operate. With the help of modern medicine, that was possible on July 1st. For over six hours I was responsive to commands, although I have no recollections of anything!

The tragic news of Gentleman Jim dying in Los Angeles rocked the Antarctic community, although we were well aware of his serious problem. Jim just could not die, but he did. We wanted to get out a special Newsletter honoring him, but before we could get around to it, Emanuel Rudolph had his fatal accident, so then we had two tragedies. Shortly thereafter lightning struck a third time with Dick Goldthwait's untimely death. Of the three, only Dick went with his boots on, as if he had written his own script. All three of these men were truly Antarctic giants, all three were really nice guys. We couldn't afford to lose them, but we did. You know only the good die young, the rest of us linger on.

In the meantime, that "aging Brit", and the South Pole crew were lining me up in their gunsights, and I'm saying, "Go ahead, shoot me," as I'm left with a 101-year old stone-deaf, cantankerous aunt living next door who I have to keep alive so she can give me a hard time. Life is no bed of roses, but Maine is a great place to live. Oh yes! the Newsletter - here it is, sad but true.

**POLLY PENHALE INCOMING PRESIDENT OF OUR SOCIETY.** Dr. Polly Penhale, Program Manager, Polar Biology and Medicine Program, Division of Polar Programs, National Science Foundation, was duly elected president of the Antarctic Society at the brief annual meeting before our last spring lecture. She has been at NSF since 1986, coming from the College of William and Mary where she was Assistant to Dean for Academic Affairs. Actually this is her second stint at NSF, as she was in the Biological Oceanography Program as a program director from 1982 to 1985. She has also been associated with the W.K. Kellogg Biological Station at Michigan State University, and the Rosenthal School of Marine and Atmospheric Science, University of Miami.

Polly graduated from Earlham College in Richmond, Indiana in 1970, which must put tier age at about 25, going on 26. Her master's and doctor's degrees are from North Carolina State University.

She's a bipolar scientist, having done research in both polar regions. She worked

at the Naval Arctic Research Laboratory at Point Barrow in the summers of 1971 and 1972, and also did field research in a place called the Izembek Lagoon on the Alaskan Peninsula, which must have qualified her for future woebegone assignments. She also found time to be a research scientist on cruises to the Bahamas and Nicaragua. Since 1987, she has been a frequent traveler to Antarctica, being the unofficial mayor and sheriff of Palmer Station.

Polly's research interests are in the primary productivity and nutrient cycling in marine systems, particularly, macrophyteepiphyte productivity in seagrass communities. And as the Program Manager for Biology and Medicine, she is particularly interested in the interdisciplinary approach to complex systems.

She's intelligent, she's a scientist, she's an administrator, she's personable, she's articulate, she's reasonable, and she's good-looking. What more could you want for our president for the next two years? We are lucky!

**JAMES H. ZUMBERGE, 1923-1992** (from the University of Southern California Memorial Convocation Program, Bovard Auditorium, May 6, 1992). President Emeritus Zumberge served as ninth president of the University of Southern California from 1980 until his retirement in 1991.

Dr. Zumberge came to USC with a distinguished record as a scholar, scientist, educator and administrator. He was president of Southern Methodist University from 1975 to 1980; chancellor of the University of Nebraska-Lincoln from 1972 to 1975; dean of the College of Earth Sciences at the University of Arizona from 1968 to 1972; and the founding president of Grand Valley State College in Michigan from 1962 to 1968. He taught geology at the University of Michigan from 1950 to 1962, and at Duke University from 1946 to 1947.

Among his accomplishments while president of the University were the development of the exhaustively researched "Academic Planning for USC," a document that set forth the goals that became the basis for The Campaign for USC, which exceeded its \$557 million goal by \$84,574,718. A Presidential Commission on Undergraduate Education developed programs to enhance the freshman experience, and provide access to research opportunities and honors programs for undergraduates. In the Zumberge decade, USC attracted more than \$700 million in sponsored research, and began or completed construction of 15 new facilities. Among those projects were the Norris Cancer Center, the Hedco Neurosciences Building, and General William Lyon University Center. Hallmarks of the Zumberge years were his creation of the Faculty Research and Innovation Fund, named in his honor, and his commitment to a new teaching library. It is typical of Dr. Zumberge's vision for USC that the most singular capital commitment he spearheaded was funding for the teaching library.

Dr. Zumberge was official U.S. delegate to the Scientific Committee on Antarctic Research (SCAR) of the International Council of Scientific Unions from 1972 to 1986, and served as SCAR president from 1982 to 1986. He was the recipient of the Antarctic Service Medal in 1966. Cape Zumberge, Antarctica, was named in his honor in 1960, and the Zumberge Coast, Antarctica, in 1986. He was chief glaciologist for the U.S. Ross Ice Shelf Project in Antarctica for the International Geophysical Year (1957-58), and chief organizer for three subsequent expeditions to Antarctica.

Zumberge earned his B.A. and Ph.D. degrees in geology from the University of Minnesota in 1946 and 1950, respectively, following service as a Marine Corps officer. He held six honorary degrees: an LL.D. from Grand Valley State College in 1970; an L.H.D. from Nebraska Wesleyan University in 1972; an LL.D. from Kwansei-Gakuin University, Nishinomlya, Japan, in 1979; a D.Sc. from Chapman College in 1982; a D.Hu.L. from

Hebrew Union College-Jewish Institute of Religion in 1987; and a D.Pub.Adm. from Chung-Ang University in Seoul, Korea, in 1989.

Dr. Zumberge was married to the former Marilyn Edwards of Western Springs, Illinois. They have four children: John, a geochemist for Core Laboratories, Houston, Texas; JoEllen, an account supervisor for Manning, Selvage and Lee Public Relations, Inc., Los Angeles; James, a physicist at the Jet Propulsion Laboratory, Pasadena, California and Mark, a research scientist at the Scripps Institute of Oceanography, La Jolla, California.

**THOUGHTS AND REFLECTIONS - JAMES H. ZUMBERGE** (presented by Dr. Robert H. Rutherford, President, University of Texas at Dallas, and Chairman, National Academy of Sciences' Polar Research Board, at a Memorial service for Dr. Zumberge at the University of Southern California on May 6, 1992). I am honored to be here today to join with you in this tribute to "Gentleman Jim," "Big Z," "the Z," "El Zumo," "the Iceman" (as he was known to some faculty), and other names I cannot repeat here.

When President Sample asked me to participate in this memorial, I quickly agreed. As I now stand here I am very glad that I came, but I am still not sure that what I am about to say will make sense to anyone but me.

Jim was a very special and unique person. He was at home in the Board Room whether it be corporate, academic, or at the National Science Foundation, or the "board" room of the local lumber yard. He loved to escape to the informal life and clothes that were an essential part of his life as a field geologist.

His abilities as a scientist were never questioned. He had an inquiring mind and was a quick learner. His work on the glacial geology and origin of lakes in Minnesota was excellent. His Ph.D. dissertation was printed in 1952 as a Bulletin of the Minnesota Geological Survey. By 1957 it was out of print! For those of you who know something about Geological Survey publications, you will recognize this as some kind of record. It is still a basic reference on the Lakes of Minnesota, and it is now a collectors' item.

Jim's involvement in the International Geophysical Year as a glaciologist led to his research on the deformation of ice and the formation of crevasses, work that continues today. His interest in Antarctic glaciology and his articulate support for research in all scientific disciplines on that continent led to his appointment as Chairman of the Polar Research Board, as U.S. SCAR Representative, and President of the Scientific Committee on Antarctic Research, an international committee.

Jim was a teacher, an excellent teacher both in the classroom and in the field. When he couldn't find the books he wanted for his classes, books that would spark the interest of students in the understanding of the earth that he loved, he wrote his own. His laboratory manual for freshman physical geology, first prepared on a mimeograph machine, has evolved and is now in the 8th edition. (As a joint author for the last several editions I can tell you it is the best lab manual available.)

His academic leadership was recognized early. He moved from the faculty at the University of Michigan, without having been a department chair or Dean, to become President of Grand Valley College where the library now bears his name. He served as Dean of the College of Earth Sciences at The University of Arizona at a time of reorganization, and became Chancellor of The University of Nebraska-Lincoln where he voiced concern about faculty salaries and quality education. His commencement address of 1972 became the subject of an editorial in 1992. He moved to Dallas to serve as President of Southern Methodist University, and then came here as President of U.S.C.

While at Nebraska, Jim received a grant from the NSF for a large glaciology project

in Antarctica, a research project that was known as the Ross Ice Shelf Project, an effort that involved 7 countries and 14 institutions. However, despite all of his best efforts, many of the folks in Lincoln were convinced that this was really an engineering project aimed at the development of a better refrigerator utilizing a new system - The Ross Ice Shelf!

Jim's interest in the Antarctic shifted from pure science to science and resource policy, and his papers on these subjects are excellent. Unfortunately, the politicians and environmental groups have not taken time to read them.

His contributions to the IGY were recognized by the U.S. Board of Geographic Names when they named a small rock outcrop for him - Zumberge Nunatak. As time went by there arose some question as to whether there really was such a feature, so the name was dropped from some maps. To ensure that the name Zumberge would always appear on maps of the Antarctic, several of us proposed that the coast where the elusive nunatak was supposed to be located be named Zumberge Coast, a large feature. Jim always laughed about all of this because both features are at least 1000 miles from where he did his research, and he never saw the features that bear his name.

Jim was a musician of international reputation, at least among the SCAR nations. He played piano in almost all of the original 12 SCAR nations, and his skills with the accordion resulted in the importing of an accordion to Antarctica so that he might lead the songs at the Beardmore Camp Symposium in the mid-1980's.

He was the originator of the famous SCAR Marching Song, a song that is now about 80 verses long! This song in its original form would be classed as "politically incorrect" today! Jim was involved in the cleansing of the then-existing verses prior to the Beardmore symposium, much to the dismay of some of the old Antarctic crew!

One of his major musical contributions was the introduction of an Australian college song into the SCAR venue, Zumberge Octoberfests, and other gatherings. That song from Canberra has traveled to all SCAR meetings - some of you will recognize the title - "It's the Same the Whole World Over."

Jim was an artisan - a woodcarver of great skill. His carvings are an integral part of his cabin in Jackson Hole where his carved plaque, HAUS ZUMBERG, welcomes all.

Jim was a family oriented man - he loved to have his family and extended family with him. He and his brother, Bob, shared a love for life. Jim was proud of the accomplishments of his children - he often told me of their latest exploits. He was proud of his German heritage. Octoberfest, German folk music, and bratwurst were an essential part of his life.

A tribute to Jim would not be complete without recognizing the importance in his life of his wife, Marilyn and the key role she played in his career. Just after they were married Jim dragged her to Alaska, put her up in a hotel, and left for the summer. This must have given her some warning about the life ahead.

Jim and I first met in 1970, and our work together began in 1972. He and I, along with our wives, became "instant friends" if that is possible. He was "Uncle Jim" to my children. He was always available for advice. When I called him to talk about my moving to Texas, we carefully weighed the pros and cons - then Jim closed the discussion by telling me that "everyone deserves to live for a time in Texas!"

We shared a love for geology, for education, for Jackson Hole, for doing things with our hands as well as our minds. We may have the only two cabins in the country with rooms built by two college presidents!

Jim lived a full and rewarding life. He gave of himself to society, and looked forward to the future with eager anticipation. He was busy planning the next revision of his lab manual when I visited him here in Los Angeles in January.

I have very special memories of this very special man. He was and will continue to be an essential part of my life. He was a mentor, an inspiration, but most important, a friend. I will miss him!

But if he were here with us today, he would tell me - "Rutford, get on with it" -and so I say to you - Let's get on with it, and live life to its best and fullest as Jim would have us do.

**A. LINCOLN WASHBURN ON JIM ZUMBERGE.** Jim had a quick mind, a breadth of interests and understanding, and a warm, informal personality by nature, yet also a glint of steel in his makeup. He was decisive but careful of facts and eventualities when making decisions. He could relax, play his accordion, and sing with the Navy personnel who were assisting with his Antarctic field work, but he could also be very formal indeed when chairing a high-level international meeting dealing with Antarctic research. He had a leadership presence that equipped him to be the right man in the right place at the right time, whatever the occasion.

Jim's many talents could have assured him success in a number of different fields. He chose academia in which over the years he combined research, teaching and administration - a difficult series of tasks to be effective in all. Unlike many college and university presidents, he managed to maintain close contact with students, despite the heavy demands to raise funds and be responsive to all the many bodies politic in academia. His own research as a geologist was primarily focused on the polar regions - an active focus throughout his career, as illustrated by his service as Chairman of the U.S. National Research Council's Committee (later Board) on Polar Research; President of the International Committee for Antarctic Research (SCAR); and the first Chairman of the U.S. Arctic Research Commission - a Presidential appointment. Throughout these activities he emphasized the importance of international cooperation in polar research. Jim's family life was equally rewarding, thanks to his wife Marilyn, who was at his side throughout, and their three sons and daughter.

When cancer was diagnosed, he continued to exhibit his strengths. I remember a meeting of the U.S. Arctic Research Commission at the University of Southern California at which he excused himself temporarily because of a doctor's appointment at which he learned he had to undergo major surgery. None of those attending the Commission meeting knew this at the time, nor did the several hundred alumni and others present that evening at the USC Alumni Homecoming Dinner on the spacious lawn of his and Marilyn's home, to which the USC Trojan Marching Band brought a festive spirit. He and Marilyn contributed to this spirit with upbeat talks full of hope and promise for USC and the future, and no one could have guessed his and Marilyn's feelings about the bad news he had just received. Jim survived the operation and continued his duties within a reasonably short time, including leading a major and highly successful USC fund campaign, following which he retired as President.

Jim planned to take a year's leave of absence, then return and teach geology to freshmen, whom he regarded as the most neglected students in big research universities. Tragedy dashed those plans when it was discovered he had an inoperable brain tumor unrelated to the earlier event. Again, his indomitable spirit came to the fore. He welcomed calls and assured friends he was doing his best to meet this new challenge, and that he remained optimistic that treatment would be effective. But no cure was found. Jim's spirit and the memory of a truly exceptional person and leader whose life made an important difference, nationally and internationally, remain imprinted on the minds of those who had the privilege of being among his colleagues and longtime friends.

**CHET LANGWAY WRITES ABOUT JIM ZUMBERGE.** I was Jim's last PhD student at the University of Michigan. I left UM in 1961 just before he left to preside at Grand Valley State College. We originally met at the Snow Ice and Permafrost Research Establishment (SIPRE) in the spring of 1956, and then the next year at Chamonix, France at a glaciological meeting. I was closely associated with Jim, Marilyn and their four kids from that time on. Although Jim was probably somewhat misunderstood by some in the field, he was a fine guy and did a lot to enhance research progress in polar regions. As a member of the NSF Board, he was instrumental in getting the Greenland Ice Sheet Program (GISP) and the Ross Ice Shelf Project (RISP) off the drawing board and into the field operation itself. Much of the drilling in ice being done today is a result of his commitment to polar research, perseverance, and science administrative skills. He was a competent, versatile, and powerful supporter of geological and glaciological research on the national and international scene. (Would that someone of his ilk existed today.) He was extremely active in many behind-the-scene adventures in advancing polar science, most of which were unheralded to the public. As you also know, he had enthusiasm, talent, energy, insight, and a somewhat easygoing manner.

Jim was also a good carpenter (his father's trade), and a pretty good musician capable of playing numerous wind and string instruments, particularly the piano in the Crazy Otto style. He was also a song-master with a repertoire of countless ditties.

He will be a tough man to replace in terms of his overall contributions to this generation of polar scientists. I would like to suggest that some appropriate recognition of his contributions might be considered by our community. I would be willing to participate, serve or contribute.

**DR. EMANUEL RUDOLPH, FORMER DIRECTOR, INSTITUTE OF POLAR STUDIES, DIES.** One of Antarctica's foremost lichenologists, Dr. Emanuel Rudolph, died on 22 June 1992 of injuries suffered in an automobile accident on 20 June 1992. Emanuel, only 64 years old, had stopped at a stop sign near Wooster, Ohio, at about 5:50 in the afternoon, and evidently failed to see an oncoming car, pulled into its path, and was hit. He was an expert on the adaptation of lichens in Antarctica, and also on the history of botany. He authored over forty scientific papers on lichenology, and presented over a hundred papers at scientific meetings.

Emanuel became Director of the Institute of Polar Studies (now the Byrd Polar Research Center) on 1 July 1969, replacing the irascible Colin Bull who moved onward and upward in the hierarchy of The Ohio State University. Emanuel had joined the Institute as a Research Associate in July 1961, coming to Columbus from Wellesley College. His major research interests included ecology and systematics of Antarctic lichens, biosystematics of the lichen family Teloschiales, and Antarctic vegetation. With these kinds of interests, how come the U.S. Board of Geographic Names came up with Rudolph Glacier in Victoria Land? However, Rorudia, a genus of lichens, and several lichen species (Catillaria-rudolphi Dodge) were named after him in 1980.

Emanuel was the author of more than 40 scientific papers on lichenology and on the history of botany. He was the editor of a book on symbiosis and parasitism, and authored more than 150 book reviews in major journals. He received the Ohioana Citation from Ohioana Library Association in 1985. At the time of his untimely death he was President-Elect of the Ohio Academy of Science. A list of his publications, memberships, and scholarly and service activities actually take up more than twenty-six pages.

We should mention that Emanuel wrote the introduction and lichen section of Terrestrial Biology, Antarctic Map Folio Ser., American Geographical Society, 1967, Folio No. 5. He also wrote "Terrestrial vegetation of Antarctica: past and present studies,"

American Geophysical Union, Antarctic Research Series, 8:109-134, 1966.

His dear friend and professional colleague, Henry H. Brecher, wrote, "As you probably know, his interests extended beyond lichenology and the polar business, particularly to the history of biology and, of course, to books and book collecting. His personal library (over 6000 volumes back in July 1969), his very active participation in the university's library support organization, and his involvement with the university press are the most prominent examples. And he was committed to service in many other directions as well." Emanuel was preceded in death by his wife, Ann Waterman Rudolph and the two of them probably had the best library of children's books on Antarctica. Henry ended his letter of 24 June to us saying, "I will miss (him) greatly." That can be echoed through the entire polar and botany communities.

**A. LINCOLN WASHBURN ON DICK GOLDTHWAIT, 1911-1992.** Dick Goldthwait died suddenly and unexpectedly of a massive stroke while he and his brother, Lawrence, were collecting water specimens from a lake near the long-time summer home of the Goldthwait clan in Wolfeboro, New Hampshire. With loving family and amid beloved surroundings while continuing a lifelong dialogue with nature, it was a kind of leave-taking to be devoutly desired when nearing the end of life's earthly span.

Dick was an international figure in polar research and one of the most highly respected glacial and Quaternary geologists of his generation. He grew up in Hanover, New Hampshire, where his father, James Walter Goldthwait, a lifelong glacial geologist of his time, was on the Dartmouth faculty. Dick obtained his B.A. at Dartmouth in 1933, and his Ph.D. at Harvard in 1939. He was an instructor and assistant professor at Brown University until World War II when he served as a materials engineer at Wright Field (now Wright-Patterson Field). In 1946 he was appointed Associate Professor in the Department of Geology and Mineralogy at Ohio State University, and only two years later was promoted to full professor. He served as chairman of the Department from 1965 to 1969 and became Emeritus Professor in 1977. Dick was the founding spirit behind the establishment of the internationally prominent Institute of Polar Studies (now Byrd Polar Research Center) at Ohio State University, which he served as director from 1960 to 1965. Dick was appointed to numerous national and international committees, and was affiliated with a number of scientific societies, including the International Glaciological Society, being elected to the Council and to honorary membership.

A dominating theme in Dick's research was comparing the behavior and deposits of contemporary glaciers with those of the Pleistocene. This led him to Alaska and the French and Swiss Alps early in his career as he studied the glacial geology of New Hampshire and the Presidential Range, along with research in Massachusetts and later in Ohio. His polar studies extended to Baffin Island, Greenland, and Antarctica; he also worked in New Zealand and briefly in Tibet. Among Dick's pioneering efforts were the introduction of seismic field equipment in the study of contemporary glaciers in Alaska and the French Alps, and his initiative in furthering interdisciplinary study of polar environments through the founding and work of the Institute of Polar Studies, which now houses the Goldthwait Polar Library.

Publications resulting from his research and other work brought Dick wide international recognition and many honors, including the first Distinguished Career Award of the American Geological Society's Quaternary Geology and Geomorphology Division (1966), the Antarctic Medal of the U.S. Congress (1968), and Ohio State University's Distinguished Service Award (1980). Mount Goldthwait (3815 m) at 77°59'S, 86°03'W in the Antarctic honors his Antarctic contributions. But the career milestones cannot fully convey the value of his services in teaching a generation of students, many of whom have now made their own mark.

Dick was a lifelong friend from our very early years in Hanover and at Dartmouth, including an Alaskan field season with him in 1934 while we were on Brad Washburn's Mount Crillon expedition. I admired Dick greatly, professionally and personally, both for his ever-present critical eye that helped him become the careful and eminent scientist he was, and for being the friendly, warm-hearted, unassuming, and straight-forward person I knew. Along with a relaxed and amusing quip when appropriate and a firm presence when needed, he exemplified leadership in Life as well as in science.

**MORE ON "DOCTOR G"**. If you want a blueprint for a traditional old-fashioned memorial service, Dick's in Wolfeboro, New Hampshire on Sunday, July 12th would be it. It was held in the boondocks in a small country church built in 1841. An outpouring of friends and neighbors joined the family - his wife, Kay, four children, four grandchildren, a brother, and cousins - filling the church to capacity. It's always good to hear something in church with which you are vaguely familiar. Faith of Our Father was the first hymn (the second one was an environmental hymn), and the Twenty-third Psalm must be known by everyone.

The eulogy was delivered by a college friend of Dick's who had many interesting stories about him and Dartmouth, especially the Outing Club. There were also some other stories, one about how, as a Sunday School student downstairs waiting for the church service upstairs to end, Dick sort of sabotaged the ends of the organ pipes with rubber tubing, resulting in some ungodly-like sounds being emitted during the recessional. On the plus side was how, as a youth, he rushed into a burning church in Hanover and rescued the silver communion service set. After the memorial service was over, refreshments were served in the courtyard, and it can be reported with a very high degree of reliability that the cookies were just excellent. Both Tony Gow and I had driven a few miles to get there, so we hit the tables pretty heavily, and then compared notes!

[Cay wrote that Dick's greatest achievement was the founding of the Institute of Polar Studies at The Ohio State University. She added that among his many awards and honors, he felt greatly privileged to be counted among the select few who were honorary members of the International Glaciological Society. Kay also pointed out that President Johnson appointed Dick to a commission to study the 1964 earthquake which had its epicenter off the Alaskan coast. Altogether Dick spent over thirty summers in the field in Glacier Bay, Alaska, and numerous summers in northern Greenland doing research. The people at the South Pole will be appalled to learn that Kay said that our so-called Newsletters "were required reading at our house!" Besides being brilliant, Dick also had excellent judgment!

**ANTARCTICAN BILL ZOLLER DID NOT DIE, BUT HE LOST 20 YEARS OF MEMORY, TRULY "PARADISE LOST" AND "PARADISE PARTIALLY REGAINED."** This is an old article, but it has just come to our attention. It's by Bill Dietrich and was in the Seattle Times of 11 November 1991. It is some story. Wild Bill Zoller woke up from a 1987 automobile accident with twenty years of his memory missing. Many people probably wish they could do the same, but not by the route Zoller took by mistake. An Antarctic, Bill skidded on ice, and his car was hit so hard by another car that both his seat-belt and his pelvis were broken. His brain sustained two enormous blood clots, inch-wide holes were left in the brain, and he was in a coma for a week. When he came to, his multiple trips to Antarctica had been erased, his participation with the first teams of scientists to enter Mount St. Helens and El Chichon were no longer remembered, nor was his 50-yard ride on the breakaway crust of a lava flow in Iceland. His 150 research papers never happened. When he found out that Ronald Reagan had been president, he said what many an American had been saying, "You've got to be kidding." And to Bill, the Vietnam War was just beginning. He did

remember courting and marrying his wife, as that was before the twenty-year loss. But with the help of his family, his physicians, his therapists, and his colleagues and friends, he has fought off near-suicidal depression since the accident, and has worked to recapture the most central thing of self, his mind. It was a major victory one morning when he woke up and remembered his own name. He has recaptured his speaking skills to the extent that 300 students pack his freshman chemistry classes at the University of Washington. Onstage his old persona seems to take over automatically, and he gives a performance that draws laughs, gasps, and jolts. It seems he remembers all the facts and theories and formulas of chemistry he knew in the 1960's, but is painfully relearning the advances since then. Students rate his lectures among the highest in the university's chemistry department.

None of this would have been possible without a remarkable wife and children who have struggled to adjust to a stranger. A genius with a national reputation as a volcanic and atmospheric chemist had been turned, emotionally and intellectually, into a near-infant. Dr. John Maxwell, his first neurosurgeon, said that the recovery of basic functions like talking and walking may be rapid, but that higher brain functions can take two or more years to come back, if at all. It would be interesting to know how Bill has been doing lately, as this was written eight months ago. Colin Bull, why don't you check Bill out for us and give us an update?

**THE ADMIRAL RICHARD E. BYRD MONUMENT RESTORATION FUND (N.Z.).** John Lenkey III, a Midlothian, Virginia man who is president of Global Business, an export, import and foreign investors consultant firm, went to Wellington, New Zealand on business last November, and decided to revisit the monument to the late Admiral Richard E. Byrd which the Kiwis had put up in 1963 to immortalize Byrd. Supposedly it is the only monument south of the equator which honors an American. To his dismay, John found the bronze plaques were missing, some rocks had been taken, graffiti had been applied, and the whole monument fallen into disrepair. So he went to the Government of New Zealand and to the American Embassy. The New Zealanders agreed to raise half the money needed to redesign and refurbish the monument and the grounds. Then he came home and organized a committee, with a goal to exceed the New Zealand funding. Among the early contributors was the National Geographic Society, and the figure above Gilbert Grosvenor's signature was \$16,000, which puts them into the realm of their rebuilding goal.

The bust will be restored, the plaques replaced, and the covering of the new monument will be scratch-proof acrylic tiles which will be painted to glow blue in daylight, representing the aurora australis. Wonder why blue for the aurora australis? Perhaps it will be a greenish-blue.

If you want to be included among the contributors, your check should be made out to the "Admiral Byrd Monument Fund" and sent to c/o John Lenkey III, 2121 Castlebridge Road, Midlothian, Virginia 23113. Administrative costs will not exceed eight percent of the contributions. Funds will be redeposited to the Account of the American Ambassador to New Zealand for disbursement. All donors' names will be permanently displayed on the monument unless not wanted. It seems to this soul that listing donors' names cheapens the whole production - why not just "family and friends", and leave it at that? People who make "significant contributions" - to be defined by the Committee - will get a full-color architect's drawing of the new monument, framed and with an acknowledgment card under glass, plus an official invitation to the rededication ceremonies in Wellington.

**RUSSIAN ANTARCTIC SCIENTISTS PUT A RUBLE VALUE ON THEIR SCIENTIFIC DATA.** Most of you have already read that 120 workers at five Russian Antarctic stations notified

the world that their homeland must sweeten the pot with higher salaries if they expect to receive real-time scientific data from them.

Walter Sullivan wrote in the New York Times of 23 June 1992, "In a statement signed by Dr. Vladimir Nazarov, leader of the Vostok station, the Russians cited their nation's severe inflation and said, 'The miserable salary of Russian polar explorers, working in the rigorous climate of Antarctica, is hardly enough for our families to even buy food. We cannot help them. We can only send moral support by telephone'." And they stopped sending scientific information to Moscow and St. Petersburg. Officials back home say they are aware of the protest, and have already increased the pay of those in Antarctica. However, the scientists' request to be paid in part in hard currency could not be met, said Yuri F. Zubov, head of the Committee of Hydrometeorology and Environment Monitoring of the Russian Federation.

Eleanor Randolph wrote in the Washington Post of 15 June 1992 that Russian Antarcticans are poorly paid by Western standards but are actually well off compared with other Russians. Top pay for station heads is 18,000 rubles (about \$150) per month. (Russian doctors make about 2,000 rubles per month; speaker of the Russian parliament gets a reported 14,000 rubles per month.) And as Aleksandr I. Bedritsky, first deputy chairman of the Committee for Hydrometeorology and Environment Monitoring, pointed out, "Their life is free," meaning they get their room and board free so their salaries can go to support their families back home. Bedritsky had one surprising statement, at least to this innocent abroad, and that was, "Now we are having difficulties with applicants." The answer to finding wintering-over personnel might be to open it up to women.

**SETTING THE RECORDS STRAIGHT ON NELSON ISLAND** (by Bernard Stonehouse, 30 April 1992). I am currently studying visitor impacts, especially tourism, which I met first in McMurdo Sound in the 1960s and more recently over three seasons along Antarctic Peninsula. This is a growing industry: though it seems to me to be in good hands at present, it could get out-of-hand if it is not well regulated under the Antarctic Treaty. My colleagues and I, based on the Scott Polar Research Institute, University of Cambridge, are gathering data on the industry and its methods, and suggesting way of guiding what many see as its inevitable development. These data are helping to provide the Treaty legislators with sound bricks for building.

My team includes research students from Australia, Denmark, India, New Zealand and the US, and I work closely with British Antarctic Survey, Instituto Antartico Argentina and Instituto Antartico Chileno. We seek funding mainly from trusts and other private sources, the bulk of which supports students in work on different aspects of visitor impact.

I spent just over one month this last season on Half Moon Island, accompanied by Indian researcher Anita Dey, and for part of the time by US researcher Debra Enzenbacher, who worked also on the passenger ships. Of course our Argentine hosts were friendly, informative and cooperative, but that was not where policy was made. Two Chilean biologists scheduled to join us were unfortunately unable to do so. We monitored fourteen visits from six ships, involving 2002 passengers, and collected over 2000 questionnaires which are currently being analysed.

Thereafter I talked in Santiago with the director of INACH and his advisors, and in Buenos Aires with the director of IAA and members of his staff. We agreed to join forces in an international operation for tourist monitoring, centred on a site at one end of the Harmony Point SSSI. I did not propose Harmony Point without the full agreement of the Chileans and Argentines, who have worked there over many years. They would not have agreed to its use if they did not judge it safe to do so. The three countries are seeking, through the Treaty, to vary the site's

management plan to include controlled incursions of tourists in a specified, demarcated area, for a restricted period, so that impacts can be measured and management procedures devised. Most of the SSSI will be retained as an untouched control area outside the experimental site, when it will be protected more rigorously than it is at present.

We are proposing a small research facility at the only permitted landing site, to augment and ultimately replace the present refuge. This will serve also as a visitor centre where information will be available. Staffed by researchers throughout summer, it will be one scientific station in Antarctica where tourists will always be welcome, because we shall be monitoring their behaviour. It will not be a hotel: there will be fairly Spartan accommodation for a small number of scientists and support staff, and no one else.

Our proposal bears no relation to what you say the Chileans have 'sort of done'<sup>1</sup> on King George Island, or what some old codger from Maine may have thought in 1957, what other Brits (of whom, incidentally, I am unaware) may be planning for South Georgia, or whatever other out-of-date nonsense your ear trumpet may have garnered. I'll be glad to give more details if you need them: it is all in the public domain. Just don't rely on your current informants, who seem intent on setting you up.

We considered over 20 other sites, including Half Moon Island, but rejected them as too small, too vulnerable, too damaged already, too little known over a long period, or otherwise unsuitable. Our project includes providing management plans for the fifty or so sites currently used for visitor landings in the maritime Antarctic, and devising a system of inspection to ensure that procedures on board all Antarctic passenger ships conform to those of the best. I gladly confirm that WWFNI supported this preliminary study.

**TO THE MEMBERS OF THE ANTARCTICAN SOCIETY** (by Stephen Warren, South Pole Station, 4 July 1992). The April newsletter of your Society, which arrived here on the winter airdrop, included an edited version of my report to NSF about the green flashes at sunset, together with a statement from the editor questioning my honesty. I am responding by offering more information about the green flash.

The shorter wavelengths of sunlight (blue and green) are refracted by the atmosphere through larger angles (i.e. the rays are bent more) than are the longer wavelengths (yellow and red). Therefore, as sunset is ending, when the upper rim of the sun is about to disappear below the horizon, the different colors set at different times. The last color to set is usually green, and sometimes it briefly appears separated from the solar disk (the green flash). Blue is actually refracted even more than green, but sunlight contains less blue light than green, and the blue is also scattered more by the atmosphere and thus lost from the solar beam. Therefore only rarely, when the air is exceptionally clean, can the upper rim of the sun appear blue (the blue flash).

The green flash is not visible at every sunrise and sunset; the refraction conditions have to be right. I had looked for the green flash dozens of times but had seen it only four times prior to the recent March equinox; each time it lasted about one second: from the hills above Boulder at sunrise over the Great Plains; from my kitchen window in Seattle at sunrise over a level cloud deck capping the Cascades; at sunset from a mountain ridge in Tasmania (this time the last light was blue); and over Lake Eyre in South Australia. On three of those occasions I used binoculars. I have not yet seen the green flash from an airplane, though on sunset flights I always request a west-window seat.

At South Pole the flakes we saw cleaving off the upper rim of the sun were all green, not blue. The green pyramid was visible without binoculars. I knew that eyewitness accounts are sometimes distorted, so I wanted to verify my description before sending it to NSF. I showed my report to several others who had watched the sunset on the evening of 21 March, and they were able to confirm its accuracy.

*(to be continued)*

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 92-93

September

No. 2

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977

Poet Laureate of Antarctica  
10 August 1902 - 11 August 1992

*A World Series Specialist on Antarctica!*

## Exploring Australian Antarctic Territory

by

Phillip G. Law, AO, CBE

Retired Chairman

Australian National Committee for Antarctic Research, 1966-80

on

*Thursday evening, October 15, 1992*

8 PM

National Science Foundation  
1800 G Street N.W.

Room 540

We are indeed most fortunate in having Phil Law as our October lecturer. With pardons to Sir Douglas, this gentleman has become Mr. Antarctica in Australia, at least in the last half century. Besides being the former chairman of the Australian National Committee for Antarctic Research, he is also the past executive vice president, Victoria Institute of Colleges, 1966-77, and past president, Victorian Institute of Marine Sciences, 1978-80. He has been active in Antarctica since 1947-48 when he took cosmic ray measurements on the continent. Phil was awarded the Founder's Gold Medal by the Royal Geographical Society in 1960, and the Gold Medal of the Australian Geographic Society in 1988. Currently he is actively promoting the establishment of an Antarctic museum in the new Victorian Museum being built in Melbourne. His non-Antarctic pursuits of happiness find him playing tennis, skiing, and skin-diving. He is also into music and photography. Otherwise, he leads a perfectly normal, routine, mundane retired life!

*Remember our annual Paul C. Daniels Memorial Lecture by Dr. Susan Solomon at the National Academy of Sciences on 22 September.  
Contact Ruth Siple for dinner reservations.*

Order your 1993 New Zealand Antarctic calendars now - see page 3.

# Barkentine Bear

On March 19, 2013 at 2010 GCT, a beloved old veteran of polar exploration, research, and rescue sank to the bottom of the sea off Nova Scotia. A man who knew her well describes her eventful past and final voyage.

◀ Author Black watches as the barkentine BEAR backs away into the sea smoke, Little Amenca, February. 1914.

By  
Richard Blackburn Black  
Rear Admiral, USNR (Ret.)

If wooden ships have hearts of oak,  
And I believe they do I know of one  
whose stout heart broke!  
I'll tell the tale to you;

The BEAR, an ancient barkentine  
Whose yeon topped eighty-nine.  
Was limping southward, old and green,  
Upon a tow-tug's line

Her destination? "Shame!", she cried,  
I'm going to be a pub,  
A rest'rant! — (Chicken? Stewed or fried?)  
A gin-mill! There's the rub!"

She lay back on the cable then  
And dreamed of alt her past-  
Of gales and ice and shouting men,  
Taut canvas in the blast.

The shriek of wind, the sting of sleet,  
The green seas sweeping back,  
The clinging seamen with their feet  
Braced on the foot-rope track,

With bellies pressed against the yard.  
Chilled fingers clutching sail,  
And elbow movement slowed and hard  
By wind on raincoat's tail.

She thought of evenings still and bright,  
Locked in Antarctic Pack, —  
Ice-blink ahead, and blue-black night  
Behind her in her track.

When Byrd and English paced her deck  
With anxious eyes ahead, While  
Ben Johansen said. "By beck,  
Ve'll push trou or ve're dead!"

Then Crusen — (now it's forty-one) —  
Fought through to Biscoe Isles  
To free the men on Stonington.  
One hundred forty miles

Of tee-locked sea BEAR could not break,  
So in a patched up plane  
The East Base men—a chance to take —  
All reached the ship again.

Her thoughts then flew back sixty years  
To Bering Sea Patrol,  
Her fights with poachers, British jeers,  
And heavy whale-ship toll.

Her year of aid to Barrow town  
And starving Aleuts, And  
murderers at her yard-arm  
A-hanging in their boots.

Now, back to present, and the gale  
Off Nova Scotia's shore:  
The seas run high, the tug men pale,  
"Old BEAR can't take much more!"

Old ships have souls, some sailors say.  
And some have died of shame,—  
I'll not contend this, either way,  
And I will place no blame

But tell you just what seamen saw  
Aboard that towing ship;  
The BEAR heaved back, began to yaw,—  
Her bow commenced to dip.

Then with a muffled, mighty sigh  
Her seams all opened wide,  
And with her colors gaff-tip high  
She plunged beneath the tide!

"West Over Sea," the Vikings said  
When funeral was planned,  
With chieftain lying midships, dead.  
Full armored, sword in band.

I'll always feel, as some will voice  
Who worked that ship with me,  
That she went down by her own choice —  
The BEAR - West Over Sea!

The Grim Reaper sure took its toll on Antarcticans this past summer, and it drove home that a lot of Antarctic history went with them. Several years ago a well-known Antarctic historian contacted me relative to doing oral histories on some of the better known, aging Antarcticans. It was an excellent idea, but it never got off the ground for one reason or another. Perhaps this is something which the Antarctic Society should consider doing. Any thoughts would be appreciated.

Ordinarily we don't have two meetings so close together as our first two of the current 1992-93 season, but when you have someone of the caliber of Phil Law available, you squeeze them in, at all costs.

This is the 15th year that Siple and Dalrymple have put these things together. We have written 86 of them. In the whole life span of our Society, only 105 have been put out, with some of the earlier ones just being meeting announcements.

We have often wondered what we were doing, never really being happy with calling this a newsletter, but masquerading under that guise so it would look good when recruiting members. But "that aging Brit," whom we actually admire, Bernard Stonehouse, inadvertently put it all into its true perspective when he wrote that he was joining our Society so he could keep abreast of the "taradiddle" that we were expounding in these pages. So now we know, and you know, that this isn't really a newsletter but a lot of "taradiddle."

If any of you folks choose to read these pages, please be aware that they may be hazardous to your blood pressure. This writer has done a self-evaluation, and decided that he can no longer be good. If you have a hangup on sexism, you will have a problem digesting what he wrote about Judy Reusswig and Norman Vaughan. But so be it, that's your tough luck. Besides, both Judy and Carolyn are understanding.

Our membership is doing quite well, although we haven't made a head count recently. The good news is that a greater percentage of our members are people who have actually been to Antarctica. In the past year, many of our new members were there in the early days of Deep Freeze. We will be going to Washington in mid-September, and bills will be sent out then. If you don't get a bill, you don't owe! Again we beseech those of you renewing to do so for multiple years, as it makes it less laborious for Ruth Siple who runs this whole Society

There are some facts herein, there's some fiction, certainly some enhancement. "Taradiddling" all over the place. It's up to you to determine which is which. But for Heaven's sake, don't take things too seriously, please! "LET THE GAMES BEGIN."

**1993 NEW ZEALAND ANTARCTIC CALENDARS.** We don't know exactly how to handle this side the basic fact that we order and buy next year's calendars in the spring before we actually see them, getting them by ship in early autumn. Then we sell them for a bare minimum markup. Ruth packages and mails them - sort of a favor to you member! There are always some lost in mailing, and some damaged, which have to be replaced.

Our philosophy on ordering calendars is that Antarctica sells itself, that calendars should be works of art. In recent years we have offered only the New Zealand Antarctic calendars, as their pictures, mostly by Colin Monteath, have been superb. The Navy-TJSAP Antarctic calendars, in our estimation, are a mixed bag of worms with picture after picture of aircraft, buildings, and equipment; and with the dates full of insignificant data, such as when Finland acceded to the Antarctic Treaty, and the date when Hugh Evans died. Their calendar needs editing in the worst way, so in spite of the annual pleas of Michele Raney and the newly-married Karen Harrower for the Navy-USAP calendar, we don't offer it.

This year we have a bit of a problem, but not for you naturalists who like pictures of penguins, seals, snow petrels, albatrosses, and sea lions. The Adelie centerfold is just great, and there is a fantastic picture of a bunch of free-loading Chinstraps getting a ride on a sculptured berg. Ditto for a company-sized conference of Emperors near Mawson Station. But December is an absolute horror with a Kiwi playing a flute in a cluttered tent scene, in the Dry Valley. This year's New Zealand Antarctic calendar is certainly not up to its usual high standard, but it's still a pretty good calendar.

We are selling it for the same price as last year - \$10, - a good buy, and probably four dollars cheaper than through a well-known polar wholesale book dealer. We hope you will support our campaign to sell these calendars, as we have ordered a lot, and don't want to eat them for Christmas.

**FORMER COMMANDER OF EAST BASE SUCCUMBS.** Dick Black, Poet Laureate of the Antarctic, died of cancer, following a long illness, on 11 August, in a nursing home in Bethesda, Maryland. He had turned 90 on the preceding day, and was the oldest living former head of a U.S. Antarctic station. His passing leaves George Toney, a Washington lawyer, as the earliest living former station leader, having been the head of Byrd Station in 1957.

Dick Black was a most unlikely Antarctic in a lot of ways, as he was a tried and true son of landed gentry birth in the Commonwealth of Virginia. His ancestral home in Woodbridge, Virginia, Rippon Lodge, was built in 1725 by his great, great, great, great, great grandfather, Richard Blackburn. That's what you really call roots. Dick also maintained a residence in the Georgetown section of Washington, but Rippon Lodge will be remembered as his true home. Originally the estate constituted some 300 acres, although he sold off most of it a few years ago, keeping forty acres around the house which has been declared a National Historic Landmark. Our Society used to hold our mid-winter picnics at Rippon Lodge, but when some members weren't particularly good housekeepers, we had to seek an alternative!

Dick was probably more Shakespearian than Antarctic, and was very active in the Shakespeare Theatre at the Folger in Washington. At their annual ball Dick always went costumed as some character out of Shakespeare, and, invariably, so it seemed, the Washington POST would publish a picture of him in all his finery. He was a Shakespearian who just happened to be an Antarctic. And his love of the theater manifested itself, in part, by his love of poetry. His epic ballad on the demise of the BEAR OF OAKLAND was read by his son, Douglas, at his funeral service, and we are republishing it in this issue as another tribute to Dick, knowing that all of you will enjoy it.

Dick's son was born while Dick was at sea enroute to Antarctica in 1933. Unfortunately his wife died while giving birth. We remember hearing Bud Waite, Dick's roommate onboard ship, saying that he (Bud) received the death radio message and could not tell him, so went to the Admiral and told him that he had to tell Dick. Whoever paired Waite with Black onboard the ship certainly had an odd sense of humor, as they were about as opposite as they possibly could have been!

Dick Black was relatively close to Admiral Byrd. He was one of a select few who were called to Byrd's bedside just prior to his death when the Navy bestowed a high-ranking medal on him. Byrd was a very sick man at the time, but insisted on being dressed in full military uniform for the occasion; and if our memory serves us correctly, they all had to wait several hours before they could get the Admiral dressed.

Dick was retired as an admiral in 1962, but continued working on programs related to the Antarctic while at the Office of Naval Research until his final retirement from government service in 1967. Prior to the International Geophysical Year, he had served on active duty with an Antarctic planning group, and made his last trip to Antarctica at that time, 1957.

Together with Steve Corey, Dick was one of the prime movers when members of the 1933-35 Byrd Antarctic Expedition held their 50th reunion in Washington in 1983. In keeping with Dick's posture in Washington, it was held in the palatial and historic home of the Society of the Cincinnati. It doesn't get much better than that, at least on this planet,,

The funeral service for Dick was held on 19 August in the chapel at Fort Myer, followed by a graveside service at Arlington National Cemetery, with full military honors – an Honor Guard of about sixty Navy men and women, a military band, a six-horse-drawn caisson carrying the flag-draped coffin, and a nine-gun salute. And like another Dick's funeral service (Dick Goldthwait's - see preceding Newsletter), the 23rd Psalm was read, "Faith of Our Fathers" was sung, and afterwards, at a reception, a long buffet table of goodies was spread out for attendees.

The following paragraphs were taken from the Washington POST's obituary on 12 August:

A civil engineer by profession, Adm. Black began his career working for mining, railroad and engineering enterprises in Canada and the western United States. From 1933 to 1935, he was a civilian member of Rear Adm. Richard E. Byrd's Second Antarctic Expedition. From 1939 to 1941, he was the civilian in charge of East Base, which was established [along with West Base for the U.S. Antarctic Service Expedition] under Byrd's leadership. In all, he made five trips to Antarctica, and the Richard Black Coast is named in his honor.

From 1936 to 1939, the future admiral worked for the Interior Department in Hawaii, and during that period he was commissioned in the Naval Reserve. In August 1941, he was called to active duty and sent to Hawaii. He was at Pearl Harbor on Dec. 7, 1941, when the Japanese attacked and brought the United States into World War II. Subsequently, Adm. Black served in the Tarawa and Saipan campaigns. In the latter operation, he was awarded a Bronze Star for directing troops and supplies through a narrow channel despite enemy mortar and artillery fire.

In 1946, Adm. Black returned to civilian life and became an aeronautics official in Hawaii. In 1950, he joined the operations research office of Johns Hopkins University. While working there, he was sent to aid in the Korean War as a civilian with the assimilated rank of colonel.

Adm. Black was born in Grand Forks, N.D. He was a graduate of the University of North Dakota, which later gave him an honorary doctorate. He served in the Army Reserve from 1926 to 1937. In addition to the Bronze Star, his decorations include the Special Silver Medal for the second Byrd expedition.

Survivors include his wife of 55 years, Aviza Johnson Black of Washington and Woodbridge; their two daughters, Debra Jane Black of Washington and Carrie Elizabeth Black of San Francisco; a son from his first marriage, Douglas F.B. Black of Beattyville, Kentucky; and five grandchildren.

**FIRST ANTARCTIC FLOATING ICE RESEARCH STATION A 117-DAY SUCCESSFUL "ENDURANCE" ADVENTURE.**

Some seventy-seven years after The Boss found himself and his men entrapped in the ice of the Weddell Sea, sixty Russians and Americans occupied an ice floe in the approximate area where the ENDURANCE had carried Shackleton back in 1915. There are, at least, two similarities in the two expeditions; one being that they were in the same general area, the second being that neither expedition lost any personnel. Shackleton was there because the whims of The Almighty prevented him from getting the ENDURANCE to the continent itself. Ice Station Weddell was there because some great thinkers thought it should be put there, and modern technology made it all possible.

One was probably Antarctica's greatest success story of human survival; one was probably one of Antarctica's greatest short-term, international, scientific success stories. The Ice Station Weddell was occupied only four months; while the overall time from entrapment to civilization for Shackleton's crew was twenty-two months and twenty-two days. The Ice Station Weddell drifted approximately 400 miles, being occupied at approximately 71°35'S, 50°01'W, being abandoned at close to 66°S, 53°W. The research ice-floe station barely moved on some days; at other times it drifted as much as 10 miles in a day. The old ENDURANCE drifted approximately 1500 miles!

It is remarkable in many ways that the station was ever established, as it was a brain child back in June 1988 when a group of Russian and American scientists got together. It not only survived the breakup of the Soviet Union, but it also survived economic problems with their Antarctic research, which, one might say, was on very thin ice. However, plans were carried out, and the AKADEMIK FEDOROV found some good thick ice, a 1.7-square-mile floe which was six and a half feet thick. So they off-loaded some 80 tons of equipment and gear, and the station became a reality.

Sixty researchers were on the ice floe, although only 32 were there at any one time. Personnel were either rotated by aircraft or by ship (R/V NATHANIEL B. PALMER and the aforementioned AKADEMIK FEDOROV). They apparently lived much better than Shackleton, as metropolitan downtown Weddell consisted of a mess hall, latrines, storehouses, generators, and even a sauna. You know it can't be all bad when you have a four-month station, and they give you a sauna, and rotate personnel. And two more pluses were a camp doctor and a chef. Scientists lived in pre-assembled Russian-built huts mounted on skis, or in 12-x16-foot tents, both supplied with heater so temperaturewise it wasn't too mean, as it ranged from a balmy 29°F to a low of only -33°F, certainly no worse than International Falls. The lowest wind chill was -60°, a subtropical day on top of Mt. Washington, New Hampshire. To make sure everyone was toasty warm, each was given some 62 pounds of clothing.

One of the many significant scientific findings, according to Chief Scientist, Dr. Arnold L. Gordon, professor of oceanography at Columbia University, was that the continental slope off the Antarctic Peninsula was about 62 miles farther west than previously thought. How that will affect the people in Peoria, we're not quite sure, as it seems pretty close for those of us who don't get overly excited about continental slopes. But Arnold says this is a fundamental topographic difference that will change scientists' understanding of ocean circulation patterns.

A press release from Columbia University, dated 5 June 1992, said that the expedition scientists gathered the first extensive data on the rates of heat exchange between the Antarctic atmosphere and the ocean, the intervening role of the sea cover, and the circulation of the ocean below the ice in the Weddell Sea. In the western Weddell Sea, water becomes cold and dense enough to sink and spread along the sea floor into most of the world's oceans. A thin layer of water, called a pycnocline, separates cold surface waters from deeper, warmer waters in the western Weddell. After gathering measurements of temperatures, salinity, heat fluxes and currents through many oceanic layers as the ice floe drifted northward, the scientists now believe that

the pycnocline is strong and stable in the western Weddell Sea and prevents warmer waters from rising and melting the ice.

By contrast, warm waters do occasionally rise to the surface of the eastern Weddell, melting sea ice. The cold refreezes the ice, but as it does, salt is released, destabilizing the pycnocline and allowing warm waters to reach the surface and melt the sea ice in a cyclical process. The scientists now think that cold air funneling up the Antarctic Peninsula brings more snow to the western Weddell, which deters the melting of sea ice and helps maintain the pycnocline barrier.

Who are the scientists? As mentioned above, Arnold Gordon was the Chief Scientist on the station, and his Russian counterpart was V.V. Lukin, Chairman of the Soviet Antarctic Expedition to the Weddell Station. Scientists came from the Arctic and Antarctic Research Institute in St. Petersburg, Lamont-Doherty Geophysical Observatory at Columbia University, Oregon State University, University of Southern California, University of North Texas, University of Washington, Cold Regions Research and Engineering Laboratory, Science Application International Corporation, and McPhee Research Company.

**INTERNATIONAL CENTRE FOR ANTARCTIC INFORMATION AND RESEARCH (ICAIR).** ICAIR is an independent, non-profit organization established under the auspices of the Royal Society of New Zealand (New Zealand Academy of Sciences). The Centre evolved out of earlier proposals for the establishment of an International Environmental Information System, ICAIR is located at the International Antarctic Centre, Christchurch New Zealand. Financial support is provided by the New Zealand government. The Centre has the full support of the three Antarctic programs of New Zealand, the United States, and Italy.

ICAIR's missions are 1) to develop and operate a Centre of acknowledged international leadership in the collection, coordination, utilization, and dissemination of predominantly scientific and environmental digital information on Antarctica and the Southern Ocean; 2) to facilitate the exchange and analysis of data related to Antarctica's role in global processes; 3) to contribute to the development of soundly based principles for environmental management and planning in Antarctica; and 4) to foster research utilizing the information and resources of the Centre.

The Centre will espouse the key principles of the Antarctic Treaty, in particular freedom for scientific investigations, cooperation and exchange of information and data. Its goals will only be achieved through cooperation and collaboration between international scientists and organizations. Information and data will be provided at the lowest possible cost, which, as a first principle will be no more than the cost of reproduction.

The immediate objectives are 1) to establish a corporate and operational infrastructure to support the activities of the Centre; 2) to develop a Ross Sea Region Science Directory; 3) to develop an environmental database for the Ross Sea Region; and 4) to establish a Ross Sea Region logistical information database to support activities of the national Antarctic programs based at the International Antarctic Centre (IAC).

A paper outlining a proposal for the establishment of the International Antarctic Science Directory is available on request from ICAIR. The International Antarctic Environmental Database would establish the information systems required to service the Protocol to the Antarctic Treaty. It will provide data critical for environmental impact assessment, data for environmental management, for the coordination of developing programs in Antarctic environmental management, and baseline information against which to measure change.

If you want more information about ICAIR's activities and objectives, or to be put on a list for a pending, forthcoming ICAIR Newsletter, send your name, position, organization, and address to International Centre for Antarctic Information and Research, P.O. Box 14-199, Christchurch, New Zealand. (We are indebted to Charles K. Paul, NSF Representative, New Zealand, for the above.)

**NOT NORMAN VAUGHAN, AGAIN.** My idol, 86-year-old Norman Vaughan, is at it again. He has been on Good Morning, America this summer, specifically on 6 July. He has been in Greenland down at the bottom of that 268-foot hole, retrieving parts of a P-38 which crashed there fifty years ago on 15 July 1942. He has been lecturing all across the States. He has been fund-raising in an effort to man an expedition to the top of 10,320-foot Mt. Vaughan in 1994. He wants to be on top of his mountain in the Antarctic on his 88th birthday, and don't count him out quite yet. Any old geezer in his mid-eighties who can talk a young, good-looking, personable Georgian Peach into becoming his fourth wife, promising her nothing materially, because all he has is a bunch of dogs and a place so far out in the boondocks that you can't get there from anywhere, can do anything.

In the September issue of OUTSIDE, David Roberts, son of an illustrious American scientist, Walter Orr Roberts, wrote about him, "Norman Vaughan - Act Your Age." Well, Norman will never act his age, as that's not his bent. The guy was in disgustingly good shape as he wheeled into Maine this summer; we got to see him again, and meet for the first time Carolyn, who, not surprisingly, is also in good shape. She has her own dog team, and she also runs the Iditarod. And the plans for the Vaughan Antarctic Expedition call for her to stand atop Mt. Vaughan with old Norman.

Roberts recalled some of Norman's adventures and shenanigans, which are often separated by such a fine line that you can't differentiate one from the other; such as going up to Pope John Paul II's plane in Fairbanks and taking him for a dog sledge trip; such as crashing the Jimmy Carter inaugural parade in 1981. The facts are that most everything he does is inconceivable to any mere mortal. He still enters the 1,150-mile Iditarod, having raced in it thirteen times. He had to scratch last March after 194 miles out when temperatures dipped to fifty below and his lead dogs got balky. When he was a 19-year-old Harvard dropout in 1925, he spent eight months in Labrador and Newfoundland with the legendary Wilfred Grenfell, ministering to the natives. Then he went on Byrd's first expedition to Antarctica in 1928-30, where he was a dog-team driver. In the 1932 Olympics, he drove a dog team to a 10th-place finish when mushing was a demonstration sport. And he made another Olympic appearance at the last winter Olympics in Albertville, again when dog sledging emerged as a demonstration event. I think going down a 42-inch-wide hole to the bottom of a 268-foot-deep shaft to get a plane out of the snow and ice is about as ridiculous as it can get for someone 86 years old.

But his latest endeavor, to dog-team it to the top of Mt. Vaughan, is going to be a hard one to pull off. First, there is the problem with getting dogs there, because even though the Antarctic Protocol banning dogs in Antarctica doesn't go into effect until after his proposed date for climbing, the U.S., supposedly, is going to honor the words of the Protocol ahead of the specified date. And then there is the matter of bucks. Norman has all kinds of backers, including L.L. Bean, but he needs megabucks. He has to raise \$1.5 million. For Adventure Networks to get them to Patriots Hill, that will cost 800K. He needs to be a big winner in one of those large state lotteries. If you want to find out more about his expedition, or if you want to be some kind of a contributor, contact Norman or Carolyn (P.O. Box 770395, Eagle River, Alaska 99507).

**HEY, LOOK ME OVER, I'M NOT SO BAD.** That's what a comely Antarctic blonde said to

the manufacturer of Saturn automobiles, and now she, one Judy Reusswig of Bethesda, Maryland, is all over our television screens, and about to appear in our magazines hawking Saturns. You may have seen Judy on Jeopardy last year, although she was short-lived on that program, as they threw her some curve balls, and she made a fast exit.

But the story we are about to tell you is a very interesting one about an enterprising lass with looks and smarts. Seems her 1974 Impala was getting some road mileage, and Judy, impressed by an article in an October 1991 issue of TIME about the team concept of building Saturns, test drove one, liked it, and ordered one. Judy had been impressed by the team concept of building Saturns, and felt that she was becoming a member of the team by becoming an owner. So she sent a letter to the "team members who are building my car," and told them the reasons she had chosen a Saturn. As a final touch, Judy enclosed her school picture and asked that it be put in the glove compartment so the workers would know for whom the car was being built. It's not certain, as we go to press, whether Judy told them she was single or sent along her vital statistics. If she didn't, she should have. Anyway, when she got the car, there was her picture in the glove compartment. But there was also a poster of the people who had built her car, signed by all, saying, "Thanks for choosing Saturn."

Later on she got a call from Saturn's advertising agency, asking her approval to make a commercial based on her letter. They sent her a script and a talent release, and had an actress all lined up to play Judy Reusswig. She wrote back that she was the only one with that name and that they should use her. The company must have said, "She's a dizzy blonde, but let her come down here to New Jersey, she will bomb out, and then we'll use that actress." She was given a token opportunity, went to northern New Jersey; they opened a school, found sixteen kids on the sidewalks, brought them in; and the director barked, "Okay, teach." Then they had Judy do another lesson, and the flabbergasted director yelled, "Cut," turned to his assistants and said, "I can't believe it, she is better than an actress." And so Judy was on her way to the big time.

She got a call from Hollywood, where a production company filmed it, and an editor, along with people from the ad agency, did the final cut. Then came the Olympics, and there she was on opening night and every day thereafter during the Olympics. And that commercial is going to be shown on TV into 1994! She was invited to Dallas to a sales meeting of Saturn personnel, and later flown to the Big Apple for a photo session where they are making a print ad out of the letter for magazine use. Every time it is shown, Judy makes a trip to the bank. She claims she is still the same humble school teacher of yore, but how can she be after going to Tinsel City and appearing in my bedroom every night during the Olympics? She is truly the Antarctic Society answer to Candice Bergen. The real good news is that she is such a powerful, convincing letter writer that she automatically moves to the head of the line as heir apparent to writing this column. We're ready if you're ready, Judy.

**FORECLOSING ON GREEN FLASH.** In the last Newsletter we printed Steve Warren's additional comments on the green flash, but ran out of space. He wanted you readers to know that eleven other camp members also saw what he reported. He also wanted to give you a couple of references to read, which are "Sunsets, Twilights, and Evening Skies" by Aden and Marjorie Meinel, published in 1983, and "Clouds in A Glass of Beer" by Craig Bohren, published in 1987.

We here in the Nerve Center thinketh if anyone is really interested in reading any thing about atmospheric phenomena in Antarctica they would have a hard time finding anything better than what Gosta Liljequist of Upsala wrote after being on the British-Swedish-Norwegian fabulous expedition to Maudheim back in 1949-51. Unfortunately.

Gosta sort of vanished from the Antarctic scene after his classic volumes on the energy budget of Antarctica.

If you are interested in reading something understandable about the green flash, look up the January issue of SCIENTIFIC AMERICAN, where a photo of the green flash adorns the cover. A Catholic priest, Father D.J.K. O'Connell, of the Vatican Observatory at Castel Gandolfo, wrote the article. To take his pictures, he used a reflecting telescope having a focal length of eight feet! He wrote, "to see the flash with a naked eye requires a sharp horizon and a sky free of haze - conditions most likely to be found in deserts, or on mountains, or over water. The clear desert air of Egypt affords an exceptionally favorable setting, and the flash appeal very frequently there."

This same article by Father O'Connell said that the longest display of the green flash on record was at Little America in 1935 - about thirty-five minutes. The sun glazed the irregular horizon of the barrier ice, and the green flash was seen off and on like it was at the South Pole this year. However, the duration of the green flash at Amundsen-Scott Station must be a new world's record if Little America held it previously, as theirs exceeded thirty-five minutes by quite a few minutes. C'est finis.

**BERGY BITS.** Henry Brecher informs us that the late Emanuel Rudolph's personal library actually numbered over 55,000 volumes! That means from the time he was born until he was laid to rest, he either bought or was given two and a half books per day! Our condolences to Ed Stump on the loss of his brother, Mugs, in a mountain-climbing accident on Mt. McKinley in May. Mugs accompanied Ed on some of his Antarctic research expeditions into the Transantarctic Mountains. He was one of the world's premier mountaineer. Lee Winslow Court, an artist who painted in Antarctica back in the late 1960s, died at age 88 on 13 July 1992. We knew Lee, as he had a summer home on Monhegan Island, and we saw him and Ruby (whom he met on a cruise ship and later married) occasionally. He was quite famous as an artist and as a designer. He was also a first-class character, and some of his, shall we say "personal art work" was rather hilarious. If you are in Minneapolis between now and 15 November, be sure to drop in to view Stuart Klipper's "Photographs from the Polar Regions" at the Minnesota Institute of Arts, 2400 Third Avenue South. This exhibit should have a great run, as his photographs of Antarctica are, in the vernacular of the State of Maine, THE FINEST KIND .....

There are three Antarctic documentaries on the way, produced in New Zealand by units from their National History Programs. Two, "The Longest Night" and "The Emperors", were to be viewed in Christchurch during the past two months, with proceeds going to the Antarctic Heritage Trust. Gil Dewart, who survived wintering-over with a real bunch of characters at Wilkes in 1957, who later on did a post-graduate year with the Russians at Mirny, who wrote ANTARCTIC COMRADES, has written that somehow a relief effort to assist our polar comrades should be established. He recalled how Fridtjof Nansen headed up a relief effort to the famine-stricken Soviet Union after the "great War." Anyone with any ideas at all about carrying out this polar tradition should contact Gil directly (Dr. Gilbert Dewart, P.O. Box 331, Pasadena, CA 91102). The popular Antarctic Boy Scout of 1986, Lou Sugarman, is in Japan for several years on a Rotary International Fellowship. Currently he's in an intensive nine-month language training program at the International Christian University in Mitaka. Then he will commence his academic studies at the University of Tokyo. With his personality, he'll make out, no matter where. Susan and Wayne Trivelpiece had a baby chinstrap on March 24th, named her Sara Ruth. What a funny name for a penguin! ..... BUY CALENDARS!!!!!!!!!!

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 92-93

November

No. 3

**Presidents:**

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-62
- Mr. Gordon D. Cartwright, 1962-63
- RADM David M. Tyree (Ret.), 1963-64
- Mr. George R. Toney, 1964-65
- Mr. Morton J. Rubin, 1965-66
- Dr. Albert P. Crary, 1966-68
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-71
- Dr. William J. L. Sladen, 1971-73
- Mr. Peter F. Bermel, 1973-75
- Dr. Kenneth J. Bertrand, 1975-77
- Mrs. Paul A. Siple, 1977-78
- Dr. Paul C. Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82
- Dr. Mort D. Turner, 1982-84
- Dr. Edward P. Todd, 1984-86
- Mr. Robert H. T. Dodson, 1986-88
- Dr. Robert H. Rufford, 1988-90
- Mr. Guy G. Guthridge, 1990-92
- Dr. Polly A. Penhale, 1992-94

**Honorary Members:**

- Ambassador Paul C. Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard
- Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Sir Peter M. Scott, 1971
- Dr. Frank Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980
- Dr. Robert L. Nichols, 1981
- Dr. Robert H. Rufford, 1982
- Mr. R. Tucker Scully, 1983
- Dr. Richard P. Goldthwait, 1984

- Dr. Susan Solomon, 1992

*Joint Meeting with The Explorers Club - Washington Group and  
The Society of Woman Geographers*

Antarctic Ecosystems

by

Dr. Polly Penhale

Program Manager, Polar Biology and Medicine  
Division of Polar Programs, NSF

and

Ann Parks Hawthorne  
Freelance Photographer

on

*Saturday evening, 12 December 1992*

at

Americus Restaurant in Sheraton-Washington Hotel 2660  
Woodley Road at Connecticut Avenue

*Social Hour (cash bar) 6-7 PM, Dinner 7-8:30, Lecture 8:30*

This will be a gala evening, with our illustrious president, Polly Penhale, a most astute scholar on the Antarctic ecosystems, and the one and only Ann Hawthorne, who has shot some of the greatest vistas in Antarctica. Come - one and all!

*Dress will be black tie, or dark suit, if you prefer.*

The cost of dinner, including tax and gratuity, is \$33/person. Underground parking will be free. Remember to take your ticket with you so it can be validated when you check in!

Those of you who read these pages know that there is no rhyme or reason as to format, as we go with the winds blowing at the time of composing. Ordinarily we try to find something of interest for all segments of our Society, although this time we are deviating somewhat from that mainstream, and putting some of you into pigeon holes. This can be dangerous and injurious to my health, but I live dangerously.

The last part of this so-called Newsletter is devoted to indexing our members. It is not intended to be complete, accurate, or unbiased, but a potpourri of classifications that this very prejudiced person thought up. The first intention, as we started out, was to show the broad depth of our Society, how it sort of covered the Antarctic waterfront, from 1928 to date. When we ran out of groupings, we switched to categories, and that was okay. But then we went a bit berserk with specialities, and fortunately ran out of space, as some specialities might have sent me up river.

We have prevailed upon Ron Naveen of Oceanites, a member of our Board of Directors, to cover the Washington scene, particularly what is going on in the State Department and on Capitol Hill. Before Ron went clean, he was a lawyer, and, as such, is probably as good a person as one can get to interpret just what goes on down there. Also he is fearless, and we like that. Plus he takes this soul out of the line of fire

If you are looking for a holiday or birthday present for family or friend, why not consider the New Zealand Antarctic calendar which we will send to you for only ten dollars? We still have about fifty as we go to press, and we would like to close up shop. They are a good buy, and four dollars cheaper than in a bookstore.

As the year comes to an end, we thank those of you who have written kind and interesting letters throughout the year. For myself, I deeply appreciated all the letters and cards when my mother passed away. You people are most kind! For those who have taken shots at us, we remain standing and undaunted! It has been a terrible Antarctic year with so many really nice folks checking out. We miss them all! Our wish to you for 1993 is first, good health; then send us your Antarctic news or stories; and finally, but not least, pay your dues!

**22 SEPTEMBER, PETER WILKNISS TAKES A WALK.** The twenty-second of September was a special day for our Society, as that evening Susan Solomon gave the first-ever Paul C. Daniels Memorial Lecture presented by a female. And it turned out to be a block buster of a party, as a few hours earlier, at the conclusion of the open sessions of the Polar Research Board's fall meeting in Washington, Dennis Peacock, Science Section Head, DPP, stunned the members and guests by announcing that Robert Corell, Assistant Director, National Science Foundation, had issued a statement saying that Peter Wilkniss was leaving the position as Director of the Division of Polar Programs for "a new assignment that takes full advantage of his significant capabilities." The announcement began by saying that Peter had indicated to Corell a desire for a change of assignment, although, if this were true, it was a pretty well-kept secret. Most people confronted on the 22nd didn't seem to believe that Peter's going to another position within NSF was of his own volition. A rumor was soon circulated that it was the heavy hand of Deputy Director Fred Bernthal.

Anyone who has met Peter couldn't have helped being affected in one way or another. He was not a stooge for anyone, and he probably ruled the office with more of an Iron Hand than any of his predecessors. As a former civil service employee this soul stood in awe as Peter cleaned house of some of his inherited work force. Right or wrong, his doings were something which many of us old supervisors wished we had had the guts to do with some of our own deadwood!

Peter must have established two records in the Division of Polar Programs - most miles traveled and most days away from his desk. But when in town, he was tops insofar as our Society was concerned, as he maintained an open door to his office with free access. He always gave at least half an hour of his time, and he answered all of our questions. He also took us to all of his project managers and encouraged them to give us their fullest cooperation. He was Five Stars dealing with us.

It's no secret that Peter had his detractors, particularly among the field scientists. But we honestly don't know what the problems may have been, if there really were problems. Antarctica is a funny place, as the continent seemingly has a parental influence on all who go there. Don't we all come away with a strong kinship feeling, which, when repeated, may give us a feeling of near ownership? However, someone is always above you, and in the United States, that person is the Director of the Division of Polar Programs. The buck stops there. He has to make the decisions, and when anyone makes decisions, there are always some unhappy people. But Peter could change his mind, such as relative to tourism.

Peter was Director of the Division of Polar Programs for eight years, and much happened during those eight years. How much he had to do with those happenings we aren't certain, but at least he never killed some pretty important stuff. The Cajun icebreaker became a reality, although the seed must have been planted prior to his ascendancy. The Crary Center at McMurdo was erected, and will remain a scientific monument for many decades. He locked the doors at Siple Station when dollars became scarce, and he was in charge when biomass was revered only by Sayed! He got crucified by Greenpeace; he got sued by the Environmental Defense Fund; and he was cheap-ended by an old Brit who took exception to his most valid position on the Footsteps of Scott expedition. And he got blind-sided by the State Department and had to provide fuel to the Transglobe Expedition at the South Pole. Then there was Monica taking dogs towards the South Pole, and all kinds of adventurers skiing and dogging to and across the South Pole who wanted support.

He retrieved a plane from the snow and ice, although ended up losing another plane and two lives. But he had the guts to do it. Overall his safety record on the ice was outstanding, with fewer lives lost per year than in any other eight-year period - we think. The BAHIA PARAISO was not of his making. In fact, the captain of the ship

was told by Ted DeLaca of Peter's staff not to depart by that route. Peter's response to that tragedy was exemplary, and planes were enroute to South America within hours.

If there's a key word for Peter's tour of duty, might it not be ozone? It certainly brought international attention to the ozone hole over Antarctica, and the problem was attacked from all quarters. Peter instituted the first ice-floe research station in Antarctic waters, and he left a legacy for his replacement with a most elaborate astronomy and astrophysics program initiated at the South Pole.

**U.S. NAVY UH-1H IROQUOIS CRASHES NEAR CAPE ROYDS - THREE DEAD.** A Navy helicopter returning to Scott Base from Cape Bird, on what a wire service report said was a routine flight, crashed in "near hurricane force winds" on the coastline near Cape Royds on 13 October 1992. One American, Petty Officer 1st Class Benjamin W. Micou, 35, was killed, as well as two Kiwis, Garth E. Varcoe and Terry F. Newport. The pilot, Lt. Cmdr. Edward L. Crews, and the co-pilot, Lt. John C. Serralles, were both severely injured and evacuated to a hospital in Christchurch where they have been reported to be in stable condition. At the time this is being written, the cause of the accident is unknown.

**THE PROBLEM WITH OPENING UP HARMONY POINT, NELSON ISLAND** (Ron Naveen). Dr. Stonehouse's letter discussing his ongoing research into Antarctic tourist/visitor impacts - published in the July issue of The Antarctic Society Newsletter - is helpful, especially with respect to understanding the goals he's attempting to accomplish. On the other hand, what needs much further airing - and what's not yet been discussed in the Newsletter - are the legal and political implications of opening up an area that is now off-limits to tourists. This is particularly important in the context of the new Antarctic Environmental Protocol and its Annexes, which are now before the Treaty Parties for ratification.

The Harmony Point area on Nelson Island, where Dr. Stonehouse would like to study tourist impacts, is designated as a Site of Special Scientific Interest (SSSI) - in particular, SSSI No. 14. The Harmony Point SSSI initially was designated for purposes of Chilean and Argentine ornithological/ecological research, and the designation continues until December 31, 1995. However, studying the impacts of tourists and visitors isn't mentioned in the existing management plan.

SSSIs are one type of protected area established by Antarctic Treaty Recommendation. The other is called a Specially Protected Area (SPA). Under pre-Protocol Recommendations and implementing authorities, entry to SPAs is totally forbidden, absent a permit that shows a compelling scientific interest. On the other hand, SSSIs might or might not require a permit, depending on whether the management plan for the SSSI allows entry without a permit. U.S. regulations to the Antarctic Conservation Act affirm that it is unlawful for U.S. citizens to enter SPAs or SSSIs, except SSSIs for which the regulations specifically state that no permit is required. However, while the management plan for the Harmony Point SSSI discusses access from the sea, presumably for the working scientists, it does not specifically state that entry is allowed without a permit. And so, while Harmony Point is listed in the U.S. regulations as a SSSI, there is no specific statement obviating the permit requirement.

Since the 1985-86 tour season, U.S. tour companies generally have stayed away from SSSI No. 14. Indeed, respecting the boundaries and staying completely out of all SPAs and SSSIs is a basic ethic of both the Oceanites Foundation's Antarctic Traveler's Code and the guidelines endorsed by the U.S. tour operators and their new lobbying organization, IATTO. It is rumored that some "rogue" yachts and, perhaps, one of the newer, non-U.S. tour vessels may have visited Nelson in the last few

years, but it's rather doubtful that any of these operations properly notified their respective governments about such visits.

Soon, under the new Environmental Protocol and its Annexes, the Harmony Point SSSI will be subject to a much tougher permitting scheme. Under new Protected Areas Annex V, all current SPAs and SSSIs will be redesignated as Antarctic Specially Protected Areas (ASPAs) and in all cases require permits from national authorities prior to entry. The standard for issuing such permits will be a "compelling scientific purpose which cannot be served elsewhere and which will not jeopardise the natural ecological system." Under this plan and absent a permit, the ASPAs would clearly be off-limits to tourists and casual visitors.

New Annex V also provides for the establishment of Antarctic Specially Managed Areas (ASMAs), presumably where mixtures of activities – including tourism – may take place, but without the need for an entry permit. However, before any ASMAs are designated, the Treaty Parties presumably must review all protected areas and decide which ones shall remain as ASPAs and which ones shall become ASMAs. (As a brief aside, since there has been mention in the Antarctic Society Newsletter about the prospect of building a tourist facility or, perhaps, a new science hut at Nelson, note that under new Annex I, such proposed construction would raise the issue of preparing an *a priori* initial or Comprehensive Environmental Evaluation.)

So, at this point – before ratification of the new rules – the suggestion of opening Nelson raises some serious questions. Do the old rules still apply until the Nelson management plan is revised, or until the new Protocol and Annexes are ratified<sup>1</sup>? Which tourists might a research team study at Nelson, now or in the future?

Clearly, in the interim, the old rules still apply, which means that visits to Nelson by U.S. tourists and tour operators will continue to be considered prohibited acts. There always is a possibility that one of the U.S. tour companies might petition NSF for a permit; however, it is rather unlikely that such a permit would be issued. Even if such a permit is proposed, I'd be willing to predict that, faster than a speeding penguin, a number of nongovernmental organizations would have NSF embroiled in considerable legal and administrative guano.

Of course, NSF does not permit foreign tour operations, and it must be recognized that other Treaty Parties don't necessarily have permitting schemes comparable to NSF's. What if British, Argentine, and Chilean authorities allow the research at Nelson to proceed, despite new Annex V and the arguments stated above? My fear is that this move would encourage new European and Japanese operators to ignore the Oceanites Antarctic Traveler's Code and the IATTO guidelines, and start visiting a location that more responsible operators, SCAR, and the Parties believe is off limits. This would be a terrible precedent, the possibility of which, in my view, seriously undercuts the stated argument for going to Nelson in the first place and, perhaps, impinges on the credibility of the projected work itself.

As to the future, the proposed Argentine-Chilean revision to the Nelson Plan, alluded to in Dr. Stonehouse's letter, has been tabled by SCAR, but without a positive recommendation to the Treaty Parties. And without such a positive recommendation, no action on the Nelson revision is likely at this November's Treaty Meeting.

So, in the "grey period" before the necessary ratifications allowing the Protocol and Annexes to enter into official force, visiting SSSIs and SPAs becomes an issue of following the "letter and spirit" of the new rules. Down the line, under the Protocol and Annexes, the Parties will have to decide whether a tourist impact study at the Nelson Island SSSI represents a "compelling scientific purpose which cannot be served elsewhere and which will not jeopardize the natural ecological system." That may be a very tough case to prove, since there are 30+ non-SPA/SSSI sites that tourists visit each season in the Antarctic Peninsula. Further, I can't envision a

convincing argument that 4,000+ visitors, including a high percentage from the love boats and casino ships, aren't at least a threat to the Nelson Island ecology.

The reality is that Nelson Island is one hell-of-a-gorgeous place, and there are reams of expedition companies, naturalists, even scientists, foaming at any chance to get there. But froth at the mouth only goes so far.

**EXCERPT FROM ADDRESS BY ACTING SECRETARY OF STATE, LAWRENCE EAGLEBURGER AT ANTARCTIC TREATY STAMP DEDICATION, 21 JUNE 1991 AT THE STATE DEPARTMENT, WASHINGTON, D.C.** Thirty years is a long time in the field of international relations, and it is an especially long time in the life of an international agreement. The Antarctic Treaty has stood the test of time, from its beginning at the most confrontational point in the cold war, until today, when the kind of international cooperation which the Treaty has fostered has become much less the exception than it was thirty years ago.

The Treaty contained some trailblazing features, all of which have proven effective. First, it stipulated that Antarctica would be used exclusively for peaceful purposes. Second, it prohibited nuclear explosions and the disposal of nuclear waste and any measures of a military nature. Third, it allowed on-site inspections of all installations to monitor compliance. Fourth, it granted scientific freedom of scientific research throughout Antarctica. Fifth, it established a novel provision for setting aside differences on claims to territorial sovereignty while protecting the legal positions of the parties.

The Antarctic Treaty has been – and continues to be – a model for the way nations ought to deal with each other, especially if we are going to address successfully the transnational issues which increasingly dominate the international agenda. The Treaty is an arms control agreement. It is an environmental agreement. And it is proof positive that states can transcend their political differences – and even mutually exclusive claims – to achieve consensus and progress on matters of importance to all mankind.

The result: Antarctica today is an effective zone of peace, a place where the principles and purposes of the UN charter are working in practice. What the Treaty has achieved is thus no different in principle from what we accomplished recently in the Gulf– international cooperation on behalf of international legality. Thirty years later, the Antarctic Treaty is powerful evidence that our hopes today for a new world order are more than just a dream; it demonstrates that they can in fact become a reality.

(Ed. note. Wonder who wrote this? Tucker? Ray? Lee? Pretty good stuff. Eagleburger became Secretary of State when Baker moved behind the helm in a futile effort to get President Bush reelected. We were reading that Eagleburger, this consummate, extremely popular man, is a walking health disaster about to happen. And it said that this great man smokes four or five packs of cigarettes a day! Holy cow, does he have a death wish?)

#### PERSONALIZING ANTARCTICAN SOCIETY, 1992

*Byrd Antarctic Expedition I (1928-30)* - Larry Gould, age 96; Norman Vaughan, about 26; Howard Mason.

*Byrd Antarctic Expedition II (1933-35)* - Clay Bailey, Tony Colombo, Steve Corey, John Dyer, Joe Hill, Al Lindsey, Bill McCormick.

*BEAR OF OAKLAND* - Gordon Fountain (1933-35).

*U.S. Antarctic Service Expedition (1939-41)* - Clay Bailey, Charlie Passel, H.H. Richardsor  
*Operation Highjump (1947)* - Jim Bentley, Bill Donnelly, Trigger Hawkes, Donald Leavitt, Richard Lockhart, H.H. Richardson.

*Operation Windmill (1948)* - Lewis Odell Smith.

*Ronne Antarctic Research Expedition (1947-48)* - Jackie Ronne, Charles Adams, Harry and Jennie Darlington, Bob Dodson, Jim Lassiter, Art Owen, Nelson McClary, Walter Smith.

*Maudheim (Norwegian-British-Swedish Expedition, 1951)*-Charles Swithinbank.

#### EARLY DEEFPREEZE

*Antarctic Builders* - Folger Athearn, Jr., Charlie Bevilacqua, Robert Chaudoin, John Forman, Mel Havener, John Heinstadt, Marcus Hermanson, W.A. Lewiston, Robert Manke, Pat McCormick, Tom Osborne, Francis Stokes, William Stroup, Ken Waldron.

#### INTERNATIONAL GEOPHYSICAL YEAR (IGY) - 1957-58

*Amundsen-Scott* - Bob Benson (57); Herb Hansen (57); Mel Havener (57); Tom Osborne (57); Moose Remington (57); Ken Waldron (57); Paul Dalrymple (58); John Dawson (58); Charlie Greene (58); Kirby Hanson (58).

*Little America V* - Hugh Bennett (57); Dick Chappell (57); Paul Dalrymple (57); Bruce Lieske (57); Fred Milan(57); Ron Taylor (57); Steve Den Hartog (58); Eugene Rodgers (58); Buck Wilson (58).

*Wilkes* - Dick Cameron (57); Gil Dewart (57); Ralph Glasgal (57); Rudi Honkala (57).

*Ellsworth* - Nolan Aughenbaugh (57); John Behrendt (57); John Weinman (57).

*Byrd* - Charlie Bentley (57); Ned Ostenso (57); George Toney (57); John Annexstad (58).

*McMurdo* - Bernie Fridovich (57).

*Exchange Scientists at Mirny* - Gordon Cartwright (57); Mort Rubin (58).

*Foreign Service* - Colin Bull, Tony Gow, Peter Webb, Gunter Weller.

#### SELECTED LISTS

*Post-IGY Exchange Scientists at Mirny* - Gil Dewart (60); Rex Hanson (80).

*Exchange Scientists at Vostok* - Michael Maish (69); Rob Flint (74).

*Wintering-Over at Eights* - Jerry Huffman (63); Lome Matheson (63); Joe Hirman (65).

*Wintering-Over at Plateau* - Mike Kuhn (67); Tom Frostman (68).

*Wintering\*-Over at Amundsen-Scott* - Robert Grass (64); Scott Kane(64); Eric Kramer(68); Richard Urbanak (71); Mel Ellis (74); Charles Jenkins (74); Tony Meunier 74); Kenneth Barker (77); Mike Metzgar (78); Michele Raney (79); Kathy Covert (82); Pat Kraker (82); Mary Vickers (83); Steve Bonine (87); Debbie Enzenbacher (88).

*Siple Researchers* - Bob Helliwell, Umrans Inan, John Katsufakis, Lou Lanzerotti, John Trabucco.

*Flag Officers* - Doc Abbot, Charles Adams. Kelly Welch.

*They Also Tried* - Lawson Brigham, John Cadwalader, Bob Dale, William Everett, Al Fowler, Orland French, Jim Lassiter, Ron McGregor, Mo Morris, William Munson, Bob Newcomb, Albert Raithel, Roy Shults, Warren Smith, Joe Wubbold.

*National Academy of Sciences Polar Research Board* - (Five Chairmen)-Larry Gould, Link Washburn, Charlie Bentley, Gunter Weller, Bob Rutford; Vera Alexander, Jerry Brown, Cam Craddock, Dennis Hayes, Bob Helliwell, Will Kellogg, Lou Lanzerotti, John Middaugh, Troy Pewe, Chet Pierce, Don Siniff.

*Division of Polar Programs* - Polly Penhale, Scott Borg, Guy Guthridge, Dennis Peacock.

*Alums of Office of Polar Programs(Division of Polar Programs)* - Hal Borns, Dick Cameron Bob Dale, Al Fowler, Helen Gerasimou, Bob Haehnle, Jerry Huffman, George Llano, Garry McKenzie, Ken Moulton, Lou Quam, Carol Roberts, Walt Seelig, Phil Smith, Ed Todd, George Toney, Mort Turner, Peter Wilkniss, Herman Zimmerman.

*U.S. Geological Survey* - Bob Allen, Kenneth Barker, Donald Barnett, John Behrendt, Peter Bermel, Jon Campbell, Kathy Covert, Mel Ellis, Loreen Utz, Jane Ferrigno, Art Ford, Karen Harrower, Tom Henderson, John House, Margaret Hower, Philip Ibarra, John Kelmelis, Bill Kosco, Art Knox,

D'Ann Lear, Mike Metzgar, Tony Meunier, Charlie Morrison, Bruce Molnia, Jerry Mullins, William Radlinski, Frank Radspinner, George Rucroft, Leroy Sanford, Walt Seelig, William Sneed, Rupert Southard, Jim Stoner, Charles Swithinbank, Leland Whitmill, Richie Williams.

*Some Antarctic Household Name Scientists* - John Behrendt, Charlie Bentley, Bill Benninghoff, Scott Borg, Roy Cameron, Bill Cassidy, Jim Collinson, Cam Craddock, Art DeVries, Gisela Dreschhoff, Gunter Faure, Robert Feeney, Paul Fitzgerald, Art Ford, Tony Gow, Bob Helliwell, Lou Lanzerotti, Al Lindsey, George Llano, Bob Rutford, Sayed El-Sayed, Bill Sladen, John Spletstoesser, Charles Swithinbank, J. Robie Vestal, Peter Webb, Jerry Webers, Ed Zeller, Bill Zinsmeister.

*Widows* - Aviza Black, Betty Canham, Mildred Crary, Teddy Daniels, Harriet Eklund, Jennie Barter, Helen Lenton, Jackie Ronne, Esther Schopf, Ruth Siple, Jane Wade, Ruth Wiener.

*Sons and Daughters and Grandchildren* - Boiling Clarke and Katharine Breyer (daughters of Admiral Byrd); Robert Breyer (and wife Susan); Harry Byrd; and Leverett Byrd (and wife Cathy) (grandsons of Admiral Byrd); Jane DeWitt and Ann Johnson (daughters of Paul Siple); Karen Tupek (daughter of Finn Ronne); Lisa Crockett (daughter of Fred Crockett); Ann Wait (daughter of Vic Czegka); David Roos (son of Eddie Roos); Francis Boyd (grandson of Buck Boyd); Mark Van Reeth (son of Eugene Van Reeth); Jean Portell (daughter of Ambassador Daniels); Kent Wertime (grandson of Paul Siple).

*Two of a Kind* - Bill and Anne Benninghoff; Hal and Margaret Borns; Harry and Jennie Darlington; Art DeVries and Past and Present; Mel Ellis and Loreen Utz; Peter Harrison and Shirley Metz; Tom and Davida Kellogg; Pat Kraker and Kathy Covert; Peter Rowley and Mary Siders; John and Beezie Spletstoesser; Ed Stump and wife; Tom Taylor and Edith Smoot; Mort and Joanne Turner; Peter Webb and XYL; Werner and Susan Zehnder.

*The Tree is Bent* - John and Kristine Annexstad; Dick and Andy Cameron; Cam and John Craddock; Kay and Shaughnessy Everett; Will and Karl Kellogg; Buck Wilson and offspring.

*Explorers Club* - Pete Burrill, Bill Littlewood, Tony Meunier, Dale Andersen, John Annexstad, Dick Chappell, Dick Failing, Gordon Fountain, Ann Hawthorne, Polly Penhale, Brian Shoemaker.

#### CATEGORIES

*Penguinites* - Bill Sladen, Frank Todd, Aileen Lotz (is Aileen the only female person who has seen all species?)

*Meteorites* - Bill Cassidy, John Annexstad, David Blewett, Brian Mason, Tony Meunier, John Schutt.

*Ice Cores* - Lyle Hansen, John Kelley, Karl Kuivinen, Chet Langway, Kent Swanson.

*Fishermen* - Art DeVries, Paul Berkman, Hugh DeWitt, Charles Knight, Tom McIntyre.

*Ice Breakers* - Lawson Brigham, Orland French, Bob Newcomb, V.W. Rinehart, Joe Wubbold.

*Dog-eared* - Norman Vaughan, Carolyn Muegge, Vernon Cooper, H.H. Richardson, Walter Smith, Gayle Wood.

*Because It Was There* - Nick Clinch, Bob Dodson, Robert Failing, Paul Fitzgerald, Ed Stump

*Hovercrafters* - Harvey Cook, Steve Dibbern.

*Mammals* - Charlie Green, Tom McIntyre, Don Siniff, John Twiss.

*Wintering-over Doctors Who Had To Feel It* - Pat Unger (L.A. V \*57); Ike Taylor (McMurdo '55); Paul Tyler (Hallett '62); Joel Mumford (Palmer '72); Harry Holcomb (McMurdo '72); Donna Oliver (McMurdo '77); Michele Raney (Amundsen-Scott '79); Richard Crane (McMurdo '80).

*Shrinks* - Noel Howard, Elizabeth Holmes, John Mateczun, Robert Strange.

*Others (Doctors)* - Bard Cosman, Barbara Fry, Howard Hiatt, John Middaugh, Chester Pierce, Harold Muchmore, Nan Scott.

*Scouts* - Dick Chappell, Art Owen, Mark Leinmiller, Scott Miller (Runner-up), Louis Sugarman, Alan Cockrell (Civil Air Patrol '69).

*Writers* - Walter Sullivan, Michael Parfait (new spelling - exclusive rights for this column), Jim Caffin, Elizabeth Chipman, Joe Dukert, Laurence Eklund, Charlotte Evans, Robert Feeney, Marget Florio, Harold Helfrich, Aileen Lotz, Mo Morris, Charles Neider, Arville Schaleben, Pat Wilson

*Photographers* - Ann Hawthorne, Stuart Klipper, Dotte Larsen, Luella Murri.

*Artists* - Alan Campbell, Jody Forster, Stuart Klipper.

*Philatelic Nuts* - Pete Barretta, Carl Fisher, Janice Harvis, Joe Hogan, John Kennaley, Bill Littlewood, Joe Lynch, Mort Turner, Hal Vogel.

*International Relations* - Lee Kimball, Pam Davis, Debbie Enzenbacher, Chris Joyner, Beth Marks, Ron Naveen, Richard Schwabacher, Bill Westermeyer.

*Tourism* - Peter Harrison and Shirley Metz, Werner and Susan Zehnder, Pam Davis, Debbie Enzenbacher, Ron Naveen, Darrel Schoeling, John Spletstoeser, Victoria Underwood.

*Frequent Travelers* - Brooks Conrad, Myrt Eller, Dotte Larsen, Luella Murri, Tana Warren

#### SPECIALTIES

*Mr. Antarctica* - Charles Swithinbank, still active into his 6th decade of life on the ice.

*Mr. Insides* - Rob Flint, who wintered over thrice in interior Antarctica - Byrd '64, Plateau '66, Vostok '74.

*Mr. Outsides* - Rudi Honkala, who also wintered over thrice - Wilkes '57, Casey '59, Palmer '67, and wasted all three years, as he never experienced a day below -60°F.

*30-Year Button* - Ken Moulton, American record holder for most summers in Antarctica. Runner-up - Art DeVries or John Katsufakis.

*Five-Decadians* - Charley Bentley, Bob Rutford, Mort Turner.

*Four-Time Losers* - Billy Ace Baker, Gerald Ness - wintered over four times, although we know not where!

*Common Man* - Russell Barnick - self-evaluation of man who has worked seven austral summers at McMurdo.

*Mayor of Seymour Island* - Bill Zinsmeister.

*Bird Man* - George Watson.

*Flightless Bird* - Bill Sladen, truly flightless and certainly a bird!

*Old Fossils* - Gerry Webers, Bill Zinsmeister.

*Photographic Coverage* - Bob Allen - sees all, knows all.

*Intelligence* - Betty Burrill, Len Dykes, Ron Podmilsak.

*Make Mine Blue Ice* - Tony Gow, Charles Swithinbank.

*Egyptian Flying Missile on Tennis Courts* - Biomasser Sayed El-Sayed.

*Finlandia* - Rudi Honkala, Karl Kuivinen.

*Lebanese Antarctic* - George Doumani, still alive after marrying that young blonde.

*Football (nee Soccer) Is The Name of The Game* - Peter Wilkniss.

*Sleds for Man-hauling* - First in line, old Bob Nichols, whose only regret is that he wasn't with Scott on his fatal trip to the South Pole.

*Nice People* - Ruth Siple, Pete Barretta, Bill Cassidy, Bill Field, Rob Flint, Bob Helliwell, Ken Moulton, Walt Seelig, John Spletstoeser, Charles Swithinbank, Link Washburn.

*Motorcycle Corps* - Will Kellogg.

*Lawyers* - Marty Belsky; Convert to - George Toney; Convert out - Ron Naveen.

*Old Contractors Never Die* - Bob Becker, Mike Pavlak, Dick Wolak.

*Whale Spotteress* - Dotte Larsen.

*Carpenter* - Bob Rutford.

*Tools* - Ed Todd, who has an insatiable appetite for tools, never saw an old one he couldn't love. Perhaps he was a tool in an earlier life!

*Make Mine A Cadillac* - Doc Abbot.  
*No Cadillacs, Please* - Make Mine A Lincoln - Steve Corey.  
*What's Wrong With Riding a Horse?* - Kelly Welch.  
*What's About A Saturn?* - Judy Reusswig.  
*Hey, I'm Still Driving a Model A* - A. Ford, as in Art Ford.  
*Ted Turner/Dennis Connors* - Gordon Cartwright, Johnny Dawson, Guy Guthridge.  
*Smith Barney* - Lee Kimball - when she speaks, you had better listen.  
*Sherwin-Williams Award* - Alan Campbell.  
*Pilot For Hire* - Doc Abbot, particularly for Bertrams.  
*Wish Upon A Star* - Kelly Welch, who is also registered aloft with a feature.  
*Road To Success Leads Thru Jackson Hole* - Larry Gould, late Jim Zumberge, Bob Rutford.

#### SPECIAL ACHIEVEMENTS

*Mother Superior* - Helen Gerasimou, long-term employee of Division of Polar Programs who was surrogate mother to all neophytes going to the ice.  
*Cover Girl* - Gisela Dreschhoff, both of a professional journal and a hard-cover book on Antarctic women.  
*Centerfold* - Category is up for grabs, waiting for some enterprising exhibitionist seeking notoriety. To date, closest is Norman Vaughan, who was a pullout in the 1991 Lands End catalog. However, with apologies to Carolyn, is an 86-year old codger really centerfold material?  
*Mr. Spelunker* - Phil "Crevasse" Smith, who never saw an opening he didn't like, who probed and explored.  
*Murray Hamlet Dummkof Award* - Someone by the name of Ed Stump actually froze a toe! So now he wears an earring for an early-warning alert device.  
*Father of Famous Offspring* - Ike Taylor, doctor at McMurdo in early Deepfreeze, fathered at least two very well-known folk singers, James and Livingston.  
*Arthur Fiedler Opposite* - Jerry Huffman.  
*Better and Certainly More Fun Under Water* - Dale Andersen, Paul Berkman.  
*GENTLEMEN QUARTERLY* - Stuart Klipper, who ran unopposed, having a lock on the title into perpetuity.  
*Bull In A China Shop Named Dry Valley* - The one and only indomitable Colin Bull.  
*Draculas Of The South Pole* - Hungry for blood, Harold Muchmore and Nan Scott.  
*Professor On The Ice* - Robert Feeney, with egg on his face.  
*Antarctic Beers* - Sy Roman, he has tried them all, from all countries.  
*Honor Guard* - Ron Thoreson. When he was the bayonet catcher on the Drill Team at Fort Myer, he never once dropped a rifle. Honest! Count his fingers the next time you visit Black Canyon National Monument. Bourbon  
*Balls* - Rachel Kuivinen, mother of you-know-who, has a secret recipe. How does she get a chocolate cover over so much whiskey?  
*Divine Guidance and Forgiveness* - Rev. Bruce Lieske, after wintering over with this taradiddler at Little America V in 1957, saw more of a need in the ministry than in meteorology, and heeded the call.  
*Antarctican Turncoat Bureaucrat* - From Chippewa Falls, Ned Ostenso.  
*Reincarnation of John Wesley Powell* - Troy "White Waters" Pewe.  
*Big Game Hunter* - Jim Collinson, who goes after dinosaurs with both fists and a geology hammer.  
*Most Unlikely Looking High Ranking Officer* - Joe Wubbold.  
*Penguinitis* - Karen Ronne Tupek has a terminal case, as they have taken over the house and the yard. Husband realizes he is interim, pending Karen finding a real live penguin.

\*\*\*\*\*

Shirley Anderson, "Antarctic Mom" for several decades, died 1 November '92 in San Diego.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emiho Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

Paul C. Daniels

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968

## Exploring the Marine Life of the Subantarctic Kerguelen Islands and McMurdo Sound, Antarctica

by

Dr. James McClintock Assistant Professor  
of Biology

The University of Alabama at Birmingham

on

Wednesday evening, 17 February 1993

8 PM

National Science Foundation  
1800 G Street N.W.

Room 540

Dr. McClintock is a frequent flyer to Antarctica, having been there in four of the past eight austral summers. In 1983 he studied the intertidal and subtidal marine invertebrate ecology, nutrition, and reproduction on Kerguelen Island. In 1985 and 1986 he investigated the reproductive biology of benthic marine invertebrates, as well as the biochemical composition, energy content, spicule armament, and toxicity of antarctic sponges at McMurdo. In 1989 he focused on the chemical ecology of antarctic marine sponges. There will be NO written examination after the lecture. *COME ONE! COME ALL!*

- Light refreshments and hot coffee -

The beautiful Antarctic photographs of one of the real premier Antarctic photographers, Neelon Crawford, are now on display through March 28th at the Albin O. Kuhn Library and Gallery, University of Maryland Baltimore County, Baltimore, Maryland.  
- Go and view Neelon's ANTARCTIC POLAR VIEWS -

The past month has seen Antarctica become of age videowise, with the first live television shows being seen on our local screens. After the two David Bresnahan shows, we forgot to tune in again. Then there was Dante! So instant replays from Antarctica are now a reality. Is anything sacred?

Antarctica is an ever-changing kaleidoscope, with pardons to Webster for the proper Antarctic spelling. It is often soul rewarding, and fun, to put things on hold and reflect back on the past. Phil Law did some of that in his lecture before our Society in Washington on 15 October 1992(see pages 6-7), and we will use that as a springboard to try and stir up some interest in you folks on your thoughts about past explorers, adventurers, and scientists. Our own personal thoughts have been drafted, but we will withhold them until the Voices of the Society can be heard.

Announcement: Loren W. Setlow will become the new Director of the Polar Research Board at the National Academy of Sciences at the end of February. For the past ten years Loren has been with the U.S. General Accounting Office as Senior Geologist, currently working on oil and gas issues in Alaska. His bachelor's degree in geology is from Tulane University, his master's from Florida State.

An exciting upcoming: David Campbell, author of the Houghton-Mifflin award-winning "The Crystal Desert" has indicated a willingness to speak to our Society in Washington.

Addition to Cross-Country Skiers, page 6: British adventurers, Sir Ranulph Fiennes and Dr. Michael Stroud, reached the South Pole on 17 January as part of their attempt to make the first crossing of Antarctica on foot. The pair are 68 days and 800 miles into their bid to make the longest ever, unsupported polar journey.

**STILL ANOTHER ANTARCTIC GIANT SUCCUMBS, ANOTHER VICTIM OF CANCER.** Bill Benninghoff internationally renowned botanist, died on 8 January of pleural cancer. He was only 74. Among his survivors are his wife, Anne who worked with Bill in the Antarctic in 1977 on airborne particles and electrostatics, at McMurdo, the South Pole and Vanda; and his 103-year old mother, who talked with Bill on her birthday in December Bill entered the hospital the day after Christmas, but it was then too late for an operation or chemotherapy. He spoke of his pending death in telephone calls to some of his closest associates, which must have been heartbreaking for all. Anne hopes she can arrange to have a Memorial Service at Arlington Cemetery the afternoon of our March 24th meeting, or the day before - Bill's birthday.

At the suggestion of Link Washburn, we are asking Tim Hushen, former staff officer of the Academy's Polar Research Board, to write the Society's obituary on Bill. Tim was one of Bill's former students and remained close to him and his wife, Anne. Tim is currently in Europe on business, so we won't have his obituary until next month's Newsletter.

It is always nice to receive recognition in one's living days, and perhaps some of you may recall a piece in our November 1990 Newsletter entitled "Bill Benninghoff Immortalized in His Own Lifetime." The Michigan Chapter of The Nature Conservancy dedicated some terrain and vegetation in T48N, R10W, McMillan Twp., Luce County, in Upper Michigan as the "Benninghoff Tract." That must have pleased Bill.

Bill is the third distinguished IGY Antarctic to die within recent months, joining Jim Zumberge and Dick Goldthwait. And the late Emanuel Rudolph made his mark shortly after the IGY. All four were relatively young, all were really nice guys. For years we zealously pursued Jim Zumberge, Bill Benninghoff, and Colin Bull to present a Paul C. Daniels Memorial Lecture for our Society. Jim agreed, but, of course, was struck down by the Big C. Bill was always putting us off until he had something worthwhile, when anything he said would have been worthwhile. Colin, you had better come up with something FAST!

**REORGANIZATION AND RELOCATION FOR NSF.** While everyone is waiting with bated breath for the announcement early in February as to who will replace Peter Wilkniss at the helm of the polar ship, several things have actually become fait accompli at the National Science Foundation. While Peter and Edith were having a ball skiing and enjoying Switzerland on a mid-winter vacation, the selection committee at NSF has whittled down scores of candidates for Peter's position to the Final Five. Could they be waiting until the new residents move into 1600 Pennsylvania Avenue, so he or she could have a Clinton look? With the new administration, the person, above all else, has to look right. Will Antarctic Gore have an input? All we can do is wait and see.

Meanwhile they have gone through a paper exercise at the National Science Foundation, and the Division of Polar Programs has once again become the Office of Polar Programs and now will report to the deputy Director of the Foundation, currently Fred Bernthal And NSF is reactivating the Committee on Polar Programs. A staff memorandum announcing these changes was issued by NSF on 13 January. There are a couple of paragraphs about how great the U.S. Antarctic Program is, and how important Antarctica is going to be in the future, but I think we can spare you all of this, as it sounds like all other government administration and management announcements. Consider yourself informed.

But a political football was finally put into the end zone in early January when NSF officials inked an agreement to relocate to a spanking new 12-story building in Ballston (see our Newsletter for April 1991 for description of all the great amenities in this new building). The Director of the National Science Foundation, Walter E. Massey, was one of those fighting the relocation. It got so bad that Rep. Frank R. Wolf (R-VA) wrote an angry letter to President Bush urging Massey be fired if the move did not proceed, accusing Massey of insubordination. But with the signing on 8 January, Wolf withdrew his demand.

It appears that NSF's resistance collapsed when Clinton's transition director, Vernor E. Jordan, Jr., got hold of Massey by telephone and explained the facts of life to him, that the new administration favored the move. Within two hours of the signing, a van pulled up at NSF to begin moving furniture! This was at the request of Senator Charles S. Robb (D-VA) who "wanted a symbolic move, in addition to the signature. I felt it was necessary to give a sense of finality to a project that has been on the books for six years." That finality won't come for another year, because it will take that long to move NSF from downtown to Ballston (in Arlington).

Supposedly this is a victory for taxpayers, as the move will save us \$81 million. I don't exactly understand Washington's arithmetic, but if moving 1200 employees out of Washington saves the government \$81 million, wouldn't our whole deficit be recovered if we moved all of Washington out of Washington? I would think so.

There is a down-side to this move. There used to be sort of a homespun restaurant in the Ballston area called Eskimo Nell. It had a lot of stuff from the Arctic on the walls; it was rather dark inside; the food was just mediocre, even when the chef was having a good day; BUT they had the best Key Lime pie you ever tasted. Supposed]

the key limes were flown up from Florida every day. Anyway, Eskimo Nell fell to the sledge hammers several years ago, and progress is now being served. However, I think it is only fitting that some food dispensing center within this building carry on the tradition of Key Lime pies in Ballston.

**XVII ANTARCTIC TREATY CONSULTATIVE MEETING (ATCM), VENICE, ITALY, 11-20 NOVEMBER 1992** (Ron Naveen, Oceanites). Well, the argula was great, and the Tintoretto cherubs still fly better than penguins.

The big news from the ATCM was the Parties' agreement, for the first time, on the need for a Treaty Secretariat. Terms of reference for such an institution were outlined. However, there was no agreement on where the Secretariat should be sited. Buenos Aires and Washington were offered as potential venues, but the issue of location didn't reach any final consensus. Indeed, subsequent to the meeting, the U.S. informed other governments that it would have no objections to Buenos Aires as a location, perhaps hardening the already stiff, United Kingdom opposition to this site.

The Consultative meeting was preceded by a two-day special meeting on tourism. There was a lot of fire and brimstone, but only a few glimmers of substantive heat and light. Much valuable information on the numbers of tourists and where they were going was submitted to the record. However, the special meeting and the entire discussion of tourism during the Consultative meeting were exacerbated by a draft tourism annex to the new Antarctic Environmental Protocol, circulated by a "Group of Five" countries (France, Germany, Spain, Chile, and Italy). The U.S. and many other countries took the view, strongly, that such new, legal authority wasn't needed, and that the Protocol and its Annexes, afforded sufficient authority to regulate all Antarctic activities, including tourism. The simple point was that the Group of Five proposal only divided the Parties from the key concern of implementing the Protocol with all deliberate speed. The Group of Five was unable to convince the other Parties of the need for their proposed annex, and that's as far as it got. The Report of the ATCM reflects this difference of opinion and, thus, the precise details of regulating tourism and other, non-governmental activities will have to wait until a future Consultative meeting.

Through the profusion of argula salads and red wine, it was rather obvious that, without the new Antarctic Environmental Protocol entering into force, all of its perceived benefits - for example, the requirement of environmental evaluations for all activities and the Committee on Environmental Protection - would be for naught. Until all Parties deposit ratifications, the Protocol and its Annexes do not enter into official, legal force.

Prior to the meeting, Spain was the only country to have deposited a ratification of the Protocol. The U.S. position at the XVII ATCM consistently reflected the view that ratification has to be the Number One priority of every Treaty Party. Although many Parties indicated progress towards ratification, there is considerable uncertainty, indeed, whether the Protocol will enter into force by the time of the next Consultative meeting, scheduled for Japan in the spring of 1994.

On the U.S. side, implementing legislation did not make it through the last session of Congress. There were two competing bills - one from the Bush administration and one developed by the House Merchant Marine Commission, and there was much wrangling over whether any or some of NSF's administrative, non-scientific functions relating to the Antarctic Treaty Conservation Act should be transferred to other federal agencies. All of this will be reprised in the 103rd Congress, just convened, and it is expected that the new Clinton-Gore administration will be rather interested in getting a bill through, so U.S. *jefes*, using their "bully pulpit," may push other Parties to ratify.

**THE MISSION IS AN UNQUALIFIED SUCCESS**, states David Lavery, Director of the Dante project. I only wish that David had been marking my Latin papers when I was trying to pass courses in that subject back in Worcester Classical. Dante had an inauspicious debut in an earlier test in the United States, failing a dry run on a slag heap at a closed steel mill in Pittsburgh, so it seems its track record has been somewhat less than a howling success.

Associated Press quoted our own Phil Kyle with bridled optimism, "This has whetted the appetite of volcanologists everywhere. There is no more nasty volcano. It has been a remarkable achievement." We don't know of any Antarctic exercise which was more ballyhooed in advance than Dante's 21-foot sojourn. It got a lot of us east-eners out of deep sleep at the ungodly hour of 7 AM to see promised live shots from inside the crater of Erebus, and then we didn't know what we were looking at. Must have been the early hour.

Dante was named after an Italian poet by the name of Dante Alighieri, no doubt a frustrated opera singer, who authored the three-part "Divine Comedy." Isn't there a message there? In the "Inferno" segment, Dante descends into Erebus, in Greek mythology the last stop before Hades, the place of the dead.

Dante is an 8.2-foot-tall robot weighing 884 pounds. In other words, he is about the equivalent of a defensive tackle in the National Football League (NFL), except Dante has magenta legs "because that color does not scare penguins." Are there really penguins up on the crater of Erebus? Dante is made of anodized aluminum, and is designed to step over obstacles 4.8 feet high. The laser scanner in Dante's central mast, or torso, provides a 350-degree field of view for distances ranging from 10 feet to 98 feet. Sensors in its feet record and map the ground it walks on, forming a computer multicolored mosaic.

Dante, like its NFL counterpart, has limited onboard intelligence, and computations about the correct path to take are done by computer software back in the human hut. The robot reports back on conditions, and the humans decide where it should go. Identical to pro football, so why don't they just hire Reggie White and send him down into Erebus? The answer is that Dante's mission was only two million, and Reggie doesn't even dress up for that kind of money.

Dante does pay out its own tether as it feels its way along, using laser range finder, 3-D video cameras and "eyes" in each of its feet to help pick its toeholds. There are also force sensors to determine the amount of traction that a given surface require.

So what happened? Carnegie Mellon and New Mexico Institute of Mining and Technology had a full team - eleven members. Well, it seems that the fiber-optic cable linking the robot with its base broke. It happens in the best of robot families.

Lavery expressed "obvious disappointment over what is a component failure" and the inability to earn, 'out the scientific portion of the project - exploring the physical and chemical features of Erebus. But the objectives of controlling the robot from afar and testing the use of sophisticated hardware in a harsh environment were met. Lavery said, "The aspects of sending autonomous robots on planetary exploration mission has been proven."

**SOUTH POLE WAY-STATION FOR CROSS-COUNTRY SKIERS.** A twenty-nine year old lawyer from Oslo, Norway, Erling Kagge, became the first person to walk alone to the South Pole, arriving there in early January after a 51-day, 814-mile trek from Berkner Island. His only link with the outside was a one-way satellite beacon for sending messages. Erling dragged a heavy sled, which started out weighing 276 pounds. Although we are not certain, we believe he will walk across the whole continent.

In mid-January four women checked in on skis at the South Pole on their transantarctic crossing. Leading the expedition, The American Women's Transantarctica Expedition, is the well-known Ann Bancroft, the first woman to travel by foot to the North Pole (1986 Will Steger International Expedition). Ann, 37, is a former physical education and special education teacher.

Besides Ann are Sue Ciller, 44, a computer programmer from Boulder, Colorado who has scaled Mount Everest and Mount McKinley; Anne Dal Vera, 37, of Fort Collins, Colorado, a ski, kayaking and wilderness instructor who has guided numerous outdoor trips; and Sunniva Sorby, 31, of San Diego, manager of an outdoor and travel outfitter store, and a teacher of navigation, rock climbing, and backpacking.

The group has attracted attention from researchers, including a University of Minnesota psychologist interested in group dynamics. Ann said in the beginning, "It's a main objective of the four of us to travel for such a long time in such difficult conditions and come out at the other end as friends." (Whoops, update. Less than a day after reaching the Pole, they abandoned their attempt. Still behind two weeks.)

**ARE YOU AN EXPLORER?** When Phil Law, retired chairman of the Australian National Committee for Antarctic Research, 1966-1980, addressed our Society in Washington on 15 October 1992, he made some interesting, if not provocative, statements about explorers. But let's kick it off with excerpts from his text that evening:

According to the Oxford dictionary, exploration (as regards territory) means examining the territory as one moves through it. Common usage has added a further dimension to this definition. The word carries the connotation of a certain element of discovery, of examining something new, something not previously examined.

Scott and Mawson, obviously, were "explorers" and so, to a lesser extent, was Shackleton. Why do I say to a "lesser extent"? Shackleton was a great "adventurer" - one of the greatest. But he wasn't a great "explorer", although he always figures in the lists of the greatest. Actually he discovered very little new territory. Most of what his expedition of 1907-1909 saw in the Ross Sea sector had already been discovered and mapped by Scott. He did discover and map the approach to, and the extent of, the Beardmore Glacier, but that stretch of territory extends for only a comparatively short distance - about 200 miles. Later, during his expedition to the Weddell Sea, where his ship ENDURANCE was crushed, he explored nothing at all.

When one looks at what has been written about the history of Antarctic exploration, one is not very impressed. The trouble is that certain patterns of thought concerning Antarctic events become widely established as a result of the media's portrayal of them and the effect of such portrayal upon the general public. Long before some historian comes along to write up the events, they have become enveloped in shrouds of ignorance, error, emotion, sentimentality, chauvinism and exaggeration. Generally, too, by that time, much valuable material has been dispersed or lost, and knowledgeable participants in the events have died.

As for chauvinism, sentimentality and emotional responses by the public, one has only to quote the British reactions to the tragedy of Scott's last expedition. Would Scott have been as famous if he had not perished? Would Shackleton's fame have been as great if his ship had not been crushed? Would Mawson's name be as well-known if he had not miraculously survived a sledge journey in which his two companions died? I doubt it.

The fervor of British chauvinism arising from Scott's death and the idolatry

of the Scott public image discouraged any real critical evaluation of Scott's expeditions and any fair assessment of Amundsen for fifty years. It was left for Roland Huntford, in his book "Scott and Amundsen" to tackle this task. Unfortunately, his prejudice against Scott tipped the balance to the other extreme and spoiled the result of some very intensive research.

Antarctica today is internationalized to an extent not seen in any other territory. Yet the literature is nationally compartmented. The British tend to sneer at Byrd, largely ignore Mawson, and take no notice at all of the Russians. The Americans accept Shackleton, play down Scott, and completely ignore the Australians and Russians. The Australians rank Scott, Shackleton, and Mawson as roughly equal, but know nothing of the Russians and Norwegians.

How should Australians rate Mawson? Certainly he is far ahead of Shackleton. I think he is marginally ahead of Scott, but to evaluate this would take more time than I have tonight. However, one distinguished British polar expert has said, "The two greatest polar explorers were Nansen in the north and Mawson in the south." Notice that he said "were". There has been no attempt to rate modern Antarctic explorers, either amongst themselves or against those of past eras. History, in fact, has not caught up with Antarctic explorers operating since World War II.

Eighty percent of Antarctic exploration occurred post-1946. The explorers of the "heroic age" merely scratched the surface at a few well-separated points. There are no explorers of earlier times that can match the achievements of these post-war people. There isn't much point in my naming them, for, apart from Byrd and Fuchs, you would not have heard of them.

Well, how about that?? Now we know that the Russians are not recognized by the Aussies, the Brits, or the Americans, and the poor Kiwis don't even get their name in the international listing! Isn't it ironic that the man who did everything right, who had the foresight to use dogs, who executed to perfection a late derived plan, who never lost a man in achieving the South Pole before any other, who discovered new territory enroute to the Pole, doesn't even get honorable mention as a great explorer? Antarctica is really a fraternity, with all of its inherent ills, and poor Amundsen just did not have the right credentials to enter the front door of The Club. He should have known enough to have picked parents from the U.K.

And Shackleton didn't come out very well in the above evaluation. It seems rather harsh to say that Shackleton was a great adventurer, but wasn't a great explorer. It seems like an evaluation which might have come out of the Scott encampment. To say that Shackleton explored nothing at all in his ordeal in the Weddell Sea seems a terrible understatement. He found a way to get his men home safely, and that is a pretty creditable bottom line, particularly when you were one of the parents.

As indicated earlier, I have drafted my thoughts on who I think was the greatest explorer of all time, but, first, we would like to hear from you readers as to who you think it should be. You know, there is a lot of credence for naming Mary Alice McWhinnie as the greatest explorer of all time, as she broke more barriers, entered more domains for the first time, than any other single person. And the odds were stacked against her, because even though she was white, she was sort of the Jackie Robinson of Antarctica. And she was a big leaguer all the way, as her Field of Dreams was krill, one of the driving forces of Antarctica. Let's hear from YOU.

**ANTARCTIC HISTORY IN THE U.S. IS NONEXISTENT.** The United States of America, which annually spends over a hundred million dollars on Antarctic operations and programs, really has no coordinated program to preserve the history of the Antarctic. The

late Gerald Pagano of the National Archives, although not a professional archivist, probably did more than any other American to pull together papers of prominent Antarcticans. But Gerry died much too young, and when he died, for all practical purposes, his polar collecting efforts died with him.

We can't help wondering how much of Antarctic history has been lost by the recent deaths of people like Albert Armstrong, Mike Benkert, Bill Benninghoff, Dick Black, Dave Canham, Bert Crary, Ambassador Paul C. Daniels, Skip Dawson, Gordon Ebbe, Mark Eichenberger, Edward Fireman, Harry Francis, Dick Goldthwait, Eddie Goodale, Sig Gutenko, Henry Harrison, August Howard, Jim Lassiter, Ralph Lenton, Father Dan Linehan, Mark MacMillan, Malcolm Mellor, John Mirabito, Murray Mitchell, Palle Mogensen, Charlie Murphy, Ike Schlossbach, Dean Smith, Harry Swinburne, and Murray Wiener. All of these men died in the past seven years, and represent an incomplete listing compiled from a poor memory bank. Is there anyone anywhere who is trying to assemble their accomplishments in Antarctica? I seriously doubt it. Many widows contact Ruth asking what they should do with their husband's mementos. I am more concerned with the lost histories which these people take with them to their graves, because, with a few exceptions, oral histories were never done on them. With the relative ease of using camcorders, Antarcticans should video themselves.

Our country is almost void of any legitimate bona fide Antarctic historian. The only one really working in the field was Peter Anderson of The Ohio State University, and now that ill health has fallen on him, there is really no one. The only worthwhile American Antarctic reference book is the one by the late Ken Bertrand, which is a jewel of information, but it only goes up through Operation Highjump and Operation Windmill. There is really no good biography on Admiral Byrd, although some may want to question that statement. Peter Anderson was in the throes of writing a definitive biography on Byrd, but it is doubtful if it will ever be finished, considering Peter's health. Lowell Thomas's biography on Sir Hubert Wilkins only saw him into the 1930's, leaving out his last twenty-five years. But here we all sit, with Antarctic history being made every day, with Antarcticans dying every month, and we are losing much of it, if not most of it.

**PERSONALIZING ANTARCTICAN SOCIETY, 1992** (continued). We knew we would take a few hits when we attempted to put you folks into slots in the last issue, and we were not disappointed. Our preamble said "It is not intended to be complete, accurate, or unbiased, but a potpourri of classifications that this very prejudiced person thought up." So we thought we had our 'butt' protected, but the equally scroungy Colin Bull wrote that we "should put a general apology to those omitted," so if you are an omiteer, consider this an apology.

One grizzly early Deep Freezer whom I somehow left off several listings wrote, "After 4 trips to Antarctica, I sure did not think much of Vol. 92-93, Nov., #3." Margaret Sides in Nashville pointed out that she was Buck Boyd's daughter. So we have three relatives of Buck's in our Society. Great! And Roberta Score wrote that she, too, was a meteorite, coming by it naturally, of course, through work with Bill Cassidy. He must have taken, literally, "scores" of people to the Antarctic, as it seems like everyone has gone to Antarctica with Cassidy. He must like variety or be a practicing exponent of equal-opportunity hiring. Mike Metzgar said that Karen Harrower never really worked for the USGS, that she was with Gisela Dreschhoff at the University of Kansas. If that was the case, Mike, then how come oh, forget it.

Billy Ace Baker said that his four winters and five summers were all spent at McMurdo and that "I never set foot on the continent." Billy Ace must hold the record for most months in Antarctica without leaving a footprint on the continent. Greenpeace should give him a plaque. Mike Metzgar also wrote, "Under 'Nice People' you should

have added (the late) Bill and Anne Benninghoff. I fell in love with those two the year I was there." You are so right, Mike, as usual. Thank you. The indefatigable Jerry Brown pointed out that under Alums of the Division of Polar Programs I left him out, as well as footballer Bob Rutherford and Gunter Weller. Merci, monsieur.

Left off the South Pole list - Harry Spohn, meteorological technician in 1962, and Loreen Utz, who was one of the first half-dozen women to winter over at the South Pole, doing her stint in 1983. One Antarctic admiral wrote of a fellow flag-rank Antartican, "Who the hell is Charles Adams?" Well, Doc, long before there was a Deep Freeze, Finn Ronne wintered over on Stonington Island with his bride Jackie, a couple named Harry and Jennie, Ike Schlossbach, Jim Lassiter, Bob Nichols, Bob Dodson, Nelson McClary, Art Owen and others, and, among the others, Charles Adams, who became a Brigadier General. Whether the military thought he deserved a star for surviving that year or what, we do not know, but he was bona fide.

Charles Swithinbank pointed out that we left off the years of his Maudheim Expedition, 1949-1952. Bill Sladen is campaigning for a list of ex-Brits in our Society. I think our immigration office has been pretty careful about who they let into this country, but occasionally they slip up on someone like Sladen! And heaven only knows how Colin Bull got into this country. Had to be some sort of a nefarious undercover operation! Probably we traded an unwanted spy for him. Gunter Weller was an Aussie, we think, and had no immediate connection with the Mother Land

Scott Sandford also wrote that he was a meteorite with Cassidy and ANSMET (whatever that is) in 1984-85, and again in 1988-89. Scott said he found our listing both impressive and scruffy. Now let's go back to the beginning of this subject. The unimpressed was Dick Conger, who was Mr. Antarctic Photography in the early days of Deep Freeze. He definitely should have been weight listed under photographers, and we believe he is also into polar philately. Although we didn't list bookworms, Dick has one of the largest private Antarctic collections in this country.

He don't feel too badly about omissions, as we did this here on the coast of Maine, and our Society files are in the Nerve Center at 905 North Jacksonville, Arlington, Virginia. We will just usurp the Charlie Bentley Law of Glaciology, "keep on doing it until you get it right," even if it takes over thirty years!

**TWO ANTARCTIC VIDEOS AVAILABLE, BUT THEY WILL COST YOU.** Milestone Film and Video, 275 West 96th Street, Suite 28C, New York, NY 10025 (Phone - 212-865-7449. Fax - 212-222-8952) have been acquiring and restoring films from the 1910-1933 era when men and women risked their lives to explore unknown lands and cultures. Two of the eight films in "The Age of Exploration" series deal with Antarctica. One is WITH BYRD AT THE SOUTH POLE, an account of the First Byrd Antarctic Expedition, 1928-30. It is an 82-minute film, and is basically the work of Joe Rucker and Willard Van der Veer. It won the 1930 Academy Award for cinematography, and the New York Times selected it as one of the Ten Best Films of the Year. But by today's standards it can only be classed as mediocre. However, it is the very best available on that expedition, so you may want to obtain a copy. A lot of it will seem familiar, as much of it has been shown in recent years on educational TV, particularly on Arts and Entertainment.

They also have another oldie but goodie in 90 DEGREES SOUTH, Herbert Ponting's film originally released in 1913. They certainly take a lot of liberty with their titles, don't they, as Ponting never was at the South Pole, and Byrd was never on the surface at the South Pole! But that's what they call artist's liberty, I guess. Twenty years after Scott perished on the Ross Ice Shelf, Ponting produced and narrated this film, which the National Film Theatre in London called "One of the 'Fifty Most Famous Films' of the first half of the century."

We, the Antarctic Society, have nothing to do with these films; we're only telling you about their availability. The price seems high - each is \$39.94; shipping and handling - \$3.75 for the first tape, and fifty cents for each additional one.

**PENGUINMANIA.** As long as we're talking about availabilities, there are several places offering creatures of the Southern Ocean. If you have a case of the Karen Ronne Tupek disease, and have to live in a Penguin World, then you should know about Next Stop..South Pole (addresses - P.O. Box 375, New York, NY 10272, or 301 Light St., Baltimore, MD 21202). They sell everything from underwear with penguins to jewelry - some 288 different items. If you buy from them, and say Antarctica Project, 10% of the purchases goes into Jim Barnes' larder.

If you want something in jewelry with real class, Main Gem in Camden, Maine (800-287-5402) is the place. The designer is Elizabeth, a very talented artisan. She designs anything with legs or fins, so you can get penguin, seal, porpoise, and dolphin brooches and necklaces, in sterling silver, 14 karat gold, 18 karat gold. She also has a great moose necklace, which every woman should have, and a sheep brooch, which no woman actually needs. We get no cutback, and only recently became aware of them. Her husband, a retired college professor, is a character, but you want Elizabeth. She has a real talent and does nice work. Ask for her catalog.

There is a third place - Cross Jewelers (570 Congress Street, Portland, ME 04101 - phone - 800-433-2988) which has something that will really knock your eyes out - a pin with two Emperor penguins, with blue sapphire eyes, and a diamond (.07 ct) between the feet. It is 14 karat yellow gold, about an inch high. What a bargain - two Emperors for your very own for only \$825!

**ANTARCTIC MOM.** An ex-truck driver in the Australian Army, World War II, who befriended literally thousands of Antarcticans over the past three decades, died peacefully in her sleep on 1 November 1992 from a collage of ailments - long-term diabetes, heart and lung problems, arterial and carteroid blockages, and an aneurysm in her chest. She married an American serviceman, Navy type, whose ship came into her home town. When the Navy hits the beaches, they don't waste time, and shortly thereafter Shirley became Mrs. James Anderson and found herself living in San Diego.

Somewhere in the early 1960's, Shirley began sending letters and Christmas cards to Navy men stationed in Antarctica. An article in the San Diego Chronicle on November 16, 1969 said she was sending out her 2000th Christmas card to Antarctica. Billy Ace Baker, mentioned earlier in this Newsletter and a very close friend of hers, estimates that before she stopped sending cards, probably about five years ago, she must have sent over 5000 cards! Family Circle presented her with their Good News Maker Award in December 1980, for which they gave her a Gold Heart. That heart was superfluous, as she must have been all heart to have sent all those cards and letters and messages to a bunch of Seabees.

Her interest in the Antarcticans also extended to their families back here in the States, as she kept up a lively correspondence with the men and their families after they returned from the ice. She must have been a most unique woman to have kept it up for so many years. And her husband must have had unlimited patience to let his wife spend all his money and all her time on a bunch of sailors who didn't even have ships sitting at the bottom of the world.

**ADDITIONAL DEATHS.** James W. Lassiter, pilot on the Ronne Antarctic Research Expedition died on 16 December 1992 of a heart attack. Lassiter Coast is named after him. More in our next Newsletter ..... Albert Westphal, formerly with the USGS, died on 14 December 1992.

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 92-93

March

No. 5

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubín, 1965-66  
Dr. Albert P. Crary, 1966-68 \*  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scon McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Sayed Z. El-Saved, 1990  
Dr. Charles W. Swithinbank, 1991  
Dr. Susan Solomon, 1992

*A Memorial Service for Dr. Benninghoff  
will be held at Arlington National Cemetery  
Tuesday, March 23, 1993 at 2 PM  
(Meet at the Administration Building at 1:30 PM)*

## **Crustal Provinces and Tectonics in the Transantarctic Mountains: The View from a Field Geologist**

by

Dr. Scott Borg Program  
Manager Polar Earth Sciences  
Office of Polar Programs, NSF

on

*Monday evening, 29 March 1993*

8 PM

National Science Foundation  
1800 G Street N.W.

Room 540

Dr. Borg graduated from Pomona College in 1977 with a BA in geology. Attracted by possibilities of working in Antarctica, he attended Arizona State University, working with Ed Stump, earning his MS in geology in 1980 and his PhD in geology in 1984. He became a soft-money researcher at the University of California, first at Los Angeles, then at Berkeley, and continued to work mainly on problems in Antarctic basement geology, with greater emphasis on using isotopic techniques to characterize continental crustal blocks and terranes in addressing problems in Antarctic tectonics. He spent a short time working for the Department of Energy on the Yucca Mountain Project prior to going to NSF as Manager of Polar Earth Sciences. Scott is truly an Antarctic heavyweight, so be sure to come and hear the newest program manager in the Office of Polar Programs.

Chances are you won't get this in time, but if you do, Gary Kopff and Gary Ball will speak at the Cosmos Club (Powell Auditorium) on Sunday, 7 March at 3 PM on "Everest and Antarctica Past Age 45?" Naturally this doesn't apply to any of us, as we're all 39 or under, but you might want to know what's in your future.

We have been sort of dogging this Newsletter, waiting for the National Science Foundation to announce the new Director of the Office of Polar Programs. Finally, as February came to an end, it was announced that Neil Sullivan was the winner, or, at least, the next ascendant to the throne. I think the scientific community must really be rejoicing over the news, as Neil has been on the forefront of Antarctic science since graduate school days. And he is a nice guy who probably hasn't alienated any people along the way.

In a way it is sort of a waste of a top-notch scientist to put him into this administrative position, but, then again, it may give him the leverage to get some of the things done which he might not have been able to have gotten done otherwise. It had to be a two-sided coin, and we're sure it wasn't an easy decision for Neil to make. Outside of Bob Rutford, there hasn't been a tried and true Antarctic scientist in that position since its inception.

As soon as the warranty ran out on our fax machine, it broke down, so that was another excuse to delay this Newsletter. And, after three mild winters, the month of February was a throwback to what winter months are supposed to be, so we have been enjoying snow and cold, and not writing.

As you will see, this Newsletter is less taradiddling by yours truly and more inputting from you members. This issue would never sell at the checkout counter of your local supermarket, but, hopefully, you will like some truthfulness for a change of pace.

Our membership is down to 600, where we seem to have stabilized. Our aim is to make the Newsletter of interest to our members, so if you want something you're not getting, let the Nerve Center at 905 North Jacksonville Street know about it. We promise nothing, but at least we will entertain your suggestions. GOOD LUCK, NEIL!

**NEIL SULLIVAN INCOMING DIRECTOR OF OFFICE OF POLAR PROGRAMS.** The National Science Foundation (NSF), announced on 25 February that Cornelius W. Sullivan, currently director of the Hancock Institute for Marine Studies and professor of biological sciences at the University of Southern California, will be the new Director of the Office of Polar Programs (OPP). Sullivan's appointment begins May 16, 1993, and he will serve as a consultant to OPP until then. OPP is responsible for the United States' multidisciplinary research programs in both Antarctica and the Arctic, with a budget of more than \$243 million for fiscal year 1993.

"Cornelius Sullivan is one of the world's leading polar scientists," said Walter Massey, outgoing Director of the National Science Foundation. "He has led many interagency and international expeditions to Antarctica, and has carried out research in the Arctic. As a former member of the National Academy of Sciences' Polar Research Board, he is also a leading voice in polar research policy circles."

Sullivan's achievements include chairing the steering committee of the Antarctic Marine Ecosystem Research at the Ice-Edge Zone (AMERIEZ) project, a pioneering multidisciplinary investigation of ecosystem processes affected by pack ice dynamic in the Southern Ocean. The research has made major contributions to confirming the ice edge's critical role in cycles of energy and materials.

The new director's own research has focused on microbial processes in the ice-edge

zone in both polar regions. He has been a recipient of NSF support since 1978 from both OPP and the Ocean Sciences Division. He is a member of the SCAR/SCOR Group of Specialists on Southern Ocean Ecology, which conducts long-range planning of research on the region's ecology. He also serves on the editorial boards of polar and microbiological journals.

Sullivan has taken an active part in NSF's Young Scholars Programs, which provides high school and college students with hands-on research experience. He supervised the first female participant, Catherine Blish, in the Young Scholars Program in Antarctica, as well as a second scholar who joined the U.S.-Russian Weddell Sea Ice Camp expedition in 1992.

The new OPP director graduated from Penn State University in 1965, and continued at Penn State through his master's. He received his PhD in marine biology from the University of California in San Diego in 1971, and then did a post-doctoral at Scripps Institute of Oceanography, 1971-1974. Since 1974 he has been on the faculty of the University of Southern California.

Incidentally, Neil Sullivan was our Society's first lecturer following Peter Wilkniss becoming Director of the Division of Polar Programs, on 17 September 1984. If tradition follows, it means Scott Borg will be Neil's replacement in 2002. Remember, you read it here first!

**SIPLE RIDGE PUTS RUTH BACK ON THE ANTARCTIC MAP.** When the late Paul Siple was on the U.S. Antarctic Service Expedition, he named several features after his family, a coastal mountain for his wife Ruth, something for his sister Carrol Kettering, and they were duly excited and pleased. But then in the late 60's or early 70's, someone in authority, using infinite wisdom, purged Antarctica of all female names not connected with the Byrd and Ronne families, so such features as Mt. Ruth Siple, Mt. Jane Wade, and others had the first names on the features eradicated.

We have just heard that the Board which approves the names of Antarctic features has named a ridge for Ruth. We grant you a ridge is no mountain, but at least it puts Ruth back on the Antarctic map. And it gives her bragging rights if she should ever find herself in a cocktail lounge where the subject is Antarctic geography. Congratulations to our Honorary President who does all the work that keeps this Society alive and active.

**THE PROTOCOL'S "EASY" RATIFICATION GOES BUMP, BUMP, BUMP** (Ron Naveen, Oceanites). As noted in the last Newsletter, the new Antarctic Environmental Protocol isn't in force because it still hasn't been ratified by the requisite number of Treaty Parties. All 26 Consultative Parties must deposit ratifications and, to date, only Spain and Ecuador have done so. France and Peru are rumored to be on the brink, and the hope is that the U.S. will soon be "on board." The U.S. Senate has given "advise and consent" to the Protocol, but no U.S. ratification will be deposited until legislation to implement the Protocol is signed into law by President Clinton. The new Clinton-Gore Administration was expected to be greatly interested in getting a bill through, so that the U.S. could pressure other Parties to ratify. Still, 40 days into the new Administration, there's still much doubt about the Protocol entering into force by the time of the 1994 Antarctic Treaty Consultative Meeting.

As of this writing, what was expected to be a relatively "easy" ratification process in the U.S. seems stalled, and there has been no reconciliation of the two competing implementation bills introduced in the last session of Congress. On February 23, Cong. Boucher held a hearing on one of last year's bills, which favors NSF's continuing the bulk of its scientific and administrative functions in Antarctica. The new version of this bill also contained a provision establishing a Presidential

Commission to assess NSF's performance and to recommend changes, as deemed necessary. Many are opposed to this bill, favoring a new approach by which many of NSF's administrative, non-scientific functions are transferred to other federal agencies like NOAA and EPA.

An important new wrinkle is the decision favoring the Environmental Defense Fund in a lawsuit brought against NSF. The U.S. Court of Appeals for D.C. ruled in January that U.S. government agencies are not exempt from the requirement to perform impact studies on decisions affecting the Antarctic environment, simply because the impacts occur outside of the territorial U.S. The specific facts involved NSF's not preparing an impact statement regarding the incineration of food wastes at the McMurdo Station. In his decision, Judge Mikva emphasized NSF's decision-making, which took place in the U.S., and the fact that the alleged effects occur in an area without a sovereign, but over which the U.S. has considerable legislative control.

With the Protocol instituting a system of impact statements in the Antarctic arena - called initial and Comprehensive Environmental Evaluations, Judge Mikva's well-reasoned decision reinforces arguments for a greater scrutiny of NSF's operations and procedures that implement the Antarctic Treaty. More to come - for sure.

**LATE NEWS ON THE PROTOCOL** (Beth Marks, Antarctica Project). Also on February 23 Rep. Studds introduced a competing Antarctic bill - The Antarctic Environmental Protocol Act of 1993 HR1066. This is the same bill that was introduced by Rep. Jones in the last Congress, and seeks further oversight of NSF's activities on the ice. Hearings have not yet been scheduled.

**THE POLAR TIMES RESURFACES** (Brian Shoemaker, National Antarctic Center). The American Polar Society is alive and well, and once again will be publishing its newsletter, The Polar Times. The Society was established in 1934 by a distinguished group of polar explorers that included Richard E. Byrd and Paul Siple. The original Secretary of the Society at that time was Mr. August Howard. As part of this responsibility, August began to publish The Polar Times twice a year - a newsletter dedicated to keeping old Arctic and Antarctic explorers (OAEs) and others interested in the polar regions in touch and informed of activities there.

Over the years The Polar Times became the heart-and-soul of the Society. Presidents and Boards of Governors were changed periodically. However, August Howard stayed on as Secretary for over 50 years. During that time he edited and published 102 edition of The Polar Times, and his name became synonymous with the American Polar Society. His death in 1987 was dramatized to us all; publication of The Polar Times ceased - a void in all of our lives.

Peter Anderson became the Secretary of the Society in 1988, and planned to publish The Polar Times from the Byrd Polar Research Center at Ohio State. Unfortunately, Peter suffered a stroke before he could begin publication. Again the Times was in limbo.

Dick Chappell phoned me in May 1992 and asked if we could publish The Polar Times at the National Antarctic Center in Reedsport, Oregon. We were apprehensive at first, but after discussing the matter, our board of directors agreed.

We aspire to the standards set almost 60 years ago by August Howard; however, we all have other duties and responsibilities, and it became apparent that several people will have to become involved. For continuity and objectivity we have established an editorial staff of four, and we appeal to the American Polar Society membership to submit manuscripts and to clip articles from other publications. We have kept most of the format developed by August for the newsletter. I am sure that you will enjoy!

As before, publication of The Polar Times is dependent upon your membership donations. We are now asking \$5 USA / \$8 foreign a year for membership, but will be happy to accept more generous donations. We encourage your generous support. Please mail to the American Polar Society, Box 692, Reedsport, Oregon 87449. The first issue is to be published April 1993.

**THOUGHTS AND REFLECTIONS - WILLIAM S. BENNINGHOFF** (Tim Hushen, San Diego State University Foundation). Bill Benninghoff passed away on January 8, 1993, after a short illness. He remained the same thoughtful and selfless friend and colleague to the end. Bill said in a telephone conversation just before his death that "up until Christmas day, 1992, he considered himself to be in as good health as could be expected for a retired, but slightly over-committed, professor."

I first met Bill and his wife Anne as a graduate student at the University of Michigan in 1965. They have remained good friends since that time. Bill started his career as a botanist with the U.S. Geological Survey working extensively in Alaska and the Arctic after receiving his Ph.D. from Harvard University in 1948. He did the early pioneering work on the effect of permafrost on vegetation. While at the Survey, he became the Chief of the Alaska Terrain and Permafrost Section. In 1957, Bill accepted a position at the University of Michigan from which he retired in 1988 as Professor of Botany and Director of the Matthaei Botanical Gardens.

Bill made four trips to Antarctica, 1968, 1976, 1977 and 1989. In 1977, Anne joined Bill to conduct a project studying the electrostatic field impact on the transportation of pollen and spores. They enjoyed their trip to the ice so much that Bill agreed to be a lecturer on one of the cruise ships in 1989 in order to visit the Peninsula region.

Bill was a member of the Polar Research Board of the National Research Council and chairman of the Scientific Committee on Antarctic Research Working Group on Biology. He had keen interest in polar biology, conservation and monitoring, and many of his farsighted proposals are now being implemented in the Antarctic. Bill was a very clear thinker who could reduce complex issues to important ingredients. Equally important, Bill is remembered by his many friends and associates as a very thoughtful and decent individual who always made time from his busy schedule to consult students and friends.

Just before his death, Bill spoke with family and friends to prepare them for his passage, reminding us that death is a natural part of life, and that room needs to be made on earth for our expanding population. Somehow, it just never seems right that the good people should be the ones making the room.

**LASSITER OF THE RONNE ANTARCTIC RESEARCH EXPEDITION (1920-1992)** (Robert Dodson, Department of State). Jim Lassiter was a competent, seasoned officer, a strikingly handsome fellow with an attractive military swagger, convivial with a good sense of humor. He had command presence, reinforced by an authoritative Texas twang. He was a neat, orderly person, usually - unlike most of us - cleanly dressed; he never grew a beard. He had a good sense of, and respect for, discipline, was frequently a moderating factor in arguments. Along with Chick Adams, Bill Latady, Ike Schlossbach (and some others), he was an "anchor to windward" in times of stress that threatened the cohesiveness of the expedition.

Jim was a terrific pilot. It was he who captained the Beechcraft on its long, risky flights into the unknown, discovering and mapping for the first time an area the size of Texas. Lassiter Coast, facing the Ronne Ice Shelf on the southeast base of the Antarctic Peninsula, is named for him. Perhaps his most notable exploit was his piloting of the Noorduyin in the rescue in September 1947 of the lost British

aviators who had crash-landed down the Peninsula. They had been foot-slogging for over a week, half-starved and tentless, through deep snow over sea ice with slush underfoot. Amid growlers and bergy bits protruding from the ice surface, with great skill he landed the plane beside the Britishers, swept them up and took off again - the latter probably more a feat than the landing, given his added load, the frozen-in ice obstacles, and the soft snow surface. He was uncanny as a pilot. He was one of those people who so blends with the machinery he operates that he seems to be heart and soul part of it.

He was also, like all of us, an adventurer, and very much so. Three years after our expedition, at a chance meeting in Washington, he told me that he had just signed on as pilot to the Maharaja of Darghangh. From that assignment, which I understand he had arranged on his own, he developed contacts that led to a career with the C.I.A. that included a number of overseas assignments, one of which took him back to Antarctica. On that occasion he very nearly lost his feet because he had declined mukluks in favor of ordinary boots so that he could better keep his feel of the foot controls; the plane was forced down and Jim spent some time in deep cold before rescue. An Argentine doctor was ready to amputate before Jim talked him out of it, but used anti-burn treatment instead to bring his feet back to life.

Jim retired to develop a U.H.F. electronic navigation system that operates for oil exploration, airborne magnetometer, photography, agricultural and forestry spraying worldwide at ranges up to 300 miles. He owned his own manufacturing company in Florida, with branches in Australia, India, Singapore, and London.

Jim died at age 72 on December 16, 1992 in Ocala, Florida, and is survived by his wife, Nicole, three sons, three grandchildren, one great-grandchild, and his mother. With Jim gone, twelve members of the Ronne Expedition (of a total of 23) remain living. Eight have died. Three (Jim Robertson, Lawrence Kelsen, Jorge DiGiorgio) are "missing." If anyone has news about any of them, please contact me.

**TRAGIC AIR ACCIDENT CLAIMS EX-ANTARCTICAN.** John Konecki, who wintered in Antarctica as manager of Palmer Station 1978-79, was killed last September 22, 1992, when his plane crashed on Lopez Island, San Juan County, Washington. He had received his MS in 1989 from the University of Washington School of Fisheries, and at the time of his death was concluding his doctoral research on the thermal ecology and physiology of Coho salmon populations. John's wife Susan and their friends, Sarah and Richard Hacker, were also killed in the tragic crash when John's single-engine Cessna 170A nosedived into the ground near the airport. The Third Annual Graduate Student Symposium on October 9, 1992 at the University of Washington was dedicated to the Koneckis. (Based on input from Laurie Connell)

**HELICOPTERING ADDS NEW DIMENSION TO TOURISM.** Beezie Splettstoesser, inveterate tourmeisteress of about thirty Antarctic cruises, has recently come back from one of her most exciting all-time cruises. She occasionally accompanies the other half of her family on John's worldwide cruise lecturing, and this past austral summer made two legs with him on the converted Russian icebreaker KAPITAN KHLEBNIKOV to the Far Side of Antarctica. The last cruise went into McMurdo Sound, and for the first time Beezie was able to get into the Dry Valleys and landed in Taylor Valley opposite the base of the Commonwealth Glacier. It was the most exciting thing to happen to her in years. Sort of like doing a post-doctoral cruise to Antarctica.

**ANOTHER NORWEGIAN REACHES THE SOUTH POLE.** Kent Wertime, business man in Hong Kong, grandson of Ruth Siple, sent the following (exclusive of last few words) from the International Herald Tribune, February 4, about a Norwegian lawyer who skied to

the South Pole during the past austral summer season. The good news is that here's one lawyer who wasn't gouging some innocent client for a three-month period. The Norwegian implied that his trip to the South Pole was boring and wondered how he could sell a book on the trip where there were no real dangers. So it looks like this guy is an honest adventurer. How did he ever get into law?

We noted that Ranulph Fiennes and Michael Stroud called it quits several hundred miles short of completing their trans-antarctic crossing, although we have heard that Ranulph has come up with some sort of an interpretation which gives him credit for doing it all! CNN certainly gave them a lot of publicity, and the international edition of TIME Magazine also gave them quite a writeup. However, the U.S. edition of TIME evidently didn't think it was newsworthy and didn't carry it. The adventurer completed 1,350 miles before they pooped out, victims of excessive weight loss, sever frostbites, and dwindling food supplies, being "more dead than alive." But a week later in London, in front of TV cameras, they looked very much alive. But back to the Norwegian:

From a fog of swirling ice at the South Pole appeared Erling Kagge of Norway, smiling and waving, the first human to conquer it alone and unassisted. He arrived the afternoon of January 7, having walked or skied 10 hours a day in minus 15 to minus 35 degrees centigrade (5 to minus 31 Fahrenheit) temperatures for almost 50 days, dragging a heavy sled behind him – having neither shaved nor showered, nor even changed his underwear, since an airplane dropped him at the edge of Antarctica 1,310 kilometers (820 miles) away.

"How do you feel?" said a man approaching him. "Happy as a pig in mud," said Kagge, laughing. He felt and looked surprisingly good. His face, masked against the harsh headwinds, was surprisingly free of sores. Within two hours he had downed a coffee and a beer, and was describing his expedition to an audience of 100 at the South Pole science base. No emergency gear had been airdropped to him, no supply depots to meet him, not even contact by radio to cheer him along the way. He had carried everything he needed, plus a chocolate cake.

"I was stronger when I arrived than when I'd left," Kagge said last weekend from London, on his way home to Oslo. "As long as you don't fight nature, you're OK. I look at it that it's not all that special to ski for 50 days. I think this trip was the best ski trip I ever had."

Kagge, who turned 30 a week after his latest adventure, is a lawyer for the Norwegian oil company Norsk Hydro. Last July he was negotiating a sale of gas stations when the idea of skiing to the South Pole occurred to him no differently than a round of golf might occur to somebody else. Just like that, he said, he decided to do it. His company agreed to finance the trip at 1.4 million Norwegian kroner (\$200,000) – easily the cheapest South Pole expedition ever. Within a week Kagge had begun training. He went for long walks wearing a backpack filled with up to 60 kilograms of rocks. On roller skis he would drag a pair of tractor tires for two hours on the outskirts of Oslo. Kagge, who is single, 6'2" tall and weighing 185 pounds, said he wasn't afraid last Nov. 18 as he unloaded his gear at Berkner Island just south of the 79th degree south latitude. With a wave goodbye to the airplane crew, he began skiing south across the hard white plain with no landmark in sight.

He planned to ski 10 hours a day for two months. He ended up averaging 26 kilometers a day. His 125-kilogram sled included just over a kilo of food a day, a stove and fuel, a two-person tent, sleeping bag, mattress, books, a Walkman, 11 cassettes, medicine and tools. To save weight he brought no change of clothes. Yet he refused to leave garbage behind; instead he packed it on his sled.

His days began at 7 AM. Within three hours he had melted snow, inspected and repaired his gear, packed his tent and other belongings on the sled, and eaten a breakfast of oatmeal with fat made from cocoa and soya, a recipe he repeated during three daily 50-minute breaks. He had been ingesting fat since the summer, conditioning his body to convert it instantly to energy. From his pocket as he skied, he snacked on chocolate and raw bacon. Dinner was always dried meats and mashed potatoes. "It tasted better every day," Kagge said.

Though he depended on a compass, he confirmed his position each night with a satellite transmitter that allowed friends in Norway to track his progress. The transmitter was capable of emitting preprogrammed messages from "Everything's O.K." to "Merry Christmas" to "SOS." "But the messages got to be too much back-and-forth between us, so I stopped using it," he said. "I'm a sociable kind of a guy. In Oslo in the evenings I like to go chasing girls, and sometimes also getting chased. But I wanted to do this alone. I wanted to experience how it is to be totally isolated."

At night he wrote in his diary, and read from Oscar Wilde, J.D. Salinger, Herman Hesse, Taoist literature. On the go he listened to cassettes ranging from Beethoven to Prince. He thought about beautiful women and good food. He prospered amid the incoherency of perpetual sunlight and boundless ice. When the wind blew freezing cold in his face, he couldn't move as quickly, yet he had to keep moving to stay warm. One night he was forced to ski for six hours until his hands grew warm enough to pitch the tent.

On Christmas Eve he stopped an hour early. For dessert he had brought an outlandish cake of chocolate and nuts. He ate half of it with a pot of hot chocolate while reading from the Bible about the birth of Jesus. The other half of the cake he finished on New Year's Eve. Kagge rested on two days – the first on Dec. 7, before climbing a glacier to reach the Polar Plateau. Twice while hiking he fell hip-deep into crevasses, extricating himself carefully so as not to slip completely through. One morning, as he chipped ice from his compass, he sliced a finger. Those were his only close calls.

"As I started closing in on the Pole, I let negative vibrations get into me," Kagge said. "But then I got out of that mood. Every other day I really enjoyed it. All in all, it was almost depressing how easy it was – depressing because I would like to write a book about it. I sort of was hoping more things would happen to me." On the 50th day Kagge made sight of the South Pole, marked by its half-globe science base. Just then a stormy fog surrounded him. He began skiing more slowly. As he emerged from the fog, the base appeared massive. "Then suddenly I was crossing the landing strip," he said. His hosts were surprised to see him. He had arrived 10 days early. (But he was 81 years and 24 days behind Roald.)

**NORMAN VAUGHAN IS IN THE HEADLINES.** It has been pretty hard to escape reading about Norman or seeing him on TV this winter, as he appears everywhere. As we go to press, Norman is about to appear on the CBS This Morning show with Harry Smith, who spent four days recently at Trapper Creek interviewing Norman and Carolyn on their forthcoming trip to Mt. Vaughan. He has his ascent team picked; he has almost enough money (within 200K); the only thing which seems to prevent him from keeping his appointed rounds for assaulting Mt. Vaughan on his 88th birthday next December is official permission to pick up some dogs-on-the-ice at a Brit station. It would seem to me that when you get to be 88, are still breathing, have a 50-year old wife, your main object in life should be to crawl out of bed in the morning to a hot cup of coffee. His idea of driving a dog team across the Ross Ice Shelf and then

climbing Mt. Vaughn for a birthday party on its summit is probably the most ridiculous thing anyone over 75 has ever cooked up. But Norman has no way out now, as he has gone so far that he can't turn back. He is sort of a Semi-God in many ways, pulling off both the atrocious and the impossible. I think every man worth his sail wishes that he could have lead the life of Norman Vaughan, as it has been full of interesting accomplishments, many of which border on the sublime. You wonder if Norman, this time, hasn't over-extended his own powers of fulfillment, although you realize that if Norman gives his life on the mountain, then he will die happy, and will really become a legend, but not in his own time!

**STUART KLIPPER'S LETTER TO ATC (ALL THINGS CONSIDERED) IN RESPONSE TO "YET ANOTHER WILL STEGER INTERVIEW."**

Admittedly undertakings such as Steger's expedition warrant the mustering of heroic efforts in daunting conditions. But the questions that must be asked about such endeavors are those of motivation and results - why are they done; what has been accomplished; what purposes have been served. Mostly, under scrutiny they don't really wash. Not to deny those who succeed, or fail for that matter, the recognition that they've done something very tough, it seems that egos (very massive ones at that) and vicarious adventure are basically what those anachronistic and romantic antics are all about, highly commercialized and PR-biased ones to boot.

What hardly ever gets asked at all is who else does these sorts of things and why? They are scientists. An international community of whom have, since the International Geophysical Year in 1957-58, been doing Steger-style feats as a matter of course, year in and year out solely for the furthering of human knowledge. (Much of what has been so rigorously learned now has bearing on our newly-wrought awareness of the problems facing the global environment.)

Case in point: This past year Margaret Bradshaw of the Canterbury Museum of Christchurch, New Zealand has led one of the truly most formidable Antarctic expeditions in the history of human activity on that continent: a five-month 'traverse' of the Transantarctic Mountains. The sole reason for such an incredibly difficult, and perilous, enterprise was to gather paleontological and geological data that might crucially influence the status-present theories of planetary history - climatological and tectonic. She, alas, probably won't be doing a book tour.

**PHOTOGRAPHS OF FLUKES OF HUMPBACK WHALES IN ANTARCTIC WATERS NEEDED.** Dr. Steven K. Katona, Professor of Biology, College of the Atlantic, 105 Eden Street, Bar Harbor, Maine 04609-1198, has requested that you folks with photos of flukes of Humpback whales could assist his laboratory by making copies of your pictures available to him. His letter of 1 October 1991 to us said in part:

Starting in 1985 we began sending research assistants to take such photographs in Antarctica, and we also began soliciting photos from other people or research groups. The primary goal is to locate winter-breeding places used by Humpback whales that feed during summer around Antarctica. For example, after comparing photographs from the Antarctic Peninsula with those taken by Lilian Florez Gonzalez along the coast of Colombia, three whales were found to have been photographed in both places. Those movements are the longest migrations ever documented for a non-human mammal. Our Antarctic photographs have also been compared with pictures taken by Salvatore Siciliano from waters along the Bahia coast of Brazil, but no matches have been found yet.

These photo-identification studies will improve the definition of population stocks as needed for better conservation management. We are also testing the possibility that Humpback whales may occasionally migrate between oceans via Antarctic waters.

Whales are among Antarctica's most visible wildlife citizens, and the results of this research dramatically show direct links between Antarctica and other countries. The emphasis on individual whales can also foster beneficial attitudes towards Antarctica. There are so few Humpback whales left in the Southern Ocean that the survival and experiences of each one are of great interest.

Back in 1986, a Humpback whale migrated from the Antarctic Peninsula region (64°20'S, 62°27'W) to Colombia (2°57'N, 78°12'W), the first known Humpback crossing of the equator. The shortest swimming distance between those two spots is more than 8,334 kilometers. Identification was by photographs of the distinctive ventral pigmentation on the tail flukes. The sighting in Antarctica was 19 April, in Colombia, 28 August. There is a catalogue of 32 Humpbacks identified from the Antarctic Peninsula, although we don't know the name of the catalogue.

**SNOWFLAKES.** The late Bill Benninghoff was recognized professionally with the Department of the Interior Meritorious Service Award, 1954; the Antarctic Service Medal, 1973; the Hiroshima University Commemorative Medal, 1974; founder and elected Honorary Life Member of the International Association for Aerobiology, 1982; Benninghoff Tract, the Nature Conservancy-Michigan Chapter, Upper Peninsula, 1990. And, there is a Mount Benninghoff in the Dry Valleys, being 1,964 meters high, located at 77°55'S, 161°19'E. That puts it in the Quartermain Mountains, overlooking the Ferrar Glacier. It will appear on the forthcoming U.S. Geological Survey's Knobhead Sheet . . . . . On the reverse side, the indefatigable Beezie Spletstoeser, who is one of a kind, paid a visit to Capt. Scott (that is, to his monument in Christchurch on 21 February), and was appalled to find Edward Adrien Wilson listed on the plaque as A.E. Wilson! How could the Kiwis have possibly reversed the initials of such a famous Antarctic? They should have another plaque made . . . . . Donald D. Blankenship of the University of Texas at Austin says that beneath the two-mile thick ice blanket covering West Antarctica are active volcanoes each pouring forth heat on a scale comparable to the hot springs and geysers of Yellowstone National Park. Supposedly the heat may help to keep that part of the ice sheet from breaking up and melting – an event that would raise sea level by 20 feet, and drown my newly-built post-and-beam on mid-coastal Maine. The volcanic heat melts just enough ice to make a watery rubble on which the ice can grind along. . . . . The Committee on Antarctic Policy and Science of the National Academy of Sciences' Polar Research Board, chaired by Dr. Louis Lanzerotti, held a successful second meeting and workshop on February 10-12, 1993. There were more than seventy in attendance each day – agency representatives, press personnel, and students, along with the committee members, to hear thirty-two invited speakers. Two more meetings will be held before a final report is published. Walter Smith of the Ronne Antarctic Research Expedition, who chauffers old Bob Nichols to get his toenails clipped, says the old warrior would appreciate hearing from friends. His address is: Dr. Robert L. Nichols, Bayshore Heights, Apt. 1109, 4902 Bayshore Blvd., Tampa, Florida 33611. We understand that Neelon Crawford, the celebrated New York City Antarctic photographer, is wintering over on the ice. Hmmm . . . . . There is a new book on the horizon, T.H. Baughman's "Before the Heroes Came: Antarctica in the 1890's." It sort of closes the door on an unsung decade of Antarctic exploration. Have any of you seen a guy wearing an old Eddie Bauer red vest, Art Jorgensen, South Pole '58? We want him.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubín, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

Paul C. Daniels

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorus, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989

May 13, 1906 - March 7, 1993  
Founding Father of Office of Antarctic Programs

McMurdo: Planning for Tomorrow

by

C. James Lawler

Fellow, American Institute of Architects

on

Thursday evening, May 20, 1993

8 PM

National Science Foundation

1800 G Street N.W.

Room 540

Jim Lawler is one of twelve architects who made a highly intensive on-site architectural examination of McMurdo Station in January 1993. The study, sponsored by the National Science Foundation, the American Institute of Architecture Students, and the American Institute of Architects, showed how intelligently applied design and construction principles will increase McMurdo's attractiveness, livability, effectiveness, and efficiency. He is sole proprietor of C. J. Lawler Associates, West Hartford, Connecticut, an architectural firm with experience in design of educational facilities, offices, industrial buildings, housing, health facilities, and, now, a polar scientific support facility.

The team of twelve members who visited McMurdo presented their concepts to an overflow audience in McMurdo last January, and now they will proffer their ideas to the National Science Foundation. Will there be a salt water swimming pool, sunning beds, kitchenettes in the dorms, wooden walkways?

Come to this very interesting, and, perhaps, provocative meeting on May 20th to learn about a proposed new McMurdo which will promote compatibility with the natural environment, while you listen to a lot of Seabees turning over in their graves.

Annual business meeting, not to exceed five minutes, will precede the lecture.

Coffee and cookies for those who indulge, and live in the fast lane.

It's always good to get down to the last Newsletter of the year, as it means that we won't have to worry about fabricating articles for several months, enjoying a respite during which we can live with ourselves with a clear conscience. Ruth and I have been putting these things together for fourteen years, this being our 90th! That's a lot of taradiddling, and, so far, no lawsuits.

Our faces came up with egg on them when we noted in our last Newsletter that Neal Sullivan had been appointed the new Director of the Office of Polar Programs at the National Science Foundation. We made him into a "Neil" when it should have been "Neal." His first name is Cornelius, and we jumped to an erroneous misspelling of his handle. And, in the preceding Newsletter we listed the late Bill Benninghoff as a junior. Another mistake! Oh my!

We also inadvertently gave you the in-state 800 number for Elizabeth Allen Tuttle, the fantastic artisan from Camden, Maine who owns Main Gem, and who turns out beautiful gold and sterling silver jewelry of penguins, seals, and other creatures. Her real honest-to-goodness out-of-state number for orders or her catalogs is 1-800-356-6310.

This past year has been sort of Doomsday for a lot of prominent Ant-arcticans, and in this Newsletter we have the sad announcement that Tom Jones, a founding pillar in NSF's Antarctic office in the post-IGY era, has died, yet another Antarctic victim of cancer. He and the late Bert Crary never got to finish the Antarctic History of the IGY, which they both had worked on for the Haverford College Press. Tom's papers are going to the Library of Congress, so at least they will be available in Washington.

The Navy runs periodically very successful Antarctic reunions, and in late April in Gulfport, Mississippi, Deep Freeze I and II will convene. The following weekend, Deep Freeze IV will meet in Nashville, Tennessee. We of the South Pole, Class of '58, are going to have our 35th reunion this fall right here on Marshall Point in Port Clyde, Maine. As this is being written in early April, we are buried in seven inches of hardened snow, but, with the good Lord cooperating, that will all disappear by late August!

Have a good summer! Please stay out of Maine - we don't need any more cars on our roads.

**DR. THOMAS O. JONES: MAY 13, 1906 - MARCH 7, 1993 AS REMEMBERED BY WALT SEELIG.** In the northern part of Ellsworth Land along the Eights Coast there is a First-order feature - the Jones Mountains. They were first sighted from the ship BEAR OF OAKLAND in 1940, and later, in 1960, observed by Ed Thiel and Cam Craddock, who proposed that the mountains be named for Dr. Thomas O. Jones.

At the end of the International Geophysical Year (IGY) 1957-58, when the U.S. Antarctic science program was transferred from the National Academy of Sciences to the National Science Foundation, Tom Jones was in charge of the Foundation's U.S. Antarctic Research Program, first as Program Director (1958-61), then as Head, Office of Antarctic Programs (1961-65). This office was responsible for the planning, managing, and funding of science, as well as the coordination of the indispensable field support by the U.S. Navy.

Tom wisely chose, for the nucleus of his staff, geophysicist Bert Crary as his Chief Scientist, and a group of enthusiastic experienced Antarciticans, including Phil Smith, Harry Francis, George Toney, and Ken Moulton. Additional program managers and engineers were added to flesh out the required staff. Through Tom's initiative, in 1960, NSF requested that the U.S. Geological Survey loan me to NSF to plan and coordinate an Antarctic mapping program. And I never left.

Those early years of the program were a period of fascinating accomplishments. From the beginning, Tom had the complete faith of the NSF director, Alan Waterman. In addition, he had a natural political acumen and quickly solidified excellent working relationships with Congress. Representative George P. Miller (D-California) was a staunch supporter of the U.S. program in Antarctica. In the academic world, Tom worked closely with Larry Gould, famous Antarctic geologist, college president, and head of the Academy's Committee on Polar Research. The Committee, (now the Polar Research Board) comprised of the cream of Antarctic scientists, has provided continuing advice and guidance to NSF. Notre Dame's president, Father Theodore Hesberg, was a close advisor and confidant during those formative years.

To gain support for the program, Tom invited visitors to inspect operations in Antarctica. With the advice of his staff, individuals who could become influential in the operation of the program were invited: select members of the political community influential college presidents, scientists from many disciplines, media, and foreign officials and scientists. They returned with a new understanding of the research opportunities in Antarctica, and many would later enrich the program through their particular expertise.

When the Antarctic program needed a research vessel, Tom called on Admiral Roy Gano of the Military Sea Transportation Service, and was offered the ELTANIN, an ice-strengthened arctic supply ship. To operate in the Palmer Peninsula area, a second vessel, the HERO, was later built, under the guidance and advice of Jack Crowell.

Tom was especially talented in developing and establishing good international relationships. His active participation in the Antarctic Treaty Consultative meetings earned him the respect of foreign representatives and their cooperation in scientific and logistic projects. Interestingly, all through the Cold War the Soviet Union and U.S. exchanged scientists in Antarctica. It was as though both countries wanted to sustain this open window despite political differences.

The participation in Antarctica by South American nations consisted mainly of a military presence at their stations. To counter this, Tom spearheaded the idea of offering promising Chilean students an opportunity to do advance studies at American universities. The knowledge and experience thus gained would then be applied to upgrading the quality of Antarctic science. State Department and NSF concurred, and a dozen or more students received advanced degrees. For his contribution in initiating this program, Tom was awarded the Order "Al Merito" by the Chilean government.

Tom never said much about his work at the University of Chicago for the Manhattan Project during WW II, but it is probable that his experience there influenced his opposition to the installation of a nuclear reactor at McMurdo Station. He eventually had to yield to Congressional pressure. In time, the unit was found to be unsatisfactory, and was removed, proving Tom to have been right.

The Office of Antarctic Programs proved its value through accomplishment. Its system of the coordination of science and logistics worked well in the South, and could improve the program in the North as well. Therefore, the organization was upgraded to the Office of Polar Programs. Later, it acquired the status of Division. His leadership was very influential in getting the Division off to a good start. During his association with the National Science Foundation, Tom made fourteen trips to Antarctica to observe and direct the U.S. Antarctic Research Program.

In 1965, Tom was appointed Director of the newly established Division of Environmental Sciences into which the Antarctic program was transferred intact. In addition, Tom served as Special Assistant for Antarctic Affairs to the Director of NSF. Although his influence on Antarctic affairs continued, his broadened responsibilities marked the end of his close personal involvement with the Division of Polar Programs.

Tom was promoted to the position of Deputy Assistant Director for National and International Programs in 1969. He served successively as Deputy Assistant Director and Acting Assistant Director of the Directorate between 1969 and 1975. The Directorate was responsible for programs in support of research related to Polar Programs (Arctic and Antarctic), Science Information Service, National Centers and Facilities Operations, Computing Activities, International Programs, the International Decade of Ocean Exploration, and Ocean Facilities and Support.

In 1970 the NSF Director presented him with the Meritorious Service Award for "his inspirational administration of the environmental science programs, particularly his worldwide acclaimed eminence in Antarctic research activities and his development of scientific cooperation programs." Tom retired to private life in 1975. He is warmly remembered by those who were associated with him during those important developing years of the U.S. program in Antarctica.

**KEYSTONE WORKSHOP** (by John Spletstoeser, International Association of Tour Operators) The Protocol on Environmental Protection to the Antarctic Treaty, signed in Madrid in 1991, is a major step in building upon the original Antarctic Treaty to extend and improve the Treaty's effectiveness as a means for protecting the Antarctic environment. It designates Antarctica as a natural reserve devoted to peace and science, and sets forth a comprehensive, legally binding environmental protection regime applicable to all human activities in Antarctica. However, before the Protocol can be put into effect it requires ratification by the Consultative (voting) members of the Treaty. The U.S. proposals in this regard are presently H.R. 964 and H.R. 1066 bills, each submitted in the House of Representatives in February of this year.

Staff of the Keystone Center, Keystone, Colorado, organized a Workshop on April 6-8 at Airlie Conference Center, Virginia, in order to bring together representatives of the key interests and key Congressional committees that are concerned with U.S. implementation of the Protocol. The purposes were to: 1) identify common goals and objectives; 2) explore potential areas of agreement regarding specific implementation issues; and 3) identify areas of continuing disagreement and discuss options for their resolution. Twenty-seven participants were there, representing NSF, State Department, Congressional committees, environmental groups, NSF grantees, and tourism, among others.

Keystone Center staff moderated the discussion, which was a workshop in every sense of the word. The Keystone people are professionals in leading discussion in order to get the most out of each participant. The Agenda was designed to touch on individual parts of the Protocol and each of its Annexes. An interesting aspect of the H.R. 1066 bill is that another agency, NOAA, would enter the Antarctic scene and be responsible for reviewing permits that would be required for virtually every activity, from the conduct or support of an expedition by a vessel of more than ten passengers, to, from, or within Antarctica; to the operation of an incinerator.

Protection of one's turf was in evidence, as NSF's past record was challenged with respect to its environmental practices, although the Director-Designee of the Office of Polar Programs, Neal Sullivan, defended NSF's role in the U.S. Antarctic Program, and assured everyone that his role as the new Director includes responsible management of the environment. A major concern of both Neal and the NSF grantees in attendance was the possibility of becoming over-regulated by the new legislation, thereby providing a nightmare of cumbersome paperwork and possible threats of liability for

the coming permitting requirements. Tourism received brief mention, inasmuch as it is also a "human activity," as covered by the new Protocol, but details of the permitting remain to be worked out.

Whatever the terms and format of the U.S. implementing legislation turn out to be, things will be different in Antarctica in the future, and, as several of the old hands pointed out, "It just isn't fun anymore." Indeed, it isn't, and it's the first time in my 33 years in the U.S. Antarctic Program that the number of lawyers around the table nearly outnumbered the people who used to have fun doing their research.

The biggest tragedy that I envision from this is the potential of experienced Antarctic researchers abandoning their long-term projects because the regulatory programs might overwhelm the benefits of doing research in Antarctica. Established academics and others don't really need all these obstacles, and can just as easily transfer their energies to the Arctic or elsewhere in the world. Perhaps the solution is to lock up Antarctica so that no one can visit there and despoil its environment by stepping on a moss bed, but I have seen enough of the continent to think that that is not a solution at all. Somehow there has to be a way for anyone who wants to go there, to simply go there if that person keeps his/her act together, whether in a science program or on a tour ship. Let's hope the new legislation will provide something that everybody can live with.

**ADMIRAL BYRD REFURBISHING.** Mid-winter Day in Wellington will see the rededication of the restored monument to the late Admiral Richard E. Byrd on Mt. Victoria high above Wellington Harbor. This has all come about through the civic pride of a Midlothian, Virginia business man, John Lenkey III, who just happened to visit Wellington and was aghast at the destruction that vandals had done to the original Byrd Monument. He came home and decided to do something about it. He organized and directed a restoration fund to help restore the memorial to the Admiral, a drive which was conducted in both this country and New Zealand, with the Kiwis coming up with most of the money. The new monument is a thing of great beauty, being made of scratch-proof acrylic tiles, painted to glow blue in the daylight, representing the aurora australis. Mr. Lenkey is still short on funds, so if any of you want to make a contribution, or buy a worthwhile VCR film on the Antarctic, read the following paragraph and let your conscience lead you to your checkbook.

There is a small contingent going down to Wellington for the rededication which includes both of the Admiral's daughters, Boiling Clarke of Media, Pennsylvania, and Katharine Breyer of Los Angeles. Ruth Siple is also going. The New Zealanders and Wellington are placing an additional plaque on the rebuilt monument, citing the late Paul A. Siple, who remained a staunch supporter of Admiral Byrd through his entire lifetime. It is most appropriate, in our opinion, that something honoring Paul should be next to the Admiral's memorial, as if the two were still walking together, the Admiral showing the way, while Paul, the Eternal Boy Scout, protects his mentor's well-being. And as sort of an American Honor Guard for the whole ceremony, Paul Siple's old Boy Scout Council in Erie, Pennsylvania is sending Jeffery Stachera, an Eagle Scout, who, like Paul when he went to the Antarctic, is a student at Allegheny College. And, of course, John Lenkey himself will be there to see the fruits of his efforts for the past two years. The Antarctic community owes John one big round of applause, and we hope he can hear them as he stands on Mt. Victoria on 21 June 1993. And, if you really want to see him smiling, send him your contribution!

**THE ADMIRAL BYRD MONUMENT FUND** (2121 Castlebridge Road, Midlothian, Virginia 23113) will send a copy of the 82-minute VHS video tape "With Byrd at the South Pole" to Society members at a 10% discount from the published price. Publisher - \$39.94 plus \$2.95 shipping/handling; Byrd Monument Fund - \$35.95 plus \$2.65 shipping/handling.

The purchase price is not tax-deductible, as it is a sale. However, if you contribute fifty dollars, or more, the contribution is tax deductible, and an authorizing IRS receipt is sent to you, along with a complimentary copy of "With Byrd at the South Pole." For those in the 30+ tax bracket who itemize, it's more advantageous to donate \$50 than buy for \$38.60!

**ALTON A. LINDSEY GRADUATE FELLOWSHIP IN ECOLOGY AT PURDUE UNIVERSITY.** Al Lindsey, biologist, Second Byrd Antarctic Expedition, 1933-35, will be honored by his old faculty members on May 7, 1993 when the Department of Biological Sciences at Purdue University will formally establish the Alton A. Lindsey Graduate Fellowship in Ecology. The date of the award of the inaugural \$1000 Lindsey Fellowship was selected to coincide with Al's 86th birthday! Al is still very active in the scientific community, and without a doubt will remain so until his number is called from Up Above.

Al Lindsey was a college pal of the late Paul Siple at Allegheny College, and had the opportunity to go with Paul on the Second Byrd Antarctic Expedition. The Lindseys and the Siples were very close, and to this day there is a close bond between Ruth and Al and Elizabeth. Ruth received a letter from two professors in Al's department at Purdue telling of the establishment of the fellowship, and we will quote from the letter of March 22nd from Professors Morris Levy and Dennis Minchella.

The Lindsey Fellowship honors the career and lifework of our colleague emeritus and friend, Al. The fellowship is designed to continue his legacy of contributions, now in their seventh decade, to the understanding, appreciation and conservation of natural environments and communities. The fellowship will be awarded annually to provide research support for Purdue graduate students conducting ecological studies. Most of these studies require the students to be involved in off-campus field work, for which support has become increasingly limited. Al is pleased to have the Lindsey Fellowship provide additional opportunities for these students.

To the best of our knowledge, this is the first U.S. living Antarctic person to have a graduate fellowship established in his name. The Ohio State University annually awards a Byrd Fellowship to the Byrd Polar Research Center. Recently it was in the form of a post-doctoral to Paul Berkman, who is now at the National Institute of Polar Research in Tokyo, Japan. The late Tom Poulter had a laboratory named after him in Palo Alto; and the late Bert Crary had a Chair in Geophysics named for him at the University of Wisconsin. The Antarctic Super Star, Larry Gould, had a building named after him at the University of Arizona, and they even presented him with a key to the men's room at the dedication. One of my very favorite Antarcticans, the ailing Fred Milan, who has succumbed to a nursing home, was honored for his lifetime dedication to circumpolar health with the establishment of the Albrecht-Milan Foundation in 1991. The late Bill Benninghoff saw the Nature Conservancy honor him in 1990 with the establishment of the Benninghoff Tract. And the late Paul Siple is remembered annually at the West Point Science Conference when they present the Siple Medal to the presenter of the most outstanding paper. But it seems, on the whole, that it is a small community of Antarctic OAEs who have been honored, and it is just great that Al gets honored in his own lifetime. Our congratulations, Al!

Anyone with any money left over after 15 April who may be looking for a place to deposit it, can write a check payable to the Purdue Foundation/Biological Sciences, attaching a note specifying the donation to the Alton A. Lindsey Graduate Fellowship in Ecology. Contributions are tax deductible. Mail to Purdue Foundation, Purdue University, West Lafayette, Indiana 47907-9988.

**FIRST WITH PONIES, LAST WITH DOGS AND WOMEN WINTERING OVER.** It is our understanding that the Brits don't want to loan the octogenarian Norman Vaughan any of their dogs on the ice so he can dog-sled to Mt. Vaughan for his 88th birthday party on its summit next December. It seems the Brits want to be known as the last to use dogs on the ice. I guess this is supposed to make up in part for their reluctance to use dogs to go to the South Pole, opting for Siberian ponies.

Norman Vaughan, who in reality is a very polite gentleman who likes to live life to its fullest, is up against it. The first thing against Norman is that he is a good old boy, and nothing is as dead in Antarctica as yesterday's hero, especially someone connected with Byrd, as that is just too much ancient history. Anyone who has wintered over knows that the new people coming in aren't interested in hearing how it was done last year; they just want the old guard out of there as fast as possible. And when you find some guy from the 1928-30 Byrd Antarctic Expedition still living, hey, he is about as welcome as the plague.

I think there is a fear that old Norman might die, or worse yet, might have to be rescued. But he has his own support system in place - Adventure Network, plus an experienced mountaineer, Vernon Tejas, who will see Norman to the summit, and a wilderness doctor, Peter Groth, who is as good as expedition doctors come. The chances of Norman dying are slim, as his most recent marriage, number four, to a dynamo in her forties, has just rejuvenated the old buck. He has finished the Iditarod, and has been to the bottom of a small hole over 200 feet deep into the Greenland ice sheet, both when he was in his mid-eighties. How old are you, and what have you done lately? Norman burned his birth certificate the same time that women were burning their bras.

The big to-do is that the United States is adhering to the terms of the new Antarctic Protocol, even though it has not been ratified by Congress, and, in all likelihood, will not be ratified in the time period when Norman would like to take dogs to the ice this coming austral summer. Is this much ado about nothing? After all, haven't dogs been in Antarctica for most of a century, and what harm have they really done? Why have people gone ape over the environment in Antarctica when they put up with most anything back home in their own backyard? I live in a very environmentally conscious state, Maine, one which gets very high national ratings for its efforts and programs, but raw sewage is being blatantly and openly dumped into our rivers and the ocean. I guess we should import penguins so we could have change, as anything in a tuxedo is environmentally sound, right? Right! And to fall back on one of my old horse chestnuts, take the Metrorail from Washington to New York City, and try to stomach what you see along the way, particularly Newark. How come we can literally turn our backs on our own backyards where we live and work and grow our food, yet put the strictest of environmental controls over Antarctica where there is no human indigenous population, and no food products, per se? It makes no common sense at all!

Norman wants to fly down to Patriots Hill with Adventure Network, fly over to the Ross Ice Shelf, make a dog sledging trip to Mt. Vaughan, climb the mountain, and come on home. But the cards are stacked against him, and it doesn't look good as we go to press. We wonder how much is because he is a good old boy, and what would have happened if his name had been Susan Butcher?

**ENVIRONMENTAL DETERMINISM.** About a century ago there was a school of thought among European geographers that there was such a thing as environmental determinism, and this country had a leading exponent of this theory in a Clark University geographer, Ellen Churchill Semple. Antarctica would almost make you believe in environmental determinism. Is there any other continent which is ruled as much by the environment as Antarctica? I think not. It certainly was not created for mankind.

Antarctica polices itself more than any other continent. Everything, eventually,

goes to the sea. The snow on the Polar Plateau will be part of the ocean of tomorrow; it's just a matter of how much time it will take for that snowflake to reach some glacier or some ice shelf, then calve off to sea. The interior of Antarctica tries to protect itself from the invasion of mankind by inhumane temperatures, but mankind has outfoxed nature by invading that privacy with clothing and equipment oblivious to the most extreme environment.

Antarctica is the only continent which has an annual seasonal protective shield around most of its periphery, as the wintertime sea ice extends outwards for hundreds of miles and is almost impenetrable. And should you violate the shield and approach the continent, you can be buffeted by some of the world's cruelest and strongest katabatic winds pouring off from the interior of Antarctica. Storms around Antarctica prowl offshore like attack dogs, seldom penetrating very deeply into the continent.

In my one year at the South Pole, there was only one frontal passage which could be traced from upper air soundings from the Weddell Sea over the Pole to Vostok and on to Mirny. The South Pole, itself, is Antarctica's heaven; once you get there, you are rewarded with the finest climate in the whole world, foolproof weather not complicated by daily cycling. A year with one day, one night, with no storms!

And the Southern Ocean really precludes permanent offshore oil drilling stations, as tabular icebergs silently drifting along the coast can overpower anything built by man. They are marine policemen. Antarctica wasn't really supposed to approach other continents, but something went askew with those plate blocks in Gondwana, and the Andes overextended onto the Antarctic Peninsula. The only thing left then for the Almighty was to do one of those Wall Street fixes, so he created Hell in the Drake Passage in an effort to keep people away from this supposedly Forbidden Continent.

This whole master plan looked just great on paper, but one thing screwed it all up. It was New Zealand. People started to go to Antarctica not because of the excitement of discovery and the opportunity to get away from the humdrum of married life, but for the opportunity to visit en route a beautiful country with friendly people, some of whom happen to be women, and some of those, just by chance, were beautiful. New Zealand is Antarctica Valhalla. If there hadn't been a New Zealand, would the United States be in Antarctica?

**JOHN SPLETTSTOESSER REVIEWS "THE CRYSTAL DESERT: SUMMERS IN ANTARCTICA"** (the winner of a Houghton Mifflin Library Fellowship Award, by David C. Campbell, 1992). I have lost count of the endless stream of books written about Antarctica, by those who have been there, and those who have not. I find it impossible to keep up with them all, much less to read them. Appealing titles to attract customers are also becoming difficult. "Crystal Desert" is not just another Antarctic book, a travelogue, journal narrative, or somebody's derring-do heroics. The title, "Crystal Desert," is explained early, on page 2, as is the subtitle, "Summers in Antarctica," so you know upfront that you are going to read about somebody's account of personal experiences. It turns out to be mainly on King George Island, off the Antarctic Peninsula, and as a guest of the Brazilians at their station, Commandante Ferraz, where the author conducted research on parasites in fish and invertebrates. Doesn't sound like much of a start for a good book, but the content is more than that. The author brings Antarctica alive, in descriptions of life at the station, collecting specimens (he's also a diver) and dissecting them, and opening up his mind and thoughts about a continent that obviously had quite an effect on him. Campbell's expressions and expertise at delivery to an interested audience came out for me when we were both naturalist/lecturers on a cruise ship to Antarctica in 1987.

The usual facts and statistics are there, as needed, but the primary benefits of the

book are in the way that not only his personal experiences are portrayed, but also the bits and pieces of tangential subjects – the geological history of Antarctica in a chapter on "Memories of Gondwana"; sealing and whaling industries; and the importance of krill in the whole food system. One of the more delightful chapters deals with the author's visits to the large chinstrap penguin colony at Bailey Head, Deception Island. Descriptions of the sounds and smells make you feel as though you are in the rookery. The chapter starts with the early part of summer, when penguins begin to come ashore and start nest-building, courting, etc., followed by later visits to the same colony, and ending with the chicks fledged, adults molted, and the site abandoned for the summer. Winter takes over and the cycle is complete.

Humans are humbled in expressions like "There is a greater biomass of *E. superba*—about 600 million tons—than of any other species of animal on earth ....". In a scene of collecting plankton with a simple hand-held net, Campbell describes the net contents "a living bouillabaisse." Although nearly all discussions reveal the author's biological background, there is a wealth of everything Antarctic. Even tourists, who visit the Brazilian base, are given some space, though none of it complimentary. Tourists, like the plethora of national stations and their personnel, are intruders in this continent known to humans only within the last 175 years. The book ends with Campbell's departure from Ferraz Station, flying to Punta Arenas on a Chilean C-130, then taking a short trip to Puerto Natales and Torres Del Paine, north of Punta Arenas. The ending is suspended a bit, but the author has provided the moral to the story in many ways throughout the book. Antarctica is not to be trifled with—it can be dangerous and unforgiving, but it also needs some help in protecting its creatures. Only people have the wherewithal to guarantee Antarctica's future.

It is possible, if Campbell has another book in him, to provide a logical sequel to his time in the "Banana Belt." As a guest of NSF's Office of Polar Programs Antarctic Artists and Writers Program, he could do a book version of the Ross Sea side of the continent. With "Crystal Desert" on his resume, whether on a research project or on the Writers Program, we would be treated to another good book.

**WUGA ON ALAN CAMPBELL.** For the past five years researchers with the National Science Foundation have been sending Alan Campbell to Antarctica. The 42-year old native of Athens, Georgia has been helping the NSF study everything from penguins to global warming and the ozone hole. But Campbell isn't a scientist. He's an artist. Researchers with the NSF are using Campbell's paintings to document landscapes and wildlife in Antarctica. They say his watercolor and oil pictures are more accurate than photographs, that is, his paintings reveal subtleties in light and color that are not always captured in photographs.

Guy Guthridge, Manager of the National Science Foundation's Polar Information Program says scientists began using Campbell's art because they wanted to show people what it's like to live in Antarctica. Guthridge says Campbell's paintings do this by getting beyond the surface of the environment and interpreting how the landscapes and wildlife affect people. He says Campbell's art translates complex research to a human experience people can relate to.

Antarctica is the most desolate place on earth. But Campbell's paintings of the continent are anything but lifeless. Many of the pictures are strange and hallucinatory. At first glance, they seem simple and realistic. But the longer you look at them, the more illusions you see, like the floating colors in Claude Monet's water lily murals or the inverted images in M.C. Escher's drawings. At his studio in Athens, Campbell recalls his visits to Antarctica and describes a surreal environment with brilliant colors and dream-like landscapes. "I had been following a

pattern or staying up and painting between midnight and three o'clock in the morning because that's when these magical things would happen. There would be mirages, holes would appear in mountains, tops of mountains would pop off and float in the air and you'd get inverted mirror images of things floating over them. And I remember watching Mount Erebus, the big snow-covered volcano that sits on the ice across the Sound, go from lemon yellow to bright gold and then to a silver blue, all within about 20 minutes."

To capture these rapid changes, Campbell painted with watercolors, which he says are more flexible and responsive than oils. But because of Antarctica's sub-zero temperatures, Campbell's paints often froze or crystallized on the paper. To escape the cold, he painted inside a small pup tent while looking through a plexiglass window. Often, a helicopter would drop Campbell off in remote locations where he'd spend several days in total isolation. Because daylight in Antarctica can last for months, he sometimes worked 48 hours without sleep. When he wasn't painting, Campbell wrote in a journal and searched for ways to turn his feelings about Antarctica into art. "I am writing at 3 AM on the shore of Lake Fricksal where I've been walking about, looking for what I might find and listening to the silence. I want to get these thoughts down and out before they change and become something else. What is it that makes a place more than what it is? Or should I say, reveals it for what it is? A place like this, so silent and beautiful, makes me aware of what I don't know."

Campbell says some of his most successful interpretations of Antarctica were done by combining elements of scientific research with art. In one painting, he altered a sheet of graph paper that had been used by researchers to chart high and low temperatures. "This piece of paper was being discarded and the meteorologist said I could have it, and I was just looking at it and then looking out the window at this sweep down the valley of these glaciers and mountain peaks, and all of a sudden I just started playing around with the watercolor on this chart paper, and I turned it into landscape of the Wright Valley with the image created by both my hand and thoughts and looking at the landscape. But it was a landscape that also depended on the winds and the temperatures and the cycles going up and down those valleys. So it was a perfect merging of art and science."

Alan Campbell intends to use other scientific images in his paintings of Antarctica, like maps or satellite photos. He also plans to incorporate garbage found on the continent, which he hopes will show people the importance of preserving Antarctica and other fragile ecosystems. "As humans, we can screw up just about anything, and some examples I can give you - I would go on hikes with scientists and we would go to places where literally no human had ever set foot before. And then all of a sudden come across a piece of trash. It was pretty sobering."

Campbell says the National Science Foundation has invited him to make the WINFLY trip this coming summer, and he hopes to be able to arrange his busy schedule so that he can take advantage of the invitation.

**LOOKING BACK, LOOKING FORWARD.** This Newsletter has been a doozy to do, as our window was only a crack. My rationale for living seems to have been caring for aging family. My 96-year old mother died last year, and as we write this, my 102-year old aunt is on her deathbed in a hospital, finally struck down by brain hemorrhaging. And Ruth has a marriage in her family, plus a visit from a daughter at this time, so-o-o .... But we staggered through. All Newsletters this year were written from the shores of Maine, thanks to our fax machines. However, better days must be ahead, and I know I'm looking forward to some downstairs teeth and some real eating after almost a year and a half of dental surgery and waiting and waiting and waiting. But people tell me implants are worth it, while my checkbook keeps quizzing me, "Are you sure?" Polly has been a dear as our president, and I hope I can give her some support next year.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 93-94

September

No. 1

**Presidents:**

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-62
- Mr. Gordon D. Cartwright, 1962-63
- RADM David M. Tyree (Ret.), 1963-64
- Mr. George R. Toney, 1964-65
- Mr. Morton J. Rubin, 1965-66
- Dr. Albert P. Crary, 1966-68
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-71
- Dr. William J. L. Sladen, 1971-73
- Mr. Peter F. Bermel, 1973-75
- Dr. Kenneth J. Bertrand, 1975-77
- Mrs. Paul A. Siple, 1977-78
- Dr. Paul C. Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82
- Dr. Mort D. Turner, 1982-84
- Dr. Edward P. Todd, 1984-86
- Mr. Robert H. T. Dodson, 1986-88
- Dr. Robert H. Rutford, 1988-90
- Mr. Guy G. Guthridge, 1990-92
- Dr. Polly A. Penhale, 1992-94

**Honorary Members:**

- Ambassador Paul C. Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard
- Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Sir Peter M. Scott, 1971
- Dr. Frank Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980
- Dr. Robert L. Nichols, 1981
- Dr. Robert H. Rutford, 1982
- Mr. R. Tucker Scully, 1983
- Dr. Richard P. Goldthwait, 1984
- Dr. Mark F. Meier, 1985
- Dr. Claude Lorius, 1986
- Dr. Louis J. Lanzerotti, 1987
- Mr. Peter J. Anderson, 1988
- Dr. Ted E. DeLaca, 1989
- Dr. Sayed Z. El-Saycd, 1990
- Dr. Charles W. Swithinbank, 1991
- Dr. Susan Solomon, 1992

*Belated birthday greetings to Larry Gould on his 97th!*

**Antarctic Operations: Challenges of the 90's**

by

Erick Chiang

Manager of Polar Operations  
Office of Polar Programs  
National Science Foundation

on

*Thursday evening, September 23, 1993*

8 PM

National Science Foundation  
1800 G Street N.W.

Room 540

Mr. Erick Chiang, as Manager of Polar Operations in the Office of Polar Programs at NSF, is responsible for budgeting, funding, and management of the operational and logistic resources needed to implement the U.S. Antarctic Program (USAP). Included in this management responsibility are Naval Support Force Antarctica, Antarctic Development Squadron Six, and Antarctic Support Associates.

Mr. Chiang received a B.S. degree from Rutgers University, and an M.S. in Earth Sciences from Adelphi University in 1975. Prior to joining NSF in 1979, he was Curator of the Ice Core Facility at the State University of New York at Buffalo.

---- *Light refreshments* ----

\* \* \* \* \*

This could very well be our last meeting in the familiar haunts of 18th and G Streets, as the Office of Polar Programs will soon be moving to their new facility in Ballston.

*Californians please note on page 2 that our 1993 Paul C. Daniels Memorial Lecture will be in Irvine, California on 4 November when we hopefully will have a dinner meeting with a very interesting speaker.*

Well, here we, Ruth J. Siple and Paul C. Dalrymple, go again with another year on the same old street corner, turning out what we masquerade as Newsletters. This is the beginning of our 16th year; this is our 91st Newsletter (111 have been put out overall). They stack up to 2.25 inches, weigh 5 pounds, and total 982 pages.

There are two sides to writing these Newsletters. The up side is that we can write anything we want, as we aren't beholders to anyone, being a couple of real retirees, with no connections. So we have no party line to follow. A plus for us both is that this keeps us abreast of the doings of a lot of Antarcticans who write us news and letters, making us feel good. The bad side is that it involves a lot of dedication and work by Ruth, as her home is the headquarters of the Society, and it falls on her shoulders to run the whole show. There is no compensation beyond personal satisfaction. Occasionally this writer catches flak from someone at Columbus or Cambridge or the South Pole, which is always reassuring, as it is living proof that someone, members or non-members, actually reads these things.

As you know, we have been looking for someone more in tune with current times to take over. Both Ruth and I would like it to be Steve Dibbern, a very well-read Antarcticans who loves the ice, but he claims he's too busy at his office. However, we know better, as he's a government worker. Maybe there's a young Antarctic couple out there who could follow in our footsteps. The best way you folks can help make this Newsletter more in keeping with your wishes is to submit more news and ideas. Send it all to Ruth at the address on the letterhead.

**MEMBERSHIP.** We have leveled off in the past two years at around 600 members. The quality is real good, although there are a lot more independents (translates to having never set foot on the ice) who are interested in Antarctica strictly from the conservation of the environment side. These people, hopefully, are members of Jim Barnes' flock in The Antarctica Project. We like to think that our Society is basically a constituency of people who have worked there or are working there.

We will send dues' notices out early in September. Dues will stay at the same rate (Single - \$10; Husband/Wife - \$12; Foreign - \$15), as in the past few years. If you don't get a bill, you are already paid up for this year. Slightly over half have already paid for this year. If you do get a dues' notice, please consider paying for multiple years, as it cuts down the bookkeeping considerably,

**PAUL C. DANIELS 1993 MEMORIAL LECTURE TO BE IN IRVINE, CALIFORNIA ON 4 NOVEMBER 1993.** Occasionally The National Research Council's Polar Research Board does not have a spring meeting in Washington, and we have to go with their fall meeting for our annual cohosted Memorial Lecture.

This fall they are meeting at the Academy's conference center in Irvine, so we are tailhooking onto their meeting with an affair that evening in the Four Seasons Hotel, we think. As we go to press, we're in the process of contacting a very well-known Antarctic Californian to give the Memorial Lecture, so if you live within gun-

shot of Irvine, please circle the date on your calendar right now - Thursday, November 4th. This will be our third California meeting, our second Memorial Lecture out there.

**THE POLAR TIMES.** After a seven-year hiatus following the death of August Howard, The Polar Times has resurfaced as an organ of the National Antarctic Center in Reedsport, Oregon. It is basically following the same format of its predecessor, which was an extremely popular potpourri of newspaper clippings on all activities in both polar regions.

We understand that people have been slow in sending in their dues, and we ourselves are among the guilty ones. The dues are \$10 per year for stateside membership, \$12 for overseas. For this you get two issues a year. Many of us have been spoiled by Ron Naveen of Oceanites who dispenses The Antarctic Century through the courtesy of some benefactor whom Ron has run down in an effort to keep himself out of the poor-house. There really aren't many free lunches in this world, so if you want The Polar Times, send a check for \$10 or \$12, as the case may be, to The American Polar Society, P. O. Box 692, Reedsport, Oregon 97467.

**DO YOU BELIEVE IN MIRACLES?** Remember those famous words the sports announcer screamed at Lake Placid as our hockey team upset the Russians? Well, there has been another miracle, but of an even higher magnitude, if that's possible. The U.S. Navy is pulling out of Antarctica!!! A meeting was held at the U.S. Naval Observatory on 30-31 March 1993 to discuss the U.S. Navy Force withdrawal from the United States Antarctic Program (USAP). The review was forced by Navy end-strength reductions and a proposal to offer all Navy billets in support of the USAP as offsets to other program reductions of higher U.S. Navy priority.

A draft Plan of Action and Milestones (POA&M) for a three-phase withdrawal by 1998 of all Navy personnel from the USAP was completed. The most problematic issue was the transfer to another government agency or commercial activity of LC-130 operations and associated safety-related functions. There is some speculation that the National Science Foundation will oppose the loss of Navy helicopters and Navy LC-130 maintenance support and safety-related functions. The full implementation of the draft POA&M will require national policy endorsement. Basically what they are thinking about is a five-year reduction plan, with the initial reductions being taken by February 1995, the final reductions by 1 October 1998.

It will certainly be the end of an era, which started with Lt. Charles Wilkes, reached its highest glories under the late Admiral Richard E. Byrd, and even survived the advent of military women to the ice. Jim Reedy, Doc Abbot, Kelly Welch, or someone from that admiral-era should write a book about Navy personnel in Antarctica. Someone could do a whole book on George Defect! A book on Finn Ronne could be a big seller! And let's not forget David Tyree, the scientists' admiral.

There must be a lot of chuckling going on among the IGY scientists, as the Navy wintering-over personnel supporting the scientists were anything but a happy brood. Antarctica in 1956-58 was sort of an unknown quantity to enlisted personnel in the Navy, and they didn't know what they were getting into, nor did the career Navy personnel relish supporting " ----- sandcrabs."

Sometimes the Navy had the last laugh, one of which sort of came at my expense. I had two people conducting the micrometeorological program at Plateau Station during each of its three years of existence; and the last year - 1968 - the station scientific leader, George Rubin de la Borbolla, was one of mine. He was a late hire when my selected man got washed out by the psychiatrists, so when the National Bureau of Standards told me about George, I grabbed him. George was a most unusual guy in

many ways, and it didn't take him long to ingrate some of the Navy personnel. And George swore that every time he got the micromet system set up and operating, the Navy would sabotage it through tricks with the generators. He demanded a hearing with personnel in the Office of Polar Programs at the National Science Foundation, and it was duly granted, with nearly all of the civilians at Plateau Station showing up to support poor George. It happened to be the one year that Louie Quam was the head of OPP, and he was shocked by it. I remember Phil Smith walking in and out. Of course, nothing happened, but at least we had the fun of protesting! It must have been the first small step towards civilian contract personnel in the interior.

**AURORA AUSTRALIS PROVIDES BEAUTIFUL CANOPY ABOVE ADMIRAL BYRD IN WELLINGTON, NEW ZEALAND.**

Through the personal concerns of a proud man of the Commonwealth of Virginia who was greatly disturbed to find the Byrd Memorial atop Mt. Victoria, high above Wellington Harbor in New Zealand, defaced and vandalized, there now sits a truly magnificent memorial to the Admiral of the Skies at the same site. This gentleman, John Lenkey III, a business man from Midlothian, Virginia, dedicated a lot of time, effort, and money over the past two years to see that one of his national heroes had a fitting and proper memorial. Although he never raised all the money he had hoped, he dug into his pockets and saw his wishes come true. The New Zealand contributions actually ended up exceeding those of this country, even with a sizable grant from the National Geographic Society.

The monument has been described in previous Newsletters. To refresh your memory, the restored monument features two large triangular tiled sides depicting the aurora australis in all its glories. There are some 2000 acrylic scratch-proof tiles which were painted to glow in the daylight. The designer is a Kiwi, Doreen Blumhardt. The original bust of Byrd and bronze plaques were left in place on the front facing Antarctica, but there was an addition to the site, a plaque at the base honoring the late Paul A. Siple, Byrd's staunchest supporter which reads: "Paul Siple accompanied Admiral Byrd to the Antarctic on three expeditions in 1928-30, 1933-35, and 1939-41. He later undertook three other Antarctic expeditions including the leadership of the scientific team at the United States South Pole Station in 1956-57. Dr. Siple became one of the foremost authorities on the geography of Antarctica, polar logistics and the principles governing the adaptation of humans to life in cold regions."

The ceremony was graced by the presence of Byrd's older living daughter, Bolling Clarke of Media, Pennsylvania; Ruth J. Siple, widow of Paul A. Siple; Jeffery Stachera, Eagle Scout from Siple's old Council in Erie, Pennsylvania, as well as a fellow student at Allegheny College; Harold Austen, Kiwi cabin boy who went south with Byrd; and, of course, the man responsible for the restored monument, the aforementioned John Lenkey III.

There were various dignitaries invited to the Rededication Ceremony on Mid-Winter Day, June 21st, including Dr. Cornelius Sullivan, new Director of the Office of Polar Programs at the National Science Foundation. Other guest speakers included the Deputy Prime Minister of New Zealand - the Rt. Honorable Don McKinnon, and Her Worship the Honorable Fran Wilde, Mayor of Wellington, who gave the opening and closing remarks - a sign of the times, if not reality, with a woman getting in both the first and the last words! But I think the best was "Her Worship the Honorable"! Can you imagine the mayor of Boston, Detroit, Philadelphia, or Los Angeles being addressed in that vein!!!

Boiling and Ruth made the front page of the Wellington DOMINION the next morning, June 22, 1993. It was a great color picture, a four-column spread, with both standing beside the monument, with the wind blowing their hair north, northeast. Said photo moved a member of the ice party from one of Byrd's expedition, to send in his comments, which follow these words.

Ruth had a great time in Christchurch, and was royally treated by the Antarctic community there. The cordial Dr. Charles Paul was her Official Greeter. He saw to it that she saw everything she was supposed to see, like the fabulous new International Antarctic Centre; meet those people she was supposed to meet, like Margaret Lanyon; and protected her from the Far Side of Christchurch! Ruth had alerted the affable Max Hamilton; the Sage of the Antarctic - Jim Caffin; and the effervescent Canadian Kiwi - Betty Monteath; that she was coming, so they all met with her. She had a ball! Then she made a hit-and-run observation trip into the Mt. Cook area, although she goofed by not staying overnight at The Hermitage. There is only one trouble with New Zealand - no matter how much time you spend there, it's not enough! Bolling Clarke took an automobile trip around South Island after the ceremony in Wellington, and, surprisingly, actually came back to Pennsylvania. If she lived in Florida, she never would have returned!

**UNSOLICITED, ANONYMOUS LETTER.** "Here before me is a color photo that I find frustrating because I am not a poet in addition to being an old Bay of Whales overnighter There is the impressive, refurbished, angular memorial to Byrd and Siple, overlooking Wellington Harbor. This is the day of its long-awaited rededication. Only two people are shown, and they make this picture a truly remarkable classic of the long antarctic story. They stand together straight, strong, and handsome beside the gleaming monument, their evident love and pride bringing it fully to life and meaning. They are thinking of a Father and a Husband.

"Thus Bolling Byrd Clarke and Ruth Siple stand for the other half of the equation for historic antarctic expeditions - all the wives, daughters, and mothers who devoted long years not merely to waiting, but in unfailing support to their men, besides their tremendous day-to-day contributions to the overall human enterprise."

**CAMPUS ON THE ICE** (Polly Penhale). A four-week course will be offered at the Crary Science and Engineering Center at McMurdo Station during January 1994. The college-level course, supported by the Polar Biology and Medicine Program, OPP, is entitled "Biological Adaptations of Antarctic Organisms," and will be taught by course leader Dr. Donald Manahan, University of Southern California and Dr. Arthur DeVries, University of Illinois, and Dr. Linda Goff, University of California, Santa Cruz. The course will include lectures as well as field collections and laboratory experiments. The themes for this course, the first of its kind offered in Antarctica, are energy metabolism during larval development of marine invertebrates; temperature adaptations of fish; and molecular genetics of algae. Ten students will be selected from over 175 applicants from 39 countries.

**2052 CUBIC FEET OF POLAR REGION MATERIALS TO GO TO ARCHIVES II.** The National Archives building at College Park, Maryland, informally known as Archives II, will open in 1994. But the polar material will not be there until late April 1996. Probably Alison Wilson isn't included in the 2052 cubic feet of polar material, as she is 'contemplating retirement. She is about the only Antarctic remnant of the pre-IGY days who is still active in the Washington circles.

The 1.7 million-square-foot building at College Park will be the largest, most eclectically advanced archive in the world. It is situated on 33 acres of land on the University of Maryland campus. Among the advantages of the new facility are 1) a more spacious textural research room, 2) a microfilm research room, 3) a new library. 4) a classified records research room, 5) separate rooms for research in special media and non-textural holdings, such as still photographs, maps, electronic records, and motion picture and sound recordings, 6) meeting/training rooms and an auditorium, and 7) a spacious cafeteria. What about rest rooms?

**ORAL HISTORIES.** We feel that the most important thing we can attempt to get underway this year is oral histories. When we brought up the subject last year, it created enough interest to merit some serious thought. And time is running out on getting oral histories from the Byrd men, as only Larry Gould, Norman Vaughan, and Howard Mason are alive from the First Byrd Expedition. We have lost so many important Ant-arcticans in the last ten years, people like Bert Crary, Jim Zumberge, Ambassador Paul Daniels, Admirals David Tyree and Dick Black, Charlie Murphy, Dick Goldthwait, Bill Benninghoff, Tom Jones, and on and on.

The door is wide open for doing oral histories, as there is no one place in this country which is really a natural repository for such things. And when there is no one prominent center, things are usually up for grabs. It takes someone with a lot of interest and drive, and we've not had that kind of a person since Gerry Pagano of the National Archives died a dozen years ago. He collected a lot of archival material from polar people, and did do some oral histories. But this country is sorely lacking pure Antarctic historians. When Peter Anderson had his health misfortunes several years ago, it left the polar community in this country without a bona fide polar historian.

We think the key to doing a good oral history is having the interviewer know the interviewee. The three hour-long interviews that Canadian geographer Trevor Lloyd did with Vilhjalmur Stefansson the month before he died are tremendous, really outstanding. Trevor knew Stef like he knew the back of his own hand, and the end results showed. We have people in our ranks like Bob Rutford, Colin Bull, John Spletstoeser Charles Swithinbank, and even Charlie Bentley, who would make excellent interviewers. We say "even Charlie Bentley," as it wasn't until he gave our annual Memorial Lecture in 1980 that many of us realized he actually had a good sense of humor.

The Society could attempt to make some oral histories if there was enough interest; at least, do some pilot studies. If they were successful, then perhaps a formalized program by some institution funded by NSF might be in order. If monies are available to fund artists, photographers, writers, basically self-serving, shouldn't monies be available somewhere to record the likes of Bill Cassidy, George Denton, Art DeVries, and others, which might help future Antarctic scientists?

Evaluating who should be interviewed would be like getting people into Cooperstown. You would have to have an Old Timers Nominating Committee for the Ancients and Honorables, and then you would have to have a Modern Day Committee for the Present-day Overachievers! We know our president, Polly Penhale, is interested, and we hope that something can be moved on it this year.

**MAWSON'S COLLECTION IN LIMBO.** We have been in communication with Antarctic Elizabeth Chipman, whose name should be familiar to you all as the author of *WOMEN ON THE ICE*, a book which one female was referred to as *Frigid Women!* Elizabeth is now in the process of gathering material for a forthcoming biography on the late polar explorer, Sir Hubert Wilkins, who pretty much covered up his tracks, making her job most difficult. Although he was an Aussie, he spent most of his life away from his homeland.

Elizabeth is in the process, I think, of trying to get me to clean up my act. This has sort of caught me by surprise, as I thought I went clean about ten years ago! But Elizabeth's letters are interesting, and the last one enclosed an article "Frozen Assets" by Peter Ward in the February 13-14 issue of *The Australian* magazine. It's all about the collection of Sir Douglas Mawson's papers, photos, rare books, and equipment, and who has the legal rights for their possession. It really is a can of worms.

Until August 1992, the seven grandchildren of Sir Douglas thought they had legal rights, as trustees and beneficiaries under the terms of the Explorer-scientist's will. The Barr Smith Library at the University of Adelaide had been holding the huge collection in storage, and was slowly positioning itself to formally accept title from the trustees who had offered it as a gift, providing the University employ a full-time collection curator; make it accessible to scholars; maintain its integrity; and establish a Mawson Museum in memory of one of the University's most distinguished scholars and teachers. This collection had been valued to be in excess of two million dollars.

But in the process of offering some of the collection for sale to cover costs associated with the gift, a bomb was dropped by the redoubtable State Librarian of New South Wales, one Alison Crook, "Businesswoman of the Year" and famed public enterpriser. She brought to the attention of the trustees that Sir Douglas had entered into an agreement with the Premier of New South Wales in March 1920 concerning the records of the 1911-1914 Australian Antarctic Expedition (AAE).

The agreement was to the effect that, in return for the NSW Government Printer publishing the Expedition reports, records and objects from the Australian Antarctic Expedition and copyright in them would be transferred to the state of New South Wales. The terms of the agreement include "all reports and records of the Expedition whether in manuscript or print, including all log-books, diaries, photographs, negatives, plans and sketches, and also including those parts which have already been printed or published which are now in the possession, power, or control of the said Sir Douglas Mawson." Crook's letter "sounded like the crack of doom for the trustees' dream of settling the collection in Adelaide University where Mawson taught for 47 years, 31 as its Professor of Geology. Right now things are in a stalemate, although Crook has expressed a wish that it all be resolved amicably.

Until 1990, the collection had a settled home of sorts in the Mawson Institute for Antarctic Research, which had been established in 1959, the year after Sir Douglas died. The Institute had been launched with great academic pomp and political ceremony, and Lady Mawson made the occasion all the more notable by announcing she would give the Institute all of Sir Douglas's papers and his library. Several years later the Institute appointed a distinguished upper atmosphere physicist and Antarctic expeditioner, Dr. Fred Jacka, as its director. But the University's interest in the Institute waned; its headquarters building was never built; research funds dwindled; and then Dr. Jacka died in October 1992. But by then the University council had "dis-established" the Institute.

The above brings to mind that after Dr. Paul A. Siple died, Ruth offered all of his material to the Graduate School of Geography at Clark University in Worcester, Massachusetts where Paul had gotten his PhD. The Director of the Graduate School, Dr. Saul Cohen, a Middle East political geographer, who later became president of a large college in New York City, flatly declined the offer. Even though they had no use for Siple's papers, they are interested in the color of the money which he earned, and annually solicit Ruth for a donation. If I were Ruth, I would tell Clark to "shove it."

**ALICE DATER SUCCUMBS FROM ALZHEIMER'S AT AGE 85.** The Antarctic Society lost a dear friend when Alice Dater died in Billings, Montana on 11 May 1993. She was the widow of the well-known Antarctic historian, Harry Dater, who was one of our past presidents, and editor of our Newsletters for a number of years. Alice finally got to the Antarctic herself, going down on a cruise ship, making quite a splash for herself when she fell out of a zodiac in McMurdo Sound. This resulted in her getting a good feeling for the world of penguins, seals, and whales.

Alice, a retired sixth-grade teacher at Sidwell Friends School in the District of Columbia, was a real pistol. A recent issue of their Alumni Magazine referred to her as the "legendary" Alice Dater. I think you could also use the word "beloved" to describe Alice. She taught there for thirty-nine years, retiring in 1982, moving to Montana in 1987. Alice was a proud liberal, and missed school to participate in civil rights marches in the 1960's. Although she has been gone from the Washington scene for quite a few years, her many friends there and elsewhere will never forget her. Alice, you were something, and we sure had a good time at the Cosmos Club when they anointed Larry Gould.

**A MID-SUMMER TREAT FROM DISCOVERY CHANNEL.** Has there ever been such a splendid plethora of Antarctic films as Discovery Channel put on from 1 August through 8 August's And they ran each show at least twice, some three times, so one was bound to find time to see them. Most were recent films, and darn good ones, really capturing Antarctica as never seen before.

Of the ten full-length features shown, I gave five stars to ICEBIRD, which was essentially a film on the Adelies. Another great film was EMPERORS OF ANTARCTICA, a film which captured for the first time the return of Emperors to Cape Crozier, and their full life cycle. The Kiwi film makers couldn't resist dramatizing an excellent film with a walk through history with the exploits of Wilson, Bowers, and Cherry-Garrard, the original perpetrators of Cape Crozier. The film said the film crew were the first winter visitors to Cape Crozier since Scott's party, although I believe history will show that some of Hillary's men went there in 1957, as I have a tape of the late Peter Mulgrew talking about the feeling of their (Wilson, Bowers, Cherry-Garrard) presence when he was there. Regardless, a really fine film, just tremendous! Another five-star film in this writer's opinion was THE KRILL EQUATION.

I would give three stars to SOLID WATER, LIQUID ROCK, to THE LONGEST NIGHT, and to Jack Hanna's VOYAGE TO ANTARCTICA. They weren't as exciting as the three above, but each in its category was fine. SOLID WATER, LIQUID ROCK was the story of Mt. Erebus from McMurdo Sound to the summit, and it told all you ever wanted to know about Erebus, and probably more. THE LONGEST NIGHT was a film based on life at Scott Base, which left one with the impression that it wasn't really a long night, and that some people were having one hell of a good time. There certainly is no resemblance between wintering over in Antarctica today with what it was like before the advent of women and the skinny-dipping ritual. Jack Hanna's film was shot on the WORLD DISCOVERER on the fantastically beautiful Antarctic Peninsula, and had such grizzly Antarcticans as Colin Bull and Charles Swithinbank in it. Of course it would have been nicer if they had someone in the film who could speak English!

One star was given to PENGUIN SUMMER and ABOVE US, THE ICE, although both are great films. There are things in those two films you have never seen before in Antarctic films, like some fantastic underwater shots of a colony of Olympic-swimming penguins captured by cameras on a relatively new cruise ship with an underwater laboratory capability.

The other two films, one TREASURE AT THE SOUTH POLE, were just average, although it was great to see and hear my neighbor from Rockland, Maine, John Spletstoesser. The other, ANTARCTICA-THE FROZEN WASTE, was a Greenpeace overkill on the pollution of Antarctica. However, this much outdated film served its purpose just fine, as it impacted my nine-year old granddaughter to make a statement, "No one should be allowed to go to Antarctica."

**HISTORY OF BYRD'S CITY OF NEW YORK** (written over 40 years ago by Vincent Van Riper, National Association of Marine Surveyors - copy furnished by Gordon Fountain).

A once-proud vessel, perhaps the oldest on the high seas to carry an American Bureau of Shipping load line, met her end on the last day of 1952. She was the auxiliary three-masted schooner CITY OF NEW YORK registered out of Honduras and recently purchased by the Halifax firm of Shaw Steamship Company, Ltd.

Her 143-foot length was small, especially in these days of 600- and 700-foot tankers and 900-foot superliners, but she was strongly built. Her 10" x 11 1/2" frames were of the best oak, closely spaced with iron knees on every second deck beam, and natural crook double oak knees on every main deck beam. Her planking consisted of three 4" thicknesses of elm, greenheart and spruce with an interior ceiling of pine varying in thickness from 6 1/2" to 4". As the frames, especially up forward, were very closely spaced, the sides of the vessel were almost 2 1/2 feet thick. The keelsons, sister keelsons and rider keelsons were built into a solid block of oak 3 feet deep by 3 feet wide, on the outside of which was the 15" x 15" oak keel. It was truly a formidable vessel for its size.

Few ships have had a more colorful career than this vessel which sailed both the Arctic and Antarctic seas. She was built at Arendal, Norway, 67 years ago as a three-masted barque for sealing and exploring in the Arctic seas. After varied service she was purchased by Admiral Byrd in 1928, and refitted as a supply ship for his Antarctic expeditions. She performed in a praiseworthy manner on these particularly hazardous voyages. Upon completion of this service she was fitted out as a floating museum, visiting American coastal ports and also sailing to the Great Lakes where she was an attraction at the Chicago World's Fair.

Captain W<sub>e</sub> Kennedy, a U.S. citizen residing in Lunenburg County, Nova Scotia, purchased the vessel in 1943 and rebuilt her into a trading schooner fitted with auxiliary diesel power. From 1944 until October 1952 Captain Kennedy owned and sailed the CITY OF NEW YORK on voyages to South America, the West Indies and to the new American bases in the far north. On many of the voyages the crew consisted of the owner, his wife, children and a handful of men. It was only by such economies in manpower that it was found profitable to run the vessel. The CITY OF NEW YORK was greatly admired by Nova Scotians, and especially by the hardy fishermen of Lunenburg. Many Lunenburgers had sailed in the CITY OF NEW YORK, and in their expert but taciturn opinion, flavored with a touch of the accent still retained from their Germanic origin, she was "a fine vessel."

The vessel was too strong for one casualty to bring its career to an end. It took several of them, happening almost simultaneously on a rocky, tide-ripped coast covered with fog, to toll the bell for this staunch ship. The first mishap occurred when the tailshaft broke; then while under tow off the mouth of the Bay of Fundy she grounded. After being refloated and the voyage resumed, the towline parted the same aight, and she again grounded on a rocky ledge in bad weather. The heavy seas, shallow water and the darkness prevented the tug from pulling her off during the night. It was then that the final disaster struck - a fire under the quarter deck completely gutted the after end of the vessel, burning out the main deck and opening her to the sea.

**WITH BYRD AT THE SOUTH POLE.** John Lenkey was left with quite a few of the Byrd videos, "With Byrd at the South Pole." If you don't already have one, John is offering a closeout sale price of \$35 to Society members. Make checks payable to John Lenkey, and mail them to him at 2121 Castlebridge Road, Midlothian, VA 23113.

If anyone is interested in a memorial package of the Byrd Rededication and Siple Dedication at Wellington on Mid-Winter Day 1993, John is offering for \$10 four of the best color prints of the monument, copies of the Official Program, copies of two newspaper accounts, and an audio tape of the 25-minute program. Price includes shipping.

**ARTIST ON THE ICE** (Fredrica Wechsler). Neelon Crawford, the first photographer ever invited to winter-over on the ice by the National Science Foundation's Artists and Writers Program, will have the first showing of the soon-to-be-historic photographic products of that trip at the National Academy of Sciences—March through June 1994.

Crawford and the Academy have big plans for the exhibition, which the Academy sees as a way of increasing the science community's and the public's understanding of the Antarctic: a catalogue to include 30 of Crawford's new images, plus essays by Antarctic experts; a reception for the Polar community (to which all Antarctic Society members will most cordially be invited); and a tour for the show.

Neelon, a 46-year old artisan, is probably the American photographer most highly qualified to undertake this project, having already made three trips to the Antarctic prior to his current nine-month winter-over — all at the invitation of the NSF. His first stay was in the summer of 1988, when he photographed almost around the clock. During his second trip, from August to October 1991, Crawford photographed during the early light of the austral spring. His third journey, in August through September 1992, took him to the Weddell Sea on the new NSF research vessel, the NATHANIEL B. PALMER. Judging by photos from his earlier journeys, the new ones should be spectacular — even though he will shoot many of them at night. How do you photograph during the Antarctic night? According to Crawford, "Very loooooong exposures."

To realize these plans, they need financial support to the tune of \$67,000. Contributions to the Arts in the Academy program of the National Academy of Sciences are of course, tax deductible. All supporters will receive recognition in the exhibition, the catalogue, and any other printed material accompanying the show. If you would like further information, Fredrica Wechsler, Director of Arts in the Academy, will be pleased to supply it. You can reach her at 202/334-2439, or by Fax at 202/334-2158, or by letter at the Academy: 2101 Constitution Avenue NW, Washington, DC 20418.

**LEE WINSLOW COURT RETROSPECTIVE.** Ruby Court, a delightful, fun-loving Antarctic widow of a well-known American painter, Lee Winslow Court, tells us that there will be a retrospective showing of Lee's paintings, including many Antarctic ones, at the Copley Society, 158 Newbury Street, Boston, opening on 9 November, running for two weeks. Lee is probably the first American artist to ever have a one-person showing of all Antarctic paintings. The Guild of Boston Artists showcased it in October 1971.

Lee was a direct descendent of Governor Edward Winslow of the Massachusetts Bay Colony, which almost made him eligible to be accepted by provincial New Englanders as a native son. Lee was an adventuresome soul, and flew across the Atlantic with Max Conrad in a tiny Piper Apache in 1956, which, according to Brad Washburn of the Boston Museum of Science, "heightened his understanding of the drama of the clouds and sky above the limitless expanse of the ocean." Lee traveled to Antarctica "in search of more of Nature's hidden treasures" which he always found in landscapes dominated by snow and ice. One of Nature's hidden treasures that he discovered in Antarctica was a rare speciwoman, Ruby Eyer. I don't know if he put tier on canvas or not, but he certainly put her on sheets as the new Mrs. Lee Winslow Court. If you are in Boston in November, drop around to The Copley and see Lee's Antarctic paintings, as well as a lot of others.

**1994 ANTARCTIC CALENDARS.** We are again offering to U.S. and Canadian addresses the fine Antarctic calendar produced by Kiwis Colin and Betty Monteath at the same attractive price of \$10 each, including mailing. Avoid the rush, place your order now! Checks payable to Antarctic Society, see address on letterhead.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 93-94

October

No. 2

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Sayed Z. El-Saved, 1990  
Dr. Charles W. Swithinbank, 1991  
Dr. Susan Solomon, 1992

*Our 1993 Paul C. Daniels Memorial Lecture*

## AN INSIDER'S VIEW OF THE OUTPOST OF MEDICINE AND SOCIETY

by

Michele E. Raney, M.D.  
Anesthesiologist-At-Large  
Saratoga, California

on

*Thursday evening, November 4,*  
*1993*

Four Seasons Hotel  
690 Newport Center Drive  
Newport Beach, California

*6 PM - Dinner : 7:30 PM - Lecture*

The National Research Council's Polar Research Board and The Antarctic Society are combining forces to bring you the indomitable Michele Raney, eminent polar biomedical authority, organizer of the informal Society of Antarctic Medicine. Michele was the straw that broke the camel's back, being the first woman ever to winter over at the South Pole, in 1979. Her interest in polar medicine continued with her serving on the Polar Research Board's Ad Hoc Committee on Polar Biomedical Research. She returned to the ice in 1987 as a consultant to the Force Medical Officer, Operation Deep Freeze of the United States Antarctic Research Program, revisiting McMurdo and the South Pole and inspecting their anesthesia and critical care equipment. While there she had some hands-on experience when a fatal plane crash occurred. This native Californian has just returned from an international symposium in Hobart on Women in Antarctica. *You Californians come see/hear Michele!*

Dinner at the Four Seasons Hotel in Newport Beach will be eating in style. The entree is marinated London Broil with crispy Maui onions. The total cost of the dinner for Society members is \$55 - a steal! - which includes wine.

*Please make your check payable to the Antarctic Society, and mail it to J. Michael Metzgar, Jr., 3253 Colorado Lane, Costa Mesa. CA 92626.*

B R A S H      I C E

This Newsletter is mostly about people, some alive, one dead, and one a great adventurer, plus excerpts from Neal Sullivan's Orientation speech to Antarcticans going to the ice this year. This is a very interesting period in Antarctica, as things are changing. In the last Newsletter we wrote about how the Navy wants to pull out of Antarctica in real time. And Neal spoke about how the power base of the National Science Foundation in Antarctica will, in all likelihood, have to be shared with other government agencies who have vested interests in polar policy decisions. Probably these are the best things which could ever happen.

For the past thirty odd years NSF has played God in Antarctica without much opposition, although occasionally they took direct hits midship from people in the Environmental Defense Fund; were harassed at times by Greenpeace; were questioned by Philip W. Quegg in his A POLE APART; but on the whole have had good sailing in calm waters. They have had a long Antarctic honeymoon.

Our only concern is to make these things readable, something which anyone, Antarctic or not, can pick up and hopefully enjoy. The obituary on Mary Goodwin, God rest her soul, should be of interest to everyone, as she was such an interesting person.

The 1994 New Zealand-produced Antarctic calendar is the best one we have ever offered. It truly is fantastic, featuring, again, the photographic creativity of Colin Monteath. And the cover shot of chinstrap penguins on an iceberg by Frank Todd is The Ultimate, alone worth the price of the calendar. We have only a limited number this year, less than 200, and will not be reordering, so if you want one or more, you better get your checks in now to the Antarctic Society at 905 North Jacksonville Street, Arlington, VA 22205. They are only ten dollars each, which includes mailing. A steal!

As this Newsletter follows one recently sent out, and will be followed by another one shortly, we are not including follow-up billings in this issue for those of you who haven't paid your dues for this year. But you know who you are, your check book will tell you if you are delinquent. So if you are one of those, how about sitting down and sending off a check to the Nerve Center, and make it easier for Ruth by making out your check for multiple years.

**EXCERPTS FROM NEAL SULLIVAN'S KEYNOTE ADDRESS, "ANTARCTIC TRANSITIONS". TO THE 1993 NATIONAL SCIENCE FOUNDATION'S ANTARCTIC ORIENTATION, ARLINGTON, VIRGINIA, 7 SEPTEMBER.**

The report, "Science and Stewardship in the Antarctic", released by the National Academy of Sciences in July 1993, addresses the relationship between antarctic research and the new environmental protocol to the Antarctic Treaty. It is the result of the efforts of a committee of 12 science, policy, and environmental experts. After reviewing the available information and hearing testimony from the research, policy, and environmental communities, the panel concluded that careful implementation of the protocol should result not only in greater protection for the environment but also in better science. While they emphasize that the existing management relationship between NSF and the research community should remain unchanged, the panel urges NSF to involve other Federal agencies in decisions for

which they have relevant technical expertise, or for which they would have normally been responsible in the United States. The panel also stresses that as the protocol is implemented, international collaboration among scientists and consultation among programs should be increased to help foster cooperative, non-duplicative, and mutually supportive research programs.

I intend to retain U.S. leadership in antarctic science, and I seek your maximum effort toward that goal. Through all the transitions of the past 12 months, our strategic vision is unwavering – provide to the nation and mankind the best possible scientific research. As changes unfold and decisions are made at all levels, this vision will guide me, and I urge each of you to adopt it also.

The strategy for NSF as a whole is (1) to enable the Nation's fundamental science and engineering capability, (2) to invest in people, and (3) to address national research priorities. In fiscal 1994 there are five special NSF research initiatives: high performance computing and communications, manufacturing, materials, global change, and biotechnology. These initiatives are set in the context of balanced funding for curiosity-driven research in the disciplines and in the cross-disciplinary problem areas.

Antarctic science is important for as many reasons as there are investigators in this room. For much of the public, Antarctica's importance is linked to its contribution to increasing our understanding of global processes and change. Other uses of Antarctica include its understand Antarctica's physical processes and ecology, as well as how they influence and are influenced by processes at lower latitudes.

Continuing studies of changes in the west antarctic ice sheet, the largest remaining marine-based ice sheet on earth, are helping us to understand the response of ice sheets to global climate change. Over the last decade we have learned that the stability of this ice sheet depends on the behavior of the fast-moving ice streams that flow from the interior of the continent. We have also learned that factors other than climate change have the potential to affect the ice sheet's stability. Recently reported geophysical studies show that heat generated by subglacial volcanoes strongly influences the behavior of the ice streams, and suggest that geology of the region may contribute as much as climate to the ice sheet's stability.

Recent discoveries by U.S. geologists demonstrate that Antarctica's rich fossil record describes not only the continent's history but also provides insight into changes in the global environment. Last year three finds brought attention to this. In the central Transantarctic Mountains about 600 kilometers from the South Pole, Ohio State paleobotanists discovered the remains of a 260-million-year-old deciduous forest. This discovery suggests that between 250 and 280 million years ago this region of Antarctica enjoyed a climate similar to Alaska's today. At the edge of the Ross Ice Shelf, a University of Nebraska field team discovered remnants of strikingly well-preserved wood and a mixture of microscopic marine organisms, which are about 35 to 55 million years old. The geologists believe that these fossils may ultimately shed light on Antarctica's link to world climate and help predict future climate change. Finally, on the opposite side of the continent, on Vega Island near the Antarctic Peninsula, U.S. and Argentine geologists found fossils of a unique bird, described as having the body of a shorebird and the head of a duck. These fossils, the first antarctic land bird fossils ever found, may illuminate how birds were evolving about 65 to 70 million years ago. They also add to the debate about mass extinctions of plants and animals during the Cretaceous and Tertiary (K/T) geological period.

In two separate studies U.S. biologists, examining ecosystem interactions, have found significant effects on biota resulting from enhanced exposure to changed levels of

ultraviolet radiation caused by the antarctic ozone hole. One team, working in the Bellingshausen Sea, measured a 6- to 12-percent reduction in marine primary production directly related to the effects of the ozone hole. The second team, using data from an experiment near McMurdo, has developed a model showing that the ozone hole might reduce near-surface photosynthesis by 12 to 15 percent.

At all three U.S. stations UV radiation is being measured, and our instruments and data distribution methods are serving as models for the development of a worldwide network. Also, our UV monitor at Ushuaia, Argentina is providing for the first time, hard data in a land area outside of Antarctica to which the ozone hole extended last austral spring in full force.

The ozone hole itself is the subject of continued study. When the hole was first discovered, it was a surprise. We need to be as ready as we can be to respond intelligently to the next surprise. And, while earlier work at McMurdo and elsewhere established chlorofluorocarbons as the cause of the hole, continued study is essential. For example, as a result of last year's investigations, researchers now have hard evidence that natural factors—like volcanic eruptions—can also exacerbate the negative effects of the depletion processes.

Studies of air, sea, and sea-ice circulation are helping us to complete global models of climate change. Last year U.S. and Russian marine scientists completed a major investigation of the Weddell Sea, which up until then had been a data-sparse region. Among the initial discoveries, the investigators found multiple sources of antarctic bottom water, with subtle differences in salinity and temperature, along the sea ice drift track of the research camp. Only farther north, through vigorous mixing, was it found that these waters become the characteristic antarctic bottom water that spreads out globally. Findings such as these are changing our understanding of ocean circulation and its relationship to global climate and of the role of the Antarctic in this process.

Because of its location and climate, Antarctica is a superb base from which to study the earth's magnetosphere, sun-earth relationships, and astrophysics. Astrophysicists have found the South Pole to be an excellent location for astrophysics because of its cold and dry and thus transparent atmosphere. For this reason and others we are establishing the Center for Antarctic Astrophysical Research. Our investment is already proving its worth. In June 1993, researchers announced that as a result of their antarctic work they had discovered evidence of cosmic structures that formed just one million years after the universe began. Using highly sensitive telescopes designed specifically for antarctic research, these astrophysicists were able to confirm measurements made by the Cosmic Background Explorer and provide greater detail to describe how structure formed in the universe. This project, as well as the others supported through CARA, shows the distinct advantages not only of working in a Science and Technology Center where collaborative efforts are possible, but also the opportunities that Antarctica offers as a research platform.

For a moment, let us step back from science and consider the political environment and transitions that are affecting Antarctica. Science is surpassing geopolitics as the prime motivator for the United States' presence in Antarctica. Today, collaboration rather than competition among Antarctic Treaty parties is one of the primary forces in support and science activities. For example, to ensure that Vostok Station and the deep ice core drilling continue to operate, we are pleased to be cooperating with Russia by annually providing an airlift from McMurdo. The transition is as symbolic as any of the acceleration of international cooperation in antarctic science

As if in anticipation of the transition from geopolitics to science as the driver of U.S. antarctic policy, we have dramatically improved our ability to support research in the last few years. The magnitude of these programmatic changes is comparable to

those carried out for the 1957-1958 International Geophysical Year. Here are a few examples: The ice-strengthened research ship POLAR DUKE, 219 ft long, replaced the 125 ft HERO in 1984. The 308 ft research icebreaker NATHANIEL B. PALMER was added to the antarctic fleet in 1992. The new 46,000-square-foot Albert P. Crary Science and Engineering Center at McMurdo replaces and improves on structures that had been there as early as 1959. New dormitories and other structures have helped to improve McMurdo generally, although we still have a long way to go to make McMurdo an efficient town. Both South Pole and Palmer stations have undergone or are in the midst of substantial improvements and, in the case of South Pole, renewal.

Two new ski-equipped C-130 Hercules airplanes destined for USAP are taking shape on the factory floor in Georgia. We have developed a new runway on glacier ice at McMurdo, the Pegasus site, for expanded operations by wheeled airplanes—including winter flights. A five-year initiative in safety, environment, and health, concluding over the coming year, has enabled us to come to terms with the new standards for waste management that now apply to all antarctic operations and science.

Science in Antarctica is also providing us with educational opportunities that will improve public understanding of antarctic research and science generally. Between 1989 and 1992, Office of Polar Programs and NSF's Education and Human Resources Directorate jointly sponsored a program through which talented young scholars from high schools around the United States were able to work directly with scientists in their laboratories and in the field. In 1992, the program also offered science teachers the opportunity to travel and work with science field teams. Both of these experiences are important, if we are to improve the public's perception of science, and provide society with our successors in research. Consequently, I am pleased to announce that NSF will again support a similar program for students and teachers. The program, the Polar Research Experience (including the Arctic and the Antarctic), will begin during 1994 with field participation for the students and teachers planned for the 1994-95 austral summer. Five students and five teachers, selected by NSF, will be able to participate. I know firsthand that this is a rewarding experience. I urge each senior principal investigator to consider volunteering to participate. (To be continued)

**ANTARCTIC BIBLIOPHILE OF NOTE SUCCUMBS.** Mary Pearson Goodwin is dead, having died suddenly in her hilltop home in the Westwood section of Los Angeles on September 13, 1993. Mary had corresponded with the Nerve Center for years, but it wasn't until this past summer that this writer was privileged to meet her and her husband, and to see her fantastic polar library. A couple of weeks ago we had a card from Mary, and she noted that she had been ill, but didn't state the cause.

A lot of our members, such as George Llano, Colin Bull, Dick Conger, and John Millard, among others, have great polar libraries, but I doubt if any of theirs could hold a candle to Mary's. She had a tremendous collection of first editions of all of the great Antarctic classics, including even a bona fide copy of AURORA AUSTRALIS, which Shackleton published (limited edition) while on the ice at McMurdo. She had to hock the family jewels to be able to afford it, but she had per priorities straight, and ended up getting the elusive volume from a New Zealand source.

Mary loved the Antarctic, she loved Antarcticans. She was on the first tour ship to ever visit Antarctica, and subsequently made two more trips to Antarctica. She visited the major sites of Antarctic holdings, and spent much time at the Scott Polar Research Institute in Cambridge doing her own research. And she published, too — see TERRA, Vol.18, No. 3, which is the organ of the Natural History Museum Alliance at Los Angeles County.

But this woman was not just another Antarctic freak, as she had her own professional

career. Her husband, who is in poor health, was the first professor of urology that UCLA ever hired, and Mary was his illustrator. She evidently was quite good at what she did, as the obituary in the Los Angeles Times of 19 September 1993 said she "was a prolific and award-winning medical illustrator."

There is a funny story of sorts connected with her professional career as an illustrator and her Antarctic library. John Splettstoesser once wrote a couple of very serious articles for an offbeat magazine about forms that freeze in the snow when one relieves oneself in the fields of endeavor. This was based, I'm sure, on some very intensive micro-stratigraphic analyses of infinite numbers of samples gathered through many Antarctic field seasons. Knowing of Mary's library, I just couldn't resist the temptation to send her these gems. Fortunately, she didn't have them in her library, was ecstatic to receive them, and wrote back that they were particularly dear to her, for in her lifetime she had drawn countless numbers of penises, probably holding the world's record! This summer she requested additional personally signed copies of those articles from John, and he duly complied.

The Goodwins also had a retreat in Snowmass, Colorado, and were ardent mountaineers. But sadness struck the Goodwins in the mountains when one of their offspring, a son, fell to his death while climbing in the Rockies. The Goodwins were close friends of the Robert McNamaras, he of Washington fame, and they climbed in the Himalayas together. Mary wrote a book about the climb with the McNamaras, a book which was dedicated to her late son.

Don't burden the family with inquiries about her library, as provisions had been taken in her will to leave it to the UCLA Library. She died much too young, and the Antarctic has lost a very good friend. She must have been a real fun person, as she was a member of a beach club in Santa Monica affectionately called "The Dirty Thirties," which also includes in its membership Robert Byrd Breyer, grandson of the late Admiral, who, himself, was a builder of the current South Pole Station.

**NORMAN VAUGHAN GETS TO TAKE DOGS TO HIS MOUNTAIN.** We can't believe it! Old Norman Vaughan, 87 years young, finally got permission to take his dogs to Antarctica this austral summer so he can climb his mountain on his 88th birthday on 19 December 1993. The odds on this getting approved were about 1000 to 1, until NSF felt the hot breath of Senator Ted Stevens who was looking over their shoulder.

I ran into Neal Sullivan on 8 September at an evening session of the Antarctic Orientation, and asked him what was going to happen to Norman's request to take dogs to Antarctica, as this had been on the back burner for some time, and it appeared that NSF was just stonewalling old Norman. Neal's reply was, "That is a loaded question." I pointed out that Norman was actually a nice guy, and I thought he deserved the courtesy of an early-on reject, if he was going to be turned down, so that he could seek alternative methods, namely, snowmobiles. Neal then said that Norman had been advised to seek other means than dogs. But hope springs eternal in all great adventurers, and as Norman had not officially been turned down for dogs, he was more or less left dangling with a noose around his neck, until Senator Stevens rose up off the tundra with a harpoon aimed at 18th and G Streets. Norman Vaughan did a lot for our country during World War II; he did it with dogs, and I think we owed him this one. And there is no skin off anyone's nose at NSF; the common sense thing was done; and everyone finally came up smelling like roses.

The press release of Senator Stevens of 13 September, which follows, is a beaut, one that anyone who is not a bureaucrat will revel in its contents. After all these months, it all occurred in one day after Stevens announced his intention of addressing the issue at a debate on the NSF budget! There's no difference between a twelve-year old kid and NSF; if you want their attention, just threaten their allowance.

It was good to see a common man win out over a government office which really had no intention whatsoever of giving Norman a permit until an influential senator spoke in language which even they could understand.

**SENATOR TED STEVENS' NEWS RELEASE ABOUT NORMAN VAUGHAN.** Col. Norman Vaughan's dream may soon be a reality. After months of bureaucratic delay, Vaughan has been issued a permit to lead his sled dog team across Antarctica.

According to Senator Ted Stevens, the National Science Foundation (NSF) approved Vaughan's application late Friday (September 10) afternoon. The agency's decision came a day after Stevens expressed his displeasure, in a Senate hearing, with NSF's handling of Vaughan's request.

"I think it's great Col. Vaughan will finally get a chance to pursue his dream," Stevens said. "Sometimes the bureaucracy in Washington needs a little prodding to recognize the importance of unique requests like Norman's. Having played such a vital role in the history of Antarctica, it's only fitting he should be the last American to drive sled dogs across that continent."

Col. Vaughan, 87, is planning a 500-mile journey by dog team across Antarctica to Mount Vaughan, a 10,302-foot peak, named in his honor by Admiral Richard E. Byrd. Vaughan was Byrd's chief dog driver on a 1929 geological party which determined that Antarctica was a continent. Col. Vaughan is raising funds to undertake his expedition which he hopes will take place between November and December of this year. According to Vaughan, a National Geographic television crew is slated to accompany him on his journey.

At a meeting of the Senate Appropriations Committee on Thursday, September 9, Stevens announced his intention to address this issue on the Senate floor during upcoming debate on the NSF budget. Stevens also indicated he was considering calling for a General Accounting Office investigation of NSF's handling of Vaughan's case and the agency's overall management of Antarctic policy.

Last fall, Stevens threatened to block Senate consideration of amendments to the Antarctic Treaty, a 41-nation agreement governing the administration of Antarctica, unless Col. Vaughan received his permit. At that time, NSF officials assured Stevens that the agency would work with Vaughan to resolve the matter.

NSF had resisted issuing the permit because of environmental and foreign policy concerns. Fears had been raised that Vaughan's dogs might transmit distemper to seals inhabiting Antarctica. In response, Vaughan offered to triple-inoculate the dogs from the disease, a measure which NSF found acceptable.

In addition, the Antarctic Treaty's new amendments prohibit the introduction of dogs into Antarctica. While not yet binding, the NSF was concerned that Vaughan's trek might violate the spirit of the new agreements. At Stevens' request, the State Department consulted its Treaty partners and determined that there were no significant objections to the permit being issued.

**THIRTY-FIVE YEAR OLD PROFILE OF CIVILIANS AT SOUTH POLE STATION IN 1958.** As we go to press, most of us who wintered over as scientists during the International Geophysical Year (IGY) at the South Pole are going to hold a short two-day reunion to catch up on old times and new times. This is our first gathering as a group since we departed the Pole in November 1958. One member said to restrict it to one day, so we wouldn't end up in fights and would live to want to have another, but we are living dangerously, making it a two-day affair.

The year 1958 at the South Pole was an interesting time to be at the station. Paul

Siple's group had built the station the previous year, and much of the mystic associated with what wintertime conditions were really like in the interior of Antarctica had been discovered that year. And shortly after most of us got there, who appeared in our front yard but The Conqueror of Everest, Sir Edmund Hillary himself, with his traverse party laying out support depots for Bunny Fuchs, then crossing Antarctica with the British Commonwealth Transantarctic Expedition. A month or so later Fuchs' party showed up, looking very much like intrepid explorers after several months on the trail. Pretty exciting stuff having the likes of Ed Hillary, Peter Mulgrew, 'Murray Ellis, Bunny Fuchs, Ralph Lenton, and George Lowe in your galley drinking coffee beside you.

But what were we really like? There were ten of us, eight of us born in the United States, two born in a foreign country, with one of the Americans having a foreign-born wife, and one of the foreign-born being married to his first cousin. Naturally, as it was 1958, it was an all-male encampment, and it just happened that it was all white. In fact, blacks were few and far between in the Antarctic in those days. Only one scientist who wintered over in Antarctica in 1957 was black. Half of us were married, and one had a pregnant woman at home. One of us was close to 50; one of us was in his mid-thirties; and the rest of us were young kids in our early twenties, still wet behind our ears.

But what set the group apart from most others was education. At least eight were collegians, perhaps nine, possibly all ten. They came from all walks of life; one was an ex-taxi cab driver; one was a mountaineer; one was a merchant mariner; three were geographers; and so it went. One was an MIT graduate; one was an alumnus from a prestigious Ivy League university, Brown. In that group of ten, five ended up with PhD degrees. Did a year at the South Pole leave a message that they had better get more education so they wouldn't have to end up in a place like that again?

Many must have enjoyed that year immensely, as one went back for yet another year at the South Pole; another got himself onto the first American oversnow traverse to the South Pole; another became the national leader of this country's network of stations studying climate change, and made frequent trips to the South Pole; another became program manager for the micrometeorological program at Plateau Station, a rural substation somewhere to the right of the South Pole; and still another got involved in outfitting people going to Antarctica. So at least four of us got back to the South Pole, possibly five. Another one of us got bitten by the polar world, but somehow lost his orientation, and ended up spending the rest of his life in the Arctic listening to sounds of whales. So six out of ten maintained some sort of a liaison with the cold regions.

What are we like now? Well, one of us is legally dead, the so-called station scientific leader, who was really neither scientific nor leader, but that's the way it went occasionally in those days. Three of us got divorced, which puts us right in the midstream of American society. One of us got into a little bit of trouble with the law. One of us, the most unlikely of all, ended up as a religious freak. Two of us have Parkinson's, and three of the wives had cancer. We are basically an ocean-oriented group, with only two living in the interior of the country. Two of us have large yachts, with one of us running a large marina on Hilton Head Island. One of us runs three pawn shops, and another has Morgan horses on his spread in Connecticut. One of us met his second wife skydiving, and evidently took a real dive. Another is in his third career, being deep into emergency research work. When not sailing, tennis seems to be the game of the Class of 58, although one couple bicycles for two all over the world. They are still in tandem after all these years! Insofar as this soul knows, no one has ever been into drugs, no one is a gay, and no one has AIDS. Be it that way evermore.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 93-94

November

No. 3

*Joint Meeting with The Explorer's Club – Washington Group  
and The Society of Women Geographers*

**The First American Antarctic Historic Site: 50 Years of  
American Presence at East Base.**

by

Edith "Jackie" Ronne Antarctic Writer and Lecturer

and

Cultural Resource Management in Antarctica: The "Clean Up"  
of East Base - 1992

by

Dr. Noel Broadbent

Archaeologist Arctic Social Sciences Program Director, OPP, NSF

on

*Saturday evening, 4 December 1993*

at

Americus Restaurant in Sheraton-Washington Hotel  
2660 Woodley Road at Connecticut Avenue N.W.

Social Hour (cash bar) 6 PM, Dinner 7 PM, Lectures 8 PM

*Dress will be black tie, or dark suit, if you prefer*

*Cost of dinner – Filet Mignon or Roast Duck – is \$37.50 per person  
Mail your reservation, with choice of entree, and check (payable to Explorers  
Club - Wash. Group) to Ms. Marcia Halliday, P.O. Box 2321, Reston, VA 22090, by  
27 November. (Daytime phone: 703-818-4667)*

*Underground parking will be free. Remember to take your ticket  
with you so it can be validated when you check in!*

FIRST MEETING IN 1994!!!

Thursday evening, 6 January

*THE AIR GATEWAY IN THE ANTARCTIC PENINSULA*

by

Lt. Gen. Jorge Iturriaga

Defense and Air Attache, Embassy of Chile

at 8 PM

*National Science Foundation's New Facility in Ballston  
4201 Wilson Blvd., Room 330, Arlington*

*(one block from Metro)*

- see page 8 -

JUST IN!!! You folks with personal computers can follow Norman Vaughan  
on Prodigy - Jump Mountain Challenge.

**Presidents:**

- Dr. Carl R. Eklund, 1959-61
- Dr. Paul A. Siple, 1961-62
- Mr. Gordon D. Cartwright, 1962-63
- RADM David M. Tyree (Ret.), 1963-64
- Mr. George R. Toney, 1964-65
- Mr. Morton J. Rubin, 1965-66
- Dr. Albert P. Crary, 1966-68
- Dr. Henry M. Dater, 1968-70
- Mr. George A. Doumani, 1970-71
- Dr. William J. L. Sladen, 1971-73
- Mr. Peter F. Bermel, 1973-75
- Dr. Kenneth J. Bertrand, 1975-77
- Mrs. Paul A. Siple, 1977-78
- Dr. Paul C. Dalrymple, 1978-80
- Dr. Meredith F. Burrill, 1980-82
- Dr. Mort D. Turner, 1982-84
- Dr. Edward P. Todd, 1984-86
- Mr. Robert H. T. Dodson, 1986-88
- Dr. Robert H. Rufford, 1988-90
- Mr. Guy G. Guthridge, 1990-92
- Dr. Polly A. Penhale, 1992-94

**Honorary Members:**

- Ambassador Paul C. Daniels
- Dr. Laurence McKinley Gould
- Count Emilio Pucci
- Sir Charles S. Wright
- Mr. Hugh Blackwell Evans
- Dr. Henry M. Dater
- Mr. August Howard
- Mr. Amory H. "Bud" Wane, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

- Dr. William J. L. Sladen, 1964
- RADM David M. Tyree (Ret.), 1965
- Dr. Roger Tory Peterson, 1966
- Dr. J. Campbell Craddock, 1967
- Mr. James Pranke, 1968
- Dr. Henry M. Dater, 1970
- Sir Peter M. Scott, 1971
- Dr. Frank Davies, 1972
- Mr. Scott McVay, 1973
- Mr. Joseph O. Fletcher, 1974
- Mr. Herman R. Friis, 1975
- Dr. Kenneth J. Bertrand, 1976
- Dr. William J. L. Sladen, 1977
- Dr. J. Murray Mitchell, Jr., 1978
- Dr. Laurence McKinley Gould, 1979
- Dr. Charles R. Bentley, 1980
- Dr. Robert L. Nichols, 1981
- Dr. Robert H. Rufford, 1982
- Mr. R. Tucker Scully, 1983
- Dr. Richard P. Goldthwait, 1984
- Dr. Mark F. Meier, 1985
- Dr. Claude Lorius, 1986
- Dr. Louis J. Lanzerotti, 1987
- Mr. Peter J. Anderson, 1988
- Dr. Ted E. DeLaca, 1989
- Dr. Sayed Z. El-Sayed, 1990
- Dr. Charles W. Swithinbank, 1991
- Dr. Susan Solomon, 1992

## BRASH ICE

We sometimes wonder if anyone reads these things, and we got proof positive from our Last Newsletter that some in the Office of Polar Programs at NSF do read them, as one was quick to respond with her resignation, plus "Since when is OPP/NSF an enemy?" In the same mail came a letter from a professional journalist with TIME magazine saying, "Thanks for the great Newsletter which I enjoy reading every time I receive one."

This writer has no personal axes to grind with anyone, but does confess to one sacred cow, the Byrd family. For the past fifteen years this Newsletter has reflected the viewpoint of only myself, not of the Society or its Board of Directors. We feel, rightly or wrongly, that people are the news, that readers can get science elsewhere. And if there's a good story out there, play it to the hilt, embellish it if need be.

If there is any one person in our Society who is a character and good copy, it is Norman Vaughan. Who else among us has been invited to two Olympics? Who else among us has met the Pope? Who else among us has raced thirteen times in the Iditarod? Who else among us would want to match our World War II, Korean, or Vietnam record against his? And who among us has a happy satisfied wife or husband at home who is thirty-seven years our junior? If any of you are doing exciting things like Norman, let us know, and we'll write you up, too.

**EXCERPTS FROM NEAL SULLIVAN'S KEYNOTE ADDRESS, "ANTARCTIC TRANSITIONS," TO THE 1993 NATIONAL SCIENCE FOUNDATION'S ANTARCTIC ORIENTATION, 7 SEPTEMBER (conclusion).** As we complete our transition to these remarkable new facilities and research opportunities, we bring with us an accompanying transition toward the entirely reasonable and necessary view that we are no longer conquerors of the earth, but rather stewards of it. Antarctica has achieved enormous symbolic importance in this transition. While NSF believes it has made good progress toward wise stewardship of the nation's activities in Antarctica, there are others who are not convinced.

The issue of man's impact on the antarctic environment has not yet been resolved satisfactorily in the public eye. The two guidelines we must not waver from are perspective and understanding. Let me give you an example. Despite all our concerns about ecological impacts due to local activities in Antarctica, the greatest antarctic environmental impact in history has come not from local activities at all, but from the increased levels of ultraviolet radiation reaching antarctic marine areas as a result of the ozone hole. Professor Ray Smith and others, in a 1992 SCIENCE magazine paper, estimate that productivity loss in the marginal ice zone due to the ozone hole is 7 million tons of carbon per year, or about 2 percent of the zone's estimated yearly production. To give perspective to this figure, consider the peak years of whaling in the Antarctic, in the 1930s. An entire industry was devoted to the removal of antarctic biomass, and the taking was so rewarding that virtually all the whales taken in the world were caught in antarctic waters. The catch during that period averaged 2 million tons a year—an amount less than one third of the current inadvertent removal of biomass that is caused by man's actions entirely outside of Antarctica. We are still struggling in our transition toward understanding and perspective regarding the protection of Antarctica. In 1993 the Marine Pollution Bulletin devoted an issue to discussions of "Environmental Awareness in Antarctica: History, Problems,

and Future Solutions. On one page an author argues that the National Science Foundation fails to protect Antarctica. On another page another author claims —quote— that "some of the current enthusiasm for environmental protection produces an over-kill that contributes little to the cause but entails a considerable cost and a long-term loss of credibility."

Who is right is not a concern of my talk this evening. But how to get to the right answer is very much a concern. Science — the scientific method — is an effective means to address complex issues. Peer-reviewed research results, published in scientific journals, are a credible means of furthering understanding of the world around us. By making the results of our investigations available in this way, we provide the data and the foundation that will guide others as they decide how best to preserve the global environment.

Three decades ago, the Antarctic Treaty entered into force with the straightforward but ambitious goals of peace and science. The Treaty was ahead of its time, but the world has indeed achieved peace — at least between superpowers — and in the process we in Antarctica have demonstrated the efficacy of science both as a means of understanding the world and as a means of brokering understanding among nations. Now the 1991 Protocol on Environmental Protection to the Antarctic Treaty renews and strengthens the Treaty's original intent for wise use and stewardship of Antarctica.

Tonight, I have tried to highlight issues that affect all of us going to Antarctica. I also wanted to emphasize to you that travel to Antarctica can be a transition of great personal significance, and to remind you that you are going to Antarctica during an extraordinary period in its history. Science has never been more relevant to the concerns of mankind. The availability of new tools for science—satellite imagery, improved communications, highly capable computers—has never been greater. The government's commitment to science has never been more clearly stated than now. Prospects for the conclusion of the international regime to direct, control, and settle environmental protection procedures for Antarctica have never been brighter. Commitment to the principles of the Antarctic Treaty—for peace, cooperative science, environmental preservation—is shared by more nations, representing more people on this planet, than ever before.

But with this extraordinary experience comes a special challenge. All of us, no matter what role we have in USAP, must endeavor to continue our nation's record of excellence in science, in educating people about science and technology, in preserving the unique antarctic environment, and building partnerships between science and society. I ask each of you to join me in this great work of scientific research for the betterment of mankind.

**A LOW-LATITUDE ANTARCTIC GAZETTEER** (Robert B. Stephenson, P.O. Box 435, Jaffrey, NH, 03452-0435). [The first of three installments by Rob Stephenson on the location of Antarctic attractions around the world. He will welcome comments and corrections from readers, especially about new places and points of interest.] Because of my interest in Scott, Shackleton and those associated with the Heroic Age of Antarctic exploration, I started recording sites while visiting England. The list just started to grow. With respect to Scott, there's his house at 56 Oakley Street, London SW3. He couldn't have been there long, but there's one of those ubiquitous blue plaques commemorating his brief stay. Scott statuary abounds: The major one is in Waterloo Place near Pall Mall, sculpted by his wife, Kathleen. The explorer is depicted dressed in sledging gear, journal case strapped to his waist, grasping a ski pole. It's cast in bronze, and is duplicated in stone (because of war-time metal shortages) in the New Zealand version at Christchurch. There's a bust of Scott on the Exhibition Road facade of the Royal Geographical Society in Kensington. Also one at Scoll Polar Research Institute in Cambridge, which, not surprisingly, is filled with

Scott-associated items, along with so much more that it would be hard to know where to begin. (Well, I will mention that the flag left by Amundsen at the South Pole is on display. The Canterbury Museum has one as well—fragments of the true cross?). Scott's ship on his first expedition, HMS Discovery, has moved around a bit in recent years. After being alongside the Embankment (where I first visited it), then in St. Katherine's Docks, it now resides permanently where it started out, in Dundee, Scotland. (Ann Saviour's recent book recounts this ship's extraordinary history.) Sledge flags were a colorful aspect of both of Scott's expeditions. I remember seeing an example at SPRI, also one hanging in Exeter Cathedral which now is in fragile condition and destined for a display case, according to a friend of mine who saw it not long ago "in the back room." It was Scott's flag from the Discovery expedition, and was presented to the Cathedral by his mother. I've been told that Wilson's flag is at his Cambridge college, Caius.

Edward A. Wilson, the zoologist, physician and skillful artist and everyone's favorite on both Scott expeditions, is well represented in his home town of Cheltenham. On the stone facade of 91 Montpellier Terrace is the carved inscription "Edward Adrian Wilson, Antarctic Explorer. Born here 1872, Died with Scott 1912." And in the center of things, on The Promenade, is a large statue, again the work of Lady Scott. It was unveiled on July 9, 1914 by Sir Clements Markham, Scott's mentor. A short distance away is the Cheltenham Art Gallery & Museum which has some interesting displays on Wilson and the Antarctic. To top it off, on Princess Elizabeth Way, there's a modern block of flats named after Wilson!

The heroic L.E.G. "Titus" Oates, who sacrificed himself on the return from the Pole so as not to slow down his companions, is suitably memorialized at the Gates Memorial Library & Museum, housed in "The Wakes," Gilbert White's parsonage in the delightful Hampshire village of Selborne. (White was the father of natural history literature; his book on the natural history and antiquities of Selborne (1789) is said to be the fourth most published book in the English language!) Although White is the main focus of the Museum, there is a good deal pertaining to Oates and his brother Frank, a naturalist and African explorer. The often-reproduced painting by J.G. Dolman of Oates staggering out of the tent and into the unrelenting blizzard to his death tiangs in The Cavalry Club, 127 Piccadilly, London.

Another of Scott's men, Apsley Cherry-Garrard, author of what's long been considered the classic Antarctic book—The Worst Journey in the World (never out of print since its publication in 1922)—is memorialized by a small statuette in a niche in St. Helen's & St. Peter's Church, his burial place in Wheathampstead, not far from St. Albans. I saw mention of it in an English magazine years back and eventually paid a visit. Cherry-Garrard lived not far away in the tiny and lovely village of Ayot St. Lawrence, where his neighbor was George Bernard Shaw. It was Shaw who suggested the title for Cherry-Garrard's book. A public footpath runs through the woods and close to what was the Garrard family home, Lamer House.

The James Caird, the whaleboat that got Shackleton, Worsley, et al, from Elephant Island to South Georgia, is on display at the National Maritime Museum in Greenwich. When I paid my visit, on a weekend, the classroom where it's set up was locked. Fortunately, a kindly guard let me into the room to have a look. It was formerly at the Dulwich Art Gallery. (I've since learned that it's once again back at Dulwich, Shackleton's school.) The Museum's collection includes a number of paintings of Antarctic interest: John Wilson Carmichael's large canvas of Sir James Clark Ross's ships, HMS Erebus and Terror; the often-reproduced portraits of Ross by Stephen Pearce and John Wildman; and Richard Granville Eves' 1921 portrait of Ernest Shackleton.

In a recent issue of Geographical Magazine I learned that Shackleton's "helmet"—a cloth balaclava affair—with a signed inscription to an old friend, Frank Thornton, is in the collection of the Royal Geographical Society, certainly not the only

interesting Antarctic artifact at the RGS.

Penguin fanciers may wish to journey to Edinburgh to see the famous daily parade of King penguins at the zoo. Since 1961 the regimental sergeant major of the King's Guard is a King penguin--only in England! Of course, in San Diego there's Sea World and Frank Todd's Penguin Encounter, probably the ultimate penguin display.

Norway naturally has much of Arctic interest but the Antarctic is well represented too, mainly Amundsen-related sites. His home, "Uranienborg," is south of Oslo on the eastern shore of Oslo Fjord. There's lots of gingerbread on this house, plus portholes in Amundsen's bedroom. The big attraction is at Bygdøy in Oslo harbor: the Fram Museum. In a modern (actually 1936) A-frame building sits Amundsen's ship, The Fram, high and dry. On the north side of town, at the famous Holmenkollen ski jump, is the Skimuseet or ski museum. Among Amundsen's Antarctic artifacts on display are a tent, sledge, skis, clothing, provision boxes and a stuffed husky. Far to the north, in Spitsbergen, is a full-sized statue of Amundsen. Also a bust with a plaque commemorating the Amundsen and Lincoln Ellsworth Norge airship flight over the North Pole in 1926. I expect there are other Amundsen memorials and public art in Norway of which I'm unaware but would be glad to know about. Even Scott has a site of interest in Norway: at Finse, on the Bergen-Oslo rail line, is a rough-hewn granite obelisk near the railroad station that marks Scott's time there training his men and testing equipment prior to his last expedition.

Among the more obscure Antarctic sites is the house on the Baltic island of Saaremaa in Estonia where the great Russian explorer Bellingshausen was born. A large carved stone marker commemorates the site. (To be continued)

**SILAS: THE ANTARCTIC DIARIES AND MEMOIR OF CHARLES S. WRIGHT.** (Edited by Colin Bull and Pat F. Wright, illustrated by Pat F. Wright. Ohio State University Press, Columbus, Ohio, 1993. \$59.50). This is a handsome book, profusely illustrated with fine works of art (approximately 250) by the subject's daughter, intelligently edited by an erudite, rascally Antarcticist, and priced out of the layman's market by an optimistic business office. The book contains everything that one needs to know about a distinguished Antarctic scientist, gleaned from the contents of several diaries, journals with field observations and comments, plus a late-in-life memoir. To put these all together so they sound somewhat coherent must have been a herculean task, but Colin Bull and Pat Wright were most successful.

Any biography on any member of the Scott 1910-1913 Expedition is going to either glorify or denigrate Scott, as he was such a worldwide figure that images created of him were more important than the life of the person being portrayed. And in many ways, this is true of SILAS, as you sort of hang on every word that Wright wrote about the person whom he affectionately referred to as "the Owner." Scott has been in a slump in recent years, hastened somewhat by Roland Huntford, but he makes a strong comeback in SILAS, who was a strong supporter of Scott. Amundsen may have won the race to the South Pole, but from all accounts in SILAS, Scott himself may have been much more concerned with besting his tormentor Shackleton's accomplishments. Besides, in Scott's mind, Amundsen really wasn't playing by the Rules of the Game, and was a fraud, not a true rival. However, one has to remember that Silas only went as far as the Upper Glacier Depot with Scott, so he wasn't privy to witnessing Scott's behavior or hear his thoughts on the polar plateau. Silas, himself, realized much sooner than most that Amundsen was definitely going to be first at the Pole. The editors have interjected into the text a play-by-play description of Amundsen's progress, although history has leaked the information that Amundsen beat Scott to the South Pole, so there wasn't much suspense!

Silas was the very first person to see the tip of Scott's tent protruding several

inches above the snow surface, and his detailed account of what happened thereafter is most interesting. One of his conclusions was that Bowers may have been the last to succumb. Actually Scott never died; he just perished in the tent, and lives on eternally. On the other hand, Amundsen won "the race," but lost the battle. In the non-Scandinavian world, Amundsen was not a giant figure, and died somewhat unheralded somewhere in the Arctic. Silas does not say this, but did the man who lost the race actually die with a fortuitous smile on his face?

Silas was not a true diarist, so his accounts may have missing days, may have long catch-ups, but on the whole are well worth reading. The man was truly an outstanding scientist, but he more or less got shackled with being the expedition's glaciologist, for which he had to take on-the-job training to be proficient. He was sort of a sacrificial lamb for the good of the overall expedition, and he ended up doing a great job

How many immortals were there on that expedition? Certainly Captain Scott and Dr. Wilson, and is there a soul among us who would not include Birdie Bowers and Titus Dates? And perhaps a book elevated Apsley Cherry-Garrard to that status. So you have five household names, and it is a well-known fact that a team can only have so many superstars. So perhaps Silas suffered on the publicity end, and is not so well-known as some of his colleagues. But as a pure scientist and as a team player, Silas was truly one of the giants, and this biography is a most worthwhile contribution to Antarctic history.

A diary has pluses and minuses, but certainly reading the news in real time before time sanitizes it makes it more appealing and interesting to the readers. There are also benefits in seeing events and people described in the best of Anglo-Saxon terminology. Silas does not really crucify his fellow men, but it doesn't take too much reading between the lines to ascertain who his good guys are and who he wished might have stayed at home.

I have agonized over whether SILAS is a good title, because, if you weren't a worshipper of Scott, wouldst thou knoweth that this was the nickname of Sir Charles Seymour Wright? To me the bare name of Silas conjures up a retired plow horse living out his life on a farm in northern Vermont. I think if Ohio State had plagiarized on the diary of Tryggve Gran and called this book "The Canadian with Scott," it might arouse more interest in the Antarctic community.

The price of \$59.50 may make some people think twice about buying this book, even though it is handsome and loaded. This is about twice the going price for such great biographies as Scott and Amundsen and Shackleton, and such great books as Reader's Digest's Antarctica and Smithsonian's Wild Ice. If you are one of the big spenders, you can always buy the limited Collector's Edition of SILAS which comes with the real live signatures of both Colin Bull and Pat Wright. Just send a check for \$108 to Colin Bull, Polar Books, P.O. Box 4675, Rolling Bay, WA 98061, and he will send it directly to you, non-stop.

**THE DISTRIBUTION AND ABUNDANCE OF ANTARCTIC AND SUBANTARCTIC PENGUINS.** (Book review by John Splettstoesser). If you ever wanted to know how many penguins there are in Antarctica, and where they are, you will need this book. It is a successor to a version published in 1983, also by SCAR (Scientific Committee on Antarctic Research), Scott Polar Research Institute, Cambridge, U.K., but about twice as large. Does that mean the number of penguins has doubled in 10 years? Probably not, but it does mean that updated information, mainly in censusing and in discoveries of new colonies, has improved on the knowledge of the subject immensely. SCAR has been instrumental for many years in promoting and co-ordinating scientific research in Antarctica, sponsoring symposia, and publishing very useful documents for the scientific community. This book is another excellent example. The title page of the book (of 76 pages,

stiff paper covers; gives credit for compilation to the SCAR Bird Biology Subcommittee, and Eric J. Woehler, of the Australian Antarctic Division, for putting the book together, and at the bottom of the title page, assistance is credited to S. Poncet. Those of you who have traveled to the Antarctic Peninsula or the Falkland Islands might know of Sally Poncet and her husband, Jerome, who operate the yacht, DAMIEN II, on cruises in those areas. They also contribute greatly to the censusing of bird populations as they travel, and have published articles in the scientific literature.

This book includes tabulations and maps of eight species of penguins in all of Antarctica and sub-Antarctic islands (can you name all 8 species?). It is an outgrowth of a SCAR recommendation that penguins are likely to be important top consumers in the Antarctic food web, particularly of krill, *Euphausia superba*, and that accurate data on their population sizes were crucial to quantifying their role (from the Introduction). The latest Antarctic field season for which unpublished data are incorporated is 1989-90. A typical tabulation of data for each species consists of a map that shows locations of each known colony, a brief description of background information, and localities by geographic name, latitude, longitude, and populations. The date of bird counts is given, as is the type of count—whether it reflects nests, number of breeding pairs, chicks, total birds, etc. Accuracy of counts is also included. Emperor penguins, for example, now total 195,400 breeding pairs in 42 colonies, including those in six new colonies discovered between 1979 and 1990. It is not difficult to understand how new colonies continue to be discovered, particularly of Emperors, because of their breeding characteristics and habitats—eggs are laid in early winter, and chicks fledge in December. By the time people generally appear for an Antarctic summer, the birds are gone.

Summaries of populations for the eight species are tabulated in the Conclusions of the book, and include Emperors with the lowest total of 195,400 breeding pairs, and macaroni penguins with the highest, at 11,841,600. Sub-Antarctic islands inflate the numbers for some species considerably, but the Adelies, a true Antarctic species, round out at 2,465,800 breeding pairs. Some of you readers have been to Torgersen Island, next to Palmer Station on Anvers Island, and might be aware that the Adelie population there is 8,732 (nest count, in 1983), and as I recall from the 1991-92 season, is slightly less now. Paulet Island, another favorite tourist stop, has 60,000 breeding pairs of Adelie penguins in 13 individual colonies (in 1984), just to whet your appetites. And how about that impressive chinstrap penguin colony at Baily Head on Deception Island, with the beautiful volcanic tuff cliffs on one side and a glacier ice cliff on the other? According to the Poncets, there are 100,000 nests there (rough count) in 1989. To find out the other numbers for all eight species at all localities, order the book, from The Distribution Centre, Blackhorse Road, Letchworth, Herts SG6 1BN, U.K. for just \$16 U.S., which includes airmail postage (or 10 U.K. pounds). I have used the 1983 edition for my trips to the Antarctic Peninsula and elsewhere on tourist ships, and this 1993 version is a real bargain for a lot of useful information. And in case you might have forgotten what some of the penguins look like, there are black-and-white photos of them, something the 1983 edition did not have, as well as a beautiful cover photograph in color of the Emperor penguin colony at the Brunt Ice Shelf. Every tourist ship, and anyone who contemplates seeing penguins in the Antarctic, should order this book before the coming season begins.

If you want help in identifying penguins and other birds in Antarctica, travel with Peter Harrison's wonderful book on "Seabirds: An Identification Guide" (Houghton Mifflin Co., 1983), as well as George Watson's "Birds of the Antarctic and Sub-Antarctic." The latter normally sells for \$18, but is now available for \$14.40 from American Geophysical Union, 2000 Florida Ave. NW, Washington, DC 20009 (or telephone 1-800-966-2481, mention code "AR24", for credit card orders). If it

sounds like I am trying to sell books, I am, because if a geologist like me can get enthusiastic about birds, so can you.

**MORE ON MAWSON.** (Elizabeth Chipman, author, critic, friend). "The June 1993 issue of Aurora carried an account of the uncertain situation of Sir Douglas Mawson's collection of papers and artefacts. The position then was that the University of Adelaide, where the collection is at present located, was not interested in, or capable of, preserving it. Also the Mitchell Library of NSW had advanced a claim for some of the material. From a follow-up story in the Adelaide Advertiser [daily newspaper] of 17 July 1993 it appears that the Waite Institute of the University of Adelaide is interested in taking over the collection. They propose to house it in restored historic buildings on the Waite campus, for which \$500,000 will be raised. An additional \$250,000 will be raised each year for salaries and cost of exhibitions. There are about 100,000 items in the collection including 20,000 photographs, many by Frank Hurley.

"There are historic associations here as some of the soil and rock samples that Sir Douglas brought back from Antarctica were analyzed at the then Waite Institute of Agricultural Research more than 60 years ago. The Mitchell Library has indicated that it would not pursue its claim on part of the collection if the Waite plan goes ahead."

**IN THE WAKE OF SHACKLETON EXPEDITION, 1993-94.** (Charles Swithinbank). In January 1994, a small crew will set sail in a modern replica of the James Caird, from Elephant Island in Antarctica, on a re-enactment of Shackleton's 1916 historic boat journey. The replica, named Sir Ernest Shackleton has the same overall dimensions and sailing rig as the James Caird, but there the similarity ends. The replica has been very carefully designed with safety in mind, incorporating watertight bulkheads. This should ensure that in the event of a rollover she will not easily flood. The replica has been built by McNulty Traditional Boatbuilders, of South Shields on the river Tyne.

The aim of the 1994 "In the Wake of Shackleton Expedition" is to follow the same route as Shackleton's original rescue mission from Elephant Island to South Georgia. The expedition will be entirely self-sufficient and unsupported.

The sea crossing of over eight hundred miles will not only be a feat of endurance, but will require exceptional nautical ability to complete successfully. Navigation will be by sextant, using, as closely as possible, the methods of seamanship employed during the original voyage. A Global Positioning System will be carried for extra safety as will an Inmarsat Communications System for daily media updates.

Once on land, the crew will attempt to traverse the glaciers of South Georgia, following Shackleton's route of almost eighty years ago. Previous attempts at this route have often failed due to blizzards and hurricane-force winds that can be encountered.

**A HOT SEAT, LIVING INSIDE A VOLCANO, FOR A YEAR.** Be sure to mark your calendar NOW for the January 6th meeting with Lt. Gen. Jorge Iturriaga, as there will NOT be a Newsletter in December (Nerve Center on Christmas holiday). The General had a most distinguished Antarctic career, highlighted by being Head of the Presidente Aguirre Cordo on Deception Island, 1967. He lived INSIDE of a volcano until the day it erupted and destroyed the station. Undoubtedly, the General holds the Antarctic record for the 10,000 meter run. He has been active in Antarctica since 1965, and will soon be leaving Washington for another assignment, so we are extremely lucky to have him aboard in early January. Don't miss him!!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 93-94

February

No. 4

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94

MODERN ANTARCTICA:

AN ARTIST'S WINTER AT MCMURDO

by

Neelon Crawford

Polar Fine Arts  
Baltimore, Maryland

on

*Tuesday evening, March 1, 1994 8 PM*

National Science Foundation  
4201 Wilson Blvd., Arlington

Room 375

(Entrance at back of building on the  
corner of 9th St. N. & N. Stuart St.  
*one-half block from Metro Ballston  
Station*)

Neelon Crawford has just returned from wintering over at McMurdo in 1993, and has chosen a set of beautiful slides, taken throughout the year, for us to appreciate. He's the first full-time professional photographer to winter over with the Americans at McMurdo. Previously he photographed McMurdo and Dry Valleys in January-February 1989; he covered Antarctica on Winfly, August-October 1991; he shot the far side of Antarctica when on the R/V NATHANIEL B. PALMER in 1992.

He will have an exhibit "Ramparts of Ice" at the National Academy of Sciences this spring. It will open on April 8th and continue through late June. Neelon has traveled extensively throughout the world, armed with cameras, but probably his greatest achievement was surviving residency in New York City. P.S.

He's out - he is now an Oriole!

What follows is a potpourri, but it qualifies as a Newsletter - we hope. This one barely made it before our next meeting. There has been some good news here in Maine - cold, snow, few tourists, and the price of lobsters is down.

We appreciate the many Christmas cards and messages which came into the Nerve Center. And for you folks who like long lead times, our 1994 Annual Paul C. Daniels Memorial Lecture and dinner, we hope, will be April 7th. So please mark your calendar NOW!!

**MEMBERSHIP.** For the first time in fifteen years our Society shows a decrease in membership, dropping from 602 in September to 560, although we may pick up about twenty in late renewals. Two couples from NSF dropped out because of what we wrote about Senator Stevens and Storming Norman, but our system has a built-in factor of five to allow for thin-skinned dropouts. If we don't antagonize someone during the year, we feel we just aren't doing our job!

It has become increasingly difficult to come up with material for the Newsletters since we took up permanent residence in mid-coastal Maine. And we miss the relationship with Peter Wilkniss who always kept his door open to us for information. We have to rely almost exclusively on letters and published information from elsewhere. Naturally we like to be up-to-date about what is going on in Antarctica, but the person-to-person accounts upon which the Newsletters are based are desperately needed from you folks still active on the ice. PLEASE HELP US! PLEASE WRITE!

**LATEST NEWS FROM THE OFFICE OF POLAR PROGRAMS** (Guy Guthridge). "Offshore, A Journey to the Weddell Sea," by Barry Lopez (NSF Antarctic Artists & Writers Program), in the Winter 1994 issue of Orion Magazine, is a 17-page description of the maiden voyage of RV NATHANIEL B. PALMER from Louisiana to Ice Station Weddell. "Antarctica," the 1991 IMAX (huge-screen) movie that was made with operational support from NSF and others, has been leased by 65 of the 70 or so theaters around the world that can show it, more than forecast. It's now showing in Atlanta, Calgary, Fort Lauderdale, Kagoshima, Monterrey (Mexico), Paris, San Antonio, Stockholm, and Vancouver. It is narrated in 11 languages.

Vostok, Russia's antarctic interior station, will shut down until November because tractor trains from the coast have not been able to deliver enough fuel. The 1994 crew will winter instead at Mirnyy, doing alternative research and readying the tractors for an October start. A U.S. LC-130 will fly Vostok's 1993-1994 summer team to McMurdo for RV AKADEMIK FEDEROV to pick up. Vostok, operated year-round without a break since 1947, supports deep ice coring of great scientific importance.

A USAP rescue team retrieved the three surviving members of a Norwegian private expedition from a crevasse field east of the Shackleton Range, and evacuated an injured man to New Zealand. A fourth team member had died after falling in a crevasse. The 7 January Science magazine says "the death of a Norwegian adventurer in a 160-foot crevasse in Antarctica has led U.S. officials to propose a certification system for expeditions. The idea is to screen out the unprepared." Jack Talmadge is quoted

**H.R. 3532, THE ANTARCTIC ENVIRONMENTAL PROTOCOL ACT** (Beth Marks, Antarctica Project). On February 8, 1993, Representative Rick Boucher, Chairman of the Science Subcommittee

of the House Committee on Science, Space and Technology, held a hearing on H.R. 3532, "The Antarctic Environmental Protocol Act." This is the bill that the Administration wrote to implement the Antarctic Environmental Protocol. Witnesses from the Administration (Tucker Scully, State Department), environmental community (Beth Marks, The Antarctica Project), and science testified at the hearing. This is the second bill to implement the Protocol to be introduced in the House (Representative Sam Gejdenson of the House Merchant Marine and Fisheries Committee held a hearing on H.R. 1066 last November). We are hopeful that a compromise bill will be agreed in time for the Antarctic Treaty Consultative Meeting in Kyoto this April 1994.

**A HERCULEAN EFFORT BY OLD METHUSALEH.** Norman Vaughan did not make it, but he gave it one hell of a try against extenuating circumstances. The 88-year old college dropout still giving it the old college try! Norman literally did not even have the proverbial pot, yet he parlayed nothing into almost gaining the pot at the end of the rainbow. When he should have been bouncing his great grandchildren on his knees, he was flying around the country telling anyone who would listen to him that he was going to drive dogs to his mountain, and then climb the son-of-a-gun. It was totally unrealistic, as this is the 1990's. There had not been a privately-sponsored American Antarctic expedition in the last forty-five years. The American Guardian Angel of the Antarctic, the National Science Foundation, was really not on the sidelines cheering him on, telling him to go for it. Neither were the environmentalists who are trying to protect Antarctica like the family jewels. So he was fighting tremendous odds, yet he came ever so close to pulling it off.

At this time we don't know just what happened when the Allcair Air Transport's DC6 crashed as it approached the vicinity of Patriot Hills on 25 November. On the plane were the guts of his expedition - 20 dogs, the veterinarian, the dog handler, and a radio operator, plus, of course, the crew of four flying the plane. The good news is that no one was killed; the bad news was that the vet, Dr. Jerry Vanek, was pretty well beat up because his seat broke loose, we believe, when the plane crashed. His skull was fractured, an arm was broken, and he suffered a severely shattered leg. Adventure Network International came to the rescue, and within two weeks Dr. Vanek was recovering in the University of Minnesota Hospital. Twelve pins have been placed in his leg, and he is learning to use a walker.

Four dogs took off on their own for Anchorage, not liking their Antarctic reception one bit. A concerted effort was made to find these dogs, with an aircraft being put up from Patriot Hills, nine miles away. Food was dropped for them, but they were never found. The other sixteen dogs arrived back in Anchorage on 29 December, and what stories they must be telling other huskies in Alaska, probably wishing they had never left the Iditarod!

For all practical purposes, that crash was the death knell of the expedition, although Adventure Network was contracted to take a small assault force to the foot of Mt. Vaughan to climb it in early January. Norman, Carolyn, Vernon Tejas, Brian Horner and the National Geographic film crew were flown to Patriot Hills on 4 January. But the weather turned bad, and on 19 January, Norman "postponed until December 1994" the Mt. Vaughan Antarctic Expedition.

It all leaves a lot of unanswered questions in this one's mind, but they will no doubt come out when an inquiry is done on the crash. We have heard a rumor that the pilot and his crew had never flown in Antarctica before, and if, that is so, that's playing Russian roulette, isn't it? And was there a whiteout? We never read. And what about the surface at Camp DeGanahl? Had it been dragged smooth for skis, or was this a wheeled landing on blue ice?

**A LETTER TO NORMAN.** The following is one person's opinion about what Norman Vaughan should now do with his Antarctic mountain - let it rest in peace, untrodden by human feet. But Norman has indicated that he is going to make another attempt to climb Mt. Vaughan next December. I think the time has come when he should put this behind him, as he made a good, honest attempt to do it his way, and he was thwarted by a series of misfortunes not of his own making. The airplane crash of 25 November doomed doing it by dogs, and then Mother Nature stepped in with some horrible weather which prevented an attempt by the assault force.

I don't think there is any doubt in the minds of those who know Norman that he can do anything physically, but he can't play God in Antarctica. So what if he should stand on the top of Mt. Vaughan. It will only be a personal triumph; his life is full of so many already that he really does not need another. And we aren't certain how history would judge him if he does go back and conquer Mt. Vaughan. Will he be remembered as an expedition leader who would not give up, or as a snow version George C. Patton trying to fulfill an oversized ego? He lost some dogs, he almost lost a life, and we thinketh perhaps that's a message. And there is no way in hell that he could ever get permission to take dogs again.

Norman is a nice guy, a gentleman, and he gave it everything he had this year. We hope he will rest on his laurels. Today he is sort of an ageless wonder. Norman, hang up your mukluks, lay down your ice axe, and count your blessings. After all, you are an alive demigod with a good-looking 51-year old bride. You know, Norman, you may have already died and gone to Heaven and don't even know it!

**I CAN'T HEAR A DAMN THING WITH THESE.** With those epic words, Antarctic Superstar, the indomitable Laurence McKinley Gould, yanked the hearing aids from his ears at a gathering of worshippers, in the foyer of the Gould-Simpson Geosciences Building, who had come to help Larry dedicate, on 23 November 1993, a display cabinet of the hoods of more than thirty honorary degrees that he and the late Dr. George G. Simpson had been awarded. Most of the honorary hoods were Larry's, as he has obtained, to date, twenty-six honorary degrees, which is comparable in the cap and gown industry to the number of shoes which Imelda Marcos had in her palace before she made a fast exit. To allow viewers to identify the hoods, Larry's initials, the name of the degree, the year of the honor, and the name of the institution granting the degree were embroidered on each hood. Among the celebrities attending were two former presidents of the University of Arizona, plus the incumbent, Manuel Pacheco.

The idea of the display came from Tucson geologist Orlo E. Childs, director emeritus of the Bureau of Mineral Technology. Childs, along with a geosciences professor at Arizona, George Davis, collaborated in spearheading a fund-raising drive at the University of Arizona and at Carleton College. One hundred and fifty-odd Larry Lovers donated more than \$7000 to the Gould Recognition Fund, which made possible a large (10'x15'x2V) glass case. Several years ago the building was named for Gould and Simpson, now the display cabinet. It is pretty powerful stuff when a university names a building for you while you are still alive, especially when you did not have to endow it with an autographed check. Among other things, it assured Larry his own personalized key to the men's room so he would never again have to wait in line there. And now, at a young ninety-seven, he has been gilded and put into a glass case in his own building. That is really being revered. He had to have done something right in his lifetime, and, for that, we turn to an excellent article by Jim Erickson in the Arizona Daily Star of 27 November 1993. Although the article doesn't say it, I'm sure Larry went through the ceremonies with one regret, that his dearly beloved Peg, one of his former students, could not have lived to enjoy that day, as, indeed, she was this great man's rudder. Peg was also a great stabilizer in controlling Larry's ego from going off scale!

One way to assess Laurence McKinley Gould is to tally paper, gold, brick and ice: 26 honorary degrees, 10 medals, one University of Arizona building and six Antarctic physical features that bear his name.

A better way to measure Gould, the first American geologist to set foot on Antarctica, is to talk with former students and colleagues. "He's why I'm in teaching now," said UA geosciences lecturer Peter L. Kresan, who took Gould's glacial geology course in 1971. "He had a way of capturing people's imagination and interest. People would take the course just to hear him talk, and it was the best course I've ever had."

"He's someone who motivates and inspires," said UA geosciences Professor George H. Davis. "I've heard people say that Larry Gould is the only person they've ever met who possesses the quality known as charisma. You go in and talk to Larry Gould and you are around a person of just tremendous intelligence and wisdom and wit, and you just feel better as a result of that experience. He is just revered and loved by those people he served."

Laurence McKinley Gould was born in Lacota, Michigan on August 22, 1896. At 13, he picked strawberries for a penny a box, then used the money to buy a biography of Abraham Lincoln, who became his role model. When he was 17, Gould left for Boca Raton, Florida, where for nearly two years he taught kindergarden through eighth grade in a one-room schoolhouse.

Gould enrolled at the University of Michigan in 1916 and intended to become a lawyer and get into politics - like Lincoln. But his academic career was interrupted by military service in World War I. As a member of the U.S. Army ambulance service from 1917 to 1919, he took part in the Meuse-Argonne offensive and, later, in the occupation of Germany. He was cited for bravery on the battlefields of France.

After the war he returned to Ann Arbor, Michigan, and switched his major to geology. He earned a bachelor's degree magna cum laude in 1921, a master's in 1923, and a doctorate in 1925. He was hired by his alma mater as a geology instructor, and in 1926 he served as a geologist on an Arctic expedition sponsored by the University of Michigan.

In March 1928, Cmdr. Richard E. Byrd chose Gould -to accompany him on the First Byrd Antarctic Expedition, and he was named senior scientist and second-in-command. During that expedition Gould conducted the first extensive geological and glaciological survey of the Queen Maud Mountains in Antarctica's interior. Gould and five companions began the grueling 1,500-mile sled-dog journey in November 1929 from Byrd's Little America base camp. Over the next 2 1/2 months they crossed snow bridges that collapsed into deep crevasses behind them, struggled through blinding blizzards and endured weather so cold that it nearly froze their eyelids shut.

Under Gould's direction, the party mapped and charted the mountains, and collected rock samples that showed Antarctica had once been densely forested. They found patches of lichen clinging to some rocks - the only indigenous life found in the region - and collected sandstone demonstrating that the Queen Mauds were part of a great uplifted fault system that stretched across the continent for more than 1,000 miles. Gould described the experience, the last great Antarctic sled-dog trek, in his 1931 book "Cold: The Record of an Antarctic Sledge Journey."

Gould's polar exploits brought him many honors, including: the Congressional Gold Medal, Norway's Cross of St. Olaf, the Explorers Club Medal, the American Geological Society's David Livingstone Gold Medal, and the Chicago Geographical Society Gold Medal.

In 1930, Gould left the Antarctic and returned to his teaching post at the University of Michigan. Two years later, he accepted an appointment as professor of geology at Carleton College in Northfield, Minnesota. Gould was named Carleton's president in 1945, and quickly transformed it from a relatively obscure coeducational college into a top-flight private liberal arts institution. He launched a drive to raise \$10 million to finance campus construction, then brought in more than \$12 million within three years.

Gould returned to the Antarctic in late 1956 to lead American scientific efforts on the continent during the 1957-58 International Geophysical Year. That assignment, during the height of the Cold War, brought him into international deliberations with the leaders of the 11 other nations that shared in the International Geophysical Year investigations of Antarctica.

It is generally acknowledged that the remarkable cooperation which characterized the International Geophysical Year led to the, 12-nation Antarctic Treaty of 1959, which proclaimed that the continent and surrounding waters shall "continue forever to be used exclusively for peaceful purposes." For those efforts, Gould received the Distinguished Public Service Award, the highest award the Navy confers upon civilians.

Gould retired from Carleton College in 1962, and the following year he joined the University of Arizona faculty as a professor of geosciences, a position he held until 1978.

Gould served as the president of the American Association for the Advancement of Science in 1965, and as president of the united chapters of Phi Beta Kappa from 1958 to 1961.

In 1984, when asked to list the ingredients of success, Gould told an Arizona Daily Star columnist: "Discipline - it's indispensable to any successful thing, isn't it? The other essential is integrity. And you can't be lazy. If you have these, and you have any gifts at all, well, there you go."

And in a letter to Larry's close friend, Grover Murray (and his wife Sally), Orlo Childs reflected on the day's events:

For the ceremony, Larry came in a wheelchair to ease the trek from the parking area. He sat in the chair throughout the ceremony, and "held court" as he was surrounded by current students and faculty, all anxious to see and/or meet him. Believe me, his personal magnetism is still very much intact! When he took off his earphones, only a few of us knew he sat there in a silent world, unable to really make out all that was being said. However, his alert attention to the event and to all who came up to him, makes me confident that he knew and appreciated what was going on. We may have to tell him over and over about the event but, "he will be happy all over again!" His pride would not allow him to stay in that wheelchair, so at the close of the ceremony he stood up to stretch his legs, and - using his walker - mingled in the crowd of 200 people who stayed to drink punch and eat cookies.

(Ed. Note: Punch on Larry's Big Day??? We trust there was some enterprising soul who saw to it that Larry's punch had a supplemental kicker.)

**GOD BLESS AMERICA** (Chris Joyner, George Washington University). One of our Society members, Chris Joyner, recently returned from the voyage of a lifetime. Chris, a professor of political science at George Washington University and longtime writer on Antarctic law and politics, was a faculty member on board a seagoing college. Here is his report:

This past September my longtime dream of seeing the world became a reality. My family and I spent the fall term literally sailing around the world as part of Semester at Sea, a fully accredited college program offered by the University of Pittsburgh. Home and campus for 100 days for us, 22 other faculty, and 400 college students was the SS UNIVERSE, a 20,000-ton, 520-foot ship that circled the globe.

SAS provides a seagoing campus that brings the classroom to the world—literally. Students usually take four classes for credit, chosen from offerings in political science, biology, English, psychology, sociology, geography, anthropology, drama, classics, and history. Professors generally lecture, and each class includes assignments relating directly to personal experiences in each country visited. One course, called "Core," was required of all students, and tied the entire trip together with daily lectures on the historical development, current social-political situation, and cultural attributes of each country we visited. No classes were conducted while we were in port.

As a faculty member, I taught three courses—American foreign policy, international politics, and a seminar on the global planetary crisis. My wife Nancy, also a professor, taught a course on "Women and Politics" in exchange for room and board. Our two children, daughter Kristin (age 13) and son Clayton (age 9) cost a little extra, but had the greatest adventure of their lives.

The trip is expensive for students, though – around \$14,000 for tuition, room and board. Side excursions are optional and at extra expense. Most students were undergraduates, but some were recent college graduates, and there were about 35 senior citizens (or, as they called themselves, "Seafarers") who also were aboard. It should also be mentioned that this was not a luxury liner "cruise," as usually construed. Faculty and students worked hard academically while at sea, and the atmosphere and attitudes on board very much resembled those of a college campus dormitory.

During 14 weeks of lecturing and traveling, my globetrotting fantasies came true: I visited the gardens of Kyoto and the Peace Memorial in Hiroshima, Japan; walked through the Forbidden City in Beijing and climbed the Great Wall in China; gazed in wonder at the Taj Mahal and Hindu temples in India; stood in awe before the Great Pyramid and Sphinx in Egypt; marveled at Suleyman Mosque and the labyrinthine Grand Bazaar in Istanbul, Turkey; wandered around the ancient ruins of the Parthenon and the Temple of Delphi in Greece; bargained in the Berber Bazaar of Marrakech, Morocco; and sampled the wonders and cultures of four other lands in between—beautiful Canada (especially Vancouver, where the voyage began), industrializing Taiwan, paradisaical Malaysia/Singapore, and depressed Ukraine/Russia. These are the things that textbooks and lectures in the classroom can never teach even the most dedicated student.

The veterans of these voyages say that those who partake of the SAS adventure are changed forever, and I know that they are right. The faculty, staff and students on board became very tight-knit as a community. Many will be friends forever. International news about these countries now affects us in more personal ways. We have been there, and met the people, walked the streets and tasted their cultures. And for me sunsets and sunrises will never be the same. Nor will thoughts of the ocean, the movement of the sky, or the brightness of the heavens at night.

But perhaps most important, I acquired a renewed fondness and deeper appreciation for an America that most of us take for granted. On that last shipboard day together in December, when we sighted Port Everglades, Florida, you could feel the patriotism in the air. Yes, each of us had been touched in different ways by our experiences in those 12 countries and as a shipboard community on the

UNIVERSE. But we also learned that the opportunities in the United States are privileges offered nowhere else. It was a wondrous four-month journey, but there really is no better place than home. That realization, more than any other, makes the Semester at Sea adventure truly meaningful as a lifelong learning experience.

Ed. Note: We had to do a bit of bargaining with Chris to get him to write this great account, but it was worth it. For a political scientist, he is interesting. Chris, who teaches international law and world politics at George Washington University, has published more than 100 scholarly articles on Antarctic law and politics in books and international law journals over the last decade. The author of *Antarctica and the Law of the Sea* (Martinus Nijhoff, 1992) and editor of *The Antarctic Legal Regime* (Martinus Nijhoff, 1988), he has just completed a book entitled *Eagle Over the Ice; U.S. Foreign Policy in Antarctica* (co-authored with Ethel Theis, tentatively forthcoming from the University Press of New England, 1994), and has begun work on another entitled *Antarctica as a Global Commons; Law, Politics and Environmental Priorities* (South Carolina University Press, 1995).

**MIKE TRIMPI - NOT YOUR RUN-OF-THE-MILL KIND OF GUY** (Rob Flint). Mike Trimpi came by a couple weeks ago (October 1993). He's a New Englander - lives in Canaan, New Hampshire, not far from Dartmouth where he's worked now and again for the better part of the last 20 years. He is another Stanford-John Katsufakis protege who originally went to Eights Station for the 1963 winter, and was Station Scientific Leader at Byrd during the tragic 1965 winter when Carl Disch was lost. My heart goes out to Mike every time I think of his having had to deal with that tragedy. Mike later wintered over at Palmer Station in the last decade, and is even now involved in the Antarctic - was down last year on the Lockheed-sponsored Unmanned Geophysical Observatory. He's also the discoverer of the eponymous Trimpi-effect, the decrease in signal strength of man-made VLF signals caused by natural VLF emissions. (I think I have that right - Mike could explain it better.) He's also a recent college graduate in music, with a major in composition from the University of New Hampshire.

**RON SEFTON WINTERED OVER AT BYRD THREE TIMES IN FIVE YEARS** (Rob Flint) Ron Sefton, who wintered over at Byrd Station in 1962, 1964, and 1966 (surely a record for SOMETHING - Byrd-brainedness?), and his talented wife Nancy (much-published and underwater photographer and writer) are presently building a house in Poulsbo, Washington, though they are keeping some of their property on Little Cayman. Ron was my original mentor and partner at Byrd in 1964. We traveled around the world together on the way home in 1965. On that trip we visited New Zealand, Samoa, New Caledonia, Fiji, Australia, Singapore, Thailand, Hong Kong, and Japan. In Japan we were entertained by Japan's "Dr. Antarctica," Tetsuyu Torii - "I am Big Face in Tokyo - what you want, ask ME." He was a marvelous host

**SIR CHARLES WRIGHT** (Rob Flint). Sir Charles was known for his love of Manhattans. On one occasion he came by Stanford and John Katsufakis organized a dinner with all the local Antarctic and geophysical types at a nice local restaurant. We had settled down in the lounge, and Sir Charles felt he needed to get a waitress's attention, and he quickly corralled one. "Young lady," he said, "young lady, my friends would all like a drink. Yes, they would all like Manhattans," turning to us, "you WOULD like Manhattans, wouldn't you?" and without even waiting for a reply, back to the waitress, "My friends would all like Manhattans!"

And then a story that may or may not be true, but nonetheless makes a good story. When he was scheduled to leave the Antarctic continent at the end of the 1965-66 season, as on so many other occasions, there were long airplane delays. So the

travelers and a contingent of Navy officers repaired to the Officers Club at McMurdo for a few Manhattans. The time dragged frustratingly on - so characteristic of Antarctic travel - with no word from Willie Field about plane scheduling. Finally, a young officer, his courage fueled by the Manhattans, no doubt, asked the Great One the burning question: "Sir Charles, what do you think of the Antarctic now?" And the Venerable One, without a moment's hesitation, mumbled his pronouncement: "You can have your - - - Antarctic!" Well, as I said, it was the current story at the time.

A LOW-LATITUDE ANTARCTIC GAZETTEE (continued - Robert B. Stephenson). Moving to the Antipodes, it isn't surprising that New Zealand is home to many points of south polar interest. First and foremost is the Canterbury Museum in Christchurch which I suspect has the largest collection of artifacts on display anywhere in the world, and no doubt much more that is in storage. Its library is impressive as well. It's very centrally located on Rolleston Avenue and adjoins the superb Botanic Gardens. Among the artifacts that caught my fancy are a china plate from HMS EREBUS; quite a few philatelic items; busts of Scott (by his wife), Shackleton, Amundsen, Byrd (by de Weldon) and Mawson; Hurley's Kodak Model B pocket camera; Amundsen's pocket knife; an oil painting of Shackleton's NIMROD done on a venesta case board (also used to bind copies of the Aurora Australis); Scott's ceremonial hat, belt, epaulettes, sword (he must have been well supplied with swords); Maggs Bros, catalogue No. 1145 - recently listed one at 6,000!), polar medal and Legion of Honor; Shackleton's Arrol Johnson motor sledge; a bottle of champagne (Mathusalem size - 6.5 quarts!) emptied in celebration of Byrd's safe return from the first flight to the Pole (inscribed by expedition members); Wilson's microscope; a box of cigars from Scott's last expedition with typed inscription "for final dash, compliments of the Sol factory, Havana"; original plan and inscription for Cape Evans cross in memory of A.E. Macintosh; and the silver communion vessels from Scott's Cape Evans hut.

In nearby Lyttleton, the port for Christchurch, is the Lyttleton Museum which is crammed with interesting things, including a large Antarctic collection. Among the highlights are a stuffed Emperor penguin, a model of the DISCOVERY, and a sledge from Shackleton's Nimrod expedition. A few hundred feet away, attached to a pedestrian bridge abutment, is a plaque that honors those four Antarctic ships of exploration--DISCOVERY, MORNING, NIMROD and TERRA NOVA--that used Lyttleton as a port of departure during the decade 1901-10. In the harbor, on Quail Island, is the site of the dog kennels built for Scott for quarantine purposes. I've not been there, so I'm unsure what remains, if anything.

In Wellington, there is the Byrd Memorial on Mt. Victoria. Dedicated in 1963, it is composed of a bronze bust of Byrd, sculpted by Thomas Johnston, set within a tent-like structure that faces south to the ice. Imbedded in this are rocks from the Antarctic. When I visited it, I thought it looked a bit woebegone, so it was gratifying to learn that others had the same reaction, and that it has since been renovated, and was rededicated on June 21, 1993.

Wellington is also home to New Zealand's national library, The Alexander Turnbull Library, a modern and efficient building that has a worthy collection of Antarctic material, including three sets of the South Polar Times (one formerly owned by Mrs. Wilson) and two copies of the Aurora Australis (the BEANS and JULIENNE SOUP copies), arguably the Antarctic book collector's ultimate prize, the first book written, illustrated, bound and published in the Antarctic during Shackleton's Nimrod expedition. Among the Turnbull's manuscript collections are the papers, journals or diaries of Rupert England (chief officer of the MORNING), C.H. Hare (Discovery expedition), Harry McNeish (carpenter on Shackleton's Endurance expedition), John King Davis (logbook of the NIMROD 1908-09), Ernest Joyce, and Thomas Orde Lees (Shackleton's Endurance expedition).

In Auckland, I found a small collection of Antarctic artifacts in a hallway display case in the Auckland Institute and Museum. Included are crockery from the Discovery expedition, a Wilson watercolor, an inkwell made from the timbers of the DISCOVERY, and a variety of medals and memorabilia.

Unhappily my year-long stay in Australia in the mid-sixties preceded my Antarctic collecting interest, so I am unable to say much about sites there. I understand that one of Mawson's sledges is at the Australian National Museum in Canberra (also Hurley's diaries and probably a lot more). And at the Mawson Institute in Adelaide there is a bust of Sir Douglas as shown in a recent issue of ANARE News. I expect that the Institute has a good collection of artifacts as well.

South America must have points of Antarctic interest, but the only one I'm aware of is the prow of the YELCHO, the tug that rescued Shackleton's men from Elephant Island. It's in Puerto Williams.

**DEFINITION OF OPTIMISM - NORWEGIANS IN ANTARCTICA TO RETRIEVE AMUNDSEN'S TENT.** Some things are so ridiculous they are totally absurd, and the nine-member Norwegian expedition to recover Amundsen's South Pole tent was really going for a needle in a haystack. Even if you knew how deep it was buried, how could you find a piece of canvas encased in ice? You could no doubt figure where the Geographical South Pole was in 1911, but how close to the real South Pole was Amundsen? Like the phantom tag of second base on double plays, all one can be certain of is that it was in the vicinity. And with all the airdrops all over the South Pole, the whole area has experienced major modifications.

However, the Lillehammer (Olympic) Organizing Committee evidently had more money than they knew what to do with, or else they had some secret no one else knew about, as they partially funded the expedition. And somehow or other, an expedition member, Jostein Helgestad, 36, fell into a 165-foot crevasse, and that was fatal. Despite rescue efforts, they were never able to recover his body. This happened near the Shackleton Range, which makes us wonder what they were doing there in the first place. Certainly crevasse training is the last thing you need if you're going to the South Pole.

**CONNIE SWAN, A NICE LADY.** Over a decade ago we got a reservation by mail from a woman in Rockport, Massachusetts for our annual Paul C. Daniels Memorial Lecture, and we wondered why this person, Constance Swan, was coming all the way to Washington to get lectured. She showed up; she was small, if not diminutive; she was quiet, yet very personable; and her love for Antarctica knew no bounds. She had been there several times on cruise ships, as well as to the Arctic. We introduced her to some of our heroes, and tried to make her feel like a most welcome guest, which she certainly was. And she became, more or less, a regular returnee to all of our annual Memorial Lectures. We knew when she lost her husband, but through all the years we really didn't know much about the Returning Rockport Swan.

Now the Swan will not be returning anymore, because after a lengthy battle with cancer she passed away at age 75 on October 28, 1993. And it was only through her family that we learned about the distinguished life this unassuming lady had led. We will miss this quiet soul, and our Memorial Lecture dinners just won't seem the same without her. She must have liked us - probably because of Ruth Siple's goodness -because in lieu of flowers, memorial donations included the Antarctic Society. We have received donations from six of her relatives and friends: Dorothy A. Brown, Mr. & Mrs. Alan Fink, Elise B. Jack, Mrs. Howell F. Mann, Beverly Quint, and Mrs. Clara M. Swan. We are sorry her number was called, but we rejoice in the fact that she must have enjoyed us.

# THE ANTARCTIC SOCIETY

No. 5

*First Lecture by An Operations Manager*

## AEROBICS TO ZODIACS: AN A TO Z GUIDE TO LIFE AT PALMER STATION

### Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94

### Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, jr.

### Paul C. Daniels

### Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Sayed Z. El-Sayed, 1990  
Dr. Charles W. Swithinbank, 1991  
Dr. Susan Solomon, 1992  
Dr. Michele E. Raney, 1993

by

Ann Peoples

Operations Manager  
Palmer Station

on

*Thursday evening, April 21, 1994*

8 PM

National Science Foundation  
4201 Wilson Blvd., Arlington

Room 375

(Entrance at back of building on the corner  
of 9th St. N. & N. Stuart St. one-half block  
from Metro Ballston Station)

Ann Peoples majored in Anthropology at Wheaton College in Norton, Massachusetts, and while a student, she worked summers for the National Park Service. Her route to Antarctica was via the Grand Canyon, Mesa Verde, and Gates of the Arctic. Ann's Antarctic career began in 1981, and by 1986 she was a full-time penguin. She has worked as Berg Field Center Manager at McMurdo and as Logistics Manager for Antarctic Support Associates. In 1991 she became the first woman hired as a Station Manager for USAP. She has been driven by a commitment to education and management of natural resources, and guided by a love of the outdoors.

*Don't forget the Grand Opening of Neelon Crawford's exhibit at the National Academy of Sciences, 2101 Constitution Avenue, Washington, DC on Friday, April 8th, with a reception from 5:30 - 7:30 PM. to which the public is invited.*

Our Society has had 170 lectures in the history of our lifetime, dating back some thirty-five years, and we bet that our Honorary President has attended close to 160. For the past sixteen years, she has missed only two or three! Not only that - in those sixteen years she has made all the coffee, even though truck-driver strong, and bought all the cookies. She has mailed out every calendar, every cachet envelope, every book sold. She provides her home as our headquarters, she answers all the mail, and she pacifies all irritators who don't like something. And at least twice, if not more, she has talked this soul from retiring from a thankless job, as she evidently doesn't want me to have peace and tranquility in retirement. Is there any other society which is the product of one person's commitment and dedication? We doubt it. So the next time you see Ruth Siple, give her a pat on the back and say, "You are doing one hell of a great job." Otherwise she might stop typing these things - she does them in one day - and folding and stuffing and mailing 600 envelopes, which takes about twenty-four more hours.

Haste makes waste. Last Newsletter - Vostok has been in operation only since 1957; the David Livingston Medal should have been credited to the American Geographical Society; and we misspelled Port Lyttelton.

Remember, this so-called misnomer of a Newsletter is NOT the voice of the Society, just an isolated voice of someone miles from the centers of Antarctic activities.

**WOMEN IN ANTARCTICA--HISTORY AND ISSUES**, was the subject of an open panel discussion on 22 March at the National Science Foundation. This was all part of NSF's celebration of Women's History Month, sponsored by the Office of Equal Opportunity.

Kim Fassbender, Senior Program Assistant for Polar Operations at NSF gave a slide presentation about the U.S. Antarctic Program, and presented statistics on women (?) in the program. She shared perspectives on administration of the 1200-person McMurdo Station.

Dr. Michele Raney, newly appointed to the faculty of the UCLA Medical School's Department of Anesthesiology, provided the history. Michele, who was the first woman to winter over at the South Pole in 1979, finds herself now as sort of an Antarctic human fossil, as she opened the wintering-over doors for women at the South Pole, and they haven't been closed since. In fact, for the first time ever, this year's wintering-over party at the South Pole has a woman in charge - Janet Phillips, Facilities Engineer with Antarctic Support Associates. Michele participated in an international conference on Women in Antarctica in Australia last August, and she told those attending this panel discussion everything they ever wanted to know about women in Antarctica. By the way, Michele came back from Down Under as sort of a heroine, as she was the object of many interviews and television appearances.

The other panelist was Rebecca Johnson who is writing a book for young readers about women in Antarctica. She won the National Science Teachers Association Award for the best science book in 1993, *Investigating the Ozone Hole* (Lerner 1993). In April she will be the keynote speaker at a four-state conference for young women on WINGS (Women Investigating Science and Mathematics). Did I miss something there in that acronym?

Guy Guthridge, Manager of the National Science Foundation's Polar Information Program, will be the convenor and moderator.

**THE CLAIRVOYANT PAUL A. SIPLE**, in his PhD dissertation at Clark University in 1939 wrote, "If in the distant future Antarctica should prove to be of sufficient commercial value for the establishment of a permanent base, perhaps the power of both solar radiation and wind could be harnessed to the extent that inhabitants could cook food and heat their houses by this transposed energy."

Turn the calendar ahead by fifty-five years, and what do we have? Heating of the summer dormitory building at the South Pole. At least the solar unit ran some 96 hours during the period 18 February through 26 February, when the sun was relatively low in the sky, 11°52'56.9" to 8°59'02.2". During one week the three and one-half story building needed to burn only 12 gallons of fuel to supplement the heat generated by its solar panels. Now if they could just find a way to keep the sun above the horizon for the whole year, NSF would have it made.

The solar collectors are simple cells, in which sunlight passes through glass faces, behind which sheets of copper, coated with black chromium powder, absorb solar radiation. Air circulated through chambers behind the hot copper plates is pumped through the building's ventilation system. John Lynch was quoted in Malcolm W. Browne's article in the New York Times of 22 February as saying, "This can eventually lead to a lot of solar heating at the Pole and some significant fuel savings."

That same article by Browne ended up with a paragraph on unconventional designs and technology reducing costs, and gave a for-instance, "new buildings built on stilts, allowing snow and ice crystals to blow away instead of piling up against walls." Well, good luck to them, as anyone familiar with the Dye stations on the Greenland Ice Cap knows that those stations had to be jacked up periodically, as huge drifts of snow were deposited upwind of the mammoth seven-story buildings.

And the current issue, September 1993, of the Antarctic Journal shows windmills on Black Island being used as an alternative source of energy for a satellite communication facility. So the late Paul Siple was 2 for 2 in his crystal-balling for the Antarctic way back in 1939. You can't beat perfection!

**FARTHEST SOUTH** (with apologies to Sir Ernest). The Coast Guard icebreaker POLAR SEA on 5 February reached the new southernmost point on Earth accessible by surface ship - just 690.1 nautical (?) miles from the South Pole - at the Ross Ice Shelf near Roosevelt Island. In 1987 an iceberg (B-9) had calved from the shelf's former Bay of Whales area, leaving a bay more southerly than Gould Bay on the Filchner Ice Shelf. The ship was doing oceanography and mapping for Lamont-Doherty Earth Observatory, and now is on the way to Sydney, its antarctic work done.

**CHIEF OPERATING ENGINEER ON BYRD ANTARCTIC EXPEDITION SUCCUMBS.** Clay Bailey died January 21, 1994 at his home in Sedona, Arizona, at age 87, ending a rather long and distinguished career, which included being the senior radio operator on the Second Byrd Antarctic Expedition, 1933-35, as well as being Director of Communications on the U.S. Antarctic Service Expedition, 1939-41. Clay served as fleet electronics officer on Admiral Halsey's staff on various flagships, including the USS MISSOURI, during World War II. Then in 1951 he joined Hazelton Electronics as division head and manager of their Whitestone Division in New York. And his last employment was as supervisor of engineering and experimental work for the Pomona Division of Convair.

On the second Byrd expedition he personally transmitted and received one million words with the Mackay Radio Company, the channel for the expedition traffic. Because of the

speed and volume of traffic keyed by Clay, the Mackay Company found it necessary to send two special operators from New York City to San Francisco in order to handle his traffic. And, for the very first time, he transmitted radio photographs over a distance of 10,000 miles.

In 1940 Admiral Byrd called him the foremost expert in the Naval service in polar communication problems. He organized the Communication Department of the Antarctic Service, drew up a comprehensive plan covering Navy, Army, commercial, and amateur channels, and drafted the specifics under which the radio equipage of the Antarctic Service was manufactured.

He is survived by his wife Frances and several nieces and a nephew. Internment was at Arlington National Cemetery, where he joined Byrd, Balchen, and Black. Could we say that the BBBB is now operating on a very high frequency?

**A LOW-LATITUDE ANTARCTIC GAZETTEER** (Robert B. Stephenson - concluded). For those of us who have no legitimate reason to go there, Antarctica isn't the easiest place to visit, nor is it the cheapest. But vicarious travellers can find places of Antarctic interest close to home and, for the dedicated enthusiast, some are certainly worth a look. I've been collecting these low-latitude Antarctic attractions over the years, and would welcome any additions, of which I'm sure there are many.

Right here in the U.S. Richard Byrd rightfully dominates my American Collection. There's, of course, the statue on the Avenue of Heroes in Arlington National Cemetery, across from the visitors' center (his gravesite is a few hundred feet further into the Cemetery). Dedicated in 1961, the sculptor was Felix de Weldon who also did the Iwo Jima Memorial not far away. (A similar version, as a bust, is in front of the NSF Chalet at McMurdo; and another full-size version is at the National Antarctic Center in Reedsport, Oregon. And probably more still elsewhere.) At the Naval Academy Museum in Annapolis there's a bronze bust of Byrd in naval uniform sculpted by Benjamin T. Gilbert. (I had heard that a sledge from one of Scott's expeditions was at the Academy, but no one seemed to know about it when I was there.) The Admiral's Boston home is at 9 Brimmer Street, at the foot of Beacon Hill. It was still in the family until sometime in the 80s and has since been renovated. (No plaque or other indication of its famous occupant; in fact, there's no memorial to Byrd of any kind that I know of in Boston, which seems a pity.) At the Pine Ridge Cemetery for Small Animals, in Dedham, Massachusetts, there is the grave of Igloo, the Admiral's loyal fox terrier who was a seasoned traveler on the ice. His headstone resembles a rather large iceberg. A few miles to the west, in Framingham, there are some Byrd memorabilia on display at "Ebenezer's Place," a bar in the renovated railroad station in the center of town on Rt. 135. At Loon Mountain in Lincoln, New Hampshire, there is a display case in the lobby of The Mountain Club, where there is a small American flag that Byrd gave to Sherman Adams in 1954. Byrd's accompanying letter says that "this flag was...with me on our flight over the South Pole in 1929 and all of my major flights of exploration. It was also with me when a combination of unforeseen circumstances forced me to spend the winter night alone at scientific duties in the shadow of the South Pole."

In Wonalancet on Route 113A are the Chinook Kennels, commemorated by an official state historical marker (Antarctic was misspelled on the first version!). Many Alaskan Malamute and Siberian huskies were raised and trained here (and at the kennels' original location perhaps a mile away), including those handled by Norman Vaughan. Eddie Goodale and Fred Crockett on Byrd's first expedition. Also there is a memorial stone dedicated in 1938 by Byrd "To All Noble Dogs" who gave their lives in U.S. service. A third stone, with a dogsled engraved on it, memorializes the Seeleys who owned and ran the kennels for many years.

At the Washington Navy Yard is the Navy Museum, a cavernous warehouse full of interesting exhibits, including a large one devoted to polar subjects, both north and south. Byrd's famous hut (*Alone*) is recreated there, as well as a variety of odds and ends, such as radio equipment, clothing, and the original stove with kerosene burner that almost led to disaster. On the roof of the hut are two stuffed penguins: an Adelie and an Emperor. Included in the display cases are polar medals, extensive collections of Finn Ronne and Byrd memorabilia, a 1965 1"=100' model of McMurdo Station, numerous examples of expedition china, and even Byrd commemorative wood matches and paper cups, and two tires from a Ford Trimotor. There's both an oil portrait of Byrd by J. G. Cowell, and a 30-inch high statuette (by de Weldon from the looks of it). Some Scott items are on display, too: A Wilson watercolor, a telescope with Scott's name engraved on it, and several items (a theodolite, a film container, and chocolate) lent by the Mariners Museum in Newport News. There are two fine ship models: the FLYING FISH (one of Wilkes' ships) and the ASTROLABE (Dumont D'Urville's ship) crafted of ivory. A large collection of papers and artifacts concerning both American and British Antarctic exploration are at the Navy Yard, catalogued but not on exhibit. Charles Wilkes' pistol is there, as is his copy of the *History of Greece* (London 1829); a cake of hand soap and a box of matches from Shackleton's hut at Cape Royds; a wood fragment from the bow of Ross's HMS EREBUS; a variety of food rations from Scott's last expedition.

Of course, Washington has a variety of Antarctic material not on display. The National Archives, the Smithsonian and the Library of Congress all have diverse collections of printed and manuscript material, as do the usual places that are familiar to most Antarcticans: Ohio State, Dartmouth, CRREL, and so on.

(Robert Stephenson welcomes any comments, particularly additions, about the location of significant Antarctic items. His address is: P.O. Box 435, Jaffrey, NH 03452-0435.)

**COMMENTS ON SOME ANTARCTIC AUTHORS AND WRITERS.** The Winter 1993 issue of Orion Magazine has a feature article on the R/V NATHANIEL B. PALMER by the erudite bard from Oregon, Barry Bishop. Ever since I met Barry a couple of years ago, I have had this innate feeling that he is the premier spokesman for Antarctica. Larry Gould will forever more be the Golden Tongue Orator on Antarctica, but when it comes to the written word, does Barry have an equal? We think not. But it started us thinking about who's who among Antarctic authors and writers, and since we need material to fill space in this Newsletter, why not provide some more very bias material for you?

Very few Antarctic writers/authors have come from the rank and file of Antarcticans who spent time on the ice. Probably the most noted was the late Charlie (BAE II) Murphy, whose biographies on the Duke and Duchess of Windsor were big sellers. Much of Charlie's life was spent with Time, Life, and Fortune magazines, being the bureau chief in Washington for Fortune for fourteen years. He was a prolific writer on defense and intelligence. We had the pleasure of getting to know Charlie a bit when we both were in Washington, and letters from Charlie to our Society were classics. And he went out in style, with classical music filling the church's amphitheater, then his family inviting one and all to one of Charlie's favorite watering holes, the Army-Navy Club in Washington.

Very few Americans have written books about their Antarctic visitations, although Paul Siple, Larry Gould, Joe Hill, Dick Chappell, Gil Dewart, Jack Bursey, Finn Ronne, and Norman Vaughan come to mind. The Ohio State University Press will be publishing the late Bert Crary's volume on his polar life, although this may be a year or two downstream. Wild Bill Cromie, who fast-talked Bill Field into supporting his Antarctic application, somehow or other ended up in the writing arena, once serving as a ghost writer for some of the early astronauts, later being the Executive Secretary of the Scientific Writers of America, and now he is at Harvard. Is that right, Cromie at Harvard? Cambridge will never be the same.

There are other Antarcticans who have published limited editions of their own journals, but who could not be classified as professional authors. One is Charles Passell, the geologist on the U.S. Antarctic Service Expedition, who assisted Paul Siple in conducting his original wind-chill experiments. A polar book dealer fell into a copy a couple of years ago, and was asking a fantastic price for what he called a classic!

Chief Julian "Goody" Gudmundsen recently sent me his memoirs, a great hundred-page glossy edition, liberally sprinkled with family pictures, and a genealogy which goes back to the 1200s. Goody made seven trips to the Antarctic, volunteering for the first one, then going south the other six times at the request of the Navy. "The handle here is Golf, Oscar, Oscar Delta, Yankee" was heard frequently by ham radio operators contacting the Antarctic on single side band back in the early Deep Freeze days. His book is not so much an Antarctic story as it is a family history, and it is interesting as the devil. He has had quite a life, and hobnobbed with the elite when he was assigned once to Camp David. A nice guy.

A unique Antarctic is Moe Morris, ex-VXE-6 pilot, who was active flying in Antarctica during the 1960s, being its Commanding Officer in 1964, 1965, and 1966. As most of you know, he has turned author, and just recently sold another book. His publication list shows five novels, two non-fictions, and a children's book.

In a letter from Moe of 24 February he writes, "I've just completed *Salinika Incident*, a contemporary thriller set in the waters around and on the island of Oahu. My usual stuff. A Navy frigate accidentally encounters an Iraqi terrorist ship that is threatening Oahu with an airborne biological attack. The frigate sinks the ship (the SALINIKA), and because of the main plot circumstances, the skipper of the frigate is court-martialed. A little twist there. Avon Books will be releasing it in mid-95. I'm also trying my hand at a children's book, *Pete, The Perfect Penguin* (What else...) and doing the illustrations as well as the story. A fun project.

"I'm keeping my fingers crossed concerning developments on the possibility of a TV or HBO movie of *The Icemen*, my 1989 effort. I did get a serious inquiry from a West Coast production company, Media Enterprises Inc., and their representative asked me if I would be interested in selling the movie rights to the book and also do the screenplay. They have a site picked out in Canada for the filming. When I reminded them that there are no trees or foliage in Antarctica, they mentioned that they had a spot that was pure ice and snow--so it sounds like they've done some homework. I should hear something next month; meanwhile I have started on the screenplay, and the book is adapting well to the format. If it materializes, I will make a pitch to also be a technical advisor since the setting is dear to my heart, and I would hate to see it go 'too Hollywood'."

An early-on favorite of mine is Walter Sullivan. He is sort of the Charles Kuralt of the Antarctic, having been "on the road" to Antarctica since the mid-1950s. I will always be indebted to Walter, as his articles in the New York Times on Antarctica during the IGY made the continent and its programs very much alive for my late father. Walter has a 40-year old Antarctic track record, and we thinketh he has loved every minute of it.

On the other hand, two individuals who fired only one Antarctic salvo and then went on to greener pastures, Alfred Lansing and Stephen J. Pyne, left their eternal footprints in the snow. Lansing's *Endurance*, at one time, was the largest selling Antarctic book of all time in this country. Probably part of its success could be attributed to the fact that it was the Alternate selection of the Book of the Month Club.

And Pyne's book, *The Ice, A Journey to Antarctica*, may be the most profound book ever written by an American on Antarctica. I'm still looking for the first person to have read every word, yet it is a great book. But, unfortunately, it's like marching

through waist-deep snow. When I reviewed the book for this Newsletter, I said it was a book you should give to your most elite friends, because, if they read it, they would think you were a true scholar to have selected it. And the book did get all kinds of accolades and awards back in 1990.

In contrast to Pyne, I find everything that Michael Parfit has written to be not only most enjoyable, but easy reading. And, in the end, is that not the bottom line - readability? I could pick up anything Mike has written and enjoy it, as all of his many articles in the Smithsonian have been good reading. Another man who has written a lot on Antarctica is Charles Neider. I have never been enraptured by his style of writing, but we know he has legions of followers in the Antarctic community.

David Campbell's book, *The Crystal Desert*, received the Houghton Mifflin Literary Fellowship Award in 1992. A valued learned friend tells me that it has more than a few mistakes, and I don't really warm up to any book centered north of the Antarctic Circlet. You know those areas are great places to visit, but .....

My true literary love, ever since grade school, has been biographies, and naturally I have hung on every word written by Roland Huntford in *Scott and Amundsen*, then *Shackleton*, and, hopefully, *Nansen*. And I wistfully pray that he will do Mawson, although from what his neighbor, Charles Swithinbank reports, he really has no interest in closing the loop with Mawson. Having personally known so many of Byrd's men and their feelings towards him, there was no way in hell that I was going to get enthralled by Eugene Rodgers<sup>1</sup> .biography on Byrd, which I considered an out-and-out hacket job.

Writing these Newsletters for the past fifteen years - this is Number 95 - I have found the late Ken Bertrand's book on *Americans in Antarctica* a great reference source on the United States' participation in the Antarctic up to the IGY. Bert Crary's book will fill a much needed void on the IGY. An invaluable general reference book for Antarctica is the Reader's Digest's *Antarctica*. If I could have only one Antarctic book in my library, it would be that book, as it has all one needs to know about Antarctica.

There seems to be a virtual potpourri of books on the Antarctic Treaty and the political landscape of Antarctica. I find the annual reports by Lee Kimball much to my liking, as they are more timely than books which are almost outdated by the time they reach the bookstores. But I am sure Chris Joyner, Deborah Shapley, Phillip Quigg, and Bill Westermeyer have their followings, too.

One of my favorite magazine articles on Antarctica was Katherine Bouton's "A Reporter at Large, South of 60 Degrees South," which appeared in the New Yorker for March 23, 1980. As I recall, she is an anthropologist, and, to the best of my knowledge, never wrote another article on the Antarctic.

Another of my favorite Antarctic writers is Charlotte Evans of the New York Times. She writes with a good deal of humor, and many of her articles from McMurdo a few years back were really delightful. We met her originally at a bus stop in Wellington, before her Antarctic involvement, when she was more or less writing on and about New Zealand for the New York Times. She has been victimized for the past two years by a severe case of tendonitis. So she has been working in the home office, instructing young writers, and occasionally doing things on a word processor which is responsive to the human voice. That's better than having an unresponsive husband or wife!

The Polar Times is alive and doing well. The indefatigable Brian Shoemaker writes that the American Polar Society now has a membership of "800 or so." And he adds, "I sure never knew what the job would be like taking over The Polar Times." When frustrated Dick Chappell called me up one Sunday and asked who in Heaven's name they could get to take over The Polar Times, I told him that Brian was just the right person for the job if he could talk him into it. So it has been a good marriage, and

Brian is planning to buy some desktop publishing equipment to speed up his publishing. Memberships are \$10 per year; his address is American Polar Society, Box 692, Reedsport, OR 97467.

Wonder whatever happened to that polar historical journal that was being published by this guy up in Bangor, Maine. Is it still alive, or did it die a natural childhood death? The editor sort of lived underground, although I believe Bill Littlewood actually had a sighting of this person.

In closing, let me tell you about how the Antarctic converted a reporter or science writer for the Christian Science Monitor. This fellow, Jim Sparkman, visited Antarctica for his newspaper in the early 1960s and was enraptured by all the good science he saw going on around him. He must have been snakebit by the likes of Charlie Bentley, Ned Ostenso, John Behrendt, and Hugh Bennett, because, when he got back to the States, he bought an airline ticket to Madison, Wisconsin, and appeared at the door of the mentor of the above students, a well-known geophysicist by the name of George Woollard. Jim said he wished to become famous like those other guys, and was willing to enroll in Woollard's graduate school. But George had no space for another student, so he told Jim he should walk down the corridor and enroll in the graduate school of meteorology with Lettau the Elder. Then he would be in Wisconsin, and he could cross disciplinary boundaries and take courses in geophysics in his department. This worked out great, and Jim got his PhD at Wisconsin. Heinz Lettau told me later that Jim's reports to the department were in a class by themselves. Last seen Jim was lost in the bureaucracy of NOAA in Washington. We wish this true story had a better ending, but at least one reporter saw The Light!

**A PLACE CALLED CAPE COLBECK** (Alan Campbell on the R/V NATHANIEL B. PALMER, 27 February 1994). I have never seen anything like it. Under a beautiful golden light we passed through an immense field of mostly tabular icebergs, most well over 150 feet above the water. With turquoise green skies overhead, they all glowed as if lit from within. We have a Kiwi (New Zealand) scientist aboard studying their shapes and distribution, and he confirmed that we saw well over 1000 in the morning's passage. Since then we have seen the tally pass 4000! The scale and grandeur of this place continue to astound. --- Over the next few days (February 17-22) we saw our first sunset/sunrise (30 minutes), and passed through several strange days of fog, ice channels and great tabular bergs. Each day the sun stayed down for at least a half hour longer. From the 22nd to the 24th we cruised to a series of stations along the Getz Ice Shelf, and passed by Mt. Siple .....One particular sunset was spectacular, with bright pinkish red light skimming across the sea ice and hitting all the distant icebergs. Then we spent several days heading due north, eventually reaching open seas at 67 degrees before turning back on our present course south. We have seen plenty of seals and penguins, both Adelies and Emperors, on the ice floes throughout the trip.

**DAUGHTER OF U.S. ANTARCTICAN COMPETES IN HER THIRD WINTER OLYMPICS.** Dorcas Wonsavage, daughter of Steve (Little America V, plus austral summers) Den Hartog, was a member of the 17-person cross-country Olympic ski team at Lillehammer, competing in the 30-kilometer race, where she came in 40th in a field of 52 racers. It was Dorcas's last Olympics, as she indicated that she will no longer compete internationally. After all, she is 29 years old, and we all know that life is really for the young.

She retires with notoriety, as her 23rd finish in the 20-kilometer freestyle event at the 1988 winter games in Calgary was the very best American finish ever in that event. At Middlebury College she was the 1985 NCAA Ail-American cross-country champion, and in skiing was a Worlds Junior as a sophomore, an Ail-American as a junior, plus participating in three Olympics. Dorcas is now one of us, living in Farmington, Maine, and we are proud to have her as a Flatlander.

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubín, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rurford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

Paul C. Daniels

Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982

*Our Brief Annual Business Meeting Will Precede This Lecture*

**"NO MORE HERO STUFF":**

**CHANGES IN LIFE AT SOUTH POLE STATION SINCE THE IGY**

by

Dr. Jeffrey C. Johnson

Associate Scientist

Institute for Coastal and Marine Resources  
East Carolina University  
Greenville, North Carolina

on

*Monday evening, May 23, 1994*

7:30 PM

National Science Foundation  
4201 Wilson Blvd., Arlington

Room 375

(Entrance at back of building on the  
corner of 9th St. N. & N. Stuart St.  
*one-half block from Metro Ballston Station*)

Dr. Jeffrey Johnson's background includes ethnographic research as a participant observer in an isolated commercial fish camp in Bristol Bay, Alaska. He is currently studying the group dynamics of winter-over crews at the Amundsen-Scott South Pole Station, and has spent major portions of austral summers at the station since 1991. He has published extensively in sociological, anthropological, and marine journals. He is the editor-in-chief of the *Journal of Quantitative Anthropology*. *Come to the Pole!!*

! Please note new time for meeting !

*Captain Sid Hartshorne, first Master of HERO, has died.*

Usually we aren't in business at the end of April, but our energetic president, Polly Penhale, came up with another excellent program, so we are forced into doing another one of these things. Our theory is when the sun shines, get outside, don't waste it on a word processor.

We ended up with 582 paid-up members, plus a potpourri of complimentary members. We had our usual number of dropouts of antagonized members, which reassured us that some people are actually reading what we write. And we received our usual amount of complimentary letters saying that we are doing a great job, and don't listen to the skin-heads, Where else can you get such realistic, true obituaries; where else can you get such unsanitized writings; where else are you going to get so much historical information on Byrd survivors? And if you think we are overloaded on the historic, take part of the blame for not sending us what you're doing. In a few short years, you all are going to be has-beens, too. You can't fight old age.

Have a happy summer! Please don't visit Maine. We don't need tourists. Our roads are atrocious, our drivers are Mainiacs, our food is terrible, and we shoot out the tires of all RVs that cross the border.

**REVIEW OF PROTECTED AREAS - MCMURDO SOUND, ROSS SEA** (Colin Harris, ICAIR, P.O. Box 14-199, Christchurch, New Zealand - E-mail: harris@icair.iac.org.nz). The International Centre for Antarctic Information and Research (ICAIR), based at the International Antarctic Centre, Christchurch, New Zealand, is undertaking a review of the management plans of Sites of Special Scientific Interest (SSSI) and Specially Protected Areas (SPAs) in the McMurdo Sound region, commencing in the 1993-94 season. The work is being undertaken on behalf of the US National Science Foundation Office of Polar Programs, the New Zealand Antarctic Programme, and both US and NZ National Committees for the International Scientific Committee on Antarctic Research. The management plans need revision to meet the requirements of the Protocol on Environmental Protection to the Antarctic Treaty, which was agreed in 1991 to strengthen environmental regulations for Antarctica.

Both national programs felt it would be advantageous for an independent centre to conduct the review, helping to ensure an objective assessment of existing protected areas, as well as a consistent approach to the preparation of the new management plans. Particular attention is being paid to protected area boundaries, presence of human installations or impacts, access routes for aircraft, ships and pedestrian traffic, and the adequacy of existing environmental policies.

ICAIR is keen to gain comments from people who have knowledge of these protected areas, so specific issues and problems can be highlighted. If you wish to discuss any of the sites with which you may be familiar, you are invited to visit ICAIR if you are in Christchurch, or please write to us.

**HERBERT PONTING PHOTOGRAPHS** (Russ Anderson Fine Arts, P.O. Box 1383, Aptos, CA 95001) This unique collection of Antarctic photographs - the most complete in private hands, as far as we are aware - comprises 125 contact prints taken and printed in the Antarctic by Herbert Ponting during the ill-fated Scott expedition to the South Pole in 1911-1912.

Herbert George Ponting (1870-1935) was the first official professional photographer to be sent to Antarctica. He joined Scott's expedition in 1910, taking with him several still cameras, two movie cameras, and a dark room with all its equipment. He left Antarctica in January 1912, and received the news of Scott's death while holidaying in Switzerland.

Herbert Ponting had originally embarked on a banking career at the age of 16. But in 1893 he left England for San Francisco where he invested in a fruit farm, married in 1895, and had two children. He was not a good businessman, however, and he developed a great interest in photography. In 1900 he won the "world" prize in a competition organised by lens manufacturers Bausch and Lomb, and was represented in the Kodak exhibit at the World's Fair in St. Louis.

For the next ten years he travelled through China, India, Japan (as the accredited photographer to the First Japanese Army in Manchuria), and much of Europe, as a free-lance photographer and journalist, and his work appeared in many magazines. In 1905 he was made a Fellow of the Royal Geographical Society; he left his wife and family and made London his new base.

In 1910 he was appointed official photographer to Scott's Antarctic expedition ..... The story of this tragic and heroic expedition is well-known..... From 1912 until his death in 1935, Ponting tried to establish an Antarctic photographic record befitting Scott's endeavours. He published *The Great White South* in 1920, and provided the commentary for the film *90 Degrees South* released in 1933. On his death, Apsley Cherry-Garrard, a member of the expedition, wrote in his obituary: "He came to do a job, did it and did it well. Here in these pictures is beauty linked to tragedy -one of the great tragedies."

These photographs cover all facets of the expedition: the TERRA NOVA, its crew, the ponies and the expedition party on the voyage South, in all possible weathers; the party at base camp and the depots; daily life in the winter quarters - dogs, ponies, birthday parties, washing, frostbite; and of course the snow and ice of Antarctica in all its glory, and its wildlife inhabitants.

The collection's provenance is clear and direct: it was presented to Mr. Kinsey, then manager of Kinsey & Co., shipping agents for the TERRA NOVA while in Lyttelton, New Zealand, before its departure to the South. He in turn presented it to Mr. J. Gossard, the next manager of the company. On his death in the 1930s, Mrs. Gossard presented the collection to Mr. Cecil John Denton, manager of Kinsey & Co., and it has passed by descent through his family. This unique and important collection has never been seen outside Australasia. It is now for sale; price on application.

**MY EYES HAVE SEEN THE GLORIES** (from artist Alan Campbell's daily journals from the NATHANIEL B. PALMER). 3/10/94. This far north (68°33'S) from the continent, the bergs get eroded into the most fantastic shapes, and these were no exception, several consisting of sharp wedges and spires separated by channels of turquoise water surging between them. And two of the bergs actually calved off large chunks in white explosion of snow and ice as we passed by. The latter one even started to capsize, but righted itself when another section calved off the back side. Quite a show! Some of these monsters tower 300+ feet above the water, and have caves in their sides large enough to drive the ship into. There is no end to the variety, and at last count, one resident iceberg scientist has logged over 4500 bergs we have seen to date.

3/3/94 - 11:00 pm. Quite a day, with over seven hours on the bridge. At one point we made a close pass of a tabular berg with a wonderful deep blue ice cave in its side, this after hours of pushing ever so slowly through dense pack ice. Pushing on past other bergs, we watched as the sun dropped into a distant cloud bank. Within minutes

an ice fog materialized and spread across the distant ice, obscuring all but the bergs which seemed to float in the mist. A half moon, pale in color like a ghost, hung low in the sky to starboard,,

3/4/94 - 7:30 pm. In the middle of a day of darkroom work, I took a break after dinner to go up to the bridge. The skies had finally cleared, and we were passing random icebergs, one in particular with a row of vertebrae forms running across its spine, seeming to glow from within the soft pumpkin gold sunset light. As a small crowd gathered on the bridge, a molten sun dropped slowly through a thin veil of clouds, and with one lingering flash slid below the horizon. Below, an amazing passage of pancake ice rolled by on an ocean of liquid gold, like the mottled skin of some reptilian when seen through the binoculars. But the real apparition was on the horizon, where, in the sun's wake, miraging icebergs floated weightless in space, cushioned on a thin stream which would slowly subside, only to flame up again and again, like flares on the surface of the sun. What a spectacle, and in fifteen minutes it was all over.

3/12/94 - 6:00 pm. The phone rings. It is Vladimir, our Russian ice pilot, calling from the bridge. "Alan, good morning. Vladimir here. I think there is a very nice sunrise outside if you want to take a look. Okay, bye bye." .... I have learned to take his polite understatements as a sign of urgency. Sure enough, when I reach the bridge minutes later it is a mystical dream world outside. We are on station, nosed into the ice pack, anchored to a landscape of small hillocks and peaks of snow which recede and disappear into a low-lying ice fog which completely encircles the ship. In the patterns of open water behind us, the sun is rising with a pale golden fire that ignites the fog and stings the eyes. I am awake, but in a dream, and for the next half hour it is a race, first around the bridge catwalk and then down, deck by deck, eventually out to the stern, to capture the illusions and magic before it all dies. And then it does, as the sun disappears into a blanket of clouds, leaving us in a suddenly cold, grey wasteland.

3/13/94. What a wonderland! We have made time in the open water, cruising in a clear track between pack ice to starboard, and the glacier-covered King Peninsula to port. The wind is still blowing hard, sweeping down off the ice cap in whirlwinds and waterfalls of snow where the glacial edge drops off into the sea. Large icebergs in a variety of sculpted forms continue to slide by in the bright light. These are largely uncharted waters, and in addition to many of the landforms being misplaced by as much as half a degree (30 miles) on the maps, the water's uncertain depth is also a concern. It has dropped down to less than 200 meters, and I recall one of our pilots saying that at 60 he would start looking for a place to turn around We have already come close on several occasions earlier today. When I ask Harry for a fix on our position, he smiles and points to a spot, "According to this chart, we are cruising across the top of the peninsula right now! What a ship!". The Captain has expressed his concern for proceeding into Pine Island Bay under these conditions, and the earlier comment by the second mate regarding a supply of food and fuel sufficient for a year should we get beset, well, let's just say it has aroused a lot of discussion. Meanwhile, vortexes of snow continue to tornado off the peninsula ice cap, and ahead, mirages play across the horizon, including one tabular berg that loot like a bar code of parallel vertical lines of varying widths through the binoculars.

3/14/94 - 6:00 am. Incredible, absolutely incredible! After two days of negotiating uncharted waters, we are finally in Pine Island Bay and are completely surrounded by icebergs, many heavily crevassed with ice caves and large cracks. We are headed for a narrow passage between two dead-ahead. Grabbing extra film and stuffing it into my polar jacket, I race outside onto the catwalk. More crevasses and cracks appear as we move into the channel. An oblique profile of the side wall to starboard appears, a fascinating procession of sculpted blocks, textures and forms. As we turn the

corner, I have to shoot backwards at what is receding, and then forwards at what is approaching, all the while glancing across at what is happening with the other berg. It is almost too much, and I quickly finish to starboard and race across to port to repeat the process. In many places there are great cracks and huge sections leaning out towards us, and it would come as no surprise if a great calving were to occur at any moment. More shots and a change of film, my fingers fumbling in the cold. I pull off a glove with my teeth, trying to reload before missing too much. And then we are coming through to the other side with more surprises. A row of ice caves, all at the waterline, recede away to port. Click, click, click. And then a channel appears, separating this berg from yet another behind it. Even under the bright diffused light of an overcast sky the colors are rich and deep. Turquoises, cerulean and cobalt blues, ultramarine, manganese, emerald green: colors like jewels. Even the sun is trying to acknowledge the scene, breaking through the clouds in several places. It is the best morning since Cape Colbeck nearly a month ago.

3/28/94. The ship has covered much territory since my last letter, with the usual complement of bad weather, spectacular sunrises, magical displays, and icebergs, icebergs, icebergs. I did see my first Aurora Australis, and even tasted raw krill (sushi!) when they clogged the seawater intakes a few days back. Twenty-four water-colors, many sketches and drawings, and over 4000 slides taken to date will give me much material to work from for months to come, back in Athens [Georgia].

**BOOKS WHICH MIGHT BE INTERESTING.** Authoress Elizabeth Chipman, erudite Aussie, writes that there is "an especially good modern mystery novel, set in Copenhagen and Greenland. Don't miss it." And that is Peter Hoeg's *Smilla's Sense of Snow*, which was published last year here in the States by Farrar Straus and Giroux. She also considers David Burke's *Moments of Terror: The Story of Antarctic Aviation* a good book. That's a new book published by the University of New South Wales Press.

Bill Sladen sent us a review from The Times of October 25, 1993 on Peter Scott, *Painter and Naturalist* by Elspeth Huxley. Scott is presented as "an almost silent figure" until he failed to take 6000 troops off the shore at St-Valery. Scott reproached himself bitterly for not going outside his orders and risking his ship in order to rescue them. The second part of the book, the story of his life after the war, is a remarkable record of achievement. Simply in the pursuit of his pleasures - as a wildflower, an explorer-naturalist, a sailor, or a glider pilot - he was an inspiration to everyone who knew him.

Scott set up the Severn Wildfowl Trust to protect the great flocks of white-fronted geese, and he helped to set up the World Wildlife Fund. He played an enormous role in the campaigns to save the Arabian oryx, the tiger, and the whale.

The author, Elspeth Huxley, age 83, has recorded it all. The review says that "Scott himself passes through its pages quietly and mysteriously, like one of his own geese winging through the night."

There's a new Antarctic novel on the streets, *The Birthday Boys*, by the British writer, Beryl Bainbridge, published by Carroll & Graf. The Boston Sunday Globe of 10 April 1994 had a lengthy review of the book which consists of five monologues on the members of Scott's party who perished on their ill-fated excursion to the South Pole. Bainbridge evidently is a well-known writer, born and raised in Liverpool, which may account for her "imagination wanderlust and her fascination with the oddball corners of history," which resulted in "her most audacious novel yet." The reviewer, Michael Upchurch, no slouch at all with the written word, wrote "Vivid in its description, shrewd in its characterizations and arresting in its structure, the book uses its hostile Antarctic terrain as backdrop to a host of yearnings, doubts, and memories." He described the five monologues "an intricately layered narrative encompassing outdoor adventure,

social commentary and a meditation on mortality that is at once sober and serene. Her mastery of masculine voices is flawless, and the conflicts between her narrative points of view provide as much of the book's suspense as their actual adventure."

Bainbridge drops in on the two-year expedition at five points along the way. First up is Petty Officer Edgar Evans, portrayed as closest to the heart of the Owner (Scott), who sets the stage for the expedition with glimpses of the world left behind and the powerful, almost erotic bond between the explorers. Second up is Edward Wilson, set in the tropical Atlantic, revealing the private man on the way to his destiny. The middle monologue is of Captain Scott, and is concerned with preparations for the South Pole trip. This is followed by a piece on Birdie Bowers concerned with the Cape Crozier foray, with "Lt. Birdie Bowers' version of those five weeks is a harrowing marvel of imaginative empathy on Bainbridge's part." The coda comes with Titus Gates' account of the doomed journey, "as death approaches, memory serves as an almost blissful anesthetic against physical suffering."

Not having read the book puts me in a great position to write about it without being confused with facts. If I were going to write a fiction about those guys, I would have given the last words to Wilson, as his strong religious background could have made a most powerful ending. This soul is convinced that Bowers and Wilson could have made it to One Ton Camp if it were not for the condition of Scott. One can play all sorts of games with those folks. And, in the mind of many Scott-worshippers, I'm sure they will equate this novel with Huntford's biography, feeling that perhaps both have the same amount of validity. You know, this is the novel which many of us have already written in our own minds, but Beryl beat us to the publisher. For only \$18.95 plus tax, perhaps it was better for her to have done it!

**THE FIRST FAMILY OF THE ANTARCTIC.** Captain Scott is never going to die, he will forever be the Eternal Antarctic. For a guy who blundered into death, he has probably achieved more fame and notoriety than any other hero we can think of. But one cannot deny the family's place in history, as his wife Kathleen was truly a giant of a person, a multi-talented woman of the arts who would have been famous in her own right, even if she had been married to a shoe cobbler. And look at Sir Peter. He certainly made an international impact on wildfowl which will live much longer than anything Scott did in the Antarctic.

Is there another Antarctic family of such prestige? I mean man-woman-offspring combination which has had such an impact on society and the world? I'm sure the present era will produce some equals, maybe even some superiors, but as of today, can't we call the Scotts "The First Family of the Antarctic"? - And for the Odd Couple Award, hey, there's no contest - the late Sir Hubert Wilkins and his Ziegfeld Folly wife. - We all have our priorities, and a most interesting one was Kathleen's picking of Robert Falcon Scott as her future husband, based on her premonition that she wanted this guy to be the father of her offspring. At least she had a reason, a rather valid one, really.

**A MAN FOR POLAR PEOPLE IS STILL ALIVE.** Fred "Muckluck" Milan is still alive, dispelling an ugly rumor that came thisaway that he had succumbed. His wife Leda wrote us that "Fred is very much alive, but for the past several years has experienced a series of cerebral vascular accidents, which have weakened him, affected his cognitive abilities, and has severely limited his speech. Until last year he managed with a walker, but is now in a wheelchair and needs assistance with everyday needs and activities. He is currently residing in the Fairbanks Pioneer Home, a wonderful place run by the State of Alaska for sourdoughs like Fred where he is given good care."

Muckluck is one of the real nice guys in this world, and knows an awful lot about a

lot of things that goes on in the polar regions. He is probably, without a doubt, the world's greatest authority on rectal temperatures of Eskimos. His Antarctic connection was as physiologist at Little America V in 1957, where he did pioneer work on the adaptation of sixteen test subjects to the cold.

Muckluck was one of the very few people at Little America V who had had any prior polar experience, and his shack was the camp headquarters for any stories or rumors being disseminated. When Bert Crary lost Peter Schoeck down a crevasse - he did live with internal injuries - the initial joy of the camp members finding out that the universally disliked Peter had fallen into a crevasse was tempered when it was learned that Bert wanted a replacement. And Bert, no one's fool, asked for Muckluck, but he had already committed himself to join up with a study group of the aborigines in the Alice Springs area, so Bert had to settle for Crevasse Smith. Muckluck had been all over the globe, even studying the tall Indians in Tierra del Fuego. And he lived for six months with the Lapps.

Muckluck was a longtime advocate of an international multidiscipline scientific and sociological approach to the study and solution of health problems in the circumpolar regions. In November, 1967 he was appointed Chairman of the four-nation (Canada, Denmark, France and the U.S.) Eskimo study program. The program started in 1968, and finished in 1972. Under his guidance, multidiscipline teams of 20-25 scientists carried out detailed health studies (general health and performance, child growth, genetics, behavior, ecology and prehistory) on the Eskimo of Wainwright, Pt. Hope and Barrow. Due to his organizational and scientific abilities, as well as his respect and understanding of people, the IBP Eskimo Study Program was a success and a model for future multidiscipline studies.

We knew that Muckluck had fallen on bad times, and I recall a telephone conversation several years ago when I asked him, "How are you really doing?" And he replied, "Well, I tell you, Scroungy, things aren't too good, but I am surviving. I tell you what I really miss, my four o'clock cocktail. The doctors have taken it away from me."

Muckluck has lived long enough to see his name on the Albrecht-Milan Foundation of the American Society for Circumpolar Health, even though he was not physically able to attend the dedication ceremonies on 14 July 1991. It was created to assure that there is continued support for improving the health of those who choose to call the Northern Regions of the world their home. Muckluck's entire post-doctoral research was devoted to the health and welfare of circumpolar people. The Foundation named after C. Earl Albrecht and Muckluck would most graciously accept any donations towards that most worthy cause - Albrecht-Milan Foundation, American Society for Circumpolar Health, P.O. Box 243994, Anchorage, Alaska 99524 - Tel. 907-272-3231.

**HOW DO YOU TELL AN EXPLORER WITHOUT A SCORE CARD?** When Phil Law, retired chairman of the Australian National Committee for Antarctic Research, 1966-1980, addressed our Society on 15 October 1992 he pricked our imagination by raising the issue of what constituted an explorer. He sought refuge in the Oxford dictionary's definition of exploration, saying that exploration means examining the territory as one moves through it. And Phil added that common usage has added a further dimension, the connotation of a certain element of discovery, of examining something new, something not previously examined. As I reread Phil's definitions, and looked at his own personal track record in Antarctica, I got the impression that the explorer who best fitted his criteria might be Phil Law himself. And he certainly has the credentials to substantiate the modern interpretation of an Antarctic explorer.

But let's look at it all a bit more closely, and also take another look at Phil's thoughts on polar explorers. Many of our members are also members of the Explorers

Club, and perhaps this organization is best qualified to define an explorer. Although not a member, I know that one of the criteria, besides a deep pocket, is to show the examining committee that you have been to at least two strange places, presumably one being New York City. I don't think you really have to prove that you did any true research at your chosen sites, although doing some science probably is not held against you. Roald Amundsen and Capt. Robert Falcon Scott and Sir Ernest Shackleton could have all passed as explorers. Another criterium is that true explorers never say "never." I remember how candidly Ed Hillary spoke to us at the South Pole in December 1957 about his visit to the Explorers Club after he had conquered Mt. Everest. Today he is their Honorary President!!

But let's go back to Phil's written text, which he also presented on that State side visit to the Explorers Club in New York City. He said, "Scott and Mawson, obviously, were 'explorers', and so, to a lesser extent, was Shackleton. Shackleton was a great 'adventurer'<sup>1</sup> - one of the greatest. But he wasn't a great 'explorer'<sup>1</sup>, although he always figures in the list of the greatest ..... Would Scott have been as famous if he had not perished? Would Shackleton's fame have been as great if his ship had not been crushed? Would Mawson's name be as well-known if he had not miraculously survived a sledge journey in which his two companions died? I doubt it....Antarctica today is internationalized to an extent not seen in any other territory. Yet the literature is nationally compartmented. The British tend to sneer at Byrd, largely ignore Mawson, and take no notice at all of the Russians. The Americans accept Shackleton, play down Scott, and completely ignore the Australians and Russians. The Australians rank Scott, Shackleton, and Mawson as roughly equal, but know nothing of the Russians and Norwegians.

(Ed. note, and it looks like he could have included New Zealand, too!) .... One distinguished British polar expert had said, 'The two greatest polar explorers were Nansen in the north and Mawson in the south.' .... There has been no attempt to rate modern Antarctic explorers....although eighty percent of Antarctic exploration occurred past-1946."

Explorers are probably created by themselves and/or their constituents - probably a state of mind of the beholders as much as anything. Several years ago I went to an evening lecture at the National Geographic Society's Washington headquarters, and they introduced the speaker, Wally Hebert, as the "foremost polar explorer alive today." When you read about Antarctic explorers nowadays, invariably they are referring to adventurers like Steger and Fiennes.

With the Antarctic Treaty coming into effect, the continent was really turned into a bona fide scientific laboratory. Exploration was achieved through scientific pursuits which resulted in publication of new and, sometimes, startling information. There are no Antarctic explorers per se, as all the continent has been seen by man-womankind, and all we have left are polar scientists.

But who were the last of the true Antarctic explorers? Offhand, I would say that there were three: the aforementioned Phil Law, the Dean Emeritus of the British Antarctic Survey, Bunny Fuchs, and the late Bert Crary. And I would like to propose, of the three, that our own Bert Crary was the Bestest with the Mostest. And if you stacked him up against Mawson, the only explorer scientist from the Heroic Age, Bert would have won there, too.

First of all, Bert was probably the most all-encompassing scientist who was ever in command in Antarctica. He was so proficient in so many disciplines, that you would be doing him a grave injustice by just referring to him as a geophysicist. He was truly an IGY Task Force in himself. He had worked and published in so many different disciplines before he ever came to the Antarctic. And he had polar experience, too, which, in itself, made him somewhat unique when the International Geophysical Year came around.

If discovery of new snowfields is a basic ingredient for polar exploration, Bert led the first two austral summer traverses on the Ross Ice Shelf, and he led the first bonafide oversnow geophysical traverse to the South Pole. And unlike many other field scientists, Bert was able to reduce his data, analyze them, and published them in the Pleistocene - no small feat.

And he was an administrator. Where would Tom Jones have been without Bert at his elbow? What would have happened to the fledging Antarctic programs after the IGY without Bert Crary? He was a scientist who just happened to have a lot of polar experience. He brought a lot into the administrative corridors of Washington, and more than any other single person was responsible for good guidance of the U.S. Antarctic programs in the 1960s.

Anyone who knew Bert realized that this person was gifted to lead men. Probably the most unassuming person any of us ever knew, one who led by example. He was the senior man on the ice during the IGY, and this was no small task, as there were many problems to be solved as Navy and IGY personnel learned how to survive with one another. And he was junior in Antarctic experience to three of the other camp leaders (the late Paul Siple at the South Pole, the late Finn Ronne at Ellsworth, and the late Carl Eklund at Wilkes) . He had an almost Impossible task as Deputy Chief Scientist in Antarctica (the Chief Scientist, the late Harry Wexler, was wintering over in Washington, B.C.), yet survived admirably.

Bert was an intelligent interdisciplinary environmental scientist who wore many caps easily and with great distinction. He was an indefatigable field worker, a meticulous analyst, and a good leader and administrator. But he was also a very real person, twenty-four hours a day, a very decent person, most humble, witty with a dry humor, honest as the day was long, fair to all mankind, and so unassuming that even some family members never knew of his achievements until his obituaries were published. He had the capacity to be equally at home talking science in the White House or addressing the local union of garbage collectors. My nominee for foremost Antarctic explorer of all time - Albert Paddock Crary of Canton, New York.

**LAST ANTARCTIC SLED DOGS ENROUTE TO MAINE** (Wendy Hanscom, Bethel-Oxford County-Citizen) Twenty years ago - before the ascension of snowmobiles - there were hundreds of working dogs in Antarctica, but by the end of March 1994 none were left. The huskies were forced to leave the Antarctic under the terms of the Antarctic Treaty Environmental Protocol. All dogs had to be off the continent by April 1. The ban was prompted by fears of the possible transmission of canine viruses to Antarctic seals.

Kevin Slater and Polly Mahoney of Mahoosuc Guide Service in Newry (Maine) , and Tony Simpson of Bethel, arranged for the last 14 dogs from Antarctica to come to Newry. Nine of the purebred huskies will then be transported to the village of Inukjuaq on Hudson Bay. In Antarctica, the dogs were managed and cared for by the British Antarctic Survey. Simpson spent two and a half years in the mid-80s in Antarctica with the BAS at Rothera. He was responsible for the care and management of the huskies, which were used for various scientific expeditions, and later for recreation.

Several private mushers had sought to acquire the BAS team, but the BAS wanted them to go into a program where they would be worked and bred. BAS dog handler John Sweeney eventually accepted a bid by Slater, Mahoney and Simpson, who proposed to reconnect the huskies to Inuit breeders. "They liked the idea of the dogs going back to the people who developed this breed," Slater said. The Antarctic dogs originated in the coastal Arctic, Simpson said, and the BAS team are in large part the descendants of approximately 40 dogs that were taken from northern Labrador in 1943.

The dogs' journey from the Antarctic to their new home in Canada was a long one. Simpson made sure in December that the dogs had the necessary vaccines and paperwork

to bring them to the U.S. and Canada. Sweeney accompanied the dogs to the U.S. The British Royal Air Force flew the team to England in mid-March. From there, the dogs were shipped air freight on British Airways to Boston, where Slater and Simpson picked up the dogs at Logan International Airport and trucked them to Newry.

The full team of 14 dogs were in Newry for only a few days before nine of the dogs began a three-day drive in a truck to Chisasibi, Canada. Five older dogs, seven- to nine-years old, initially stayed behind. Those huskies will travel eventually to Hudson Bay, for retirement in a breeding program.

Once in Chisasibi, the dogs will set out on a 500-mile, 20-day sledding expedition to Inukjuag, Slater said. He, Mahoney, Simpson and Sweeney will be accompanied along the trail by two other Americans, two Canadians and three native Inuits. In Inukjuag the dogs will be turned over to Adamie Inukpuk.

Inukpuk is a former Inuit cultural teacher, and serves on the town's School Board. Inukpuk has owned sled dogs for many years, Slater said. His teams have appeared in several movies, including "Shadow of the Wolf" and "Krabloonik." The dogs from Antarctica will join the village's seven other dog teams.

... What few purebred huskies remain in Hudson Bay, Slater said, are the product of interbreeding that has weakened the strain. "Natives in Hudson Bay don't have purebred Eskimo dogs," he said, "but there is a lot of interest in bringing the dogs back." The new arrivals from Antarctica will provide a valuable boost to the local gene pool, Simpson said, and will form the core of an expansive breeding program that supporters hope will reestablish a healthy huskie population throughout the Canadian Arctic.

o.... Slater said members of both Inuit and Cree Indian villages have expressed interest in the five dogs that are to go into a breeding program. "Where they wind up is less important than that the breeding program is successful," he said. Slater plans to research where the best location for the dogs would be, and to try to make sure both Inuits and Crees have access to the breeding program. Natives of Labrador, where some of the dogs' ancestors originated, are also interested in the line, Slater said.

The cost of relocating the huskies is being picked up by private donations. The RAF is covering the biggest expense by providing air transport, Slater said. Estimated additional expenses are \$12,650. Slater, Mahoney and Simpson have been collecting donations for the dogs - mainly equipment and food. Anyone who would like more information or who wants to donate to the program can do so by mail to Native Home for the Huskies, Box 245, Bear River Road, Newry, Maine 04261, or by calling 207-824-2073.

**SNOWFLAKES.** *Stuart Klipper*, Chairman of the Committee to Reforest Antarctica, points out that we really blew it in the April Newsletter when we inadvertently got two of our Barry friends' names mixed up. We intended to type Barry Lopez as our candidate for the premier spokesman for Antarctica. But our fingers and our mind doublecrossed us, and it ended up that Barry Bishop, the famed Mt. Everest and Elsewhere Mountaineer, was named. Lopez is our Greatest Spokesman for the Antarctic, and we will create another category of Greatest Mountaineer for Bishop. Incidentally, Stuart Klipper, whose photography I greatly admire, will be exhibiting his Antarctic photographs in June and July at the MacDougall Gallery of Art in Christchurch, New Zealand. And Stuart, who will never be a centerfold for QG, points out that back in October 1983, Ursula LeGuin wrote a wonderful short story, "Sur," about a team of South American women who achieved the South Pole before A & S, but kept it secret so male egos are not bruised. What about that, Jeff Johnson? .... Jeff's talk should be rather interesting. How come people who go to the South Pole are considered freaks and need to be analyzed? Look at all the human investigators who have studied those people in the last thirty-five years.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET

Alan Campbell is the Gainsborough of the Antarctic. This graduate of the University of Georgia received his Master of Fine Arts in 1975. Further studies were completed at the University of California at Berkeley, and with Georgia's Foreign Studies Program in Cortona, Italy. Besides painting in Antarctica, he has wetted his brushes in Kenya, the Galapagos, Montana, and even North Haven Island, Penobscot Bay, Maine.  
Don't miss Alan!!

A man of great stature, Tony Meunier, U.S. Geological Survey, Reston, Virginia, is our Society's new president. Tony wintered over at the South Pole in 1974, helping close down the original IGY Siple-Tuck-built station. Later he returned to the ice as a meteorite seeker in 1981-82. Polly Penhale, who served so admirably as our past president, has consented to serve as Tony's Vice President.

So another year is upon us. For Ruth and me, it marks the beginning of our 17th year of putting together this misnomer which we masquerade as a newsletter. This is our 97th, and we hope we survive through 100.

We are certainly in an age of transition, and it was never made more clear than visiting the Office of Polar Programs and seeing how e-mail has changed the modus operandi of passing information. Have we reached the state where we either conform or cease to exist? It's scary for those of us with a mentality like Forrest Gump's.

Our membership has dropped off by about twenty members, but we still have close to 600 faithful. The bills are in the mail, and if you have any concern for Ruth's health and welfare, to say nothing of her happiness, renew for multiple years, and reduce her work load as she is carrying this all by herself.

Again your newsletter continues to be the sole voice of an irresponsible person who will not let the truth get in the way of a good story. Our tongue-in-cheek style of writing can be injurious to the health of those of you who take yourself and the world seriously, so you shouldn't read these things. Our aim is only to write something which those of you who can read will want to read. Period.

**1995 NEW ZEALAND (MONTEATH) CALENDARS ARE TRULY GREAT.** We have received the Hedgehog House's 1995 Antarctic calendar, and it's another beauty. This is the calendar which sells Antarctica for its environment and indigenous populations, and some of the photographs, such as Colin's reflections at the southern end of the Lemaire Channel, and another of his showing hitchhiking Adelies atop a small iceberg off the Mackellar Islands, are just superb.

The good news for you folks is that we are selling these calendars at the same price as last year, even though we had to pay an additional fifty cents each this year. If you bought directly from Hedgehog, you would have to pay \$16.50 each, but we're selling them to you for only \$10, including postage and mailing. If you live in the Washington area, you can pick them up at 905, and we'll charge you only \$9.00. What a bargain!! We have only 175, so if you want some, order NOW. We will NOT be re-ordering.

**NORMAN VAUGHAN IS STILL ALIVE AND DOING WELL.** At this time of the year one always wonders what Norman Vaughan is up to, and whether Christmas will be cancelled, as Santa could go on strike. The answer to the first wonderment was answered by a telephone call to Eagle River, Alaska, where a strong and booming voice assured us not only was Norman still alive, but that he was still planning on climbing Mt. Vaughan on his 89th birthday this coming December. It seems he has the full support of Anne Kershaw in getting himself and Carolyn to Patriot Hills in late November, then over to Mt. Vaughan where the assault team will hit the slopes. Norman does not know the word "defeat", and this physical marvel is going to give it every ounce of his strength and energy. We wish Norman only the very, very best, as Norman is truly a nice guy.

**BILL FIELD (30 January 1904-16 June 1994)** (by A.L. "Link" Washburn). William Osgood Field, known as "Bill" to colleagues and other friends around the world, was educated at Hotchkiss School and Harvard University. He became a major contributor to the field

of glaciology in the United States and internationally over a lifetime of research devoted to advancing the discipline.

Bill's contributions were manifold. They included many seasons of fieldwork, especially in southeastern Alaska (Glacier Bay) and neighboring Canada. He also worked in Greenland, the Andes, and during the International Geophysical Year (1957-58) in the Antarctic. His carefully indexed photographic records and studies of Alaska's and Canada's glaciers constitute a baseline and national resource that contribute significantly to the study of local and regional climatic change as interpreted by variations in glacier position and volume. His "Mountain Glaciers of the Northern Hemisphere" was published in 1975 by the U.S. Army Corps of Engineers Cold Regions Research and Engineering Laboratory.

Starting as a Research Associate with the American Geographical Society in 1940 he subsequently became Director of its Department of Field Exploration and Research. In the 1950's he was responsible for the World Data Center A for Glaciology. He was elected to the Society's Council in 1970 and served on it until his death.

Bill is survived by his wife, Mary Losey Mapes, whom he married in 1963 following the death of his first wife, Alice Withero in 1960. In addition, he is survived by a son, a daughter, a brother, two sisters, and two stepsons.

Bill was a quiet, modest, unassuming, and warm person. His dedication and research won him wide recognition, including the Charles P. Daly Medal of the American Geographical Society, the Busk Medal of the Royal Geographical Society, the Explorer's Medal of the Explorers Club, and the Seligman Crystal, the premier award of the International Glaciological Society. But perhaps the greatest honor bestowed on him was the esteem in which he was universally held by his colleagues and friends the world over.

**MORE ON BILL FIELD.** Every time an IGY VIP dies, we turn to Link Washburn for his obituary, as he knew them all, and he knew them well. Most of those people, like the late Dick Goldthwait and now Bill Field, were just as nice as Link. There was a lot of class in those IGY glaciologists. They wore the mantle of being nice guys very well, I knew Bill somewhat, as I was contract officer to the American Geographical Society for the above referred Glacial Atlas of the Northern Hemisphere. Incidentally, there was also a companion atlas on the Glaciers of the Southern Hemisphere. So I knew Bill professionally quite well. He had a young upstart working for him by the name of George Denton. I wonder whatever happened to George. Probably driving a cab somewhere, or perhaps he's a fisherman on the Grand Banks.

Bill was a man of considerable means, never had to worry about where his next meal was going to come from. His last name might give you a clue to his lineage. But one would never know of his wealth, as he was a most common man, loved and respected by all, never had an enemy. He lost his first wife, remarried, and took his bride to a symposium that the National Academy had at UCLA on the Results of the IGY. The penalty of being a bride to Bill Field!

**FROM THE e-MAIL SCREEN OF GUY GUTHRIDGE.** President Clinton sent a midwinter message to Antarctic stations, with copies to Antarctic Programs and U.S. ambassadors in the Antarctic Treaty nations, saying, in part, "Humanity looks upon the distant continent of Antarctica as unsullied wilderness, a last refuge of nature, and a wellspring of scientific discovery. All of you are helping to turn the continent's promise into a reality that benefits the entire world."

Thomas N. Taylor, Ohio State University paleobotanist, has been elected to the National Academy of Sciences. Taylor, a professor of plant biology and geology and a researcher with the Byrd Polar Research Center, has worked in Antarctica for several years. In

1992, Taylor, his wife Edith Taylor, also a researcher from Ohio State, and co-worker N. R. Cuneo reported in SCIENCE that they had evidence of a forest more than 200 million years ago in Antarctica at 84°S. This is the highest-latitude forest, living or fossilized, ever recorded.

Four polar books are on the National Science Teachers Association list of 69 outstanding children's science trade books published in 1993: "Here is the Arctic Winter," "Land of Dark, Land of Light: The Arctic National Wildlife Refuge," "Penguins at Home: Gentoos of Antarctica," and "Investigating the Ozone Hole." The last, by Rebecca Johnson, resulted from NSF's Antarctic Artists & Writers Program and is one of just 17 of the 69 that the NSTA is publicizing as Selectors' Choices - "books that panel members responded to with particular enthusiasm."

Six polar books (for grownups) are reviewed in the 13 May SCIENCE: "Archaeology of the Frobisher Voyages," "The Meta Incognita Project," "Before the Heroes Came: Antarctica in the 1890s," and three books about Antarctic fish history, biology, and fisheries.

Eight thousand thirty-four tourists from 42 countries visited Antarctica on 64 cruises by 10 ships in the 1993-1994 season. There were 514 landings at 85 or more sites; Port Lockroy, the most popular spot, got 4,274 visitors in 30 events. Palmer Station had 1,185 visitors in 10 events. At least 42 percent of the tourists were American; 17 percent, German; and 9 percent, British.

The Falkland Islands shelf may have substantial hydrocarbon reserves, preliminary seismic surveys suggest. Licensing for offshore exploration and drilling rights is to start this month under the auspices of the United Kingdom.

A U.S. Air Force C-141 made the first of two midwinter airdrops of mail, fresh food, and other cargo to McMurdo (26,679 lbs.) and flew on to make this winter's one drop of 8,664 lbs. to South Pole. An accompanying KC-10 tanker (a modified DC-10) refueled the C-141 in midair during the flight of 5,520 nautical miles. The length of these remarkable missions is the same as if you were to leave Dulles Airport to overfly Yellowstone (Northwest Territories) and Fairbanks (Alaska) before returning to Dulles to land. NSF has supported the drops to maintain readiness for a winter emergency and to provide material to winterers midway through their 6- to 8-month isolations.

A cover story on Antarctic air operations in the 16 May AIR FORCE TIMES says, "The Navy wants out, the Air Guard wants in, and the Air Force appears ambivalent. The [National Science] Foundation just wants to make sure it ends up with someone it can rely on."

Senator Kennedy sent a 22 June letter to the Director, Defense Research & Engineering, DoD, to "urge the Department of Defense to maintain at least the air operations support for the NSF Antarctic Programs."

Another meteorite from the Moon has been announced. The specimen, collected in 1993 in the Queen Alexandra Range, Antarctica, is sure to provide important new insights on lunar science, says the Meteorite Working Group.

Over 400 scientists and students attended the Sixth SCAR Biology Symposium in Venice, Italy. The theme, "Antarctic Communities: Species, Structure and Survival," featured sessions on environmental change and human impact. Invited keynote talks were presented by Neal Sullivan (satellite oceanography) and Polly Penhale (the Bahia Paraiso).

At the meeting, Bill Fraser's talk on Adelie penguin population trends near Palmer Station drew attention. Trends show an overall decrease over the past two decades, with a 13-percent decrease at Torgersen Island (site of scientific and tourist activity) and a 56-percent decrease at SPA Litchfield Island (rarely visited). Data presented show differences in snow-cover history and rookery locale relative to side of island for the two sites. Fraser concluded that the potentially adverse effects of tourism and research may be negligible relative to the effects imposed by long-term environmental changes.

The \$12.5-million Kelly Tarlton Antarctic Center opened in Auckland, New Zealand. It has an 8-minute ride in a Sno Cat through a simulated whiteout. A life-size plastic orca attacks a seal, throwing the riders into a near panic. Superb lighting simulates conditions at Scott's hut and the surrounding landscape. Antarctic dawn is created with mercury, metal halides, and halogen luminaries. "Professionally presented and exciting," says an ASA staffer who went. No live penguins yet: a plan to import some from San Diego and Antarctica is at the center of a well publicized international dispute,

"Images of a Frozen Continent," a photographic exhibition by Stuart Klipper (USAP artist), is showing at the McDougall Art Gallery in Christchurch and has received a fair amount of attention. "Stuart's photo of the tons of snow deposited on the South Pole dome illustrates the engineering structural problems in ways that a report never could," says one observer.

Tasmania held an Antarctic exhibition at its Queen Victoria Museum & Art Gallery. Two huskies from Australia's Mawson station, brought in for formal festivities, promptly peed on a sledge on display and then attacked and damaged two stuffed dogs.

"It is probably more important for Australians to do science in Antarctica on global change than it is to study Australia," Pat Quilty, Antarctic Division, said during a national review after a \$100-million rebuilding of stations. Funding is down, but Australia has new direction in Antarctica: understanding global change, protecting the environment, maintaining and influencing the Antarctic Treaty, and obtaining information of practical importance. "Science is the currency of authority in Antarctica," said Barry Jones, former Minister of Science.

There is no credible evidence for a 1958 Antarctic ozone hole, writes Goddard Space Flight Center's Paul A. Newman in the 22 April SCIENCE. A 1990 French paper had said spectrographic plates of the sky, the moon, and two stars taken at Dumont d'Urville, the French Antarctic station, suggest ozone values were low in 1958, well before significant CFC emissions. Newman says the plate data reflect "a large instrumental bias" and are inconsistent with a number of other observations.

Winds on Antarctica's Adelie Coast may be among the strongest observed anywhere, but USAP's automated weather stations on a line from that coast into the interior have found even higher wind speeds some distance inland.

A cold snap at the South Pole set daily record lows 15-19 May. For example, -103.5°F on 19 May retired the 1966 record low for that day of -98.0°F.

**ANTARCTIC TRASH.** Newspapers near Port Hadlock, Washington, where the ship GREEN WAVE unloaded 450 containers of Antarctic trash in March, gave positive coverage to the event. The Island Independent reported that Washington's Department of Ecology "was favorably impressed after an onsite inspection at Indian Island."

Toxic metals in ambient air at McMurdo during the 1992-1993 austral summer were well below (better than) U.S. air quality standards, according to an April 1994 report published by Idaho National Engineering Laboratory (INEL), which did the monitoring.

INEL also published a report that summarizes all recent wastewater impact assessments at McMurdo - as done by Antarctic Support Associates, Moss Landing Marine Laboratories, Montana State University, Monterey Bay Aquarium Research Institute, and INEL.

Antarctic marine ecosystems are six times less contaminated than in the North Sea, according to Belgian scientists who gathered data on heavy metals and organochlorides. At higher trophic levels, fish receive much of their low levels of contamination from the water rather than up through the food chain.

**TWO MORE DEATHS.** Not everyone is made for Antarctica, and the doctor who wintered over at the South Pole in 1958, Vernon Houk, certainly was one of that kind of strange people. But he went on to become a very illustrious doctor of national repute with the Center for Disease Control and Prevention in Atlanta, associating himself with some very important national concerns. But one he could not lick, and the Big C claimed this sixty-four-year-old on 11 September 1994.

Vernon came from a well-to-do California family, and why he gravitated to the South Pole remained an unsolved mystery to those who wintered over with him. But he served his time, spending the year wearing clean mukluks, sitting at the head of the dining room table drinking endless cups of coffee. And when he left the ice, that closed that chapter and book. He never answered letters from Antarcticans, never returned calls from Antarcticans, but was apprehended by a fellow Antarcticman who ended up with him on a plane flying to Africa.

But let's give the Devil his due rights - - he did amount to something after all. In the 1970's he helped direct studies that showed the health threats posed by lead in paints and gasoline. In the 1980's he directed publicly-linked radiation from the U.S. nuclear weapons industry to increased cancer rates among those exposed. And in recent years he had become embroiled in the debate surrounding dioxin, which was contained in Agent Orange. He doubted the toxic effects of dioxin were as great as originally believed. He sure fooled a lot of us!!

Another man in his sixties who succumbed was Lars-Eric Lindblad, 67, whose name is synonymous with opening up Antarctica and other exotic places to well-heeled, sprightly, adventurous tourists. In a way, he was sort of a cult leader, and even though there were other tour ships going to Antarctica, veteran travellers like our beloved whale spotteress, Dotte Larsen, wouldn't think of going south with anyone else but Lindblad. He offered cruises to Antarctica as early as 1966, and his company stayed in business until 1989 when he violated U.S. trade embargoes against Vietnam and Cambodia by offering tours to those countries, getting penalized some 75K. Lars looked upon travel as a birthright, and "to embargo travel was like burning books or imprisoning journalists." He evidently had an easily-won reputation with the fair sex, and if you want an hilarious shower story about a feminine scalding accident, ask John Spletts about it. Lindblad lived in Wilton, Connecticut, but died from a heart attack while vacationing in Stockholm

**ANTARCTIC IGY OFFICIALLY ENDS 3 OCTOBER 1994.** So you thought the IGY was over and done with years and years ago, but the last remaining Washington staff member that we are aware of, Alison Wilson, retires from the National Archives on 3 October 1994. Now that is the end of a real era, she outlasted all. Not only that, but she is the last polar connection in the National Archives who personally knew the players. At one time the indefatigable polar enthusiast, Gerry Pagano, the well-known geographer, Herman Friis, and Alison constituted a very active three-person polar office in the National Archives, and soon they will all be gone from their hallowed halls. In fact, within six months all of the polar material will be shipped to their new center on the University of Maryland's campus.

Alison started her IGY back in 1955, when she went to work for John Hanessian (later killed in an European plane crash, flight from Paris to London, I believe) and Hugh Odishaw, who was Mr. IGY in the U.S. And somewhere in there, she switched over to work for Bert Crary and Dick Hubble in the polar office. Later on, the young country beauty called "Yum Yum" by one and all joined the staff, and to this day is still reverently remembered by all who passed through those portals back in 1956. However, Alison has outlasted all of them as a loyal, devoted government worker, and when she walks out that door for the last time on the third of October, it is truly going to be the end of an era. The best of luck, good health, and have a great time, Alison.

**CREVASSE SMITH CROSSES ANOTHER CREVASSE.** Phil Smith, who can be described in various terms, has finalized a most distinguished government career by sort of retiring from the National Academy of Sciences and the National Research Council, effective the end of June this past summer. On paper he is retired, although he is still associated with a major study of the Academy's Committee on Science, Engineering, and Public Policy on the future of graduate education. And he plans on remaining active in science and technology policy, do some consulting, and may spend some time in one or two private-sector ventures. Old spelunkers just don't drop dead, you know, they just disappear very gradually. But to find him you may have to go to the Southwest, as he writes that "my house in Santa Fe beckons." For the time being, though his primary address is 464 M Street SW, Washington, DC 20024, where you can reach him by phone 202/554-5715, or at <psmith@nas.edu by internet.

Phil came onto the polar scene as a young lieutenant in the Transportation Corps, serving first in Greenland, and then coming onto the Antarctic scene during the IGY. Because of his propensity for wanting to know what was in crevasses - he never saw one he didn't want to explore - he was called Crevasse Smith by one and all. And he got along just great with the media, was a traveling companion of Bill Hartigan and Pat Trese, and, if my memory is correct, may have been one of the composers of a humorous song, "Oh Odisahw." After the IGY, now a civilian, he took a position with Bert Crary and Tom Jones in the polar office at the National Science Foundation. And his career was off and running at breakneck speed, knowing no bounds. The world was waiting for Phil to conquer it, and he did. From the National Science Foundation he went to the White House where he worked as a staff member on the President's Science Advisory Committee. And from there he went to the National Academy of Sciences and the National Research Council where he was in the Executive Office as first hanzo to Frank Press. And through all this, he remained a firm and true bachelor. How could he possibly have accomplished so much without a woman telling him what to do and when to do it? A miracle man!

#### **ARTISTS AND WRITERS IN THE U.S. ANTARCTIC PROGRAM.**

Arthur Beaumont. Painter. 1958. Paintings of Antarctic military, historical, and other subjects.

Emil Schulthess. Photographer. 1959. Book: Antarctica, a Photographic Survey (198 p., Simon & Schuster, 1960). A classic, depicting both Antarctic scenes and human activities there.

Kenneth Bertrand. Historian. 1961. Book: Americans in Antarctica, 1775-1948 (554 p., American Geographical Society, 1971). The definitive history of U.S. involvement in the Antarctic.

Donald Finkel. Poet. 1968. Book-length poems: Adequate Earth (Atheneum, 1972), Endurance (Atheneum, 1978). Poet Emeritus, Washington University.

Charles Neider. Writer. 1969, 1970, 1977. Books: Edge of the World: Ross Island, Antarctica (461 p., Doubleday, 1974), Beyond Cape Horn: Travels in the Antarctic (387 p., Sierra Club Books, 1980).

Louis J. Halle. Writer. 1969. Book: The Sea and the Ice, a Naturalist in Antarctica (286 p. Houghton Mifflin, 1973; paperback reprint by Cornell University Press, 1989).

Daniel Lang. Painter. 1975. Paintings at galleries and museums in USA and Europe. Traveling exhibition.

Eliot Porter. Photographer. 1975. Photographs, traveling exhibition, and book: Antarctica (169 p. E.P. Dutton, 1978).

James Westwater. Photographer. 1977. Photographs and multimedia presentation (symphony orchestras with 3-screen slide' show).

Stephen J. Pyne. Historian. 1982. Book: *The Ice: A Journey to Antarctica* (448 p., University of Iowa Press, 1987). Reprinted 1988 by Ballantine Books. Praised by the New York Times Book Review (one of the 16 best books of 1987), Scientific American, and others.

Michael Parfit. Writer. 1984. Book: *South Light, a Journey to the Last Continent* (306 p., Macmillan, 1986; paperback, 1987; U.K. edition, 1988). Articles in Smithsonian, National Geographic, and others.

Lucia deLeiris. Painter. 1985. Book (with author Sanford Moss): *Natural History of the Antarctic Peninsula* (Columbia University Press, 1988); watercolors and drawings shown at museums and galleries.

Jennifer Dewey. Painter, writer. 1985 Drawings and two illustrated children's books (*The Adelie Penguin* and *The Wandering Albatross*, Little, Brown, 1989) in her *Birds of Antarctica* series. A third book, *On the Edge*, is planned.

Barry Lopez. Writer. 1987, 1989, 1991, 1992. Articles for Harper's and Washington Post Outlook. Future book. Mr. Lopez is the award-winning author of *Arctic Dreams* (Charles Scribner's Sons, 1987).

Rachel Weiss. Sculptor, arts administrator. Conceived and produced the arts and sciences exhibition *Imagining Antarctica*, displayed in several cities in 1986 and 1987. A book of that title was published.

Alan Campbell. Painter. 1988, 1989, 1994. Traveling exhibitions at galleries and museums in Australia, New Zealand, and in the United States, sponsored by the U.S. Information Service, Mobil, and Lockheed Aeronautical Systems. Exhibition catalogs. Public television biography.

Neelon Crawford. Photographer. 1989, 1991, 1992, 1993. Exhibitions at galleries in New York, Baltimore, Washington. *Southern Lights Portfolio* (photogravures).

Stuart Klipper. Photographer. 1989, 1992, 1993. Exhibitions at Museum of Modern Art and other locations. Two Guggenheim fellowships. Future book of high latitude photographs.

Elizabeth Arthur. Writer. 1990. Knopf will publish her novel *Antarctic Navigation* in January 1994.

Ann Parks Hawthorne. Photographer. 1990. Numerous credits in magazines. Represented by Black Star.

Nena Allen. 1991. Shows at galleries in southeastern United States.

Rebecca Johnson. Writer. 1991. Lerner will publish two books for young adults: *Investigating the Ozone Hole* in 1993 and a book about antarctic scientists in 1994.

James Gorman. Writer. 1991. Book, *The Southern Ocean*, to be published by HarperCollins in 1994.

William Stout. Painter and writer. 1992-1993. Exhibition and book, *Lost World: Pre-historic and Modern Life in Antarctica*.

Galen Rowell. Photographer and writer. 1992. With. Barbara Rowell, an illustrated book about Antarctica. Also: "A most unearthly place," March 1993 *Life*.

Jody Forster. Photographer. 1992. Exhibitions in galleries in the American Southwest and elsewhere.

**ANNUAL NSF ANTARCTIC ORIENTATION CONFERENCE MAY BE A THING OF THE PAST.** For the past thirty-nine years, there has been a gathering in mid-September, or thereabouts, of Antarcticans going to the ice. In a way it has become the Annual Murray Hamlet Show of Frozen Extremities, although, to the best of my knowledge, in some thirty-seven years no

one as yet has frozen any appendages. However, with modern electronic technology there may not be a necessity henceforth to bring fresh spirited young Antarctic aspirants and grizzly old Antarctic hands together to fortify each other for the coming summer season on the ice.

From time to time, I have had the pleasure of attending these orientations, dating back to the very first one in Davisville in mid-October 1956. Dennis Peacock thought it would be a good idea if I wrote something about that first orientation.

According to THE POLAR TIMES, seventy scientists gathered at the United States Navy Construction Battalion Center in Davisville, Rhode Island for a week-long program of orientation. Back in those halcyon days, there was no support contractor, as it was rumored that our support was going to be willingly provided by an eager group of "Swabees", so it was just an encampment for the so-called scientists. And, naturally, being 1956, there was no need for women, as we men were going to do it all in our own way. So there.

Where there were few Antarctic experts in those days, we were sort of a motley crew of people brought up in the Byrd era who had been patiently awaiting an opportunity to leave home ... and go to the Antarctic. Sir Hubert Wilkins, the first man to fly in Antarctica and the first to take a submarine under polar ice, was there; Carl Eklund, a sledding partner of Finn Ronne's on the U.S. Antarctic Service Expedition, was also there. And maybe Finn was there, although I don't think so. Paul Siple definitely was not there, as he left for the Antarctic on 4 October. So there weren't too many OAE's. But there were some IGY biggies, including the illustrious physicist, Dr. Arthur Kaplan of UCLA, who was the Chairman of the U.S. National Committee for the IGY.

Unlike the most recent orientation conference, at a spacious conference center with a park-like atmosphere of lawns, trees, and deer aplenty, we were in very spartan military barracks, with military police at the gates. There was one watering hole in the area, the Kingston Inn, and that was our nightly escape. I remember one evening when Eklund left his ID badge back in his room, he borrowed Sir Hubert's and as he went out the gate he proclaimed, "I'm Sir Hubert, and I will make out tonight!"

I don't seem to recall anything about any lectures, but there were talks on clothing and equipment and survival. We were all issued what we were to wear in Antarctica. Basically it was Quartermaster issue from my old laboratory at Natick, Massachusetts.

A funny thing happened at the very end as we were breaking up. Someone remembered that Sir Hubert had never been invited to say a word, and as a farewell gesture turned to him and said, "Sir Hubert, would you like to say a final word to all these people before they go to Antarctica?" And he replied, "Yes, as a matter of fact I would - please don't p -- in all the crevasses." And so was issued probably the first environmental impact statement ever given to Americans going to the Antarctic.

The week was over, and we were riding back to Natick with Sir Hubert and some of the clothing experts who had come down to distribute the clothing. The radio was on, so no one was saying much as we were all tired and just wanted to get home. Suddenly the program on the radio was interrupted with a news bulletin - a Navy plane flying into McMurdo had crashed, killing three, one more was subsequently to die. The reality of where I was going was very suddenly upon me, and here I was with the man who introduced flying to Antarctica. I took solace in knowing that I, like all except Paul Siple, would be going to Antarctica by ship, the last time that U.S. scientists were to go by ship.

In retrospect, orientation was most enjoyable, as it gave all of us an opportunity to . meet our fellow scientists from the other stations, and more or less establish a camaraderie among those in Antarctica for the IGY stations (Byrd, Little America V, Amundsen Scott, Ellsworth, Wilkes, McMurdo^ and shared Hallett with the Kiwis). Many of you know some of the men who wintered over that first year, as they are well-known names in

science, such as Charlie Bentley, John Behrendt, Ned Ostenso, and others. But, professionally, probably the best known internationally is our ex-Boy Scout, Dick Chappell, who has truly made a name for himself.

**LECTURERS ON ANTARCTIC CRUISE SHIPS.** Although there is no master list available on lecturers who have appeared on the various cruise ships going to Antarctica, we do know that a goodly number of them are members of our Society. Once upon a time it was relatively easy to keep track of the Antarctic cruise ships, but nowadays one company may have as many as four different ships going to the ice throughout the whole austral summer. It is really big business, and such authorities as John Splettstoesser, Frank Todd, Peter Harrison, Charles Swithinbank, Ron Naveen, Barrel Schoeling, and a few others can practically write their own tickets, choosing those ships and cruises on which they wish to go. But after the first-tier lecturers, the rest are pulled from the rank and file, depending on their specialities.

George Llano was our first member who established himself as a bona fide Antarctic lecturer, and he was Mr. U.S. Antarctic lecturer for many many years. Now Llano has been supplanted by John Splettstoesser, who goes back to the ice each and every austral summer (as well as to the Arctic during the summer), with well over forty Antarctic cruises to his credit. John is the closest thing to being a professional full-time polar lecturer there is on this globe. Frank Todd calls his own shots, too, and we doubt if there is a single penguin in Antarctica who is not on a first-name basis with Frank. That ageless wonder, Charles Swithinbank, goes when the spirit moves him, which is every year! Being on board with Charles must be like being with a talking Antarctic encyclopedia, as what he does not know is certainly not worthy. Ron Naveen, the former lawyer who has gone straight, who has seen the light, is a naturalist with camera who is most highly regarded. Barrel Schoeling is another one of the permanent brigade of high repute.

The British ornithologist Peter Harrison, who now claims Port Townsend as his domicile, amounts to a cult leader. His faithful followers would no doubt even follow him on a downtown tour of the Bronx. Peter is a rare breed himself, being part ornithologist, part artist, part actor. And he is accompanied by a companion act, as his bride of a few years is none other than the indestructible Shirley Metz who skied her way to the South Pole back in 1989, then stripped to her undies for a cool photo for LIFE! But Peter can outdo Shirley. He convinces every tourist on their very first night aboard that their upcoming trip to Antarctica will be the greatest thing to happen to them since they discovered sliced bread, and then he proceeds to even exceed those limits.

Then there are the fill-ins, and they are a virtual potpourri of who's who in Antarctica. Our Honorary President, Ruth Siple; a daughter of the late Admiral Byrd, Boiling Clarke; and one of the first two women to winter over in Antarctica, Jackie Ronne, all brought famous names with them. And, as time allowed, Hugh BeWitt lectured through his Antarctic-honeymoon with Jane Siple. Past members of the Office of Polar Programs include Bob Rutford, Bwayne Anderson, Peter Anderson, Gunter Weller, and Mort Turner (as well as the aforementioned George Llano). They even took college deans several times, the irascible Colin Bull, and that Austrian wine connoisseur, Mike Kuhn. Gerry Webers of Pensacola Mountain fame also served, as did Bob Bodson of the Ronne Antarctic Research Expedition; Brian Shoemaker who flew planes before flying the flagship of the American Polar Society; plus yours truly. We forgot Dick Cameron and Bill Sladen!!!! Sorry!

That comes out to twenty-five members of our Society, although we are sure there are others. Among the deceased', Gentleman Jim Zumberge and Bill Benninghoff both lectured. And among the front offices sending tourists to Antarctica, we have the well-respected Werner and Susan Zehnder, and Victoria Underwood as members.

*Remember to pay your dues!*

*Remember to buy your calendars NOW!*

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 94-95

November

No. 2

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorus, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Sayed Z. El-Sayed, 1990  
Dr. Charles W. Swithinbank, 1991  
Dr. Susan Solomon, 1992  
Dr. Michele E. Raney, 1993

*OUR 1994 PAUL C. DANIELS MEMORIAL LECTURE*

Joint Meeting with The Explorers Club - Washington Group  
and The Society of Woman Geographers

Astrophysics at the South Pole

by

Dr. Doyle A. (Al) Harper Director,  
Center for Astrophysical Research  
in Antarctica Yerkes Observatory

on

*Saturday evening, December 10, 1994*

at

The Cosmos Club

2121 Massachusetts Avenue, NW

Social Hour 6 PM - Dinner 7 PM - Lecture 8:15 PM

The cost of dinner, including tax and gratuity, is \$33/person.

Club rules preclude having a cash bar, so drinks must be ordered and paid for when you send in your dinner reservation. Each drink: Liquor - \$4.25, Beer - \$3.25, Wine - \$2.75, Sodas - \$1.75. Make check (dinner & drinks) payable to Explorers Club-Wash.Group, and send to Ms. Marcia Halliday, P.O. Box 2321, Reston, VA 22090 (daytime phone: 703-818-4667) *by December 3rd.*

Dress will be black tie, or dark suit, if you prefer.

Dr. Al Harper has been Director of the Center for Astrophysical Research in Antarctica (CARA) since 1991. The high South Polar Plateau is an excellent place to do infrared work - best on the surface of the earth - because most of the water vapor is frozen out of the polar atmosphere. Scientists have recently begun several major initiatives to capitalize on the unique atmospheric, climatic, and geographical advantages of the site for astrophysical experiments. If these ventures are successful, Antarctic telescopes may become premier tools for a broad range of earth-based astronomical observations during the twenty-first century.

A new monster has surfaced in recent years which will depersonalize these Newsletters while at the same time will saturate you all with facts, and that is the utilization of Guy Guthridge's e-mail file. Taradiddling would become a thing of the past; begging for news items would be passe; there would be no more calls to Link Washburn pleading for a heartrending obituary of some beloved polar scientist; biased book reviews would not be written by some prejudiced soul; and tales of the Antarctic would only be spun at bull sessions.

But there is at least one Antarctic, a former roommate of mine at Little America V in 1957, who is a program manager at the National Science Foundation, who is fighting e-mail. He feels in his work that it is much more important to have the personal touch of communication with his subjects. He equates e-mail with the interstate highway system and the use of condoms, where one loses touch with reality.

I feel that we are at a crossroad with these Newsletters. For the time being we will probably go with a mix of e-mail plus taradiddling. If you, the readers, like e-mail, we can make these things all e-mail. Until then, read the Newsletters with caution, as we will continue to strive to make sure the truth doesn't in any way get into the substance of a real good story.

**CALENDARS AND MEMBERSHIPS.** The 1995 Colin Monteath Hedgehog Antarctic calendar is just fantastic, and our price is ridiculously low. We have only a limited number, so if you want one, better order now, as we will take what's left to the next meeting and unload, freeing Ruth for Christmas activities. Ten bucks by mail, nine dollars by hand.

Our membership has stabilized at around 600, which is a good neighborhood to be in. As we go to press, we have around a hundred delinquent for this year, which isn't bad, since we haven't sent out second notices yet. Two-thirds of those who have renewed have done so for multiple years, which sure helps out on the bookkeeping and billing. Thank you, thank you, thank you!

**ELLE TRACY IS IN THE ON-DECK CIRCLE.** Your next Newsletter will be written by a former contract employee of ASA, Elle Tracy of Seattle, Washington, who wintered over at McMurdo in 1992. During the austral summer of 1991-92 she wrote a column, "Scientific Souls and Sun Dogs" for the weekly military newspaper; edited and published thirteen issues of *THE DARK STAR*, the winter-over newspaper for the station. Elle is interested in writing for the Antarctic Society, and because Yours Truly will be historian on one of the Antarctic cruise ships for five cruises early in 1995, we accepted her invitation to write and told her to crank out the next one.

I think you will find her both refreshing and interesting. She is planning to write an Antarctic book, entirely different from any written to date. On her way back from the ice she studied her way through the New Zealand libraries, South Australian libraries, and spent several months at the Scott Polar Research Institute in Cambridge. She is one of the few American women who has gone to SPRI and not been conscripted by Brother Stonehouse for an advance graduate degree on tourism and the Antarctic environment. That makes her real unique. She has been exposed to Charles Swithinbank,

Colin Bull, and John Splettstoesser, and is still interested in Antarctica, so she is a real hardy soul. In spite of her unbinding love for Antarctica, she does NOT want to go back to the ice, which is impossible to believe. We told Elle that the ball was in her court, that she could dribble it, pass it, or shoot it, do anything she wanted.

**PROPOSING U.S. STAMP FOR DR. PAUL A. SIPLE** (John Lenkey III). During the course of fund-raising for the restoration of the Richard E. Byrd Memorial in Wellington, New Zealand, John Lenkey III of Midlothian, Virginia came to the conclusion that the late Dr. Paul A. Siple was "the most effective Antarctic of all."

On October 1, 1994, Mr. Lenkey contacted the Citizen Stamp Advisory Committee of the U.S. Postal Service for directions on how to proceed. Members who wish to second the motion to have a stamp for Dr. Siple should send letters of endorsement to Mr. Lenkey (Mr. John Lenkey III, Siple Stamp Committee, 2121 Castlebridge Road, Midlothian, VA 23113).

**AN APPRECIATION OF PAUL A. SIPLE** (by Robert F. Benson of Goddard Space Flight Center, Greenbelt, MD 20771) in *BOS, TRANSACTIONS, AMERICAN GEOPHYSICAL UNION*, Vol. 75, Number 31, August 2, 1994, pages 355, 361. (Bob Benson was a wintering-over scientist with Siple at the South Pole.) We are republishing parts of Bob's longer article in memory of Paul's recently departed sister, Carrol Kettering, for whom Paul once named a geographic feature sighted on the U.S. Antarctic Service Expedition.

At 19, Eagle Scout Paul Siple, at 6'1" and 167 pounds, with 60 merit badges, was selected in a highly publicized contest from among thousands of Boy Scout applicants to participate in the first Byrd Antarctic Expedition (1928-1930). This expedition took place just 16 years after the race between Amundsen and Scott for the South Pole. It was the first of 4 winters and 10 summers that Siple would spend in Antarctica. On this first expedition, he performed a wide variety of tasks in addition to serving as taxidermist—he brought a collection of seals, penguins and flying birds to the American Museum of Natural History of New York.

He returned to Allegheny College, in Meadville, Penn., where he completed his B.S. in 1932, gave many lectures, and wrote his first book describing his adventures in Antarctica. This book provided some welcome financial support—though he gained invaluable experience in Antarctica, he received only a symbolic \$1 in financial compensation.

On the second Byrd Antarctic Expedition (1933-1935) Siple was chief biologist, in charge of equipping Admiral Byrd's Advance Base where Byrd would remain alone for 5 months, and led a 3-month dog-sledding party into unexplored regions

In 1939, between the second and third expeditions, Siple earned his Ph.D. in geography from Clark University. After the third expedition, he was asked to act as an expert cold weather clothing designer for the U.S. Army, which led him to accept a commission in the Army Quartermaster Corps.

The "wind chill temperature," a common term used in daily weather reporting on cold winter days, has its origin in the "Wind Chill Index" specifically designed for Antarctic conditions, which was introduced in Siple's 1939 Ph.D. dissertation. It was developed to simplify the complicated formulas for expressing the relative comfort scales of different weather conditions. The motivation for this goal came from experience gained by Paul Siple during the first two Byrd Antarctic expeditions. As stated by Siple and C.F. Passel in 1945: "Perhaps there is no place on Earth where one is so acutely aware of the need for a

suitable scale to express sensible temperatures as the polar regions. Here there is striking contrast between relatively tolerable days of calm, subzero weather, and windy days that are warmer although sensibly much more unpleasant."

The wind chill index was refined based on research carried out during Siple's third expedition to Antarctica from 1939 to 1941. During that expedition, he was geographer and supervisor of supplies for the U.S. Antarctic Service (USAS), leader of West Base, and navigator and principal geographic observer on all West Base exploration flights. His wind chill work at that time, with Charles Passel, was based on measurements made in "unconfined atmosphere under condition of freezing temperature and darkness."

In addition to determining cooling rates from the time required for water to freeze and give off its latent heat of fusion, experiments were performed to determine human physical endurance for exposed flesh under various wind conditions during subfreezing temperatures. This work also contributed to his classic guide about the proper clothing for "large numbers of inexperienced men being taken into polar or other cold-climate regions," and led to new designs of cold weather gear such as the cold weather parka and the basic insulated boot, which was the basis for one of his eight patents.

Because of the experience gained from three wintering-over expeditions with Admiral Byrd in Antarctica, Siple was asked to return to Antarctica on several key assignments. He went as senior War Department observer during the Navy's Operation High Jump (1946-1947), and during Deep Freeze I (1955-1956) he served in two capacities, as director of scientific projects for Task Force 43 and as deputy to Admiral Byrd. Finally, after pleading requests from Larry Gould, Hugh Odishaw, and Admiral Byrd, he accepted the challenging role as leader of the first wintering-over party of 18 men at the Amundsen-Scott South Pole Station during the IGY. Admiral Byrd told Siple that if he were not satisfied that it was safe to live there, he would have the authority to call off the operation. So, once again Siple had to leave his supportive wife Ruth and daughters Ann, Jane, and Mary for more than a year, while he applied his professional talents to Antarctica. This time, it was to establish a manned presence at the geographic South Pole. He was the overall station leader, and John Tuck Jr. was in charge of the Navy support personnel. The two formed an ideal leadership team that made the first winter at the South Pole one of the great success stories of the IGY.

His leadership and organizational skills quickly became evident during that first winter at the South Pole. Siple led his coworkers in performing the many difficult tasks necessary to prepare the station for the dark 6-month winter when temperatures were typically between -60° and -80°F with a wind. He was almost always the first to dig into the many outdoor projects to be completed before sunset, and the last to come in out of the cold. It was difficult for a station member to complain about the cold working conditions when Siple—many years their senior—was outperforming them.

He cheerfully took his turn at hauling trash, cleaning floors, digging snow for our water supply, and kitchen duties. He refused to buckle under the demands to show a movie every night, arguing that the limited supply of films, while plentiful, would lead to massive reruns at the end of our stay when morale problems could become greatest. Instead, he instituted a series of seminars by station members and lectures on medical topics by our station physician.

In addition to their leadership roles, both Siple and Tuck spent many hours during the winter night taking star shots to determine the precise location of the Amundsen-Scott Station relative to the geographic spin pole. This effort

was closely related to a major interest that Siple had in the motion of the poles. Like Alfred Wegener, recognized author of the continental drift hypothesis, Siple was convinced that many terrestrial geographic and geological features could not be explained by the accepted geological dogma of the day. In particular, he was a firm believer that the existence of coal beds in polar regions could not be explained by global climatic changes. He devised experiments involving the motions of small magnets on a spinning metal sphere in the basement of his home in Arlington, Virginia to test his view that forests and swamps once existed in Antarctica due to polar wandering in addition to the movements of the continents.

After returning from Antarctica, Siple resumed his role as special advisor to the director of Army Research, wrote a book describing the first winter of the Amundsen-Scott South Pole Station and the history leading up to it, and was elected the second president of The Antarctic Society. He later accepted a position as the first U.S. Scientific Attach<sup>e</sup> to Australia and New Zealand, where he was instrumental in strengthening ties between scientists in all fields. He died in 1968 at 59 after struggling for more than two years to keep working despite partial paralysis resulting from a stroke. In addition to the numerous honors he received—including a cover picture on *Time Magazine*, in 1956—an Antarctic station was dedicated in his honor.

**NORMAN VAUGHAN SEEKS DIVINE SUPPORT AS HE ASSAULTS HIS OWN MOUNTAIN.** Everything is on GO, as we go to press, for Norman Vaughan to leave Alaska on 16 November to start the 1994 Mt. Vaughan Antarctic Expedition. Leaving no stones unturned, he appeared on Robert Schuller's Sunday morning "Hour of Power" in September. There is no question that Norman doesn't need any inspirational motivation. In fact, he could write a book on motivation. But if the Lord was listening that morning, if He was moved, perhaps He will show Norman the way to the top on his 89th birthday.

Norman made a swing through Maine in early November, and we heard him speak at the College of the Atlantic in Bar Harbor, Maine. He was all charged up like a thoroughbred racing horse, just waiting to burst through the starting gates. His supporting team is thin in numbers, consisting of his 52-year old bride, Carolyn Muegge-Vaughan, and a veteran Seven Summitter, Vernon Tejas, age 41. If need be, it will fall on Vernon to backpack Norman to the summit, as dogs are no longer part of Norman's life-support system in Antarctica.

There will also be an official photographer, Gordon Wiltsie, a guide from Adventure Network International (ANI), and a film crew from National Geographic Television. The expedition will leave Punta Arenas on an ANI C-130 on 22 November, flying, hopefully, the 1750 miles to Patriot Hills, where they will set up their base camp. A week later they will fly 750 miles in a Twin Otter to the base of Mt. Vaughan. A DC-3 supply plane will also accompany them. If all goes well, they will have a birthday celebration on the summit of Mt. Vaughan on 19 December, then return to Punta Arenas and the States within ten days.

Expedition updates will be sent frequently via the Prodigy Services, which is sponsoring on-line communications through a feature called "Mountain Challenge." If you are interested in being on-line with e-mail to get daily updates, send them your e-mail address.

Norman has no idea at all how old he really is, as no self-respecting man of 89 would even consider doing what Norman is contemplating. Norman says, "Age is not a factor in the pursuit of dreams and lofty goals. No challenge is too great at any time within a person's life. This effort will serve as a symbol of vitality to people in their senior years that it's possible to live younger, longer." That's

all sort of a sophisticated way of saying what another immortal, Satchel Paige, once said, "Don't turn around, as someone might be gaining on you."

There's no one behind you, Norman, you are out there all by yourself, you vs. the environment, and we'll just have to wait and see who wins out. But you have already defied so many odds by doing so many crazy impossible dreams that we aren't going to lay any money in Las Vegas against your making it.

5four folks are all going to have a chance to meet and hear Norman when he comes back, as he is so deep in a financial hole that he's going to have to lecture for the rest of his life in order to pay off his debtors. But the guy is a good speaker, very entertaining, and is sort of the Rip Van Winkle of the Antarctic, having been there in 1928-30, 1978, and now 1993-94. And wouldn't you pay to hear Rip? Imagine being in Antarctica covering a span of 65 years, and having a 52-year old bride who supposedly is happy with your antics? Truly a miracle man.

**BEWARE OF SOFT SHOULDERS - BARRY CHAPMAN BISHOP IS DEAD AT AGE 62.** As old Norman goes to his destiny climbing Mt. Vaughan, a very famous mountaineer who had some Antarctic blood in his veins met his destiny in a single-car accident on the soft shoulders of a road near Pocatello, Idaho, on 24 September. Barry served in the Antarctic Projects Office of the U.S. Air Force from 1955 through 1958, working as a scientific adviser to the late Admiral Richard E. Byrd. He also was the official U.S. observer on the Argentine Antarctic Expedition in 1956-57.

Barry got a real head start climbing mountains, as he made his first ascent (Mt. Mitchell, North Carolina, 6,684 feet) at age three, riding piggyback on his father's back. Twenty-eight years later, on 22 May 1963, he made it to the top of Mt. Everest. It was a costly victory, as he lost his toes and part of two fingers to frostbite. His son Brent successfully climbed Everest last May, making them the only American father and son to achieve the top of the world. Barry, along with his wife Lila, were on their way from their retirement home in Bozeman, Montana to San Francisco where he was to appear at a lecture with Brent, when Barry lost control of the car after it veered onto the shoulder of Interstate 86. Lila suffered minor injuries.

Barry was probably the most visible member of the National Geographic Society, where he worked for some thirty-five years, being chairman of the Committee For Research and Exploration. He was to have been honored on 4 November with the Society's Distinguished Geography Educator Award at the annual meeting of the National Council for Geographic Education in Lexington, Kentucky. He has been the recipient of many awards, including an honorary doctorate from the University of Cincinnati, the Explorers Club Medal, the National Geographic Society's Hubbard Medal, the Society's Franklin L. Burr prize, the William Howard Taft Medal from the University of Cincinnati, a National Press Photographers Association award, a Distinguished Alumni award from the University of Cincinnati's McMicken College of Arts and Sciences, and honors from the Association of American Geographers.

**KAYE EVERETT, DISTINGUISHED POLAR SOIL SCIENTIST DIES.** Kaye Everett was truly one of a kind, and even though he worked for me for a couple of years, I was never able to separate fact from fiction. But one thing is known for sure, he loved being in the field, and was probably happiest when there, as long as a supply of beer wasn't too far away. He spent some time in Antarctica, although he was much better known as an Arctic man. One of his daughters, Shaun, worked for the Antarctic contractor as sort of a travel agent, and probably spent more time in Antarctica than her Dad.

Kaye died as he wanted to die, in near obscurity, with few knowing of the seriousness of his condition. He died peacefully during the early morning of 21 October, victim of pancreatic cancer at the age of 60. Kaye had a 34-year love affair with

the polar center at Ohio State University, where he got his PhD under the late Dick Goldthwait on downslope soil movement and deformation. Recently he had initiated a new project to study carbon status of soils and permafrost in northern environments.

Kaye was a real character. When he worked for me, he drove a deplorable vehicle of sorts which he took to the office via back roads, as it could never pass inspection. The hood was tied down, and when he stopped the car, he had to disengage the battery. At that time, he was an inveterate smoker, three packs a day, and couldn't answer the telephone unless he had a cigarette in his mouth. But he gave up smoking many years ago, after waking up one morning with a sharp pain in his chest. He became an instant convert.

And he had a great capacity and love for a popular malt beverage, holding some sort of a chug-a-lug record at some watering hole in Idaho or Utah of which he was particularly proud. He used to claim he drank a case a day, two six-packs before dinner, one with the meal, and another during the evening! Fact or fiction? We had him working in the field the summer after the Good Friday earthquake in Alaska, and after being out in the boonies for a fortnight, he came back to a military installation to get resupplied. He went to the PX to get some beer, and they told him it wasn't necessary to buy any, because after a party the night before, there was a whole trash can full of beer outside the back door. Kaye's comment to me afterward was, "I always wanted to know if I could drink a whole trash can full of beer!"

Kaye claimed that he once was a motorcycle racer of some repute, but when I brought this up to some of his other friends, they had never heard of him cycling! So maybe he created special stories for all of us, spreading them around like scattering bird seed for the innocents to pick up and promulgate.

But Kaye was truly a nice guy, a fun guy to be around, a great guy to be in the field with, and a dedicated polar soil scientist. He died much too young, but if he did all the things he claimed he did, he lived a very full life in those far-too-few years. Presumably he got through St. Peter's pearly gates with no problems, and somewhere up there, he is enjoying yet another beer.

**IF IT'S A KLIPPER, YOU CAN BE SURE.** Now available: a top-of-the-line Antarctic poster at a rock-bottom price. Photograph by Stuart Klipper, published by Mirage Editions. Image is a dramatic depiction of a spectacularly striated iceberg in a brash field. It was shot in 1989 from the launch of the USCGC POLAR SEA in the Dumont d'Urville Sea at the Geomagnetic South Pole. Price: a mere \$15.00 plus shipping. (Stuart's address: 5044 Xerxes Avenue South, Minneapolis, MN 55410.)

**ANTARCTIC SPLENDOR** (Esplendor Antartico) by Frank S. Todd (Book review by John Spletstoeser). "Mr. Penguin" has really done it this time. Frank Todd has produced one of the handsomest coffee-table picture books of Antarctica in existence. The book's title tells it all. The splendor of the continent is revealed in a book of mainly photographs, which follow a brief Preface and a 10-page Introduction. To reach a wider audience, all text in the book is in both English and Spanish, including captions for photographs.

Frank Todd is best known for his work as a naturalist and expert on birds, but he has a very diversified background. He was at Sea World in San Diego for many years, when he created "Penguin Encounter," for which he is probably most widely known. Other "Penguin Encounters" have followed in the U.S., as well as overseas, all a tribute to Frank's success in displaying wildlife in a realistic setting. If there is anything Frank knows well, it is birds and Antarctica, and both come together in this book. But he also knows a lot about photography, as is evident in the quality of the photos, as well as the message the scene conveys.

the dust cover photo is a deep-blue-colored iceberg with Chinstrap penguins on it, a classic, once-in-a-lifetime opportunity for such a scene. Photo subjects in the book include not only icebergs, but all penguin species found in Antarctica, other birds, plants, and marine mammals. All these indicate Frank's knowledge of the continent on which he has spent more than 20 summer seasons, for he is a walking encyclopedia of its biology. I have been with Frank on many cruise ships to Antarctica, where we sometimes are employed as lecturers, and each time I come away with some new facet of information that Frank has stowed in his lecture repertoire. His presence on a tour ship is an asset for the tour companies, for he has a considerable following of passengers associated with wildlife organizations. He is also one of the leading proponents of environmental protection of Antarctica, going back to a time when it was not even fashionable to be known as an environmentalist.

As you might have already suspected, I recommend this book highly, and to order a copy contact Hancock House Publishers, 1431 Harrison Avenue, Box 959, Elaine, WA 98231-0959. In Canada, contact Hancock at 19313 Zero Avenue, Surrey, B.C. V4P 1M7. The book was published in 1993, has 177 pages, and a Special Patrons Deluxe Limited Edition (signed by Frank) is priced at \$75 (U.S.). Add \$6 for postage and handling in North America; outside N.A. add \$15 for airmail. If you happen to be in Chile, contact Diseñadores Asociados Ltda., Pucuro 2151, Santiago 9, Chile.

**A DYNAMIC REDHEAD, APRIL K. LLOYD, GOES TO THE ICE.** This austral summer, a teacher who had a dream is seeing it all come to fruition, as she will be part of Al Harper's crew at the South Pole working on CARA's (Center for Astrophysical Research in Antarctica) programs. An Antarctic, upon returning from summer field programs at McMurdo, used to visit her school and tell the captive creatures all about the ice. At least one was listening to him, the teacher, and she was enraptured by it all. One thing led to another, and when she found out that teachers were not ostracized from going, she made application.

We met her at the September orientation, and she certainly is dynamic. One staff member of OPP said that she would "melt all the ice in Antarctica." Well, we don't know about that, but she is going to be what is known in the sports world as an impact player. RJS and I had dinner with her and her husband at the home of the lecturing Antarctic, and I came away with the feeling that she will either end up as Ms. Antarctica or be lynched, and I wasn't quite certain which way it would go. This is no Yes Person. She has a mind of her own, and she's not against changing the system! Reminds me when as a young redhead myself I was confronted by Roger Babson of Babson Institute when he visited Harvard University's Blue Hill Observatory and he said to me, "I would never marry a redhead, but I would hire one any time, as they stir up things!" We asked April to write us about how she got involved in Antarctica, and she sent the following:

I have taught third grade in Charlottesville, Virginia, for the past six years. I am an avid user of technology and believe that reform to education must incorporate the inclusion of public schools in the Internet Information Highway. Schools have traditionally been isolated pockets where students learned in seclusion. Teachers were responsible for providing resources and experiences without access to the larger community. My passion in teaching is to use the Internet to provide students access to the world that we are preparing them to enter. My goal is to create a classroom where students look forward to coming to school each day, where they like to learn and feel comfortable looking for answers to difficult questions. If children feel that they have the power to learn, with people available to help them, our future is bright.

I have been interested in Antarctica for many years. The dream to actually go

there became a reality this past year when I was told that the National Science Foundation Office of Polar Programs and Teacher Enhancement Divisions were offering a grant application program for high school teachers. Another requirement was prior participation in a Teacher Enhancement Program. Although I was an elementary teacher, I had participated in a TE program and applied anyway. As with most things in life, if you believe in what you are doing, work hard to convince others to give you an equal chance, and follow through with your commitments, opportunities materialize. The opportunity to go to Antarctica fulfills a dream while also allowing me to work on a project connecting students to scientists over the Internet.

When I am not teaching, or logged onto the Internet, I am reading, running or riding my bike. I like all kinds of music, from rock and roll to classical, but being born in Texas, I especially like country rock and Texas swing music. I wear lots of western clothes and boots, and the younger kids at my elementary school fondly refer to me as the cowboy teacher.

If you would like to contact me directly, I am an avid e-mail correspondent and would welcome a message:alloyd@pen.k12.va.us

**FROM THE E-MAIL SCREEN OF GUY GUTHRIDGE.** The growing season in the Antarctic Peninsula is two weeks longer than it was in 1964, says Ron Lewis Smith of the British Antarctic Survey; summer temperatures are up 2 degrees C. So, one of Antarctica's two species of flowering plants has increased on three islands from 700 in 1964 to 17,500 in 1990. The other has increased from 60 to 380. Species new to Antarctica could get started if the warming keeps up. The plant expansion mirrors that in Spitzbergen and northern Finland, says Robert Crawford of the University of St. Andrews, Scotland.

The grounded part of the antarctic ice sheet has lost mass at 235 billion tons (about a hundred-thousandth of the ice sheet) per year for the last century, says W.S.B. Paterson. He used worldwide sea level rise figures to calculate the loss and reported it at a NATO workshop on ice in the climate system. His 1993 paper recently came to the attention of the Antarctic Bibliography project.

Summer sea ice cover in the Bellingshausen Sea was 30 to 60 percent less in 1989-1991 than it was between 1973 and 1986. When researchers led by Stanley Jacobs, Lament Doherty Earth Observatory, visited the area in February 1994 aboard USCGC POLAR SEA and NSF's RV NATHANIEL B. PALMER, the sea ice had recovered from its minimum, but was still less than the 1973-1986 average. In some locations the oceanographers collected the first data since Adrien de Gerlache's ship BELGICA was icebound there more than a century ago.

McMurdo's sea ice runway gets thicker as the season progresses. K. Morris and M.O. Jefferies of the University of Alaska report seasonal increases of as much as 0.57 meter (in 1989), with a maximum thickness of 2.34 meters (in 1990). So the amount of ice that grows during the operation of the runway is about 25 percent of the maximum ice thickness.

France won't rebuild the damaged airstrip at Dumont d'Urville. The Cabinet decided to drop the project "because of the difficulty of maintaining it permanently and out of concern to protect the antarctic environment." The Cabinet also banned whaling in France's antarctic economic zone.

A new French-New Zealand agreement covers antarctic operations out of Christchurch. French personnel will be headquartered in the International Antarctic Center and stage a C-130 out of Christchurch and a Twin Otter out of McMurdo to reach Dome C and Dumont d'Urville.

Glycoproteins extracted from antarctic fishes by OPP grantee Arthur DeVries, University of Illinois, were crucial to an experiment that froze a rat liver and revived it six hours later. Boris Rubinsky, University of California, Berkeley, who did the experiment, thinks it's just a matter of time before human organs are routinely frozen for significant periods. "I'm convinced," he says, "that long-term organ preservation will come through mimicking the strategies that nature has already devised."

Weddell seals can produce at least eight calls with their mouths and nostrils closed, according to three Australian researchers. The calls range from long, high-frequency whistles to short, low grunts, and are the same on land as those made under water.

The Antarctic contributes significantly to marine biodiversity, state two Belgian biologists. Benthic amphipods of the Southern Ocean comprise 702 species, of which 85 percent are endemic.

The 27 September New York Times gave prominent coverage to research on penguins by grantees Gerald Kooyman (Scripps Institution of Oceanography) and William Eraser (Montana State University). Gerry Kooyman and party made the first October visit since 1969 to the Emperor penguin colony on sea ice at Beaufort Island, 50 n. mi. north of McMurdo. A VXE-6 helicopter provided the transportation. Kooyman had 2.5 hours on the site and did a detailed census of the colony in calm conditions. David Bresnahan, NSF Representative Antarctica, cites the quickly planned event as "a great example of the team approach desired in USAP that allows science personnel to take advantage of all the logistics expertise available."

At Macquarie Island, an Australian study shows a correlation between the decline of wandering albatrosses and the onset of large-scale longline fishing for tuna in the southern hemisphere. Near South Georgia, on the other hand, wandering albatrosses and possibly light-mantled sooty albatrosses probably sustain themselves on dead squid scavenged from, among other sources, fishery waste. Black-browed and especially grey-headed albatrosses eat mostly live squid. A British study yielded this information.

Notornis Magazine reports occurrences of live Adelie penguins (a) at a camp 50 kilometers from the nearest open water at McMurdo Sound (there were two; both died), and (b) at a public beach in New Zealand (there was one; a conservation officer took it to a more remote beach).

The 1994 antarctic ozone hole is nearly as deep and wide as ever. That's a surprise: Mount Pinatubo's 1991 debris, which enhanced the chemical destruction, is almost gone. Ozone levels over South Pole Station dropped to 102 Dobson units in early October, comparable to 105 in 1992 and 108 in 1991, but not as bad as the record 91 in 1993. The discouraging possibility is that the hole is being deepened and enlarged by the steady increase in the stratosphere of chlorine and bromine from synthetic chemicals. Arlin Krueger of Goddard Space Flight Center figures maybe we've returned to "normal," which means a progressively deepening ozone hole.

The main reason for the lowest-ever value of total ozone – the 91 (+ or - 5) Dobson units recorded 11 October 1993 over South Pole – was prolonged presence of polar stratospheric clouds caused by unusually low temperatures, sulfate aerosol from the 1991 Pinatubo eruption, and increased chlorine, writes D.J. Hofmann in Geophysical Research Letters.

An intense phytoplankton bloom in the western Ross Sea polynya, three to four times previously reported values, is shown by coastal zone color scanner imagery. The bloom in December 1978 covered more than 106,000 square kilometers; primary productivity was 3.9 grams of carbon per square meter per day. Kevin R. Arrigo and Charles R. McClain of Goddard say in Science, 14 October, the western Ross Sea may be a much bigger carbon dioxide sink than recognized. They hope for better data from future satellite ocean color missions.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET

ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 94-95

January

No. 3

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans

## THE ANTARCTIC ENVIRONMENT: A DIFFERENT PERSPECTIVE

by

Joyce Jatko

Environmental Officer Office of  
Polar Programs National Science  
Foundation

on

*Thursday, February 23, 1995*

7:30 PM

National Science Foundation  
4201 Wilson Blvd., Arlington

Room 340

(Entrance at back of building on the  
corner of N. 9th St. & N. Stuart St.  
*one-half block from Ballston Metro Station*)

Ms. Jatko is the Environmental Officer for the Office of Polar Programs at NSF. A newcomer to NSF, Joyce is responsible for coordinating and integrating the environmental aspects of the different components of Polar Programs, including planning, operations and science. Among the issues she is concerned with are waste management, impact assessments, and the effects of human presence on the polar environments.

Ms. Jatko received a B.S. in chemistry from Rensselaer Polytechnic Institute, a M.S. in environmental engineering from Kansas State University, and is currently enrolled in a doctoral program at the University of Southern California's Washington Public Affairs Center. Prior to coming to NSF, Joyce headed the Environmental Management Branch at NASA Headquarters.

COME ONE! COME ALL!

## Bergy Bits

Elle Tracy, Guest Editor

On the evening of April 18, 1990, I sat in the basement of Elliott Bay Books in my Seattle neighborhood and listened as Will Steger spoke of his book, *Saving the Planet*, the preface for which he wrote before he walked across Antarctica. That night, he'd been off the ice for about six weeks.

As he read, I thought about how natural it is that a human would pursue a personal passion. Will used his parka belt to demonstrate an effect of the hole in the Ozone layer. Now bleached white from its original turquoise, he'd worn the belt under the hole for four weeks. Twenty-eight days of 24-hour sun, mind you, but only four weeks nonetheless.

Listening to Will, I made the connection between my sense of living an environmentally sound life and the Antarctic continent, the only place where scientists can study the biological health of our planet. I realized I would become passionate about Antarctica.

Next morning, I phoned the National Science Foundation. "I want to work in Antarctica," I started. "You and 8,000 other Americans," the NSF operator's tone of voice told me. She gave me the number of the sub-contractor in Colorado.

Finally in September 1991, I deployed to Antarctica where I spent the next year living the most interesting, exotic adventure of my life. I returned to America researching my way through the New Zealand Antarctic Centre Library, Australia's Mawson Institute at the University of Adelaide (which closed weeks before I arrived, so I studied rare polar books at the South Australia National Library next door), and Scott Polar Research Institute at Cambridge University, Cambridge, England.

My passion for Antarctica has led me to this place: an opportunity to promote the Antarctic Society in a way that I humbly hope contributes some to its rich legacy. We 257 souls isolated during the winter of 1992 decided that since there were 260 million American citizens, we were indeed "one in a million." So I welcome this chance to influence my share of the million others who can experience Antarctica through my stories.

I wrote a column for the Navy newspaper during the summer. During the winter-over period, I published a bi-weekly newspaper in McMurdo with all earnestness, and with blessings from the NSF representative and the US Navy OIC in residence. *The Dark Star* gave me license to complete scientific and explorer research in the richly populated polar library at Scott Base, our New Zealand neighbor, to assist in the work of others to learn more about all the work done on Ross Island during the winter, and to filter Antarctic images, ideas and great stories with the muscle between my ears.

I work in the general field of adult computer literacy, and when I developed an opportunity to author a CD-ROM title about Antarctica (essentially an electronic book designed to be "studied" on a computer monitor), I wrote Paul and Ruth asking if I could include material from the Antarctic Society Newsletter in the title. "By the way," I added, "I understand you're looking for an apprentice editor," and "I'm interested. I have experience."

So here we are, you and I, sharing this time and space about Antarctica together. As many people—tall and short humans alike—as I've talked with about my Antarctic adventure, an expression of my deep gratitude is buried among these lines in appreciation of this privilege to share Antarctica with people, who like me, have walked in this pristine place and felt a spirituality present that occupies no other landscape on earth.

## Dream Big and Dare to Fail

Norman Vaughan celebrated his 89th birthday at 8,200 feet, on top of Mount Vaughan (85°58'S 155°10'W)—between Mounts Goodale and Crockett in the Will Hays Mountains (all named by Byrd for his [musketeers] dog handlers), which lie between Amundsen and Robert Scott Glaciers in the Queen Maud Range—by fighting back tears that rushed to bless his 65-year old dream. With his voice accompanied by wind howling under him, he conducted a telephone interview from the Patriot Hills using a "telephone in a suitcase." At the top, "I couldn't believe it," he said. "Then I said to Carolyn, 'Only two more feet.'" One guide, Vern Tejas, slid his cap off his bald head, and garnered a kiss from both Carolyn and Norman.

The team included Zippy, their stuffed toy husky, who paid humble tribute to the end of the Husky Era in Antarctica. They buried a cache (a Mount Vaughan Antarctic Expedition mug) filled with mementos of MVAE, Alaska, the Iditarod, 1929 Byrd Expedition pictures, a scroll from the Charles J Givens Organization, a copy of the summit speech and a history of the expedition.

"Was it difficult?" asked the interviewer. "Nine days to get to the top. For me it was exhausting, not zig-zagging, but climbing straight up through the 6-9,000 steps cut in by guides. But we got there two days ahead, on the 19th. We pitched a tent (p.8) and the four of us, Vern, Gordon Wiltsie, Carolyn and myself, slept on top through the night." Hearing the tone of his voice, his authentic enthusiasm, even saying "Over," is unforgettable. No one we know deserves a mountain top with 89 sparklers as a birthday cake. We're howling for you, too, Norman. Congratulations.

Watch for the National Geographic Explorer Series coverage on TBS April 2nd, and for the LIFE Magazine spread. *Thanks to Tana Warren for the Internet text used to fill in the particulars.*

## BAS 24 November 94

The Twin Otter aircraft belonging to Kenn Borek Ltd., an air charter company of Calgary, crashed at 0300 GMT on take off from Rothera Research Station (67°34'S 68°08'W), Antarctica, located on Adalaide Island off the Antarctic peninsula. All four crew members, presumed to be Canadian citizens, were killed.

The aircraft, mobilizing for charter to the Italian National Antarctic Programme, had been granted land and refuel facilities by BAS, at the request of Italian authorities. It landed at 0110 GMT in transit from Punta Arenas, Chile to Terra Nova Bay on the Ross Sea.

BAS personnel observed that the aircraft failed to gain sufficient height on take off and was seen to stall and crash into a large iceberg situated in the sea immediately off the southern end of the runway. It subsequently erupted into a fireball on the iceberg. Station personnel executed immediate emergency procedures and undertook an inspection of the area by crash boats, which revealed no survivors.

Rothera Research Station is the principal base from which air operations are conducted in support of the BAS science program during austral summer. It features a 915 metre crushed gravel runway, hangar, fuel farm and accommodation for 80 personnel. The air facilities were completed in 1991 and BAS routinely operates its four wheel-ski equipped Twin Otter and one DHC-7 aircraft from this base. An investigation is planned. *Thanks to our friend Charles Swinbank for the press release.*

## Remembering John Katsufakis and Hugh DeWitt

Rob Flint, who acted as a pallbearer at John's funeral, sent a copy of his recollections, noting primarily that at John's death he'd lost "the most influential person in my life, outside my parents." Apparently the ever astute John organized his last weeks, catching up with lifelong friends and other special people, with such grace and generosity that the ritual around his death was almost as provocative as his life.

John Katsufakis served twenty-two tours on the ice, totaling nearly thirty-six months. He earned the nickname, "Mr. Siple Station" recruiting researchers and managing Stanford University's radio science laboratory there.

Professor Katsufakis earned NSF's Distinguished Public Service Award in 1981, the Soviet Academy of Sciences bronze medal for his Antarctic work, and the honor of an Antarctic peak that bears his name.

Hugh DeWitt, beloved son-in-law of Mrs. Ruth Siple and loving husband of Jane, passed away unexpectedly recently. With Paul away and me lacking the proper materials to pay an appropriate respect in this issue, let me simply say to his family, our thoughts and prayers are with you in these days. A proper Antarctic Society tribute will appear as soon as possible.

## Tea with the Washburns

Paul Dalrymple suggested I phone a local member of the Antarctic Society and arrange for tea. So I did. They invited me to their gracious high-rise home near Seattle. Within the ninety minutes I spent with them, we soon chatted like old friends. Mrs. Washburn treated me to raspberry white chocolate cookies, and Mr. Washburn proffered Earl Gray tea.

"My interest is more Arctic than Antarctic," "Link" confessed, but both areas have some of the same geological properties that interest me. Perma-frost and its effect on landscape has drawn the Washburns to high latitudes since the fifties. Tahoe (she comes by the name honestly) showed me photos of their homes in Northern Canada and Greenland. "Historic sites by now," she mused. I remain struck by the photo she showed me of her three children standing on tiny ice islands totally engaging their curiosities in the natural world.

It was in that moment that I decided to include articles I wrote while in Antarctica; hoping my stories would satisfy some curiosities about how people work and live at McMurdo Station. Tea with the Washburns also convinced me that this time, I was with an Antarctic crowd in whose company I will be very comfortable.

These articles will appear again in my book *The Antarctic Method: Hiring and Managing High Performance Impermanent Workers*.

## Scientific Souls and Sundogs November 1991

Science is hard work. Three four-meter holes had been drilled for divers in the Cape Armitage sea ice, and underwater foot of Observation] Hill. By comparison, the Observation Tube's diameter would crowd a diver wearing air tanks. The dive holes had grown eight-inch [thick] ice plugs since last being used. Hunter S. Lenihan, the alternative PI, carved a square within each hole using a Stihl chain saw strung with an ice chain.

Dive tenders and other members of the science team picked, chipped and hacked at the ice plugs, scooping out chunks and slush with landing nets to round out the holes.

This team, from the Moss Landing Marina Labs in California, is assessing the biological impacts of anthropogenic (our) chemical disturbances to the marine benthos (ocean bottom) in Antarctica.

Hunter describes the study: "Our job is to study pollution ecology in the benthic habitat. In one study, we deposit marine animals into environments where we can choose between two sediments pulled from under the ice at the Outfall, the Jetty, Cape Armitage, Winter Quarters Bay or Hut Point. Then we can observe their preferences. Sometimes they float on top of the water, as far away from both sediments as possible." The requirement to obtain sediment and animal samples precipitates dives under the ice, usually one or two a day.

Now clear of ice, ropes tied with colored flags and a weight could be dangled into the sea to mark each diving hole, top to bottom. We draped the entry hole (furthest away from land) with mats to protect the divers from the stinging cold of sea ice. Both divers slipped into their tank vests, and tugged on flippers, close-fitting rubber hoods and gloves. Both requested assistance to seal out 27 degree water, to zip suits shut, to double neck bands and roll them inward, and to press air pockets out of the suits' tight-fitting neck, wrist and ankle bands. The divers strapped on weight belts.

Perched on the edge of the hole, a diver spat in his goggles, rubbed his finger inside the lenses, then rinsed them in the sea. He double checked redundant regulators, hopped in, stuffed the primary air source into his mouth and dropped into the navy blue water.

The second diver leaped in, as off a cliff. The tenders watched all three holes and each other—tending the dive, waiting. We watched slush coagulate and the sea ripple in an occasional gust of wind. I sucked a piece of sea ice to taste thirty-three percent salt. All the shades of blue evident in the ice caves bleed into the remaining blue shades visible in the sea water column. We waited.

Under us, the divers dropped through the ice into open water "...floating, like soaring over a rolling desert. Eyes adjusting to the dark reveal the benthos littered with white sponges, and the ice ceiling holding back the light. We hovered over the base of Ob Hill, then ascended to the watery plateau to gather samples. And spotted a school with a bajillion fish."

Twenty-six minutes later, the flagged line suspended into one hole twitched. The sea inside churned and rolled with bubbles. The dive tender waived both arms and hollered, drawing all tenders to the "lucky hole," to pull the divers out. We watched closely for each diver's gesture signaling the quality of the dive. Unreserved, both divers transmitted "a WOW dive." Out of the hole they rolled on the sea ice, becoming more human looking with each peeling—of tanks, masks and flippers—being peeled off by the tenders.

Hunter described his harvest in the shorthand of his science. We watched him talk through blue lips outlined by his frosty beard. The wind froze water on his exposed skin. Gently, he gathered animals from the dive sock, a vivid yellow sponge that looked like a cactus, "toe biters," long brown worms, wide, flat worms that reflected a purple sheen in the sunlight and invisible animals hunkered in the sediment.

After transferring the harvest into buckets, Hunter grinned with a genuine enthusiasm for his work, like a child exposing a new kinda critter to his pals.

Later, we sorted animals at the Aquarium. Our tool kit included a plastic picnic knife with a square inch of screen stapled to the tip, used to relocate wee animals from the sorting basin into carefully marked experiment beakers. We sorted out specimens for the Aquarium's observation pool, and watched tiny delicate animals under the

microscope to witness movement, observe colors, shapes and component parts.

One diver turned sorter, sitting in a sunlight stream and picking through a sponge "a big underwater house" plucked out minute animals with tweezers. "Some of these animals may never have been seen before," he said.

Science is—fun, rich—hard work.

## Survival School January 1992

I poked the tip of my ice ax through the glacial blue ice next to my uphill knee and watched the granular snow and ice drop into the darkness. All morning we had climbed up the hill and slid back down, practicing a variety of self-arresting techniques. Thus when we might find ourselves on a steep, icy Antarctic slope, we can minimize any danger. We were learning atop the sturdy roof of a crevasse. Sixteen of us spent an evening, two days and a night together in Snowcraft I, a [required] option for winter-over survival training.

The first evening, Steve Dunbar, a Berg Field Center Safety Training Instructor, talked us through gory worst-case possibilities the cold, offending environment can visit on the human body. Frostbite that can lead to self-amputation of digits, body core temperatures so low as to mimic death, and severe hypothermia sufficient to render one truly obnoxious and deathly dangerous to self, and a liability for a group field expedition.

After a clever ice ax relay Steve used to (sorry) break the ice the first morning that introduced us practically to the effects of hypothermia, eight of us tagged behind Lucy Smith for her Survival School lessons. Her teaching techniques were both demonstrative and intelligent with clear, descriptive language that included the new terminology. So whether we learned by watching—she'd kick a foothold step into the ice hill spraying the snow in front of her carefully scooping toe—or learned by incorporating our intellect into the process, she made her snow skills accessible to every student.

Snowcraft I helped me focus on the Antarctica where I now make my home. Snow Mound City, [a] McMurdo blue ice district, serves as the ultimate school site. It resembles a homemade, very Spartan "Street of Dreams." Baronial ice domes and chunky ice brick fences curve across the [Ross] Ice Shelf. It lacks every other feature of a neighborhood: no kids, no dogs, no station wagons, no property lines, no lawns, no utility easements, no taxes and no neighbors except those who tagged along with Steve.

Lucy chartered our group, as Steve did his, to erect sleeping space for eight, in which we could comfortably be protected from the wind and cold. Two snow caves resulted from our efforts. One, called a *quin-zhee*, we built by piling all our bags in a heap, covering them with snow, then beating the snow mound with the backs of shovels until the snow melted slightly, freezing together

in a rough dome shape. We also built an igloo using quarried snow blocks. Both domes rose no more than three or four feet off the surface of the snow; we made them taller by digging under them into the snow.

Two men dug under the *quin-zhee* and pulled out the bags. Then we dug down to a sleeping floor, carved out a wider bell around the base of the dome, leveled the floor as best we could, and dug a step down under the front entry arch. Keeping the top of the entry way close to the sleeping floor's height blocked out errant night winds.

Our igloo, mastered by our tallest member, rose brick by brick by brick by brick. (Next class can use it as a basketball sports dome.) Our wind break, also made of quarried snow blocks, marked the extent of our survival home. Benches carved inside our wall, steps cut into entry ways for each sleeping cave and a playful sense of providing nest for all, finished out our survival complex....

In all this work—some for big gorillas, some for little gorillas—we began developing a sense of community. Everybody worked hard. Self-directed, we drifted into tasks we felt comfortable performing, switching off jobs to stretch and use fresh muscles. We also shared a playful, cooperative tone in our labor.

At the completion of our day's work we melted quarry casualties (broken snow bricks) for water. We gathered inside the curve of our wind break, sitting together, drinking and eating water-warmed food stuffs, acknowledging our accomplishments. I spent a charming, comfortable evening in the company of my school chums, enjoying them and feeling very confident I would survive the night. Sleeping through the bright night in snow caves with seven strangers on the [Ross] Ice Shelf in the ice fog-veiled shadow of Erebus might be my most exotic Antarctic activity to date.

The portable lessons, available from Lucy, Steve and other Field Safety Training Staff (and from books) came along easily. Accepting people different from ourselves, appreciating the value of a different set of experiences, and actually hearing others' ideas are personal lessons that are also available.

I graduated rich with personal lessons: unless we provided for the survival and inclusion of everyone, we would fail in our survival task. Cooperation in these situations is imperative. Taking care of another soul feels as satisfying as being taken care of. In Antarctica, to avoid community is to remove key value from the privilege of surviving comfortably in the wildest landscape on earth.

[Station closed on February 28, isolating us. I started *The Dark Star* and pursued science support stories. About 60 people of our 257 served there with the United States Navy. I found them uniformly pleasant, able and extremely supportive of every maintenance task they performed.]

## We Dig Lights

April 12, 1992

I saw him sitting astride a runway light fixture at Willy Field, looking like he was having the time of his life. I'd asked a SeaBee what he was doing when I walked up to him on a Black Island Flagging Expedition. He explained he and his team were digging out lights: sixty-two light stanchion sets carefully littered over ten thousand feet of runway approach and skiway. Secretly, I wanted to play, too. But I'm a Red Coat [civilian] and work inside.

After completion of the necessary perfunctory, ritual approval procedures, I was allowed to accept the invitation to accompany the team on their last day of digging lights. They made this Red Coat welcome, and kindly allowed me to work beside them. They clearly possessed the strength, stamina and experience only three straight weeks of this kind of work melds.

Some lights only require eight inch [deep] holes to elevate them to operable heights. Some holes are dug eight or nine feet into the Ross Ice Shelf, the average being between four and five feet. Some holes can be dug by a solo SeaBee, others require a team. The SeaBee and I dug a four to five foot hole; twice as deep on his side than on mine. The three-foot deep ice core surrounding the light's transformers and heavy cabling had melted into high-quality ice. High quality that is, if you want to carve swans. We hacked and picked and scraped and shoveled until all the cabling revealed itself.

Three ten-foot poles were inserted beside the original poles, lights spliced into power with extensions to accommodate the new operating height and the hole refilled....

I felt the teamwork and the sense of purpose even while they called each other by names that didn't match ones they'd given me, names with heavy story lore. Sure, I played in the ice and snow with SeaBees. But I dug working with this team as they clearly dedicated themselves to the task at hand, ribbed each other mercilessly and looked to me like each was having the time of his life. Thanks!

## Who Needs Television? June 1992

Recently, several of us bundled up in our ECW gear and got away from the lights of town to gaze at the stars. Two of our Scott Base neighbors joined us. As we trudged up the road lit by only starlight, I watched the dark forms move like I imagined heroic explorers had moved along these same paths eighty and ninety years ago. Yet we were on a modern adventure, with a happy chance collection of hungry eyes and minds, bundled in as many layers as we could manage.

"Get up here to the top, you won't be sorry," somebody yelled. A faint green glow seemed to be projected up from behind the crest of the hill. As I reached the top, I could see a quarter of the sky bowl in front of me dance with the slow-motion ballet of an aurora.

For the next long while, after moving out of the wind and making our way to a protected place in our path, we lay down on our backs, the better to witness the sky show. The Milky Way fairly sparkled its way from the Royal Society Range to the saddle just this side of Terra Nova. The ambient light silhouetted Mt. Erebus in this cloudless, moonless sky. In fact, the Milky Way appeared freshly dusted with the atmospheric ice fog we see here occasionally. Unlike its appearance from town, with a few stars splattered here and there, this sky looked like a very busy place.

This view of the night sky was the clearest I have seen of any night sky. I know the Milky Way is a typical spiral galaxy, and may contain several *hundred billion* stars. And the atmosphere through which I viewed the stars is less than five miles thick directly overhead and several tens of miles thick as I looked at the horizons. But our Antarctic skies are so clear and free of atmospheric gases, compared to skies in more populated areas, I can't imagine being more rewarded by a star gazing adventure anywhere else on earth.

As gazing intensified, and as our eyes became accustomed to the low light, the aurora appeared to swoop and hover over the Ross Ice Shelf lingering over Scott Base and Minna Bluff.

One of the Kiwis knew astronomical facts and names providing a narrative for the whole group. No one was bored. Many of us lay silently as long as we could tolerate attempting to warm the Antarctic continent with our body heat, then would get up, move around to warm up, and lay back down again...for more.

Suddenly, the aurora appeared directly overhead and I felt like I was standing under a curtain, looking up toward the Milky Way through a nap of dust made of light. The aurora was still visible in all the other places we'd seen it; it appeared to simply expand itself.

As the overhead ions vibrated their way toward the Royal Society Range, their silhouette, too, and Mt. Discovery's became defined. Finally we watched the aurora curl and weave back on itself, and braid itself in a dazzling finish over the Royals. It wasn't finished, but I was. It was 11:30, two and a half hours after we'd started out.

We made our way back to town. I fell into bed and slept as well that night as I have since my arrival. I could feel myself smiling as I drifted off, knowing I'd been privy to a spectacular, singular performance. Humbled me, too.

After two months without sunshine on the ice, and with the volcanic rubble of Ross Island, a look skyward confirmed that yes, I am still a resident of planet Earth.

And the sun isn't the only show in town, especially when a great one like this plays on the road.

## National Science Foundation Air Drop

An interview with the Winter OIC details our mid-winter resupply. "Weather permitting, on June 13 and 15 [full moon], some 110-120,000 pounds—mostly fresh fruit, personal cargo and mail—will drop out of the sky onto the Ross Ice Shelf. After weeks of careful and coordinated planning among [NSF], the Military, and Scott Base, everybody will be anxious to harvest and savor our ice pickings. An air drop-configured C-141 Starlifter from the 619th Military Airlift command...will fly...to Christchurch, to prepare for the two-day Air Force training event.

"Historically the bundles have measured two feet by four feet by fifty-four inches or by ninety-six inches. Sometimes they've dropped into the ice far enough to have to be retrieved by a crane. This year, however, we'll be receiving palettes with a bigger footprint; four feet by four feet by four and a half feet, or by eight feet. This should lessen the number of palettes we all have to manage. It will be interesting to see if any imbed themselves this year. [Only one did: it landed on its head and was the last to be recovered.)

"Although palettes can weight up to 2,000 pounds, typically each weighs in the 900-1,000 pound range. Even though parachutes—each requiring 500-600 pound loads to pull chutes out of the bay—are attached to the bundles, their function is to stabilize loads, to guide the load's landing—at 60 MPH—onto the energy absorbers packed at the bottom of the palette. This year, we're using some unproved, but possibly sensible technology. Every bundle will be packed in a canvas containment bag to contain the explosion upon impact. [Three-foot thick corrugated cardboard energy absorbers footed every bundle and guiding chutes oriented them foot-down. The technology was a roaring success.]

"The first day we can expect half the C-141 load to drop here—estimated to be twenty palettes. Then the C-141 will close its hydraulic doors and fly up to resupply our cohorts at Pole. The C-141 will be accompanied by a KC10 refueling aircraft—a modified Boeing 707. To the best of my knowledge no KC10 crew has believed McMurdo was far enough South—we expect them to continue to the Pole.

"At Pole, the remainder of the first day's payload—mostly mail—will be pushed out of the paratroops' doors on the sides of the Starlifter over the Amundsen-Scott South Pole Station. At those low temperatures, the crew won't take the chance that the hydraulic systems used for the unloading bay will freeze the bay open, rendering the aircraft at least fuel inefficient. It's too risky.

"On the second day...the C-141 will aim for the now-familiar drop zone, a 3,000 foot patch of blue ice marked at the beginning with two rows of five, twenty-gallon drums filled with two gallons each of MoGas fuel mixture. The

end of the drop zone *is* marked with a single row of similarly configured, flaming drums.

"MACenter acts as Regional Aircraft Following Center, picking up the aircraft at 60° South Latitude, guiding them to 90° South and back to 60° before returning control to New Zealand Air Traffic Controllers. MACenter will probably have control for five to six hours of their total flying time. [C-141 Starlifter flight time from Christchurch to McMurdo is in the eight-hour range.]

Sightseers may view by the light of the moon, which helps in recovery visibility, and lights up landmarks possibly aiding the drop visibility, and if the wind's not blowing you may even be able to hear the planes' engines 1,000 feet overhead.

[That morning, from a viewing position on the T-site Road, matching altitude with the top of Observation Hill, the sound and sight of that Civilized Creature bearing down on the blue ice target was truly a lift. Three and a half months without communication with our culture, save MARSgrams and New Zealand Antarctic telephone calls (at \$5.50 a minute), I was startled at how excited I became as I watched that bird slow to about 250 knots and slide in about 350 feet off the deck, open the bay doors then head nearly straight up, dumping its belly full onto the Ice Shelf. Yes, NSF air drop is a major morale-booster.

As spring approached, having marked the winter with the Scott Base Swim Club three ritual dips, sunset, mid-winter's day and sunrise, I anticipated the end of my Antarctic year. I posted sunrise and sunset times during fall and spring, and posted Civilian Twilight (sun 6° or less below the horizon), Nautical Twilight (sun 12° or less below etc.) and Astronomical Twilight (sun 18° or less below etc.) in *The Dark Star*. Of the later, we enjoyed over three hours of it on mid-winter's day.]

## Nacreous Clouds... The Science August 1992

Although Nacreous—*nacre*, Latin for mother-of-pearl, clouds were first identified by H. Mohn in 1892, they remain a special, rare and astonishing vision. This atlas\* defines them as "...clouds resembling Cirrus—white, delicate filaments or white or mostly white patches or narrow bands with a fibrous, hair like appearance, or a silky sheen, or both, or Altocumulus lenticularis—lens-shaped upper air clouds that appear diffuse and frequently partially translucent. Further nacreous clouds show very marked irisation—rainbow-like colouring—similar to that of mother-of-pearl; the most brilliant colours are observed when the sun is several degrees below the horizon."

Nacreous clouds are rare and seem to occur only in certain regions. Scotland, Scandinavia, occasionally in France during winter months, and Alaska. According to one scientist the clouds observed in southern Norway occurred at an altitude between 21 and 30 kilometers—70,000 and 100,000 feet. [In 1975, mind you, Antarctica's Best Kept Secret?\*

Bill [Haals] suggests that at McMurdo Station, "nacreous clouds generally start forming near sunrise [August 17, 1992], only a couple at a time right on the horizon. Their colors are not as vibrant as they will become. Scientifically, the clouds become more colorful when the sun is about 7 to 10 degrees below the horizon. So a week or so after the sun officially rises, that's when the clouds really show off—sunrise and sunset.

"The last several years there has been one day when the sky just explodes in color and that day usually occurs a week to a week and a half after the official sunrise. Each morning, small wisps of white clouds start to form in the northern sky and turn color when the sun sets. On the day when the sky explodes with color, many of these white clouds will be seen in the sky."

*Scientific material taken from the World Meteorological Organization, International Cloud Atlas, Volume I, Manual On The Observation of Clouds and Other Meteors, WMO No. 407, Secretariat of the World Meteorological Organization, Geneva, Switzerland, Copyright 1975, World Meteorological Organization.*

[So my Antarctic adventure ended, a privilege few can experience, and even fewer can share with others. Bless us all.

To clarify a point I read in the last issue, I would return to Antarctica in a heartbeat, but I would not return under the same arrangement under which I served in 1991-1992.]

## Antarctic Navigation, a novel by Elizabeth Arthur, Knopf 1995

Unencumbered by national pride, underutilized war machinery or the spirit of competition, Morgan Lamont's 90 South adventure retraces Scott's *Terra Nova* expedition. I appreciate the notion that a woman can recreate and command an Antarctic expedition, especially one that captured the world's imagination in 1913, and probably inspired countless youth who served their countries during the first World War. Arthur's story comes packaged with appealing ingredients: a feminist to cheer on, a combination of Antarctic history with current events and it's a meaty—eight-hundred page—book.

NSF Poets and Writers grantee Arthur moves Morgan from her Colorado birthplace, through her American life, and finally to her Cape Evans base camp. Throughout, Morgan's behavior demonstrates nearly self-righteous attitudes toward rules, guidelines and others, perhaps reflecting a certain self-centeredness of polar explorers. My cheering waned as I read on, watchful for and never finding the graceful balance, the generosity of spirit, the ableness that can grow out of Antarctic expedition leadership, the stuff that inspires imagination.

Primarily, Morgan's 90 South expedition represents one way a person can return to Antarctica, after being exported from the ice for being caught breaking NSF rule Emotionally, she may emulate Shackleton in this passion to return. She echoes Scott somewhat, by changing her

mind, late and impetuously (about different particulars), and may also expect that her expedition can explain her mother's death, who ala Titus Dates, walks to death in a Colorado blizzard.

In planning, like all expedition leaders, Morgan enrolls comrades from her life. She includes her childhood friend Wilbur, who reads dog's minds; and Brock, met outside the "Tilted Place," whose congenital talent is navigation, with and without tools, their trekking tasks pre-ordained. And though she includes New Zealanders, she makes no mention of the Antarctic Treaty, its spirit, its usefulness or its power.

En route, and given the luxury of a conflict-free expedition, we read Morgan's mental discourses about women in Antarctica, about Greenpeace's policing of the US Antarctic Program, about judgment—good and bad—edited at McMurdo Station (its \$37 million environmental cleanup plays a cameo role), the Gulf War and our nationalized gluttony for gasoline, and that threat to a pristine Antarctica. She also muses about Quantum Mechanics.

She takes direct aim at NSF Polar Program's rules, policies, survival guidelines, the contractor, and some authoritarian personality types. One could argue, she has a point. But I sensed empowered (by a \$10 million gift to pay for the expedition) inexperience in some of this unrelenting bureaucracy bashing. Although it seems natural and comfortable for Morgan Lamont, the dose here can irritate those who appreciate the merits of sensible guidelines. Admiral Byrd, after all, spent Rockefeller and Ford money, but with considerable respect for Antarctic experiences and proven guidelines.

This OAE can only imagine events that make up Morgan's Antarctic experiences. Unlimited access to fondle and ponder over artifacts inside the *Terra Nova* and *Discovery* huts; mid-winter, solo access to the Cape Evans landscape; abundant pre-expedition free time; American entitlement to New Zealand assets, and full medical services at McMurdo Station (as a rescued, badly injured private expeditioner), courtesy of taxpayers like you and me. Although recent South Pole Station events demonstrate a softening of this anti-expedition NSF formality, the feminist in me bowed my head, slightly shamed.

Elizabeth Arthur has earned some poetic license in six books. Here, that the Chalet at McMurdo began life as a chapel, and that a hike from Cape Evans to the top of Mt. Erebus and back takes place in a day, understandably stretch truth.

But I'm less willing to abide some license she employs. At 90° South, the sun can never be "directly overhead." Emperor penguins possess no architecture for "sitting" on eggs. Sun-glow (Astronomical Twilight) on mid-winter's day (at 77°S) is over three hours long, and

when the sun begins to rise in the spring, only one 24-hour period has four hours of it. Will Sieger's name is simply misspelled. (Antarctic buffs can have a field day straightening out her Antarctic-based facts.)

She explains why she fictionalized some USAP-related events in her acknowledgments. But I wonder why an accomplished novelist would fictionalize Antarctica's natural wonders. Since none of the unnecessary license really moves the story along, one might wonder why it survived the fact-checking process.

A woman recreating the *Terra Nova* expedition is a worthwhile and provocative premise, and Arthur crafts that story with a certain tension around her heroine. If you're a woman, an Antarctic traveler or cruiser, been benefited by anyone in NSF Polar Programs, love a feminist, have an extra \$10 million, or have accomplished major hiking or expeditionary feats, you should display this book in your library. But if you want to learn more about Antarctica or America's presence there, be warned: *Antarctic Navigation* is a substantial work of fiction.

OUR 1995 PAUL C. DANIELS MEMORIAL LECTURE

## Fossil Tree Rings and Paleoclimate in Antarctica

by

Dr. Edith L. Taylor

Research Scientist, Byrd Polar Research Center  
The Ohio State University

on

*Wednesday evening, April 26, 1995*

7:30 PM

National Science Foundation  
4201 Wilson Blvd., Arlington

Room 375

(Entrance at back of building on the  
corner of N. 9th St. & N. Stuart St.  
*One-half block from Ballston Metro  
Station*)

Dr. Taylor joined the Byrd Polar Research Center in 1986 after serving as an Assistant Professor of Biology at Hope College in Holland, Michigan. Her area of research is paleobotany and paleoclimatology of fossil floras from Antarctica. Dr. Taylor's specialty is Permian and Triassic petrified plants from Antarctica. She is particularly interested in fossil tree rings and the information they can provide about past climates. Dr. Taylor has received a number of honors, including the Isabel Cookson Award of the Paleobotanical Section of the Botanical Society of America.

*Come hear all about the lush vegetation of Antarctica!*

*Be sure to watch Norman Vaughan on TV  
Sunday, 2 April 1995  
at 9 PM on TBS*

This is the 100th Newsletter which Ruth J. Siple has helped put together, dating back to October 1978. Yours truly has written 99 of them, taking a sabbatical - assuming that you can take a sabbatical in the midst of your retirement - while Elle Tracy pinch-hit for me on the 99th. I thought for a while that we should make the 100th issue something special, getting some real authentic Antarctic authors like Barry Lopez to honor the occasion with some of their gifted words. But time is a factor, having just returned home, so we are foisting more taradiddle upon you.

Seventeen years, a thousand, one hundred and twenty-six pages! Has anyone read every word except Ruth and me? I wonder. A couple of people offered to pay to have these things bound. One was the late Bob Nichols. The other will remain anonymous, as he is still alive and we want to protect his reputation!

As I look back over the past seventeen years I can't help but think of the many great American Antarcticans whom we have lost, the likes of Bert Crary and Jim Zumberge, and our first Honorary President, the architect of the Antarctic Treaty, Ambassador Paul C. Daniels. Our first Newsletter announced a meeting at which the late Mary Alice McWhinnie addressed our Society - an American scientist who opened so many doors for other distinguished women scientists to follow. And the saddest Newsletter told the story of the ill-fated Air New Zealand DC-10 tragedy on the lower slopes of Mt. Erebus, which claimed 257 lives. But the good news for the past seventeen years is that we all have had the benefit of having Larry Gould in our presence. He will be 99-years young this coming August, and we are going to hold him to his promise, to be our Paul C. Daniels Memorial Lecturer when he turns 100 next year.

For the past four years Ruth has been stuck with putting out these Newsletters, as I sought refuge in my midcoastal Maine hideout, leaving her with the menial and tiring job of getting these Newsletters out. And she labored with a heavy heart this year, as she lost her best friend, Lucy Ashley, to cancer, then Paul Siple's sister succumbed, and lastly, but by no means least, her son-in-law, Hugh DeWitt. But Ruth is a rock, and has survived it all. The Antarctic Society is really Ruth Siple.

**NEWLY ORDAINED HONORARY MEMBERS.** Last fall some great minds in our Society decided that we needed to get even with Charles Swithinbank for exporting a Mt. Holyoke graduate back to Cambridge as his spouse, so we nominated him for our next Honorary Member, making him live with seeing his name printed on our masthead.

Charles's popularity in this country knows no limit. About ten years ago he was going to be visiting Richie Williams' crew out at Reston, and someone said, "Let's have a meeting when Swithinbank is here." In my infinite wisdom I replied, "It's mid-August - no one goes to meetings in Washington in mid-August. Besides, everyone in town is on vacation on Nantucket." But no one paid any attention to me. The meeting was held, and we had to call in the carpenters to move the walls back so

everyone could get in. Charles made a real believer out of me that night. And down through the years he has served as our listening post in the U.K., and passed on some real red-hot items, such as Pam Davis's engagement. And he also sees to it that we get the latest Antarctic books coming out of the U.K.

But on the way to the voting booth, there was some hanky panky undercover maneuvering going on. Something which is called pork barreling, I believe. When there's a sure thing going through Congress, individual Congressmen attach their own pork barrel bills. So my name was added, and when I got back from the ice, the stationery had already been printed. I had ridden on Charles's sweeping victory onto the masthead myself! Ruth said that Hugh had suggested it to his wife before he died. It wasn't a deathbed wish, as Hugh went very suddenly, but I can understand his rationale perfectly. He felt if he could get me elected Honorary, perhaps I would retire and then they would get someone good to write these things. It didn't work, Hugh, but good try, anyway!

**DEEPFREEZE REUNION '95, 27-30 APRIL, NEWPORT, RHODE ISLAND.** Ken Waldron has succeeded his South Pole colleague of 1957, Mel Havener, as the chief honcho in masterminding the DeepFreeze reunions. They have been very successful to date in getting Navy personnel who built Antarctica together to share memories of the good old days. But the ranks are depleting every year, and one of the latest to join Dave Canham, Jack Tuck, and others is Father John Conduit, the first wintering-over Catholic chaplain at McMurdo in 1956. Father John, who died from cancer last June, was known as much for being one of the good old boys as he was for his chaplaincy. If our memory is correct, he liked to wrestle.

The DeepFreeze reunion is really for anyone involved in the early DeepFreeze days, military and civilian alike, although these reunions have become basically retired military and their families affairs. The main days this year are Friday the 28th and Saturday the 29th when they will hold a memorial service, go on a tour of Davisville, have speakers on Navy and Antarctica, and a clambake on Friday evening. If anyone is interested in attending or in more details, they should contact Ken at 51 Hornet Road, North Kingstown, Rhode Island 02852 (telephone: 401-885-2884).

In the spirit of DeepFreeze, here are a couple of anecdotes from Commander Mo Gibbs written to us in late January. Bear in mind, Mo was a 20-year old Aerographer's Mate back in 1955.

"So many things happened that are comical now, but were somewhat trying then. One was the Christmas service at Little America V. Since I was the organist for Chaplain Peter Bol, Admiral Byrd came up with the idea that I move the little pump organ outside and we all sing Christmas carols. I borrowed an officer's grey gloves, but after about 2 1/2 carols, I seized up. The fingers simply wouldn't function. Of course, I was in agony, but that was little appreciated at the time. The entry about this in my personal journal isn't printable, even today!

As a postscript, years later ('66-'67) when wintering, I discovered a mercurial barometer among the piles in McMurdo's hillside of junk that I had packed for shipment to the ice while in Davisville in '56. It made it to the ice, yet 11 years later had not been unpacked. Miraculously, the writing on the shipping document was still legible, and I recognized my own handwriting on the slip. Such is the waste of Uncle Sam. I backloaded it to the States in January '68 when I came back to the ice briefly after wintering."

**HUGH HAMILTON DEWITT, WHO NEVER SAILED AROUND THE WORLD.** At an Antarctic Society Memorial Lecture, I introduced Hugh to Jane, and within a few short months the Southern Ocean ichthyologist and the middle daughter of Paul and Ruth Siple were on their way to Antarctica on their honeymoon. Jane was sort of an uncut diamond when Hugh married

her, but she became a dazzling, meaningful person, and the two of them had a very loving, time-sharing thirteen years, listening to Amadeus, sailing the Penobscot Bay, and taking turns reading each other to sleep at night. Hugh especially enjoyed music of the baroque and classical periods, and was a devoted fan of Gilbert and Sullivan operas. A mention of the *Gondoliers* or the *Pirates of Penzance* could inevitably evoke a lusty baritone response.

Hugh was sort of a human dynamo. He played as he ate as he worked, all with gusto. He climbed in the high Sierras with his two brothers this past summer, realizing then that things were not quite right, but optimistic that nothing was really wrong beyond being 61. But cometh fall, and he had to undergo not one, but two, angioplasty operations. When Hugh was found in his office, he had his exercise clothes on, with a skipping rope and weights nearby. Hugh died as he lived, with great intensity, but he was also a very kind, loving, and considerate person. The obituary in *Maine Perspective*, Vol. 6, No. 16, said, "Hugh was an internationally known ichthyologist with extensive, worldwide field experience. As a marine biologist and oceanographer, his special research interests were the taxonomy, functional morphology, biogeography and ecology of marine fishes, especially those from the Southern Ocean. At the height of his research career, he was one of the two best-known authorities in the world on fishes of the Antarctic Shelf. Mt. DeWitt, a 7,227-foot peak in South Victoria Land, Antarctica, is named for Hugh in recognition of his south polar research.

"Among colleagues both in the United States and abroad, Hugh was particularly known for his skills with fishing gear and his ability to get work done at sea, often under dreadful conditions. He knew about trawls, nets, winches, shackles, towing cables and all the other pieces that have to come together in a working system if one is to recover a bag full of fishes and invertebrates from the sea floor at a depth of several thousand meters from the deck of a heaving ship.

"In 1975 he served as Chief Scientist aboard the Argentine Navy research vessel ISLAS ORCADAS during a major research cruise to the Subantarctic, sponsored jointly by the U.S. and Argentina. Because of his technical expertise, Hugh was often invited to participate in the research cruises of other foreign programs. In 1980 he joined French scientists aboard the MARION-DUFRESNE for an extended research expedition to rarely visited Bouvet and Marion Islands in the South Atlantic and South Indian Oceans, respectively.

"During his career, Hugh's field research took him from the tropical Pacific and Mexico to the Antarctic and the Gulf of Maine. Hugh received support to visit and work at various museums around the world which held important collections of fishes. His exciting career thus included studies at the Museum Nacional de Historia Natural in Santiago, Chile, the Dominion and Canterbury Museums in New Zealand, the British Museum (Natural History) in London, the Royal Scottish Museum in Edinburgh, the South African Museum in Cape Town, and other museums in Sweden, Norway, Argentina, Australia, France, and Germany.

"Hugh's investigations of the systematics of fishes resulted in a number of articles in professional journals and book chapters, one of the most important being his review of the Family Nototheniidae, a group of mostly benthic fishes endemic to the Southern Hemisphere, which appeared in *Fishes of the Southern Ocean*, a massive volume published in 1990 by the J.L.B. Smith Institute of Ichthyology in South Africa."

A Memorial Service was held for Hugh in the Newman Center at the University of Maine in Orono on 28 January 1995. His ashes will be inurned in his native California on 10 April. Those who may wish to make a contribution in his memory can do so to either The Society for the Preservation of Natural History Collections, 121 Trowbridge Hall, University of Iowa, Iowa City, IA 52242-1379, attn. Julia Golden, or to The Goldthwait Polar Library, Byrd Polar Research Center, Ohio State University, 1090 Carmack Road, Columbus, OH 43210-1002, attn. Mrs. Lynne Lay.

**THE EVER CHANGING FACE OF TOURISM,** The venerable British Antarctic, Bernard Stonehouse, told tourists on the ALLA TARASOVA this recent austral summer that he expected tourism in Antarctica to double and redouble by the year 2000. When Stonehouse talks on tourism in Antarctica, you had better sit up straight and listen, as this Antarctic with nearly fifty years of Antarctic service has been devoting his more recent years to studying the effects of tourism on the Antarctic ecosystem. He has had a front-row seat for the past six years or more watching penguins and tourists, tourists and penguins. He has seen tourism go "from the days when only widows of brain surgeons could afford to go to today's school teachers." Stonehouse is about to start publishing the results of his studies on the effects of tourists on the so-called pristine Antarctic environment, and the world awaits with bated breath his findings. Talking to Stonehouse, one gets the impression that he does not hold a doomsday attitude about either tourists or penguins, that the Antarctic world is big enough for both to live in harmony.

This year, according to CNN, fourteen ships took 8000 tourists to Antarctica. Expedition leaders play a shrewd game of chess, making sure that no other ship is visiting Deception Island when they are there, as they want their passengers to feel like their ship is the only one in Antarctic waters. But if Stonehouse's prediction comes true, by the year 2000, bathers from one ship will exit the waters of Pendulum Cove as the next load enters. Really hot-tubbing it.

Tourists get to see only a very small fraction of one percent of Antarctica, and most of that is north of the Antarctic Circle. BUT they do get to see and visit the very creme de la creme of the Antarctic, as nowhere else in coastal Antarctica is the scenery so majestic and stunning and awe-inspiring as it is in the Neumayer and Lemair Channels. No human being who has traversed these waters can ever be ho-hum about Antarctica. But will these channels eventually become conveyor belts for tour ships?

Tourism in Antarctica is very dynamic, with rapid changes being made in response to human desires. In recent years we have seen the introduction of Russian icebreakers carrying helicopters, opening up new opportunities for tourists. Emperor penguin colonies in the Weddell Sea, hitherto protected by a cordon of sea ice, are now within the reach of helicopters on icebreakers. And this past Christmas, tourists were flown over to the top of a relatively large tabular berg for a barbecue or cocktails, or both. No longer will people have to stay at home with their extended families for Christmas when they can escape it all by going to an exotic extended place like the top of a tabular berg to really live it up (or is it down?).

It wasn't so long ago that going on a cruise ship to Antarctica was like going back to one's high school reunion, as there was a large number of people with deep pockets who kept coming back, time after time after time. But nowadays it's a different ball game, with more vendors, more ships. On five cruises on one ship this past austral summer, only one tourist had ever been there before. Competition has driven the fares down to where normal human beings can now afford to go. Toshiko Isomura ;of Tokyo told me that it is so cheap for them to go to Antarctica that she couldn't afford to stay home! One Japanese tourist described her occupation as a "chambermaid" in a hotel. So cut-rate fares are opening Antarctica to commoners. The Ugly American now has serious competition from abroad for spaces on Antarctic tour ships!

In the old days, there was only a limited number of ships to choose from, but today one can choose from a small yacht to a luxurious monster of the high seas carrying hundreds of passengers, so you can name your own poison. This person is thinking of trying to stir up interest among Antarctic IGYers to take their spouses, or whomever, to Antarctica on our 40th anniversary, as one can now find a ship to fit the number of one's own party. The many options for today's Antarctic traveller are almost limitless.

Ron Naveen told me that while hedge-hopping, or was it wave-hopping, on three different cruise ships this summer, they stopped at twenty different places. If you are an expedition leader on a cruise ship, there are so many givens (such as visiting a manned station, swimming at Pendulum Cove, stepping foot on the continent, seeing at least three species of penguins), and then you have open options as weather permits. But are they going to face a situation by the year 2000 when only X number of visits can be made to a fascinating place like Paulet Island? The U.S. is already restricting the number of port calls by tour ships to Palmer Station, and this could become a blueprint for some of the best environmental stops. Maybe tourists should travel to Antarctica now. Obey the sign outside a Maine cemetery, "Get a lot while you are young!"

Who is going to really set policy on Antarctic tourism? All of the Antarctic environmental protocol bills before our last Congress (went down the tube before they could be enacted) had statements saying that the Department of State shall coordinate an inter-agency study to determine whether or not additional measures should be taken with respect to Antarctic tourist activities, said study to be completed within 24 months after the enactment of the Environmental Protocol. Sort of scary to see that inter-agency tidbit. They might start out protecting the penguins, but by the time they get through all the committees, they actually might end up protecting the ubiquitous aggressive fur seals, which are going to take over this world if the cockroaches don't beat them to it.

I have only the highest regard for Antarctic Expedition Leader Dennis Mense of British Columbia, whom I was able to observe close hand on the ALLA TARASOVA for five cruises. If all expedition leaders were like Dennis, there would be no need for any rules of conduct already set down for tourists' behavior on shore. He conducted the mandatory lectures, showed the mandatory films, and took attendance at each gathering. And, when he went ashore, he whistled down people he thought were encroaching on the neutral zone around birds and seals.

**EAST BASE REVISITED** (by Jackie Ronne). Neither photographs nor superlative adjectives can convey the raw, icy magnificence of the Peninsula area of Antarctica. I experienced this in 1947, on my first panoramic view of the Continent, as we headed for our future base on Stonington Island in Marguerite Bay. And I had the same feeling recently when I returned on the M/S EXPLORER. There was a lump in my throat when our Captain announced we were crossing the Antarctic Circle. It was the first time without my husband, and those years of hurdles and vicissitudes came flooding back. Although I had also been to the Antarctic in 1959 and again at the South Pole in 1971, I never thought I would ever return to East Base. Yet, here I was, 47 years later, walking over the snow-covered rocks toward the first American Historic Site in Antarctica, and I was thrilled to be there.

My daughter, Karen, was with me. She was the fourth member of the Ronne family to get to the Antarctic. Her father, Finn, and grandfather, Martin, had left their footprints on both sides of the Continent years before. Together, we peered in the window of the 12x12-foot hut I shared with her father nearly half a century earlier. It had changed. The room was nearly bare, as was the once congested mess hall and science building, except for a small museum containing artifacts reminiscent of far busier times. The machine shop had blown away and so had many of my memories, both happy and sad. Later, I learned that our geologist, Bob Nichols died that very day - a fine gentleman and a good friend. I only wish he had known that I had gotten back. So many of our expedition members preceded him.

Karen had made three 18x24-inch panels explaining the achievements of the Ronne expedition which she had installed on the walls near the small museum. We signed the guest book, made sure doors were closed and plowed our way slowly back to the ship, overwhelmed with nostalgia and gratitude that unusually favorable ice conditions and the determination of our ship's Captain and crew had allowed us this opportunity.

**ANTARCTIC SITE INVENTORY PROJECT** (by Ron Naveen). Ron Naveen reports an excellent, first season of work on The Oceanites Foundation's Antarctic Site Inventory project, the project, which is the subject of a start-up grant award from NSF, intends to create a database of relevant information to assist both the preparation and the evaluation of environmental assessments under the new (but not yet in force) Antarctic Environmental Protocol. The upside news is that during the 1994-95 austral summer, the initial year of data collection for the Inventory, research teams accomplished 43 survey visits at 20 different Peninsula locations, and in the process 139 count sites were established at which data regarding penguins, flying birds, and seals may be collected from season-to-season.

Under the Protocol, environmental assessments will be required before the start of any and all human activities in Antarctica, whether that activity be the construction of new science bases or the operation of Antarctic tour ships. But at the moment, a database of relevant information to support and facilitate the assessment process simply doesn't exist, and it is this precise gap that the Antarctic Site Inventory intends to fill. It is contemplated that, ultimately, the Inventory will contain a vast assemblage of data and information about the physical and biological characteristics of the many locations that are potentially visited, including everything from maps, photos, and animal counts to historical information, geological descriptions, and profiles of floral communities and associations. In these early stages, the project is focused on the Peninsula and the 116 locations that expedition tourists, scientists, and field teams have visited in the last six years.

Ultimately, the Inventory project intends to establish strong links with all other national Antarctic programs, to avoid a duplication of effort among the various national programs and among the wide coterie of Antarctic researchers. This process commences in April with a number of coordinating sessions with personnel at the British Antarctic Survey and the Scott Polar Research Institute.

**THE WARMING OF ANTARCTICA.** A lot of media attention was showered on that berg that broke off from the Larsen Ice Shelf, even though in 1987, a berg twice that size had broken off from the Ross Ice Shelf in relative obscurity. But what made the Larsen berg so newsworthy was that this berg might be the first of many to follow, as an overflight of the Larsen Ice Shelf showed that the area where it broke off was in a state of rubble, and that the huge tongue of ice which used to connect James Ross Island to the mainland was no more. We were in that general area in early February, completely oblivious to what had already happened or was about to happen!

Malcolm Browne wrote an interesting article in the New York Times for 14 March 1995 in which he reported about findings in the Dry Valleys. He wrote about Andrew Fountain of the University of Washington looking for clues to changes in the earth's climate, and they are evidently all over the place in the Dry Valleys. The melting on the Commonwealth Glacier has forced the closing of the New Zealand Lake Vanda research station, as melting in the past decade has seen the level of the lake rising three feet a year. And Fountain's measurements of the rate of melting of the Canada Glacier and the resulting flow of meltwater into Lake Hoare showed a similar pattern.

And when Jackie Ronne "went home" to Stonington Island, she saw with her very own eyes what others had seen before her, the glacier ramp which previously had connected Stonington to the mainland was no longer there. There appears to be substantial warming of the Antarctic Peninsula, and the Greening of Antarctica may be underway! Old hands are reporting great growths. Will climate change supplant the ozone hole as the tail which wags the dog? Stay tuned.

**THE LURE OF ANTARCTIC FICTION.** There are few names which are recognized as The Antarctic Authority, but when it comes to Antarctic fiction, there is such a person,

Fauno Cordes, whose words have graced these pages down through the past decade. Her *Coming-Out Party*, her debut at the Met, or whatever, came forth on Sunday, March 12, 1995 when she presented the lecture, *The Lure of Antarctic Fiction*, at the winter meeting of the Gleason Library Associates at the University of San Francisco.

A post-game press conference, really an open reception, was held afterwards in the Donohue Rare Book Room, where Fauno had a spectacular display of her Antarctic material, which included a real laugh, an overseas aerogram from Australia of Sir Hubert Wilkins, which said "First to fly in the Arctic!" She has seventeen exhibition cases full of various Antarctic subject matter, and this exhibit will be running through 1 May 1995. Her lecture, which covers Antarctic fiction from 1605 to date, may become available to interested parties. If you are one of the interested parties, you should contact us, and we'll see what can be done about it.

**BOOK NEWS FOR ANTARCTICANS** (by John Millard). The book event of the year, for me, was The Major Book Auction Sale, held in Melbourne, Australia, on the 15th, 16th and 17th of November 1994. It was organized by Gaston Renard, Fine & Rare Books, in collaboration with Leonard Joel, Auctioneers & Valuers. Three comprehensive catalogues were produced for this sale. Volume #1, *Antarctica*, consisted of 1744 lots. Copies of the catalogues are still available, including lists of prices realized. The price is \$60, in Australian dollars, which includes Air Mail postage to North America. MasterCard, Visa and American Express are acceptable. From Gaston Renard, CPO Box 5235BB, Melbourne, 3001, Australia or by FAX +61 3 417 3025.

For *Antarcticans* almost all of the classical items of the Antarctic Literature were listed, in some cases more than one copy was available. The prices quoted in this short review are in Australian dollars, and include the obligatory 10% Buyers premium on all successful bids. Postage, handling, insurance, etc., extra.

Book prices in Australia, both for new and used, are somewhat higher than in Britain and North America. Australians are very avid book buyers, they don't seem to be deterred by the high prices, particularly when it comes to interesting collectibles.

There were two copies of the original *AURORA AUSTRALIS*, the book produced in the Antarctic by the members of the British Antarctic Expedition, 1907-09, which was led by Ernest H. Shackleton. Lot #1435 sold for \$27,500, and lot #1436 for \$22,000. In previous sales copies of the 'AA' have fetched prices a good deal higher, in the \$30,000 to \$40,000 range. Also in sale was a copy of Shackleton's book *HEART OF THE ANTARCTIC*, the special edition bound in Ivory Vellum, in 3 volumes, limited to 300 copies, lot #1445, \$7,150. Cherry-Garrard's classic, *THE WORST JOURNEY IN THE WORLD*, was represented by 20 different editions, including two copies of the first edition, which, of course, is the most complete. Lot #304 is the first edition, in the first binding - linen-backed, blue-papered covered boards at \$2,860, and the 2nd binding, light blue cloth, lot #305 at \$1,540. Also there was copy of the last hard cover edition, published in 1965, by Chatto & Windus, in an arrangement with Angela Mathias, Cherry's widow and Literary Executor. All the previous editions were published by Cherry-Garrard, and were distributed for him by John Constable Publishers, and later by Chatto & Windus. This particular edition has a frontispiece portrait of the author, plus four maps, but no other illustrations. Also the original forewords and the author's introductions have been omitted. A short memoir of the author by the late Rev. George Seaver, has been added as a foreword. This edition is also the pattern for all of the later Penguin paperback editions of 1970-1979 and 1983, and also for the most recent Carroll & Graf editions of 1989-92, the four maps are present, but not the frontispiece portrait.

There is another item of interest - Lot #1120, *THE ANTARCTIC MANUAL* for the use of the Expedition of 1901, edited by George Murray, FRS, published by The Royal Geographical Society, xvi, 586 pp., maps, illus., etc. It covers a host of different topics,

including scientific items to be studied by the Expedition, plus geographical and historical items, such as: *The Journal of John Biscoe*, pp. 305-335, *The Journal of John Balleny*, pp. 336-347, and the *Log of John Balleny's Second Mate*, pp. 348-359. These are not in print anywhere else. There is also an interesting early Antarctic Bibliography, from before 1700 to 1900, compiled and edited by Dr. Hugh R. Mill, former Librarian of the Royal Geographical Society, pp. 521-580. There is also an index. This lot sold for \$2,860. It was an inscribed presentation copy from one of the contributors to another kindred colleague.

For those who have an interest in the Second Byrd Antarctic Expedition, 1933-35, Lot #744, a set of *THE LITTLE AMERICA TIMES*, 1933-35, compiled and edited by August Horowitz (who later changed his name to Howard). Eighteen issues of the Byrd section and thirteen issues of the Ellsworth section, sold for \$1,980. In my 40+ years of collecting Antarctica, this is the first time that I have ever seen a mention of an issue of *THE LITTLE AMERICA TIMES*, never mind a complete set, in any Book Sellers catalogue. On a personal note, I have been trying to find someone with a complete set of *THE TIMES*, as I would like to acquire some photocopies of the early issues to complete my file. I need the first four Byrd issues and the first three Ellsworth issues. Any assistance that can be provided would be sincerely appreciated. My address and phone number: 86 Broadway Avenue #18, Toronto, Ontario M4P 1T4, Canada - 416-489-7015.

**BOB NICHOLS, A THROWBACK TO THE HEROIC AGE (1904-1995).** Bob Nichols was the last of a vanishing breed, a man who thought the only good that could be accomplished in Antarctica came through man-hauling efforts, a man who thought that Captain Robert Falcon Scott was the greatest Antarctic explorer of all time, and a man who dared to come before a bisexual Antarctic orientation and end up his spiel bellowing out, "And what I like best about Antarctica is its masculinity." He worshipped Scott, he liked the Brits, and was proud to show off a picture of the annual British Antarctic black-tie affair with himself among the heroes. He should have been Scott's son, because then everything would have been perfect.

But he wasn't a bad American either, and he dearly loved Tufts College, the hills of New England, and even Cape Cod. A large part of Bob died the day his wife decided that they should move from the Cape to Florida to be near one of their offspring. He wrote asking for climatic data for Florida, and I embellished the data with "You're going to hate the place, Bob, it's not like New England at all, in fact, it's a miserable place to live."

I always knew when the field season in Greenland was upon us, as old Bob would appeal at our office scrounging tents, clothing, footwear, and rations for himself and his graduate students. And, if my memory is correct, he once led a couple of young whippersnappers by the names of Bob Rutford and George Denton on a man-hauling sledge exploration journey in the McMurdo area. Wonder whatever happened to Rutford and Denton? Probably driving taxi cabs somewhere, certainly not man-hauling any more.

Bob Dodson, who served with Bob Nichols in the Antarctic wrote the following:

Robert L. Nichols, chief geologist on the Ronne Expedition (1947-48), died on February 25, 1995 in Tampa, Florida at the age of 90. He had Alzheimer's disease. For the past year, following the death of his wife, he had been in a nursing home. While there he had enjoyed regular visits from his former expedition bunkmate of 1947-48, Walter Smith, who lives in Tampa.

After becoming a geologist, and earning a Ph.D., he spent most of his career on the faculty of Tufts College (now Tufts University) in Medford, Massachusetts. His will calls for a portion of his ashes to be placed perpetually on the window sill of his office there. Following his retirement from Tufts, he taught for a number of years in eastern Kentucky, then retired to Cape Cod before moving about ten years

ago to Tampa.

Bob's contact with the Ronne Expedition came about through a last-minute chance. In December 1946, only a month before we were due to sail, Finn called me to say that his geologist had withdrawn; could I help find a replacement - someone professionally qualified and willing to leave for a year of isolation in the Antarctic on less than a month's notice. I was a student at Harvard at the time, majoring in geology. I talked to the eminent professor, Kirk Bryan, who told me, "...there's a fellow named Bob Nichols over at Tufts, a big, strong guy. He has a long shelf of Antarctic books, loves the Antarctic; he just might go for it." When I met Bob and told him what we had in mind, his eyes lit up. From that time on there was no stopping him. He managed to disengage, from work and family, on short notice.

On the expedition Bob was, as Smitty puts it, probably the most loved man on the expedition. He was certainly among the most upright, trustworthy and diligent members of the group. He was scrupulously honest, endowed with a warm kindness and selflessness sparked with enthusiasm, always willing to lend a hand for any task, naive at times but usually wise in dealing with people, a great team worker. Bob was one of a group (along with Ike Schlossbach, Chuck Adams and Bill Latady) who were our strongest anchors to windward during moments of tension.

**MISCELLANEOUS.** This wasn't what we thought our 100th Newsletter would look like, but .... We strive to go to bed with some current news, but for the first time that I can recall, we have nothing from NSF. Without their input, it becomes a pretty dry Newsletter. And some other news items never came through, for one reason or another. Plus one of our fax machines broke down, not once, not twice, but three times. So we ended up with no time on the clock, and a need to announce the Memorial Lecture now. . . . Remember to watch old Norman Vaughan on April 2nd. As we go to press, he is bouncing all over the eastern seaboard. If he ever drops anchor, we hope to talk to him about his trip and future plans. The last we heard was that he wants to make Mt. Vaughan into an upside down Grand Canyon and lead expeditions there.

Besides Jackie and Norman going home this past austral summer, Bert Getz finally got to the Getz Ice Shelf. Bert and his daughter did the whole ball of wax in five weeks: Mt. Vinson, the South Pole, the Dawson Lambton area, and other by-stops on a 4,000-mile continental trip. He was thrilled to be with Frank Todd in an Emperor colony, which was topped off with the first recorded sighting of a melanistic Emperor penguin. Bert ran into Norman at Patriot Hills, and I guess he thought he had met God, although I think Todd convinced him that he, Frank, was really God in the Antarctic. Bert wrote Ruth that "it was indeed a marvelous experience in a beautiful environment." And so say all of us!

Ed Williams of 4536 Greenlee Road, Roanoke, Virginia 24018, has shot and produced the best home video imaginable on Antarctica. Just fantastic! A little over three hours running time, with great background classical music. People play a most insignificant role, and the natural environment and its native inhabitants are featured, just as they should be. My only criticism might be that the music background when in penguin rookeries might have been lower, as the penguins themselves play a pretty good symphony on their own.

**LATE NEWS.** *Norman Vaughan will be a guest on Reeves' circumpolar flight of the Arctic 23-24 June 1995. Next winter he will lead tour groups to the interior of Antarctica. He is optimistic that he can pay off his debts which are considerable, especially for an 89-year old renegade. Has anyone in history ever been so young after reaching age 80, completing several Iditarods, being actively involved in the retrieval of World War II planes on the Greenland icecap, involved in two Antarctic expeditions - one climbing a 10,000' mountain, and marrying a fortyish woman?*

# THE ANTARCTICAN SOCIETY

*Paul-Emile Victor - "I am not frightened by death. What annoys me is to stop to live."*

Ordinarily we don't put out a Newsletter in mid-summer, but we have made an exception after two of the most famous Antarcticans in the world departed our company this spring-summer. Larry Gould was certainly the Silver Tongued Orator of the Antarctic, and Paul-Emile Victor could well be considered the Bon Vivant of Antarctica.

The two traveled to Antarctica on the USS CURTISS in January 1957, and, as one of the IGY scientists going to Antarctica on the same ship, it was paramount to being with two demi-gods. We got to know Larry quite well, and have fifty-five letters from him in our files, but none of these are from his last years.

Every time an Antarctic figurehead dies, we ask Link Washburn to honor the person with his personal thoughts, as Link knew them all. As our cover shows, the peers of Larry and Paul-Emile have just about vanished. We wanted Grover Murray to write something, as he was very, very close to Larry, but Grover is not in the greatest of health and could not bring himself to write about him. We regret that we don't have words from Clark Arnold, a very close friend of Larry's, but, as we go to press, the Arnolds are rafting down the Colorado out of communication.

**LAURENCE MCKINLEY GOULD - A TRIBUTE** (A. Lincoln Washburn). Many tributes and memorials will be written for Larry Gould, reflecting his many far-flung official and unofficial accomplishments and associations. Rather than being comprehensive, the present tribute is highly selective and personal, based on periods when our paths crossed most frequently and I had the privilege of getting to know him increasingly well with the passing years. Larry's career covered an array of accomplishments among which most of the following are ones I knew something about firsthand.

I first met Larry in 1935 while he was Professor of Geology and Geography and founder of the Department at Carleton College in Northfield, Minnesota. Together with my wife, we visited him, thanks to an introduction from mutual friends, so I could seek his counsel on undertaking a possible career involving geology and northern exploration. I was uncertain about going to graduate school for full-time study of geology as opposed to combining graduate school with more general geographic exploration, stimulated by a summer in Alaska while an undergraduate at Dartmouth. His counsel was unstintingly given, being essentially as I remember it, "Whatever you decide, don't get sidetracked from completing your graduate work." He and his wife, Peg, could not have been more gracious to us.

In World War I, Larry was a member of the U.S. Army Ambulance Corps and took part in the Meuse-Argonne offensive. During World War II, Larry was Civilian Chief of the Arctic Section of the U.S. Air Force's Arctic, Desert, and Tropic Information Center (1942-1944), in view of his earlier Arctic research and his later work as second-in-command of Admiral Byrd's Antarctic Expedition (1928-1930). It was an honor to be part of Larry's section and to have the opportunity to know him and Peg better. By the time I left I had come to appreciate his many talents as a truly exceptional leader whose insights and judgments were consistently on target, and whose warm personality and considered approach to problems appeared capable of moving not only mountains but even high military brass.

After World War II, I again had occasion to admire Larry's talents as one of the

founders and later a member of the Board of Governors of the Arctic Institute of North America, with which I was then affiliated. But it was during Larry's subsequent tenure as Chairman of the Antarctic Committee of the U.S. National Committee for the International Geophysical Year (IGY) 1957-1958, and his later Chairmanship of the National Research Council's Polar Research Board (1958-1972), that I had occasion as a member of his committee to appreciate his full genius.

Although Larry would have loved to participate in the Antarctic personally in 1958, as he had on the First Byrd Expedition, responsibilities kept him home. He had recommended the late "Bert" Crary for Chief Scientist of the U.S. field program - a fine choice, exactly as Larry was confident it would be.

Among his many successes Larry, as President of the International Council of Scientific Union's Special Committee for Antarctic Research (SCAR) (1963-1970), promoted and secured agreement on many science policies for the Antarctic where there were few precedents to serve as guides. He was clearly a key figure in stimulating the present Antarctic Treaty agreement to preserve the Antarctic as an international science laboratory, free of military or commercial bases, and as free of pollution as stringent international requirements could make it - the only continent where it was possible to start almost from scratch and to a degree overcome damage already done.

After retiring from the Presidency of Carleton College in 1962, he joined the University of Arizona in 1963 as Professor of Geology, then Professor of Geosciences, becoming Professor Emeritus in 1980. He was not only a valued member of the geological community there but on occasion an influential advisor to the University's President.

I saw Larry occasionally during the years when advancing age began to take its toll. In 1985 he wrote me that not to retire "... is the only way to survive happily. Even now in my 90th year I maintain my office at the University in the Gould-Simpson Science Building." When he began to fail he did so gracefully until the time came for him to join again his beloved Peg.

Larry Gould left a legacy of great accomplishments recognized by numerous awards and honorary degrees and, especially, by a legacy of personal warmth and a deep understanding of people that made for exceptional leadership qualities in human values as well as in polar science.

**DISTINGUISHED PUBLIC SERVICE AWARD - LOST IN THE SHUFFLE.** Larry wrote us on 16 January 1980 about how "the announcement of the award to me seemed to have been lost in the shuffle. It has been given little attention and very few people seem to know about it. I am very proud of it. I consider this a very great honor."

So it behooves us to roll back the calendar to Larry's last trip to Antarctica, one made in 1979, presumably to celebrate the 50th anniversary of Bernt Balchen and Commander Richard E. Byrd making the first flight over the South Pole. But on the way to the Pole, something terrible happened, the worst disaster in the history of the Antarctic, an Air New Zealand DC-10, slammed onto the lower slopes of Mt. Erebus, killing all 257 people aboard. The official polar flight was cancelled, and the Chairman of the National Science Board announced that a meeting would be held at 2:00 PM at McMurdo to carry out the ceremony that had been planned for the South Pole. A number of people spoke, and at the end of the ceremony, the Chairman of the National Science Board presented Larry with the Distinguished Public Service Award. And here it is, read it!

"Dr. Laurence M. Gould, geologist, polar scientist, explorer, and educator launched his distinguished career in polar affairs in 1926 as assistant director and geologist of the University of Michigan Greenland Expedition. In 1928 he made his first trip

to Antarctica as senior scientist and second in command of the First Byrd Antarctic Expedition. His book "Cold" records the 1,500-mile sledge journey he led from Little America to conduct the first major geological research on the Queen Maud Mountains, just 300 miles from the South Pole.

"During World War II he was Chief of the Arctic section of the Arctic, Desert, and Tropic Information Center of the Army Air Force.

"His role and influence in Antarctic affairs became more prominent with his participation in the planning and initiation of the International Geophysical Year (IGY). He was a member of the U.S. National Committee for the IGY and was director of the U.S. IGY Antarctic Program. He visited the continent to help establish six U.S. scientific outposts.

"Dr. Gould's deep interest and involvement in the high levels of Antarctic policy and planning continued in 1958 when he became a charter member and chairman of the Committee on Polar Research of the National Academy of Sciences. During his 14 years in that position he directed the establishment of research priorities for Antarctica. The principles which were developed still guide the U.S. Antarctic Research Program.

"On a global level, the International Council of Scientific Unions chose Dr. Gould to head its Scientific Committee on Antarctic Research, a post he held from 1963 to 1970. In these national and international roles Dr. Gould became known for his great interest, knowledge, and industry and for his constant dedication and diplomacy.

'From 1953 to 1962 Dr. Gould was a Member of the National Science Board (NSB), the policy-making body of the National Science Foundation (NSF). In that position and later as Chairman of the Advisory Panel for the Office of Polar Programs at NSF, Dr. Gould made exemplary contributions as an adviser on research, education, and science policy.

"His lifetime of dedication and performance in the conduct of research, and his national and international leadership in geology and in Arctic and Antarctic affairs are recognized with appreciation and commendation." (Richard C. Atkinson, Director NSF)

**LARRY GOULD ON THE ANTARCTIC TREATY.** Larry was very much enamored by Herman Phleger, Head of the U.S. Delegation to the Antarctic Treaty discussions. Larry often said that Phleger was "responsible for the prose poetry in which the treaty is phrased." There was a mutual love affair between Herman and Larry. He inscribed a photo of the signing to "Laurence McKinley Gould, without whom there would have been no Antarctic Treaty."

Larry wrote on 1 January 1982, relative to Herman's inscription on that photo, "He apparently was aware of my lobbying before the Senate Committee on Foreign Relations. I was strongly supported by my fellow Minnesotan Senator Humphrey. The Committee as a whole was friendly, but some of the other people appearing before the Committee were not. The representative from the D.A.R. was bitterly opposed to any treaty which included Soviet Russia, and she was highly critical of my presentations.

"I think I was the only person from Antarctica who appeared and did so as Chairman of the Committee on Polar Research at the National Academy of Sciences. In my 'lobbying' I was surprised by the negative responses from some senators whom I approached, especially the late Senator Russell of Georgia, a charming urban-wise education man."

**PEG WAS JUST A NORMAL EXTENSION OF LARRY.** In spite of all the greatness of Larry, I think all who knew him realized that he needed a rudder, and he had the best one possible in his bride Peg. At the age of 17, this one-time reference librarian in the Detroit Public Library enrolled, along with some 400 others, in Larry's course

in Geology 101 at Michigan. She must have impressed Larry, as they got married that year, and his lecturing to her on geology lasted for another fifty-eight years. Hopefully, she got a final passing grade, as it was a lifelong course!

She must have been a great companion for Larry, as one of the past presidents of Carleton College, Stephen R. Lewis, Jr., said in the Minneapolis Tribune, " ... a person of wit and insight, and an avid reader, Peg Gould had a sharp mind and spoke freely and candidly about matters that took her interests." And when Peg turned 80, Carleton's Board of Trustees passed a resolution stating its appreciation, "Her strength and beauty of character have been a light unto her many friends, admirers, and successive wives of Carleton's presidents."

We never knew Peg, but have some nice letters from her in our files. And she even sounded like Larry, quoting from two letters, the first of 28 June 1981, "There's nothing so good for the body and spirit as a good resounding belly laugh. Please, therefore write more Bergy Bits or letters to Larry. Whenever I am feeling downcast, I get out your letter about women in Antarctica and am immediately renewed." And then on 18 November 1981, "But - damn it - why don't you bring yourself out this way some time?! The country is lovely and both my legs are the same length and my eyes aren't crossed. Furthermore, I've been known to carry on a short conversation without splitting infinities. And isn't himself the Grand Man!"

Peg came from a family of four, all struck down by cancer. When she died in 1988, we always felt that a large piece of Larry went with her, that life was never the same thereafter. He had fantastic support from his multitude of friends in Tucson, but he never had his beloved Peg. Now they are in adjoining urns on the campus at Carleton and Larry is still continuing his lectures on Geology 101!

**NORMAN VAUGHAN ON LARRY.** With the passing of Larry, there are only two living members of the 1928-1930 Byrd Antarctic Expedition, Howard Mason of Seattle and Norman Vaughan of The World. Howard keeps a low profile, living under a bushel basket. He is the only man I know who went north with Sir Hubert Wilkins and then south with Byrd. As a radio operator, he was one of the few men who got paid on that expedition, being on the New York Times payroll. When he came back, he had some money in his pockets, and walked the streets of San Francisco looking for the proper place to deposit it. Not knowing anything about banking, Howard told us in a visit to his home about a dozen years ago, that he decided to put the money in the bank with the most imposing columns. However, it did Howard no good at all, as the great bank crash came the next day and he lost his money! Howard is still alive, but we were unable to reach him at the time of Larry's death, so no comments from Howard.

Norman was the one who notified us that Larry had died, as Carleton College had called him right away, and then he called us twenty minutes later. Norman sent off a message to Clark Arnold to be read at Larry's Memorial Service, and here it is:

A personal magnetism of charisma, extreme loyalty, and love for his students partially described Laurence McKinley Gould. To have had 18 months with him in Antarctica, including membership on his 1600-mile sledge journey which discovered new lands was my greatest education. My son Gerard, my grandson Jay, and my great grandson Joshua all proudly have Gould for their middle names. In 1979 Jerry flew Larry and me across the Pacific and to Antarctica to celebrate on November 29th the 50th anniversary of Admiral Byrd's flight over the South Pole. My three sons and I are proud to have just a share of this man's unrivaled life."

Incidentally, Norman is planning to go back to the South Pole on November 29, 2029, when they celebrate the 100th anniversary of Byrd's first flight over the South Pole. In fact, he has already started to pack his survival pack for that flight.

**TWENTY-SEVEN HONORARY DOCTORATES** (Orlo E. Childs). It took nearly six months to track down the names of degrees and the institutions that honored Larry during his long and fabled career. Unfortunately, Larry's memory was impaired to the extent that he could not help us in our efforts, but he never failed to recognize Michigan, Carleton, and Harvard hoods! He had 27 doctoral hoods: one was an earned Doctor of Science degree from Michigan, 26 were honorary doctoral hoods, and of those one Doctor of Science degree could not be identified as to the university giving the degree. A chronological listing of the degrees has been made, and is part of the display. Dr. Gaylord Simpson (for whom, along with Larry, the building is named) is also featured in the display. ....

On November 27, 1993, a formal opening of the display of the doctoral hoods of Larry Gould and Gaylord Simpson was held in the entrance lobby of the Gould-Simpson Building of the University of Arizona. Larry was there, and at 97 he clearly understood and enjoyed the entire ceremony. I shall always see him there as I enter the building, and my wife and I shall continue to think of him and appreciate his great friendship as one of life's treasures.

#### Honorary Degrees

Sc.D. University of Michigan (1925)	D.H. Wayne State University (1960)
Sc.D. Polytechnic University, Brooklyn (1931)	LL.D. Brandeis University (1961)
L.H.D. Ripon College (1941)	LL.D. Occidental College (1961)
LL.D. Coe College (1945)	LL.D. Harvard University (1962)
LL.D. Macalester College (1946)	L.H.D. Carleton College (1962)
L.H.D. Rhodes College (1953)	Lit.D. College of Wooster (1962)
LL.D. University of Michigan (1954)	LL.D. University of Minnesota (1962)
Lit.D. Chicago Medical School (1955)	LL.D. St. Olaf College (1962)
Sc.D. Union College, New York (1958)	L.H.D. Kalamazoo College (1963)
LL.D. New York University (1959)	Lit.D. Simpson College (1966)
LL.D. Dartmouth College (1959)	Sc.D. University of Alaska (1970)
Sc.D. Columbia University (1960)	Sc.D. Ohio State University (1980)
Sc.D. Notre Dame University (1960)	Sc.D. University of Arizona (1982)

"Laurence McKinley Gould - You have combined several careers with brilliance and grace. You are a geologist, educator, explorer, diplomat and humanitarian. Your contributions as a teacher, researcher, scientist and statesman are incalculable. You are perhaps the world's leading specialist in glacial geology. Your years of Arctic and Antarctic exploration, research and writing have established a solid foundation for all future polar exploration, vitally important today as we search for new sources of energy. In recognition of your contribution to mankind, and to the quality of your own life, the University of Arizona confers upon you the degree of *Doctor of Science*." (John P. Schaefer, President, The University of Arizona, May 15, 1982)

**LARRY'S THOUGHTS ON A SOCIETY TIE.** On January 15, 1985, Larry wrote, "I like the idea of an Antarctic Society necktie, provided it is red, for I like any bright color so long as it is red. Penguins and whatever you wish would look well against a red background.

"I have a biomass tie which I wear occasionally but it is quite dull - but not nearly as dull as a deep blue (looks black) tie with such tiny white maps of Antarctica that one must get indecently close to recognize what they are. I don't remember who sent it. The Society should really get busy and sponsor a really handsome tie no matter what it costs."

Relative to the above, Bob Rutherford sent a check about that time for the winner of an acceptable Society tie. We thought that the famed Frankie Welch's staff in Alexandria

could come up with an appropriate design, but for some reason never got off the ground. Then we had a very talented naturalist do a painting of an Emperor penguin, but Rutford vetoed that, and since then nothing has been done.

Ten years ago a straw vote showed 50% of our Society wanted a penguin tie, 50% wanted anything but a penguin. And Bill Sladen said, "if we have a penguin tie, it has to be an Emperor." Bill said that Roger Tory Peterson owed him a favor, so he might get him to sketch one for us, but then he added that Peterson was so wrapped up in King penguins that he would do one of those birds, and that a King would not be appropriate as it is a subantarctic bird. So that died a natural death.

I hope we are entering an era when all neckties will be outlawed, or at least there will be a strong ground swell against wearing ties. But if anyone has any thoughts about a Society tie, please let us know.

**LARRY'S ENDING.** Larry's ending was somewhat tragic, and none of the people we contacted wanted to write about their dear friend's death. But it seems that the beginning of his downfall occurred five years ago when he had a quadruple bypass, and one source felt that the medication afterwards affected him, saying that thereafter Larry lost ground fast. It got so bad that even his closest friends were not certain they would always be recognized.

Larry went to the nursing home a couple of months ago, the Saturday before Easter. Even in his sickening condition, he remained his ever charming self, and all the nurses fell in love with him. He and Peg never had any children of their own, but from what we heard, he died with the love of a self-adopted family. A very large floral arrangement at his Memorial Service came from those nurses.

A couple of days before Larry's death, one of his geology students, Clark Arnold, and his wife, took Larry for a ride around Tucson, up onto the hills where he could enjoy the scenery. We understand from another source how much Larry appreciated the ride.

But on his way to Heaven, the day before Larry died, he had some unfinished business to attend to, and he did it! Somehow or other, he had lost his polar orientation, and was back in the Arctic with Captain Bob Bartlett, with whom he had traveled northward twice on his schooner, the MORRISEY. Larry spent part of his last day haranguing old Bob who had been dead for 49 years! Never let it be said that Larry didn't have an opinion, nor never let it be said that he was prone to suppress his opinions.

In a way it is rather hard to use the best of Larry Gould, as his candid opinions expressed in his letters to this office would take a lot of people by surprise and shock! When talking to one of his closest friends about a certain polar figure, he said that he knew much of Larry's feelings and thoughts, but that most of them were obtained after the second martini, and thus had immunity from being quoted.

**WHO IS GOD, NOW?** With Larry Gould dying, who is God in Antarctica? To avoid any international conflicts, why don't we just concede all of Antarctica to the United States, and just not recognize anyone but ourselves? That seems entirely fair to this broad-minded individual, so naturally the Antarctic God should come from our country.

First of all, one does not truly replace a Larry Gould, because when he was created, the mold was destroyed. Is there anyone who even approached his rhetoric? Anyone who ever heard Larry speak will never forget him. His long tenure as head of SCAR (Scientific Committee on Antarctic Research) and chairman of the National Academy's Polar Research Board, showed both his international and national popularity.

The U.S. had an heir apparent to replace Larry in Gentleman Jim Zumberge, but on his way to the podium to succeed Larry, Gentleman Jim was stricken with a brain tumor and

preceded Larry to the Great Beyond. Too bad, as he would have made a terrific God, as everyone loved the man.

Link Washburn has many godlike attributes, but he is too nice a guy. We need a God who will sin so he can be forgiven, and that is not Link. Besides, he has made only cameo appearances in the Antarctic, as his love since the crib has been the Arctic, and we don't want a part-time Antarctic God, particularly one who will probably die studying some ice wedge in the Arctic. So throw out Link.

What really are the requirements to be God? If God has to be a dog handler, like Larry was, Norman Vaughan would be a shoo-in for Antarctic God. Besides, he has already appeared on the Hour of Power and confessed to being a born and true Christian. However, the new Protocol being kicked around by various countries before ratification outlaws dogs in Antarctica, so I guess the new God must not be a dog driver. Sorry, Norman. Anyway, you have your hands full trying to keep that young bride satisfied, so you don't need the job, conserve your energies.

Does God need some experience man-hauling sledges? I doubt it. Besides, our number one proponent of man-hauling was Bob Nichols, and he, too, checked out shortly before Larry. Maybe George Denton could be a man-hauling God. He has been to Antarctica for 27 working summers, and he has no intention of hanging up his ice axe. But we don't want a God who works, anyway, as he is supposed to be sort of a titular head. So, George, we aren't even considering you.

Some people might want to throw up the name of Art DeVries for Antarctic God, but hey, let's be serious. I'm not a biblical student, but was God ever a cod fisherman? I know someone over there could part waters, and others could cast nets, but Art has to drill holes and drink his beers, so let's leave him be where he is totally happy. And to be utterly frank, Art's profile doesn't look very godly to me.

There are a couple of old guys hanging around from the IGY who go by the names of Charlie Bentley and John Behrendt. They have served their time, so have to be candidates. But Charlie has a good deal going, as glaciologists will always get funded to study the mass budget, which will never, never be determined, so why should he accept a position as God when he can get megabucks each year from our National Science Foundation? Besides, God would never have a wife like Marybelle! I don't know too much about John. Some say he has already experienced hell in Antarctica, so is ready for anything. He seems to have the right holes punched in his national and international qualification cards, so let's not throw him out as a valid candidate as Antarctic God.

I have purposely avoided the name of Bob Rutford until now, but it looks to me like this old footballer from Minnesota is going to replace Larry as the Antarctic God. He was on a "Zumberge Track", going to Nebraska, going to Texas as a university president, representing this country at SCAR, being head of the Office of Polar Programs at NSF, being chairman of the Academy's Polar Research Board, and even having his summer hole at Jackson Hole where both Larry and Gentleman Jim had places. I think Bob realized that he could become God when Larry checked out, as Bob retired this past year as President of the University of Texas at Dallas to clear his desk. The only question is, "Is Rutford too shy to be God?"

So here we are in paragraph ten, and we haven't even found a female Antarctic God. If Mary Alice McWhinnie were still alive, we would put her name on the ballot. After all, her credentials in the Antarctic were superb, and she had divine connections with the holy fathers at a good Catholic university. However, she smoked, and whoever heard of God smoking, so maybe she really wasn't a viable candidate anyway. If we really need a balanced ballot, let's toss Polly Penhale's name into the hopper. In a way, she is sort of a Goddess.

So where do we end up? Certainly no true replacement for Larry, but I guess we could

live with Rutherford. He would not be a dull God, a do-nothing God, that's for sure! And, if he doesn't work out, perhaps Behrendt or Penhale could step in.

**FEED ME TO THE SHARKS, AND PAUL-EMILE GOT HIS WISH.** Paul-Emile Victor was many things, among which we can cite polar explorer, pilot, ethnologist, writer, sketcher, humanist, and promoter of scientific ecology. Although French, he also carried a U.S. passport, and served as a polar rescue advisor for the U.S. in World War II.

An early influence on his life was the famed French explorer, Dr. Jean-Baptiste Charcot, who took Paul-Emile with him on expeditions to Greenland on the famed POURQUOI-PAS? This ship, with Charcot aboard, fell victim to a gale off the Icelandic coast on 15 September 1936. Paul-Emile then continued making expeditions alone, most notably to Lapland.

Another great influence on Paul-Emile's life was Rachel Carson's "Silent Spring" which his second wife, Colette, gave to him in the 1960s. But it wasn't until 1968, when he was more than 70 years old, that he really got into ecology. He set up the Nature Conservation Fund, but it really didn't get off the ground. So he finally decided to set up a scientific think tank, and that came to fruition in 1974 as the Paul-Emile Victor Group for the Defence of Man and His Environment. He declared himself a "scientific ecologist" and said, "Ecological activism, appropriated by some newspapers, has produced impassioned prejudices that have nothing to do with the fight for man and his environment." Noting that public opinion in France wasn't being moved by his pleas, he decided on a radical Gauguin-like change of lifestyle, abandoning his home in Paris for Motu Tane, a tiny atoll off Bora Bora in French Polynesia. He wasn't exactly forgotten back home, as President Mitterand visited him on the atoll to award him the Legion d'Honneur.

But let's flash back to his polar enterprises which numbered many. He once estimated that he had covered 300,000 miles across snow and ice in his lifetime. He first achieved fame in 1936 when he was 29, with a long crossing of Greenland by dog-drawn sled and on foot, spending the winter on the northern coast of eastern Greenland. In 1947 he founded Expeditions Polaires Francaises to oversee French scientific missions in the polar regions. He went on to lead several expeditions to the Antarctic, and became an expert on the protection of the continent, as well as an authority on its mineral resources. His last book "Planete Antarctique" was published in 1991. Prior to that he had published "The Poles and Their Secrets", as well as his most famous one, "La Grande Faim", about the terrible deprivation suffered by his beloved Inuits during the grim winter of 1882-83.

There is an interesting story circulating in the polar community about the Victors in Greenland. It seems that both Paul-Emile and his wife were on a French plane resupplying one of their bases in Greenland, and after the long winter, they were air dropping such mundane things as fuel drums and other sheer necessities of subsistence Paul-Emile got on the radio to the base to see how the drops were coming, and found a bunch of uninterested people down below. It seems that they were more interested in seeing a woman's bosom than more fuel drums, so on the next pass, his wife stripped to her waist and leaned out the open bay of the aircraft as it made a low pass over the station. First recorded UFOs in Greenland, although in the French log, they were described as IFOs.

Paul-Emile handled his departure from this planet in his typical flamboyant style. He sketched himself flying up into Heaven, wiggling his fingers, waving goodbye to his wife and kid down on the island. Then he wrote his farewell message to his friends aside the sketch, "Paul-Emile Victor regrets (and how regretful he is ... he expected to be here several more centuries ...) to tell you he was obliged to interrupt all of his activities (de-fin-ni-ti-ve-ly) on: March 7, 1995 at NOON."

The message continues to state that it is from "Colette (his wife) and Teva (*his son*) in Bora Bora, and Jean Christophe, Daphne and Stephane (his children in Paris)." This was given to his secretary back in Paris, with a list of those whom he wished to receive them, and she wrote in the date of his death, March 7, and mailed them out.

An editorial comment in the "Journal Francais d'Amerique" states that "it was rather incredible that, eight years before his death, Paul-Emile Victor, had the imagination to prepare (for his friends) a message that he would leave this earth in the future and wish them goodbye. He exhibited a great sense of humor, of clairvoyance, of friendship, and finally great courage. He was also a simple man who loved his life and work. One wonders that this drawing and others done by him were not published in science books." (Courtesy of Peter Barretta)

We don't know the exact circumstances, but several years ago Paul-Emile turned over much of his polar memorabilia to an auction house. Whether that included the gold medal given him by the Royal Geographical Society in 1953 is unknown to us. Pete Barretta informs us that the Victor home on Motu Tane was destroyed by a typhoon, including all his papers and souvenirs. That certainly was an ill wind.

Paul-Emile left instructions that his body should be "fed to the sharks", and he was duly given a burial at sea, on a very appropriate ship, the DUMONT D'URVILLE, on 13 March 1995. He certainly was one of the most colorful of all polar explorers, and a lot of us going south on the USS CURTISS in 1956-57 had a wonderful opportunity to meet with him on the ship. I remember wishing we were French, as Paul-Emile was then bringing his expeditions home with a stop-over in Tahiti. What a way to run an expedition!! My personal log started out on 13 January 1957 with "Had breakfast (at the Warner Hotel in Christchurch) with Dr. Gould, Director, Antarctic Programs, Dr. Kaare Rodahl, Director, Arctic Aeromed Lab, and Paul-Emile Victor, famed French explorer." How about that for breakfast companions!!! Incidentally, there is a Musee de L'Exploration Polaire, Centre Paul-Emile Victor in the Jura mountains, some 40km from Geneva. We know, as Gordon Cartwright sent us a card showing it - nice looking, too.

**VIVIAN C. BUSHNELL, 1910-1994** (Walt Seelig). Early this year, Josephine and I were saddened to learn of the death of Vivian Bushnell on October 7, 1994 in Palm Harbor, Florida.

The National Science Foundation had a continuing concern as to how to make the scientific results of the International Geophysical Year and following years of scientific research in Antarctica available in a concise form to interested scientists and the public. An atlas-type volume was considered but deemed impractical because of the rapidity and volume of new information being generated. A loose-leaf map folio series which could easily be revised, seemed the answer. Vivian, because of her experience, devotion to her job, understanding, and ability to work with senior scientists was an ideal choice for the Executive Editor of the new Antarctic Map Folio Series.

At the American Geographical Society, Vivian was responsible for the development of a series of base maps at various scales, projections, and areas of coverage on which to portray the results of terrestrial, marine, and upper atmospheric studies in and around Antarctica. Working with the senior researchers on the map content and text, twenty-one loose-leaf folios were produced in the Antarctic Map Folio Series, now a fundamental source for Antarctic information. They are a monument to Vivian's energy and dedication. The Folios are now out of print and are collectors items\* Mount Bushnell, in the Tapley Mountain Range, is named in honor of Vivian Bushnell. We are sorry to have lost a good friend and fellow Antarctic.

*Editor note: Please do NOT be offended by " Who Is God, Now?". We did not write it for you, but for Larry who had a real appreciation for humor.*

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 95-96

October

No. 2

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94  
Mr. Tony K. Meunier, 1994-96

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorus, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Sayed Z. El-Sayed, 1990  
Dr. Charles W. Swithinbank, 1991  
Dr. Susan Solomon, 1992  
Dr. Michele E. Raney, 1993  
Dr. Doyle A. Harper, 1994  
Dr. Edith L. Taylor, 1995

MR. ANTARCTIC FREQUENT FLYER

40th Anniversary of U.S. - New Zealand Antarctic Marriage

by

Robert M. Thomson, O.B.E.

Order of Sacred Treasure

Queen Jubilee Medalist

British Polar Medalist

U. S. Antarctic Medalist

plus

Three Antarctic features

on

*Tuesday evening, November 7, 1995*

7:30 PM

National Science Foundation

4201 Wilson Blvd., Arlington

Room 390

(Access to room at Security Desk)

Bob Thomson, who directed the New Zealand Antarctic Program for 23 years (1965-1988), is now a member of the Commonwealth of Virginia, living in Moneta.

His Antarctic career is unequalled. He was in charge of the Ionosphere and Auroral Program on Campbell Island, 1958; Scientific Leader at Hallett Station, 1960; Officer-in-Charge, Wilkes Station, 1962; Deputy Leader, Scott Base, 1964. Participated in famed traverse from Wilkes to Vostok in 1962.

While Director of the New Zealand Antarctic Program, he visited Antarctica on 78 official visits, and has made over 100 flights to the continent. The Order of The Sacred Treasure is the highest award Japan bestows on a foreigner.

*Come and hear the man who met his wife  
in an elevator in Honolulu!*

The same old twosome of Siple and Dalrymple are still on the same old street corner with our eighteenth year of putting together these things we call newsletters for lack of another name. Bernard Stonehouse says we are actually taradiddling, and upon looking in the dictionary, he is right.

Ruth has been intimately involved with Antarctica for sixty odd years, and I have a forty-year connection, so you get a strong overdose of historical Antarctica. But we are trying, always have, to use as much current news as we can find. The philosophy of the person who puts the words onto paper is not to let the truth get in the way of a good story, as first and foremost we want something that people will actually read. So whatever you read, remember our credence.

We once had an heir apparent to this potpourri, a delightful, charming person who went off to Scott Polar to pursue her polar interests. She recently completed her studies, but she isn't coming home, as Pam Davis recently got married to a British penguin. Damn, damn, damn! But good luck to you, Pam, and may you continue to enjoy rowing!

**ANTARCTIC CALENDARS.** The 1996 Hedgehog House Antarctic calendars are in hand, waiting for you folks to snap them up for your inlaws and outlaws for Christmas. Although we have been selling 200 each year, this year we ordered only 150 to facilitate an earlier sale, closing up our shop, hopefully, by Thanksgiving. A.S we go to press, we have only 100 left!

The calendars feature, primarily, the artistry on film of Colin Monteath, and we challenge any of you to find anything better. If you'd order directly from Hedgehog; you would be charged \$17, but we put them in your mailbox for a mere \$11. Our markup is pennies, so you are getting a real bargain. And trust us, the calendars are GREAT again this year. Order NOW, as when we sell out, that's it!

**MEMBERSHIP.** Our Society numbers 570 active members, which is down about twenty from what we totalled a year ago, down about thirty-five from our all-time peak. Our Washington area membership runs about a quarter of our total membership. Basically our group remains one of people who have worked in Antarctica, and includes members from all major U.S. Antarctic expeditions. In recent years, new members often show a strong interest in the preservation of the pristine environment. But don't we all, I trust.

Membership dues' notices are practically "in the mail." If you do not get one, you do not owe. Dues remain the same. Single - \$10; Husband/Wife - \$12; Foreign (outside U.S.) - \$15. Those of you renewing, please, if you can, do so for multiple years, as this Society is a one-person operation, and it helps Ruth if you do.

*Joint Dinner Meeting with The Explorers Club-Washington Group and Society of Woman Geographers at the Cosmos Club, 2 December 1995, will feature Dr. William Cassidy, University of Pittsburgh, speaking on "The Frozen Meteorites of Antarctica." More to follow in next Newsletter, but mark your calendar NOW if you want to hear about a meteorite with a terrestrial age of 2.3 million years (not Cassidy)!*

**GOVERNMENT WIDE POLICY REVIEW OF THE U.S. PRESENCE IN THE ANTARCTIC** (Senate Appropriations Committee Report 104-140). U.S. Antarctic Program: Presidential Memorandum 6646, issued in 1982, calls on NSF to be the lead agency for the U.S. Antarctic Program. That policy directive calls for this Nation to maintain a year-round active presence on the continent and to maintain three stations: McMurdo, Palmer and South Pole. The cost to maintain a U.S. presence in Antarctica is expensive due to the remote location and severe weather conditions. The NSF required \$166,770,000 in logistics and operations support in fiscal year 1995 to support \$29,060,000 in scientific research activities.

The Committee is very concerned about the ability for NSF to continue to fund a U.S. permanent presence on the continent given severe budget constraints. This situation is exacerbated by the need for NSF to upgrade or replace its aging facilities such as \$200,000,000 estimated to replace the deteriorating South Pole station. The Committee questions whether the 1982 policy to maintain a presence in the Antarctic is still valid.

As a result, the Committee directs the National Science and Technology Council to undertake a Government-wide policy review of the U.S. presence in the Antarctic. The review should examine the validity of the policy contained in Memorandum 6646, namely, the need for a year-round presence, the need for three stations, and the roles of the NSF, Department of Defense, and other Government agencies. The review should examine the policy in the context of the value of the science performed in Antarctica and other U.S. interests. Finally, the review should address the affordability of continued U.S. presence in Antarctica in light of the severe budget environment and examine options for reducing annual logistical and operational budget needs. At a minimum, budget-saving options should include greater international cooperation, less than a year-round human presence, and closing one or more of the stations. The results of the review should be submitted to the [Senate Appropriations] Committee by March 31, 1996.

Background information (American Institute of Physics Bulletin of Science Policy News, Number 131, September 19, 1995):

The National Science and Technology Council (NSTC) responsible for the March 31, 1996 report is a cabinet-level council established by President Clinton in November 1993. Its purpose is, according to the White House, to "coordinate science, space, and technology policies throughout the federal government." NSTC is chaired by the President, and includes the Vice President, Assistant to the President for Science and Technology, and the secretaries of Commerce, Defense, Energy, HHS, State, Interior, Agriculture, Labor, Transportation, and Education, as well as the heads of NASA, NSF, EPA, NIH, OMB, CIA and various other White House councils and offices.

The FY 1996 NSF U.S. Polar Programs budget request, which includes research and logistical support at both poles, is \$234.88 million. The request states: "The Foundation is charged with supporting national policy goals in Antarctica: to maintain the Antarctic Treaty, ensure that the continent continues to be used only for peaceful purposes, foster cooperative research contributing the solution of regional and worldwide problems, and protect the environment."

There are three major facilities in Antarctica: McMurdo Station with a summer population of 1,200, the South Pole Station with a summer population of 125, and the Palmer Station with a summer population of 42. A variety of military and leased aircraft, research vessels, and icebreakers are used to maintain the stations, with operations support provided by a civilian contractor.

The budget request states that an estimated 1,396 people are involved in both Arctic and Antarctic Polar Programs Activities in the current budget year. In describing

the U.S. Antarctic Research Program, the request notes: "The U.S. Antarctic Research Program (USARP) budget for FY 1996 totals \$31.54 million, an increase of \$2.48 million. The program supports over 120 research projects in Antarctica each year. This research, best or uniquely carried out in Antarctica, provides the principal expression of U.S. presence in Antarctica. Investigations focus on the earth, the ice, surrounding oceans, the atmosphere and terrestrial and marine biota. The cold, dry atmosphere at the South Pole Station is ideal for several kinds of astronomical and astrophysical investigations. Because conduct of research in Antarctica is expensive, significant attention is devoted to the preparation for projects deployed there. Data analysis and modeling is supported as well."

The House Appropriations Committee report did not discuss this program. Unless the conference report specifically overrides this Senate report language, which is unlikely, it will stand as a component of the final legislative package.

**A NEW SHIP ON THE HORIZON, THE L. M. GOULD.** The POLAR DUKE's Antarctic career is ending much before her time, but a newer and better ship, the L. M. GOULD will replace her in a couple of years - delivery on or about 1 June 1997. The original ten-year contract for the POLAR DUKE has already been exceeded, and Congress has mandated that a U.S. yard-built ship flying the U.S. flag must be used. The POLAR DUKE is a Norwegian flagship built in Nova Scotia, so doesn't meet the requirements.

Although the POLAR DUKE was originally made for oil exploration, she became available when there was no longer any work for her in Canadian waters. She came on-line Antarctically in 1984 and has served admirably ever since. So much so that the National Science Foundation wanted a "DUKE-like ship at a DUKE-like price." If the DUKE was so great, why didn't they convert her into an American flagship? Quite simple - it seems the cost of converting her would have exceeded the cost of leasing a new ship. Plus the fact that with the required Coast Guard inspection of U.S. flagships, there would have had to be expensive changes made, such as removing the asbestos. So financially it was not feasible.

There were three competitors in the bidding to build the new ship, one with an oceanographic capability, a definite improvement over the DUKE. And there was a clear winner, both price-wise and technically, the people who built the NATHANIEL B. PALMER, Edison Chouest Offshore of Louisiana. So the Cajun Antarctic Fleet will be increased by one unit each!

Most Americans are obsessed with statistics, although O. J.'s jury certainly didn't allow figures to get into their brains or heads. However, some of you may be interested in a comparison of the new ship to the DUKE, and here's a fact sheet out of the hands of Al Sutherland.

	L. M. GOULD	DUKE
CLASS	ABS-A1	BALTIC SEALER
DIMENSIONS		
Length	230 ft.	219 ft.
Breadth	46 ft.	43 ft.
Draft	18 ft.	19 ft.
Gr. Tons	1599 tons	1594 tons
HORSE POWER	4200 BHP	4500 BHP
PROPELLER	2-VAR Pitch Kort Nozzle	1-VAR Pitch Kort Nozzle
ACCOMMODATIONS	44	41

	L. M. GOULD	DUKE
LAB SPACES		
Wet Lab	425 Ft2	400 Ft2 (Max)
Hydro Lab	426 Ft2	300 Ft2 (Max)
Dry Lab	356 Ft2	300 Ft2 (Max)
Elect. Lab	420 Ft2	400 Ft2 (Max)
Aquarium	6 Tanks	6 Tanks
CARGO	9 MiIvans	7 MiIvans

Not having any idea how much a ship like the L. M. GOULD would cost, we asked Al for a ballpark price, and he said that it would probably run about \$20 million. That sounds cheap when you realize the Detroit Tigers paid a grossly overweight, underachieving Cecil Fielder over \$9 million to show up at a ballpark some 144 times this year to play a child's game for three hours. And the L. M. GOULD will not strike out with the bases loaded, or send you home heartbroken. The new ship will lease for about \$3,600,000, which is only a couple of hundred grand more than they are paying now for the DUKE.

We do have one complaint, though. Why the L. M. GOULD? Why not the LARRY GOULD, or even the LAURENCE M. GOULD? Larry Gould was one of a kind, one of the most personable engaging, alive persons to ever visit Antarctica, and to reduce him to his first two initials is like castrating the poor guy. If Palmer, who probably never set foot on the continent, merits Nathaniel being put on his ship, doesn't Larry, recipient of some twenty-seven honorary degrees, merit more than two sterile initials in front of his name? We know that fame is fleeting, but guys like Larry Gould, Bert Crary, Paul Siple, Richard Byrd, and a few others should live on. I was surprised, if not shocked, to hear Neal Sullivan say that in spite of going to Antarctica nineteen times, he never had met Larry Gould. I am hereby encouraging anyone who thinks the new ship should be anything but L. M. GOULD to write a letter to us here at 905 N. Jacksonville Street, Arlington, VA 22205-1325, and we will forward it to NSF.

**40TH ANNIVERSARY OF DEEP FREEZE IN NEW ZEALAND.** The city of Christchurch was the site of a gala celebration in late September, early October of 40 years of cooperation between the United States and New Zealand in Antarctic operations, during which the Garden City has served with distinction as the Antarctic Gateway. One wonders if it all could have been accomplished without the full support of the citizenry of New Zealand, who not only know where Antarctica lies, but also are steeped in the history of Antarctica. Certainly the people of the country made stopover visits to their country pure delights, and greatly enhanced the overall enjoyment of going to Antarctica. And for those who seized upon the opportunity to vacation there, what grandeur they had to offer at Mt. Cook, Milford Sound, the Milford Track, the Bay of Islands, and many more special places.

On 29 September, key personnel from both the U.S. and New Zealand spoke on the past, present, and future of Antarctica. The Office of Polar Programs at NSF was represented by its director, Neal Sullivan, and Erik Chiang, Manager of its Polar Operations Section. And Deep Freeze was represented by Dick Bowers who headed up the construction party which built the first station at the South Pole. He also was the first one to locate the South Pole with any degree of accuracy. Dick has aged very gracefully, and is in better shape than many current active military officers. Neal Sullivan told this soul that the thing which surprised him most about the ceremonies was the sincere interest the populace had in what was now going on scientifically on the ice. This may have been due in part to the fact that even though he has been active scientifically many, many years, overall Neal is a nouveau Antarctic when

it comes to 40 years! This was brought out in a conversation when he said that he had never had the honor of meeting the late Larry Gould. About 350 showed up for the gala reception/dinner. Essentially this was a military celebration, as scientists never came over the horizon until the following year.

People from Deep Freeze are really bonded together by their past experiences, and they get together on call, at least every other year. This past summer they convened in Newport, Rhode Island in late April, and made a pilgrimage to Davisville, which was the center of Antarctic ship operations back in days of yore. A few civilians wandered in to monitor their activities, to make sure they were telling the truth. After forty years, you know, one even begins to believe the wildest stories.

**IS THE ERA OF SCIENTIFIC SUPREMACY ENDING IN ANTARCTICA?** With the recent 40th Anniversary ceremonies in Christchurch, it was sort of reflective time on what had occurred in the past 40 years and whereto in the next forty. Eighty years ago this month Ernest Shackleton gave the order for his men to abandon their sinking ship in the Weddell Sea. Forty years ago we were ready to commence the biggest scientific thrust ever initiated on an unknown continent. The International Geophysical Year put all would-be Antarctic players with the wherewithal and the desires into the starting gate in 1957. And the Antarctic Treaty in 1959 formalized an Antarctic fraternity and resulted in bylaws governing operations in the Antarctic.

But it appears that science may have peaked in Antarctica in terms of number of stations, especially in terms of non-masquerading pure scientific stations. If it were not for flying the flag, how many of the nine nations on King George Island would be in Antarctica? Is there any report anywhere, classified or unclassified, on how many stations have reputable scientific programs? Greenpeace once said, and we can believe them, that after visiting one station, "the most sophisticated scientific instrument seen was a thermometer!"

One of the biggest players since the IGY, the Russians have a cash flow problem which has forced them to retrench and close up some of their operations. And now we ourselves find our Congress asking some hard and fast questions. Is our Antarctic Honeymoon in jeopardy, or is this all just another small hurdle on the road?

Antarctica certainly has an ever changing face, and it's a nonpareil scientific laboratory. The ozone hole and climate change should drive the scientific programs for the next forty years, as taxpayers can understand things which might affect the welfare of their grandchildren. And it's beginning to look like Antarctica may become an international park as well, as tourism is here to stay, and areas which hitherto were sanctum sanctorum for non-scientists, like the bowels of the Dry Valley, will soon be seen by tourists being transported by helicopters. Antarctica is beginning to get real interesting to even laypersons!

**WALTER SULLIVAN HOSPITALIZED.** The one person who has covered Antarctica for the past forty years is Walter Sullivan of the New York Times, and he was supposed to have been one of the key speakers at the 40th Anniversary ceremonies in Christchurch. But on the way to the Forum, he had to bypass Kiwiland, ending up at the Columbia Presbyterian Hospital in Upper Manhattan. They discovered a tumor in Walter's gastro-intestinal system, which was deemed superfluous for his continued good health, so was subsequently removed on September 25th. RJS talked to his wife, Mary on October 8th, and at that time he was still on intravenous and expected to be in the hospital a week to two weeks more. Get-well cards can be sent to 66 Indian Head Road, Riverside, CT 06878-2420.

When he completely recovers, he will probably have to call his travel agent and make reservations for both himself and his wife to go to New Zealand, as Mary was going

with him when he was struck down. In fact, it was going to be her first trip to New Zealand. Walter owes her that trip.

Maybe that tumor was agitated by his newspaper pulling the wrong Gould out of their pictorial archives, and showing Chip Gould alongside Walter's obituary on Larry! One of the two surviving members of that expedition, Norman Vaughan of Alaska, pointed out to us that the expedition carpenter's picture had inadvertently been used.

**P.A.S.S.** (April Lloyd). One morning as I was standing at the door of my third grade classroom, my room mother walked her child, (now fondly referred to by the polecats at the South Pole as "Baby Beaker"), to the door and said, "I think you have P.A.S.S."

Knowing that this woman is a nurse, I looked at her seriously and said, "What's that?" She laughed, as did her daughter and said, "Post Antarctic Stress Syndrome." I joined in the laughter and then sobered ... "Well, I'm getting well then because last week I had Post Antarctic SHOCK Syndrome."

The really frightening thing is how true that was. Finding myself on a plane returning from New Zealand, I could only wonder what one does after fulfilling a life goal and dream to go to Antarctica. For seven years, I had networked and questioned every person who mentioned any connection to Antarctica. At that point, it was a short list, headed by Stephen Dibbern.

Steve and I met through the father of a child I had in my class seven years ago. Steve volunteered that year to come to my class and share his slides about Antarctica. He has come back every year since. I know over the years he inspired the children to learn about Antarctica, but he infected their teacher each year with a more virulent strain of Antarctica fever (the condition preceding P.A.S.S.). Each year, Steve would bemoan the fact that a Girl Scout had bumped him off the flight that would have taken him to the South Pole. His words would ring in my heart, "It's easier for a teacher to get to the South Pole than a scientist like me!" And last year, Steve called to tell me that the National Science Foundation was taking high school teachers and students to Antarctica on a grant program called Teachers Experiencing Antarctica (TEA). He gave me the name and number of the grant administrator warning me that he had heard it was for high school teachers with previous NSF grant experience.

I called and made an appointment to meet with the grant administrator. The rest, as they say, is history. I was the first elementary school teacher in the TEA program and the first elementary school teacher to go to the South Pole. I was also involved in a PBS program, "Live From Antarctica" and got to talk to my third grade class in the first live television connection from the South Pole!

The TEA program matches teachers and high school seniors with science groups to experience a minimum of two weeks on the ice. The group that I was assigned to was CARA, the Center for Astrophysical Research in Antarctica. CARA conducts astronomy experiments from a remote observatory at Amundsen-Scott South Pole Station. The air above the Antarctic Plateau is the best on earth for the type of astronomical observations they are conducting in the infrared spectrum. A simple one-line answer to the question, "What are they doing?" is: "CARA is trying to discover the origins of the Universe." I like to think of it like the old Shake & Bake commercials where the little girl with the deep southern accent adds, "and I helped!" I learned a great deal about the work CARA and other Antarctic researchers are doing, and I translated their work for students and teachers to bring into their classrooms.

I believe that the future of education lies in connecting schools using the Internet. This project gave me the opportunity to use the World Wide Web (WWW) and telecommunications to connect the science and scientists in Antarctica with students across the

state of Virginia and the nation. The response from schools was phenomenal. Many schools invested in new technology and upgraded connectivity in order to participate in the project.

Using Internet commands, a digital camera and many late night hours, I sent journal writeups that included pictures and sound back to the states for teachers and students to use. Antarctica may be the most remote continent, but with Internet and the WWW students can access it daily and directly and see pictures rather than relying upon verbal descriptions.

While in McMurdo, my class and I also experimented with video teleconferencing using CU See-Me, a computer program that allows real time audio and video connections. Hopefully in the future, many schools will be able to take advantage of this type of connection where students can see and talk directly to scientists in the field. Certainly for Antarctica, this is the only way most of them will ever experience the important science being conducted there.

I must admit that while I was dreaming about going to Antarctica someday, I could never have imagined all of these amazing opportunities. It was Steve who wanted to get to the actual South Pole ... I just wanted a chance on the continent anywhere! And now that I have been, I have an even stronger desire to go back. Antarctic Fever must be like malaria, the symptoms lessen, but it never really leaves the blood!

I no longer suffer daily bouts of Post Antarctic Stress Syndrome although I do long to return to the ice. When people ask how it feels to have attained my goal of going to Antarctica, I smile and remind them that the need to connect science and education still exists, and like my desire to return to Antarctica, it may be stronger now than ever.

**ASHES OF MISTER CIRCUMPOLAR PEOPLE COVER NORTHERN NEW ENGLAND.** There's a small core of Antarcticans who found their way to the ice by serving an apprenticeship on the top of Mt. Washington, New Hampshire, working at the meteorological observatory. The station, for some ungodly reason, likes to boast as having the worst weather on earth, and actually does hold the record for the highest wind speed ever measured. It seems that when Bob Eisner and Fred Milan worked there back in the early 1940s, they skied a lot in Alpine Gardens, and in the process of talking between runs, projected that it all was such a great place that it would be a wonderful final resting site after they served their time as living human beings.

Fred checked out last January, succumbing in Alaska after a long illness, ending a very distinguished career as a circumpolar anthropologist, physiologist, humanist, and plain good old boy. He well may have been the world's leading authority on rectal temperatures of Eskimos, as he certainly made a lot of them uncomfortable. He was the only U.S. physiologist in Antarctica during the IGY, serving in that capacity at Little America V in 1957, and his office in camp was the center of all good and bad polar banter. When he died, his close friend and colleague, and former Mt. Washington companion, Bob Eisner, remembered Fred's wishes of yore to return to the earth which he had enjoyed so much in his twenties.

So Fred's ashes were subdivided, and 25% of old Fred was taken by Bob, Bob's wife, Fred's brother, Bob's brother, Rudy Honkala, and myself up the Lion's Head Trail onto Alpine Garden's where Bob scattered old Fred to the seven winds. Time had not been kind to some of us, and the trail up from Pinkham Notch had evidently undergone some late Pleistocene uplifting, as it was much steeper, longer, and rockier than it ever was in the 1940s. It took over three arduous hours to do what once was only an exhilarating one-hour jaunt. But it was time well spent, as we all took turns telling wonderful stories about old Fred. I recalled talking to Lowell Thomas, banquet speaker at the Boston Museum of Science dinner following the symposium "Man Living In the Arctic," telling me that Fred was "the greatest acrobatic skier alive."

Lt was sort of an Irish wake without the booze. Never have I walked so far for calling hours. The day was perfect, and the coastline of the Atlantic was visible from the summit in early morning, a most rare phenomenon. And even in mid-September, Lt was warm. The wind was light and variable, and when Bob went out on this promontory to scatter old Fred, the wind was swirling in different directions, and Fred sort of drifted around, maybe getting the smell of the land, to see just where he was, and then as if he recognized it, part of him settled down onto Alpine Gardens, but part of him took off to find other horizons. In death, Fred not only recognized home, but he was still exploring! If I'm lucky, maybe some of his ashes will finally settle on my property on the coast of Maine!

To have known Fred personally, was a joy and delight, and those of you who never had the pleasure should read Bob Eisner's obituary in ARCTIC, September 1995. Maybe the ceremonies were a bit unusual, maybe a bit crazy, but very, very meaningful and touching.

**BASELINER FOR POLAR AUDIO (ORAL) HISTORIES DIES.** This column has moaned and groaned for the past ten years about the dearth of oral histories on our polar heroes and scientists. One of the reasons is that we don't really have any great Antarctic historians who are glib behind the mike. Larry Gould would have been sublime, Jim Zumberge would have been entertaining. Of the living, Bob Rutford would no doubt be the best, as he is of the mold of Gould-Zumberge. But how do we get airborne?

In early February, a fantastic polar geographer died - Trevor Lloyd. Never an Ant-arctican that I know of, but his three-part armchair interview of Vilhjalmur Stefanson has to be the greatest interview of a polar expert ever conducted. As I recall, Trevor sat down with Stef a few weeks before his death, and did it all for Canadian television. Trevor knew Stef like he knew the back of his own hand, and the end product was just fantastic.

Once upon a distant past, I attended an International Geographical Congress, the one held in Moscow. Trevor and I were staying in the Rossiya, and I had the pleasure of dining with him each and every morning. I don't remember any papers or anything else at the Congress, but I sure remember my breakfasts with Trevor, he was so great to talk with, listen to. A real nice guy, and one of the truly great polar geographers. Read J. Brian Bird's obit of him in ARCTIC, September 1995.

**CDS RICHARD T. WILLIAMS REMEMBERED BY HIS COLLEAGUES.** SEABEES have always been a bunch of hardworking, competent, over achievers, but they also have big hearts and don't forget their comrades. Charlie Bevilacqua, who was one of Dave Canham's boys at McMurdo in 1956, wanted to be sure that their first casualty at McMurdo, CD3 Richard T. Williams, was duly recognized with a plaque at McMurdo, and spearheaded action to get this accomplished. He was successful in getting approval, and hopes to raise enough money to pay for it! Contributions can be sent to Charles A. Bevilacqua, 81 Peach Orchard Road, Burlington, MA 01803-3230.

A heavy commemorative bronze tablet, approximately 26" by 30", suitably mounted on a steel or concrete backing, will be placed in front of the shrine honoring Willy at the Williams Air Operating Facility. The target date for it to be in place is January 6, 1996.

**AMERICAN RETURNS RELICS WHICH WALKED OFF TO THE STATES.** An American Antarctic enthusiast, Rob Stephenson, described in a New Hampshire newspaper as an historic preservationist, was the catalyst who engineered the return of liberated souvenir items from Shackleton's Cape Royds camp to the New Zealand Antarctic Heritage Trust. It seems that Rob found out that the widow of an ex-American helicopter pilot,

Conrad S. Larson, had items in her possession that had been picked up in the course of an official visit back in 1955. Conrad, who was working with officials from the British Museum, had apparently been given the items in the course of his work. These included a leather pony halter and chain, glassware (including an unopened glass salt container), a bottle of ginger essence, tins of cocoa, fish, matches, and a sledging fuel can. Plus a book, MAD DUMARESQ, and a sketch map of the original Cape Royds supply arrangements.

It took Rob some time before he could finalize the return of the items to New Zealand, but thanks to the National Science Foundation and its contractor, ASA, it was pulled off. The items have been treated by the Antarctic Heritage Trust personnel for long tenure, and were on display at the Antarctic Festival Day on 1 October, when the 40th Anniversary ceremonies were being conducted. Two other relics, a newspaper and a can of cocoa, were recently returned by another American, Dr. Curtis Lundy. Several years ago when much of the polar memorabilia of the late French polar explorer, Paul-Emile Victor, was being auctioned off, there appeared on the list several items from the historic huts. So it must have been a common policy back then to pick up stray items to show to the little woman back home. This Society applauds the families who have returned items to the Antarctic Heritage Trust, and encourages those among us who may have additional items to follow suit.

Incidentally, those interested in the historic sites of the Ross Sea region, which should include all of us, can now buy either a hard cover or soft cover copy of David Harrowfield's new book, ICY HERITAGE, one hundred pages covering informed commentary and pictures of thirty-four sites. The hard cover sells for NZ\$39.95, the soft cover NZ\$29.95. Then one must add another NZ\$10.00 to cover handling and postage. Order by personal check or through your Mastercard, Visa, or Amex. Address: Antarctic Heritage Trust, P.O. Box 14-091, Christ church,- New Zealand.

**THE JAMES CAIRO SOCIETY** (John Millard). For those who are interested in the life and times of Sir Ernest H. Shackleton, Dulwich College, London, Shackleton's alma mater, founded the James Caird Society in May 1994. It was established to bring to the notice of the general public, world wide, all aspects of the expeditions made by Sir Ernest (1874-1922) to Antarctica and related aspects of Antarctic history.

James Caird was a sponsor and a supporter of the Shackleton expeditions. Also, his name was given to the largest of the three lifeboats on the ENDURANCE, and the boat that Shackleton and five companions made their historic voyage from Elephant Island to South Georgia in 1916. The boat is now the property of Dulwich College, and is now considered to be a national treasure. It can be seen on display at the College.

Memberships in the Society are £.30.00 for 3 years and £.50.00 for 6 years. For information and memberships contact Harding Dunnett, The James Caird Society, Dulwich College, London SE21 7LD, United Kingdom. Make all checks and money orders payable to Dulwich College.

**MORE ON LARRY GOULD.** Carleton College held a Memorial Convocation in honor and celebration of its 4th President on October 13th. There was a mutual love *affair* between the college and Larry. He once said, "If I had my life to live over again, I could not invest it with greater satisfaction to myself than I have done at Carleton College." And from his commencement address on June 6, 1955, "Now finally I remind you of what I said to you four years ago, that you were forming an association that nothing, nothing, not even death could break, because always you are a part of Carleton College ... I remind you of the ancient legend of Antaeus, and you, like Antaeus, will find your strength renewed and your faith revitalized when you return to this maternal ground." What a guy! It's most appropriate that the ashes of Larry and his beloved Peg are resting side by side at Carleton.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 95-96

November

No. 3

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-4  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94  
Mr. Tony K. Meunier, 1994-96

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Sayed Z. El-Sayed, 1990  
Dr. Charles W. Swithinbank, 1991  
Dr. Susan Solomon, 1992  
Dr. Michele E. Raney, 1993  
Dr. Doyle A. Harper, 1994  
Dr. Edith L. Taylor, 1995

*MINERAL NAMED CASSIDYITE TO STRIKE WASHINGTON AREA*

Joint Meeting with The Explorers Club - Washington Group  
and The Society of Woman Geographers

The Frozen Meteorites of Antarctica

by

Dr. William A. Cassidy  
Professor, Geology and Planetary Science  
University of Pittsburgh

on

*Saturday evening, December 2, 1995*

at

The Cosmos Club

2121 Massachusetts Avenue, N.W.

Social Hour 6 PM - Dinner 7 PM - Lecture 8:15 PM

The cost of dinner, including tax and gratuity, is \$40/person. Make check for dinner payable to Explorers Club-Wash. Group, and send to Donald M. Watkin, 3001 Veazey Terrace NW, #120, Washington, DC 20008-5455, by November 25th.

*If you wish to have drinks before dinner, or wine during dinner, please write a note immediately to Don Watkin. He will send you a form to fill out, as all drinks at the Cosmos Club now have to be purchased on a charge card.*

Bill Cassidy is an oddity, a bona fide Antarctic scientist who looks like a bona fide Antarctic scientist. He has led fifteen Antarctic field parties into the realm of meteorites, and has been responsible in part for doubling or tripling the number of meteorites available for study in the world's collections. The meteorites are found as lag gravels on *stranding surfaces*. These ice patches may contain very old ice with stratigraphic sequences predating any record obtainable from drill cores. A dust band site at Allan Hills may become one site where we can sample very old ice in any quantity with a chain saw. Stay tuned to Bill Cassidy and listen for his Stihl!!

**B R A S H I C E .** We have come to the conclusion that a little history does no one any permanent damage, and, using this as our guide, we are presenting in this Newsletter a listing of all the known lectures officially presented to our Society in its thirty-seven year history. Our charter shows that we are a not-for-profit educational society and our lecture program constitutes the largest proportion of our educational efforts. Members also get this semi-serious publication, which is part educational, part amusing but, hopefully, always entertaining.

Looking over the list of lecturers, we do have one major regret, that we never had Gentleman Jim address us. He had promised that as soon as he got through working on the Los Angeles Olympics that he would find time to come before us, and we had him pencilled in for the fall of 1991. But he came down with a brain tumor, and you folks know the rest. Zumberge would have been a great lecturer, as not only was he a fantastic man, but one of great personal warmth and humor.

We have been extremely lucky in the caliber of people who have come before us, as we only give them a handshake and a warm letter from Ruth Siple. Bill Cassidy epitomizes the very best of the Antarctic race. He had forgotten that he was to address us in Washington until it was too late for him to catch a plane, so he ran out, jumped in his car, and burned up the highway between Pittsburgh and the nation's capital, getting here minutes before his scheduled presentation. What a truly nice guy!! On the other end, there's an Antarctic photographer who got the opportunity to go to the ice through the NSF Antarctic Artists and Writers Program, who called us to say that he would give a presentation for \$4,000. His name is conspicuous by its absence on our list of lectures! Alan Campbell has blessed us not once, not twice, but thrice with the beauty of his watercolors, oils, and photographs.

**IT WILL BE THE LAURENCE M. GOULD.** We got a telephone call from Al Sutherland to call off the wolf packs, that the L. M. GOULD will actually be christened the LAURENCE M. GOULD. Al said they read us loud and clear, but it seems the convincer was that if the ship had been named for anyone at NSF, none of them would have liked just their initials before their surname. Anyway, they are happy, we are happy, and Larry doesn't even care!

When Larry was alive, he resisted every effort by Carleton College to name something after him, but when he passed on this summer, he no longer had a vote. So when they had the Convocation in celebration of Larry's life on October 13th, Carleton College named their library after him, the Laurence M. Gould Library. As long as there is a Carleton College, Larry will really live eternally.

**SCOTT POLAR BECOMES OF AGE, CELEBRATING SEVENTY-FIVE YEARS ON 25 NOVEMBER 1995.** Back on 26 November 1920, Sir Raymond Priestley and Professor Frank Debenham founded the Scott Polar Research Institute in Cambridge, giving intrepid Antarctic scientists a place to hang their parkas, ice axes, and mukluks. On Saturday, 25 November 1995, they are having a showing of Sir Raymond's lantern slides of Scott's last expedition. Afterwards they are having light refreshments, cutting a birthday cake, and opening some bottles of an appropriate wine - although not necessarily bottles of seventy-five year vintage.

The coordinator of the whole shindig is good ole Pam Davis, who used to be one of us, who went to the U.K. to seek fame, fortune, and a future, and ended up sculling, with a husband and a PhD. Sounds like a good compromise, maybe even a workable solution, who knows. Scott Polar has taken on certain aspects of being a retired home for old Coast Guard icebreaking captains, as two, Lawson Brigham and Joe Wubbold, are enrolled there doing the Masters in Philosophy in Polar Studies.

*CONGRATULATIONS TO BILL SLADEN ON BECOMING A SIXTH-DECADE ANTARCTICAN!!*

## LECTURES OF THE ANTARCTICAN SOCIETY - 1959-1995.

### 1959-61

- November 19, 1959  
April 6, 1960  
June 3, 1960  
January 10, 1961  
April 11, 1961
- Film shown. "U.S. Navy Supports the IGY in Antarctica." Panel Discussion of International Antarctic Scientific Symposium, Buenos Aires. Participating were Bert Crary, Carl Eklund, Mort Rubin, and Harry Wexler.
- Capt. Edwin A. McDonald and Philip M. Smith. "Antarctica, 1959-60."  
Dr. Harry Wexler. "Antarctic Heat and Water."  
American Observers in Antarctica. Dr. Henry Dater (with Argentinians), Admiral Richard Black (with Belgian resupply ship), Erv Volbrecht (with Australians at Mawson and Davis), and Walter L. Boxell (with Japanese).

### 1961-63

- September 18, 1961  
November 27, 1961  
January 26, 1962  
April 30, 1962  
November 1, 1962  
February 14, 1963  
May 7, 1963
- Sir Charles S. Wright. "Scott Expedition, 1910-13."  
Mr. Harold Lewis and Mr. John Sieg. "Nuclear Power Plant, McMurdo Station."  
Film. Herbert Ponting's film, "90 Degrees South."  
Admiral David Tyree and Philip M. Smith. "Operation Deep Freeze 62 and USARP 62."  
Dr. Laurence McKinley Gould. "Reflections on the Antarctic."  
Dr. Martin A. Pomerantz and Dr. T. Neil Davis. "Atmosphere and Beyond."  
Admiral James R. Reedy, Mr. Robert Mason, and Dr. George Llano. "Highlights of 1962-63 Antarctic Season."

### 1963-64

- October 2, 1963  
November 6, 1963  
January 30, 1964  
March 31, 1964  
April 30, 1964
- Honorable Paul C. Daniels. "Antarctic Treaty."  
Dr. Raymond Spaulding. "U.S. Navy's Experience with Psychiatric and Psychological Evaluation of Deep Freeze Personnel."  
Honorable George Laking. "New Zealand Antarctic Activities." *First Memorial Lecture.* Dr. William J.L. Sladen. "Penguins and Skuas."  
Admiral James R. Reedy and Dr. Albert P. Crary. "Highlights of the 1963-64 Antarctic Season."

### 1964-65

- September 30, 1964  
November 12, 1964  
January 14, 1965  
March 10, 1965  
May 25, 1965
- Dr. Kenneth J. Bertrand. "Early History of Antarctica." Dr. Meredith F. Burrill. "Antarctic Geographic Names." Capt. Robert H. Graham, RN, MVO. "Two Years in HMS PROTECTOR in Antarctic Waters."  
*Second Memorial Lecture.* Admiral David M. Tyree. "Technological Advances in Antarctica."  
Major Francois Bastin, Royal Belgian Air Force. "Belgian Activities in the Antarctic, 1959-60."

### 1965-66

- September 28, 1965  
November 23, 1965  
March 15, 1966  
May 12, 1966
- Rear Admiral Rodolfo N.M. Panzarini, Director of Argentine Antarctic Institute, Vice President of SCAR. No title shown.  
Capt. Frank H. Radspinner, USA. "Army Helicopter Operations in Antarctica."  
*Third Memorial Lecture.* Dr. Roger Tory Peterson. "Impressions of Antarctic Wildlife and Conservation."  
Rear Admiral Fred E. Bakutis, USN and Dr. Thomas O. Jones. "Highlights of Antarctica, 1964-65."

1966-67

October 11, 1966 Ambassador Paul C. Daniels. "Does Science Contribute to World Peace?"

November 15, 1966 Admiral Richard Black. "Antarctica Revisited."

February 21, 1967 Dr. Samuel C. Silverstein and Mr. Charles Hollister. "American Antarctic Mountaineering Expedition, 1966-67."

March 21, 1967 Harry S. Francis, Jr. "Japanese Antarctic Research Expedition, 1965-66."

April 11, 1967 *Fourth Memorial Lecture. Dr. J. Campbell Craddock. "Geologic Studies in Antarctica."*

May 16, 1967 Rear Admiral James L. Abbot, Jr., USN and Dr. Thomas O. Jones. "Highlights of Deep Freeze 67."

1967-68

October 26, 1967 Col. Merle R. Dawson, USA (Ret). "Eleven Against the Ice."

December 5, 1967 Mr. Thomas F. Kelly and Mr. Ralph H. Lenton. "Antarctic Philately."

January 26, 1968 Dr. Gordon de Q, Robin. "The Norwegian-British-Swedish Antarctic Expedition, 1949-52."

February 20, 1968 Capt. Lewis O. Smith, USN. "Operation WINDMILL, 1947-48."

May 28, 1968 *Fifth Memorial Lecture. Mr. James B. Pranke. "Events and Activities at Plateau Station, Antarctica."*

1968-69

October 18, 1968 Dr. Laurence McKinley Gould. "Fortieth Anniversary of the Byrd Antarctic Research Expedition, 1928-30."

December 5, 1968 Dr. Ernest Stuhlinger, NASA. "Antarctic Research, A Prelude to Space Research."

February 6, 1969 Mr. Amory H. Waite, Jr. "The History and Development of Radio Ice Depth Measurements."

March 20, 1969 Dr. Maurice Levy. "Dumont d'Urville: The Space Year."

April 24, 1969 Rear Admiral James L. Abbot, Jr. and Dr. Albert P. Crary. "A Review of Deep Freeze 69."

May 12, 1969 Mr. George Doumani. "Antarctic Trail Exploration."

1969-70

September 11, 1969 Mr. Robert B. Thomson, Superintendent, Antarctic Division, Dept. of Scientific and Industrial Research of New Zealand. "New Zealand Antarctic Research Program."

October 14, 1969 Mr. Richard H. Schirmacher and Dr. R. Regula, both of Lufthansa. "Third German Antarctic Expedition, 1938-39."

November 18, 1969 Dr. Carleton Ray, Johns Hopkins University. "Underwater Investigations of Polar Marine Mammals."

January 13, 1970 Col. Bernt Balchen, USAF (Ret). "First Flight over the South Pole."

March 10, 1970 Films. "OCEANOGRAPHER in the Polar Regions" and "Passage to Prudhoe."

April 14, 1970 Rear Admiral David F. Welch and Dr. Louis O. Quam. "Deep Freeze 70."

May 13, 1970 *Sixth Memorial Lecture (also called Presidential Address). Dr. Henry M. Dater. "Antarctica, A Study of Technology."*

1970-71

March 3, 1971 *Seventh Memorial Lecture. Sir Peter Scott. "Antarctica - Past, Present, and Future."*

1971-72

November 3, 1971 Dr. David H. Elliot, Ohio State University. "Antarctica: Key to Gondwanaland?"

January 13, 1972 Dr. J. Michael Lock. "Shackleton's Last Antarctic Expedition."

February 9, 1972 Mr. Frank Mahncke. "Antarctic Treaty Inspection Visit." *Eighth Memorial Lecture. Dr. Frank T. Davies. No title shown.* NSF Presents Highlights of the 1971-72 Antarctic Season.

March 8, 1972

April 19, 1972 Mr. Morton Rubin. "NOAA - The Oceans, The Atmosphere, The Solid Earth and Space."

May 8, 1972

1972-73

October 30, 1972 Mr. Herman R. Friis, National Archives. "Work and Resources of the Center for Polar Archives," plus Operation Highjump film entitled "The Secret Land."

December 8, 1972 Dr. Robert E. Benoit. "Environmental Monitoring and Conservation in Antarctica."

January 17, 1973 Dr. David R. Rodenhuis and Dr. Gunter Weller. "Influence of the Polar Regions on Global Circulation of Ocean and Atmosphere." *Ninth Memorial Lecture. Mr. Scott McVay. "Whales: A Planetary Concern."*

May 1973

1973-74

November 12, 1973 Rupert B. Southard and William R. MacDonald, USGS. "The Cartographic and Scientific Application of ERTS-1 Imagery in Polar Regions."

December 1, 1973 Panel Discussion on "Civil and Criminal Jurisdiction of Unclaimed Polar and Offshore Territories." Panelists were N. Marshall Meyers, Dr. Kenneth Bertrand, Justin W. Williams, and William Thomas Mallison, Jr.

January 8, 1974 Dr. Fred G. Armstrong. "Environmental Considerations in Construction of the Trans-Alaska Pipeline System."

April 7, 1974 Dr. George H. Denton. "The History and Possible Disintegration of the West Antarctic Ice Sheet."

April 30, 1974 Dr. Roger Duff, Canterbury Museum, Christchurch, New Zealand. *Tenth Memorial Lecture. Mr. Joseph O. Fletcher. "Antarctica and World Climate."*

May 21, 1974

1974-75

April 29, 1975 National Science Foundation film, "Antarctica."

June 3, 1975 *Eleventh Memorial Lecture. Mr. Herman R. Friis. "The Records in the Center for Polar Archives and the National Archives - A Memorial to United States Participants in Polar Activities: 1750-1975."*

1975-76

December 2, 1975 Dr. Robert H. Rutford. "Account of Antarctic Activities, 1975-76."

February 25, 1976 Dr. Ian W.D. Dalziel, Lamont-Doherty. "The Scotia Arc Region Unlocks Some Secrets of Gondwanaland." *Twelfth Memorial Lecture. Dr. Kenneth J. Bertrand. "Ellsworth's Transantarctic Flight from the Perspective of Its Fortieth Anniversary."*

March 30, 1976

April 28, 1976 Commander Jerome R. Pilon. "Dome Charlie, Herculean Task."

May 20, 1976 Dr. George E. Watson, III. "Bird Life in the Southern Oceans."

1976-77

November 4, 1976 Dr. Duwayne M. Anderson. "Mars, The Permafrost Planet."

1976-77 (cont.)

January 25, 1977 Film. "Window to the Arctic" - about NARL at Barrow, Alaska. Guy  
March 29, 1977 Guthridge. "Palmer Station, What It Does and Why It Is There."  
May 3, 1977 *Thirteenth Memorial Lecture. Dr. William J.L. Sladen. "Snow Geese  
and Detente."*

1977-78

December 13, 1977 Dr. Mort Turner and Col. Peter Barretta, USAF (Ret). "Polar  
Philately."  
February 2, 1978 Mr. Norman Wulf, NSF. "The Antarctic Treaty and Antarctic  
Resources."  
March 9, 1978 Dr. Richard L. Cameron. "Icebergs, A Water Resource."  
May 25, 1978 *Fourteenth Memorial Lecture. Dr. J. Murray Mitchell. "Climate  
Change in the Polar Regions."*

1978-79

October 26, 1978 Dr. Mary Alice McWhinnie. "Antarctica, A Changing Scene." Rear  
December 5, 1978 Admiral Richard B. Black (USN Ret). "Antarctica Revisited." Dr. H.  
January 31, 1979 Jay Zwally. "Satellite Observations of Antarctic Sea Ice." Dr.  
March 22, 1979 Chester Pierce. "A Physician's View of Antarctica." *Fifteenth  
April 19, 1979 Memorial Lecture. Dr. Laurence McKinley Gould. "My 50 Years of  
Antarctic Exploration and Research."*

1979-80

October 2, 1979 Mr. Robert B. Thomson. "New Zealand Antarctic Research Programs."  
November 27, 1979 50th Anniversary Commemorative Lecture. Mr. Peter J. Anderson.  
"Admiral Byrd and Antarctic Aviation."  
January 29, 1980 Rear Admiral William M. Benkert (USCG Ret). "Antarctica: A  
Sailor's Point of View."  
March 11, 1980 Dr. Herman J. Viola. "Wilkes Expedition, 1838-1842 - First  
Round-the-World Naval Expedition."  
May 1, 1980 *Sixteenth Memorial Lecture. Dr. Charles R. Bentley. "Collapse  
of the West Antarctic Ice Sheet, Fact or Fiction?"*  
June 5, 1980 Dr. George A. Llano. "Tourism in Antarctica with the WORLD  
DISCOVERER."

1980-81

October 21, 1980 Dr. James W. Collinson. "Gondwana Geology in Antarctica and  
Tasmania."  
December 2, 1980 Dr. Thomas Wright. "GANOVEX-79, the West German Antarctic Research  
Expedition to Northern Victoria Land, Antarctica."  
January 27, 1981 Dr. Hugh H. DeWitt. "The French Oceanographic Expedition to Bouvet  
Island and the Ob and Lena Banks: A Biologist's Perspective."  
March 3, 1981 Dr. Lisle A. Rose. "Antarctica From the Bottom Up."  
May 13, 1981 *Seventeenth Memorial Lecture. Dr. Robert L. Nichols. "Captain  
Robert Falcon Scott and His Last Expedition."*

1981-82

September 10, 1981 Dr. Frederick A. Milan. "Recent Studies on the Human Biology  
of Circumpolar People."  
November 12, 1981 Dr. Gisela Dreschhoff. "A Tale of Two Projects: Radioactivity  
and Solar Activity."  
January 19, 1982 Dr. Stephen Ackley. "Antarctic Sea Ice: Some Results from the  
Joint US-USSR Weddell Sea Experiment, 1981."  
February 16, 1982 Dr. William A. Cassidy. "Planetology on the Polar Plateau/Outer  
Space Research in the Antarctic."

1981-82(cont.)

- April 1, 1982 *Eighteenth Memorial Lecture. Dr. Robert H. Rutford. "Antarctica in the National and International Context."*
- May 1, 1982 Dr. Edward P. Todd. "The United States Research Program in Antarctica."

1982-83

- August 31, 1982 Dr. Charles Swithinbank. "Nationalism and Internationalism in the Antarctic: One Man's Perspective - 1949-82." 25th Anniversary of the IGY. Walter S. Sullivan. "The International Geophysical Year: Antarctica Rediscovered." Walter Sullivan's Videotape Interview with Dr. Laurence McKinley Gould.
- November 11, 1982
- January 18, 1983
- March 24, 1983 Dr. William Zinsmeister. "Discovery of Land Mammals in Antarctica: 1982 Seymour Island Expedition."
- April 21, 1983 Mr. F. Geoffrey Larminie. "Offshore Oil Development in Polar Regions: Applicability of Arctic Experience to the Antarctic."

1983-84

- September 14, 1983 Dr. George H. Denton. "Antarctica and Its Relation to the Global Ice Age."
- October 12, 1983 *Nineteenth Memorial Lecture. Mr. R. Tucker Scully. "Future of the Antarctic Treaty System."*
- November 16, 1983 Dr. Albert S. Chapman. "1983 Antarctic Treaty Observer Mission." (Poulter Chapter meeting, Stanford). Dr. Charles R. Bentley. "The Future of the West Antarctic Ice Sheet."
- December 8, 1983
- January 24, 1984 Mr. James N. Barnes. "Full Protection for the Antarctic - A Viable Goal?"
- March 20, 1984 Dr. William E. Evans. "Whale Watching in the Antarctic."
- May 18, 1984 *Twentieth Memorial Lecture. Dr. Richard P. Goldthwait. "50 Years Underneath Glaciers."*

1984-85

- September 12, 1984 Dr. Edmund Stump. "Exploration of the Queen Maud Mountains: The Reach to the Southernmost Rocks."
- October 18, 1984 Dr. Cornelius W. Sullivan. "Preliminary Results of the Antarctic Marine Ecosystem Research at the Ice Edge Zone."
- November 19, 1984 25th Anniversary of the Antarctic Society. Dr. Albert P. Crary, "Dr. Harry Wexler and the IGY Antarctic Program."
- January 25, 1985 Ms. Mimi George. "Human Dynamics of a Small Independent Antarctic Research Expedition."
- March 19 1985 Ms. Lee Kimball. "We Have Met the Enemy and They Are Us: Diploma! Meet Scientists at the South Pole, The Antarctic Treaty System Meets the United Nations."

1985-86

- October 10, 1985 Twenty-first Memorial Lecture. Dr. Mark F. Meier. "Not Quite All You Ever Wanted to Know About Ice, CO<sub>2</sub>, Greenhouse and Sea Level."
- November 26, 1985
- February 13, 1986 Commander Lawson W. Brigham. "Modern Icebreaker Operations." Dr. Dagmar R. Cronn. "Atmospheric Chemistry Measurements in the Antarctic."
- April 15, 1986
- May 17, 1986 Mr. Kendall N. Moulton. "American in Antarctica 1955-1985."
- June 24, 1986 Dr. Peter E. Wilkniss. "America in Antarctica." *Twenty-second Memorial Lecture. Dr. Claude Lorius. "Polar Ice Cores - A Record of Climatic and Environmental Changes."*

1986-87

October 17, 1986 Dr. James Margitan. "Antarctic Ozone Hole."  
November 15, 1986 Dr. Ian W.D. Dalziel. "Structure and Evolution of the Antarctic

December 2, 1995 Dr. William A. Cassidy. "The Frozen Meteorites of Antarctica."

**CANDID COMMENTS ON LECTURES AND LECTURERS.** What an impressive array of speakers in the above list of 181 lectures over a thirty-seven year span! No one has heard them all, although our Honorary President has probably heard at least eighty per cent, nearly all for the last twenty years. This soul feels like he must hold the record for attending the most consecutive lectures, as we never missed a single lecture for fifteen years from 1977 through 1991, even showing up for all road games (Columbus, Palo Alto, and San Diego) during that period.

There were many great nights, but probably none bigger than when Larry Gould gave the 15th Memorial Lecture in the Auditorium at the National Academy of Sciences. It was a gala occasion, so big, so important, that we even got Crevasse Smith to come. A near impossibility! Another great night was when Charlie Bentley gave the 16th Memorial Lecture, and detoured in mid-stream from science to personal recollections of his IGY memories, bringing the house down with his dry humor. That same evening, Senator Byrd walked off the Senate floor to put in a cameo appearance at our pre-lecture dinner to personally thank Bud Waite for his efforts in rescuing his uncle from Advance Base. What a gracious gentleman - the Senator, that is! And for those of us who revel in antiquity, it doesn't come much better than our 17th Memorial Lecture, when Dick Black warmed up the crowd with his Antarctic "doxology" of poems before old Bob Nichols told us that Antarctica really belonged to Captain Robert Falcon Scott, and that everyone since has just been intruding on his sacred territory.

Who could forget the inimitable Mimi George, with her New Guinea tribal facial marking, resplendent in a U.S. southern belle broad-rimmed hat, coming before us and playing it straight, then casting the hat asunder, tossing it to the floor, and going on with her story about the Frozen Sea Expedition! What a character!! And for real class, how about Laney Chouest, who showed up for his lecture on the Cajun Icebreaker with a three-foot-high ice-sculptured emperor penguin? Little did it matter that this piece de resistance finally had to be left on the sidewalks of Foggy Bottom. Imagine the astonishment this must have created from people staggering home to Georgetown after a late evening at their favorite watering hole!! One of my favorite Antarcticans, as well as one of my favorite persons, was old Mike Benkert, the deceased two-fisted Coast Guard admiral who played out his life with full gusto. The evening he spoke to us, you could smell his cigar leading him down the corridor long before you could hear his voice. No small feat! And everyone loves Charles Swithinbank. Whenever he talks, we have to remove walls to accommodate his following. Steve Ackley brought his very own environment, as Washington was encapsuled in a solid half-inch of glaze from a terrible ice storm when he spoke, and only a handful of fools and idiots showed up. What an evening!! We hope that the above listing of all Society lectures brings back many memories to you who have been privileged to hear them.

In closing, I think the Devil must get his due reward, because after nineteen years of the Society having just the good old boys give one lecture after another, after even exhausting speakers from Belgium, Argentina, England, New Zealand, and, get this, the Lufthansa, this soul had as his first speaker in his term as your president the first female speaker for our Society, Mary Alice McWhinnie! And one of our more brilliant speakers, Lee Kimball, I once self-annointed a non-existing title of Man of the Year. But I don't hide from the fact that Antarctica was really made for men, any more than I hide from the realization that women have made Antarctica a better place for all.

## CARLETON COLLEGE'S MEMORIAL BROCHURE ON LARRY GOULD.

Some twenty-odd years ago we approached Larry Gould about the possibility of The Antarctic Society establishing their own Hall of Fame. While the words were still hanging in the air, Larry shot back, "Forget it," and it came with such gusto that we realized there was no negotiating space to make him our First Hall of Famer. Carleton College got an equally profound rebuke when they approached Larry about naming a building for him on their campus.

A great many of us thought Larry was really immortal, but he finally succumbed last year. Carleton College then dedicated the Laurence M. Gould Library at their Memorial Service for Larry on October 13th! If Carleton College can do it postmortem, why can't we now make Larry Gould The Antarctic Society's First Hall of Famer?

Carleton published a beautiful brochure on Larry for their Memorial Service, and we contacted the College about obtaining copies for our Society. They were most cooperative, so each and every member is herein getting Carleton's great tribute to their beloved former president and professor who lives on eternally on their campus, alongside his beloved Peg.

The Society hopes for at least one more collaboration with Carleton College, that being a presentation on Larry at the dedication of the LAURENCE M. GOULD next year. Do you think there is any possibility that Larry could rise from the ashes and deliver an off-the-cuff talk about his real life? Do any of you have any connections with St. Peter so we might get an overnight pass for Larry? Many of us have addressed the Lord while on the ice, so now let's see if any of us has any clout.

The Society hopes that this brochure on Larry will be the format for annual pictorial essays on other distinguished OAEs.

*ANOTHER SOCIETY FIRST, A NOONTIME MEETING*

Sir Clements R. Markham and the *DISCOVERY*  
Antarctic Expedition

by

Dr. T. H. Baughman  
History Department  
Benedictine College  
Atchison, Kansas

on

*Thursday, March 14, 1996*

12 Noon

National Science Foundation  
4201 Wilson Blvd., Arlington

Room 310

(Access to room at Security Desk)

Dr. Baughman ("Bockman") is the author of a recent Antarctic book entitled "Before the Heroes Came: Antarctica in the 1890s." He is currently working on "Pilgrims on the Ice: The British National Antarctic Expedition, 1901-04."

His presentation will be on a past president of the Royal Geographical Society, Sir Clements R. Markham, who had much to do with shaping the nature of British Antarctic expeditions during the Heroic Age. Sir Clements' greatest accomplishment, however, probably was introducing the Cinchona tree, which brought relief from malaria to India.

The focal point of Sir Clements' presidency of RGS was launching a national Antarctic expedition. Unfortunately for Scott, Sir Clements' rule of polar travel - "No skis, no dogs" may have been Scott's undoing.

*Come and hear a noted historian talk about  
a controversial Antarctic figure!*

The calendar says it is 1996, the 40th anniversary of when some sixty-nine of us were selected and sent off to Antarctica for the beginning of the International Geophysical Year in 1957. During this year we will devote considerable space in these Newsletters to the people and events of the IGY in Antarctica. I feel somewhat qualified to write on those years, 1957 and 1958, as I was one of four (the others being the late Bert Crary, the still Antarctic-active Charlie Bentley, and the Wild Bull from the Pampa, Mario Giovinetto) to spend both years on the ice. Two of those who went down forty years ago, Bentley and John Behrendt, never packed up their mukluks and ice axes, and still visit the Seventh Continent as worthwhile, contributing scientists. Hopefully, they will have words of wisdom for you folks in ensuing Newsletters.

This Newsletter, as do all of our Newsletters by this impostor, will contain some truisms, some exaggerations, and a lot of tongue-in-cheek comments. It is up to each of you who want to take the time to read this stuff to separate the facts from the fictions. Our motto is first to make everything interesting, and then don't worry too much about upsetting the troops. After all, we are on earth for only a very short time, so let's enjoy it at all costs. We just can't let all of those politically-correct purists ruin everything.

**GEOGRAPHIC NAMES OF THE ANTARCTIC**, 2nd edition, 1995. (Government Printing Office, \$41.00). The United States Board on Geographic Names has come out with the first descriptive gazetteer of Antarctic Names since 1981. We all should have bought then, as that volume sold for only \$13.00. They have added a few hundred more names, and now it is selling for \$41.00, including packaging and shipping. It's a lot of money, although that won't even buy you a good seat for a Boston Bruins hockey game at the Fleet Center! (Send your orders to: Superintendent of Documents, Government Printing Office, Washington, DC 20402.)

David Bresnahan, in one of his more profound moments, told us about ten years ago that no real Antarcticans were in our Society. We denied that vehemently, saying that the true Antarcticans were solid members. Our rolls now show that we are 560 strong, and that exactly a third of our members are prominent enough to have had features in Antarctica named after them. And when you include Antarctic widows, such as Aviza Black, Mildred Crary, Teddy Daniels, Harriet Eklund, Kay Goldthwait, Helen Katsufraakis, Jane Wade, Ruth Wiener, Marilyn Zumberge, and many others, almost forty percent of our members' names show up in this volume.

We have many more members, who are prominent Antarcticans, who have never been honored. In alphabetical order, a precursory glance through the volume shows nothing for Peter Anderson, Paul Berkman, Charlie Bevilacqua, Rodger Brown, Dagmar Cronn, Gisela Dreschhoff, Gordon Fountain, Tom and Davida Kellogg, Karl Kuivinen, John McClintock, Polly Penhale, Al Raithel, Michele Raney, Si Roman, Chuck Stearns. Paul Streich, Ike Taylor, Thomas Taylor, Frank Todd, Peter Webb, Robert Wharton, and Bill Zinsmeister. Half a dozen of the above are members of the prestigious Explorers Club. Has there been an unconscious discrimination against women? It sure looks like it. And Zinsmeister? What does he have to do, change his soap or what? He certainly has made most major contributions to the discoveries of little and large critters roaming the Antarctic.

I think our Society probably is the society with the highest percent of its members

having nationally-approved geographic features named for them. When there are 12,710 approved names, it is almost easier to get something named for you than to be left out! But I know one guy who used to work for me, who is now a college professor at North Carolina State, who wintered over with the Kiwis at Vanda twenty-five years ago, who absolutely refused to let his name be proposed, as he felt it had political overtures if political claims in Antarctica ever were settled, and he did not want to be any part of that.

Members of our Society with geographical features named after them in Antarctica are listed below. The list also includes family members (F).

Abbot, J. Lloyd	Dale, Robert	Greene, Charles
Adams, Charles	Dalrymple, Paul	Guthridge, Guy

**ONLY ONE CONSTANT IN ANTARCTICA - CHARLIE BENTLEY.** As we approach the 40th Anniversary of the International Geophysical Year, it seems like every year has brought forth fascinating discoveries. Some changes immediately followed the IGY: the U.S. closed Little America V, pulled out of Hallett, and turned over Wilkes to the Aussies and Ellsworth to the Argentines.

From the hard core of sixty-nine scientists who went to Antarctica forty years ago this fall, only one has parlayed it all into an everlasting career, going back, and back, and back, some fifteen times altogether. And when he hasn't gone back, he has sent his proteges from the University of Wisconsin, and stayed at home working up Antarctic data. Forty years of Antarctic involvement, and he isn't even slowing down. He certainly is going to put in a half-century of Antarctic field research. He already must be a Million-Dollar Man in funding from NSF, although the bursar at the University gets ahold of most of it before it filters down to Marybelle.

But look at Charlie Bentley. He went to Antarctica as a slim youth. He is still slim, probably never will put on any weight. He must have had a high forehead when he was in his cradle, so having a high forehead now is nothing new. It certainly was there at Byrd in 1956. And he was quick to pick for a career an unsolvable problem, the mass budget of Antarctica. It was something which the residents of

1600 Pennsylvania could relate to, because, if all the ice in Antarctica should melt, there would go the rose garden and all those wonderful photo opportunities so necessary for the continued welfare of its residents. So all Charlie has to do is dust off the same old objectives, move his study site several hundred kilometers, and raise the funding figures to coincide with GNP figures. Yes, Charlie is Antarctica's only Constant.

Charlie is very clairvoyant about things which are not frozen. Back in 1959, he attended a post-IGY symposium of some sort in Argentina, and casually made a comment that he foresaw the day in the near future when women would be going to Antarctica as scientists. He was neither advocating it, nor opposing it - just made a comment that the New York Times picked up. I know that I almost had a heart attack when I first read it, because I thought that good old Charlie was advocating it. It seems that someone who could predict women would have no trouble predicting ice streams. Bentley is the U.S. answer to the Brit's Swithin-bank, although by the time Charlie B. retires to a rocking chair on Lake Mendota, he will eclipse all other icemen. But, will he have solved the rose garden dilemma? We doubt it, but go for it, Charlie!

**PHASING OUT OF NAVY BIGGEST CHANGE IN FORTY YEARS**, according to John Behrendt who should certainly know, as he was there when the IGY went to Antarctica, and he has been accumulating frequent-flyer miles to Antarctica ever since. The Navy was the only game in town during the IGY, and, supposedly, was there to support science and scientists. With the sole exception of Paul Siple, all the IGY crew went down by ship, even Larry Gould. No one moved unless the Navy moved them. Now if you are in the Navy, and in Antarctica, you are an endangered species, a short-timer. Within recent weeks, the last Naval helicopter flight sat down at McMurdo. Can you believe that?

If we may reflect on the IGY period, there was really no honeymoon between the Navy support and the civilian side of the camp. Actually it would make for a rather interesting story if someone wrote about their interrelationships. Probably the best way to get any support from the Navy was the Zumberge Approach, as he arrived at Little America V in October 1957 with a foot-locker full of special medicinal products which had certain rapid pharmaceutical affects when taken internally out of a tumbler, particularly effective among chiefs who had clout.

Whether right or wrong, this writer likes to feel that one of his men may have helped to speed the way for contract personnel working in the interior of Antarctica. The station leader at Plateau in 1968 was one of my hirelings, a hot-blooded soul from Mexico City who didn't endear himself to all, and the Navy certainly didn't take to him. And he accused the Navy of sabotaging our micrometeorological system every time it really got up and working well, and demanded a hearing at NSF when the year was over. Poor old Louie Quam was then wearing the top hat in the Office of Polar Programs, and he said that he never realized there was any problem in the Antarctic between the civilians and the Navy! The hearing lasted all day. I can recall that Jerry Huffman was there, and that Crevasse Smith walked in and out periodically. Somewhere in my garage I have a five-page summary of that hearing!

But back to that last helo flight, info was supplied by Guy Guthridge. "A ceremony at McMurdo's helicopter pad on Saturday, 3 February 1996 marked the U.S. Navy's last helicopter support mission in Antarctica, ending a half-century's tradition of naval rotary-wing aircraft support to antarctic science. The Navy had introduced helicopters to Antarctica during Operation Highjump 49 years ago and, in the following season of 1947-1948, built an entire mapping and reconnaissance mission - Operation Windmill - around two H03S-1 Sikorskys and one HTL-1 Bell.

"The end came as part of the Navy's planned withdrawal from antarctic research support. The National Science Foundation is evaluating bids from private firms to replace the Navy's helicopter role, and next season will usher in what everyone expects will be a seamless transition to the new operator. The change will save money because the type and number of helicopters can be altered to meet research needs and because the contractor will be on duty only during the summer season.

"Al Sutherland, NSF's onsite representative, wrote this in his weekly report: 'The most touching event was the ceremony commemorating the last VXE-6 helo flight. Of all the services, I believe that the Navy is best when it comes to tradition - and this was certainly no exception. There was a gathering to watch the last helo come in - not a staged flight, a real job, right to the end. Then a Here overflight.' He read messages from wellwishers, including one from Neal Sullivan, director of NSF's Office of Polar Programs, who had written, in part, 'I salute you as you commemorate today the Navy's conclusion of half a -century of helicopter support of antarctic science. Those of you assembled here are the standard bearers of that history. You own it, and you deserve to be proud of it. Some of VXE-6's best seasons of helicopter performance have been among its most recent ones. The societal and economic forces that have made necessary the transition now under way are not of your doing. On behalf of the National Science Foundation and the Nation, I thank you for your exemplary performance and extend best wishes to you all'."

**SEE YOU IN THE COURT ROOM, AND BRING YOUR BRASS KNUCKLES.** Art Ford's thirty-four-year old Antarctic Honeymoon came to a screeching halt recently when the U.S. Geological Survey cut off Antarctic research by such stalwarts as Art, and John Behrendt. But old Art, he's really only 62, is not going out the doors without a fight. Even though his job has been abolished and he is officially retired, he and thirty-five other victims have hired a lawyer and have filed a lawsuit against the U.S. Geological Survey. At-a-boy, Art! Give 'em hell, go for it!

In a letter to us of 27 October 1995, Art wrote, "Antarctica is not of interest anymore in the Survey's Geologic Division, so positions that mentioned Antarctica like John Behrendt's and mine were abolished. We've accordingly both taken retirement. The USGS has been totally reorganized and is no longer the world's premiere earth science research agency. It has been denigrated to merely another data-gathering bureaucracy.

"My thousands of Antarctic rock samples and other field and lab data, mainly from the Dufek intrusion, are not of USGS interest for storage and will likely be relegated to the dumpster. Tragic! As of now there is no U.S. depository for such data, but Ohio State U., at least, is trying to set up such a depository under proposed NSF support. It may be too late, though, for preservation of all my collections, as I've been ordered out of my office."

**THE ONE, TWO, THREE OF NED OSTENSO'S (RECENT RETIRED BUREAUCRAT).** I have had only one job all my life. That is trying to understand the Earth and how it works. Albeit I have been on a number of different payrolls throughout my career: University of Wisconsin, Army, Navy, Columbia University, Woods Hole Oceanographic Inst., Arctic Inst. of North America, and NOAA. Each of these have brought special opportunities and challenges. As all polar explorers worth their pemmican know, there is a time for hunkering down and a time for moving on. I am just moving on.

In my mind the polar regions occupy three stages in human inquiry. The first was discovery of the unknown. I was privileged to have been born at a time that enabled me to get in on the tail end of that epoch. However small my role, it was the thrill of my life. The second was overcoming the prejudice of Mercator projections that

dominated all the maps on our classroom walls. Slowly we learned that instead of being the "ends of the Earth" the polar regions are an integral part of the Earth system. Indeed, they often serve at once both as the barometer and the thermostat of global environmental variability. What happens there is of vital importance to the residents of Northfield, Minnesota; how they plant and what they wear. It is a source of enormous pride that so many of the laboratories and programs with which I have been associated for so long have been at the vanguard of this revolution in scientific understanding; from ozone holes to thermohaline circulation. The evolution on thought, like the evolution of species, is a long and continuing process, and credit for the origin of this second stage goes back to at least the pioneering planners of the First International Geophysical Year, or Polar Year as it was then called.

The third stage is less easy to define and will be more elusive to achieve. That is the integration of the polar regions into the culture (using the broadest definition of that word) of the world in addition to understanding their role in environmental dynamics. A salient example of this is the Antarctic Treaty, which set a new standard for geopolitical behavior. However, this is but a start. We cannot make a preserve of the Earth, even the polar regions. The survival of our species will necessarily involve best use of all global resources, be they as a source of material optimal repository for waste, or a place to live and work. This raises issues of enormous complexity that are emerging all about us. This quest is a worthy challenge and I look forward to being a continuing part of it.

**ANTARCTICA ONLINE (OPP, NSF).** Computer access to antarctic information is growing fast. If you can get on the Internet's World Wide Web, you can - with a few clicks of a mouse - find out today's noon position of Australia's antarctic icebreaker, the latest astronomy at South Pole Station, the availability of research samples at the National Ice Core Laboratory in Denver, Belgium's antarctic plans for the next five years, and lots more. National Science Foundation grantees have set up many of the Web home pages that are in the USA. NSF's own polar site (<http://www.nsf.gov:80/opp-/start.htm>) is modest yet, but it's a place to start because it has hyperlinks to some other antarctic sites. Or you can use Netscape's search tools to find what you need. There's a tourist's page or two, and at least two antarctic educational sites - one on the Scholastic Inc. home page (<http://www.scholastic.com/public/-Home-Page.html>) and one called Blue Ice at <http://www.necc.cin/blueice.html>.

**TERRAQUEST'S "VIRTUAL ANTARCTICA" A BIG HIT, NEARLY 800,000** (from press release "Terraquest" from Mountain Travel-Sobek, January 1, 1996 and ComputerWorld, January 8, 1996). Mountain Travel-Sobek reaped tons and tons of valuable publicity when they initiated a colorful, easy way to navigate Web Site, enabling Internet explorers to follow the research vessel LIVONIA's journey down the Antarctic Peninsula to Palmer Station. Author and photographer Jonathan Chester was co-producer of the site.

"Virtual Antarctica" was the first in the Terraquest series of online adventures to exotic locales around the world. The award-winning site featured a series of live satellite links with an actual cruise in Antarctica between December 10 and December 23, 1995. Nearly 800,000 hits to the site made it one of the most popular travel destinations on World Wide Web.

The Terraquest Antarctica event earned considerable mention in the national and international press, including the London Times, the New York Times, the Los Angeles Times, USA Today, both the San Francisco Chronicle and Examiner, and many more. In addition, it was featured in several on-line magazines,

including HotWired, Web Review, and the Conde Nast Traveller and People on-line publications. Many "Best of the Web" lists posted its URL - <http://www.terraquest.com> - as a "Cool Site of the Day," and Virtual Antarctica has already won a design excellence award, with more sure to follow.

During the actual Antarctic voyage of the R.V. LIVONIA, uplinks of digital photos, crew and passenger logbooks, wildlife sightings, and other information was fed directly to the Web site via the International Maritime Satellite system. Kodak Digital Services supplied the equipment for the Web-ready photographic uploads, and 7E Communications of Ascot, England handled the technically demanding communications.

(From ComputerWorld) Mountain Travel-Sobek in El Cerrito, California, and WorldTravel Partners in Atlanta god-fathered something fresh on the Internet. They sponsored an expedition of about 40 people who spent most of December in Antarctica cruising around cold waters in a specialized ship, photographing wildlife and scenery and going ashore in inflatable boats. The travelers relayed their picture and diary entries via communications satellites to an Internet service provider in Dallas, where they were immediately posted on the World Wide Web.

The technology to link to the Web is simple, said Christian Kallen, project director at Mountain Travel-Sobek. Traveling on shipboard were an Apple Computer, Inc. Power Macintosh 7500 with 1.6G bytes of disk storage connected to CD-ROM-burning equipment and digital cameras.

Most of the travelers wrote their diary entries on Power-Books supplied by the travel agencies, although some brought their own notebook computers. Pictures and text were uploaded through a mobile downlink connected to orbiting Inmarsat communications satellites, then relayed to a Web server . maintained by the Synapse Group in Dallas and posted to the Internet.

The travelers also hosted twice-daily live chat sessions on the Web. The sessions were relayed through the Inmarsat satellites.

The only real problem with the setup was obtaining a good line-of-sight transmission to the satellites, which was a hit-and-miss affair, said Kevin Twidle, a director at 7E Communications Ltd. in Ascot, England, which managed communications for the trip. Still, the travelers managed to update the site regularly, although they missed several chat sessions, Twidle said in a shipboard telephone interview from Antarctica.

**ONE NEARLY PERFECT SUBMARINE VOLCANO (OPP, NSF).** The age of exploration is not over yet. America's antarctic research icebreaker NATHANIEL B. PALMER has a new profiler called Seabeam 2112<sup>T\*</sup> that records not just the bottom beneath the ship, but a wide wath, churning out accurate topographic maps, in color, of the sea floor for immediate use onboard. Lawrence A. Lawyer of the University of Texas at Austin and Gary Klinkhammer of Oregon State took NATTIE B into Bransfield Strait in November 1995 looking for hydrothermal vent fields in a unique marginal basin setting. They found, among other things of scientific significance, "lineated pillow piles interspersed with one nearly perfect submarine volcano and one apparently dissected submarine volcano." The better preserved volcano is about 3 nautical miles across at its rim and stands 900 meters above the bottom, but still 600 meters beneath the ocean surface. The investigators write that "lineated seafloor pillow piles of these lengths are completely unknown in the world's oceans. Perhaps as more areas are surveyed they may turn out to be more common, but so far the central Bransfield Basin is unique.

Then, using a towed water chemistry and transmissivity monitoring sled, they found two hydrothermal vent fields whose sizes rival the largest geothermal field on the Mid-Atlantic Ridge. Turning again to the Seabeam mapper, they found a compressional ridge that is the equivalent of the San Bernadino Mountains of southern California.

**IMPLEMENTING LEGISLATION FOR THE ANTARCTIC ENVIRONMENTAL PROTOCOL** (Beth Marks). Both the House (Science Committee) and the Senate (Commerce, Science and Transportation Committee) have drafted bills to implement the Madrid Protocol. Although neither bill has a number or been officially referred to specific committees, there is some hope that a bill might be agreed and passed before the annual Antarctic Treaty Consultative meeting which begins April 29 in The Netherlands. Twenty nations have now ratified the Protocol, although only six have ratified with enabling legislation. All twenty-six Consultative Parties must ratify the Protocol for it to enter into force. Hopefully, U.S. ratification will provide the momentum for the remaining five nations to ratify.

**BOB RUTFORD BLINDSIDED BY GOPHER MEN'S SPORTS HALL OF FAME**, November 10, 1995. (By Dr. Ned Hedges) I am especially privileged to introduce Bob Rutford as a recipient of a Lifetime Achievement Award from the University of Minnesota "M" Club. Bob has had a distinguished academic career, as a teacher, innovative researcher, and imaginative administrator, eventually serving two institutions as Chief Executive Officer. He is a geologist of international renown, most prominent in the management of research and international policy formulation relative to polar programs both in Greenland and the Antarctic.

A native of Duluth, he grew up in St. Paul and came to the University of Minnesota in 1950 from Murray High School, where he was an all-city quarterback. I did not know Bob Rutford when he was an undergraduate, never saw him play, and have not been told about his athletic career—until tonight. And tonight I have heard on the one hand that every yard Paul Giel ever made was because Bob Rutford threw a block for him; and on the other hand I have heard that Rutford was most innovative in trying to catch a pass with the back of his helmet. But, even though I never saw him play, I have known him well for a good long time, and I'll bet I can tell you what he was like. He obviously was not big enough to play end for a Big Ten team, even in those days — but he did — lettering in both football and track. He would have played with discipline, and with dogged determination, pushing himself beyond any reasonable limitations, neglecting his own best interests in his willingness to risk all for the sake of the team. He has tackled the rest of his life in the same headlong way. Bob does tend literally to throw himself into his job — how else can you explain how he could suffer a broken jaw while simply giving a speech as the Chancellor of the University of Nebraska?

After graduating from Minnesota as a Distinguished Military Student with a commission in the U.S. Army, Bob served first at Ft. Eustis, Virginia (where he made the all-army football team in 1954), and then served a year in Greenland, marking the beginning of his career as a glaciologist ("glaciologist" is a fancy term for a grownup who likes to play in the ice and snow). He returned to Minnesota and coached the Minnesota Frosh in 1956 and 1957, while pursuing his graduate studies, and then coached football and track at Hamline University in 1958. Bob has spent a lifetime making decisions, but he will tell you himself that the best decisions he ever made were during this period of his life: first, when he persuaded Margie Johnson to marry him in 1954; and second, when he decided to forego a (frankly not very promising) career as a football coach and go to Antarctica in 1959 as a part of a research team. One result of these decisions is a marvelous family — which I am sure he will tell you about. Another result is a superb scholarly career.

After receiving both his master's and doctorate from Minnesota, Bob taught at the University of South Dakota, serving for three years as department chair. In 1972, Jim Zumberge brought him to the University of Nebraska as Director of RISP (the Ross Ice Shelf Project), and over the next three years Rutford developed the UNL office as the principal support unit for international polar research programs, particularly in Antarctica. In 1975, he went to Washington as Director of the Division of Polar Programs at the National Science Foundation, bringing new energy to Foggy Bottom, and eventually receiving the NSF's Distinguished Service Award. (I might add parenthetically that he brought enthusiasm to NSF in ways other than walking across all the secretaries' desks in his stocking feet – but he did that, too.)

Throughout his career as an academic administrator, he maintained his position as an international leader in polar research, and not only standing on the sidelines. In 1974, along with Chet Langway and John Rand, he personally took the first ice core from South Pole Station. For many years, he has been a representative to the Antarctic Treaty group. All in all, he has made the trip to Antarctica sixteen times, although I have it on good authority that the last couple of times he went only so he could wear his famous ankle-length bearskin coat and play on his very own glacier, the Rutford Ice Stream, a very large glacier in Antarctica named after him. He has received the Antarctic Service Medal, and most recently has received an honorary Doctor of Science degree from St. Petersburg State Technical University in Russia in honor of his achievements.

I know Bob Rutford best as a university administrator. He left NSF in Washington and became the first Vice Chancellor for Research at UNL in 1977, and was interim Chancellor at the University of Nebraska-Lincoln during 1980 and 1981. In 1982 he left for the University of Texas at Dallas, a very unusual university, where he served as President with imagination and distinction until 1994. In thirty-five years I have worked for and with hundreds of university administrators. On balance, Bob Rutford is simply the best of them all. He is direct, decisive, energetic, thorough, and highly disciplined. He engendered genuine research strength at both UNL, as Vice Chancellor for Research, and at UT-Dallas, where he virtually built an institution which for the first time takes advantage of, and provides leadership for, the immense technological environment of Dallas.

Strong loyalties develop around Bob Rutford, because for him loyalty works both ways. He is a winner, he has been a winner at everything he has ever set out to do.

It is especially appropriate, I think, for this group to recognize and honor Bob Rutford's lifetime achievement. His proven characteristics exemplify those values that lie at the heart of intercollegiate athletics: loyalty, courage, selflessness, imagination, unshakeable integrity – and just a touch of the foolhardy, and always, always, never forgetting to have "fun."

I am deeply honored to introduce Robert H. Rutford to you as a Lifetime Achievement Award winner.

**SNOWBALLS.** Dr. Hedges' introduction was just the way Rutford had dictated it to him the night before. We regret that space does not allow us to print Rutford's nine-page, single-spaced acceptance speech . . . . . We got some nice favorable responses to the Carleton College Memorial brochure on Larry Gould which we sent to all of our members. Imagine our surprise when Marjorie Cierlante of The National Archives wrote back and told us she was a freshman at Carleton the last year Larry was President of the college! She wrote how he insisted that sheepskin diplomas be real sheepskin. Also while he was President, he offered an annual prize of \$100 to the student who wrote the best essay on his/her own personal library. Quite a guy!

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 95-96

April

No. 6

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63

OUR 1996 PAUL C. DANIELS MEMORIAL LECTURE

-- Joint Dinner Meeting with the Polar Research Board --

SIX DECADES WITH THE PENGUINS

by

Dr. William J.L. Sladen

Professor Emeritus, Johns Hopkins University  
Director, Environmental Studies, Airlie Center, Virginia

on

Thursday evening, 9 May 1996

8 PM

Holiday Inn Georgetown  
2101 Wisconsin Avenue N.W.  
Washington, DC

\* \* \* \* Cash Bar - 6 PM ----- Dinner - 7 PM \* \* \* \*  
Cumberland Chicken - \$27 per person

To reach the Holiday Inn, go north on Wisconsin from Georgetown. After passing R Street, look for Whitehaven Street; just beyond Whitehaven turn right off Wisconsin into Holiday Inn parking lot.

*Please make checks payable to Antarctic Society, and mail them to Ruth Siple (address above) by 6 May. Thank you!!*

Bill Sladen's first penguin encounter was in 1948; his last one a few short months ago. He's been with the Brits, he's been with the Americans. He's been in the McMurdo area (Cape Crozier), in the Weddell Sea, in the South Orkneys, on the Antarctic Peninsula. A very close personal friend of the late Peter Scott, Bill is a world authority on waterfowls. Probably no one knows more about swans than he. So come and hear this multi-birded man speak about the flightless bird which more or less got Bill airborne. (Bill's resume is on pages 2-3.)

*Bill is also hosting a mid-winter picnic with a very interesting program at Airlie on Saturday, June 15th. For details, see page 10.*

## B R A S H    I C E

I am convinced that putting together these so-called Newsletters is not for the weak at heart. There are times, of course, when you know you are leaving your flanks exposed, and you readily accept return fire. But we recently took a direct hit when we were being good! Our first in eighteen years - not a bad record!

The Antarctic community gets decimated each month by the death of some Antarctic of note, and in recent months we lost one of the good old boys, plus two outstanding ones from the Now Generation. I had the privilege of meeting and getting to know John Dyer of the 1933-35 Byrd Antarctic Expedition. He was a distinguished, stately, classy gentleman of the first order, probably the first M.I.T. graduate to winter over on the ice. Walter Sullivan was an Antarctic Icon, and he probably wrote more good words on Antarctica than any other professional man of the key boards. I remember Larry Gould telling us, "There is no one I would rather sit down with and talk about my life in Antarctica than Walter Sullivan." What an endorsement! And Ed Zeller. We did not know him personally, but what a track record he established in Antarctica, covering close to forty years. And, like Dick Goldthwait, he literally died with his boots on, as the morning of his death he was out climbing with his beloved Gisela near Boulder.

**BILL SLADEN, OUR PAUL C. DANIELS MEMORIAL LECTURER FOR 1996.** Our first-ever Memorial Lecturer was Bill Sladen some thirty-two years ago. Bill not only refuses to die, he won't even stop going to Antarctica, so we keep hauling him out periodically as our Memorial Lecturer so the young folks can see and hear someone who went there nearly fifty years ago - he wintered over at Hope Bay in 1948. That was a really ill-fated year, as two men perished in a camp fire. This past austral summer a bunch of deep-pocketed tourists in search of the Emperors had an opportunity to be "iceolated" with Bill on some sea ice when bad weather set in and prevented the ship's helicopter getting back to their rescue for several days. It resulted in the longest non-stop Antarctic lecture ever given. Hopefully, this year's Memorial Lecture will be controlled, and we won't be exposed to an endless dialogue of all the penguins which Bill has studied in six decades.

William J.L. Sladen (Bill) is an acclaimed research scientist, explorer and one of the world's foremost experts on polar birds, especially penguins, swans and geese. He's also an amateur botanist, photographer and film maker.

Born and educated in UK, he received his medical degree (M.B.,B.S.) from London University during World War II. After a stint in plastic surgery under Sir Harold Gilles. he joined the Falkland Islands Dependencies Survey (now called British Antarctic Survey-BAS) in 1947, wintering over in Antarctica twice as medical officer, first at Hope Bay (1948-49), then at Signy Island, South Orkneys (1950-51). His Antarctic research on upper respiratory bacteria and the common cold in isolated communities earned him a second medical degree (M.D.) from London. His research on the Adelie penguin also earned him his doctorate (D.Phil.) in Zoology at Oxford.

A Rockefeller Foundation scholarship brought him to the USA in 1956 where he joined the faculty of Johns Hopkins School of Hygiene and Public Health, teaching ecology to graduates, and fledging a number of masters and doctorates. At this time he became deeply involved, pre-Antarctic Treaty, with the establishing of the post-IGY U.S. Antarctic Research Program's (USARP) biological and medical research, being a

•member of the National Academy of Sciences Panel on Biology and Medicine as well as the U.S. Representative for Biology on the Scientific Committee for Antarctic Research (SCAR). He became a U.S. citizen in 1962.

Professor Sladen's long-term ornithological research on penguins and albatrosses, some of which still continue, involving the banding of some 50,000 penguins and 60,000 albatrosses, were the first of its kind. His pioneering banding and radio-telemetry techniques for bird studies have taken him to far-flung places such as Antarctica, Lapland, Alaska, Iceland and even Siberia's Wrangel Island, where in 1957 he was the first westerner to be invited by the former USSR to study the Snow Geese which the USA and Russia share. The films he has made on penguins and other polar birds to illustrate his research have been shown on all major U.S. TV stations, the BBC and throughout the world.

Sladen's current research involves a ground-breaking and highly publicized project for imprinting new migration routes to geese using an Ultralight aircraft which could help in restoring rare or endangered waterfowl, such as the Trumpeter Swan and the Whooping Crane.

Bill's numerous awards include the M.B.E. from King George VI, the Polar Medal from Queen Elizabeth II, and the U.S. Antarctic Service Medal, all for services in Antarctica, and the highest award of the Explorers Club, the Explorers Medal. Mount Sladen in the South Orkneys is named after him.

**OUR NEW INCOMING PRESIDENT IS NONE OTHER THAN RON NAVEEN.** When we look for a Society president, there are several criteria we check for. It's no secret that the Society is Ruth Siple, who gives up two rooms in her home to the Society and does all the leg work. She answers nearly all of the mail, and without her the Society would be up a creek without a paddle. So we must have a person who will work with Ruth.

And we try to have "known" persons with names who were or are prominent in Antarctica. Ron covers the waterfront, as this founder and president of Oceanites, and lead author and photographer of Smithsonian's WILD ICE, is a strong environmentalist who bridges the sciences and tourism, one of the key issues confronting the Antarctic Treaty. He has spent thirteen seasons of field work in the Antarctic and Subantarctic. We sort of turned our cheek the other way when it came to Ron's background as a lawyer. It appears he has gone clean, although Bob Rutford said something to the effect that giving up law doesn't make him a virgin again. But we are willing to take the risk that Ron is a virgin, and that he will lead our Society with great aplomb and distinction for the next two years.

Ron has been Vice-chairman of the U.S. Section of the International Council for Bird Preservation, and formerly edited the Section's publication, U.S. Birdwatch. He is an accomplished naturalist, writer, and photographer. He was a major contributor of seabird species-accounts to the Audubon Society Master Guide to Birding (1983). His articles include: "Storm-Petrels of the World: A Preliminary Guide to Their Field Identification" (1982); "Seabirding" (1983); "Identifying Seabirds by Their Flight and Feeding Characters (1986); "Oakum Boys" (1986); "Dr. Murphy's Minions" (1986); and, "Birding Galapagos" (1988); and his photographs have appeared in Natural History, Mother's Nature, Islands, American Birds, The Living Bird Quarterly, and National Geographic World. Ron has served as the Editor of Birding, the journal of the American Birding Association. He is expert in the identification of seabirds, marine mammals, and sea turtles, and he lectures frequently about the conservation and identification of these animals.

Ron was a co-founder of International Student Research, an organization of educators

and naturalists that trained aspiring student scientists to work in various international and national locations, the goal being the protection and preservation of sensitive habitats and ecosystems. He has led natural history trips to the outer continental shelf of the north Atlantic Ocean, the Galapagos Islands, mainland Ecuador, Antarctica, South Georgia, the Falkland Islands, Kenya, and Madagascar.

Prior to the full-fledging of his present career, Ron spent four years as the U.S. government's marine mammal attorney in the National Oceanic and Atmospheric Administration. During this tenure, he played a role in the regulation of dolphin and porpoise mortality in the eastern tropical Pacific Ocean tuna fishery and the north Pacific Ocean salmon gillnet fishery, the international protection of whales and north Pacific fur seals, and the developing U.S. involvement in the Antarctic Living Marine Resources Convention.

**CHRIS ELFRING, NEW DIRECTOR OF POLAR RESEARCH BOARD.** Chris Elfring is Director of the National Research Council's Polar Research Board (PRB). Since joining the NRC/NAS in 1988, she served as a senior program officer and study director for the Water Science and Technology Board, and directed studies ranging from Flood Risk Management and the American River Basin: An Evaluation (1995) to Water Transfers in the West: Efficiency, Equity, and the Environment (1992). Other projects have focused on soil and water research priorities for developing countries, climate change and water management, irrigation, and science in the national parks. Since joining the PRB in late 1995, Ms. Elfring has been responsible for completing two important studies: The Arctic Aeromedical Laboratory's Thyroid Function Study: A Radiological Risk and Ethical Analysis and The Bering Sea Ecosystem.

Before coming to the NRC, Ms. Elfring was a policy analyst at Congress's Office of Technology Assessment, where she focused on natural resource management. She first came to Washington in 1979 as a AAAS Congressional Fellow from the University of Wisconsin-Madison. She has a long-standing interest in topics relevant to polar and northern climates, having worked on issues related to watershed management, sustainable development, public lands management, the environmental impacts of resource development, and alternative dispute resolution. In addition, in the spring of 1995 she was a resident fellow for The Island Institute in Sitka, Alaska, and enjoyed a unique opportunity to gain insights into Alaska's people, issues and current scientific needs.

**ED ZELLER, VETERAN ANTARCTIC RESEARCH SCIENTIST, DIES AT AGE 70.** Ed Zeller first went to Antarctica in 1958; his last trip there was in 1990-91, during which time he saw more of Antarctica than nearly all others. He spent summer field seasons there from 1958 to 1961, which was evidently followed by a fifteen-year hiatus doing other things. Returning to Antarctica with Gisela Dreschhoff in 1976, the two became annual returnees to the land of snow and ice and outcrops. For eleven summers they surveyed potential uranium deposit sites in Antarctica. The husband-wife team of Zeller and Dreschhoff became the best known husband and wife research team to ever work in Antarctica.

A cohort of Ed's at the University of Kansas, who also worked in the field with Ed in Antarctica, one Ernie Angino, said, "He was a garden hose of ideas, and had more ideas in five minutes than most people have in a year." Although trained as a geologist, Ed engaged in active research in both chemistry and physics. He was a pioneer in thermoluminescence and, later, in electron spin resonance, and he developed techniques now used throughout the scientific world. He was also involved in studies of disposal of radioactive waste, atmospheric pollution, sunspot cycles, climatic change on Earth and Mars, faulting in the mid-continental United States, and hydrogen production in Kansas and other areas. Somehow or other, in spite of all his interests,

he also was a giant in the classroom. Five of Ed's doctoral students now have faculty appointments in higher education, described as "a remarkable record."

Ed received his bachelor's degree in geology from the University of Illinois, his master's from Kansas University, and his doctorate from the University of Wisconsin. He joined the Kansas Geology Department staff in 1956, became professor of geology in 1963, and professor of physics and astronomy in 1969. In 1971, he became Director of the Kansas University's Radiation Physics Laboratory. He attained emeritus status in 1992, although he continued as Director of the Radiation Physics Lab.

We don't think you could really separate Ed Zeller from his wife Gisela Dreschhoff, so we asked her if she would write several paragraphs about their association, and she has kindly obliged.

My association with Ed Zeller as a research team meant the beginning of the most exciting time of my life. First, based on our basic research on the effects of particle radiation on interplanetary dust, we got deeply involved with the Apollo Program. In 1976 Ed could fulfill his dream of being able to go back to Antarctica and also introduce me to that beautiful, icy world. We conducted a radiometric survey for ten consecutive years which took us to many of the remote camps along the Transantarctic Mountains, the Ellsworth Mountains, Marie Byrd Land and even the Antarctic Peninsula by icebreaker.

However, our project took a turn and brought us back to the beginning of our research together, i.e. space physics and solar activity. By studying the chemistry of the snow layers and refining our method more and more, we were able to show the presence of a solar flare signal via anomalies in nitrate concentrations in ice cores from both polar regions. Because of this project we spent two more seasons in Antarctica (1988-89 and 1990-91), and two seasons in Greenland (Thule 1990 and GISP2 1992).

Many times during the last few years we discussed our research plans, and we both felt that we had another ten years ahead of us as a husband and wife research team. We felt that we had an ideal situation with our offices and house on the hillside next to a large wooded area. Many times we would walk to our lab and enjoy the wildlife - coyotes, deer and even a bobcat. This ended on our long-awaited ski trip in the Rockies. I am continuing the work, however, that we started together, as I know Ed would have done.

**JOHN NEWTON DYER, BAE II, DIES AT AGE 85.** If a person is known by the company he keeps, then the late Admiral Byrd had to be a great man, as never before in history had so many men been paid nothing and turned out to be such great successes in life. One of those was John Dyer, chief radio engineer on the 1933-35 expedition. This M.I.T. graduate, Class of '31, was a television engineer for the Columbia Broadcasting System. During World War II he led a group developing radar at the Radio Research Laboratory at Harvard University, and later served as director of the American-British Laboratory in Malvern, England. At the end of the war, he and others formed Airborne Instruments Laboratory in Garden City, Long Island, becoming its president in 1968.

John retired in 1973 to Center Sandwich, New Hampshire, where he continued his community involvement, while also perfecting his skills as an enameler through the New Hampshire League of Arts and Crafts. He brought his love of music and his business skills to the New Hampshire Music Festival, serving many years on its board. He also was an avid ham radio operator, and used to talk each week with the late Bud Waite, also BAE II. John wrote us in 1980 that "all Antarcticans should be ham operators."

**THE DEAN OF ANTARCTIC WRITERS, WALTER SULLIVAN, DEAD AT AGE 78.** The following are excerpts from the New York Times of March 20, 1996, with supplemental material provided by his widow Mary (Mrs. Walter S. Sullivan, Jr., 66 Indian Head Road, Riverside, CT 06878-2420). This gentleman, who, The Times wrote, "Chronicled science at its most daring," went to Antarctica seven times, and was known and loved by many Ant-arcticans, but probably none more so than our first Honorary President, the late Ambassador Paul C. Daniels. Walter liked to tell how he and the Ambassador would meet fairly regularly during the Antarctic Treaty discussions, and even with the aid of a tongue relaxer, could never get his fellow Yale alumnus to tell him anything about the ongoing discussions! Ironically, one of his last Antarctic articles was the obituary on his dear friend Larry Gould. They sort of left together, two giants, hand-in-hand.

Walter Sullivan, a science reporter and editor for The New York Times, whose articles took him from pole to pole and ranged from the seabed to the shifting continents, and from the nuclear to the cosmic, died March 19, 1996 at his home in Riverside, Connecticut. He was 78. The cause was pancreatic cancer, his family said.

In a career spanning half a century of prodigious scientific endeavor and discovery, Mr. Sullivan expanded the intellectual and geographic boundaries of science journalism. He set the pace for colleagues and competitors with inexhaustible energy, enthusiasm and a keen sense of what was important and interesting. He won nearly every prize offered in science journalism.

His reports stretched the minds of newspaper readers, as he told of the marvels of the restless earth and violent universe and the audacity of the people trying to understand them. He wrote swiftly, hurrying to be off on the next article, but the authority of his articles impressed scientists. On at least one occasion, physicists said they did not fully appreciate the significance of their discovery until they read about it in Mr. Sullivan's article the next day.

His bags always seemed to be packed, keeping him ready for the call of Antarctic expeditions, explorations of tunnels deep under Greenland's Arctic icecap, round-the-world experiments of the International Geophysical Year of 1957-58, rocket launchings at Cape Canaveral or the early searches for extraterrestrial intelligence.

Before turning to science, Mr. Sullivan was a foreign correspondent for The Times in China, Korea and Berlin. He became science news editor in 1962 and, in 1964, succeeded William L. Laurence as science editor. In that position, he worked fervently to expand the paper's science coverage and staff.

Mr. Sullivan held the title of science editor until his official retirement in 1987. He continued to go into the office and write occasional articles until the last two months of his life, and his commitment to science writing never flagged.

"The discovery that there is order and logic in the seeming randomness of nature can be a quasi-religious experience," Mr. Sullivan once said. "There is great beauty to be found there, and the successful teachers and writers are those who, having glimpsed it, are driven to share it with others."

Walter Seager Sullivan, Jr. was born on January 18, 1918, in New York City. His father was an insurance executive who had been advertising manager of The Times. His mother, Jeanet Loomis, was a pianist and composer from whom he inherited an enduring love of music. Even late in life, Mr. Sullivan would gather friends on weekends for a string quartet, taking his place with a cherished 18th-century cello.

As a young man, in fact, Mr. Sullivan had visions of becoming a music critic. After school at Groton, he majored in English history at Yale University and also studied music. Upon graduation in 1940, he joined The Times as a copy boy but had to shelve

his original aspirations with the outbreak of World War II.

As an officer in the Navy, Mr. Sullivan served on destroyers in the invasions of a dozen Japanese-held islands in the Pacific. One of his last articles, published last year in The New York Times Magazine, was an extract of the memoirs he was writing. He gave a stirring account of a pivotal sea battle he was in off Guadalcanal in 1942. At the end of the war, he was a lieutenant commander at the helm of the USS OVERTON.

Back at The Times, and perhaps too restless to settle into music criticism, Mr. Sullivan jumped at the chance to try science reporting with Operation Highjump, a Navy expedition to Antarctica under Rear Admiral Richard E. Byrd.

Though he had oscillated between the coverage of world politics and the world of science, Mr. Sullivan definitively shifted to science writing with his comprehensive reporting on the International Geophysical Year, which involved most of the world's nations in coordinated studies of Earth's interior, atmosphere and, as it turned out, the space above. The Soviet Union's most startling contribution to the effort was the launching of Sputnik on October 4, 1957.

On that evening, Mr. Sullivan was at the Soviet Embassy in Washington for a reception for international geophysical scientists. He was interrupted by a telephone call from The Times with the bare details about Sputnik. Mr. Sullivan took delight in returning to the reception and announcing the news to all gathered, the Russians included.

As Mr. Sullivan covered a greater range of science topics, he also became a prolific book writer. His most notable ones were "Quest for a Continent," about Antarctic exploration; "Assault on the Unknown," about the geophysical year; "We Are Not Alone," a best seller and prize-winning account of the search for extraterrestrial intelligence; "Continents in Motion;" "Black Holes: the Edge of Space, the End of Time," and "Landprints," a book about the geological history explaining American topography.

One of Mr. Sullivan's most coveted awards was the Public Service Medal of the National Academy of Sciences, which made him a nonvoting member of that body. The award had never before been presented to a journalist.

He visited Antarctica seven times, the last time as a lecturer in 1993. A 30-mile mountain chain there was named the Sullivan Range in his honor. Other honors included the Daly Medal of the American Geographical Society, the George Polk Award, the Distinguished Public Service Award of the National Science Foundation, and several writing prizes from the American Institute of Physics, the American Chemical Society, and the American Association for the Advancement of Science. The American Geophysical Union even named its science writing award in honor of Mr. Sullivan.

A memorial service will be held for Walter Sullivan on Tuesday, April 23, 1996, at the Century Association, 7 West 43rd Street, New York City (2½ blocks from Grand Central Station) at 2:45 PM.

**THE 90 DEGREE KID, THE ANCIENT MUSER, NORMAN VAUGHAN.** There's a lot in this Newsletter about Antarctica's Ancients and Honorables, three of whom have left us, but old Norman Vaughan, now 90, continues to set records which will probably never be equalled by anyone. Last fall a lithesome blonde bombshell, socialite, heiress to two American fortunes (Whitney and Vanderbilt), Queen of Saratoga Springs, called up Norman and said, "I want you to take me to the South Pole, and you can even bring along your bride." She had such a fantastic time — things must have changed an awful lot at the South Pole since 1958 — that when she got home, she ran up Norman again, and said, "Hey, buddy, that was some fun, so now take me to the North Pole." As you read this Newsletter, old Norman and Marylou Whitney are cavorting around the North Pole. They were scheduled to be flown by the same pilot, on the same plane, on April 21st, that took them to the South Pole on December 5th.

It's pretty hard when you live on the coast of Maine to really know what goes on in this world, and, especially, when you don't much care, but has anyone 90 or over ever been to both Poles? It could have been some well-heeled tourist; Ann Kershaw would have the answer. But one thing is certain, no one that age who once wintered over went to the South Pole when they were in their 90's. And I dare say that the span of eight decades from when Norman arrived at the Bay of Whales in December 1928 to when he was at the South Pole in December 1995 will probably never be broken.

Actually we can't imagine anyone but Norman who would want to keep going back. After all, when you reach 90, there must be a thousand and one things of higher priority to do before you die than to go back to Antarctica. Norman, have you ever thought about one of those tropical beaches with Scandinavian beauties lying all over the place in various modes of dress and undress?

lim Coffey, the South Pole Station leader when Norman was there, gave old Norman the flag that was flying over the station when he was there. Some time this year he will be one of multi-thousands to carry the Olympic torch from Los Angeles to Atlanta. Norman, as most of you know, participated in the Lake Placid Winter Olympics of 1932 as a sledge dog driver - it was a demonstration sport. Norman joined the Explorers Club in 1931, which makes him one of their oldest members in terms of active years.

If you want to read about Marylou Whitney, you should have no trouble finding information about her. According to one magazine article that we read, "she has at least five press agents on the payroll" and "loves cameras and adores interviews." She is reportedly 69, but a very well-preserved 69. According to Norman, she hosted the Iditarod pre-race banquet, the likes of which had never before been seen in Anchorage. So maybe the cold regions have a benefactor of sorts in Marylou.

For those of you who want to vent your ire about the sexist overtones in this article, go ahead and waste your 32 cents on a stamp. The address is P.O. Box 325, Port Clyde, ME 04855. They will help ignite early morning fires in the Vermont Casting, taking the chill off the place.

**LCDR JIM WALDRON TOUCHES DOWN ON INTERNET.** Jim Waldron was the CO of the VX-6 group at Little America V in 1957, and now lives at 12,617 Meghans Bay Court in Richmond, VA 23233-3344 (Tel. 804-364-0118). Jim was sort of a low-key, quiet, don't-rock-the-boat type of a guy, as we recall. All the noise was made by a cigar-chomping, swashbuckling pilot by the name of Harvey Speed, now deceased. Anyway, we just heard from old Jim, and thought you might be interested in his letter, so here it is.

Dear Fellow Antarcticans:

Perhaps you don't remember me, but I remember you from our tour of the Antarctic. It was a most adventurous time in my life and I presume it was in yours. Time glides by and later events take over, and we lose memory of what took place when we were called on to support the International Geophysical Year.

A couple of years ago I started to write a book about my flying experiences on the Antarctic ice. I should have started the book earlier than I did because trying to remember facts from out of the distant past is not so easy. Fortunately, I had flight logs, letters, news articles and other writings to jog my memory. When I finished writing the book I considered getting it published by commercial printers, but as always neophyte writers don't stand much of a chance on first book submissions. I tried two companies, and while they were kind in their comments, it was obvious that flying history was not a high priority on their lists.

I discovered a group on the Internet called the Antarctic Centre for Research and Studies, and when I proposed giving them my book for publishing on the World

Wide Web, they were very interested. And so the book is now being loaded onto the WWW Internet, and it is available to anyone interested at no cost. You can call up the book, read it and erase it, or you can call it up and print it out for later reading. The book has 31 chapters, and it covers my flying experiences out of Little America V and NAF McMurdo Sound. I don't cover a lot of personalities, but I do cover what it was like flying over the continent, seeing the vast iciness, marveling over the glaciers, and musing over the many long, lonely hours in the air.

Should you be interested in reading my book, you may call it up on the Internet by the following WWW address: <http://icair.iac.org.nz/history/flight/index.html>

I hope this letter finds you healthy and happy. If you wish to write to me on the Internet, my address is: [JWaldron@aol.com](mailto:JWaldron@aol.com)

Best wishes, Jim Waldron

**CHRIS JOYNER IS A HAPPY CAMPER AT GEORGETOWN** (letter of 18 February 1996). It has been a very productive academic year. In January 1995 I moved from GWU to Georgetown University, which for me was a great promotion in self-fulfillment and psychological gratification, as well as in getting greater recognition and some extra financial benefits. I now have a real campus, with a government department that really appreciates my research on international law, Antarctica and the law of the sea. At any rate. I have managed to finish two long-standing books on Antarctica this year (one on the legal and environmental implications of Antarctica as a global commons, and the other on U.S. foreign policy interests and activities in the Antarctic). And there have been several journal articles as well, dealing with a variety of issues from U.S. policy and the law of the sea, to Islam, democracy and U.S. foreign policy, to several pieces on the United Nations. And lots of academic conference trips around the U.S., as well as to Australia, Norway, Canada and Germany. So it has been a busy time.

**THE WILL AND THE WAY OF JOHN RIDDOCH RYMILL** (John Bechervaise - Compiler & Editor). (Published by Bluntisham Books, Bluntisham, U.K. 1995. H14.00 postpaid surface mail from the publisher. Air mail is extra.) (Book review by our Canadian Antarctic book authority, John Millard.) This is a very welcome addition to Arctic & Antarctic biography, the life and times of a dedicated polar explorer, John R. Rymill, 1905-1968, an Australian who at a very young age became interested in the polar regions. He deliberately set out to educate and train himself as a polar explorer.

He took courses in anthropology, ethnology, navigation, etc. at the Royal Geographical Society, and acquired a private pilot's license. He was already a very accomplished skier. He received his first practical polar experience with the British Arctic Air Route Expedition, 1930-31 (BARRE), in Greenland, under the leadership of Gino (G.H.) Watkins. On the 2nd Arctic expedition, 1932-33, he became leader after the death, by drowning, of Gino Watkins.

Next, the highlight of his polar career and a dream of Watkins, an expedition to Antarctica, The British Graham Land Expedition, 1934-37 (BGLE). This expedition explored the little known area along the west coast of what is now called the Antarctic Peninsula. It was a very successful expedition on a very small budget, and laid the foundation for the future exploration in this area. John Rymill wrote the expedition narrative "Southern Lights," which was published by Chatto & Windus in 1939. It garnered a fair number of favorable reviews, but it was not a runaway best seller.

After paying off the debts of the expedition and finishing the expedition narrative, his life took a completely new turn. The estate in South Australia which had sup-

ported him, his brother Robert, and his mother Mary Edith, for many years, needed some personal attention.

So he became a pastorlist - a sheep farmer, bringing to it the same enthusiasm and determination that he used in his exploration. He also got married, to Dr. Eleanor Francis; they had two boys. He worked hard to improve the station pasturage and eventually turned to cattle, rather than sheep. He established a very successful international seed company. He was also a very enthusiastic horseman, and became well-known in Australian equestrian circles. He died on the 7th of September, 1968, as the result of injuries received in an auto mishap, without regaining consciousness.

Dr. John Bechervaise, the compiler & Editor, is to be commended for this outstanding biography of a little known polar explorer, pastorlist, husband, father and enthusiastic horseman. It must have been difficult as John Rymill did not leave a written record of his accomplishments; he enjoyed the doing, rather than the telling.

The book is bound in a substantial and attractive soft cover, with 25 photographic illustrations and 4 maps. There are some footnotes, but they are not intrusive and they can be easily ignored. There is a bibliography for those who wish to do some further reading, and a helpful index.

**MORE ON GEOGRAPHIC NAMES OF THE ANTARCTIC.** As we indicated in our last Newsletter, our listing of Society members who have geographic features named for them, or members of their family, was thrown together after a cursory glance through the publication. We knew that Rodger (LA V, "58) Brown had a Mount Rodger named after him, but in our haste just left him off our list. People like Rodger, and Ron Taylor, and Peter Anderson, with popular last names, often find their feature has their first name.

And we left out both Frank M. Boyd and Margaret Sides, whose father, Vernon "Buck" Boyd, was Byrd's master mechanic on BAE II. Boyd Glacier is located in the Ford Ranges in Marie Byrd Land.

It should have been pointed out that the gazetteer revision represents a joint effort by three Federal agencies - the U.S. Geological Survey, the Defense Mapping Agency, and the National Science Foundation. The USGS funded research by Fred Alberts and supplied production coordination by the Advisory Committee on Antarctic Names' secretary, Jon C. Campbell. NSF directed the printing of the publication, and DMA provided the funding. Official copies are being distributed "to U.S. Antarctic stations and ships, principal investigators of the U.S. Antarctic Program, and a number of institutional libraries around the world." The Government Printing Office (202-512-1800, fax 512-2250) will be happy to send all others as many copies as they desire, as long as each order is accompanied by a \$41.00 payment per copy.

**MID-WINTER PICNIC AT AIRLIE ON SATURDAY, 15 JUNE.** Bill Sladen is inviting the Antarctic Society to join the Explorers Club-Washington Group and the Society of Woman Geographers to gather at Airlie House at 10:45 AM for an all-purpose environmental day featuring swans and Bill. Coffee will be on the house, but you have to bring your own brown bag lunch, and Bill suggests we wear/bring "outdoor clothing." At 11:15 - 12 noon, Bill will have a sneak preview of the upcoming Hollywood production, FLYING WILD - a fictional account of Bill Lishman's and Bill's famed Canada goose/Ultralight migration study. At 12 noon, a 5-minute walk to Airlie Reservoir to see the flock of 25 swans. At 12:45 - 1:30, the brown bag picnic lunch in Airlie Pavilion. If the weather is inclement, we'll use the reserved room in Airlie House. At 1:45, in as few cars as possible, a 5-minute drive to Clifton Farm (Bill & Jocelyn's home). Best way to get to Airlie - take Route 66 west to Exit 43A-Gainesville onto Route 29, south 9 1/2 miles to Rt. 605 (sign for Airlie), turn right. (40-45 minutes from Washington]

*SOCIETY GETS A BLOOD TRANSFUSION*

*COOL WOMAN (52 MONTHS ON ICE IN LAST 8 YEARS)  
JOINS STAFF*

KRISTIN LARSON

Environmental Compliance Section  
Office of Polar Programs  
National Science Foundation  
4201 Wilson Boulevard  
Arlington, Virginia 22230

E-mail [klarson@gwis2.circ.gwu.edu](mailto:klarson@gwis2.circ.gwu.edu)

Kristin will be writing *PENGUIN PRATTLE* in our Newsletters. Although there is no "clear cutting," Kristin will essentially tell us what her sensitive ear drums pick up in the corridors of the Office of Polar Programs, and PCD will continue taradiddling on the Ancients and Honorables.

Neelon Crawford returns to the hallowed halls of the National Academy of Sciences for the second time in two years with "Antarctic Palette," an exhibition of large color photographs of Antarctica, 28 September 1996 through 15 December. In the last seven years, Neelon has made five trips to the Antarctic, as well as one trip to the Arctic. His exhibited photographs, seventeen in number, vary in size from 21.5" x 25" to three 30" x 50". Needless to say, all photographs are for sale, ranging from \$1800 to \$3500. One winter-over McMurdoite ordered one by E-mail for his stateside charmer. So bring your checkbook and walk out with a beauty!

Two of the world's premier Antarctic lecturers, Society members John Spletstoeser and Frank Todd, will be doing their thing on the first ever circumnavigation of Antarctica by a cruise ship this austral summer. The KAPITAN KHLEBNIKOV will sail from Stanley in the Falkland Islands on 24 November 1996, and return some 65 days later, 27 January 1997. Some sixty deep-pocketed adventurers are paying anywhere from \$29,900 (triple occupancy) to \$55,000 to hear John and Frank. They had better be great!

1997 ANTARCTIC CALENDARS (New Zealand's Hedgehog Fantastic) now on sale here! Send \$11.00 each to Ruth at the address above. Best Possible calendar buy!

Here we go again, the nineteenth year that Ruth Siple and yours truly have been involved putting out these so-called Newsletters, but this year we are introducing new blood into our production. One of our ex-presidents told us about this woman in the Office of Polar Programs who was a human Antarctic dynamo, and we propositioned her immediately. And she said, "Why not?" So a large segment of each Newsletter this year will include the words of Kristin Larson. We hope that Kristin will add a stronger current flair to the Newsletters. Both Ruth and I welcome her aboard with open arms, and look forward to working with her. Later in the Newsletter, she will tell those of you who have not had the pleasure of meeting her just who she is, and all about her Antarctic connections.

Even though Kristin is joining our staff, she will not influence our style of writing, or vice versa. We still will strive to get people to read these things, and we certainly don't intend to let the truth get in the way of an otherwise interesting story. It will be up to you to determine if anything herein is valid. So basically we are in business as before, with rays of hope for you who want something current.

This year marks the 40th anniversary of the IGY scientists who went to Antarctica in the fall and early winter of 1956. With many of the IGY Antarctic countries experiencing financial questioning, including the United States, the past forty years may well have been the Golden Years of Antarctic Science, never to be equalled again. However, maybe Roberta Score's pickup back in 1984 bought some more time for the United States. Let's hope so. Global warming and the ozone hole need new running mates up on Capitol Hill, so when in trouble hook onto any passing meteorite from Mars!

**AND THEN THERE WAS ONE.** Howard F. Mason died on June 26th of this past summer, and with his passing, the only living survivor of the First Byrd Antarctic Expedition of 1928-30 is the indestructible Norman Vaughan of Trapper Creek, Alaska, who has no immediate, or even future, plans for packing it in.

Howard Mason was a very quiet and subdued man, whose actions spoke much louder than his words. Insofar as we know, he is the only man who went north with Wilkins and south with Byrd. He was a radio operator, and was one of the very few who got any remuneration for his services, being paid by the New York Times. He told us that when he got home, he had this check, and didn't know in which bank in San Francisco to deposit it. So he walked around town, looking for the bank with the most imposing pillars, and when he found it, deposited the whole check therein. He slept soundly that night, but it was to be his last good night of restful sleep, as that bank went belly-up the next day.

Howard built his own home with his own hands in Seattle, and actually died in that house. Howard was married more than fifty years to his beloved Genevieve, and they were a very devoted and loving couple. Genevieve is a lively soul, and reports that she is in good health, counts her blessings, and drives "anywhere I want to, or need to." Howard was 94, but we won't tell you how old Genevieve is. Ruth and I had the pleasure of visiting in their home in Seattle in 1986, and it was a most enjoyable day. We will stay in touch.

**BON VIVANT OF THE SOCIETY, HARRIET EKLUND, SUCCUMBS.** We were remiss in not doing an obituary on Harriet Eklund who passed away on March 19, 1996 after a long illness. She and her late husband, Carl R. Eklund, were the genial host and hostess who germinated and gave birth to the Antarctic Society in the basement of their Washington home back in 1959. Both were always ready for a good party, so this Society got off to a rousing start. An elephant hoof was the receptacle for donations to help pay for the fare of the day, which, with people like Ambassador Paul Daniels, Bert Crary, Harry Dater and others, leaned heavily towards the liquid side.

Harriet was born in Brooklyn in 1910, the daughter of Eduardo and May Donaldson San Giovanni. She was a physical education teacher, and taught in many parts of the United States, as well as in Santiago, Chile and Malawi, East Africa.

HARRIET EKLUND - A MEMOIR (Mort Rubin). How does one remember Harriet Eklund? Generous? - hospitable? - energetic? - excitable? - attractive? - ebullient? - interesting? - warm and responsive? Yes, all of that and much more. Her life had many facets, much of it associated with Carl Eklund, but a lot more as her own personality was not one to be subsumed by someone even as engaging and energetic as Carl.

She was the daughter of a college professor, a former Roman Catholic priest. She and Carl met at a summer school at the University of Wisconsin in Madison, where she was in the physical education program. They carried on unusual activities together, such as collecting wild rice in the northern lakes in Minnesota. She was with Carl during his various assignments with the Fish and Wildlife Service. When Carl was in the Antarctic at Wilkes Station during the IGY, she and their daughters, Linda and Signe, spent some of that time in Santiago, Chile "to be closer to Carl." There she met Tessa Chau, a young Taiwanese woman, who later came to Washington and looked on Harriet as her surrogate mother, and was considered a member of Harriet's family over the years.

No one who has ever been associated with Harriet, even casually, was impervious to her charms. Harriet was unofficially the 'First Lady' of the Antarctic Society, and the elegant Eklund home on Tulip Hill Terrace in Bethesda was the venue for the founding of the Antarctic Society in 1959, with Carl, as one of the original members, becoming its first president. For years it was a gathering place for many reunions of 'Old Antarcticans', where the elephant's foot had a place of prominence, and seal burgers were on the menu. All were assured of a warm welcome. That tradition continued after Carl's death in 1962, when Harriet moved to an apartment in Bethesda.

In later years she lived close to her daughter, Signe, and Signe's husband, Chris, in England (where Rosa and I visited her in 1981, in Forest Row, Sussex), in Birmingham, Michigan, and in Spring Valley, New York.

After her stroke she lived in a nursing home in Monsey, New York, where she died after a long debilitating illness. However, in telephone conversations with her, while she was not particularly happy, her wry sense of humor was still evident. She was a person who radiated warmth and personality, and her memory will long be cherished.

**AN ANTARCTICAN SPAWNED THE IGY.** There is hardly a soul alive in this country worth tiis/her mettle who doesn't know that the IGY was an outgrowth of a remark made by an Antarctic, Lloyd Vilh Berkner, at a social gathering at the home of James A. Van Allen in Silver Spring, Maryland on April 5, 1950. Lloyd was a former radio engineer on the First Byrd Antarctic Expedition, serving on the CITY OF NEW YORK. This six-foot, two-and-a-half-inch man, made a suggestion at the party that it was time for another polar year, and it was met with such enthusiasm that it was decided that

Lloyd and Sydney Chapman should present such a plan at the meeting of the Mixed Commission on the Ionosphere at Brussels in three months' time. And so it all began in Silver Spring unless . . . .

You want to say that the true Father of the IGY was an Austrian naval lieutenant by the name of Karl Weyprecht who, in 1875, presented a paper at the German Scientific and Medical Association meeting in Graz which set in motion the First Polar Year. It began in August 1882; the only stations even remotely close to Antarctica were the French station at Cape Horn and the German station on South Georgia. Twenty or more volumes were published about that Polar Year.

A second Polar Year was conceived by a German explorer and meteorologist, Johannes Georgi, and proposed on November 23, 1927. It was to follow the 50th anniversary of the First Polar Year, but was to be carried out "for the earth as a whole," with emphasis on the polar regions. The year was to run from August 1, 1932 through the end of August 1933. Forty-nine nations pledged to take part, and twenty-two sent out expeditions. Thirty magnetic stations were established north of the 60th parallel.

In October 1952, Sydney Chapman proposed at the Amsterdam meeting of ICSU (International Council of Scientific Unions) that the third Polar Year be changed to the International Geophysical Year (IGY), and it was so carried by its General Assembly. The aforementioned Antarctic of old, Lloyd Berkner, was named Vice-president of the Special Committee for the IGY. The Rome conference in late September 1954 set in motion efforts to study both Antarctica and outer space. And the United States agreed to operate scientific stations at the Geographical South Pole, one on the Ross Ice Shelf near where Byrd had quartered, and one at 80 degrees south in Marie Byrd Land. Stations were later added on the Knox Coast and on the shelf ice bordering the Weddell Sea. And the rest is all history.

**40TH ANNIVERSARY OF THE START OF THE ANTARCTIC IGY.** Although the paper date for the official beginning of the International Geophysical Year was 1 July 1957, it was necessary to have the Antarctic scientific personnel in place during the preceding austral summer, so forty years ago this summer people were being selected for slots at Amundsen-Scott, Little America V, Byrd, Ellsworth, Wilkes, and Hallett. There were no official IGY programs at McMurdo.

We like to feel that the beginning occurred at the National Academy of Sciences on Constitution Avenue at an evening meeting in late April 1956. It was a gathering of everyone who was anybody in Antarctica prior to the IGY, and the keynote speaker was Admiral Richard E. Byrd, who was quite frail and beginning to show the effects of an illness which was to strike him down a year later. He was followed on the podium by Admiral George Defect. On the stage at the time was something covered by heavy wrapping paper. As the new Antarctic admiral assumed the stage, he had a lackey jerk the wrapping paper off this object with great fanfare, and the uncouth admiral bellowed out, "That was to wake up all of you people." That was really the opening of the Antarctic IGY, the exit of Byrd and his supporters, and the ascension to the throne of Defect. What was under the wrapping paper? Bill Breismeister's brand new 1:5,000,000 map of Antarctica published by the American Geographical Society.

Seventy individuals were selected/chosen/picked up or whatever, for the first year of the Antarctic IGY. A good book could be written about the seventy. You could write a whole chapter on the ballistic, arrogant German, Peter Schoeck, who asked Larry Gould for "the toughest assignment in Antarctica." Another chapter could be written on the Bull of the Pampas, Mario Giovinetto, who left his mark at the South Pole in the form of a hole in the wall which got in the way of his fist. And how about Harry Wexler's hand-picked leader for Weather Central, Bill Moreland, who never walked outside the camp during the four months without sun. His reply to why he

wasn't going outside for flag-raising ceremonies when the sun returned was "Why should I? I never took it down!" Bill Cromie, who had no particular qualifications for going to the ice, was there only because he had met Bill Field in New York City and convinced him that he merited a chance. Moose Remington was there mostly because his father was a military officer who personally knew President Dwight Eisenhower. The Norwegian Olav Loken was found on a ship in Baltimore harbor, and was brought into this country for his Antarctic assignment through Canada! I was there by default, as MIT taught, on a one-time-only basis a summer course on micrometeorological instrumentation, and I took that course, even though I tried to drop it the afternoon after the first class. It made me eminently qualified when no one else applied for the Antarctic job some six years later. But I was highly qualified compared to the glaciologists they finally picked up. They did have one very strong candidate, but he couldn't convince the head shrinks on his sexuality, so never got to the ice.

A ticket to Antarctica was no guarantee of success. Detailed camp plans (prepared months ahead) were often just exercises in futility. An unexpected located radio antenna farm at Little America V drove me to the South Pole the following year. My program was actually two-pronged, being a sister program to one being established in the high Arctic on a glacier in the Brooks Range. But my counterpart, a professor from the University of Washington, committed suicide at the camp site, so that comparison study went out the window.

The true story of the Antarctic IGY will never be known, as it involved six different camps, six entirely different camps, led by six very distinct individuals. Siple wrote about the South Pole, Ronne about Ellsworth, Dewart about Wilkes, Chappell about Little America V. But they are pretty well sanitized. John Behrendt is coming out soon with a book about Ellsworth which should be a dandy. And as soon as Mildred Crary gets through dotting the i's and crossing the t's, Bert Crary's long-awaited book on his illustrious career in both the Arctic and the Antarctic will be published by The Ohio State University Press. This should be the most definitive of all books on the Antarctic IGY, as it comes straight from the horse's mouth, and if it is Vintage Bert, it will be great.

The summer of 1956 will probably never be forgotten by those of us who had to visit Washington periodically. Young college candidates beat a steady path to Bert Crary's office where a West Virginian beauty by the name of Yum Yum worked. The story goes that when she came there to be interviewed for a job, an incumbent by the name of Alison Wilson said, "Well, you aren't going to hire her, are you?" And Bert replied, "Hell, yes, she can type 15 words per minute." Besides Yum Yum, visitors included the world's famous. I can distinctly remember the thrill of meeting and standing aside of Maurice Herzog, and we walked in history with the likes of Paul-Emile Victor.

We all rendezvoused as a group at Davisville, Rhode Island, in mid-October 1956. That was the one and only time we were all together, although Paul Siple wasn't among us, as he was already on his way to Antarctica. But there were some heavyweights, as the overall chairman of the United States National Committee for the International Geophysical Year, Dr. Joseph Kaplan, was there. Ditto for the first man to ever fly in Antarctica, Sir Hubert Wilkins. Davisville is not exactly the Fun Capital of the World, but there was one watering hole in Kingston which was a salvation. There was a large amount of mystique associated with it all, as the only station awaiting us was Little America V. Ellsworth and Wilkes were not even pinpointed until icebreakers found havens in January. Station leaders for some stations were still up for grabs. The sessions ended under a cloud of gloom, as we heard that four had been killed in a plane crash at McMurdo. The runway ended up with large holes, and it was touch-and-go up until the end of January 1957 whether the Amundsen-Scott station could even be established before winter set in. An Austrian glaciologist, Andy Assur, was brought in to solve the holy problem, and we all lived happily or sadly evermore.

The IGY selectees for the first year were a somewhat older group than was to go in subsequent years, as the first crew consisted of a lot of people who had been standing in the wings for years just waiting for an opportunity to go to Antarctica. Sort of a motley crew, but not exactly nun-like personnel on earlier expeditions. The oldest was probably Carl Wyman, a retired Marine colonel whose family had grown up and left the hearth, leaving him with nothing to do . . . . . The youngest was Dick Chappell, a young Boy Scout from near Buffalo, who went on to become one of the most distinguished scientists ever to go to Antarctica . . . . . There were many from foreign countries: Herfried Hoinkes from Austria, Peter Schoeck from Germany, Hans Bengaard from Denmark, Vladimir Rastorguev from the USSR, Jose Alvarez and Mario Giovinetto from Argentina, and Olav Loken from Norway . . . . . There was only one black among us, Bob Johns, probably the first black American to winter over in Antarctica. And, unfortunately, he was also the first one of us to die, because upon his return to CONUS, the Weather Bureau conscripted him to go north to a floating ice island station, where he contracted pneumonia and died within days of arrival there early in January 1958 . . . . Another one of us, one of our more promising superstars, Ed Thiel, died in Antarctica in November 1961, burning to death in a fire which erupted when a plane crashed on takeoff from Wilkes . . . . . Only one of us had to be evacuated, the German, Peter Schoeck, fell into a crevasse and suffered multiple injuries, including broken ribs, and had to be air-evacuated back to New Zealand . . . . . Four of us were to stay in the Antarctic for the following year - Bert Crary, Charlie Bentley, Mario Giovinetto, and myself, and thus was coined the phrase "two-time losers." Many of the seventy were to return to Antarctica, but only one, Charlie Bentley, has remained active on the ice in each of the following decades . . . . . John Behrendt has gone on to be an Antarctic powerhouse, and is one of this country's foremost authorities on Antarctica . . . . Some fled to the Arctic, like Fred Milan, who became the U.S. head of studies on Circumpolar People.

One of my roommates, Bruce Lieske, even became a man of the cloth, although I vehemently deny I drove him to such an extreme. George Toney became a lawyer; Ned Ostensco became a high ranking bureaucrat in Washington; Ralph Glasgal became president and head of a large communication company. On the unlikely side, Bill Cromie became the executive secretary of the Scientific Writers of America, and was ghost writer for a lot of the astronauts; Rudi Honkala got fouled up with a politician in Montana, and followed him to Capitol Hill.

A lot of PhDs came out of the Class of 57, and a lot, a whole lot, became college professors - to mention a few: Nolan Aughenbaugh, Hugh Bennett, Charlie Bentley, Dick Berkley, Dick Cameron, Dick Chappell, Gil Dewart, Mario Giovinetto, Herfried Hoinkes, Arlo Landolt, Fred Milan, Jim Shear and Ron Taylor. Quite a few are now deceased: Dick Berkley, Bert Crary, Carl Eklund, Gerry Fierle, Ben Harlin, Gene Harter, Norman Helfert, Herfried Hoinkes, Bob Johns, Fred Milan, Finn Ronne, Jim Shear, Paul Siple, Ed Thiel, and Carl Wyman. Mind you, any listing herein is incomplete, as we can't keep track of everyone, and we are reporting only those whom we are sure of. If any of you have additions to any list, please send them to the Nerve Center.

George Toney is the only 1957 U.S. Antarctic station leader still alive; he shook off his polar reins for the comforts of court houses. The premature death of our Antarctic IGY leaders is really appalling. The Chief Scientist, Harry Wexler, died at age 51; Carl Eklund, Station Scientific Leader at Wilkes died at age 53; Paul Siple, Station Scientific Leader at Amundsen-Scott died at age 59; Lloyd Berkner, United States National Committee for the IGY, died at age 62; the Voice of the IGY, Hugh Odishaw, died at age 67; and Admiral Richard E. Byrd died at age 68. Although we don't have a date for his death in our failing memory bank, we do know that Jim Shear, Station Scientific Leader at Hallett, died in his late forties. An Antarctic comet who hovered above Roosevelt Island in 1957, who became a truly great Antarctic,

Gentleman Jim Zumberge, also perished before he reached 70. A lot of these famed Antarctic IGY scientists literally died with their boots on. Paul Siple dropped dead at his desk at the Army Research Office; Lloyd Berkner collapsed at a meeting of the Council of the National Academy of Sciences; Harry Wexler, I believe, had just finished attending a conference or workshop at Woods Hole; Carl Eklund was on a lecture tour. But the Antarctic Superstar, Larry Gould, defied everyone, and was on a roll until the Great Reaper in the Sky called his number. He was 98, which proves some Antarcticans can live long lives, but you should not count on it. Chances are that you will go before your time, and you should beware of cancer.

**THEN AND NOW.** What are the big differences between 1957 and 1997 in Antarctica? If you were at Byrd Station in 1957 and were to go to any U.S. Antarctic station this year, you would think you had died and gone to Heaven. Through an open loop-hole at Little America V, a whole case of beer was inadvertently sent to Byrd Station for the camp for the year! About a can per person per year! And they had the guts to complain!!

If you were at the South Pole in 1957 and went back now, you would sing hallelujah every time you went to the head. The thrones at the South Pole were, naturally, open pits, and, when they got filled nearly to the top, some Navy man would go out and set off charges, and there would be a big hole again. The air space took on the temperature of snow at depth, probably ranging 60 to 70 degrees below zero. If you had any concern at all for the family jewels, you never dallied. I never heard of anyone having frosted testicles, but presumed if anyone was sitting out an attack of constipation, that it could have happened.

If you were at McMurdo in 1957 and went back, the first thing you would notice is that women are everywhere, and junk and debris are nowhere. It's not that women didn't get to McMurdo in 1957, as a chartered PAA Super Constellation made one flight into McMurdo, and two hostesses (one, Pat Hepinstall was a former model) were taken into camp and given dog-sled rides. Well, the dogs are gone, and now women are performing like men. I mean, they are actually doing men's work of yore. Those men could probably accept women with some belief, but they never could understand how a polar camp would be shipping trash back to the States!

And the Navy Task Force could never, never, never believe that their jobs have either gone to civilians or are in the process of being transferred to civilians. The most sacred of Antarctic jobs, flying, will in the relatively near future be in the hands of civilians. A document recently sent by some public release expert said that 70% of all Antarctic exploration was done by Task Force 43. If that was the case, why did the United States have an IGY and send scientists there? But now the Navy is losing Antarctica, and they are going to have to go back to Pearl, San Diego, and Norfolk.

Now the Crown Jewel of the Antarctic, the South Pole Station, is on the hit list up on Capitol Hill. Back in 1957, every Congressman wanted to fly to the South Pole. Six of them flew over the South Pole in a C-124 on November 24, 1957, and Oren Harris, Arkansas Democrat and chairman of the group, said to Paul Siple over the phone, "I can assure you this committee will take your problems before Congress when we return." We believe there is a Latter Day Arkansas Democrat who is chairman of another group in Washington, and we wonder if he has the same warm feeling towards the South Pole as Harris. Forty years can make one hell of a big difference!

**OPERATION HIGHJUMP, 50TH REUNION, OCTOBER 10-13, 1996, NORFOLK, VIRGINIA.** In what was described at the time as the largest peaceful invasion in history, Operation Highjump saw 4,400 men and 13 ships visit Antarctica in 1946 for the purpose of mapping and charting Antarctica. Now the men of Task Force 68 are going to assemble

at the Waterside Marriott Hotel in Norfolk in October to celebrate their events of fifty not-so-long-ago years. Those of you who may want to attend are requested to contact Don Leavitt (2109 Grand Ave., Morton, PA 19070-1311, tel. 610-461-1623). An alternative point of contact is James Bentley (1863 Bruce Rd. NE, Atlanta, GA 30329. tel. 404-634-8373). If you want to assure yourself a reservation at their hotel, the Marriott number is 1-800-228-9290. They have a special room rate of \$94 per day; running hot and cold water comes with that rate. Parking at the hotel is another \$8. Fifty years ago you could have stayed at any hotel in the south for a week at that cost! For those of you not-in-the-know, Operation Highjump left from Norfolk for the Antarctic, so this will be a returning home trip for the good old boys. We encourage you to attend, as the committee has been working really hard to stir up interest, and they deserve a good turnout for their efforts.

## P E N G U I N      P R A T T L E

**OFFER AND ACCEPTANCE.** When Paul Dalrymple and Ruth Siple first approached me with the idea of contributing to the Antarctic Society's Newsletter I was more than just a little flattered ... but being new to the "beltway", I didn't know too much about the Society nor exactly what I was agreeing to. Now that I have attended some of the meetings, and have met many of the "colorful" local members, I feel even more honored to be contributing to this shared passion! The readers may well wonder what "antarctic credentials" I bring to the Society, and I will hasten to admit that they pale in comparison to those of the many accomplished explorers and scientists in our midst. Nevertheless, I offer them up now as a grain of salt to take while reading this first edition of ... Penguin Prattle.

**GRAIN OF SALT.** We all have some recollection of our first real awareness of Antarctica, and probably even remember the awakening of an odd, if not outright perverse, desire to venture to the icy continent. Mine didn't occur until my third year in college when some fellow biologists came back from a season at Copacabana Camp on King George Island. Their amazing stories of life among the penguins, ice floes, and Poles (as in Polish nationals), and their photos capturing the subtle blues and greys of the peninsula region struck me as other-worldly. What really cinched it, though, was Eliot Porter's picture of Bull Pass in the Dry Valleys. Now, some eight years later, I have visited both Copacabana and Bull Pass, and have logged over 52 months of "ice time" along the way!

I started out my Antarctic journey as the winter-over Lab Manager in McMurdo's Eklund Biological Center - a job I performed for two successive winters. During that same time, the Crary Science and Engineering Center was quickly rising up alongside the old "biolab", and soon I became the first Supervisor of Laboratory Operations in that world-class facility. The new lab provided many opportunities to get acquainted with, and to support a much wider cross section of antarctic science, and engendered many noteworthy collaborations and lively seminars. The Crary Lab also opened up many opportunities for laboratory-based research hitherto impossible in the older "expeditionary"-style labs. Still, in retrospect, the caliber and breadth of "pre-Crary Lab" research becomes all that more impressive when one considers that it was performed in a space 90% smaller than the new lab!!! After four years of fine-tuning the Crary Lab, I made a transition into the environmental compliance group as a contractor at the National Science Foundation where I now bring my collective experience in research, science support and writing to bear in a very satisfying new job. Anyway, enough about me.

**WHAT IS PRATTLE?** My primary goal with this column is to provide informal updates on happenings in and around Antarctica. While this particular edition focuses largely on NSF news, members can look forward to news on Antarctic tourism, the

Environmental Protocol legislation (which is currently on President Clinton's desk), mini-profiles on antarctic "players", rumors and gossip in future editions. I am particularly keen to hear what you readers want, too.

**THE BLUE ICE RUNWAY.** A first! This year WINFLY (Winter Fly-in) was accomplished using Air Mobility Command C-141 Star Lifters. Usually, station opening at McMurdo is heralded by the deep drone of the Hercules LC-130 prop planes lumbering onto the skiway at Williams Field. This austral spring, a new chance to test the Pegasus Blue Ice Runway concept was made by bringing in wheeled aircraft at a time historically reserved for ski-equipped birds. Pegasus is located approximately 30 miles from McMurdo Station (as the skua flies) in a snow ablation zone. The current concept for a blue ice runway was conceived by the late Malcolm Mellor, an ice engineer from the Cold Regions Research and Engineering Laboratory. Up until this year, the Pegasus Runway (named for the Pegasus C-121 Constellation aircraft which crash-landed nearby in 1971) was used only at station closing to augment the fleet's Hercules aircraft. Who knows, maybe mid-winter flights will be next!

There are many advantages to using the larger, wheeled aircraft, payload capacity being most obvious. Another advantage is the aircraft's ability to fly all the way to McMurdo and return to New Zealand without landing. As we all know, weather in Antarctica can turn unexpectedly nasty with little warning; thus having the extended range is a real safety bonus. Dave Bresnahan, Office of Polar Programs' Systems Manager for Operations and Logistics flew into McMurdo on the opening flight, and was very pleased with the C-141 operation despite some minor weather delays. The use of the larger aircraft presented the McMurdo winter-over population with new challenges, too. In the past they have only had to contend with an "invasion" of 30 new faces per flight ... can you imagine seeing 100 jubilant, tan and energetic new people arrive in one day? That could make even the most gregarious winter-overer run for cover! Mickey Finn, NSF Winter Station Manager, reported on the "freshies" gorge fest that kept many winter-overs prone or otherwise incapacitated in the Winfly aftermath!

**OZONE DEPLETION, RIGHT ON SCHEDULE.** Reports are coming in on the annual formation of the ozone hole from researchers in McMurdo. Dr. Terry Deshler, Atmospheric Scientist and Professor at the University of Wyoming, who has been going to the ice for over ten years, told me that the ozone depletion rate is showing its characteristic depletion pattern. As of mid-September, approximately 50% of the total column ozone had disappeared, and is expected to reach its seasonal low by early October. Dr. Deshler's field team goes to McMurdo each year during Winfly to launch several small- and medium-sized balloons into the polar vortex. The measurements provide a kind of "ground-truthing" for the satellite-borne Total Ozone Mapping instrument. The big news is that Dr. Deshler's team and some collaborators from Italy are finding absolutely no traces of volcanic aerosols in the lower stratosphere. This is significant because of controversy surrounding the degree to which volcanoes contribute to, or cause ozone depletion versus manmade agents like chlorofluorocarbons (CFCs). The new measurements should help settle this dispute ... and remember you read it here first!

On the topic of ozone, this year marked the tenth anniversary of the National Ozone Expedition (NOZE) to McMurdo Station. This expedition spawned much of our current ozone research efforts, and led, in part, to the recently awarded Nobel Prize in Chemistry to three scientists whose early work on stratospheric chemistry has contributed significantly to our current understanding.

**ARTISTS AND WRITERS ON THE LOOSE.** Also during Winfly, Ann Hawthorne, Antarctic Society Vice President and professional photographer, went to McMurdo as a member of the august group of NSF Artists and Writers. I imagine that even as I write this, Ann is suffering greatly from the sleep deprivation brought on by endless hours of extremely photogenic pink and violet light which bathes this region in early spring

("cottoncandy light"). Ann joins David Rosenthal, a landscape painter, who wintered over in McMurdo as the resident artist this past year. Reports have it that David greatly enriched the winter-over community by providing drawing and painting classes, "gallery events", and dining hall beautification, while also making significant additions to his remarkable portfolio! Also, hot-off-the-press is Sara Wheeler's new book *Terra Incognita*, a travelog of her many trips to Antarctica. Sara was twice an NSF-sponsored writer, and also a visitor to Italian, Chilean and British bases. Thus far the book is available only through her British publisher, but should be out in the United States very soon. Look for a review in an upcoming Newsletter!

**WHIRLYBIRDS ENTER NEW ERA.** As many of you know, the Navy population in Antarctica has been diminishing steadily over the past several years, and this year we will see yet another major milestone. Helicopter operations in McMurdo will be handed over to Petroleum Helicopters International of Louisiana starting in October. The initial contract is for a two-year period with three optional one-year extensions. In the first year, there will be a total of four aircraft: three "Squirrels" (also known as "A-Stars") and one Bell-212 (the civilian equivalent to the Navy "Huey"). This contract affords the U.S. program the flexibility to extend the flying season, and to field a variety of payload capabilities. The contract was competitively bid, and the selection was based largely on the impressive safety record of Petroleum Helicopters. Last year alone they flew over 200,000 hours worldwide without serious mishap.

Naturally, this new helicopter contract will result in some adjustments to the way business gets done around McMurdo Sound; mainly because the new contractor will be operating under FAA Regulations rather than DOD Flight Instructions. For instance, sling-loads must be flown separately from passengers; hazardous materials will be subject to new rules; and the aircraft will be piloted by one person only (i.e., no crew members). Also, the cabin-size of the Squirrels is significantly smaller than that of the Navy Huey, so mission planning will be closely coordinated. For the transition period, some former squadron helicopter pilots (who have switched to fixed wing operations) will be on-hand to assist with terrain familiarization. Also, rumor has it that the new contractor was able to hire one pilot who had previously flown in the McMurdo Sound region as part of a U.S. Coast Guard coterie.

**MARTIAN MESSENGER.** Roberta Score never dreamed that the rock she picked up off of a remote Antarctic ice field in 1984 would result in an endless stream of interviews and national media appearances twelve years later. The rock, it turns out, is most likely from Mars, and initial investigations have revealed that it harbors tiny structures similar to microfossils found on earth. If the interpretation proves correct, Roberta will be the first person to have ever made physical contact with extra-terrestrial "life", and the rock may well become the story of the century!! Dr. Dennis Peacock, Chief Scientist for the U.S. Antarctic Program said that the finding of this meteorite illustrates that even relatively small research projects can produce remarkable results. He pointed out that the job now at hand is to look at the rock itself and try to unravel its mysteries. For instance, the search for life is usually the search for water; but this meteorite appears to have originated in a very arid environment. How will this fact be reconciled if the microstructures are determined to be biogenic in origin?

Meanwhile, in between calls from *People Magazine* and *Larry King Live*, Roberta (known as Robbie) is busy planning her return trip to Antarctica. This year, however, Robbie is not planning another Martian rendezvous, but, rather, will serve on the staff of the Crary Laboratory at McMurdo. Robbie recently left her position as Supervisor of the Meteorite Laboratory at the Johnson Space Center in Texas, and is excited about her return to Antarctica (she must have been bitten by the "gotta-get-back-to-Antarctica-bug!"). Her former teammates will also be returning to Antarctica to resume their search for messengers from outer space.

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 96-97

November

No. 2

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guihridge, 1990-92  
Dr. Polly A. Penhale, 1992-94  
Mr. Tony K. Meunier, 1994-96

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Franke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986

Joint Meeting with The Explorers Club - Washington Group  
and The Society of Woman Geographers

**The Greatest Survival Story Ever Told**

by

Geoff Shelley  
Custodian of the Shackleton  
ENDURANCE Lecture

on

Saturday evening, December 7, 1996

at

The Cosmos Club 2121  
Massachusetts Avenue, N.W.

*Social Hour 6 PM - Dinner 7 PM - Lecture 8:15 PM*

The cost of dinner, including tax and gratuity, is \$40/person. Make check for dinner payable to Explorers Club-Wash. Group, and send to Donald M. Watkin, 3001 Veazey Terrace NW, #120, Washington, DC 20008-5455, by November 30th.

*If you wish to have drinks before dinner, please write a note to Don Watkin. On it print your name (as it is on your credit card), name of credit card with number, name of bank, and the expiration date - as soon as possible - and sign your name.*

Dress will be black tie, or dark suit, if you prefer.

The epic story of Shackleton's ENDURANCE Expedition, utilizing original magic-lantern slides taken by Frank Hurley! There will be Limited Edition photographic prints from the Expedition on exhibit and for sale. Leonard Hussey, first man ever to present a banjo concert to an all-penguin audience, returned to England and gave this lecture to various interested groups. The baton for continuing this 80-year old lecture has been passed to Geoff Selley, a policeman involved with school groups. Guaranteed to tickle the cockles of your heart, make the hairs on your backbone stand up. Three cheers for Sir Ernest! Hip, hip, hip hooray! COME!!!!

Please buy 1997 Antarctic calendars! (see page 2)

We got a lot of positive feedback on Kristin Larson and her Penguin Prattle. Some of you people weren't paying attention. She is not an employee of the National Science Foundation; she works there as an independent contractor assigned to the Office of Polar Programs. We like Kristin as she is a bit of a free spirit, a breath of fresh air. And, of course, it doesn't hurt that she is an attractive woman, fun to talk to. Her only obvious drawback is that she is going to law school, which can lead to debauchery, swindling, and even worse things. We were sort of hoping that Kristin would eventually take over this whole operation, as we could live with her quite easily. So enjoy Kristin as long as she writes for us, and let's hope that she does not drop us. You can trust her words, but all the rest remains suspect as before.

**BUY, BUY, BUY THOSE NEW ZEALAND ANTARCTIC CALENDARS.** We have a surplus of Antarctic calendars this year, as some of our big buyers, like Jim Stoner who used to buy about forty, aren't doing too well on the farm this year and have cut back. So as we go to press, we still have a hundred sitting in the Nerve Center. You can't beat our price, as after mailing, we are only making pennies, and Ruth drives every day to the post office to mail them with no compensation. Say there, Michele Raney, Gisela Dreschhoff. Anne Benninghoff, don't you need some more for your mail man, your ice man, your garbage collector? And don't forget your mechanic.

**ABOUT THE LAST NEWSLETTER.** Several people, including some whom I highly respect, wrote us after my tongue-in-cheek words about how many of us who went to the ice with the IGY forty years ago this fall were a pretty motley bunch. We used to get a lot of letters when we purposely spelled Admiral Dufek's name as Admiral Defect. I'm not just certain when it all came about, as I spent both 1957 and 1958 on the ice, but somewhere along the line his name did get changed to something which we thought was more appropriate. Perhaps it happened at the South Pole, as we got to see a lot of the Admiral with both Ed Hillary and Bunny Fuchs leading traverses into the camp. However, Defect, pardon me, Dufek, did have one strong backer, admirer, and that was the legendary Larry Gould who liked to quote from an argument he had with the Admiral which ended up with Dufek saying, "Damn it, Larry, you let me run this Navy, and I'll let you run the goddamn IGY program." The quotes are sort of a sanitized version of the true spoken words, which were so effective that both lived happily ever after with one another.

Paul Humphrey wrote to the effect, "Hey, you forgot me, I did a lot of work, I was an important man back in those days." So, right, Paul, you were important, but I wrote about the characters, and you were so serious and straight arrow and worked so hard that I couldn't think of one thing comical about you. But let's give Paul some of his just dues, quoting from his letter of 24 October 1996. "I was the designated representative on the USS ATKA voyage of the U.S. National Committee for the IGY for a possible return to Little America and to investigate other possible station locations. I was then responsible for recruiting and selecting all meteorological personnel, and made a second and a third trip to the Little America location to start assignments there. Throughout the IGY I was Dr. Wexler's only assistant on IGY matters pertaining to the Antarctic. I also selected, ordered, and spent many Saturday afternoons overseeing the packing and shipping of all items in the meteorological program." There's more, but we're going to cut Paul off right there!

**HARVARD TRAVELLER CLUB HONORS ITS SECOND ANTARCTIC DROPOUT.** Norman Vaughan doesn't come in second very often, but he did November 12th when he became the second Antarctic to receive the Club Medal from the Harvard Traveller Club. The first to receive it was the late Eddie Goodale, a fellow dropout of Norman's, who also drove to the dogs on the 1928-30 Antarctic Expedition. Norman addressed the illustrious group at the Harvard Club, speaking on "Dogs on Ice: Adventure and Exploration in the Antarctic." This preceded his and Carolyn's return to the ice later in the season on a cruise ship. Norman is trying to put some distance between himself and Charles Swithinbank for overlapped time in Antarctica. Norman was in the Bay of Whales for his 23rd birthday in 1928, and will be in the Drake Passage for his 91st birthday this year, a span of some sixty-eight years.

When Norman and Carolyn get back to Alaska, they are going to be actively involved in sort of a Grand Alumni of the Iditarod camping trip. All mushers have to be former racers, but they are going to do it the civilized way this time, with ten hours of rest each day. They will even loan dogs to the weary, and have an escort of four snowmobiles. There is a real famous and real old Eskimo who will be the ceremonial leader, although his health will allow him to do only the first mile and the last few hundred meters. He is the Satchel Paige of Eskimos.

Remember that ultra wealthy blonde phenom of about 70 whom Norman took to the South Pole last year, and then close to the North Pole last spring? Evidently Norman must have spent some time banging her ear about the joys of a younger life partner, as she is about to marry a thirty-one year old. I don't know exactly what is in the air or in the water, but Norman seems to have started a groundswell of Antarcticans searching and finding something young. The latest to have a big smile on his face is John Spletstoeser who found a lovely at Scott Polar Research Institute who is thirty-five his junior. And the amazing thing is that Kim also has a big smile on her face. What is going on in this world? And speaking of Scott Polar, the heir apparent for writing this column about five years ago was this charmer Pam Davis. She took down her real estate shingle and went over to Cambridge, presumably to pick up a degree and come on home. But she got hooked on sculling or rowing or something in the water, and decided that England wasn't all bad, in spite of its weather. Then she, too, met a young Antarctic, and on her way to her PhD, they got married. So now it is Dr. Pam Davis, and there will be a little sculler at the boat house this spring. So there goes that heir apparent.

Meanwhile back at the ranch in Cambridge, Charles Swithinbank is going to solidify his position as the person who has seen the most of Antarctica by being on the baptism flight of Air Adventure Network out of Capetown, flying a bunch of intrepid Norwegian mountaineers into Queen Maud Land. If you are an avid reader of this taradiddle, you know that Charles has been in Antarctica in the 40's, in the 50's, in the 60's, in the 70's, in the 80's, and in the 90's. I don't quite understand it - it might be the new arithmetic - but he has been in Antarctica for six consecutive decades, but is still only in his mid-sixties! Don't turn around, Norman!!

Two percent of Antarctica is exposed bedrock, but about 98 percent of the earth scientists lecturing on cruise ships are geologists! Art Ford, who was submarined by the U.S. Geological Survey last year, has laid down his geology hammer, and will be on the ALLA TARASOVA lecturing this austral summer. Another hard-rock type out there lecturing will be Hal Borns. John Spletts is circumsizing Antarctica on the KHLBNIKOV as we go to print, and must be encroaching on getting his ten-year pin as an Antarctic lecturer. Gerry Webers lectures frequently, and Bob Rutford occasionally. The late Gentleman Jim Zumberge was another lecturing geologist, bon vivant, and entertainer extraordinaire. But outside of Swithinbank and Dick Cameron, how many glaciologists have lectured on cruise ships?

**HARRY DARLINGTON III OBITUARY** (Robert Dodson). Harry Darlington, 78, veteran of two Antarctic expeditions in the 1940s, died in Virginia of a stroke on November 6, 1996.

In 1940-41 Harry was the youngest member of the U. S. Antarctic Service Expedition (USAS), serving at its East Base on Stonington Island on the Antarctic Peninsula. As a dogteam driver, he took part in a 1500-mile sledge journey that mapped previously unexplored territory on the Weddell Coast. Previous to the U.S. Antarctic Service Expedition, Harry had taken part in the Grenfell Labrador Expedition in the 30s.

Returning to Stonington Island in 1947-48, he was a pilot with the Ronne Antarctic Research Expedition. On this expedition he was accompanied by his bride, Jennie. She and her companion, Jackie Ronne, were the first women to winter over in Antarctica. Upon her return, Jennie - with the help of author Jane McIlvaine (who became the wife of the expedition's first mate, Nelson McClary) - wrote a book entitled "My Antarctic Honeymoon." The Darlingtons<sup>1</sup> daughter, Cynthia, who was born in 1948 soon after their return, was the first child to have been conceived in Antarctica. Had it not been for a rescue by two Navy icebreakers, enroute home from the Ross Sea in the southern summer of 1947-48, making the long detour to extract the expedition's ship from unrelenting summer ice, the expedition would have been stranded for a second winter. This would have given Cynthia the added distinction of being the first person born on the continent (Stonington Island, at that time, was connected to continental glacier ice).

During World War II Harry, as a Naval aviator, flew with a B-26 anti-submarine squadron which made several successful bombing missions against German submarines.

A lifetime sportsman, he was a member of the American World Championship bobsled team in 1939. He was an avid sailor since childhood. Two years ago, at North East Harbor, Maine where he had a summer home, he finished first (at the age of 76) in a world series of racing for "International One"-designed yachts. Last year, at 77, he placed third out of 22 boats at an international competition in Norway.

Harry has raised cattle on his Chilly Bleak Farm since the late 1940s, crossing Charolais and Angus breeds, receiving national recognition. Anyone who toured his spread came away with a strong impression that here was a well-managed operation whose owner had devoted heart and soul, and much work, to its success.

Although he had not returned in almost fifty years, he held a deep respect for Antarctica and the early expeditions, including those of Admiral Byrd who had been titular chief of the USAS. This was evidenced during an outdoor dinner at his home during the 1980s. His longest and most heartfelt toast was directed at Ruth Siple who was among the guests that moonlit evening. She was, for him, a most admired member of the Antarctic community.

**1996 ANTARCTIC OZONE HOLE BELOW RECORD AVERAGE SIZE** (Goddard Space Flight Center, Greenbelt, Maryland). Two NASA instruments again have detected substantial depletion of ozone levels over Antarctica, commonly referred to as the Antarctic Ozone Hole.

The average size of the Antarctic Ozone Hole during 1996 has been almost as large as in the peak year of 1993, although ozone values are higher than the record lows seen in September 1994, according to preliminary analysis of satellite data by scientists at NASA's Goddard Space Flight Center in Greenbelt, MD. During the current year, the ozone hole covered a surface area over the South Pole roughly equal in size to the North American continent.

These data were recorded by two of NASA's Total Ozone Mapping Spectrometer instruments (TOMS) launched this year, one on board the NASA Earth Probe Satellite and another on the Japanese Advanced Earth-Observing Satellite (ADEOS). Low ozone amounts over the Antarctic continent consistent with these TOMS data also have been

validated by ground-based instruments and other satellite-based instruments.

The average size of the ozone hole during this year was 8.3 million square miles, similar to observations in the last four years. The largest observed average size of the ozone hole was in 1993, at 8.5 million square miles.

The hole started to form in mid-August of this year and reached a one-day peak size on September 7, 1996, of about 10 million square miles, then quickly shrunk to values of less than 8.5 million square miles. The previous largest one-day peak size hole was 9.4 million square miles on September 27, 1992. In comparison, the surface area of North America is 8.1 million square miles, while Antarctica has a surface area of 5.4 million square miles.

Since the mid-1980s, the region covered by low total ozone begins to grow each year in early August. This region reaches its maximum extent in September, while the lowest ozone values are typically seen in late September and early October. The ozone hole usually disappears by early December. The ozone hole in 1996 opened up slightly earlier than in previous years, but had begun to decrease in surface area below 7.7 million square miles by October 16, 1996.

"This ozone hole is very similar to those seen in recent years," said Dr. Paul Newman, research scientist in the Laboratory for Atmospheres at Goddard. "Although its area climbed briefly over that of the previous peak, that is not as great a concern as the average size, because meteorological conditions can cause large day-to-day fluctuations. This is similar to winter temperatures, where one really cold day is not as important as the average temperature over the whole winter season."

The ozone amounts measured by TOMS/ADEOS and TOMS/Earth Probe dropped to 111 Dobson units on October 5 near the center of the Antarctic continent, with values below 220 Dobson units measured over a wide area. Total ozone values less than 100 Dobson units were measured in both 1993 and 1994, with the record low value of 88 Dobson units measured on September 28, 1995.

Scientists at the South Pole from the National Oceanic and Atmospheric Administration (NOAA), working with balloon-borne measurements, have found low total ozone values similar to those seen in 1994. "However, in the central region of the ozone hole, from 7.5 to 12.5 miles altitude, ozone depletion was more severe than in the past," said Dr. Dave Hofmann of the NOAA Climate Monitoring and Diagnostics Lab in Boulder, Colorado. The NOAA measurements showed that complete destruction of ozone at an altitude of 10 miles was observed over the period from Sept. 24 to Oct. 14. "Total ozone did not reach record lows because of unusually high ozone above the ozone hole at 15 miles which compensated for the low values in the ozone hole," Hofmann said.

"These deep and large ozone holes are likely to continue to form annually until the stratospheric chlorine amount drops to its pre-ozone hole values," said Dr. Richard Stolarcki, also a research scientist at Goddard. "The slightly earlier ozone hole this year probably resulted from the continued increase of Antarctic stratospheric total chlorine levels." (To be continued in next Newsletter)

**INTERPERSONAL DIFFERENCES** calls for a minor two-minute penalty in the ice hockey world and back in the old days at a Dew Line station people never even looked up from their Carlsbergs when a Saturday night brawl broke out among the construction workers. But things are changing in this world. The world turns aghast as an all-star baseball player expectorated in the eye of an incompetent umpire, and the outside world read screaming headlines that the FBI and a mediator were heading to McMurdo and Casey stations to bring peace and happiness back to the pristine continent. All the time this was happening, people at home were crushing down turnstiles to get the opportunity to fork over big bucks to watch mayhem being committed on the turf below. Life is all in the eyes of the beholder.

The Manchester Guardian had big black screaming headlines announcing "FBI Rushes to the Pole as Mutiny and Mayhem Follow Outbreak of Cabin Fever in Antarctica." It does not say anything about all the 911 calls the night before from some irate wife or browbeaten husband. The weapon of choice in McMurdo was a clawed hammer, not exactly a loaded gun, but it got the attention of the world. And, not only that, but it gave enterprising reporters the chance to dig into Antarctic history to cite other interpersonal matters, such as the deranged staffer at Casey who had to be locked up in a storage room, although the AP article out of Australia said incorrectly that it was at Mawson. And, of course, they rehashed how the doctor at Almirante Brown burnt down the station rather than face wintering over in front of one of the most spectacular sceneries in the whole world - Paradise Bay. And they recounted the story in the National Geographic Society magazine about an American doctor who had to refrain himself from pushing the camp commandant over a cliff. Antarctica has about a hundred-year history, and I doubt if there is a town in America where less violence has occurred in the last century. Big Deal!

**SPOUSES OF ANTARCTICANS** (Dr. Peter Suedfeld, Dept. of Psychology, University of British Columbia, Vancouver, BC V6T 1Z4, Canada). A research program is now beginning to study the adaptive strategies and other reactions of spouses and families of Antarctic scientists, support and military personnel, etc., during the absence of the family member on the ice. The researchers, both of whom are professors at the University of British Columbia in Vancouver, Canada, are a husband and wife team who are interested in this project at a personal as well as a professional level. Dr. Peter Suedfeld, an environmental psychologist, has done field research on how current-day crew members have adjusted to working in the Antarctic and the High Arctic. His wife, Dr. Phyllis Johnson Suedfeld, is a professor in Family Studies whose work has included research on family adaptation to novel circumstances. Both of them believe that the families play an important role in the sojourner's adjustment, and that the prolonged absence of an adult family member in turn affects the activities and interactions of the family. There is little systematic information available about the impact of these influences. Spouses of Antarctic travelers are requested to volunteer to fill out a mailed questionnaire, which asks how the family dealt with many aspects of daily life - emergencies, child care, finances, employment, family celebrations and traditions, contact with extended family, social activities, etc. - during and after deployment to Antarctica.

If you would like to participate, or wish to receive more information about the study, Dr. Peter Suedfeld can be reached at the address above; phone (604)822-5713; e-mail: psuedfeld@cortex.psych.ubc.ca Dr. Phyllis Suedfeld - phone (604)822-4300; e-mail: pjohnson@unixg.ubc.ca

**THE STORY OF TWO WOMEN.** Ten years ago, according to my notes, a cameo-complexion woman of youthful age joined our Society, and asked us how she could possibly get to Antarctica. As she was a very competent writer at the Pentagon, it looked like she might possibly qualify for some sort of a writing job at McMurdo. So she got a job with the contractor, but on the way to the Forum, got shunted off to another job at McMurdo. But she loved it there, soon found a man, and returned to the ice time after time after time. Eventually Lisa Fetterolf married Randy Jones, and they now are building a traditional Pueblo-style adobe house on five acres on the Carson River in Carson City, Nevada. They can't see Mt. Erebus from there, not even on a clear day, but they are sure dreaming about it. They are also talking about starting a family. Lisa is special in our Society, as she was our 400th member. We thought she was a good kid. We still think so.

A couple of years ago Steve Dibbern had impregnated this Charlottesville fourth-grade

red-headed school teacher with his love for the Antarctic. She said she wanted to go, Steve said, "You can't, they don't take elementary school teachers." She couldn't hear what Steve was telling her; she made application, and, lo and behold, was assigned to Al Harper's South Pole program.

We met her, April Lloyd, at the September orientation. A bevy of VXE-6 pilots seemed to be constantly convoying her every step. It was obvious that she was excited about going to Antarctica, as she was walking on the ceiling. I later had the chance to spend an evening with her and her husband at Steve's house. Before she left for the ice, I wrote in the Newsletter that everyone would either love her or someone would shoot her. I really wasn't certain in my own mind which it would be. She confessed to being in a funk for awhile at the station, but had a great time. And she wrote several paragraphs about her experience in our Newsletter when she got back.

Then April moved to her family residence outside of Syracuse, and we wondered, but did not ask. We found out that April had turned in her husband for one of those VXE-6 pilots, one Gene "Rio" DeGennaro, and they are living in some weird place called Hawaii. From what I have heard, it is not very polarlike. Rio will probably take an early discharge, and hopes to become a commercial pilot. April is still teaching, still in touch with Al Harper, still in touch with NSF, and still dreaming of Antarctica.

**THE BULL OF THE PAMPAS.** We heard through a third party that Mario Giovanetto, Byrd '57, South Pole '58, plus a traverse from McMurdo to South Pole, was going to be cited by his native homeland, Argentina, for his Antarctic achievements. Several years ago, while browsing through Geographic Names of the Antarctic, I discovered that my old South Pole roommate had been the first person to ever set foot on Shag Rocks. Seems he was lowered down by helicopter when on an Argentine ship. Shag Rocks, between the Falklands and South Georgia, are about the most desolate rocks anywhere. Only a cormorant would find them inviting. Mario ended up as a geographer, and is currently at Calgary. Congratulations!

**PENGUIN PRATTLES ON.** Okay, well here we are already Issue No. 2. I am gradually getting into the "Ruth and Paul mode" of producing these gelid gems, bergy bytes, and reflections from the refrigerator on a timely basis, and I must say again that it is truly a pleasure to serve as a "mouth of the south"...spreading news, myths and heroics to points north! If any of you want to contribute an anecdote, poem or comment, please send it to my electronic mail address (klarson@gwis2.circ.gwu.edu) or directly to the Antarctic Society address. I do have a small confession: my electronic receptor (AKA e-mail) has been problematic this past month...so to those of you who already sent comments in that medium, or are considering doing so: I will be responding soon! For the moment, however: On, on!

**THE BIG WHITE JUST GOT GREENER.** On October 2, President Clinton signed into law H.R. 3060, also known as Antarctic Science, Tourism and Conservation Act of 1996, which implements the *Protocol on the Environmental Protection to the Antarctic Treaty* (also referred to as the Madrid Protocol). In so doing, the United States became the 23rd nation to ratify the Protocol. Full ratification will occur when all 26 "consultative" treaty nations accede to the Protocol. Finland will be ratifying it soon, leaving Russia and Japan as the remaining nations to complete the process. Mr. Tucker Scully, Director of Ocean Affairs at the State Department, reported that the legislation may not be "deposited" internationally until federal regulations are in place to implement the new bill. Currently the National Science Foundation, the Environmental Protection Agency, and U.S. Coast Guard are developing plans for completing the "rule-writing." In the interim, OPP will continue to observe

regulations which fulfill the spirit and intent of the Protocol as well as applicable federal regulations. The following is an excerpt from President Clinton's transmittal upon signing the bill:

"Almost 40 years ago, the United States proposed a treaty among the nations carrying out scientific research in Antarctica. The resulting Antarctic Treaty establishes this fascinating and remote region of our planet as a zone of peace, reserved exclusively for peaceful uses, and guarantees freedom of scientific research there.

The Antarctic Treaty has proven a uniquely successful agreement and has spawned an innovative system of supplementary agreements to protect the Antarctic environment and conserve its living resources. For these reasons, it gives me particular pleasure to sign into law legislation that will provide authority for the United States to ratify the most recent extension of that system: the Protocol on Environmental Protection to the Antarctic Treaty. The Protocol sets forth mandatory rules for the protection of the environment of Antarctica and the promotion of scientific research there. The bill that I have signed today implements the provisions of the Environmental Protocol. The Senate has already given its advice and consent to ratification of the Protocol.

Enactment of this legislation reaffirms United States leadership in Antarctic affairs. Our leadership is expressed in our world class research program on the ice, which is helping to answer basic questions about the Earth. The United States has also provided leadership in the innovative diplomacy that has made Antarctica a shining example of constructive international cooperation."

**SENATE-MANDATED EXTERNAL PANEL HOLDS FIRST MEETING.** A distinguished assemblage of professionals from industry, universities and government - Richard B. Alley - Pennsylvania State University; John B. Anderson - Rice University; Norman R. Augustine Lockheed Martin Corporation; Rita R. Colwell - University of Maryland; Charles E. Hess - University of California, Davis; Hansford T. Johnson - USAA Capital Corporation Lewis E. Link, Jr. - Army Corps of Engineers (CRREL); Rudy K. Peschel; Rusty Schweikert President, NRS Communications; Susan Solomon - NCAR; and Edward C. Stone, Jr. - Jet Propulsion Lab - met at NSF October 11-12, to learn about the U.S. Antarctic Program from a variety of scientists, NSF staff, and collaborating government agencies, including "frozen chosen" - mainly contractors with a lot of ice time.

The External Panel which was established by NSF in August, is chaired by Norman R. Augustine, Vice Chairman of the Board and Chief Executive Office, Lockheed Martin Corporation. The panel will meet again before making a post-Christmas inspection visit to U.S. facilities in Antarctica. Neal Lane, NSF's Director, has asked the panel to "examine and make recommendations concerning: the stations and logistics systems that support science while maintaining appropriate environmental, safety, and health standards; the efficiency and appropriateness of the management of these support systems; and how and at what level the science programs are implemented. The panel's views and recommendations should include consideration of eventual replacement of South Pole Station and other infrastructure."

The Panel plans a preliminary letter report late this year or early next year to inform the fiscal 1998 budget process, and will convene once or more in early 1997 to write up a final report. Mr. Augustine wishes to receive comments from the public on how the nation should conduct its business in Antarctica. To be useful,

comments should be based on a good understanding of science, engineering, technology or management relevant to the U.S. Antarctic Program. We have passed the point of asking if the United States should be in Antarctica, so testimonials won't be of much use. What is required are suggestions to improve the present-day program. Suggestions received by 10 December will be presented to the panelists before their next meeting. Please send them to Guy Guthridge, Executive Secretary, U.S. Antarctic Program External Panel, Room 755, National Science Foundation, 4201 Wilson Boulevard, Arlington, Virginia 22230.

**SHIPS, BOTH WET AND DRY.** The research ship NATHANIEL B. PALMER completed a cruise in the Indian Ocean sector earlier this year and, in so doing, has now completely encircled the Antarctic continent. During that same cruise, the N. B. PALMER called on the Russian Mirny Station in something of a "mercy mission" to donate four tons of food! It turns out that the Russian resupply ship, the FEDEROV, was hampered by mechanical problems causing the Mirny Station food supply to run dangerously low ... imagine the ingenuity of those chefs ... canned cabbage and cake mix?! Right now the N. B. PALMER is deep in the ice of Ross Sea, completing the second of 12 "JGOFS" (Joint Global Ocean Flux Study) cruises. To date, this is the largest program to be funded in collaboration with NSF's Ocean Sciences Division. One of the primary objectives of this project is to evaluate what role the Southern Ocean plays in controlling the global carbon budget. This information may help investigators predict the consequences of climate change and the fate of some greenhouse gas components. The first JGOFS cruise encountered some of the Southern Ocean's finest winter weather and two temporary labs on the aft deck broke loose! The N. B. PALMER will be used for a total of seven JGOFS cruises during the next 18 months, and, in so doing, will extend an opportunity to many investigators who have never worked in Antarctica.

On the subject of ships, fabrication of the new research ship, the LAURENCE M. GOULD, is on-track and expected to meet its maiden voyage date in September 1997. According to Al Sutherland, OPP Ocean Projects Manager, the L. M. GOULD is being fabricated in modules in the same shipyard that produced the N. B. PALMER (Edison Chouest in Louisiana). More progress reports to follow!

**HEW CAMP AT SIPLE DOME.** For the past five years or so, glaciologists have been scouring the West Antarctic Ice Sheet, looking for the perfect place to extract a deep ice core. They found what they were looking for some 8,000 miles from McMurdo at 81°65' South latitude and 148°81' West longitude. The location is named Siple Dome because it is an elevated ice feature located near the Siple Coast area of Mari« Byrd Land. This site was selected because of its relatively flat subglacial topography and simplistic ice dynamics which allow for easier interpretation of core samples. The Siple Dome Camp was opened on Schedule (October 26) with a 10-person construction crew and six camp personnel. During this first year the camp will be assembled, and the coring rig will be erected; however, core extraction will not commence until next year. It is expected that this project will produce a 1000-meter core and will be completed in January 1999.

Some of you may well ponder what we can discover from a piece of ice five inches across and more than half a mile long ... the truth is, many clues about the world's climatic history can be revealed by looking carefully at these cores in much the same way as belly-button lint provides clues of recent wardrobe choices. Seriously, though, the core can be analyzed by measuring the minute quantities of gases, isotopes and other chemical species which are laid down as annular layers. By looking at these layers from modern times back through the last ice age, and beyond, researchers hope to define past global and regional climate regimes. The information obtained from the Siple Dome core will be compared and calibrated against data

collected from Greenland ice cores, and will assist researchers to differentiate between regional effects and truly global climate patterns.

Drilling for ice cores will also continue at the Russian Vostok Station (freshly provisioned!) where the deepest and oldest core is being extracted by a research team of Russian, French and U.S. scientists. Initial analyses of the Vostok core have shown a close correlation between known climate regimes and concentrations of the so-called greenhouse gases over the past 200,000 years. Many of you have probably already heard about the lake recently discovered below the Vostok drill site which is thought to be on the order of Lake Ontario in size, and has been sealed off from the atmosphere for hundreds of thousands of years. Rest assured, the drilling activity is planned to stop at approximately 3600 meters depth, and will not penetrate into the lake itself.

**MEETINGS MEETINGS MEETINGS.** I would hate to disabuse any of our readers of the notion that our nation's capital is a virulent hotbed of packed board rooms and maxed-out dayrunners ... "meet for those who can't," I always say! Be that as it may, October was exceptional, even by local B.C. standards. In particular, Antarctica was the focus of at least four major forums, starting early in the month with a workshop on Antarctic Tourism held at nearby Airlie House (see the movie *Fly Away Home* for visuals of the location, and the October issue of *Washingtonian Magazine* for a great account of Dr. Bill Sladen, and his research on Canada Geese at Airlie). The Tourism Workshop was convened to delineate roles and strategies for meeting new obligations imposed by U.S. legislation implementing the Madrid Protocol. This workshop was attended by the Antarctic Society's new president, Ron Naveen, who has been engaged in collecting data on the effects of tourism in Antarctica for the past several years. Also attending the Tourism Workshop were folks from EPA, OPP and IAATO (International Association of Antarctic Tour Operators).

Shortly thereafter the Polar Research Board met. Among the notable presentations made at that meeting was a review of XXIV SCAR (Scientific Committee on Antarctic Research) in Cambridge, England which was given by Bob Rutherford, U.S. Delegate to SCAR. Our Arctic brethren also made several excellent presentations at the Polar Research Board meeting.

To cap it all off, at month's end, the Commission for the Conservation of Antarctic Marine Living Resources (CCAMLR) held its fifteenth annual meeting in Hobart, Tasmania. Dr. Polly Penhale, OPP Manager for Antarctic Biology and Medicine and U.S. Delegate to CCAMLR kindly provided the following commentary on the Hobart meeting: "The Treaty regulates harvesting of marine resources from the ecosystem perspective, taking into account not only species that are harvested (such as fish, krill, and squid), but the dependent species such as seabirds and seals, which feed on harvested species. At this CCAMLR meeting, a total of 23 new fishing regulations were adopted. A main issue of concern continued to be the problem of illegal fishing in the Convention area. The other main focus of the meeting was the issue of "new fisheries," as several applications were made to fish in areas never fished in before. Fishing regulations for the "new fisheries" contain requirements for significant data collection, so that a better understanding of the population will be gained."

Of course this is only a tiny taste of the meeting-potential for those of antarctic ilk, but then, this is the deployment season! If any of you harbor morbid, or otherwise honest curiosity as to the upshot of any of these meetings, please contact me, and I will endeavor to provide details.

PLEASE! Help us sell our remaining hundred 1997 calendars! \$11 each if mailed! A real bargain! We need your help! Thank you!

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 96-97

March

No. 3

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rurford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94  
Mr. Tony K. Meunier, 1994-96

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983

*ANOTHER NOONER NEAR THE BALLSTON METRO STATION!*

**Private, Public, Governmental: IAATO and  
the Protection of the Antarctic Environment**

by

Barrel F. Schoeling

Executive Secretary

International Association of Antarctica Tour Operators

111 East 14 Street, Suite 110

New York, New York 10003

on

*Wednesday, March 5, 1997*

12 Noon

**(Come early, please!)**

National Science Foundation

4201 Wilson Blvd., Arlington

**Room 360**

**(Sign in at Security Desk!)**

Barrel Schoeling was a founding member of the International Association of Antarctic Tour Operators (IAATO), and has participated in annual meetings with NSF since 1988. He was named to the Antarctic Section of the U.S. State Department Advisory Committee in 1991, and since 1992 has been a U.S. delegate to the Antarctic Treaty Consultative meetings. He was elected Executive Secretary of IAATO in 1995.

Barrel is an enthusiastic naturalist who has traveling boots, binoculars, and a camera whose bounds have no limits, although he has a strong affinity for the polar regions. He has led tourist expeditions to the Antarctic since 1987. He became a small business man in 1996 when he founded *GEOGRAPHICA*, a mail-order book service, specializing in natural history and exploration.

Barrel is an Ivy Leaguer, graduating from Brown University with a degree in biology. He has been a college professor and also has worked at the American Museum of Natural History.

*Come and hear all about Antarctic tourism from one who  
knows all about Antarctic tourism!*

We have not gone underground nor have we vacated the post, but a series of events beyond our immediate control put us out of operation. First of all, this taradiddler got an invite from a tour company to be the historian on six consecutive cruises to the Antarctic, and since it was the 40th anniversary of my first going there, I could not turn it down, especially because it got me out of the country over that dreadful, stressful Christmas season. We thought we had protected our flanks by getting a massive input from Al Lindsey on what it was like to winter over at Little America II in 1933-35, and that was going out as a newsletter in January.

But on the way to the Forum, our Honorary President and Society worker, Ruth Siple, came down with a bad case of shingles, and she sort of went under cover, shall we say, with pain. They had to give her some strong medication, and one thing led to another, so to make a long story less long, she was hospitalized three different times, most of January and the early part of February. It seems all of her major problems were caused by the medication, and it is only now in late February that Ruth has recovered enough to resume an active role in our Society. So, we are all back at our respective posts, and away we shall go, with Kristin Larson's Penguin Prattle adding a touch of reality to these newsletters.

There are some changes being initiated with this issue, both good news and bad news. The Postal Service has changed things, and rates have gone up, so for small outfits like ours, it was deemed more feasible to mail everything first class. So within the capabilities of the Postal Service, you, hopefully, will get your newsletters much faster. But if we put out our usual ten-page newsletters, the cost would go up appreciably. So we are going to reduce the number of pages to eight, and keep our dues, for the time being, at least, at our current low rates. What remains the same is that there will be some truths, some fictions, some fabrications in what you expose yourself to when you open these newsletters.

**ANTARCTIC TOURISM.** As our March speaker is the Executive Secretary of the International Association of Antarctica Tour Operators, and since this soul has just returned from serving as historian on six consecutive milk-run trips to the Antarctic Peninsula, it might be a good time to personalize our thoughts on Antarctic travel.

Antarctic tourism is big business, and is getting bigger all the time. When the National Geographic's *TRAVELER* covered a tour ship's trip to the Antarctic in their May/June 1990 issue, they cited only three different companies as being active in Antarctic tourism. This past austral summer, there were nine companies, thirteen different ships. And next year will be even bigger, at least in number of passengers as two of the large ships, the MARCO POLO and the VISTA MAR, will be going to the ice

We feel that although there may be close to ten thousand travelers going to the ice each year, most really do not know the options available to them. At least ninety percent of those travelers do not know that there are vendors other than the one with whom they booked. Ten years ago there was a lot of repeat traffic, but nowadays with lowering prices one finds some ships booking with all first-time Antarctic travelers.

It's an entirely new ball game with the introduction of so many of the Russian ships, particularly the influx of the smaller vessels which carry around thirty-six people, an exceedingly popular way to go. Two years ago we quoted the venerable British Antarctic scientist, Bernard Stonehouse, as saying that he expected tourism in Antarctica to double and redouble by the year 2000. We think Bernard got carried away a bit in his enthusiasm for what puts scones on his table, although the way the Japanese people are buying tickets to Deception, Paradise, Half Moon, he may be right.

We think Jeff Rubin's paperback, a Lonely Planet publication, *ANTARCTICA*, is a great step forward in educating travelers about the opportunities and options available in Antarctica. We understand from Barrel that there will be two other Antarctic-type guide books coming out in the next year, one by Moon Publications, the other by a British firm called Cadogan. The International Association of Antarctica Tour Operators (IAATO) publishes their *NEWS*, and their IAATO Membership Directory lists IAATO objectives and includes a profile of member companies. Darrel has fulfilled requests for some 500 copies in recent months, so the word from the horses' mouths is at least getting to some of the travel agencies.

The Antarctic Peninsula will always be the big attraction for Antarctic tourists, as the thrills per dollar spent cannot be equalled elsewhere in Antarctica. With the influx of Russian ships on the scene, prices have dropped, and no longer is Antarctica a luxurious visit for only those with deep pockets. A young Japanese lady two years ago told me that it was so cheap to travel to Antarctica that she could not afford to stay home! But one should still do some comparison shopping. A man from Vancouver told me that he could have saved well over a thousand dollars on a trip to Antarctica if he had first flown to London and gone down with a prominent English travel group.

It's interesting to talk to the tourists about why they are traveling to Antarctica. Most are going for the whole package, although birders from around the world have a real sense of their priorities. All companies seem to make certain that all cruises give their travelers the opportunity to visit some base in Antarctica, to step on the Antarctic continent, to visit Deception Island, and to see tens of thousands of several species of penguins, hundreds of seals, tens of whales. The piece de resistance for me is the Lemaire Channel, where it all comes together in all its glories. And the Neumayer Channel is not far behind. No one, absolutely no one who goes to Antarctica is shortchanged!

Another big change of late are the ships. You can choose between yachts that carry less than ten passengers to large liners that carry over four hundred. The one constant is the Drake Passage, which has to be traversed. I had the ultimate pleasure this past austral summer to be on a relatively new Russian research ship, the *AKADEMII IOFFE*. This Finnish-built ship (1989) has a lot of stabilizing equipment, and sailing on her was a sheer delight. If anyone avoids Antarctica because of skepticism about rough seas, they should go on the *IOFFE*, as it cuts down swells and waves to mere ripples. There are several small Russian ships now which carry thirty-six people, and the word we are getting is that, in spite of their rock and rolling, everyone loves the camaraderie of being on such small ships. You have that old faithful, the *EXPLORER*, which has been in Antarctic waters for years and years, and is loved by legions of its travelers. So there's a ship for everyone, a cruise for everyone. You just have to match your profile with your ship with your interests and your pocketbook.

Antarctic travel has certainly changed dramatically in the last five years with people now having the option of going on a Russian icebreaker with helicopters. This past austral summer saw the first-ever circumnavigation tourist cruise of Antarctica. Now we are really talking megabucks, in the range of tens of thousands of dollars. The world is really full of a lot of people who have so many greenbacks they don't know

what to do with them, and it's up to the tour companies to come up with the ultimate cruises. But let's hope that the Dry Valleys never become as popular as Half Moon Island. We believe that the number of tourists who have flown to the Geographical South Pole now totals over a hundred. If the Antarctic Peninsula gives more per dollar, then the South Pole gives the least - they could get the same view by visiting International Falls in January!

When is the best time to go to Antarctica? Depends on when you can get away, and what you want to see. Let's assume that penguins are the number one attraction, that people can't get an overdose of seeing their newborn, then the best time to go to the Antarctic Peninsula would be from mid-December to mid-January, when it is practically daylight around the clock. And if you go over Christmas, it's a great way to escape the commercialism of what was once a religious holiday. Penguins are a great equalizer for kids and grandchildren on December 25th? No penguin, no matter how young, has ever been heard to say, "Is that all?" And some companies even give a small token reduction in fares over the holidays.

By the end of January, chicks in some of the rookeries are getting ready to fledge, and are not quite so adorable. But if you want to go south to Marguerite Bay, hoping to see East Base, then you had better plan on a late austral summer trip in late February-early March. And some exciting things occur outside of the Penguin World, as in late February the EXPLORER made the first-ever circumnavigation trip around James Ross Island (see an adjoining article). So travelers should do their homework, not shoot a spear into a barrel of fish; make their seasonal selection on what turns them on. And books like Jeff Rubin's are going to help people make the best choices for themselves.

There will always be some variables where tourists will be playing Russian roulette, and this is relative to expedition leaders, to planned stops, and weather. I have sailed with three different companies over the past seven years. The main differences are in the expedition leaders, some of whom are strong leaders, some are what I call hands-on leaders who are active lecturers and like the last word, and some are hands-off leaders who leave the lectures to the lecturers. Really tremendous differences among leaders! And some know the landing sites much better than others. Repeat travelers come back and think because they are going to the Peninsula they will automatically go to Paulet Island or to Petermann Island, and when they find out that the itinerary does not include their favorite sites, feel victimized. So travelers can control their choice of ships, the length of their itinerary, but they can't control who will be expedition leaders, where visits will be made, or the weather.

Are there any Pied Pipers, either expedition leaders or lecturers, who by themselves attract tourists to return with them to the Antarctic? It is my impression that Peter Harrison, British-born ornithologist, comes closest to being the Antarctic Pied Piper, as I have known quite a few who have followed Peter around Antarctica and the world. Barrel tells us that Matt Drennan is sort of a Pied Piper and has a following of his own. Peter has a cult following, no matter where or when. One self-avowed widow follower has supposedly found the love of her life when a wife conveniently died. One of my most favorite Antarctic travelers is the Whale Spotteress from Pittsford, New York, Dotte Larsen, who made many, many trips on the EXPLORER. She told me that it was the overall package which kept bringing her back, but confesses to having enjoyed the lectures of historian Alan Gurney, whose first of two books on the history of Antarctica, *BEYOND THE CONVERGENCE*, has recently been published. Charles Swithinbank, glaciologist and lecturer, has two books coming out on his Antarctic career. The first, *ALIEN IN ANTARCTICA*, will be out this spring.

The Antarctic has not really proven a very good hunting ground for either male or female looking for spouses, so buying a ticket to the south isn't paramount for finding a life partner, although our West Townsend, Vermont-Monhegan Island, Maine member,

Ruby Court, ended up with artist Lee Winslow Court. And the above-mentioned Peter Harrison met Shirley Metz in the Antarctic, and that led to wedding bells. And now veteran Antarctic John Splettstoesser and Cuverville's Kim Crosbie are very much items. But if you are looking for a life partner, your chances are probably better in the express line of your local supermarket.

**EXPLORER CIRCUMNAVIGATES JAMES ROSS.** Two years ago we wrote a short article in these pages on "The Warming of the Antarctic," telling therein about a large berg breaking off from the Larsen Ice Shelf, about Stonington Island becoming a true island, about warming in the Dry Valleys. Climatologists deal in neat little packages of thirty-year periods, so it is impossible to get a good handle on what is happening in Antarctica (where records of even forty years are rare), although events happening like ice shelves disintegrating and glaciers melting sure lend credence to warming, especially on the Antarctic Peninsula. J. Murray Mitchell, why did you have to die so young when the world truly has a need of thee?

As we go to press, Victoria Underwood informs us that the M/S EXPLORER, owned and operated by Abercrombie and Kent and Explorer Shipping Corporation, has circumnavigated James Ross Island, which is supposedly another first in the annals of Antarctica. And the expedition leader is a woman! Can you believe that? Says so right here in the fax, that the Scottish lassie, Kim Crosbie is the leader. Could it really be that her romance with John Splettstoesser, who was on the ship as a lecturer, was so hot that it melted the remaining ice around James Ross and made it all possible? Our illustrious president, Ron Naveen, was also aboard, although he was an innocent bystander to it all. The ship's captain, Uli Demel, a veteran of over sixty-five Antarctic voyages, was on the bridge for this historic occasion. It's not the first time, nor will it, in all likelihood, be the last, when the EXPLORER makes history, as she was the first passenger vessel to transit the Northwest Passage in the Arctic in 1984.

**NEAL SULLIVAN INDICATES THAT HIS TIME HAS COME TO MOVE ON.** Neal Sullivan only planned on fulfilling his four-year commitment as Director of the Office of Polar Programs, and, sure enough, he is a man of his word, and has indicated that he will move on. However, he has been talked into staying on for a few more months, so will be in Ballston for several more months.

Neal is the seventh official director of the Office of Polar Programs (formerly the Division of Polar Programs). Tom Jones, Louie Quam, Joe Fletcher, Bob Rutford, Ed Todd, and Peter Wilkniss preceded him. But there are many who will say that there was another director in there, as didn't Helen Gerasimou more or less serve as the acting director for a considerable period of time? She certainly was the surrogate mother to many going to the ice back in the 60s and 70s. Louie really wasn't in the director chair much longer than to have a few cups of coffee, as his wife's failing health necessitated his leaving the position after one year. Rutford and Fletcher weren't there many years, with Bob answering the call of academia, or was it following the footsteps of Gentleman Jim? Fletcher found the crosscountry commuting between Washington and his west coast residence overbearing. The power of the position struck home when readers of The New Yorker opened up an issue about fifteen years ago and saw a cartoon of a parka-clad man strolling down a city street in a blizzard, and around his neck hung a sign "ED TODD."

Now the speculation begins as to who follows next. We once heard that Charlie Bentley might consider a short term in Washington. Rutford is too young to really hang it up, but on the other hand he may be too old to go up on Capitol Hill and fight over budgets. But since when did Bob ever back down from a challenge? And the USGS made John Behrendt an available commodity on the flesh market when they

abandoned their Antarctic geological research. The government, supposedly, likes to promote from within, so they could move P2 into the position. A lot of good candidates.

**STEVE LEATHERWOOD, THE CONSUMMATE MARINE SCIENTIST, THE CONSUMMATE HUMAN.** Steve Leatherwood died at age 53 on a California beach where at sunset he saw dolphins at play and two migrating whales, exciting him to say to a child nearby, "Look, do you see that?" Steve was born in rural Alabama, some distance from the Gulf of Mexico. But in the 1960s, while scuba diving off the coast of Florida, he came around a coral reef, and a dolphin was staring him in the face. His sister said that it was love at first sight, a love that summoned Steve to distant parts of the world, introduced him to a vast variety of marine mammals, and beckoned him into a distinguished career as a scientist and conservationist. The Leatherwood Guides to marine mammals have been described as being to "marine mammals what the famous 'Peterson Guides' are to bird watching."

Steve died from lymphatic cancer, surrounded by family and friends. He was a most unusual person. I had the pleasure and the honor of being with Steve on a 23-day Antarctic cruise back in 1990 when we were both lecturing on the WORLD DISCOVERER. He was such a nice guy that Ruth Siple wanted to adopt him! Everyone shared her love for the man, and nearly a hundred and fifty of his dearest friends showed up on February 15th at Scripps Institution of Oceanography for one of three memorial services honoring Steve (another one was at Texas A&M, where Steve got his PhD, and the other at Ocean Park in Hong Kong, where Steve most recently worked).

From 1978 to 1989 Steve worked at Hubbs-Sea World Research Institute. In 1991 he served as chairman of the Cetacean Specialist Group of the World Conservation Union, where he oversaw a worldwide network of scientists working to prevent extinction of animals. His fervent desire for marine conservation led him to serving on the advisory boards of thirteen different scientific/conservation organizations, most of which focused on interactions between humans and marine mammals.

Steve was a man of many hats. He loved classical music, probably in part to being self-taught by whales. He did not play any musical instruments, but said that music was a language he understood, but did not speak!

Some of you may remember him from appearing in a made-for-TV underwater film in which Steve appeared with Australian supermodel Elle Macpherson and Olympic-famed, multi-gold-medalled Matt Biondi. He was traveling in some pretty famous company then, but they were, too.

Victoria Underwood, who supplied most of this information on Steve wrote, "Steve was one of the most prolific and productive professionals to have ever graced this earth. He authored well over one hundred scientific papers, over two dozen chapters in popular and technical books and field guides to the cetaceans of both coasts of North America. He encouraged many individuals to work in the marine sciences, and was a great champion of this field. Steve was an academic through and through, but those of us who were lucky enough to have known him recall the delightfully playful and inquisitive side of him that loved to explore and experience all that the universe had to offer."

**PETER WILKNISS RETIRES, BUT RETOOLS.** Peter Wilkniss, former Director of the Division of Polar Programs, officially retired from the National Science Foundation on January 3, 1997. We have it from a most reliable, impeccable source that Peter will live again as a polar figure in the private sector. As we go to press, Peter is drafting a master plan which runs the gamut from the old to the new, and he has promised to outline his hopes and dreams in a forthcoming newsletter.

**PENGUIN PRATTLE.** Greetings South-o-philes! It has been such a time since last we wrote that I considered changing my byline to Penguin Pallor, or even Penguin Pratfall!

Some nice bergy bits have come up on my radar screen recently, but before launching into that, I think it only fair to reveal my newest transmogrification. I have lately accepted an opportunity to assist in the development of regulations stemming from U.S. legislation on Antarctic tourism and conservation that was signed by President Clinton last October. Yes, this does entail leaving the National Science Foundation, but my new job will keep me in close contact with the many Antarctic friends and experts that I have come to know over the past nine years. In fact, this new job rolls many favorite things into one neat little package: Antarctic science, environmental conservation, writing, and law. In truth, I think I would have taken this job even if it didn't pay! And to allay your fears, I promise that fresh news will continue to wag this newsletter!

**BUTTERSCOTCH AND PINK POPCORN.** Antarctica is again heading into its twilight months, bathed for weeks and months in lovely low-angle pastel light. In my opinion, there is no nicer time to be there...sure enough the thrill and racket of the rookeries has disappeared and whale sightings become rare, but perhaps it is the solitude and rising wind, the surety of a coming darkness that makes this phase of the Antarctic cycle seem so poignantly bittersweet. By now, most summer residents have fled north, reducing the total continental population from about 4,000 to about 1,000 hearty souls. Radio communications allow these isolated pockets of humanity to share in an obscure camaraderie, but mainly it is a time for voyaging inward. It's a chance to get "the knittin' done" as a friend of mine often says! This year McMurdo Station is experimenting. Most of the town's population departed before 22 February, but an additional 83 "unwinter-overs" will remain there until 7 March and depart via C-141 from the Pegasus Blue Ice Runway. These folks are staying the extra 2-3 weeks to button-up the town for winter which helps offset end-of-season time crush presented by a longer research season, and allows for an overall reduction in winter personnel. Speaking of small winter populations, this year McMurdo will have only 155 folks, bringing the population to its lowest level since construction started in the late 1980s. Also, it is noteworthy that this will be the last winter for Navy personnel. What a long and distinguished chapter that has been!

**HUMAN LEGENDS.** The Ross Island community was graced this past January by not just one, but two human legends! The first one arrived surreptitiously on January 11th, as a lone skier gliding down the "Willy Road" (a snow road connecting the residents of New Zealand's Scott Base and McMurdo Station with the local Williams Field "airport," the road is also a gateway to the vast Ross Ice Shelf). The man was tidy and unassuming, so much so, that the people he passed along the road did not realize that they were witnessing history, as well as the making of a new human endurance record. The guy was Norwegian Borge Ousland and he was completing the final leg of his solo trans-Antarctic trek, in only 64 days, completely unsupported!

Mr. Ousland had tried the previous year to make his solo trek across Antarctica, only to be stymied at the South Pole. That particular achievement gave Mr. Ousland the distinction of being the first person to reach both poles, solo and unsupported. But he was not satisfied. So he came back for another crack at the continent. This year's trip had been planned as an 80-day sojourn, starting at Berkner Island (78 degrees South and 45 degrees West) on 15 November. During the trek his boot soles cracked, but he refused a new pair at South Pole because that would have been support! He made the journey on skis (which had been specially painted by his 8-year old son), and with the aid of a wind sail. On one record day he covered 226 kilo-

meters! Because of his fast travel time, Borge opted for a longer, yet safer, route off of the Polar Plateau by traveling down the Axel-Heiberg Glacier, (the same route followed by another famous Norwegian, Roald Amundsen), instead of the shorter, crevassed ice fields of the Beardmore Glacier (the route taken by Robert F. Scott). Regarding his colorfully painted skis he said, "They reminded me to take more caution because it's more important to go home alive to my family than cross Antarctica." The lucky guy got both!

The other intrepid visitor to Ross Island was Sir Edmund Hillary, who came to town to help celebrate the 40th anniversary of New Zealand's Scott Base. Many of you will recall that Sir Edmund, besides being the first man to reach the summit of Mt. Everest with Tenzing Norgay, also led the New Zealand contingency of the Commonwealth Transantarctic Expedition of 1957-58. Both Sir Edmund and Mr. Ousland traveled to the South Pole via LC-130 to stand side-by-side at the place their respective heroes and forefathers had toiled so hard to arrive at earlier in this century. Both men provided excellent lectures to the residents of Ross Island.

**ART-ANTICA.** The Prattler hopes to bring readers regular news of upcoming art exhibitions and recently released books inspired by the Seventh Continent. If you know of any, please write the newsletter or e-mail me (note my new e-mail address below).

Lucia de Leiris is currently having two art exhibits of her Antarctic images made from visits to Palmer Station and McMurdo Sound. These exhibits are in Newport, Rhode Island and in Barrington, Rhode Island, but unfortunately will terminate on March 9th.

**OTHER FISH WORTH FRYING.** This year more meteorites were found by National Science Foundation researchers, bringing the total number to over 8,000 found by this group during the past twenty years in Antarctica! These are the same folks who picked up the famous Martian meteorite which may or may not contain traces of microscopic life. NSF and NASA have initiated a special joint research project to further explore the mysteries of that rock.

The Congressionally-mandated external review group, led by Mr. Norman Augustine, visited Antarctica in late December for a tour of McMurdo and South Pole stations. On the whole, the group was very impressed by the U.S. Antarctic Program, and even held "town meetings" at both locations to get grass roots opinions. A comprehensive report on their findings and recommendations will be out in late March. Watch this column for a complete review of that report, which will also be posted on the World Wide Web.

Just when you thought Antarctica had become too civilized with too many of life's conveniences (good and evil), McMurdo Station sprouts an ATM machine! That's right, a "money tree" appeared right in the middle of town this year. All you have to do is give it a shake and out comes crisp greenbacks. The most amazing part is that it also provides the account balance...stateside spouses be warned!

Another successful set of live educational TV broadcasts emanated from the Seventh Continent in January, this time from Palmer Station and the research vessel POLAR DUKE. All sources agree, that these were the best yet. The Prattler is checking on shows available in video format, and will report back soon!

Please make note of my new e-mail address: [k\\_larson@earthlink.net](mailto:k_larson@earthlink.net) I apologize to those who have been victim to unresponsiveness when writing to my former address.

**RIDDLE.** Where can you sit on a beach and enjoy icy Antarctica? (the answer will be in the next Prattle, and no, it won't be a swimsuit issue!)

# THE ANTARCTIC SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 96-97

May

No. 4

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-64  
Mr. Gordon D. Car  
RADM David M. Tyree (Ret.), 1965-66  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94  
Mr. Tony K. Meunier, 1994-96

Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

Paul C. Daniels

## THE OUTGOING DIRECTOR OF OPP SPEAKS TO US ON THE FUTURE

### Perspectives on the Future of the U.S. Antarctic Program

by

Dr. Cornelius W. Sullivan

Director, Office of Polar Programs  
National Science Foundation

on

Thursday, June 5, 1997

7:30 PM

National Science Foundation  
4201 Wilson Blvd., Arlington  
Room 360

(Sign in at Security Desk!)

*Light Refreshments*

Dr. Sullivan heads the Office of Polar Programs of the National Science Foundation, which directs scientific research and operations in both the Arctic and Antarctic. Dr. Sullivan, who has held the National Science Foundation position since 1993, is an oceanographer with a focus on the structure and function of ice-covered ocean ecosystems. His focus is interdisciplinary in nature, ranging from research on microbial ecology in sea ice to the interrelationship between biological and geophysical features of the Southern Ocean from space. Before joining the NSF, Dr. Sullivan was the director of the Hancock Institute of Marine Studies at the University of Southern California. He has served on a number of editorial boards of polar journals and advisory committees for polar research, and was a member of the Polar Research Board, National Academy of Sciences.

*Read about Peter Wilkniss's new endeavors on page 5. He solicits the help of the ancient Greeks, arctic terns, orcas, and the King of England in 1670 to get airborne with his multinational company!*

While strolling through The Baltimore Museum of Arts last fall I wandered into a room where a polar painting by the irascible Rockwell Kent, done on a Greenland scene, struck my fancy. Aside the painting was this notation by Rockwell from his book, *IN SALAMINA*, published in 1935, "In Greenland one discovers as though for the first time what beauty is. God must forgive me that I tried to paint it." This certainly could apply tenfold over relative to the Antarctic, although I don't recall any American artists in Antarctica feeling that its grandeur was beyond their capabilities.

A friend recently wrote and asked if I was related to the famed Scotsman, Alexander Dalrymple. I only wish that I were, because after Christie referred to him in his *THE ANTARCTIC PROBLEM* as "cantankerous," my imagination was piqued to learn more about him. This has been done very nicely in Alex Gurney's truly fantastic new Antarctic history, *BELOW THE CONVERGENCE, VOYAGES TOWARDS ANTARCTICA 1699-1839*. He wrote quite a bit about Dalrymple, so let me quote some of the best. "A portrait of Dalrymple in middle age shows him to be a corpulent figure with petulant lips, beefy face, and choleric eyes that glared accusingly at the viewer. This is a Scot with a grievance, and one who will nurse it to keep it warm. Dalrymple admitted to being 'priggishly precise' ... not one to smooth and lubricate the vagaries of personal relationships." God, I hope that I am related to old Alexander, as he sounds like truly a great man with just the proper attitude towards people, my kind of a man!!

Jackie Ronne will make two cruises on one of the giant Antarctic cruise ships, the MARCO POLO, this upcoming Antarctic austral summer, and will be taking her two grandchildren on one of them. - - - - Have a great summer, but please don't come to Maine. We already have too many cars on the road, and we Mainiacs are antisocial and would prefer less people to more people.

**ANTARCTIC GEOPHYSICIST, NED OSTENSO, CONSUMMATE GOVERNMENT BUREAUCRAT, SUCCUMBS SUDDENLY ON APRIL 13TH.** For thirty years, Ned Ostenso walked the streets of Washington looking very much like a distinguished bureaucratic head that he was, bearing no physical relationship to the man who held for many, many years the record for the world's thickest ice sounding of 4,270 meters. In January 1996, Ned retired as the assistant administrator of the Office of Oceanic and Atmospheric Research, the research arm of the National Oceanic and Atmospheric Administration (NOAA) in the U.S. Commerce Department. He served as NOAA's chief scientist from 1989 to 1990. Prior to coming to NOAA in 1977, he had served as deputy director and senior oceanographer in the Office of Naval Research. Between 1969 and 1970, he was an assistant presidential science advisor in the Office of Science and Technology of the Executive Office. But his longest tenure and his finest and unquestionable happiest hours were spent as the male member of the Ostenso Scientific Household. His dutiful wife, Grace, never upstaged him, but she herself had a distinguished career serving on the staff of Representative George Brown of California who was most prominent in the area of science and technology up on The Hill.

We could quote endless passages from obituaries on Ned, but when it came to coining a phrase, Ned was nonpareil, so we have dug into the past to let Ned tell about

his own career. Let's go back to NOAA Magazine of October 1978 and hear what Ned had to say. "To begin with, I had the good sense to be born at a time and in a place where the action was . . . . Mine has been a privileged life. Not by fortune of inheritance nor heritage, rather, luck and good timing. . . . When I was in college, my research grant constituted the use of my major professor's gasoline credit card, thanks to Dr. George Woollard's own munificence. It wasn't until the day before sailing for a year-and-a-half tour in Antarctica that I learned I was actually going to get paid. Not only had I taken the term "volunteering" literally, but having the opportunity to do research was generally regarded as a privilege and not a source of income. For the most part, the equipment we had was what we made ourselves, from seismometers to magnetometers. I am not saying that those are the good old days, albeit the memories are fond. Today's reasonable compensation to the researcher, plus his supporting infrastructure of technicians, laboratories, computers, etc., is the proper and necessary direction of social evolution reflecting society's expectations from the scientific milieu.

"Discovery that the Antarctic ice cap was kilometers thick, rather than tens or hundreds of meters as commonly believed, drastically revised concepts of the global water budget with profound environmental implications. I still proudly hold title to the world's thickest ice sounding of 4,270 meters. The discovery was sufficiently startling that when we finally arrived at Byrd Station and radioed our findings back to the Academy of Sciences, the message was believed to have been a garbled transmission."

Now let's turn to a letter of November 1986 to The Antarctic Society. "My introduction to Antarctica was both casual and traumatic. The casual part was a brief note from an unknown named Bert Crary with some terse instructions about a physical examination and reporting to Davisville. Upon investigation, I discovered that George Woollard had volunteered me for 2 years of Antarctic service. The fact that I had not been his graduate student since being given an irrefusable offer to serve my country in the U.S. Army Signal Corps, or that I was then happily engaged in the search for oil in the Gulf of Mexico, or that I may harbor some independent views about my future did not occur to George. By the same token, it never occurred to me that I should not go.

"The traumatic part was a little warm-up exercise in Greenland. Someone (to this day, I don't know who to blame) thought that we were entitled to a preview of coming attractions by driving across Greenland along the 80°N parallel to the region (pole of inaccessibility, if not undesirability) where an earlier British-French expedition had failed to get seismic reflections. Charlie Bentley, Hugh Bennett, and I were greeted in Thule by the Air Force Strategic Air Command with unlimited access to their junk yard and garbage heap, from which we finally assembled three working weasels and rations. We got there, and we got back. In between there was a lot of unpleasantness.

"On the JOSEPH F. MERRILL, we shared the number four hold with Mort Rubin, Mario Giovinetto and Vern Anderson for a 2-month cruise to the Bay of Whales. My first view of the Ross Ice Shelf under the Antarctic sun was the first of a long series of visual, emotional and intellectual experiences I was to have for the next 18 months of oversnow traverses and station life. I remember no hardships or privations, only beauty and excitement. But most of all, I remember people. Comrades are, after all, the heart of the Antarctic experience and the soul of the continent."

I should know enough to stop right there, because after those last few sentences, everything else is going to be anticlimactic. But we must mention that Ned was given the prestigious Waldo E. Smith Medal by the American Geophysical Union in 1996 for "extraordinary service to geophysics."

For a kid from Chippewa Falls, he did all right. He was involved in regional

gravity studies in Alaska, a seismic traverse across Greenland at 80°N, and he ran a line of absolute gravity pendulum stations the length of Africa. And, as you should know, Ned was an important member of the International Geophysical Year's scientific staff at Byrd Station in 1957-58, and was on the summer traverse which discovered all sorts of good stuff. Ned's work resulted in more than fifty scientific papers, including ones with Charlie Bentley that helped to establish the mass of the Antarctic ice sheet and the topographic discontinuity between East and West Antarctica.

The scientific community is sure going to miss Ned. He went quickly, dying from a sudden and massive coronary attack on April 13, 1997, following a healthy and fruitful sixty-six years of good living and high accomplishments.

**EMPERORS CAN WEAR WHITE.** Gerry Kooyman culminated thirty years of studying penguins by seeing the piece de resistance, an all-white penguin. He was scanning the penguin colony at Terra Nova Bay with his binoculars last December when he saw an Emperor which was white right down to the toenails and the bill. . But it was not an albino, since its eyes were brown. Kooyman said that this bird was just a genetic accident. He said that white Adelie penguins and pure black King penguins had been sighted, but he knew of no white Emperors.

The good news is that Kooyman saw it and photographed it; the bad news (for the penguin) is that he/she/it may be a short-timer. First, the survival rate for Emperor chicks is low, and second, a white bird would stand out in the water, and could be more vulnerable to leopard seals and fur seals. Kooyman said that the white color may be the ultimate flasher.

**EMINENT WORLD CLIMATOLOGIST, AND FATHER OF AN ANTARCTIC SCIENTIST, RESPONDS TO REQUEST ON ANTARCTIC WARMING.** The fact that the Planet Earth is warming in this century cannot be denied any more, and the contention that this warming is due to human activities is now generally accepted by the scientific community. It was just twenty years ago that my World Meteorological Organization's technical note was published on this subject, and last year the prestigious Intergovernmental Panel on Climate Change (IPCC) weighed in with essentially the same message. After carefully reviewing all the evidence, the IPCC said, "Taken together, these results point towards a human influence on global climate."

Thus, if the world is warming up, so must the Antarctic. There is already good evidence that it is indeed warming, as evidenced by both the temperature record (which is unfortunately noisy and too short) and the behavior of the ice shelves around the continent. I think the most important next question has got to be: Is the Antarctic ice sheet growing or shrinking as a result of the warming? (I will not deal with the alarming suggestion that the West Antarctic ice sheet might suddenly slip into the ocean, which few responsible people, including Charlie Bentley, believe could happen in the next several centuries.)

The importance of this question obviously lies in the fact that if the ice sheets were to melt or slip into the ocean, it would raise sea level more than 60 meters; and those near sea level (like Florida) look upon this sort of change with considerable apprehension, of course.

One's first thought must be that a warming would result in a melting, and this would raise sea level. But, on second thought, consider that warmer air can hold more moisture, so there would be more snowfall on the ice sheet and it would grow. Interestingly enough, Capt Scott was one of the first to suggest the latter scenario, as pointed out to me by Norbert Untersteiner.

I wish I could tell you which of the two predictions was the more plausible, but

I cannot. For more than ten years a group of us (including the late Bill Campbell) has been urging NASA and the military satellite people to fly a series of satellites in high inclination orbits (to cover the poles) and equipped with either radar or infrared altimeters to accurately survey the height of the ice sheets. (We know this can be done, since Jay Zwally has published such satellite observations for the southern third of the Greenland ice sheet.) I hear rumors that such observations may be in the planning stage - let's hope so!

So there you have my thoughts, Paul, for what they're worth. I hope your readers will find them interesting, and just possibly someone in authority will give the satellite idea a push in the right direction. (William W. Kellogg)

**WILKNISS'S INTERNATIONAL POLAR BUSINESSES - PKI AND TAAI.** I have established two organizations in Alaska - Polar Kybernetes International (PKI, *kybernetes* - Greek for steersman, governor) and the Transnational Arctic and Antarctic Institute (TAAI) to engage in a variety of businesses in both polar regions.

VISION. Beginning with the ancient Greeks, the polar regions held mystery, wonder, and challenge, and fueled the desire to know the unknown. In these regions extraordinary forms of life defy incredibly harsh climates and have sustained equally defiant ancient civilizations in the Arctic. Last explored and conquered, involving human drama of epic proportions, the polar regions have waxed and waned in their importance in the political, economic, and strategic aspects of global significance

Today, using modern means of communications, transportation, and the ever increasing globalization of international business the polar regions offer unique opportunities to the entrepreneur willing to take advantage of the bipolar, i.e. Arctic and Antarctic historic, cultural, environmental, artistic, tourist, scientific, technical, educational, resource, and commercial aspects of business and trade.

Therefore, create PKI and TAAI as the foremost global organizations doing business in both polar regions. The inspiration for this is Hudson's Bay Company. This "Company of Adventurers" chartered for the lucrative fur trade by the King of England in May 1670 could be considered the first multinational company. Hudson's Bay Company in its prime, a century and a half ago, was an absolute commercial monopoly and the de facto government in northern and western Canada, as well as parts of Siberia and what would become the northwestern United States. Such reign over commercial activities, as that exerted by Hudson's Bay Co. in the Arctic regions, never existed in the Antarctic realm, where sealers and whalers operated the only commercial ventures. Today, seizing the exciting opportunities of the modern age the bipolar business approach is feasible, inviting and promising.

ORGANIZATION SYMBOLS. The symbols for these organizations are the Arctic tern and orca. The Arctic tern is a small, aggressive bird that follows the light as it migrates annually between the Arctic and Antarctic, while the orca is a magnificent, fierce marine mammal residing in both polar seas. These unique animals represent the bipolar nature of the Institute as well as the global, far-ranging, competitive and tenacious spirit of these organizations.

MISSION. To be the worldwide leader in promoting knowledge and understanding of the importance of the Arctic and Antarctic, and in providing the highest quality information, communication, products, services, and solutions for opportunities and problems in both polar regions on a for-profit and/or not-for-profit business basis. (Peter E. Wilkniss)

**REVIEW OF ANTARCTICA - A LONELY PLANET TRAVEL SURVIVAL KIT BY JEFF RUBIN.** (John Splettstoesser) Designed mainly for new travelers, the contents provide excellent background information, including a very thorough section on "Facts" (History &

Exploration, Geography, Geology, Climate, and so on), followed by practical information such as visas, customs, money, books, films, photography tips, and an interesting section on "Dangers and Annoyances," in which the casual comment is made that "If you fall overboard, you will die." Seawater at less than freezing point makes realistic the advice given for those who fall overboard—swim as hard as you can for the bottom, for drowning is thought preferable to freezing to death. I remember similar advice from a C-130 crew member on a flight from Christchurch to McMurdo many years ago—if we have to ditch at sea, chain yourself to a foot-locker and go down with the plane—it's quicker and less painful!

Not all Jeff's travel tips are as brutal, however. "Getting There" is covered thoroughly in a chapter on tourist groups and tour vessels, as well as yachts and air travel to the interior, which includes mountaineering expeditions, skiing, flights to the South Pole, and also visiting and camping in emperor penguin colonies. The Antarctic Tour Operators group known as IAATO is given praise for keeping the tour vessel community together and following environmental standards for visits. Contributing authors provided very useful chapters on wildlife, environmental issues, science and private expeditions. Antarctic gateway ports are reviewed to the degree that the reader is given lots of tips on where to stay and what to see in Cape Town, Christchurch, Hobart, Punta Arenas, Stanley, and Ushuaia, virtually all of the ports used nearly every season for tour vessels going to Antarctica.

The book then provides brief accounts about individual parts of itineraries in Antarctica, including the sub-Antarctic islands, Falkland Islands, and many of the commonly visited sites in the Antarctic Peninsula, Ross Sea sector, and even in East Antarctica (east longitude coastline), where tour ships are uncommon. In case you hop on a flight from Patriot Hills (SOS, 85W) in the interior to the geographic South Pole via small aircraft operated by Adventure Network International, the book has advice on what to do there, what to see, and things to buy. Yes, souvenir shopping has been in Antarctica for many years, even at the U.S.-operated South Pole Station. To complete the contents, the Antarctic Treaty is included in an Appendix, followed by a Glossary of tricky terms, and then an Index to lead to subject matter in the text.

For the price (\$17.95 U.S.) the book is a bargain, complete with many color photos taken by the author and others. As with virtually all other Lonely Planet Survival books, this one will need regular updates to keep the information current. The list and description of tour operators and ships, as an example, applies to the 1996-97 austral summer, for the most part, and succeeding seasons will differ in some respects, including new operators in IAATO, as well as new and different itineraries. The few glitches or gremlins I spotted in reading every word in the book, scrutinizing each map, and all other details were not surprising. None of those detracts from the book or its overall value, and presumably will be corrected in the next edition. Some errors are carryovers from earlier reference works, I suspect, as (p. 269) in Shackleton's men spending 105 days on Elephant Island following the shipwreck of the *ENDURANCE* in 1915-16. Reader's Digest *ANTARCTICA* has carried that mistake through two editions. On p. 302, the largest Adelie penguin colony in the world is at Hope Bay, whereas that claim more accurately applies to Cape Adare (with more than 270,000 breeding pairs, vs. 124,000 at Hope Bay). On p. 306, there is confusion about Waterboat Point (where Bagshawe and Lester spent the 1921 winter - the Chilean Videla Station is there now) and Almirante Brown, site of the present Argentinean station. And the map of Cape Town on p. 203 should have included the monument to R. F. Scott, just across the street from the tourist center—it's worth looking at if you're in the city.

The efforts put into the 362 pages are well worth it, and a treat to see a reputable book about Antarctica by someone who has been there several times and knows the subject well. Too many times the literary outcome is by someone who visits the place once, normally on a tour ship, becomes an "instant expert," and the product shows it. Jeff's book is a pleasing exception.

*Kristin Larson's*  
*PENGUIN PRATTLE*

**SAD REMINDER.** We all know how remote Antarctica is. Whether we go there by ship or by plane, or even if we never get any closer than a perusal of a map, it is far away, and it is white. Kind of like the moon. And we intuitively know of the risks that we willingly expose ourselves to in traveling there...in fact, for some of us, those risks are an inherent part of the attraction. Yet in spite of this intuitive knowledge we are always pulled up short when we learn of the death of a fellow Antarctic sojourner.

Just last week (early May), a man who has been an integral part of the Antarctic fabric, died of heart failure in the midst of the Antarctic winter. The man was Charles "Chuck" Gallagher. Chuck has been a part of the program for as long as I remember, which means the better part of a decade. In the early years of my acquaintance with Chuck, he was "a green coat"...part of the Naval Support Force. He had an important role as Command Master Chief, a top-ranking position, charged with keeping young (and not so young) enlisted folks happy and motivated. He did his job well. Later, after Chuck retired from his distinguished 30-year naval career, he went to work for Antarctic Support Associates, the civilian contractor for the U.S. Antarctic Program. Chuck was wintering over in McMurdo Station when he became gravely ill. A C-141 medevac flight was enroute from Travis Air Force Base when he succumbed. What we sometimes forget while we are in Antarctica, surrounded by the trappings of modern living, is that the veil of life is thin indeed; and the nearest hospital is thousands of miles distant. Many are the amazing rescue missions, but this too is part of the Antarctic story.

**U.S. INSTRUMENT GETS "DEPOSITED."** Last month, the United States officially deposited their instrument of ratification for the 1991 Protocol on Environmental Protection to the Antarctic Treaty. This leaves only two Treaty Parties who have yet to accede: Japan and the Russian Federation. Once all Parties have acceded, the Protocol will enter into force and provide important environmental protections to Antarctica. Many countries, including the U.S., have already incorporated the environmental protection requirements of the Protocol into their national programs, and thus will not need to make substantial adjustments to meet the Protocol's standards. One area of Antarctic activity that will experience some new duties, at least at the administrative level, will be non-governmental visitors to Antarctica, including the tour operators and private expeditions. These folks will now be assessing their own activities to ensure that they have considered their potential environmental impacts. To a visitor on a cruise, the changes will probably not be too noticeable, mainly because the tour operators are already keenly aware and take care to minimize their impacts.

The enacting legislation, signed last October, named the U.S. Environmental Protection Agency (EPA) as the agency to provide oversight to the non-governmental activities in Antarctica. Part of EPA's charge is to develop guidelines for the tour operators and expeditions to use when assessing their potential environmental impact. Currently these guidelines, which take the form of an agency rule, have been published in *interim* form. This was done so that the U.S. could deposit the ratification instrument prior to the annual Antarctic Treaty meeting to be held later this month in Christchurch. It is hoped that the United States' action will prompt the remaining two Parties to do likewise and allow the Protocol to officially enter into force. In the meantime, EPA is developing a final rule in the usual federal manner which involves plenty of opportunities for public involvement. A public meeting focused on hearing people's ideas and concerns about tourism in Antarctica will take place on July 8th in the Arlington, Virginia area (probably very near to NSF). If

you want details on time and place, drop me a line at the Antarctic Society address or via e-mail, and I will provide information when it is known. Also, for you cybersurfers, the Interim Rule and its supporting Environmental Assessment (which yours truly had a hand in writing) can be viewed at EPA's World Wide Web site: <http://es.inel.gov/oeca/ofa/>.

**ART-ANTICA.** Currently the Smithsonian's Natural History Museum is running a show which includes 30 splendid photographs by Galen Rowell. The show's title is "Poles Apart, Parallel Visions of the Arctic and Antarctic," and it runs through August 4th. You may have seen Galen's large format book of the same title.

Ann Hawthorne, Society Vice President, has a number of her images posted on the World Wide Web at <http://www.discovery.com/area/eyeonroadmar/photogallery.html>. These images and others will make up a traveling exhibition that Ann is currently putting together.

A new book on Antarctica has just hit the racks. It is by Rebecca Johnson, an award-winning writer of books for young adults. She has previously written an excellent primer on ozone depletion after traveling to Antarctica, and her most recent oeuvre is about women! The book's title is *BRAVING THE FROZEN FRONTIER, WOMEN WORKING IN ANTARCTICA*, Lerner Publications, 1997. One enthusiastic reviewer had this to say about it: "And this one to the girls who love to question the rules and aren't afraid to compete with the boys - they have nothing to lose but the feeling in their fingers and toes!"

**NIGHT SHIFT SCIENCE.** For many Antarctic researchers these are the months to warm up, dig around in the garden, collate results, and (yee gadz) write proposals. However, for a small enclave of dedicated astrophysicists and upper atmospheric scientists, the Antarctic night provides a perfect palette. Currently wintering over at South Pole Station are eleven researchers. Dr. John Lynch, Program Manager for Antarctic Astrophysics and Aeronomy at NSF told me that only in the past couple of weeks has it become dark enough at the South Pole to turn on the huge telescopes and start making observations and measurements of such things as auroral spectra. There aren't any big celestial events expected, at least not on the same scale as the collision of comet Shoemaker-Levy with Jupiter, which the South Pole telescopes captured with amazing clarity. However, once the Hale-Bopp comet moves into the southern hemisphere it may provide some entertainment for the "Pole-cats." John also told me that four Automatic Geophysical Observatories, which record and transmit all types of atmospheric data from locations around the Polar Plateau, are in operation. I guess they qualify as part of the wintering science population too!

**WAGGING TAIL.** Well, the much anticipated report from the "External Panel" will be on the street any day now. Recall that the External Panel was a Senate-mandated group composed of highly distinguished scientists, administrators and industry professionals, and headed up by Mr. Norman Augustine, former CEO of Lockheed Martin. The Panel was charged with reviewing the entire U.S. Antarctic Program, and most particularly the concept of a replacement South Pole Station. Apparently the Panel's report provides strong and convincing endorsement for the new South Pole Station, and for the program as a whole. I was also informed that the House Authorizing Committee provided very positive language to NSF recently regarding their plans for the new South Pole Station, probably as a result of Mr. Augustine's testimony on that topic. We all know that talk is cheap, but a new station is looking brighter all the time!

*In our next Newsletter we (will say farewell to POLAR DUKE and welcome to LAURENCE M. GOULD!*

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 97-98

October

No. 1

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Tone, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94  
Mr. Tony K. Meunier, 1994-96  
Mr. Ronald S. Naveen, 1996-98

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Court Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amor) H. "Bud" Waite, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C Dalrymple

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Saved Z. El-Sayed, 1990  
Dr. Charles W. Swithinbank, 1991  
Dr. Susan Solomon, 1992  
Dr. Michele E. Raney, 1993  
Dr. Doyle A. Harper, 1994  
Dr. Edith L. Taylor, 1995  
Dr. William J. L. Sladen, 1996

IS WEST ANTARCTICA ON THE MOVE?: IMPLICATIONS  
FOR CLIMATE AND SEA LEVEL

by

Dr. Robert Bindschadler

Chairman, West Antarctic Ice Sheet Working Group  
NASA Goddard Space Flight Center

Greenbelt, Maryland

on

*Tuesday, October 28, 1997*

12 Noon

National Science Foundation  
4201 Wilson Blvd., Arlington

Room 380

(Sign in at Security Desk)

Dr. Bindschadler has led eight field expeditions to Antarctica, and has participated in many others to glaciers and ice caps around the world. His main interests are in the dynamics of glaciers and ice sheets with a focus on the use of remote sensing to improve our understanding of the role of ice in the Earth's climate. He has developed techniques to measure ice velocity and elevation, using both visible and radar imagery, to monitor melt of the ice sheet by microwave emissions, and to detect changes in ice-sheet volume by repeat space-borne radar altimetry. Bring your crampons and ice axes!

1998 New Zealand Antarctic calendars available at \$11.00.  
Send your orders now to RJS. Avoid the rush.

*Highly recommended family reading - Charles Swithinbank's  
AN ALIEN IN ANTARCTICA! See pages 8 - 9.*

The northern hemisphere summer is winding down, so we must get back to the word processor. But this year something new has been added – we now have an e-mail address here in Maine. It's on the cover page, but here it is again – pcdal@midcoast.com That will come in on the white box of Paul Dalrymple. Should you wish to e-mail Ms. Penguin Prattle, aka Kristin Larson, her address is: k\_larson@earthlink.net

The big news in our headquarters is that our Honorary President was invited by the powers-to-be in the Office of Polar Programs to swing with some gusto a bottle of champagne onto the bow of the LAURENCE M. GOULD. I'm sure Larry would have wished that it could have been poured through his very own lips rather than smashed against his bow. He certainly would have felt in this case that it was a waste of the nectar of the gods.

We recently had a great overnight visit from George and Mary Lowe. Hadn't seen George since mid-January 1958 when he came into the South Pole station as a member of Bunny Fuchs' British Commonwealth Trans-antarctic Expedition. He's in great shape; ditto for his bride, even more so! George is a famous mountaineer, famous photographer. He was with Hillary and Tensing on Mt. Everest, and his film, "The Conquest of Everest," won the award that year for Best Documentary Film. Antarctica breeds great friendships.

Bernadette Hince, science editor for the Australian National Dictionary, will publish in late 1998 a "Dictionary of Antarctic English," documenting what well may be the world's youngest English dialect. Such words as "bolows" will appear, which is defined as burned-out left-over winterer. Antarctica itself was created by ancient Greeks, hypothesizing an icy southern place to match the one they knew about in the north: thus, *ant*, Greek for opposite, and *arctos* or Bear, after the name for the northern constellation.

We haven't gone to press recently, and during that interim our ranks have been depleted. Elsewhere in this newsletter you will read about the passing of a very active member of our Society, Pete Burrill. But also gone is Gordon Fountain, age 84, who may have been the last surviving member of the BEAR OF OAKLAND from the 1933-35 era. And Roy Shults, a retired Navy captain who served under Admiral Dufek, died at age 82 in early August; plus Admiral Dick Black's beloved widow, Aviza Black, an artist who did fashion drawings, who died of cancer on May 7th. Although not a Society member, the internationally renowned Emperor penguin photographer, Bruno Zehnder, got caught in a blizzard while working off Mirny station, and perished in the storm when he wasn't able to find his way back to camp. John Spletts' obit on Bruno appears at the end of this newsletter. As far as I know, the rest of us are more or less alive as Ruth and I enter our third decade of giving you some facts, some fictions, some out-and-out fabrications. The astute Bernard Stonehouse compliments our outputs by referring to them as "taradiddle." We don't care what you call it as long as you read it! For the pure truth read Kristin Larson's Penguin Prattle which will appear in each and every issue.

**THE 1998 NEW ZEALAND (HEDGEHOG) ANTARCTIC CALENDAR.** Again we offer you the most beautiful Antarctic calendar that we know of at a ridiculously low price. We don't break even on them, as we are here to serve you, not to make money off you. Come to think of it, though, not the best way to run a society!

But this new calendar is a good one, although not their greatest. The centerfold is certainly not your typical centerfold, this one being a painting by Wally Herbert of the *ENDURANCE* locked in the ice, complete with an aurora overhead canopy. The January photo of an orca skyhopping at McMurdo is well worth much more than the price of the calendar. Truly spectacular! And September's light on icefloes and peaks in Paradise Bay is a dandy.

We have enough calendars this year so you will get them in plenty of time for Christmas mailings. But don't delay, order now, and liberate Ruth from making Christmas runs to the post office in late December. Buy, buy several!

**OCEANITES ANSWERS DREAMS OF TOURISTS.** Our Society's illustrious president, Ron Naveen, who is the commander-in-chief of Oceanites, has come up with two breadwinners which will shortly be on the streets. And one, "The Oceanites Site Guide to the Antarctic Peninsula," bids well to be a big seller for the 10,000 or so tourists going to the Peninsula. It will be the bible that will give everyone a detailed description of what lies in store for them, as well as a factual history to take home to show friends, neighbors, and cohorts what they actually did see. Jeff Rubin's "Lonely Planet" book will get tourists to the ships, but old Ron is going to make their trip come alive by telling them what's in store for them.

This black wire-bound book, 9" x 6", has 128 pages, 116 colored photos, 20 maps, and covers 39 prime visitor sites. Another 21 sites are also mentioned. This is the first site-by-site guide ever published. All tour companies distribute end-of-the-cruise logs for their tourists, but this study will be a handy-dandy to have to help one do his/her own planning as the ship moves along the Antarctic Peninsula.

At this time we cannot give you specific information on how to obtain this site-specific book, but we will tell you how in our next newsletter. It will be available in November. People going to our meeting on the 28th will have an opportunity to see an advance copy.

Another Ron Naveen/Oceanites report coming out soon is "The Compendium of Antarctic Visitor Sites," which will be available through the governments of the United States and the United Kingdom. Essentially it is the result of three summers' work on the Antarctic Site Inventory at 51 sites on the Peninsula, and a full analysis of where tourists have gone and what they have done in the last eight years. The report will have site descriptions, maps, photographs, data, animal counts, and a lot more, some of which may actually be of interest to someone. One never knows what curiosities lurk in the hearts of humans, but this book should be an encyclopedia of information and data on all Antarctic tourist sites. All you ever wanted to know about Half Moon Island, and never asked!

Again, we have no detailed information on how you folks can get a copy, but it is expected to be available through our State Department's Ocean and Environment Section. And if you have a U.K. address, you can go to the Antarctic desk in the Polar Regions Section of the Foreign and Commonwealth Office in London. But more information in the next newsletter.

**R/V LAURENCE M. GOULD DEDICATED, OCTOBER 9, 1997.** Isn't it a miracle that our illustrious Honorary President was able to christen the R/V LAURENCE M. GOULD with only one swing, and here I thought she was a weakling! I notice the write-ups on

the ship keep referring to it as "the GOULD." Even though he was a most distinguished scientist, college president, and chairman of everything polar, he was always just plain "Larry." Anyway, this new multi-disciplinary research platform, designed for year-round polar operations, will accommodate 26 research scientists working on 75-day missions. Larry lasted almost a century, so this ship has a lot of sailing to do, a lot of miles to cover, to catch up with him.

Ruth being selected to christen the LARRY was another jewel in her tiara as Grand Dame of U.S. Antarcticans. For many, many, many years she stayed on the sidelines at home being the dutiful wife and mother while Paul was serving as a polar explorer-scientist. With Paul's passing, Ruth, in a very conservative reserved way, started to nurture her own personal interests in the Antarctic. Her home became our headquarters, and for twenty years now she has done everything to keep us afloat as a Society. And, believe me, typing, folding, and stuffing these things into over 500 envelopes is no picnic. It is just so nice when something like this is bestowed upon this gracious woman. I know how deeply she appreciated the honor. And I also know how much she appreciates letters from you all - they make her days. We're so happy for you, Ruth.

**CEREMONIES TO MARK DOD ANTARCTIC SUPPORT TRANSITION** (May 28, 1997, Naval Support Force Antarctica, Public Affairs Office in Port Hueneme, California). Since the days of Admiral Richard Byrd's historic flight over the South Pole, the U.S. Navy has led the way in opening Antarctica to scientific exploration.

However, with its expeditionary mission complete, the U.S. Navy will formally turn over the responsibility for logistical support of the U.S. Antarctic Program to the U.S. Air Force in a ceremony to be held in Christchurch, New Zealand on February 21, 1998.

A second ceremony will be held on March 12, 1998 at the Naval Construction Battalion Center in Port Hueneme, California. This ceremony will formally disestablish the historic U.S. Naval Support Force, Antarctica after 42 years of providing expeditionary and logistical support on the world's most southern continent. Individuals interested in attending any or both of these ceremonies are asked to contact JOC(AW) Jacqueline Kiel at (805)982-5934, or via e-mail at: nsfa15b.nsfa@asa.org.

**OHIO STATE UNIVERSITY IS BECOMING ANTARCTIC CITADEL IN THE U.S.** The United States has never had a dominant polar center, although the Stefansson Library at Dartmouth once made Hanover a center of importance. And there is not only a great, but truly fantastic, Arctic museum honoring Peary and MacMillan at Boudoin College in Brunswick, Maine, which is a well-kept secret. It is a model of what a polar museum should be, and one of our very own, Ken Moulton, is a docent there.

But elsewhere in this newsletter you will see supporting articles for bringing back the dome from the South Pole and reestablishing it on the campus at Ohio State University, using it as a polar centerpiece museum. Ohio State has come a long, long way since the establishment of their Institute of Polar Studies immediately after the International Geophysical Year. There is no other university in this country which even comes close to approaching them in Antarctic PhDs. Their current facilities are superb, they have a lot of topnotch researchers, and they seem to have an aggressive bunch of professionals. And what a delightful addition to their library in Emanuel Rudolph's collection of fine polar books. Although Ohio State maintains their archives elsewhere on campus, there are some pictures of polar explorers on the wall, and a display case of polar memorabilia. Visiting the Byrd Polar Research Center makes one feel good inside, and, as an individual interested in polar history, there is a strong internal wish to see their center grow and prosper as they have

since their inception under that great gentleman, Dick Goldthwait.

**BRING THE DOME HOME!** (Sandra Markle). I'd like to invite you to share the vision for an exciting opportunity—the creation of a special national Antarctic museum.

Plans are underway to add new facilities at the South Pole Station that will expand its size and research capabilities. These plans, however, include removing the dome which has sheltered the main station buildings for the past two decades and retrograding it as trash. Instead, let's BRING THE DOME HOME! When it's home, let's reconstruct it as a national Antarctic museum—perhaps to be called The Richard E. Byrd National Antarctic Museum. And let's pack it full of exciting, interactive learning experiences about past exploration, current research, and, most of all, the incredible continent of Antarctica.

I'm pleased to share that an effort is underway to make this vision a reality. Senator John Glenn has expressed enthusiasm for the project. So have a number of Antarctic researchers, including Gerald Kooyman and Ellen Mosley-Thompson. Brian Shoemaker of the American Polar Society has also been actively working toward this goal. At a recent meeting of the Byrd Polar Research Center's Executive Committee, the group voiced unanimous support for the idea of bringing the Dome to Ohio State University and constructing the museum in connection with this Center, a plan with exciting potential for a powerful synergy of purpose, people and place.

A national Antarctic museum would be especially valuable for children. This would be a place to remember the past and to explain the present. Even more, though, it would be a center for creating a vision for the future. From the very beginning of the project, school children throughout the U. S. should share the vision by contributing their pennies, nickels, and dimes to BRING THE DOME HOME! Then while they await its return, they will have a reason to learn about Antarctica and the rich research history of which the Dome is a part.

The opportunity to transform the Antarctic Dome into an interactive museum for the children of the 21st century offers exciting possibilities. It's rare when something that might otherwise become trash has an opportunity to inspire future generations. Come share the vision! Please speak up, and add your words of support!

**MEREDITH F. "PETE" BURRILL, BON VIVANT GENTLEMAN, SUCCUMBS AT AGE 94.** Pete Burrill, one of the founding planks in our Society, one of our past presidents, supposedly died according to the most prestigious national newspapers, on October 5th. Not true, Pete just stopped breathing. He is going to live on ad infinitum among those of us who were fortunate enough to have known him. His voice may be silent from now on, but his spoken words of nearly a century of achievements will echo on for years, and his eyes, twinkling from hearing something which tickled his fancy, will shine on and on and on.

There was a very lengthy - seventeen paragraphs - humanized obituary in the New York Times for October 10th, and there was a watered-down obituary in the Washington Post on October 11th. But, unfortunately, some of his accomplishments were not included, including his important roles as a highly recognized and accredited national and international scientist. He was a past president of the Association of American Geographers, 1966, and for years and years headed up their Bylaws Committee. He was the second president of the American Name Society, 1955, an organization pertaining to place names rather than name calling. He was chairman of the U.N. Conference on Standardization of Geographical Names, held in Geneva in 1967, and from 1960 to 1977 was chairman of the U.N. Group of Experts on Geographical Names. For thirty years Pete was the Executive Secretary of the United States Board on Geographic Names, and Director of the Office of Geography, Department of the Interior, until he was super-

annuated in 1973. He also taught at Lehigh, Oklahoma State, and George Washington University, among others.

Pete was introduced to the polar regions in 1940 and 1941 when he went to Alaska on behalf of the General Land Office, and shortly thereafter started working on problems related to Antarctic names. In 1949 he produced the first U.S. Gazeteer on Geographic Names of the Antarctic, and followed that one with another in 1956. He visited Antarctica in 1959, and, subsequently, was honored with his name on a 2310-meter mountain in Victoria Land.

In early spring of 1981, Pete, who lost his first wife two years previously, married Betty Didcoct, another geographer, another past president (she of the Society of Woman Geographers). We were officially invited to the ceremony, and we unofficially wrote it up in the April 1981 Antarctic Society Newsletter. It was loosely written, to say the least, but Pete liked it, so sent it off to the headquarters of Phi Beta Kappa, and, lo and behold, they reprinted it in its entirety. There went Phi Beta Kappa!! Pete was described as being dressed to the gills, and looking something like an Emperor penguin with a mustache. Betty made out better with "her smiling radiance permeating every inch of the church." Famed mountaineer Barry Bishop was quoted as saying that it was a grand reaffirmation of how weddings should be. And we wrote that "never in the history of geography in this country had so many geographers gathered in a rookery with such a commonality of love and friendship. The church, Chevy Chase Presbyterian, was filled with people, wall-to-wall. It was a great wedding as weddings go, and the reception was a fantastic production, too.

Pete, for all practical purposes, amounted to Mr. Geography in this country, the Charles Swithinbank of geographers. We all know that Charles has been in Antarctica during the past six decades; well, Pete went to the national meetings of the Association of American Geographers in each of the past eight decades, even presenting a paper in the 1990s. He was a most loyal graduate of Bates College in Lewiston, Maine. His class of 1925 annually returned to join other class reunions. On his 70th, he led the Alumni Parade, sitting in a wheelchair with his class numerals on a placard in his lap, and waving warmly to the surrounding crowds. A devoted native of Maine, Pete returned most summers to midcoastal Maine where he had a home in Pemaquid. Pete is going to be missed - one hell of a guy!

**AN ALIEN IN ANTARCTICA BY CHARLES SWITHINBANK** (reviewed by Steve Dibbern). Surely Dr. Swithinbank's experiences must qualify him as one of the preeminent explorers of the OAE. He has been a part of Antarctic operations from 1949(!) in Queen Maud Land to the present. Longevity and breadth of experience alone would put this book on any Antarctic's "Must Read" list. Fortunately it meets all expectations from a number of directions.

It should be understood from the outset that the real limitation is the scope which limits the book to his experiences with the American program. The good news is that it is understood that there may be one or two more books concerning his career with his native British program and private expeditions.

Historically Dr. Swithinbank does a good job of weaving his experiences into the overall fabric of our program. Many researchers who write about their experiences maintain a strictly personal narrative, but he explains both the setting and the personal detail that paint a picture of the changes in politics of science, the methods used and the conditions in the field. "Alien" is also very well illustrated with photos (mainly his own) and maps. His story also illustrates how early scientific developments with such things as glacial flow measurements can, over time, grow into larger and branching programs, such as the flying programs, with the Scott Polar Research Institute and later to the Blue Ice Runway program and tourism flights.

Personally he is generous with anecdotes so that the younger reader can understand what conditions were like during a not-well-recorded period of Antarctic research. He is also generous with his praise of both his scientific colleagues, and just as importantly, with the support personnel who made much of his scientific work possible

A last point, both for the reviewer and in his book, is a most interesting epilogue. This may be the most important part of his book. It is a summing-up of his total experiences scientifically, politically and personally, and it is worth reading. He uses both praise and criticism to make his points about how Antarctic science happens and where it is headed. It is one of the most balanced assessments that I have read.

I do not know Dr. Swithinbank (although we must have come very close at one point at McMurdo), but this book makes me wish I did. He writes like the gentleman that, I am told by mutual friends, he is. I look forward to the future volumes about his vast Antarctic experiences.

**AN ALIEN IN ANTARCTICA BY CHARLES SWITHINBANK** (Additional review by John Spletts-toesser). It was a pleasure to read this book by Charles, having known him since 1960, my first trip to Antarctica, and for him at that time, just another of many and many more to come. During later years I had the good fortune to spend time in field areas where he also worked, and witness some of the exploits he meticulously has recorded in his book. He apparently kept very detailed journals because names and events are thoroughly documented. It is not just another explorer's journal, but an interesting account of his life in Antarctica. Somehow he got the publisher to include numerous color photos and also keep the cost of the book within reach of the intended audience. And the good news is that he intends to issue additional books to cover other aspects of his career. By all means, order the book for a reading of adventure "in the pursuit of science," as the author puts it. Send a check for the book cost (\$49.95) plus \$3.00 shipping and handling to McDonald & Woodward Publishing Co., 6414 Riverland Drive, Fort Pierce, FL 34982 (telephone 800-233-8787) For orders to non-U.S. addresses add another \$3.00. Once you have the book in your hands you will discover the meaning of the word "Alien" in the title.

Kristin Larson's PENGUIN PRATTLE

(e-mail address: [k\\_larson@earthlink.net](mailto:k_larson@earthlink.net) Rewards for news, comments, tips!)

**PENGUIN PRATTLES.** Antarctica wakes and stretches; the gauzy pinkness of her sky belies the yawning ozone hole beyond. Mole-eyed winter-overs tire of their papaya-tinged dreams and their two-dimensional travel plans. Meanwhile, tour operators are pulling on their Helly Hansens, intrepid ice pilots dust off their machismo, and eager Antarctic researchers strain towards the gaping white maw of discovery. A fresh season beckons: on! on!

**ACTING UP.** In our last newsletter (eons ago) we informed our subscribers of Dr. Neal Sullivan's decision to step down from his position as the Director of Polar Programs, which happened this past August. While a search for his replacement is underway, NSF has recently named an Acting Director, Dr. John B. Hunt, who assumed the position on September 8, 1997. Dr. Hunt comes to the Office of Polar Programs from NSF's Mathematical and Physical Sciences Division where he has served in a number of capacities including Program Director, Executive Officer and Directorate Executive Officer. Dr. Hunt, who received his Ph.D. in 1962 in Chemistry from the University of Chicago, has also been a Professor of Chemistry at Catholic University at the U.S. Naval Academy, and at the Marine Science Consortium on Wallops Island, Virginia. With a background like that, Dr. Hunt is sure to "catalyze" the program., or at least get a "reaction"...

**NAVY PULLS ALONG SIDE FOR THE LAST TIME.** The 42nd and final season of the U.S. Navy's operation Deep Freeze is currently under steam. This year the Naval support group will be on hand in McMurdo and in Christchurch, NZ throughout the 1997-98 season. Sometime in March 1998, they will close up shop in New Zealand and in California and hand over the remainder of their functions to the New York State Air National Guard's 109th Mobility Air Wing and to civilian contractors. A formal farewell ceremony will be held in Christchurch on February 20, 1998, where the Navy will unveil a plaque honoring the 50 Americans who have perished in Antarctica since 1955. After that it's bumpers up and anchors aweigh...this is a sentimental time for all of us who have been a part of the great polar partnership with Operation Deep Freeze!

**THE HOLE THING.** It's a good thing that Antarctica is cold because, if it weren't, our southern friends would be getting more suntan than would be good for them right now! For the 12th year in a row, since British scientists first reported an unusual thinning in the protective ozone layer over Antarctica, U.S. researchers are again watching the springtime depletion phenomena. Reports are coming in that the "total ozone column" (density measurement) is currently 60-70% below normal levels. That's bad news. However, the good news is that the depletion levels may not reach the record lows witnessed in 1993. Dr. John Lynch, NSF Program Manager for Polar Aeronomy and Astrophysics says there may be at least two explanations for the lower ozone loss this year. First, in the early 1990's there was quite a bit of volcanic activity which released ash into the stratosphere. The ash can speed up ozone depletion. Second, the hole is "elongated" this year due to upper atmospheric waves; this slows down the depletion. Those wishing to look at some neat images, and track Antarctic ozone depletion should surf over to these two web sites: <http://jwocky.gsfc.nasa.gov/index.html> and <http://www.cmdl.noaa.gov>

Most all of us have heard of ozone destruction and its connection to certain manmade materials called CFCs, but some of you may wonder why it only happens over the polar regions. Antarctica is isolated from other continents, and is the only major land-mass that is completely surrounded by unimpeded ocean currents. These factors effectively block warmer air and ocean water from approaching the continent. When the sun goes down in March, the air over Antarctica gets colder and colder, and eventually leads to the formation of cyclonic winds known as the polar vortex. Inside the vortex the air gets so cold that some naturally occurring gaseous chemicals actually turn into ice crystals that get trapped inside the vortex with other chemicals, including CFCs. It's like a bowl of alphabet soup sitting over Antarctica not doing much throughout the long dark night. Only when the sun comes up in August do problems start to occur. The first rays of sunlight add energy into the soup bowl which wakes up the inert CFC molecules. The CFCs then start chewing up the protective ozone. This reaction keeps going until late October when the sun has finally warmed up the air enough to break apart the vortex and let some ozone-rich air get in from lower latitudes.

The same type of reaction also occurs over the North Pole, but is much weaker. This is because North Pole is closer to other continents and warmer oceans. Thus, the North Pole Vortex never gains the same strength as its southern cousin. NSF funds several projects researching the causes and effects of ozone depletion in Antarctica. One interesting project is looking at the possible damage to the phytoplankton (microscopic marine plants) in the clear ocean water near Palmer Station. They may be the most important members of Antarctica's food chain.

**ANTARCTICA GETS X-RAYED.** Imagine being able to peer into Antarctica's innards and see old secrets deep beneath her snowy mantle. Well, a new project called Radarsat is doing just that, and has recently produced some stunning images of ice streams and crevasses. Radarsat has even spotted the IGY South Pole Station and its ski-way which

are now more than 40 years old and buried beneath 30 feet of snow! Radarsat is an international project funded in part by NASA and NSF, in cooperation with the Canadian Space Agency in Quebec. Radarsat utilizes a sophisticated microwave radar system able to produce images through cloud cover, smog, haze, smoke and darkness. The satellite can be programmed to capture images of an area as wide as 320 miles, and can detect objects as small as 26 feet. The Antarctic Mapping Mission was made possible by rotating the satellite 180 degrees from its normal field of view, which was completed on September 11. Full mapping will require the collection of over 5,000 images

"Antarctica is the only continent on Earth that has not been properly mapped. Despite many years of research, we still do not know whether its massive ice sheet is growing larger or smaller. Radarsat<sup>1</sup>'s Antarctic Mapping Mission should help us answer this question, and many related questions about its potential for affecting global sea levels," says Dr. Robert Thomas, Program Manager for Polar Research in NASA's Office of Mission to Planet Earth, in Washington, D.C. Previous research has revealed that about 90 percent of Antarctic ice flows into the sea via large "ice streams. These rivers of ice are tens of miles wide and about half-a-mile thick. Little is known about these ice streams which eventually flow into ice shelves, moving seaward at about half-a-mile per year, occasionally 'calving' off into huge tabular icebergs. High-resolution images of the ice sheet and exposed portions of the continent will serve as a benchmark for testing the predicted effects of global warming on the interior ice sheet and ice shelves.

Luckily you don't need to have sophisticated technology to take a gander at these great images. The Prattler strongly suggests checking out the web at:

<http://radarsat.space.gc.ca>

**LOGO LOGIC?** Prattler recently heard a rumor that NSF may be considering changing the old U.S. Antarctic Program logo. Personally, Prattler kind of likes the historic and "dated" quality of the old design...maybe I am just a traditionalist. Whatta y'all think?

**1997-98 USAP HIGHLIGHTS.** One of the most ambitious Antarctic research programs planned for this year is a six-nation geological drilling project at Cape Roberts (about 120 miles northwest of McMurdo). This 3-year project was originally slated to start last year, but had to be canceled for lack of sea ice. The drill rig itself is set up directly on the annual sea ice and will be coring the sea bed looking for clues of early geological and climatological conditions (30 - 100 million year old sedimentary rocks). The sea ice is again quite thin this year. This may curtail surface traverses to the drill site and necessitate the use of helicopters instead. The project will also make extensive use of the Crary Laboratory's geological research facilities.

The camp at Siple Dome will start its second year of operation at the end of this month. Like the Cape Roberts project, Siple Dome is also a drilling project, but the product is million-year-old ice instead of rock. The core is expected to be approximately 980 meters in length and 13 centimeters in diameter. These investigations will help to accurately assess the dynamic state of the ice and the age-depth relationships needed to decipher the paleoclimate record at this location. This will then allow researchers to differentiate ancient climate conditions that were local from those that were global. This is accomplished by cross-calibrating and comparing the Siple Dome ice core with cores from Greenland, and other Antarctic sites. The Siple Camp is located in West Antarctica and will support up to 75 investigators this year (bigger than most year-round stations!). Almost 400 hours of twin otter support and 275 hours of LC-130 (Hercules) aircraft time will be applied in support of research projects in this camp.

Among those conducting research at the Siple Dome location is Dr. Bindschadler, Antarctic Society's guest lecturer for this October. Dr. Bindschadler's field team will establish three elevation monitoring sites in the upper reaches of Ice Stream D, which will be revisited annually to measure the rate of thickening or thinning of the ice sheet in that region. Highly accurate Global Positioning System (GPS) receivers will be used to provide the precise elevations.

As always, NSF has an interesting lineup for their much-acclaimed Artists & Writers Program this coming year. This program provides opportunities for a small number of scholars in the humanities to participate in the Antarctic Program (including current Antarctic Society Vice President, and photographer, Ms. Ann Hawthorne). Among those selected for this year is a writer "memorist" from the University of Alaska, Anchorage, named Gretchen Legler. The author's goal is to produce a non-fiction book about the natural world that is both entertaining and consciousness-raising. Also, already deployed to McMurdo, is Norbert Wu who is a widely-published underwater art photographer from Monterey, California. Norbert, and his author, Leighton Taylor, and their team, plan to produce a publication illustrating the natural history of McMurdo Sound.

The long tradition of Scouting will continue this year. The first Scout in this program was Paul Siple, 1928-30, who went on to be one of the finest polar researchers. This year, Ms. Hannah Thomas of Saratoga Springs, New York, is the scholarship winner and is representing the Girl Scouts of the USA. Hannah is a sophomore at Mount Holyoke College and holds the highest award in Girl Scouting (the Gold Award). She will be assisting scientists in McMurdo and South Pole.

Also on the docket is the "penguin paparazzi"...those of you who read these publications may want to be on the lookout for stories posted from dateline Antarctica: Rocky Mountain News, Newsweek, Associated Press (science editor), New York Times (science editor), Albany Times, Aviation Week, and Science Magazine. Also on hand will be reporters from National Public Radio, Reuters TV News Service, and TV New Zealand's natural history unit.

**BRUNO ZEHNDER'S UNTIMELY DEATH** (John Spletstoesser). The news came from the Russian base Mirny in Antarctica in July - Bruno Zehnder had died in a blizzard. Later information gave details, that he had set out from the base on foot across the sea ice to the nearby Emperor penguin colony to do what he enjoyed more than anything else - study and photograph the Emperors, the only Antarctic penguin that breeds in winter. Bruno radioed the base that the weather had deteriorated, and he was starting back. He never arrived, but apparently missed the base by a short distance, walking right by without seeing it in the blowing snow.

I was at Mirny in January 1993 on a warm and sunny day - the base was on the itinerary of a Russian icebreaker with tourists. Much of that day was spent on the somewhat mushy sea ice in the area Bruno would have gone to, and we saw lots of Emperor penguins. Their breeding time had ended. I remember sitting on the rocks of nearby Suromskiy Island named for a man who died on a Soviet Antarctic expedition in 1957. I photographed Adelie penguins that nest on that small island, which barely has room for the Russian cemetery that consists of 29 caskets and 4 memorials, all of them bolted to the rock because there is no soil to bury them. According to Bruno's obituary in the New York Times, July 23, his brother Guido said that Bruno will be buried in Antarctica by his Russian friends, so I expect that the grave will be on that island.

Bruno was one of a kind. As the story goes, he had his Swiss passport changed to make 'Penguin' his middle name! His marital history is worth a story as well, but for that I refer you to the obituary in the New York Times.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 97-98

November

No. 2

Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Cary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94  
Mr. Tony K. Meunier, 1994-96  
Mr. Ronald S. Naveen, 1996-98

**Antarctic Tourism: Getting to the Bottom of  
A Lonely Planet**

by Jeff Rubin

on

*Saturday evening, December 6, 1997*

at

The Cosmos Club

2121 Massachusetts Avenue NW

Social Hour 6 PM - Dinner 7 PM - Lecture 8:15 PM

The cost of dinner, including tax and gratuity, is \$40/person. Make check payable to ECWG, and send to Frank R. Power - 13208 Glen Mill Road, Rockville, MD 20850 before December 2nd! (No cancellations after December 4th.)

Dress will be black tie, or dark suit, if you prefer.

Jeff Rubin, journalist, writer, traveller, lecturer, and relatively recent bridegroom, comes before us as the author of the first comprehensive guide book to Antarctica - *ANTARCTICA: A TRAVEL SURVIVAL KIT*. For the past ten years Jeff has been carrying on affairs with penguins, first with the Australian National Antarctic Research Expedition to the subantarctic islands of Macquarie and Heard, as well as to Davis on the continent. He spent ten years working for TIME Magazine in Sydney and in New York. Most recently Jeff was the science and environmental writer for ABC News Online. He has lectured frequently on Antarctic tour ships, and has been to Antarctica nine times. He's small in stature, but large on words. Come and hear some of them!

*November 3, 1997 was declared Norman Vaughan Day by  
the Commonwealth of Massachusetts.*

*We still have calendars! Please buy! See page 2!*

This is a somewhat shorter edition of a newsletter, as we are both short on news items and late in getting this draft put together. The new age technology spreads information and data around, but it also has its drawbacks. Are we creating a bunch of monsters who one-line e-mail messages to all hands, and leave it at that?

Here are some facts and figures about our Society. This is your 129th overall newsletter, of which Ruth and I have been involved in putting 110 of them to bed. Quite a record for two people, particularly when you think that we are still speaking to one another after some twenty-odd years, twenty-odd years of laboring for love with no recompense except for letters of appreciation from some of you kind folks which really make it all worthwhile. And let's not forget our lecturers, who now total 190, who have all made possible a very educational, enlightening, and enjoyable thirty-five-year history of Who's Who in Antarctica.

We hope that our future will continue to be bright, and we are really excited about the shot-in-the-arm being provided by Kristin Larson with her up-to-date reports on what is now going on in Antarctica. She is a real delight to work with, vivacious, alive, fun. She also just happens to be young, good-looking and single, with a delightful writing style. Her only drawback is that she is a law student, which will no doubt lead to her complete corruption. Meanwhile Brash Ice will remain a collection of taradiddles. Remember, our motto is "The Truth Shall Not Get in the Way of a Good Story."

**BUY MORE ANTARCTIC CALENDARS FOR CHRISTMAS, PLEASE!** Each year we find ourselves backed into the same old corner begging you to buy the Antarctic calendars of Colin Monteath with all those beautiful pictures of down below. And each year, it seems that some of our big spenders from yesteryear, who used to buy twenty or more, are cutting back. Anyway, here we are with an inventory of over a hundred, and time is running out, so if you have a mother-in-law or an uncle, why not send them one for Christmas? Next year we promise not to order so many! 'You know they are a real bargain, as you are practically getting them at cost, a cost reduced by bulk buying.

**PBS, A HATCHET JOB OF THE WORST KIND.** First, an American, whom we will not honor by calling him an author, put together a tirade, diatribe on Admiral Byrd which was subsequently published in this country; then a bunch of British characters came along and extended the debacle in something called a documentary, which our PBS stations picked up and presented on TV recently. Hopefully, because it is so biased and full of so much b.s., it will be totally rejected by the viewing audience. Byrd was actually a very decent man, was by no means an alcoholic, and was generally highly respected by nearly all of his men. I think I know somewhat of what I speak, as I was fairly close to Byrd's bridge playing partner, Henry Harrison; Byrd's biographer, Charlie Murphy; Byrd's rescuer, Bud Waite; and one of his dog drivers, Norman Vaughan And I knew a lot of the others, too.

It all dates back to this guy who had some sort of a personal vendetta against the Admiral, and was out to prove that he was both a drunk and a lousy navigator. I happened to be in the home of Henry Harrison, meteorologist on BAE 3, when this questionnaire of some sixty questions came in for Henry to answer. He showed it to me, and all the questions were so worded as to put Byrd in a bad light. It was a

travesty, but somehow the guy got the book published, even by a respectable publishing house. And then these people came over and interviewed everyone, but when they put the documentary together, they more or less followed the script of the aforementioned nameless book by the unnamed author, whose pudgy old face kept showing up on the screen every seven minutes. Without a doubt the most respectable member of the whole expedition, Al Lindsey, professor emeritus of Purdue University, who is an ageless 90 and has all his marbles, was not included in the film at all, IN SPITE of having been interviewed for four solid hours. Why? - because he is a Byrd supporter. His memory of the day's taping was "it was obvious that they were trying to maximize sensationalism. They did their best, unsuccessfully, to pry out of me something about Advance Base with which they could denigrate and discredit Byrd." The archivist at Ohio State University was told that he would be shown the script prior to the film release. He wasn't! One of the members of BAE II who was shown was Joe Hill. Joe telephoned Ruth the day following the initial showing, and was furious that he was part of the final product, because he thought it was going to be a truthful documentary.

If you really want something close to the truth about the whole affair, you should reread what Charlie Murphy presented as a prelude to Bob Rutford's Memorial Lecture on April 1, 1982. We weren't exactly certain if Bob could get the audience fired up, so we brought Charlie in as a crowd awakener-arouser, and his presentation, "Some Vagrant Recollections of an Elderly Antarcticist" was so good that we published it in its entirety in our newsletter of April 1982. He talked in great detail about Byrd being at Advance Base. This is the same Murphy who was making the daily contacts to REB. Our version is straight from the horse's mouth, by a highly respected member of the keyboard whose publications need no embellishments. Contrast the highly regarded, respected Charlie Murphy who WAS THERE vs. the mind wanderings of prejudiced interlopers hallucinating over what might have happened.

A month ago today, as we type this, five of the seven surviving members of BAE II held a reunion. And they all signed statements that they did not know Byrd to be anything more than a very casual social drinker. One was Byrd's cabin-mate going south on the ship; another was his orderly, both of whom would certainly have known. The whole film, by today's vernacular, sucks! Oh yes, if your name happens to be Alan Shapley, do you have any influence with Deborah? If so, could you possibly get her to return some precious letters to us from Charlie Murphy which she borrowed from us light years ago? Thanks!

Pete Demas was in town to hear Larry Gould give the 1979 Memorial Lecture, Christine Russell spent a lot of time interviewing Pete, whom some of you know as one of the tractor drivers who rescued Byrd. Pete has long since gone, but if any of you Washingtonians know Christine, could you ask her if she still has her notes from talking to Pete? We have about thirty letters in our files from Bud Waite, but they are all handwritten, and resemble penguin tracks more than penmanship. So there is stuff available which is truthful, but it sure did not get on PBS that evening of November 17th.

**SOMETHING NEW IN TOURISM, PERHAPS.** Yogi Berra could be the national spokesperson for the Antarctic, as his epic statement that it is never over 'til it's over could apply to so many things on the ice. When you think you have seen everything relative to tourism, with ice-breaking icebreakers taking tourists everywhere, from which they helicopter to the inner bowels of the continent, now we have a nation, Australia, contemplating making two of their stations available to the ultimate tourists who want to live there. This was hinted at by Representative Bob Hale of Maine when he was part of a visiting bunch of Congressional firemen visiting Antarctica in November 1957. While at McMurdo, Representative Hale gave an interview to the press which was widely circulated in which he predicted that hotels for tourists would eventually be

coming to McMurdo. Forty years later, almost to the day, Australia says that they have a money crunch, and wish to consolidate their research at their stations (Davis, Mawson, and Casey) at one station, making the other two available to tourists going there on strictly controlled expeditions.

The Australian stations are about 1,000 km apart from each other, each with its own transport system and infrastructure. Their logistics consume two-thirds of their Antarctic budget of about \$A60 million a year, leaving only one-third for research. The Australian government is expected to accept the recommendation of consolidating research at one station, leasing the other two to other countries or allowing tourists to go there. Australia expects to get a lot of static from environmental-conscious organizations, such as Greenpeace, so don't call your travel agent quite yet. But isn't it interesting? Wow!!

**A CIGARETTE SMOKER CAN MAKE GOOD.** The second doctor to winter over at the South Pole station was the son of a well-to-do California family, a man by the name of Vernon Houk. He did not seem to be overly impressive to most of us at the station. Of course he didn't have much to do except initial outgoing messages, so he sat at the end of the table, wearing mukluks, smoking cigarettes by the pack, consuming endless cups of coffee. No one there picked him for stardom. BUT he rose to become the Assistant Surgeon General, the second highest ranking official in the Public Health Service!! He became the Director of the Center for Disease Control's Environmental Services Division in 1972, and ordered the first major study of blood lead levels in the United States (1978). Houk was very well-known professionally for his continuing efforts to ban lead-based products from the home and workplace. In 1978, the government banned lead-based paint for residential use, and in 1982, began phasing out leaded gasoline. So next time you top off your gas tank, why not say, "Thanks, Vernon." In 1985 he was awarded the Distinguished Service Medal for his research on lead poisoning in the blood. And in 1988, orders followed up a study of blood lead levels. Vernon was deeply concerned that inner-city children were still being exposed to dangerous amounts of lead, and compared them to canaries in a coal mine. "Let us not let the next generation be so cursed." He died much before his time, at the early age of 64 (in 1994), although he looked in pictures like an old man. He was thirty years old when at the South Pole, so he was somewhat of a late bloomer in real life, although a most significant one. For an important national figure, he is remembered somewhat insignificantly in Antarctica by a bare rock spur in the Patuxent Range of the Pensacola Mountains.

**SOLE CIVILIAN SCIENTIST AT LITTLE AMERICA V, 1956, DIES.** Chet Twombly, meteorological technician, was the only civilian wintering over at Little America V in 1956. I don't really know the reason why, but presumably someone wanted upper air soundings from that station prior to the IGY. Chet was an interesting person, as well as a character. He had a strong interest in astronomy, and photographed a series of stars in the 1950s which appeared in the National Geographic Magazine. He was also interested in computers, and actually built one from scratch. And he had his own plane which he enjoyed flying.

But we must tell you a real funny story about his relief at Little America V in January 1957. The following is entirely truthful, as we were an eye/ear witness. The incoming scientific crew for Little America V for 1957 came to Antarctica on the USS CURTISS, and we were taken off the ship in Kainan Bay by a chopper. With us was the chief scientist for the Antarctic for the IGY, one Harry Wexler, a rather serious person without much of a sense of humor when it came to duty. By the time we all had assembled in the camp, Chet had his luggage by the door, waiting to go out to the chopper for the flight to the CURTISS. However, Harry wasn't really ready to release Chet right away, and said to him, "Chet, I want you to check out Sam Wilson

on your gear before you leave." Chet didn't bat an eye, walked over to his luggage, threw a duffle bag over his shoulder and said, "Harry, it has been a long, hard winter, and I don't want to miss that ship." Then he casually glanced at Wilson, and said, "Sam, the GMD is up that ladder," and walked out the door!!

**KATHLEEN SCOTT, WHO WAS SHE?** This soul is having a hard time making up his mind about Kathleen Scott, although one thing is for sure – she was one of the most gifted and talented women to ever be associated with Antarctica. Maybe The Most!

I was really enchanted about Kathleen after reading her autobiography, *SELF-PORTRAIT OF AN ARTIST*. Recently I have been reading Louisa Young's *THE LIFE OF KATHLEEN SCOTT*. Louisa just happens to be a granddaughter of Kathleen's, and has been a freelance journalist for the past twelve years. Her book was published in 1995 by Macmillan, but is rather hard to come by. I think one should read both books, but, if given a choice, maybe Louisa's book would be a more realistic single source reading, as Kathleen's autobiography printed only what was fit to be printed. Not that Kathleen led a jaded, tainted life, but her manipulation of men to her own advantage was a large part of her life according to her granddaughter. And, to a large degree, wasn't Kathleen the Great Protector of Captain Scott, and had a strong hand in the version of his diary released to the public immediately after his death? But so what? Wouldn't we all like to think that those left behind when we depart would become saviors of our lives, protectors of our true-life frailties?

I had this feeling when I read Kathleen's autobiography that she was a woman much ahead of her time, that she was a twenty-first-century woman. If she were alive today, no one would think twice about her life-style. She LIVED! She picked out Robert Falcon Scott as the man she wanted to father her children, not because she loved him. The love did come after they married. Not being successful in my one venture into marriage, I'm not expert on selecting a mate, but her way seems to be one worthy of consideration. She certainly had a bevy of men, distinguished men, who were attracted to her as a person. She does not appear in her pictures to be a person of great physical beauty, so she had to charm them in other ways. And charm them, she did.

I think if you have any intent on being famous, one should not keep a diary. There are very few of us saints left!! Kathleen kept most complete diaries, so her life in a way is an open book. Nixon had his tapes, Kathleen had her diaries, and no one really knows what happened to REB's journals! But Kathleen's personal life should in no way detract from her great talents as an artist, as a sculptress of international renown, whose works are in many of the great museums in the United Kingdom. However, one gets the feeling that perhaps Kathleen was much bigger in real life as a person than she was professionally as an artist. What do you think?

Most of the books on Antarctic women, and now I am referring to Barbara Land's and Elizabeth Chipman's books, have been devoted to women on the ice. And I grant you that the Gisela Dreschhoffs certainly merit serious contention as Antarcticans of Note. Several years ago, in comments on who was the foremost Antarctic explorer, I suggested that due consideration should be given to the late Mary Alice McWhinnie, as she opened more doors for women in Antarctica than any other person, changing the whole landscape of Antarctica. And I also wrote once-upon-a-time in this column that Lee Kimball should be the Antarctic Man of the Year for her great writings on the geopolitics of Antarctica. What I am trying to say is that all these women, plus those who stayed behind and supported, like Kathleen Scott, Ruth Siple, Harriet Eklund, and others, are part of the overall Antarctic picture. But, with due respect to all, Kathleen Scott stands out in my mind as the greatest Individualist.

*Hey! We still have calendars! Order now for Christmas!*

**PRATTLE POLITICS.** For this edition, Penguin Prattle takes a small, and short-lived detour to dredge up some news on budgets, bills and bipartisanship. Apparently science and research have become the "feel good" news that we can all rally behind, no matter what our political (or apolitical) stripes may be. From what the Prattler can tell, this bodes well for Antarctic science. What's good for the goose, is good for the penguins, too. Happy Holly-daze, back atcha in the new year!

**BUDGETARY TRICK OR TREAT?** Just before Halloween, President Clinton signed into law an appropriations bill providing NSF and several other agencies with their budgets for next year. The NSF appropriation is up approximately 5% over last year, and includes a real treat - \$70 million for the South Pole Station Rehabilitation project. Also signed into law is the National Science Foundation Authorization Act of 1997, which amends sections of previous National Science Foundation Acts dating from 1950, 1976 and 1988. The committee report on this Act made specific note of the strategic and scientific importance of maintaining an active research presence in Antarctica, and authorized a total of \$128 million for the South Pole Station, of which \$70 million was appropriated for the coming year. Congress has apparently taken the recommendations of the USAP External Panel quite seriously, and specifically notes that the Act's funding levels are consistent with the Panel's findings. (Recall that last year NSF convened the External Panel; a group of specialists, headed by former Lockheed Martin CEO, Norm Augustine, to review USAP's physical and logistical infrastructure.)

**SOUTH POLE FACE-LIFT.** The Office of Polar Programs has already initiated work aimed at rehabilitating South Pole Station. There are two parts to the effort. The first phase is to make immediate safety and environmental upgrades in order to bring the Station up to a more acceptable standard. The other phase is to conduct an Environmental Impact Assessment of the proposed new facility for South Pole. This environmental document will be packed full of interesting information and should be completed as a draft in late January. The draft will be available for public review and comment, before it becomes final. The Prattler will let you know when and how to get this document.

During December, NSF will formally break "ground" near the present South Pole Dome and begin construction of a new garage and shop, a fuel storage system and a new power plant. The plan is to erect a new arch for the garage and shop before the close of the season. Also, a new Atmospheric Research Observatory will be dedicated in January, to replace the aging Clean Air Facility. The new facility is twice as big, and will support research on climate, ozone, ultraviolet light and other atmospheric phenomena.

**SCIENCE IS NON-PARTISAN.** New legislation introduced in the Senate, the "National Research Investment Act," could double funding for basic research over the next ten years. If passed, this bill could prove to be very good for the U.S. Antarctic Program, especially during the next five or so years as the new South Pole Station is being built. What is the connection? Well, harkening back, once again, to the External Panel report that came out last April, there was talk of a possible reduction in Antarctic research funding to help offset the costs and logistical strain of construction at South Pole. While it is currently not clear how deep these proposed reductions could cut, the new "National Research Investment Act" may be able to help ameliorate USAP's competing needs. Senator Gramm (R-Texas) pretty much summed up the bipartisan spirit when he said, "President Clinton has talked a lot about building a bridge to the 21st Century and, our philosophical differences aside, I want to help him build that bridge [with research and technology investment]." The bill is sponsored by Senators Gramm (R-Texas), Lieberman (D-Connecticut),

Domenici (R-New Mexico), and Bingaman (D-New Mexico). Feel free to let them know *your* opinion!

**SO CLOSE.** 120 million years short of the goal, the multinational Cape Roberts drilling project abruptly stopped work last month due to weird weather. Readers may recall that this same project was also delayed last year due to insufficient sea ice on which to set up their drill rig. Unlike most ocean drilling, the Cape Roberts Project could not use a drill ship because the sea ice is *usually* too extensive in this part of the Ross Sea (about 75 miles north of McMurdo Station). And why Cape Roberts? For years polar scientists have been searching for exposed rock or sediment that dates back to the period when Antarctica was being transformed from a "lush landscape teeming with dinosaurs" into the land of many ice forms we know today. Since Antarctica hides more than 98% of its rock and soil beneath thick sheets of ice, the scientists turned their attention to a more accessible medium -the ocean. Through sonar imaging, it was determined that the marine sediments at Cape Roberts were the right age. The project engineers designed an ice-based drill rig, which was finally pressed in to use this past October. The drilling had been underway for just nine days when a fierce three-day storm charged through the region and broke up the sea ice dangerously close to the drilling operation. Within twenty-four hours the drill rig was disassembled and moved onshore. Gladly, the season was not a complete loss because the scientists were able to recover about 113 meters of sediment core dating back approximately 22 million years. The recovered core is considerably younger than the hoped-for sediments in the age range of 145 million years...but heck, if it has been around that long...what's another year?

**NO ESCAPING EL NINO.** Reports have been coming up from the ice that the weather is stranger than normal. Of course I think we say that every year, but there have been several unseasonably fierce storms in the area. The temperatures around McMurdo are averaging 10-15 degrees warmer than normal and winds more severe. Perhaps El Ninja would be a better name for the El Nino's Antarctic counterpart! These storms have kept McMurdo residents boarded up inside their rooms, replaying videos; have curtailed the Cape Roberts project; and delayed field deployment of several parties. The hardest hit has been South Pole Station which finally opened eleven days late. The South Pole delay is particularly noteworthy when one considers that eleven days represents more than ten percent of the total field season! So if you are headed south, be prepared for a rollicking good time.

**POLAR PLUNGE.** Well, it seems our Northern brethren and Sistren really know how to make a splash. During the recent launching of the U.S. Coast Guard's new ship HEALY, which OPP scientists will use to explore the Arctic, 600 guests got completely sloshed. And we're not speaking of fine champagne, of the sort Ruth Siple recently let fly on the new Antarctic Research Ship. Nope, the Coast Guard's guests, who included Senator Stevens (R-Alaska), and several OPP scientists and staff, were soaked through by a wall of greasy swamp water that was thrown up by the ship before righting herself in the Mississippi bayou. Like the tail that wags the dog, it appears that it was the ship that christened the guests! Boy, that Arctic gang is a tough group.

**BYRD MEMORIALIZED.** This past July, while your newsletter staff was resting on its collective summer laurels, a new statue of Admiral Richard Evelyn Byrd was dedicated in Winchester, Virginia. As many of you know, Admiral Byrd was the first to fly over both Poles, and also played a pivotal role in exploring and mapping Antarctica. He was a winner of the Congressional Medal of Honor, and a man who captured the hearts and minds of America. Dedication addresses were given by Secretary of the Navy, John H. Dalton, and Admiral Byrd's daughter, Mrs.- Boiling Byrd Clarke. The statue was funded entirely by contributions from friends, and was sculpted by Dr. Jay Morton.

Secretary Dalton reminded the audience that Albert Einstein once said, "We don't know one-millionth of one percent about anything." And went on to analogize this idea to the concept of exploration, saying that the monument of Byrd is not only an ode to the past...but also a challenge to embrace our future through continued courage and discovery. If any of you get over that way, let us know what you think. And while you are in the neighborhood, you may also want to visit Patsy Cline's grave site. She wasn't much of a polar explorer, but the woman sure could sing!

**TWO BOOK REVIEWS ON DOGS IN ANTARCTICA** by Steve Dibbern. *HUSKIES IN HARNESS* (A Love Story in Antarctica) edited by Shelagh Robinson. 1995, Kangaroo Press, Kenthurst, Australia; and, *OF DOGS AND MEN* (Fifty Years in the Antarctic) by Kevin Walton and Rick Atkinson. 1996, Images Publishing, Malvern Wells, England. Both of these books came about because of the expulsion of the last dogs from Antarctica brought on by decisions made at the Madrid Conference in October 1991. In short, all dogs (specifically) must leave the continent by 1 April 1994. Both are tributes to the dogs that Australia and the United Kingdom used in their national programs. Both books, also, contain scientific and emotional disdain for the process that doomed the use of the dogs. Both are also obviously labors of love and respect by many more people than those cited as authors or editors.

*HUSKIES IN HARNESS* is a collection of short essays by members of the Australian Antarctic Program. The format is that of a series of remembrances with a basic, but not too strict, chronology. There is a brief history of the beginnings of Australian dog breeding on Heard Island, and progressive stories to their use first at Mawson in 1954 and then at other stations. It is clear that Mawson was where it was happening with the dogs for the Aussies though. To leave the description of this wonderful book at that would be an awful disservice, however. It is a "Love Story in Antarctica," as the subtitle implies. Each essay is a heartfelt homage to the spirit and loyalty of what the writers describe as magnificent working animals and loyal friends. Although the essays are frequently outlines of specific traverses and trips, each one conveys the faith the men put in the dogs and the honest labor that they willingly gave. The book is well illustrated, (save the cover), with black and white photography, much of it credited to the drivers and scientists who wrote the articles.

Walton and Atkinson have done a wonderful job of chronicling the history of the use of dogs by the British from 1944 to 1994 in *OF DOGS AND MEN*. It is written as a chapter-by-chapter explanation of history, "how to," equipment, accomplishments and even includes such headings as "Grow-a-Pup" which explains puppy-raising practices, and "Kurahound," which is Brit-speak for the veterinary section. This book will be a treasure trove in the future when the people who had the privilege of working with the dogs are gone. Walton and Atkinson have a startling array of color photographs to lavishly illustrate this exceptional book. More than that, though, they have used the anecdote as the extended captions for the photographs throughout the book. At times it was difficult to decide if one should forge ahead with the text, or linger over the anecdotes provided by drivers from the very beginning to the very end.

Both books are excellent in offering bittersweet reminiscences of a time now passed. Both are very well done with a tip of the reviewer's hat to the beauty of the color photography in the British book. If any of you care to vicariously live in an era you missed, or wish to return to times you may have experienced, both are exceptional.

The reviewer is left with a sense of loss at the removal of the last dogs from Antarctica. Both books vigorously reject the politically correct "greenness" of the dogs' expulsion. They both put up the theory that the loss of dogs was a bribe to achieve larger goals, and that the bureaucrats who betrayed them had no understanding of the lack of any real threat that they represented or of the positive morale factor they were to the Antarcticans they served.

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET

ARLINGTON, VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 97-98

January

No. 3

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94  
Mr. Tony K. Meunier, 1994-96  
Mr. Ronald S. Naveen, 1996-98

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Court Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. Bud" Waite, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

**Paul C. Daniels**

**Memorial Lecturers:**

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rufford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorus, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Saved Z. El-Sayed, 1990  
Dr. Charles W. Swithinbank, 1991  
Dr. Susan Solomon, 1992  
Dr. Michele E. Raney, 1993  
Dr. Doyle A. Harper, 1994  
Dr. Edith L. Taylor, 1995  
Dr. William J. L. Sladen, 1996

*" I remember it well - like it was yesterday "*

Alton Lindsey was one of the more prominent scientists who went south with the late Admiral Richard E. Byrd, and what makes him most unique is that he is still alive today, plus the fact that he still has all his marbles. A couple of years ago he started to put together some notes about his being on the Second Byrd Antarctic Expedition, and we were going to publish them in a single newsletter last winter, but on the way to the Forum, Ruth came down with the shingles, and we never got it out. But now is the time, and here it is!!

Al and Paul Siple became close friends at Allegheny College, and both went on to have distinguished scientific careers. Al got his PhD at Cornell University in 1937. He taught at Purdue University until he retired in 1973.

There are only two living scientists from the Byrd expeditions, namely Ervin Bramhall and Lindsey, although Norman Vaughan who was on the 1928-30 expedition lives on; and Steve Corey, Bill McCormick, Joe Hill, Guy Hutcheson and Olin Stancliff, of the Second Byrd Antarctic Expedition, are still alive.

It is an especially appropos time for us to publish the words of Al Lindsey about the Second Byrd Expedition, as it will help to set the record straight on some scores associated with Byrd at Boiling Advance Base, which were greatly maligned by a British film group who produced a terrible documentary on Byrd which was shown on a limited basis at several PBS TV stations in this country this past fall. Al, Bill McCormick, and Joe Hill have written strong letters to newspapers and the PBS, denouncing the documentary as a fraud.

Al's account is really the second in our newsletters of what transpired at Little America II, as we featured in our Newsletter, Vol. 81-82, April, No. 6, pages 2-10, the talk which the erudite Charlie Murphy had presented to the Society on April 1st. The similarities in the message being given by both of these gentlemen is so in contrast to the portrayal which people who never knew Byrd are trying to feist onto the public. The bottom line for them is not truthfulness, but will it sell, will it put monies in our pocket.

Hope you enjoy your trip to Little America II.

## INSIDE BYRD'S SECOND ANTARCTIC EXPEDITION

Alton A. Lindsey, BAE II

**BYRD'S PRACTICE WORK - THE NORTH POLE FLIGHT.** If doubts that have been raised about both Robert Peary and Frederick Cook are valid, the first humans to see the North Pole were Richard E. Byrd and his pilot Floyd Bennett. Most of the very few who have questioned that Byrd's plane reached this pole (or close enough for practical purposes) rest their case on newspaper accounts of the time element.

On April 30, 1975, the late E. J. (Pete) Demas sent to at least two other Byrd expedition veterans, radio engineer Amory Waite and me (and to the U.S. National Archives) a carefully prepared 15-page typed manuscript bearing on that point, entitled "Eye-Witness Facts about Byrd's North Pole Flight." It has apparently never been published nor even referenced in print. Knowing Demas throughout the 19-month BAE II, I vouch as literal truth that no expedition member was more serious and conscientious nor more highly respected for total integrity. An outstanding aeronautical engineer and career explorer, he believed in precision. He wrote, "Having been ashore [at King's Bay runway] during the entire time the plane was on its historic flight, I speak out in hopes the record can be corrected."

Expedition meteorologist William C. Haines advised Byrd on the fortunate weather for May 8-12, 1926. Skies were clear to cloudless, visibility excellent, and the air was universally smooth between Spitzbergen and the Pole on the flight date, May 9, when Haines estimated the average wind for the entire flight was five knots or less. Demas personally recorded the flight times on his automatic camera. Take-off was soon after midnight, 00:30 GMT. They reached the pole at 9:04 GMT, flew in circles for 12 minutes for fixes, and at 9:16 headed south, arriving back at 17:45. Time in air was 16 hours and 55 minutes, and the difference in the outbound and return flights was only 5 minutes. Demas stated, "The outbound flight to the North Pole is more than adequately documented by Byrd's fixes. His navigation was checked by experts of unquestionable qualification, upon his return."

The published flight time is an hour short because a rewrite man in New York lost an hour through mistaking the reported GMT time to be local time. The total shortfall was 1 hour and 20 minutes. The 20 minutes were because the reporters called 17:25 the landing time, when that was actually 20 minutes later. A Norwegian published account concurred with Demas's time, but most reports worldwide made the flight time an hour and twenty minutes shorter than it was, and critics have questioned Byrd's North Pole claim on this basis.

**A FORMAL SCIENTIFIC BANQUET AT GOVERNMENT HOUSE.** Admiral Richard E. Byrd was well-known and popular in New Zealand from his stops there during his 1928-30 expedition. Again, on the arrival of our flagship, the JACOB RUPPERT, in late 1933, New Zealanders proved the most hospitable people anywhere. However, the Governor General, Lord Bledisloe and his Lady did not invite Byrd to their gala dinner held specifically for introducing the most eminent New Zealand scientists to the twelve members of our scientific staff, among whom only Paul Siple, the youngest, was internationally celebrated.

The resident scientists were gray-haired, dignified, and serious-minded. Byrd, in selecting us, had kept in mind that (in those days) polar exploration was a young man's game. (The average age of our 55 Ice Party members was 26.) Only three of the expedition scientists had Ph.D. degrees; most of the other nine of us had interrupted our graduate studies to go on the expedition. Moreover, during the recent Equator-crossing festivities, before we "walked the plank" into the salt-water pool improvised on our top deck, the shellbacks of the ship's crew

had run wild with clippers, leaving our heads semi-shorn in the most creative and bizarre fashions. Of course, this was some decades before such male coiffures had become commonplace. The host, hostess, and the distinguished New Zealand scientists did very well at keeping straight faces in front of us virtual Indians from the wild American West. Paul Siple, after whom the New Zealand government later named the east rim of the Ross Ice Shelf as "Siple Coast," had a scalp-lock of long jet-black hair that gave him a particularly fierce aspect.

As the two men sat together at the head table, Lord Bledisloe's short stature and neat, slight figure made a striking contrast with the gigantic and muscular bulk of our Senior Scientist and Second in Command of the expedition, Dr. Thomas Poulter. In introducing Poulter for a speech on our scientific objectives, the diminutive but commanding and suave Lord asserted that the next speaker was "very big in American science." In the social hour following the dinner, the gracious Lady Bledisloe, hearing that I was a biologist, led me to a rare wall hanging, a robe of Maori workmanship. I recognized it as skillfully pieced together skins of the Kiwi, but held my counsel when she said it was made of Moa feathers.

Lord Bledisloe presented each of us with an autographed book he had written on the human geography of the country. He gave Siple, known in New Zealand as the Boy Scout of BAE I, a framed photograph of the famous "Pelorus Jack," a porpoise whose self-appointed mission in life was meeting ships off Wellington Harbor and piloting them in safely.

Six decades have passed since I directly experienced the happenings recounted here, which I had recorded in my expedition diary but which have not appeared in print before. Many other events were much more significant as history, but those have long been accessible in polar literature. BAE is said to stand for "Boys After Experience," and I offer these true vignettes of unusual experience. Even footnotes have their value and interest for history. Those below are given chiefly for what they reveal of the character, personality, and problems of one of the most fascinating individuals of Twentieth Century geographic exploration, Admiral Byrd.

**ON THE TRAIL WITH BYRD AND WITHOUT.** The scientific staff of BAE II, including the senior scientist who was next in command after Byrd, were on the same footing as all other of Byrd's subordinates. We were all on call by Executive Officer George Noville for the routine but essential jobs such as K.P., unloading and transporting gear, construction of buildings and the snow-shoveling which seemed endless. This, and the importance of dog teams, must be the chief difference in antarctic life for scientists prior to World War II versus those based at the research stations established since, such as the Amundsen-Scott South Pole Station, McMurdo, and Palmer, as well as the closed Byrd, Siple, Eights, and Plateau stations, and the U.S. stations given to foreign governments, Ellsworth and Wilkes.

As the expedition Vertebrate Zoologist and biological collector, I had never tried dog driving until arrival at the Bay of Whales brought on the unloading job of transport across sea ice to Little America by tractors and dog teams. I was then one of several terrified amateurs at dog driving. On the same memorable day I had four new and notable experiences - learning to ski, harnessing and driving dogs, seeing my first polar atmospheric effects caused by sunlight and ice-crystal showers, and having a celebrated polar explorer hitch a ride on my dog sledge. The seven dogs per sledge were harnessed in pairs on either side of the center-axis rope, with the leader hitched out front alone. The driver skied along, to the left of the sledge's front end, holding the slanting gee pole with his right hand, controlling the leader by yelling "Yake," "Gee," "Haw," or "Whoa." No whip was carried

Seeing my sledge emptied and my readiness to drive it back to the moored ship, the Admiral volunteered as a passenger. Most of the 7-mile trail was over apparently

stable ice, but for about three miles over sea-ice, subject, near the Bay's edge, to lateral pressure, trail-building and repair crews were kept on duty 24 hours daily to keep it relatively passable. Admiral Byrd sat low on the ash-wood vehicle, holding an outer slat with each hand to stay in place. Sharp curves around ice-pinnacles were more the rule than the exception.

About the time we started into the area of unstable pressure ice, the dogs realized they were headed back toward open water and the trail's end where their feeding was done. They sped the empty sledge with full power on the stretch of trail where speed was least appropriate or safe. I managed to stay on the skis and keep the sledge from overturning. Backward glances were not affordable. The dogs finally tired enough for me to get them stopped, and I turned to check on Byrd. The sledge was upright, but there was no sign of the Admiral on it or on the backward trail! Had he been unceremoniously scraped off by an overhanging spur of ice? Had he been plunged into a frigid pool of sea water? Had he, in fact, survived the ordeal at all?

While I was struggling to straighten out the yelping dogs to retrace our course as far as might be needed, I was overjoyed to see him appear from behind an upthrust slab not far back. As he approached on foot, I particularly noted that he was grinning widely. What a relief! Soon he was explaining that he had decided to jump off at a particularly tricky stretch of the trail not far back. He seemed actually to have relished the incident, enjoying the joke on his tyro dog driver. He blamed the trail and the approach of feeding-time rather than me, and I reverted to a vertebrate zoologist happy to anticipate getting to my own occupation even though it also would entail considerable sledging.

Many such frequent small happenings on the 1928 and 1933 expeditions might easily have ended tragically, since most of us had no previous experience with antarctic conditions. We were, especially during the field season, scattered widely in small groups, over a vast area, or alone, as I usually was when working on animal life. The British polar authority Brian Roberts correctly characterized Byrd's early expeditions thus - "Looking back now in the light of hindsight at the first two [Byrd] expeditions, it is impossible not to wonder at the extraordinary risks which were constantly taken without fatal consequences." We became aware of this as the time in Antarctica wore on, and referred to the phenomenon as "Byrd Luck." He and the rest of us were particularly fortunate that the Ross Ice Shelf itself, which cracked and moved, threatening to give way under Little America, at least as early as the (antarctic) autumn of 1929, did not break off there until 1961 or 1962.

**BYRD'S WINTER AT ADVANCE BASE.** At the time when Byrd was preparing for his 1933-35 Antarctic venture, no expedition had collected winter climatological data deep in the continent away from ameliorating influence of the seas. The bases had all been on the coast or nearby oceanic islands. The most recent (Nov. 1997) and least acceptable television treatment of Byrd, (in the PBS "Adventurer" series) concentrated on the Advance Base story. Interpretations of the "why alone?" issue have so far not taken into account evidence from the late Paul Siple. My tentative conclusion considers information in his 1936 book Scout to Explorer, and conversations I had with him while at Little America in 1934.

The earliest relevant information I have is in a letter of June 1, 1933, to Emanuel Cohen of Paramount Productions, which had made the movie on BAE I, but was reluctant to risk another. The Admiral desperately needed another, for he was risking personal financial ruin during the Great Depression. He confessed to Cohen, "It is one of the ways that I can keep from being bankrupt," and wrote that he had a dramatic secret plan which he could not put down on paper. He did reveal that "two men will spend the winter night at the foot of the mountains only 300 miles from the Pole, where the temperature will be as low as 90 degrees." This letter

came to me through the courtesy of one of only a few authentic Byrd historians, Dr. Raimund Goerler of the Byrd Polar Research Center at Ohio State University. (The interpretation given it here is my own.) Siple's book Scout to Explorer (1936) is quite revealing.

I was not in the inner circle of the expedition, but Paul Siple, who at age 19 had been selected by the Boy Scouts of America for the 1928-30 expedition, was. He had been my college friend before that, and had joined my ongoing project studying the biology of an extensive Pennsylvania swamp (Pymatuning) which involved owning an automobile together. During the 1934 winter night, we spent many days in my zoology shack flensing and cleaning museum skins of seals and oceanic birds, and talking about expedition work, policy, and politics.

Two men connected with BAE I, Siple and Victor Czegka, were in on the Advance Base project from its start. Nearly as early were two BAE II people, Ivor Tinglof (carpenter) and Stevenson Corey (supply officer). Byrd delegated Siple to oversee the operations. Siple wrote in Scout to Explorer (p. 37), "I had watched every stage of its construction in Boston...."

Apparently, very soon after Byrd wrote to Cohen about posting two men to the "Mountain House" over winter, he changed his mind, the idea being held so briefly as to be practically non-existent. Siple told me one important reason. Byrd had explained to him what he thought the "smart-aleck New York writers" would have done with that arrangement. From that point on, Siple's work on the extra camp was definitely based on three occupants. On page 45 of Scout to Explorer he states: "The original plans for these investigations called for a staff of three men, food enough for at least nine months, and additional emergency rations for another three months.. There could be no tolerance of a slip-up when on it depended the lives of these men."

While the ship was being unloaded and freight being taken to the base, Paul was responsible for keeping track of every piece of the "Mountain House" and its supplies, and he put it up at Little America for its "trial run." This Advance Base project was Paul's almost exclusive job during this stage of the expedition.

I postulate that throughout this period Byrd still intended that it harbor three men, following through on the detailed preparation Siple had supervised in Boston. One of them would probably have been one of our two meteorologists, William Haines or George Grimminger. Siple would clearly not be one, since Byrd promised him the leadership of a summer field journey to the eastern mountains. Preparations for that would require most of Paul's winter.

On March 4 came the crisis which determined the final "plan" for Advance Base - the breakup of the Low Barrier Ice that supported Little America over salt water off the edge of unseen Roosevelt Island. Dr. Poulter showed me that day the ice movements along the widening cracks around our base, and the active tiltmeter in his geophysics shack. Not one of the 56 men doubted the direness of this threat, which was fated to carry Little America out to sea about 1961. Byrd called together all the members of his previous (1928-30) expedition, and after discussion called for a vote on how to proceed. This resulted in a compromise action. If Byrd had then been wedded to the thought of being the sole occupant of the "Mountain House," it does not seem he would have put the closely-related decision to a vote, which easily might have resulted in total abandonment of Advance Base.

Response by establishing the emergency Retreat Camp on High Barrier set the expedition schedule back more than a month. The approach of winter rendered the plan to place three men at the foot of the mountain range clearly impossible. When it became nearly too late even for the retrenched project, came a break in the weather. Byrd suddenly directed Siple (p. 59), "Cut all of the food supplies down to that amount required for one man. Reduce all weight to a minimum. Take the

canned food out of their boxes, and arrange them in 1,000-pound shipments ready to put into the planes as soon as they are conditioned for flight." Siple noted, "I was surprised, but there was no time for speculation on his meaning now."

The Pilgrim and the Fokker planes were both to have taken this freight, but the Fokker had just been wrecked in a short test flight. Siple had one hour, while the plane heated its engine oil, to load the Pilgrim. "In the meantime (p. 60), I must have a ton of supplies ready for shipment. I ripped open the boxes of canned stuffs and stacked a *third of their contents* (italics mine) on a small, man-hauling sled. The weight of each item was calculated down to ounces, and each time my sled held 100 pounds, I dragged it out onto the aviation field. Incoming fog made it necessary to take everything else, including the piecemeal "Mountain House," by tractor.... There were hundreds of last-minute things to do, so that I was rushing around following out the Admiral's instructions a dozen or so behind the newer one." Later, the same split had to be made for items to go south by tractor. Tinglof and Paul traveled out by tractor to direct the erecting of the camp. (p. 64). *While enroute* (italics mine), Siple received Byrd's radioed directions to set up the house 123 miles south of Little America by trail. Siple does not state exactly when he was assured that the one man was to be Byrd himself. But I am convinced by our later talks in Blubberheim that Paul himself believed essentially throughout that Byrd had intended the project for three men. And Byrd could hardly have arranged these complicated, frenetic events and circumstances. I have seen no credible evidence that Byrd had intended from the start that he would be alone that winter, though, of course, such may still turn up. My tentative conclusion is that Byrd's going it alone was a last-minute decision, and that the secret he was not ready on June 1, 1933, to confide to Cohen was that Byrd would be one of the (two or) three occupants. This would certainly, as he wrote Cohen, "have more drama than anything that I had ever done before," and "will turn out a [movie] which will beat anything that has ever been produced." It seems the outcome quite surprised his wife, Marie Byrd.

This fact shines through the fog of speculation, publicity, and financial worries - Byrd was strongly guided by something which fails to impress most movie-makers and journalists - the permanent value of finding basic scientific knowledge. Despite Byrd's debilitated condition that winter, he routinely climbed the ladder to his outdoor instruments, kept them free of clogging snow, and changed the record sheets, and, quite remarkably, produced an unbroken record, unprecedented deep in the continent. This scientific achievement is valued more today, when Antarctica is a continent-sized Nature Preserve owned by no one, an internationally enforced "Pleistocene Park." Though Byrd did not live to see this happen, he was more responsible for it than any other individual.

**SOME PROMISES UNFULFILLED.** From the fact that more than three thousand hopefuls had applied to go with Byrd for the nineteen-month absence on BAE II, it seems clear that lacking any salary, some other tangible benefit was among their expectations. Public approbation of Byrd's and his crew's accomplishments would seem to hold that promise, for at least the Ice Party members. But this favorable attitude of society as a whole was not universally shared, immediately after the return, by university scientists and administrators. The media attention included Byrd's being quoted that ten heavy volumes of scientific results were forthcoming, but I learned in 1996 that this hyperbole originated from a member of our scientific staff! Many in the world's scientific community (before the many technical papers had appeared in journals) felt that a big wind from the south was all they could expect. At least two of the twelve expedition scientists fell afoul of this situation, in two of the large and prestigious universities of the eastern United States.

One young man had left his graduate teaching assistantship, after a creditable

performance for three years. He applied for reinstatement on his return, but was rejected. By borrowing money he went back on campus, to complete his two theses, both quite unrelated to Antarctica or the expedition. At the same time he wrote, and published at first try, five technical papers on his BAE II research. By two semesters after his return, his double effort had won the respect of his hard-nosed colleagues. He was reinstated with a graduate assistantship to finish his degree work, and soon accepted a higher-ranking university post elsewhere. By and large, having been one of the overwintering party was helpful to one's long-term advancement. It also enables one to reflect, with novelist Joseph Conrad, "Only a moment, a moment of strength, of romance.... a fleck of sunshine upon a strange shore."

Our next story of a promise and its fate concerns Byrd, his young zoologist, and one of the four great natural history museums in America. Before leaving for BAE II, Byrd had an advance agreement with one of them that his expedition would include a capable taxidermist, and that enough good specimens would be donated gratis to the museum for its artists and finish taxidermists to build into an exceptionally large habitat group of antarctic life and terrain, to stretch across the entire end of the Hall it would occupy. It was agreed that the museum would put up the necessary \$10,000. This was probably the main objective Byrd had in taking me with him as the expedition Vertebrate Zoologist and museum collector. I had been a naturalist and taxidermist since age 13 (resembling President Theodore Roosevelt in that one respect), had been a Ranger Naturalist and learned about glaciers at Mount Rainier and Glacier National Parks, and had taken many zoology courses in college and graduate school. The time I spent collecting for the museum during the 19-month trip equaled that spent on my own research on the ecological life histories of two seal species.

On returning home on May 10, 1945, the Ice Party sailed up Chesapeake Bay in the old icebreaker BEAR OF OAKLAND, and were welcomed back by President F. D. Roosevelt waiting on the dock of the Washington Navy Yard with thanks for each man individually. A few days later, I delivered and unpacked my biological collection at the museum of Byrd's arrangement. Its chief taxidermist stated that it was in better condition than the skins done by their own field men, who unlike me, had been paid for their work. (I had time during the winter night, with Paul Siple's help, to clean skins very thoroughly.) After everyone concerned had seen my collection, I made my first post-expedition visit, separately, to the two department heads who were accepting it for the museum. Since their taxidermy artists had praised my work, I was expecting at least a kind word. The two must have conferred together as to how I should be handled. Handshakes and greetings were not offered, nor was I invited to be seated. Their first words were, "Well, what do you want?" Though surprised, I held my peace. Since the museum aspect of my job was done, I didn't want anything. The ball seemed in their court. Each told me, without explanation, apology, or qualm, that the museum was not going to fulfill its end of the bargain.

The head of the Mammal Department asked, "Why should we spend our money for the glorification of Dick Byrd?" I added to this, only mentally, with "...now that his big donation is already in our hands." I was really puzzled at having been "wined and dined" nearly two years earlier on departure, then being so crudely snubbed on my return "with the goods." Many years later I learned what doubtless lay behind my treatment. During our time in the South, the Great Depression had hit that museum heavily. The director was fired for his emphasis on expensive scientific expeditions by museum personnel. There were simply insufficient funds for the promised exhibit group. But, instead of notifying Byrd, who would have well understood, they let his underling bear the brunt of the unexpected and unpleasant surprise, which Byrd apparently never mentioned to anyone. Neither he nor anyone else received any payment or thanks for the largest collection of mammal skins and skulls and bird skins ever brought back from the Antarctic Continent.

**KEEPING IN TOUCH WITH HIS MEN.** Dr. Paul Dalrymple wrote in 1996, "If a person is known by the company he keeps, then the late Admiral Byrd had to be a great man, as never before in history had so many men been paid nothing and turned out to be such great successes in life." Part of the reason for their success was Byrd's faithfully keeping track of the former associates from his expeditions' Ice Parties particularly, and repaying his perceived moral debt to them by support in their career moves. In extremely few cases did a man fail in gratitude for all that being a "Byrdman" meant to his subsequent career. The most flagrant instance involved one of Byrd's former key plane-pilots, who later became an alcoholic unable to hold a job, so that the best Byrd could do to help him proved insufficient. This account was told me by Paul Siple. The man's bitterness over the tragedy of his personal life and career, said Siple, led him to conspire with an unscrupulous newspaper reporter to be "found" jobless and destitute on a park bench in New York City, wearing the medal which Congress had conferred for his work with Byrd! The latter was especially shocked by this published canard because the impression given was diametrically untrue - all his former associates well knew that Byrd stood up for them to the highest possible degree.

Siple attributed a special importance to this incident. He said that on his first Antarctic trip Byrd had an easy, relaxed style of leadership, as "one of the boys." With so many of the personnel of his expeditions being civilians, military discipline was out of the question as inappropriate for dealing with scientists particularly. But the park-bench episode between BAE I and BAE II convinced him that easy-going leadership and familiarity tended to undermine respect. Beginning with BAE II, his leadership style was more formalized, with his personal contacts more restricted to his Department heads, and relationships with the general run of us largely indirect. He lived on the bridge of the ship and took his meals there, and at Little America had separate quarters where he had meals with Executive Officer Noville. He never ate with the men in the mess hall. He did not watch the movie showings there with us. He rarely posted memos on the bulletin board. He gave no speeches, except once when he briefly introduced the showing of Paramount's "Little America" documentary from his previous southern expedition.

During the eastward cruise before we headed for Little America, I served two watches daily as the one-man Iceberg Watch, stationed on the very prow of the thin-shelled iron freighter, JACOB RUPPERT. Once, when fog was quite severe, Byrd made his way forward to urge me to keep a very sharp lookout. He said that the man watching to warn against bergs was the eye of the vessel, on whom everyone else depended for their lives. The ship was moving at half-speed, he stated, and he was reluctant to move her at all, but the expedition was so far behind schedule that he felt he had to risk it, but "don't relax your vigilance for an instant of your two-hour stretch!"

Rear-view critics have surmised that Byrd was overly "aloof" toward his men. My sense was that he was properly reserved instead, that he was leading from out front and doing his job well. I never heard one of the men say that The Old Man was aloof or unsympathetic.

Prior to Byrd's leaving Little America for his vigil alone at Advance Base, I had but one other personal conversation with him. Noville sent me into Byrd's office for a get-acquainted chat about my work. He made a similar effort to get to know all those who had not been on his previous trip. Clearly, the Admiral knew as little about polar biology as I did about his aviation interests. All that I remember of this, our first real talk, was his asking whether, in case some feature of Antarctica was to be named for me, I would prefer that it be a topographic feature or some new-found life form. I was surprised, since the possibility of either had not occurred to me. I suggested that as a biologist, the latter might be more suitable. I realized, knowing how organisms are named, that he would not be likely to have any

influence in such biological naming. In 1940, Byrd personally discovered a group of 12 coastal islands, which were given my name officially in 1960.

Shortly before Siple took freight 123 miles south to the site of "Boiling Advance Base," word came down directing me to select enough books to fill a wooden chest - reading matter during separation from the library at our main base. Our news correspondent Charles Murphy was more literary in interests than I was, but he was probably too busy for an extra job.

Byrd's experience at Advance Base during the winter night of 1934 changed his attitude toward science and scientists generally. The three-man tractor party which reached Byrd and nursed him through his illness was led by Senior Scientist Thomas Poulter, a geophysicist. The months of long, serious conversations gave Byrd a better understanding of the motivation and methodology of scientists, which was essentially new to him, and enhanced his appreciation of their role in modern expeditions. I recognized this improved atmosphere from the very day of his return by plane to Little America.

Certain "repeaters" on his several expeditions became Byrd's highly cherished friends, lifelong. Dr. Paul A. Siple was with Byrd on BAE I as the Eagle Scout selected from all U.S. Boy Scouts. He accompanied all of Byrd's southern expeditions and others after Byrd's death. Pete Demas, George Noville (a companion of his early Atlantic Ocean flight), and Charles J.V. Murphy who assisted the Admiral with several of his books, were also among Byrd's close friends. Likewise, Amory (Bud) Waite was along on all Byrd's southern forays except the first. These and many other capable associates developed an almost religious devotion to the Admiral. As an old man, on his last expedition in 1956, Byrd and his nearly lifelong associate Paul Siple, revisited the original Little America, and were photographed standing before one of the three familiar triangular metal radio masts so characteristic of this base. Only five feet of its 70-foot length still projected above the snow surface. Byrd passed away in Boston on the 11th of March, 1957.

Two episodes that signal Byrd's personal nature are etched into my memory, one at Little America in 1934 and the other back in Washington, B.C. in 1939. When the Admiral finally flew back to Little America, haggard and gray-haired and still in precarious health, he spent the rest of that day touring all the buildings so that he could be brought up to date about everyone's work, and have a friendly visit with each Ice Party member. He made the rounds with an expedition publicist to physically assist him through the undersnow tunnel system. The super-sensitive guide had never ventured into my zoology shack, having heard that, although its false floor 18 inches above the real floor and the pot-bellied, blubber-burning iron stove make it the warmest place in town, it was reputed to smell of seal and penguin blubber. He led Byrd past the door, saying that he would find the blubber odor too unpleasant to bear. The Admiral passed me by, apparently. However, at the end of his tiring tour and interviews, I was surprised by his arrival alone at my door. I realized that he could not hurt the feelings of the guide, or mine, so after he had finished the rounds and excused his guide, Byrd returned without him. He asked many questions about my work and reactions. It was far and away the best talk I ever had with him, and it dissipated the feeling that I had not yet come to know Admiral Byrd.

This zoology and taxidermy cabin was the last Little America II building to be constructed. All other new buildings had been placed upon the snow surface, and the wind quickly filled in snow between them, up level with their flat rooftops. (The buildings of BAE I were in the same area but submerged at one story lower.) We biologists had been kept busy with general demands, and nearly missed our chance to have our own shack, since winter was setting in rapidly. Siple, Earle Perkins, and I had to dig a hole by shovels, down ten feet and sixteen feet square, into the hard-packed snow, and carry it away. Soon after we completed this strenuous job, a

blizzard drove us indoors and quickly filled the space up to its rim. In the next couple of days we had to dig it out twice again before we were able to cover the newly re-emptied space with a temporary roof, beneath which the prefab shack was set up on a bitter cold but calm day. My colleagues dubbed it "The Lindsey Hole of Science."

In 1939, during my three years of teaching biology and ecology at American University in Washington, Byrd's thoughtful nature was again revealed. My fiancée Elizabeth Smith lived in B.C. Her widowed mother worked at the Library of Congress and was putting her through college. We sent a wedding invitation to the Admiral at his Boston home, for his information, but with little expectation of his being able to attend. He replied that he was sorry that his testimony on Capitol Hill for justifying Congressional financing of his third (U.S. Antarctic Service) expedition was scheduled for that very afternoon. Although this would most likely prevent his getting to our ceremony, he would try to cut the questioning short enough to make the attempt. At this news, we felt it was quite unlikely that he would be with us. Byrd kept a taxi standing by throughout his testimony before the Appropriations Committee. After answering the final question, he rushed out and spurred the cab on toward Quebec Street, arriving a bit after my minister father had pronounced us man and wife, but still during the reception! Our parents, other relatives, and friends joined us in deep appreciation for this chance to talk personally with the gracious Admiral one-on-one.

**THE MAN, THE EXPLORER, AND HIS EXPEDITIONS.** Richard E. Byrd was widely and highly respected during his life and afterward. Since "the higher one gets in the world the harder the wind blows," he has also been criticized, even vilified, but almost exclusively by those who never visited Byrd's arena of action. The world's leading explorers have long been favorite targets of professional detractors. No one else on earth, during the depths of the Great Depression, could have raised the funds and donations of supplies and equipment to mount an ambitious scientific/technological expedition like BAE II. That it was a privately supported project, for which he went deeply in debt to be defrayed by his radio shows, New York Times syndicated news stories, books, documentary movies, and lectures, evidences Byrd's faith and courage.

What sort of man was capable of weaving all the necessary strands together? First and last, he was an aviator, but he was far more. The public thought of him as the Admiral of the Antarctic lands and seas, and not as the Virginia aristocrat living on Boston's historic Beacon Hill among New England's aristocrats. Although a complex and many-faceted personality, he was not a scientist and never claimed to be one. He was skilled at navigation, taught the subject to aviation cadets, and invented the sun compass. He became the superlative organizer and visionary generalist who made a continent safe, nearly, for specialists, in his own time and onward.

The male half of the public admired Byrd's derring-do as a flyer and discoverer, while many women saw the soft-spoken, strikingly handsome leader as also a romantic Tyrone Power look-alike wearing a fur parka. The size of the Saturday night listening audience for the expedition's hour-long, prime-time C.B.S. radio broadcasts was phenomenal, partly because few in Depression days could afford to go out "on the town." It is no exaggeration to state that BAE II, although a non-governmental project, was quite equivalent in the public mind with the Apollo "space" effort of one generation later. Indeed, Byrd's flight over the South Pole in 1929 had been mankind's last step before the moon.

The second Byrd expedition formed the historic dividing line between the old-time excursions with dog-teams, wooden ships and iron men, versus the modern antarctic science done on prolonged research cruises and in more or less permanent fixed

bases, supplied largely by aircraft. Byrd's successful adaptation of mechanical air and land transport and high-tech living, started the trend to polar modernity. The use of dogs tapered off after BAE II, until today sledge-dogs are banned entirely from the southern continent. Byrd would have been surprised if told that he was a conservationist, but his influence toward substituting machines for dogs eventually saved the lives of countless coastal seals, which would otherwise have been killed for dog food over many years.

In his speaking and writing, Byrd always emphasized the vital role of his men in the success of his expeditions. The men of the Ice Parties and ships were of two basic categories - the tattooed and the untattooed. The tattooed were sailors, mechanics, sailmakers and artisans who were indispensable for keeping things on a continuous even keel. The non-tattooed were aviation pilots and navigators, scientists, physicians and other professional men who had previously not had many opportunities to mingle with the tattooed persuasion. On the expeditions, men of these two groups learned to appreciate each other's qualities and viewpoints.

The last job I was assigned at the base camp, after I had loaded all my boxes of heavily salted specimens aboard the flagship, was to help retrieve the corrugated metal fuselage, tri-motor Ford monoplane of 1929 South Pole fame. It had been left after careful burial on high shelf ice inland from Little America I, to be perhaps salvaged later for its historical interest. We found it five years later, encased in a shell of hard ice, hidden beneath the Barrier snows with no surface indication it lay there. While freeing it from its icy tomb was very laborious, it was a labor of love. This airplane is now preserved in the historical museum of Byrd's friend Henry Ford, at Dearborn, Michigan.

The first general reunion of BAE II veterans was held on October 22-23, 1983, the 50th anniversary of our departure from the United States. Twelve men from the Ice Party and their wives, and two from the icebreaker BEAR OF OAKLAND, gathered in Washington. We laid a wreath at the base of Admiral Byrd's sculptural likeness (in polar furs) on the Avenue of the Heroes on the approach to Arlington National Cemetery, and shared reminiscences at a gala banquet that night renewing cherished friendships. Byrd was the only great man that most of us had known personally.

Of the fifty-six-man Ice Party, seven have survived through 1997, and five of us gathered in Irving, Texas on October 17-19, 1997, for the second reunion. In addition, Byrd's daughter Boiling Byrd Clarke, was our special guest. The seven are Ervin H. Bramhall, (now) of Sun City, Arizona, physicist; Stevenson Corey of North Andover, Massachusetts, supply officer; Joseph E. Hill, Jr., of Canyon Lake, California, tractor mechanic and driver; Guy C. Hutcheson of Arlington, Texas, radio engineer; Alton A. Lindsey of Tulsa, Oklahoma, vertebrate zoologist; William S. McCormick of Scottsdale, Arizona, aviation pilot; and Olin D. Stancliff of Erie, Pennsylvania, dog driver.

T H E     O U T B O U N D     B R E E D

From random meetings of rare ancient genes  
There is a breed of Man in every clime  
Who skirts the edges and a bit beyond.  
On the last continent, in the abyss of sea,  
Or probing unprogrammed infinity,  
They revel in adventures few may share.  
A wisp called Fame appears to beckon some;  
Some seek new knowledge on the mind's frontier.  
The beauty these men find is truly there,  
Not second-hand, as that of man-made art.  
Perhaps unconsciously, their major search  
Is for that most elusive goal - Escape.  
Not From, but To, the true reality.  
Which is more real, the fragile hive we build,  
Or this God-given universe itself?  
If singing Homer could return today  
He'd tell of Byrd as Richard Eagle-heart  
Who knew the air, the ice, the dark, the sun.  
He brought back far romance to stay-at-homes,  
Yet left the take-off strips for flights of Science

- A. A. Lindsey

Dr. Charles W. Swithbank, 1991  
Dr. Susan Solomon, 1992  
Dr. Michele E. Raney, 1993  
Dr. Doyle A. Harper, 1994  
Dr. Edith L. Taylor, 1995  
Dr. William I. L. Sladen, 1996

Dr. Bentley's talk will be a retrospective on his long career with highlights from his many experiences in the Antarctic. He's brilliant, he's enlightening, he's engaging with dry humor! The only thing he doesn't have is hair, but that should not detract from a glorious time! COME! COME!

(More about Charlie on page 3)

Operation Deep Freeze lives on. Reunion of Deep Freeze I and II will be on 7-10 May 1998 at the Marriott Hotel, Denver Tech Center, Denver, Colorado. Keynote speakers include Boiling Byrd Clarke and Ralph Glasgal. For more information contact the Coordinator, Jim Bergstrom at 703-978-6541.

East Coast residents should be on the lookout this year for visit to their home ports of the 110' replica of Cook's ENDEAVOUR!!

**WHITHER SHOULD GOEST THE SOCIETY, AND HOW?** (Paul Dalrymple). Without going into any unnecessary details, may we tell you that for the first time in the history of our Society there has been internal strife within our Washington ranks. It involved me, and it affected me so strongly that I have resigned as editor of the Newsletter, and asked our president to tell the Board at their March meeting, although he never did. But I am happy to say that through the turmoil Ruth Siple has remained a staunch supporter. And the new "kid" in the Nerve Center's operations, Kristin Larson, has been in our camp, too.

But the person who has really been affected by it all is our Honorary President, a very devoted member of the Society, who really is the uniting force of the whole organization. In fact, she is the Society. It operates out of her home, although she will be moving soon to the grandmother's apartment at her granddaughter's home out in Fairfax County. This move in itself is somewhat of a traumatic event, being made as sort of a concession to her family as Ruth moves past the age of 80.

I had a professional relationship with Ruth's late husband, as we were more or less in the same working arena, being civilians with the Department of Army, being in environmental research, sharing many of the same interests in climatology. And when my work took me to the Washington area in the early 1970s, I got to know Ruth, and I guess it was a natural thing for both of us to get involved in this Society. I got to know the whole Siple family; Jane became an undeclared daughter. I even had a hand in engineering her marriage, finding her Mr. Right.

Ruth and I got involved in the operations of the Society, and, as Ruth is prone to say, "We were a team." I could not have written the newsletters without Ruth, as she not only censored out all the really good stuff which could have gotten me sued, but she proofread every sentence. I, in turn, helped Ruth out with the membership, the treasury. The Antarctic Society became Ruth's life, and I truly enjoyed every minute of it when I lived in the Washington area.

But things change in life, and I knew without anyone telling me that when I moved to Maine my writings lost some of their personal punch. I was out of the mainstream, and then Kristin surfaced, and there was an immediate love affair between Ruth, Kristin, and me. It became obvious that the time was fast approaching when new blood had to take over the things Ruth and I had been doing. We have long talked about it, and Ruth said, "When you go, I'll go." She is willing to follow me now, although this would not be her first choice, as she wants to keep writing those little yellow notes.

It has all been a very traumatic experience for her. She said that it has been her worst experience with people in her whole lifetime. Ann Hawthorne has been designated as chairperson of the Nominating Committee for the new officers, and they are meeting on April 25th. I am proposing in this period of strife and turmoil that Ruth be selected as our incoming president, with Kristin as her vice-president. Put the position in the hands of the people who will be doing the work. Hey, no one gets reimbursed for anything in the Society, so give the power to those who do the work. Ruth will stay on to do the work, if elected.

It also has to be a time of reflection as to what you people really want. Have the newsletters become passé; are you reading them? Are the Washington lectures worth continuing, or should we just have our annual Memorial Lecture? Has the time come, as John Behrendt proposed, that we consider getting into your home computers?

Write your thoughts to Ann P. Hawthorne at 649 C Street SE, #402, Washington, DC 20003, or e-mail her at APHAWTHORN@aol.com. Decision day - April 25th - so please do it NOW!!!

And for those whom I have offended or stepped on in the past twenty years, I do apologize. Perhaps I knew not what I was doing. But then perhaps I did.

**A WORD ON DR. BENTLEY** (Julie Palais, NSF Program Manager for Glaciology). Charlie Bentley's career, which has spanned more than five decades, began far from the ice of Antarctica. In fact, when he graduated from Yale University in 1950 as a Physic major, his plan was to enroll in law school in the Fall of 1950. However, during the summer of 1950 he took an opportunity to work with Maurice Swing's group at Columbia University aboard the research vessel ATLANTIS. After two months at sea he "never thought of law again," and went on to earn a Ph.D. in geophysics from Columbia University in 1959. His dissertation topic involved seismic measurements on the Greenland Ice Cap. This work in Greenland prepared him well for his many trips to "the ice," the first of which coincided with the International Geophysical Year, where he was the Antarctic geophysical traverse leader for the Arctic Institute of North America, in Marie Byrd Land.

In his early work, Charlie Bentley pioneered the use of geophysical techniques in Antarctica, including the study of wave propagation in glacier ice and other heterogeneous media. His work has also included flow and mass balance studies, and studies of icebergs, ice shelves, subglacial till and subglacial crustal structure. In 1961 Charlie began his long association with the University of Wisconsin-Madison as an Assistant Professor in the Department of Geology and Geophysics. Since 1987 he has been the A. P. Crary Professor of Geophysics in that department. He and his many students, post-docs and collaborators are the authors of over 280 papers and abstracts in the scientific literature.

Dr. Bentley is a fellow of the American Association for the Advancement of Science (1990), the American Geophysical Union (1991), and the Arctic Institute of North America (1992). In 1990 he was honored by receiving the International Glaciological Society's highest award, the Seligman Crystal for being "one of the pioneer who laid the foundations for current work on the ice sheet," Dr. Bentley's other honors include having two features in Antarctica named for him: Mount Bentley (4245 m) in the Sentinel Range of the Ellsworth Mountains, and the Bentley Subglacial Trench, a major subglacial trench (2540 m below sea level) of West Antarctica which lies south of the Byrd Subglacial Basin.

Dr. Bentley has been very active in national and international organizations and committees, including Chairman of the Polar Research Board from 1981-1985, Vice President of SCAR from 1990-1994, and a Convenor of the SCAR group of Specialists on Global Change and the Antarctic (GLOCHANT) from 1992-1997. Dr. Bentley has been a pleasure to work with over these many years. He is a role model and mentor for many, myself included.

**CHARLIE BENTLEY AND THE BENTLEY FAMILY** (Paul Dalrymple) . In the old days, Pleistocene people seemed to be of the very finest cut. All you have to do is look at the late Bill Field, the late Dick Goldthwait, and the current Link Washburn. Charlie Bentley is from the same piece of fabric, and as the limb is bent, so will the tree grow. Marybelle, his evermore bride, is a most delightful person, and is a Russian literature scholar. Daughter Molly is and has been for some time, a very fine radio producer for a Madison, Wisconsin station. And son Alex, a handsome young man, is on a PhD track with two masters, one in archaeology and one in geochemistry.

Charlie is the only surviving IGY link still working in Antarctica. Over forty years on the ice, and he still hasn't hung up his ice axe, nor does it look like he will in the immediate future. Retire as a professor, yes; retire as an indefatigable investigating field scientist, never. The Satchel Paige of the Antarctic. Charlie is going to keep at it until he gets it done right, or the ice sheets of Antarctica all melt away, whichever comes first.

**CURTAIN CALL.** Light fades and a thick dark curtain sweeps down around the continent, separating players from guests. Another transition is underway and the Prattler has reason to believe that this will be no ordinary winter in Antarctica. However, like all good beltway denizens, I cannot reveal my sources. While that news develops there is plenty other libation on which to slake our curiosity of all things ice.

**A FITTING END.** Following closely on the heels of an El Ninja summer season of continuous storms, Mother Nature walloped Antarctica one last time before turning out the lights. Her parting shot was the biggest earthquake of the year, measuring 8.1 on the Richter scale, centered just off the "Australian sector" near the Balleny Islands. This zinger of a quake occurred on March 23. It undoubtedly sent huge waves ashore, and probably caught snoozing Emperors a bit flat-footed. Maybe March should be renamed "Jump," as it is a common month for seismicity. The Alaska earthquake of 1964 was magnitude 8.6, and it occurred on March 27. Then, on the same date in 1980, Mt. St. Helens blew up.

**GOOD AS GOULD.** The R/V LAURENCE M. GOULD set out on her maiden voyage this past Christmas Eve, heading south from her cozy patch of earth in the Louisiana swamps. To date, the GOULD has performed two research cruises in and around Antarctica's peninsular region. She is also scheduled to support Palmer Station and perform "ice trials" into the winter months. As with all new vessels, the GOULD has a few kinks to be worked out, the most serious being what is termed "hull noise." Apparently the ship's stout snout, which is needed for ice breaking, causes "bubble sweep-down." The bubbles obliterate depth-sounding signals, making scientific measurements of all types very difficult. Luckily, the 230-foot GOULD was able to borrow a portable depth sounder from a 20-foot Zodiac at Palmer Station, and press ahead with her important scientific missions!

**OF ICEBERGS AND SHIPS' HULLS.** While seasonal ice folks flew north to places like Fiji and Borneo, the crew of M/V GREENWAVE contemplated Davy Jones Locker, and the USAP came uncomfortably close to providing a southern version of Titanic. The GREENWAVE is a large cargo container ship used each year to resupply McMurdo Station, South Pole and New Zealand's Scott Base. Approximately two days out from McMurdo the GREENWAVE's propulsion system became badly disabled right smack in the middle of Antarctica's notorious Iceberg Alley. Iceberg Alley is like a backwoods-bowling lane on a Saturday night. It is the home of Antarctica's wayward icebergs and growlers which rage around the continent, borne upon a band of rollicking sea between 60 and 70 degrees south latitude. And if icebergs and big ocean are not enough for a foundering ship, this region also experiences nightfall! Imagine bobbing around in that frigid soup! The U.S. Coast Guard Icebreaker POLAR SEA was able (just barely) to tow the GREENWAVE several hundred miles to the comparatively calm waters of New Zealand. Undoubtedly this episode will provide spawn for many a new ice legend!

On the subject of ice and unlucky ships, I recently came across a remarkable bit of testimony in the matter of Steamship TITANIC provided by one of our own - Sir Ernest Shackleton! During liability trials held in the Southern District of New York, Sir Ernest served as an expert witness owing to his "large experience with ice." Good old Shackleton minced no words, stating that "a speed of 21 to 22 knots per hour should never be maintained in an ice zone," and that "when there is no wind and an abnormal fall of temperature, such a drop would be an indication of ice." For more see the Web at <http://www.thesmokinggun.com/titanic>

**OTHER MARITIME MORSELS.** The research ship NATHANIEL B. PALMER will be departing New Zealand on May 1 for a winter cruise into the deepest parts of the Ross Sea.

They will travel south along the 180th meridian and return north in mid-June along the 175th. east meridian. The primary purpose of the cruise is to examine sea ice formation dynamics; however, a lucky bird biologist is also hitching a ride! Dr. Jerry Kooyman, well-known for his work with Emperor penguins, will be surveying transmitter packs on some lucky birds so that he can track their winter wanderings and diving habits. Jerry has been studying Emperor penguins for several decades, but has never observed them in their winter habitat. Watch for updates here!

On a more sobering note for items of an ocean-going character: readers of Prattle may recall that last year Chuck Gallagher, retired Navy Master Chief and long-time Antarctic, died in McMurdo Station during a winter-over stint as a civilian. This past season Chuck's "cremains" were committed to the deep just north of McMurdo Sound in a ceremony by the Coast Guard.

**FAIR WINDS AND FOLLOWING SEAS.** In February the U.S. Naval Support Force Antarctica closed its shops for good, thus ending a century and a half of naval support of research in Antarctica. Leading the vanguard was Lieutenant Wilkes, who, in 1838, undertook the six-ship U.S. Exploring Expedition. Wilkes' fleet sailed with many naturalists and scientists into uncharted waters and along shorelines that now bear his name. Lieut. Wilkes set the tone for the many stout squadrons and detachments that have followed over the years. The Navy has often led the charge in Antarctica, opening up its vast frontiers and helping establish the United States as a leader on the continent. Putting aside all that bravery and apple pie stuff, we will just plain miss them. There really is no replacement for pork adobo and beanie-weenies. All the best!

**SAY CHEESE.** It appears that the U.S. Antarctic Program quietly pulled off one of its more remarkable feats ever this past austral summer. You may be asking yourself "Self, what could be this amazing act of which the Prattler preaches?" Hint: Combine six distinguished Senators from the Committee on Appropriations, with an El Nino weather year and an exceedingly narrow window of opportunity for a visit to Antarctica....a bleeding ulcer is almost assured. Truth-be-told, the Prattler is still not sure who can rightfully claim credit for the parting-of-the-clouds and the calming-of-the-winds during the remarkable three-day evolution this past January, but somehow the Senators, led by Ted Stevens (R-Alaska), saw Antarctica without a hitch. From the heights of the polar plateau and South Pole Station to the dun-colored Dry Valleys, Antarctica entranced them. Even the Orcas and the Emperors were on cue. Someone has been leading a charmed life. Either that or a devils' bargain has been struck!

**ART-ANTICA AND THE WOABLE WU.** Early in the 1997-98 austral summer USAP sponsored a unique and ambitious addition to its venerable Artists and Writers program. For the first time, a team of professionals was dispatched to Antarctica whose sole mission was to document the underwater world of McMurdo Sound. Many of you will be amazed when you see Norbert Wu's images of Antarctica's exotic underworld. Unlike most of the continent that is devoid of life, the Antarctic underwater realm palpate with color and vibrancy. The Artists/Writers group was led by Norbert Wu, a widely published and highly regarded professional photographer (with a scientific background!), included three other professionals with equally impressive credentials. They made more than 68 dives during their two-month stint, and shot thousands of images! One of this group's goals is to produce a natural history guide to McMurdo Sound. In the interim, the Prat suggests that you check out their exciting and educational Web site at <http://scilib.ucsd.edu/sio/nsf/index.html>

**NO IDITAROD THIS YEAR** (Paul Dalrymple). Norman Vaughan, the ageless 92-year old musher mountaineer, went into a local garage, the Providence Hospital, for a spring tuneup. They checked out his body works, found a little rust on his chassis, something about corrosion around an artery on the left side of his neck. They took a hammer and chisel and got rid of that nasty old corrosion. Someone had said he was all heart, so they looked that over, and decided that he might be better off with a few bypasses, so they gave him three. We talked with a spokesperson at the hospital on 1 April, and he said that it was no joke, that old Norman had just had a couple of rough days, but was doing better. They expected that he would have to remain in the garage, pardon me, hospital, for another week. Bride Carolyn was at his bedside. A later call to Trapper Creek revealed that Norman is making slow progress.

On 6 April they had Norman up and standing, after a month of being flat in bed. It is now expected that he will leave the hospital the day after income taxes are due, although it is not believed at this time that there is any federal connection with his exiting on that date. C'mon Norman, get up and going. You have things to do, a life to live.

P.S. Another luminary of lesser years, Ed Hillary, 78, got injured when he fell in a shower on an Antarctic tour ship. He later developed pneumonia, and had to be hospitalized - as we understand it. But he has recovered and is doing well. WE ARE ALL VULNERABLE, WE'RE MORTALS AWAITIN'.

**A REAL SWEETHEART, RURIKO HOSAKA LINDBLAD** (Paul Dalrymple). Everyone connected with Antarctica has heard the name of the late Lars Eric Lindblad, the Founding Father of American Antarctic Tourism, but this will be all about one of the sweetest, most delightful persons I have ever met, his widow, Ruriko. I had the pleasure of being on two Antarctic cruises with her this past austral summer, and, oh!, how she enriched both trips.

She is very quiet, very soft-spoken - so much so that I heard only about 37% of what she was saying, but that was enough for me to realize that she was a very special unassuming person. She refuses to lecture, even though she has so much to say that would be of interest to everyone. But she will engage freely in one-on-one conversation, or even in small groups.

And as a translator, just superb. The first lecture I gave with her translating to an all-Japanese group, I wrote out my lecture, with blanks for where I'd be stopping so she could translate. It was a total waste of my time, as she can translate instantaneously. She is FABULOUS.

All staff members went ashore in the first zodiacs to assist the tourists coming ashore later. We had made a landing at Petermann Island to the right of where Charcot had tied up their POURQUOI PAS, and our expedition leader made the decision to beach one of the zodiacs up over this particular rock-bound coast. I was down near this zodiac, and glanced over my shoulder at the pulling task force, and there was the small, lithe Ruriko nearly bent to the ledges, pulling as hard as she could, with a line over her shoulder. Instantly she became "Captain Scott" to me.

So I called her by that name for the rest of the trip, and every time I did, this silly little grin would creep/spread over her face. She was/is a sheer delight. Occasionally you meet someone whom you either want to adopt, like Paula Hull of the San Diego Wild Animal Farm, or take home, like Ruriko. She lives in Connecticut I hope she gets real hungry for a lobster and comes to my doorstep looking for one, as it would be so great to see this wonderful person again. Captain Scott, I will never forget you. You are GREAT.

**AT LEAST THIRTY-FIVE SOCIETY MEMBERS HAVE LECTURED ON ANTARCTIC SHIPS** (Paul Dalrymple)  
Antarctic shipboard tourism started back in January 1958. During these forty years quite a few members of our Society have lectured on ships going to Antarctica. We came up, with John Spletts<sup>1</sup> help, with a list of thirty-seven current members who have lectured.

Peter Anderson	Barbara Fry (MD)	Tony Soper
Tim Baughman	Peter Harrison	John Splettsstoesser
Eal Borns	Mike Kuhn	Charles Swithinbank
William Breed	John Levinson (MD)	Frank Todd
Colin Bull	Bill Littlewood	Mort Turner
Dick Cameron	George Llano	Gerald Webers
Boiling Byrd	Shirley Metz	Gunter Weller
Clarke Jim	Ron Naveen	
Collinson	Jackie Ronne	Widows of lecturers (who accom-
Paul Dalrymple	Jeff Rubin	panied their husbands): Anne
Gisela Dreschhoff	Bob Rutford	Benninghoff Jane Siple DeWitt
Bob Dodson	Darrel Schoeling	Kay Goldthwait Marilyn
Sayed El-Sayed	Brian Shoemaker	Zumberge
Carmen Field	Ruth Siple	
Conrad Field	Bill Sladen	
Art Ford		

There are probably others who have fallen through the cracks, but even this list is rather imposing. The real high rollers in this crap game have been George Llano, John Splettsstoesser, Peter Harrison, and Frank Todd. These people have been on so many cruises that they have lost count, although most know the number of years. Probably all four have over one hundred cruises each, meaning over two hundred crosses of the Dreaded Dunkin Drake.

**THE LIGHTER SIDE OF TOURISM** (Paul Dalrymple). Several members of our Society, including yours truly, lectured on Antarctic tour ships this past austral summer. There is limited compensation for one's services, but there is very liberal compensation from the association with Antarctic-interested tourists. Some are real gems, and I was very fortunate this year in meeting a naturalist-artist, or perhaps she is an artist-naturalist - whatever. An interesting event happened as we landed the tourists on a beach at West Point Island in the Falklands. As soon as we left the ship, each and every zodiac had a convoy of dusky dolphins alongside and darting across the bow.

After we had unloaded all the tourists, this artist-naturalist came up to me and said, "I would just love to go back out there and play with those dolphins." And I replied, "Do you want to use my chest waders?" Naturally she did, so she put them on and walked out in water up to her neck, and had a fantastic time for the next forty-five minutes cavorting with the dolphins.

So let's fast-forward to the end of the cruise when everyone assembles, and all staffers have to summarize their thoughts. I had the perfect introduction to my talk, but thought I had better first run it past the expedition leader. So I told him this was what I wanted for my introduction. "This no doubt will be my last trip to Antarctica as Father Time was finally catching up with me at age 74. I first came to Antarctica forty-one years ago, during the International Geophysical Year. And in all those years, I thought I had seen everything, but I discovered on this trip that I had not. For the first time ever, a woman got into my pants." I wasn't allowed to use it! But, Ho, you were/are something else!!

**FORTY YEARS ON ICE:** A Lifetime of Exploration and Research in the Polar Regions, by Charles Swithinbank (Reviewed by John Splettstoesser). After reading Charles's first book on his professional life, "An Alien in Antarctica," I wondered how he might top that with another, but he has. "An Alien..." is about his six expeditions to the New Zealand side of Antarctica, but "Forty Years On Ice" is about nearly all the rest, told in 19 chapters. Each chapter contains a first-hand account of what 40 different men might have accomplished in their professional careers, but here in 40 years, Charles has done all of it alone, from circumnavigating Baffin Island in an icebreaker (1956 - Ch.1) to his extensive work with The British Antarctic Survey, and since his retirement with the Adventure Network International in its exceptional 12-year history of transporting clients to the interior of Antarctica with wheeled aircraft landing on blue-ice runways (1987-88 and continuing - Ch.19). (I don't think Charles was aware that the field party of 4 that I was a member of, in the 1961-62 season in the Ellsworth Mountains, was the first to see the blue-ice runway that ANI uses at Patriot Hills. Of course, it took Charles and the veteran polar pilot, Giles Kershaw, to see its utility for wheeled aircraft.)

Between those chapters are accounts of his cruise on the icebreaker SS MANHATTAN through the Northwest Passage in 1969, then on a submarine under the ice at the North Pole. He also has hundreds of hours of flying in Antarctica, doing a variety of field work, as a passenger and also as co-pilot, much of it involving radio-echo sounding of glacier thickness. In fact, much of Charles's polar life revolved around ships and aircraft and each activity is a story in itself.

One aspect of his life that I knew little about is given in the Prologue (1926-56), covering his early life and events which led to his career as a glaciologist. A brief experience on glaciers (Iceland), and a visit to Spitsbergen while in the Royal Navy, set the stage for his love of cold places with ice, and an invitation to join the Norwegian-British-Swedish Expedition in 1949-52. The rest is history.

As with his first book, this one is a first-class product with color photographs and high-quality paper. It was published in 1998 by The Book Guild Ltd., 25 High Street, Lewes, East Sussex, BN7 2LU, U.K., which takes orders by credit card only, at 25 British pounds, plus 15% for shipping. In the U.S., try Transatlantic Publications, Inc., 311 Bainbridge Street, Philadelphia, PA 19147, or get the book cheaper yet by writing to the author in Cambridge, U.K., where you can get an autographed copy for \$47.50, which includes shipping by surface mail. Charles will accept checks in U.S.\$, and lives at 7 Home End, Fulbourn, Cambridge CB1 5BS, U.K. It is possible that Charles has yet another book to bring to light, perhaps his personal account of the 1949-52 expedition in Antarctica.

**SAFE PASSAGE QUESTIONED:** Medical Care & Safety for the Polar Tourist. John M. Levinson and Errol Ger, Editors. Cornell Maritime Press. (Reviewed by John Splettstoesser). Dr. John Levinson, M.D., experienced ship surgeon, and past President of the Explorers Club, was the motivator behind a conference on medical aspects of polar tourism, held at the Scott Polar Research Institute, Cambridge, England, on October 29-31, 1995. Medical experts from Antarctic Treaty Parties and tour companies attended, and provided the presentations.

There are certain risks involved in polar tourism, ranging from safety practices on board vessels and associated transport vehicles such as zodiac-type craft and helicopters, physician qualifications, medical equipment and supplies; medical emergencies, types of injuries encountered; liability issues, and so on. The volume addresses these issues and more to form a handbook of a sort for both tourists and tour operators to plan for and conduct safe tourism in polar regions, where the nearest medical facility might be a thousand miles away. (Paperback - at booksellers, or by calling 1-800-638-7641 in the U.S. Price \$24.95.)

# THE ANTARCTICAN SOCIETY

905 NORTH JACKSONVILLE STREET  
ARLINGTON., VIRGINIA 22205

HONORARY PRESIDENT — MRS. PAUL A. SIPLE

Vol. 98-99

August

No. 1

#### Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rutford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-9-1  
Mr. Tony K. Meunier, 1994-96  
Mr. Ronald S. Naveen, 1996-98

#### Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. Bud' Waite, Jr.  
Dr. Charles W. Swinbank  
Dr. Paul C. Dalrymple

#### Paul C. Daniels

#### Memorial Lecturers:

Dr. William J. L. Sladen, 1964  
RADM David M. Tyree (Ret.), 1965  
Dr. Roger Tory Peterson, 1966  
Dr. J. Campbell Craddock, 1967  
Mr. James Pranke, 1968  
Dr. Henry M. Dater, 1970  
Sir Peter M. Scott, 1971  
Dr. Frank Davies, 1972  
Mr. Scott McVay, 1973  
Mr. Joseph O. Fletcher, 1974  
Mr. Herman R. Friis, 1975  
Dr. Kenneth J. Bertrand, 1976  
Dr. William J. L. Sladen, 1977  
Dr. J. Murray Mitchell, Jr., 1978  
Dr. Laurence McKinley Gould, 1979  
Dr. Charles R. Bentley, 1980  
Dr. Robert L. Nichols, 1981  
Dr. Robert H. Rutford, 1982  
Mr. R. Tucker Scully, 1983  
Dr. Richard P. Goldthwait, 1984  
Dr. Mark F. Meier, 1985  
Dr. Claude Lorius, 1986  
Dr. Louis J. Lanzerotti, 1987  
Mr. Peter J. Anderson, 1988  
Dr. Ted E. DeLaca, 1989  
Dr. Saved Z. El-Sayed, 1990  
Dr. Charles W. Swinbank, 1991  
Dr. Susan Solomon, 1992  
Dr. Michele E. Raney, 1993  
Dr. Doyle A. Harper, 1994  
Dr. Edith L. Taylor, 1995  
Dr. William J. L. Sladen, 1996

**FROM THE NERVE CENTER.** This is a late-summer Newsletter telling you that we are still in business. I, Paul Dalrymple, resigned in all good faith and honesty last spring, submitted my resignation to our president for submission to the Board. But he never turned it in, and the Nominating Committee for our officers nominated me for your president for the next two years. In our last Newsletter last spring I pleaded with you folks to write the chairperson of the Nominating Committee and ask them to support Ruth Siple for president. And she received your wholehearted support and universal endorsement. But in their infinite wisdom, the Nominating Committee reached down to the bottom of the barrel and came up with my name. It just does not make any sense, reaffirming my previous thoughts on how committees function.

I have not officially accepted the presidency, but have temporarily agreed to work with Ruth Siple. Ruth and I have had a good relationship for many, many years, a relationship spawned by our mutual interests in Antarctica, one nurtured by the fact that we each had/have some spare time on our hands. Although I am willing to throw in the ice axe, the Society has become Ruth's life-support system. Your letters make her day.

Incidentally, our Society is moving, lock, stock, and barrel this fall, as Ruth is moving, somewhat reluctantly, but still willingly, into a grandmother's apartment being built over the attached garage of her granddaughter's house in nearby Fairfax County. Ruth is fully mobile, can take care of herself, is in good health now, but her family is looking ahead to the day when it might be good to have a family member in the same building with her. You folks will be given due notice when she will be moving, her new address, her telephone number. But for the time being, use her current address in Arlington.

**MEMBERSHIP.** The Society has stabilized at about 550 members, which is approximately what we were a year ago. The whole system has worked real well with you people renewing for multiple years. This helps Ruth in her bookkeeping — this year she will have to send out only 210 notices for renewal. We are keeping the dues at the same low figures: single \$10 USA and Canada, husband/wife \$12, and overseas \$15. Members from BAE I, BAE II, and U.S. Antarctic Service Expedition get theirs gratis, as do the National Archives, Goldthwait Library, SPRI Library, Jim Caffin and Max Hamilton in New Zealand.

**CALENDARS.** Again we are going with Colin Monteath's splendid Hedgehog House Antarctic calendars, and, again, we are keeping them at the same low price of \$11 each. Betty Monteath, who fulfills many duties for husband Colin, assures us that this year's 1999 calendar is one of the very best. Our order is already on a ship somewhere in the South Pacific headed for Maine. Distribution will be made from Maine, although your order and check (\$11 each includes mailing) should be sent to Ruth. Incidentally we didn't buy as many as before, so with a reduced quantity, get your order in ASAP to assure some for your Christmas stockings.

**THERE GOES ANOTHER BYRDER.** Ervin Bramhall, physicist on the Second Byrd Antarctic Expedition, 1933-35, succumbed on July 3rd, leaving Alton Lindsey as the only surviving scientist from the first two Byrd expeditions. The immortal Norman Vaughan is the only living member from the First Byrd Antarctic Expedition, but there are several compatriots of Bramhall on BAE II who are still alive - the above-mentioned Al Lindsey, Steve Corey, Bill (Whirley Bird) McCormick, Joe Hill, Guy Hutcheson, and Olin Stancliff. Bramhall was in charge of the cosmic ray program, both shipboard and at Little America II. He and Gil Morgan led a four-man party up onto the polar plateau, running a seismic and magnetic survey, which, at that time, was the most ambitious research program ever conducted in the polar regions.

**REUNIONS ARE IN.** A grand total of 135 people attended the recent, 7-10 May 1998, reunion of Deep Freeze I and II in Denver, Colorado. Thirty-six were spouses, twenty-four were guests, including the son and daughter-in-law of the much-beloved leader at McMurdo in 1956, the late Dave Canham. Two of the original South Pole sitters in 1956-57, Cliff Dickey and Ken Waldron, were there. And an amazing number of sandcrabs showed up - in alphabetical order, Steve Barnes, John Behrendt, John Brown, Gil Dewart, Ralph Glasgal, Bill Littlewood, Fred Long, Mike Maish, Kim Malville, Hugo Neuberg, Don Skidmore, and John Weihaupt. Two of these, Dewart and Maish, were to later winter over with the Russians at Mirny. Two of them are authors of books about wintering over in Antarctica, Dewart and Behrendt. Two of these people spoke to the gathering about their experiences in Antarctica, Behrendt and Glasgal, although the keynote speaker was one who wintered over at 9 Brimmer Street in Boston, the eldest daughter of the late Admiral Richard E. Byrd, Boiling Byrd Clarke. Incidentally, Boiling was not named after Byrd's ship, ELEANOR BOLLING, which was dishonored with a well-merited verse which went something like "Eleanor Boiling, Ever Rolling!" Boiling is a family name.

Vice Admiral Lyle G. Bien, U.S. Navy, Deputy Commander in Chief, U.S. Space Command, Colorado Springs, presented the Navy Commendation Medal to Doc Aldrich and George Moss, who were in attendance, and to Bill Hess and Charles Slaton, in absentia. Special presentations were made by John Rand and Jerry Marty of NSF, and Carleton Walker of the Antarctic Support Associates. And Dian Belanger, designated oral historian for these hearty warriors, was introduced to the gathering.

**SOUTH POLE** sitters of 1958 are planning to have their 40th reunion on the 25th and 26th of September 1998 at Skyland on Skyline Drive in Virginia. It's not going to be a big affair, as the station complement was only eighteen, and Vernon Houk, Palle Mogensen, and Steve Fazekas have all crossed the Great Divide. The Navy guys have all vanished to ports unknown. So that leaves Jim Burnham, Dee Baulch, Johnny Dawson, Mario Giovinetto, Charlie Greene, Kirby Hanson, Art Jorgensen, and myself as survivors. Now one of us eight is on the bubble until the departure day. When he wakes up he will make his decision. One part of his brain tells him he should come and join in the revelry, the other part tells him that it was the worst year of his life, and that he should stay home. Two of us have been battling Parkinson's for close to twenty years, one (the strongest of us all) suffered a heart attack a few years ago and is now a 255-pound weakling. One of us has implants and a bad knee.

So if we were to take a physical, only three of us could pass (and unfortunately, I am not one of the three!). The 40th reunion is really your last hurrah, as after that, groups begin to look like the survivors of the Bataan Death March.

**OVER THE HORIZON.** After 44 years, VXE-6 is going to be disestablished at 1100 hour (that is approximately 11 a.m.) on Saturday, the 27th of March 1999 in their hangar at NAWS, Point Mugu, California. We have no idea whatsoever what NAWS stands for, just another military acronym to confuse bewildered innocent civilians. An announcement says the formal disestablishment will be on the 27th, but goes on to say the squadron will be disestablished on Wednesday the 31st. Huey Buno 158288 may be flown in for a static display. Presume you VXE-6 guys/dolls know what the Huey Buno is and what a static display consists of, but we don't! Hey, why not dust off old Que Sera Sera, put old Gus Shinn on temporary duty for 48 hours, and have him fly that over from Pensacola. Make it historic, make it interesting. Seriously, the ceremonies and reunion are open to everybody, and if you want to follow developments, there is a web site link, <http://www.navy.mil/homepages/vxe6>, whose reunion page takes you to a directory questionnaire. We'll try to keep you updated here, toe

**AND SIR ERNEST IS COMING TO TOWN.** Yesiree, Sir Ernest Shackleton is making a big comeback, and the Big Apple itself will host an exhibition about Shackleton's ENDURANCE expedition at the Museum of Natural History in New York from April 11, 1999 to October 11, 1999. Sir Ernest, himself, is being detained in Grytviken, South Georgia, so won't be able to make this one, but his JAMES CAIRO will be there, along with his historic primus stove. This is the first legitimate reason since Babe Ruth played in Yankee Stadium for anyone to go to New York City, and we are even considering having our first-ever Antarctican Society function there at the time of the opening. There is a very strong rumor that Hollywood is going to make a movie about Shackleton, and that some kid by the name of Harrison Ford will be portraying Sir Ernest. If that comes to fruition, will anyone thereafter ever hear about Scott???

**BOOKS AND THINGS WRITTEN.** This Newsletter has a long-winded review of Huntford's latest polar biography, this one on Fridtjof Nansen, entitled "Nansen." Why Nansen in an Antarctican newsletter? Hey, Nansen was a man for all snow and ice areas, wherever. One might say he was Heir Apparent to being the first at the South Pole, as that was one of his strongest desires. But he was counselling Scott, Shackleton, and Amundsen, and thought they should be given the first opportunity. It's a GREAT BOOK, buy it!

Charles Swithinbank thanks those of you who heeded John Splett's advice and ordered his books directly from him. Charles says he has a *great deal* for those of you who haven't bought his most recent books, "An Alien In Antarctica" and "Forty Years On Ice." For 100 U.S. dollars, he will send you a copy of each book with his distinctive small autograph.

John Behrendt's forthcoming book, "Innocents On Ice," should be a dandy. It took over forty years for this book to come out, but anyone at all familiar with what happened at Ellsworth Station in 1957 will want to get the book. It will be published this fall by the University of Colorado Press.

Another Antarctican, Barry Lopez, has a relatively new book out, "About This Life." When it comes to Barry Lopez, it doesn't get any better, so this book which is selling for around \$24 should be a MUST BUY. It's not about Antarctica per se, as it is about life, but Antarctica has been a prominent part of Barry's life. We had the luxury and the pleasure of spending several hours at an NSF orientation six years or so ago in the company of Barry, Stuart Klipper, and Jody Forster, and it was sheer delight. Barry spoke about this book which was in his head, what he wanted it to be, and now it is here!

Occasionally one can get a good bargain. Rudi Honkala, who wintered over once at Wilkes, again at Casey, finally at Palmer (please note, he never left the Banana Belt) bought a copy of Matthew Henson's book, "A Negro Explorer At The North Pole," about thirty years ago for \$15. A recent polar catalogue is carrying the same book for something like \$960! I, myself, had a windfall back in 1958 when I bought mint-condition, first edition volumes of Scott, Shackleton, and Mawson at an auction in Wellington for a grand total of \$28. They are probably worth close to \$2000 now, especially considering that one set is personally gifted/inscribed to Lord Curzon by Kathleen Scott, Herself.

**THE SEVENTH CONTINENT - GREAT READING.** The Montreal Antarctic Society has a most unique and very interesting newsletter with all kinds of offbeat and upbeat articles on Antarctica which make it a sheer delight to read. No stuffiness there. The president and editor is Valmar Kuroi, and they are located at 4633 Harvard Avenue, Montreal, Quebec, Canada H4A 2X3 (e-mail: mtl.ant.soc@sympatico.ca ). They even welcome the English, and Valmar is VERY cooperative. Issue No. 5, Spring 1998, has a great resume of "Antarctica Experienced Through Music," summarizing twenty-two CDs! It is the most definitive resume of Antarctic music I have ever seen, and he is to be congratulated for putting it all together. And he is just as good with up-to-date book reviews. Fauno Cordes will be happy to know that Valmar recognizes Antarctic fiction as a legitimate part of Antarctica.

**"WINFLY" HERALDS BEGINNING OF ANTARCTIC RESEARCH SEASON (NSF).** Beginning August 20, five flights of a U.S. Air Force C-141 Starlifter aircraft brought personnel and supplies from Christchurch, New Zealand to McMurdo Station in Antarctica, ending six months of isolation for the research station. The winter fly-in, or "Winfly," sets the stage each year for the United States Antarctic Program (USAP) austral summer research season.

Winfly flights were scheduled two days apart from August 20-28, leaving Christchurch at 5 a.m. and arriving at McMurdo at about 10:30 a.m. In the long twilight and brief daylight, crews spent several hours offloading equipment in frigid temperatures (near -40 degrees) before the aircraft headed north again. The flights brought in 217 people, and more than 100,000 pounds of cargo, including supplies, mail, and fresh fruits and vegetables to McMurdo Station.

The C-141 Starlifters are huge, four-engine jets with up to 11 crew members and the ability to carry up to 150 passengers. They are operated by the U.S. Air Forces's 62nd Airlift Wing, headquartered at McChord Air Force Base in Seattle, Washington. The planes landed on Pegasus Runway, a blue-ice runway on the Ross Ice Shelf that partially covers the Ross Sea. McMurdo-based crews had been busy preparing and testing the runway. They removed snow and, to ensure the runway was strong enough to hold the weight of a loaded airplane, dragged a "proof cart" over it to simulate the landing pressure of a fully loaded C-141 Starlifter. The steel cart was loaded with concrete blocks weighing 384,000 pounds, and rolled on eight actual C-141 tires.

This year's Winfly scientists include those who will study ozone and seals, as well as those who provide science support to prepare for the Cape Roberts Project. This effort includes researchers from the United States, New Zealand, Italy, Germany, the United Kingdom, and Australia to establish a drill rig on the sea ice and extract sediment cores from the sea floor. The cores will span a period of 25-70 million years

"Main Body" flights that mark the start of the research season will begin this year on Tuesday, September 29. The summer population at McMurdo will reach about 1,000 scientists and support staff until the end of the season in February 1999 when only about 150 people will remain for the winter.

**FROM THE DESK OF JOHN LYNCH.** The big news in the upcoming Antarctic season will be mostly operational. Some pretty big construction projects will dominate activities at the South Pole. The new large garage and shop facility will be built inside the oversized arch which was installed last summer. There will be a big jump in the total winter-over personnel numbers to 45 or so, in order to complete the garage interior (ed. note, they must be interior decorators). The nine 25,000-gallon bladders in which the fuel is stored will be replaced by forty-five 10,000-gallon steel tanks. This will be the last summer in which uniformed Naval personnel will be a part of the U.S. Antarctic Program. They will operate and maintain four LC-130s.

**NANSEN**, by Roland Huntford (published by Gerald Duckworth & Company, Ltd., London, 1997. 610 pages. ISBN 0-7156-2740-6. Price \$52.50 at Amazon. - There are 43 black-and-white photos.) (Reviewed by Paul Dalrymple). Fridtjof Nansen, Norwegian, was a Man made for the Snow and Ice, a Man made for the Most Elite Damsels of Europe, a Man equally at home behind a microscope in a science laboratory as he was madly skiing in near darkness down an unknown precipitous mountain slope. He was a Man of Many Faces, and the one he wore at his death was that of a great humanitarian who served causes for the less fortunate souls of the world. Huntford's book about Nansen is really a two-volume book in one cover, with the first half about his great polar achievements, the second half about his diplomatic and humanitarian careers.

Nansen is really The Baseline for evaluating all polar explorers, the Fritz Klammer of explorers, leaving them all far behind. This book is a Glorification of Nansen, and indirectly a subtle denunciation of all the other so-called giants of the Heroic Age. When you say Nansen, you aren't just talking about the invention of some stately geographical society; you are talking about a self-made man of science nobility whose lust for a full life took him into the previously uncharted domains of the world. His nearest polar counterpart probably was the great Swedish scientist-explorer, Dr. Otto Nordenskjold. Roald Amundsen did great things, but wasn't he a one-dimensional, finely-tuned machine who could only execute to perfection?

Nansen is not portrayed as a great leader of men, and his saving grace may have been in having Otto Sverdrup as captain of the FRAM, plus the fact that Nansen (and Johansen) were off the ship by themselves for a year and a half. It appears that the crossing of Greenland had left Nansen as sort of an egotistical polar authority who wasn't prone to taking suggestions from his men. So Nansen never enjoyed the popularity of, shall we say, Shackleton. Nansen's only cardinal sin that affected his transit was a short lapse in winding his chronometer which resulted in uncertainties in calculating their longitudes. Certainly the biggest problem for the whole expedition was booze, but that was squelched very early on with strict restrictions on its availability.

Somehow or other Dame Fortune travels with a lot of polar people, and she certainly did with Nansen, as she did with Shackleton and Mawson, walking hand-in-hand. Probably never more so than the sheer luck in Nansen accidentally running into Frederick Jackson at Cape Flora - a culmination of a series of happenings which were strictly blind luck!

Three-fourths of the book is pure excitement, where you can't wait to read what is on the following page. Then when Nansen gets back home, and becomes more or less a puppet for the government, being sent on diplomatic missions here and there, often with a clandestine undertone, it becomes less exciting. However, the book is spiced up by revealing that Nansen had involvements with women everywhere, even being so reckless as to fall in love with a neighbor while he was still married. When his wife died, he eventually married her, but by then the frost was off the pumpkin.

Everyone seemed to love Nansen, and he tried with a great deal of success to reciprocate, so he was a very, very popular man in Europe. He was The Native Dancer on the

floor, could do any dance, and was never known to have sat out a dance. He went riding with the hounds, and the very first time out he astounded everyone, several hundreds, with his expertise in riding and taking jumps. Fantastic guy, very athletic, handsome debonair - he had everything all men wish they had. An early day Errol Flynn, perhaps

He shared himself with the high and mighty, being a treasured friend of the King of England, who constantly wanted his companionship. Kathleen Scott was one of his admirers, and this was not exactly a one-way street. When Captain Scott finally arrived at the South Pole, his wife and Nansen were rendezvousing for a week in Berlin Keeping it all in the polar family, one might say. However, when Nansen's wife Eva died, Kathleen was said to have rejected Nansen's proposal to marry him.

But one must not think that Nansen was just an international playboy. These were just fringe benefits, as he was a key figure in Norway gaining its independence, and then serving not only his country but the whole world in various humanitarian causes at the League of Nations in Geneva. However, at the same time he continued his pursuit of sciences, particularly in oceanography - he had his own research yacht -and in geology. He even got into one of today's popular science themes, climate change. He was a very serious scientist, and published many books on his research. Nansen was something else.

He harbored a burning desire to be first at the South Pole, but he found himself so heavily committed to nationalistic causes that he had to sit by and be an armchair witness, as those he counseled and advised made repeated attempts. One of the tragedies of it all, according to the book, was that Cherry-Garrard harbored a guilt feeling during his life over his personal inadequacies on skis, and sought 'solace from Nansen in his failure to not go further in his searching mission for Scott's party. And Nansen, so it was said, could not give him reassurance that it was not his fault.

Huntford has changed one thing in his latest book; the references are now incorporated right into the text, so you no longer have to have that finger back in the references. It makes for much smoother reading. I have only two complaints with Huntford. He has a liking for profound or stilted words for someone who likes simple, one- and two-syllable words. If he had a choice of writing simply or complicatedly, he takes the low road! But those of you who are well-educated and well-versed in the English language will enthral with his word selection.

The other thing which bothered me was Huntford's reluctance to put the year after the month and date. Because Nansen was a man of action and movement, you were often left hanging-out-to-dry guessing the year. Like on the FRAM arctic trip which left home in mid-summer, returning some thirty-nine months later, covering four years; being two prongs (Nansen and Jacobsen, plus the ship), with the story going back and forth from one to the other. It all got somewhat confusing at times. Later on, in his diplomatic career, he was on a yo-yo between several homes in Norway, diplomatic stays in London, duties at the League in Geneva, missions to Russia and Greece, plus endless ongoing lecture tours. If each chapter had the year at its beginning, it would have helped those of us with Alzheimer's.

**SOMETHING NEW, SOMETHING DIFFERENT.** This year there is a group doing something which almost makes sense - sea kayaking around South Georgia. Of course, the weather will often be overcast, cloudy, rainy, windy. But every time they go ashore, they will be entering Heaven, with albatrosses providing air coverage, kings and macaronis monitoring the beaches. And what a backdrop should the sun ever shine!! If you people want to buy a truly great book, buy Tim and Pauline Carr's "Antarctic Oasis," published by W. W. Norton, available through Barnes and Noble, selling for \$40. Fantastic book by the island's only permanent inhabitants, who have lived on South Georgia for the past five years on their yacht, the CURLEW.

The Carr's are the curators of the fabulous South Georgia Museum. (Note that "Whaling" has been dropped from the name of the museum.)

PENGUIN PRATTLE by Kristin Larson

**SUMMER PRATTLE.** Summer (the boreal variety) is the planning season. While a few souls swoosh around on squeaky winter-over snow, keeping the hearth ablaze, the rest of us Antarcticans live by lists, sweltering over details, minds clogged with misty ice images of what we hope our plans will produce. We plan because the nearest supply depot will be 10,000 miles too far away, should we short-shrift the spade-work now. We plan so our budgets can sustain a glorious cruise through Neumayer Channel some windless day in January. We plan because we want to attain or exceed modern estimates of our life expectancy. Aside from travels into outer space, or to our highest peaks, no other destination causes a sojourner to so drill down, peeling back layers, revealing details of the details. Why? Duct tape and bailing wire can only do so much.

Technology has changed the planning equation, and some might even say reduced its role. Regular flights zip us that forgotten widget; satellite communications get us rapid answers to questions we forgot to ask; GPS always tells us where we are, even if it's lost. But in a place like Antarctica, technology rarely replaces planning; it merely expands our capacity for accomplishment, creating new bottlenecks of dependency, and upping the ante. So get back at it, and don't forget to factor for the coming solar max!

**MERRY TIME.** News of the shipworthy continues to dominate the Prattler's radar. As reported in our last installment, the R/V NATHANIEL B. PALMER was just heading out for the depths of the winter ice-laden Ross Sea. The primary mission objective of this winter cruise was to analyze sea ice formation dynamics, and by all accounts was highly successful. Also along for the cruise was Dr. Gerry Kooyman, Emperor penguin biologist, who in his nearly 40 years of Antarctic research has never had the opportunity to venture into the bird's winter foraging grounds. Recall that male Emperors are the only warm-blooded Antarctic natives to endure the full force of the continent's winter conditions, all the while incubating eggs in the cradle of their upturned "toes." As the sun dips down, taking temperatures with it, the females head northward to socialize amongst the clouds of krill. During this recent cruise Dr. Kooyman tagged a number of birds. However, contrary to expectation, there were not many mature females among them; perhaps the gals are more domestic than we thought? Thus in the tradition of truly fine research, this experiment produced more puzzles than it solved!

The N. B. PALMER is now in a shipyard in Seattle, having new equipment installed, while her new sister ship R/V LAURENCE M. GOULD heads into the body shop for some time with a torch-wielding surgeon to correct her minor imperfections.

**NOT SO MERRY TIME.** Our Australian mates also sponsored a winter cruise this past July on the R/V AURORA AUSTRALIS. Destination: Mertz Glacier Polynya (about 110 miles from the French Dumont D'Urville Station). Mission: deciphering the role that the polynya ("sea lake") in the midst of the sea ice plays in driving the deep ocean currents and global climate. Unfortunately, within hours of initiating the first measurements, an engine-room fire abruptly changed science goals into survival goals. Happily the smaller backup engine was unharmed. After sussing out the melted wires and drifting in the pack for three days, the good ship limped home to

Hobart to get fitted out for another sally in the salt. A great, day-by-day account of this expedition by a former NSF-sponsored writer can be found on the Discovery ONLine Channel at: <http://discovery.com/exp/antarctica/dispatch1.html>

**HIGHLIGHTS FROM TROMSO.** The Antarctic Treaty Meeting held in Norway earlier this summer produced many fine accomplishments. Highlights follow:

Bulgaria was welcomed as a new Consultative Party to the Antarctic Treaty, bringing the number of such parties to twenty-seven. In order to attain Consultative Party status with full voting rights, a nation must make a significant, ongoing investment in the advancement of Antarctic research. The last two Consultative Parties to be added were Ecuador and The Netherlands on 19 November 1990.

Work continued on the establishment of a permanent Treaty Secretariat, and received strong support from most Treaty Parties. Such an office would provide a "home" for Treaty matters, and facilitate the sharing of information. Several locations are currently under consideration, including Hobart, Australia (already the home for the Marine Living Resources Convention), and Buenos Aires, Argentina. As with most significant international decisions, this one appears to be temporarily snagged on some political thorns, but good progress is being made.

Recall that the Protocol on Environmental Protection to the Antarctic Treaty entered into force this year on January 14th. This important event precipitated a flurry of working papers and new activities during this year's Treaty meeting. Australia proposed that January 14th herewith be recognized as "Antarctic Environment Day," a suggestion that was taken under advisement. The Committee on Environmental Protection (CEP) was formed and initiated deliberations. Their first actions included adoption of Rules of Procedure and the election of Dr. Olav Orheim, (Director of the Norwegian Polar Institute) as chairperson for a two-year term. Several delegations emphasized that even though the CEP is the most important advisory committee (i.e., it does not have enforcement or decision-making authority), other scientific and managerial groups retain the ability to provide independent advice to the Consultative members. The CEP will meet each year in conjunction with the annual Treaty Meetings. Dr. Robert Hofman from the Marine Mammal Commission acted in the capacity of the U.S. representative for the convening of the CEP. The Department of State will remain as the point-of-contact for the CEP, and will likely name the CEP delegation on a meeting-by-meeting basis.

**NEW DIRECTOR.** In August 1998, Dr. Rita Colwell took up the reins as Director of the National Science Foundation. Immediately prior to becoming NSF Director, Dr. Colwell was President of the University of Maryland Biotechnology Institute and Professor of Microbiology at the University. Dr. Colwell has served on important USAP oversight panels, and recently traveled to McMurdo Station and South Pole as a member of the External Panel chaired by Mr. Norm Augustine. NSF's Office of Polar Programs continues to operate under the able, but temporary guidance of Dr. John Hunt. Sources somewhere inside the Beltway claim that the search for a permanent Director for OPP may soon yield more reportable prattle.

**DASH IN THE DARK.** In early August a New Zealand Air Force C-130 Here plucked the McMurdo Station Winter Manager off the ice before his "hot" appendix got any hotter, and took him to a Christchurch hospital where it was safely removed. The wheeled aircraft made the 16-hour round-trip journey in the dark, landing on the Pegasus blue-ice runway near McMurdo. Normally the U.S. Air Force would provide this type of support, but no polar qualified aircrews were in the immediate areas, and time was of the essence. Good on ya, mates!

# THE ANTARCTIC SOCIETY

Joint Meeting with The Explorers Club - Washington Group  
and The Society of Woman Geographers

*Around the World Under the Sea*

by

Dr. Norbert Wu

on

*Saturday evening, December 5, 1998*

at

The Cosmos Club 2121  
Massachusetts Avenue NW

*Social Hour 6 PM - Dinner 7 PM - Lecture 8 PM*

The cost of dinner, including tax and gratuity, is \$45 / person  
Make check payable to ECWG, and send to Frank R. Power --  
13208 Glen Mill Road, Rockville, MD 20850-3708 (301-294-9377)  
before December 1st! No cancellations after November 30th!

Dress will be black tie, or dark suit, if you prefer.

(Parking free at Cosmos Club)

Dr. Norbert Wu, professional underwater photographer, led a team of four (himself; Dr. M. Dale Stokes, oceanographer; Dr. Leighton Taylor, marine biologist and writer; and Peter Brueggeman, Director of the Library, Scripps Institution of Oceanography) diving in McMurdo Sound in the 1997-98 austral summer. Photos were taken on sixty-eight scuba dives, and on field excursions to Cape Royds, Cape Evans, Cape Bird and Cape Washington, Granite Harbor, the Dry Valleys, and on the sea ice edge of McMurdo Sound. Ernest Brooks II, President, Brook Institute of Photography, said, "Norbert is a true visionary with a magnificent sense of balance and design." For a partial resume of this most remarkable man, said by the Chicago Tribune to "combine the eye of the artist with the training of the marine biologist," turn to the bottom of page 2.

*We still have calendars! Please buy! See page 2!*

You have not missed a Newsletter! The last issue, August No. 5, should have been August No. 1, as our calendar year starts with Midwinter Day and goes to the next Midwinter Day.

One thing we are trying out here is getting more inputs from more people for the Newsletters, so you will find some new names. In some cases, as in Robert Schwarz and Caroline Alexander, we will give you a thumbnail sketch of them, although with all the print Caroline is getting, you should know who she is. Plan now on attending the opening of her Shackleton exhibit at the American Museum of Natural History in New York City in early April next year. Our Society hopes to have a big shindig with an internationally-known authority on Shackleton speaking to us.

I am walking out on the Society again, but just for the winter season. I leave with great happiness, leaving this entire column in the hands of the very capable Kristin Larson. When I hear the call of the Antarctic, I must answer, as I know there will be a day when that call won't be coming in over my telephone line, as I will be seventy-five on our day of departure from Ushuaia. I have to stand on the deck of some ship, with my mouth agape, gazing again and again at the beauty of the Lemaire Channel; I have to stand on the shoreline of Circumcision Bay, Petermann Island, and wonder about Dr. Jean-Baptiste Charcot's POURQUOI PAS being tied up there; I have to stand again at Capt. Larson's crumbling stone hut on Paulet Island, and relive in my mind the incredulous story of Dr. Otto Nordenskjold's expedition; I have to go out to the hangar at Whalers Bay, Deception Island, and visualize what it had to be like for my old co-worker, Sir Hubert Wilkins, taking off from that very beach in front of me for the first-ever Antarctic flight; I have to stand on the burnt-out ruins of the Almirante Brown Station and wonder what in the world was in the mind, if anything, of the doctor who had the audacity to burn down the station, located on one of the most peaceful scenes in the whole world, the placid waters of Paradise Bay rimmed with beautiful, majestic mountains. I love to stand in the foot prints of Antarctic history. It will be a great winter/summer for me. And I will miss Christmas. Ha! Ha! Ha!

**LAST CALL FOR ANTARCTIC CALENDARS FOR THOSE CHRISTMAS STOCKINGS.** We ordered fewer calendars this year in order to get out of the begging business, but we still have sixty left, as we go to press. Order tout de suite, as we are pulling out of Maine, which is our 1998 distribution center, in mid-November, and we don't want to have to dump a load on Ruth's lap as we fly south. Mail your order, with check (\$11 each) payable to Antarctic Society, to Ruth at 905 N. Jacksonville St., Arlington, VA 22205-1325. Some of you were disenchanted last year when the Kiwis started the week on a Monday, but they have their act back together, so the week starts on Sundays. Again the calendars are very nice, and the price is a real bargain, as we buy bulk and only mark them up pennies. Make our day - buy us out, NOW!

**NORBERT WU - CINEMATOGRAPHER, PHOTOGRAPHER, AUTHOR - SPECIALIZING IN UNDERWATER PHOTOGRAPHY AND WILDLIFE:** Biographical Sketch. In the course of his worldwide travels, Norbert Wu has been bitten by sharks, run over by an iceberg, stung nearly to death by sea wasps, and trapped in an underwater cave. He has photographed under water in nearly every conceivable locale, ranging from the freezing waters of Arctic and Antarctic waters to the coral reefs of the tropics. His writing and photograph} have appeared in numerous books, films, and magazines, including *Audubon*, *Harper's*,

*International Wildlife, Le Figaro, National Geographic, Omni, Outside, Smithsonian,* and the covers of *GEO, Natural History, Time,* and *Terre Sauvage*. He serves as contributing editor to *Photo Techniques, Nature Photographer,* and *Scuba Times*. The author and photographer of seven books on wildlife and photography, his photographic library of marine and topside wildlife is one of the most comprehensive in the world. He has worked as chief still-photographer for Jacques Cousteau's *Calypso*; as research diver for the Smithsonian Tropical Research Institute; and as cinematographer for numerous television productions. His background includes degrees in electrical and mechanical engineering from Stanford University and doctoral studies at the Scripps Institution of Oceanography. He is a technical, certified nitrox and rebreather diver, both of which allow extended bottom times and other advantages underwater. He co-authored the feature article on marine biodiversity in *Encyclopaedia Britannica's 1996 Yearbook of Science and the Future*, and he was recently awarded a National Science Foundation (NSF) Artists and Writers Grant to document wildlife and research in Antarctica. His recent projects include filming the revolutionary new *Deep Flight* submersible for National Geographic Television, filming tiger sharks for *Survival Anglia*, and filming attacking great white sharks for the PBS series *Secrets of the Ocean Realm*.

**NSF NAMES NEW HEAD OF POLAR PROGRAMS.** (John Lynch). The National Science Foundation (NSF) has named physicist Karl A. Erb to head its Office of Polar Programs. Erb will assume his new position on November 2, 1998.

In 1986, Erb joined NSF as a program manager in the physics division after a sixteen-year career in research and education at Yale University, Oak Ridge National Laboratory and the University of Pittsburgh. From 1989 to 1993, under two presidential science advisors, he oversaw the area of basic research in science and engineering at the White House Office of Science and Technology Policy. Erb has served as Senior Science Advisor at NSF since 1993. As part of the senior NSF management team, he has considerable familiarity with the management of polar programs. His experience has included representing NSF in the National Science and Technology Council review of the U.S. Antarctic Program, that resulted in the 1996 White House affirmation of the importance of the program to the nation.

Erb is recognized for his research in experimental nuclear physics, particularly in the areas of heavy-ion science and nuclear molecular phenomena. He received his masters and doctoral degrees from the University of Michigan, and his Bachelor of Arts degree from New York University. He is a Fellow of the American Physical Society and the American Association for the Advancement of Science. He was recently recognized for his work in the public sector with the Presidential Meritorious Rank Award.

**BONDING AT THE SOUTH POLE.** Through a very circuitous route - Liberty Graphics in Liberty, Maine - we made contact with some awfully nice people at the South Pole, and they made our summer by e-mail communicating. The station leader, Robert Schwarz, a German, has provided a couple of inputs for this Newsletter. One, as you will see, is quite technical on one of their most glamorous studies, the AMANDA, and the other on one of their most fun activities, the 300 Club. Through Robert, we were able to borrow a video he made from within the old South Pole station last October, which was shown at the 40th reunion of those of us still living from the 1957-58 wintering-over crew. Looking at it, we're not even sure that we wintered over at the place!

The good thing about all the communicating we did was the great camaraderie that developed between us. There seems to be a bonding just because we all had experienced a winter at the Pole. Robert has a great, sincere love for history, history of the South Pole, and he hopes to extend his most elaborate and fantastic website - ( <http://alizarin.physics.wise.edu/rschwarz> ) on the South Pole to include history.

He sent us an extensive annual summary of South Pole construction highlights for the last thirty years. We're not sure about this, but the interest might be out there for a symposium/reunion of just South Pole people, and, should it come about, it will be because of nice people like Robert Schwarz.

There is also another group of South Pole bonders - Tom and Gloria Hutchings, South Pole alumni, who are continuing their South Pole interests with The Antarctic Connection, P.O. Box 538, Jackson, NH 03846 - [www.antarcticconnection.com](http://www.antarcticconnection.com). Gloria worked at the South Pole in the early 1990s in logistics, and Tom worked as a construction coordinator for ASA. In fact, he is still involved as a state-side contractor doing some "test builds." They also operate what amounts to a ship's store, and you can buy Antarctic baseball caps and other goodies from them. And they are sort of a South Pole Unofficial Clearing House, dispensing news on what goes on at the station, as well as monthly summaries of their weather. Their menu can be found by pushing the right buttons on <http://www.listbot.com/>. They have so many checks and balances confirming who you are that I threw my arms up in hasty retreat and signed off, but those of you with patience might want to join their club for "the chosen frozen."

**AMANDA** (Antarctic Muon and Neutrino Detector Array) - A telescope at the South Pole looking at the Northern Hemisphere (Dr. Gary Hill and Robert Schwarz). AMANDA is a neutrino telescope located at the South Pole. Instead of using light (Photons) like normal telescopes or radio waves like radio telescopes, it is using neutrinos. Neutrinos are subatomic particles and a lot of facts are still unknown about them. But it is known that their interaction with matter is very weak. This makes them very interesting, as they can escape from regions surrounded by dust or gas that would attenuate all optical or radio radiation. Thus, we can learn about regions where we may have no other observations available. The origins of these high energy neutrinos are unknown, but they are believed to be produced in very high energy particle interaction in objects like the cores of active galaxies, binary X-ray systems and near super-massive black holes or supernova explosions.

The weakness of the interaction makes neutrinos very hard to detect, because to detect a neutrino you need it to interact with matter. However, given a lot of neutrinos and a large target (like the entire earth), a reasonable rate of interactions is possible. Those neutrinos that interact with the earth produce muons, which, if produced close enough to the detector, may be sufficiently energetic to travel the remaining distance and be detected.

However, the interaction of cosmic ray protons and nuclei with the earth's atmosphere also produces lots of muons, some of which will travel down through the ice, and trigger the detector in much greater numbers than the neutrino-induced muons. So the detector works by using the entire earth as a filter for the atmospheric muons, i.e. we look down toward the center of the earth. That way we are sure any muon we see was produced by a neutrino. So we are actually observing the northern skies with a detector at the South Pole.

How does the detector work? So far there are 17 strings with about 550 PMTs (Photo Multiplier Tubes) in the polar ice cap. PMTs are light-sensitive devices. If they are hit by light (even a single photon), they give out a measurable electrical signal. The AMANDA-A array consists of four strings down to 1000m, with 20 PMTs on each string at the lower section of the string with a spacing of 20m between each PMT. The AMANDA-B array goes down even to nearly 2500m, and consists of four older strings like the A ones, six with 36 PMTs per string and a spacing of 10m between each PMT, and three new ones with 42 PMTs.

When charged particles travel through an optically-transparent medium like air, water, or, in our case, ice, and their speed is higher than the speed of light in this medium

the so-called Cerenkov effect occurs. The particle emits light, creating a cone-like shock wave in the same way a supersonic aircraft produces a sonic boom. Now, if this light cone travels through the array, different PMTs are hit by the light at different times. By analyzing the data one can reconstruct the trajectory of the muon and hence of the neutrino. A two-dimensional analogy would be a boat traveling on a smooth surface of a lake, with the waves created by the boat hitting a number of buoys on the surface. One would just measure the arrival times of the waves at each buoy, and thereby infer the path the boat took.

The times of arrival of the light cone at each PMT allow the determination of the muon path; this direction is closely correlated with the original neutrino path, and thus we can do directional astronomy. Our aim is to look for areas in the sky where we got a lot of neutrinos, and hopefully find correlation with astronomical objects. (For more information go to the AMANDA homepage - <http://amanda.berkeley.edu> )

**300 CLUB** (on a cold night in July - actually it was 21.07.97 - Robert Schwarz). Today twelve people joined the famous 300 Club, which means 300 degrees Fahrenheit temperature difference. The temperature outside finally dropped again below -100 F (73.4 C - with wind-chill it was -150 F and -100 C). We heated the sauna up to over 200 F, and got warmed up. After a couple of minutes we all ran outside just wearing boots, like nature created us. The moon was high up in the sky, and around every body was a cloud of steam. It was a lot of fun, and we took a couple of pictures of the steam clouds. Then we ran back to the sauna. We were out for a good minute, and it wasn't too bad, so we decided to make a run for the geographic pole. After warming up in the sauna and getting the cameras ready we went bursting out into the polar night again. One hand was protecting the "wing wang," and three of us were running to the Pole. The first half of the trip was good, but the breathing was quite hard because of the cold air and the altitude of 3000m (10000 ft). The last thirty meters I would have rather turned around, but there were only 30m of 230m (one way) to go. I looked around and two gasping figures were following me. We touched the pole and turned around. Now it would have been nice to have a nice warm parka or such stuff. But there were 230m back to the top of the hill in front of the entrance, and then down to it and back inside the dome to the sauna. I thought what a stupid thing to do, run around naked at -100 C (-150 F) wind-chill at South Pole in the middle of the night. Gasping for air I had to walk a couple of steps. The sweat on the back and butt was frozen and cracking during running. The dome was closer, but still about 100m to go. The cold was getting very, very intense, and you only wanted to get back in. I can't really describe the feeling. On one side you really didn't feel any pain (not until you were back to the sauna), but on the other side you could feel the freezing cold, not a slowly creeping cold you normally feel with clothing on; the cold was just there, all over you. There was the slope down to the entrance through the door, up the stairs back into the sauna. It was still at 200 F (93 C), but it felt cold, and even the hot wood felt cold. My ears were white, and I had to cough for a couple of minutes, but then we took the victory shots of all of us in the sauna and in front of it. Now, nearly 24 hours later my ear; are still glowing in the dark, but they feel already much better. It was great fun, and next time we'll probably do it again, not running to the Pole, but just running outside. It was a lot of fun, and my ears are back to normal.

**SOUTH POLE STATION MODERNIZATION** - A Project Update provided by Jerry W. Marty, NSF Construction and Operations & Maintenance Manager for South Pole Station. This year NSF's South Pole Modernization Project (SPSM) enters its second field construction season, and is proceeding on schedule and within budget. The modernized station will be an elevated facility (see architects' rendering) that is designed to accommodate 110 personnel (46 scientists and 64 station operations personnel). The flexible

design will allow for expansion to accommodate 150 people should future growth be necessary. The project will also provide infrastructure upgrades for fuel storage, garage/shops, and a new 750 kW power plant capable of expansion to 1 megawatt peaking capability.

The design efforts are scheduled to be completed this coming March, and procurement and delivery of materials is proceeding smoothly. First stop for the approximately 20 million pounds of construction material (purchased and shipped over a period of several years) is the USAP cargo processing facility at Port Hueneme, California. From there consolidated crates are transported to McMurdo Station on the annual re-supply ship, and then flown to the South Pole by LC-130 Hercules aircraft. It is estimated that the project will require 800 LC-130 flights to South Pole throughout the duration of the project.

This coming season the construction work force, which includes added personnel to support the construction population, will be 80, and the winter construction crew will be 18. The primary focus of the construction effort during the summer months will be the replacement of the existing nine rubber fuel bladders (25,000 gallons each) with 45 new steel tanks (10,000 gallons each). Also this summer, the new garage/shop facility building (shell only) will be constructed, and its interior will be completed during the winter months.

Construction of the new power plant will begin in the summer of 2000 and be completed the following year. Construction of the SPSM elevated facility will begin in 2001, and the total project will be completed in 2005. The SPSM project budget is \$153m with \$19m remaining to be funded.

**CAROLINE ALEXANDER COMES TO CENTER STAGE.** We became aware of Caroline Alexander last spring when she wrote our Society and said that she was the curator of a new exhibit on Shackleton to be held at the American Museum of Natural History in New York City, an exhibit which will officially open in early April 1999. Recently she wrote an article in the November 1998 issue of the National Geographic Magazine on "Epic of Shackleton." And the October 26th issue of TIME Magazine has an article on her new book, *ENDURANCE, Shackleton's Legendary Antarctic Expedition*, which should be published by Knopf and out on the streets by the time you read this. And a previous work, a children's book on Shackleton entitled *Mrs. Chippy's Last Expedition* was her grand entrance into Shackleton Mania. One might say that there is now a strong umbilical cord between Squam Lake, Holderness, New Hampshire where Caroline lives on True Farm, and Sir Ernest's grave site at Grytviken, South Georgia.

But who is this woman who has taken over center stage with Sir Ernest? We asked her, "Who are you, anyway?", and her reply was, "I'm Anglo-American (dual citizenship), and a classicist by training. I received my doctorate at Columbia University. My area of specialization is Homeric epic, which obliquely equips me for the Shackleton epic! I am a freelance writer. I lived and taught in East Africa for some years. I have written for the *Smithsonian*, *National Geographic*, *Outside*, et al. The new book on the ENDURANCE expedition is my fifth book."

**AMERICAN MUSEUM OF NATURAL HISTORY IN NEW YORK CITY PRESENTS THE ENDURANCE: SHACKLETON' LEGENDARY ANTARCTIC EXPEDITION, APRIL 10, 1999 - MID-OCTOBER 1999** (Caroline Alexander), "October 26, 1915; Latitude 69, 8 S; Longitude 51, 28 W; Temperature 0 to -15. I shall ever remember vividly this afternoon. The dogs, instinctively conscious of the imminent peril, set up distressed wails of uneasiness and fear. Sir Ernest, standing on the poop, calmly surveying the movements of the ice, and giving an occasional peremptory order ... At 6 p.m., the pressure develops an irresistible energy ... the ship groans and quivers, windows splinter, whilst the deck timbers gape and twist. Amidst these profound and overwhelming forces, we are the absolute

embodiment of helpless futility." (From the diary of Frank Hurley, photographer of the ENDURANCE)

The story of how Sir Ernest Shackleton and his men survived as castaways in Antarctica is one of the very greatest in the annals of exploration. After five months on disintegrating ice floes, the 28 men took to the three lifeboats they had salvaged. Eventually two open-boat journeys were made under appalling conditions; the second of these – a winter journey skirting the notorious Drake Passage in the 22-foot JAMES CAIRD – is considered to be one of the most remarkable in maritime history.

On board the ENDURANCE was a talented Australian photographer, named Frank Hurley. When the ship went down, he dove into the icy water to retrieve a hermetically-sealed cannister containing his glass plate photographic negatives. Shackleton, relaxing his rule that only two pounds of gear be allowed for each man, allowed Hurley to save his best images. Hurley's diary entry for November 9, 1915, records that he and Shackleton spent the day "selecting the finest of my negatives from the year's collection." They selected 120, destroying the remaining 400, so that Hurley would not be tempted to retrieve them again. The chosen negatives survived ice, open seas, and burial under the snow of a desolate island.

On April 10, 1999, the American Museum of Natural History in New York City will present *The ENDURANCE: Shackleton's Legendary Antarctic Expedition*, a comprehensive exhibition of Hurley's salvaged ENDURANCE photographs. The exhibition, which will run through mid-October 1999, will also display the few artefacts to survive the expedition – including the 22-foot-long JAMES CAIRD, which in the winter of 1916, battled sixty-foot waves to rescue all of Shackleton's men.

#### PENGUIN PRATTLE by Kristin Larson

**NEW OLD PRATTLE.** Much new news to report on this month. Not only are we at the threshold of a new Antarctic field season with its uncharted discoveries, fresh faces, and unimagined anecdotes; the Office of Polar Programs has a new Director, and the South Pole is embarking on an all new look. One thing is not new, Antarctic's weather still challenges even the best-laid plans; foils the most accurate weather forecasts; and leaves dozens "grounded" in New Zealand. Hurry-up-and-wait has been a common refrain for many early season travelers to McMurdo this October. Thus no matter how we travel to Antarctica, or in what type of structure we take refuge, Antarctica's weather holds us both captive and captivated. Could it be this lack of predictability that makes us yearn to return?

**SCIENCE HIGHLIGHTS** (with help from NSF's Office of Legislative & Public Affairs). After being stymied by weather and ice conditions for the past two years, the Cape Roberts project will again attempt to collect cores from the Ross Sea floor. This international team, which involves scientists from the United States, New Zealand, Italy, the United Kingdom, Australia and Germany, plan to drill through their sea ice platform and 170 meters of water into the underlying sea floor. Sediments and fossils in the collected cores should provide information about conditions 25-70 million years ago. This period is of particular interest because it may have been the last time that earth experienced temperatures as warm as those expected over the next few centuries.

This December and January a big balloon will circle the Antarctic continent at an altitude of approximately 120,000 feet, born on circumpolar air currents for about two weeks before being parachuted to the ice for recovery. The balloon is supplied and launched by NASA, and its payload will measure temperature variations in cosmic microwave background radiation. Details about these relic photons left over from the beginnings of the universe will help scientists discriminate among various models of the cosmos.

In conjunction with the Argentine Antarctic Institute, U.S. researchers will be excavating Mosasaur and Plesiosaur fossils and searching for Hadrosaur fossils on Vega Island near the Antarctic Peninsula. The fossils provide important information about the geographic distribution of these marine reptiles. In particular, because Hadrosaurs were large land-dwelling, plant-eating dinosaurs, the Antarctic demonstrate a significant land bridge between the Americas and Antarctica, and also provides evidence of a complex and extensive plant ecosystem on land in the region which was then at a high southern latitude, not unlike its current position.

Ice core drilling will continue this year at Siple Dome, in West Antarctica, where a 1,000-meter core will be extracted and examined for clues about past climate conditions. Also at Siple Dome, researchers will try to determine the dynamics of ice flow, a topic critical to understanding the stability of the ice sheet. The West Antarctic Ice Sheet, which rests on thin continental crust, may be an important contributor to a future global warming-induced sea level rise.

The R/V LAURENCE M. GOULD will have its first full season this year. The research vessel will embark on cruises in support of ultraviolet research, Long Term Ecological Research, marine geology and geophysics, as well as providing logistic support to Palmer Station. The 230-foot long ship is capable of breaking ice one foot thick.

**PENGUIN PAPARAZZI.** Seventh Continent news: CBS will make programs for evening and weekend morning shows, and "60 Minutes." Also on-site to catch breaking stories will be staff from The Washington Post, the Knight-Ridder news service, the New Scientist, and USA Today's weather editor.

**LIKE BEING THERE.** A new interactive CD-ROM entitled *Wildlife of the Deep Antarctic* takes you and your armchair into the midst of Antarctica's penguin and seal colonies, and nudges you up to the edge of the frozen sea as giant killer whales rise out of the water, only inches away. Two "ice veterans" share their best images (both video and photos), which are accompanied by sounds, narration and natural history notes. The only thing missing is wildlife odors...smart choice! The CD is available from MastroMedia by phone (760-434-6110) or on the worldwide web ( <http://www.antarcticaonline.com> ).

Architectual Design (Ferraro-Choi & Associates)  
of the new South Pole Station (see pages 5-6)

# THE ANTARCTICAN SOCIETY

7338 Wayfarer Drive  
Fairfax Station, Virginia 22039

HONORARY PRESIDENT ---- MRS. PAUL A. SIPLE

## Presidents:

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubín, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter F. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94  
Mr. Tony K. Meunier, 1994-96  
Mr. Ron Naveen, 1996-98  
Dr. Paul C. Dalrymple, 1998-2000

## Honorary Members:

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Court Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Write, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

Vol. 98-99

May

No. 3

## We Have Moved!!!

You will note by the letterhead that the Society has a new address. That is also the new address of our Honorary President, Ruth J. Siple. Her telephone at this new address is 703-250-7338. The Society means much to Ruth, it is one of her lifelong interests and she loves to hear from you people. Please keep writing and calling her. After all, she just can't be put out to pasture now... she is only 39!

## Antarctic Poet to Speak at NSF

**When:** 12:00 noon, Tuesday, 18 May 1999

**Where:** Room 375, NSF, 4201 Wilson Boulevard, Arlington

**Who:** Bill Manhire, New Zealand's inaugural poet laureate

**What:** Public lecture and reading, "Poet on Ice"

**Action:** Mark your calendar!

Bill Manhire, in Antarctica in 1998 with New Zealand's Artists to Antarctica program, is "one of the freshest and most exhilarating poets now working in English," states the British journal PN Review. Like NSF with its Antarctic Artists and Writers Program, Antarctica New Zealand give humanities scholars the chance to work with scientists in a part of the world that otherwise would be inaccessible to them. The program "aims to encourage understanding among New Zealanders of the values of Antarctica and its importance to us as a nation." Like the NSF program, it helps to record our cultural history there and enables people who do not travel to Antarctica to conceptualize experiences they cannot have.

Bill Manhire is editing an anthology of imaginative writing (particularly fiction and poetry) about Antarctica. Its working title is 'The Wide White Page.' The poems he wrote in Antarctica will be in a book titled What to Call Your Child, which Random House will issue this year. This semester Mr. Manhire is Fulbright Visiting Professor of New Zealand Studies at the Center for Australian and New Zealand Studies, Georgetown University.

## Brash Ice

By Paul Dalrymple

Treading on Sara Wheeler, the Newsletter has been "incognita" of late. But we promise to get better rather than worsen. We have a litany of excuses, whether you will buy them or not, such as Ruth Siple moving her residence (and the Antarctic Society's "nerve center"), and such as my cavorting around the Antarctic Peninsula for four months.

First the bad news. Ruth has been diagnosed as having that aging eye disease, macular degeneration. The good news is that there is only one wet eye, and she is under the care and treatment of a local ophthalmologist. At this point in time no one really knows what the consequences will be, how active Ruth can remain in the Society. But we aren't about to take Ruth out behind the barn and shoot her, and she will continue to do some of the things she has done so expertly for the Society for the past twenty-five years.

Along with macular degeneration, Ruth has developed an arthritic condition in her hands, which will not only prevent her from typing the newsletters, but also cost some of you the personal notes she used to affix to your newsletters. Kristin Larson, our co-editor, has volunteered to step forward to type the newsletters, and it may be that we will have to find a new method of dispersing them. One possibility proposed last year would be for those with computers getting your newsletters right off your screen. At this point in time, it is too early to do any forecasting of the future; however, we have included a brief questionnaire with this letter so you can voice your opinions on the matter.

### The Shackleton Exhibit

The only thing wrong with the *Endurance* Shackleton exhibit, now at the American Museum of Natural History in New York City, is the lack of space. An excellent exhibit of Frank Hurley's photography and *Endurance* memorabilia is encumbered by its confinement to a narrow corridor in the majestic museum. Dennis Peacock of the Office of Polar Programs admitted defeat while attending its opening on 10 April, seeking refuge outside the jammed corridor.

Both Caroline Alexander (curator of the show and author of the book reviewed below) and Shackleton are having an excellent year. She is serving as his mouth and secretary; appearing weekly on national television and in printed media across the country. Sir Ernest, aka The Boss, is truly Mr. Renaissance Man of the Antarctic, and bids well to become the most legendary Antarctic explorer of all time, especially if the long-promised full-length movie production of the *Endurance* expedition comes to fruition. The piece-de-resistance of the whole exhibit may have been something never associated with Shackleton or Hurley, but rather created by modern technology. There, surrounding the tiny whaling boat, the famed *James Caird*, are three screens upon which is projected oceanic waves of sizable proportions and generated by computer wizardry. But impressive as the projected waves are, they probably pale in comparison to what was actually experienced during the boat journey from Elephant Island to South Georgia. Perhaps it was a desire on the part of the curators not to have the spectators becoming seasick that they have reduced what were probably forty-foot waves. Too bad, as wouldn't it have been more befitting to see green-colored spectators fleeing the hall in a mad dash for fresh air covering their mouths with "barf bags"? Shackleton would no doubt have enjoyed such a spectacle!

### The Shackleton Show Schedule:

The curators of the New York *Endurance* show can not yet confirm plans for where the show will next be traveling when it closes in early October. However, it seems fairly certain that the photographs and "some of the memorabilia" will come to the National Geographic's Explorer Hall in Washington DC and stay through the holidays. The next stop is rumored to be the Maritime Museum in Salem, Massachusetts and thence on to Seattle, Washington. One thing seems fairly certain: the tiny cork of a boat, *James Caird*, which brings awe and chills to any follower of the *Endurance* story, most likely will be returned to its home at Dulwich College in Engknd, and not part of any traveling retinue. If you want to see *that* boat on this side of the drink, we suggest you get on up to NYC before October 11<sup>th</sup>!

The Antarctic Society is looking into the possibility of holding special regional meetings in conjunction with the opening of shows in Boston

and Seattle that would include special guest lecturers. Watch for postings!

### **Other Tall-Masted Tales**

In early February I was on the pier at Ushuaia, Argentina (jump-off point for cruises to Antarctica) hoping to meet an old friend who was serving as the expedition leader on the *Vavilov*. A young man walked down the gangway and soon we were deep in discussion. It seems he was the grandson of the famed shipper/explorer of the *Belgica*, and he and sixty-five other Belgian nationals were about to sail on the centennial anniversary celebration of that famous expedition. I asked him (Francois Ole Gerlache) if it were true that his grandfather had sold the *Endurance* to Shackleton. His reply was "No, but Adrien did have the plans drawn up for the *Endurance*, and he was along for its maiden, shakedown cruise." Incidentally, Francois has wintered-over with the British expedition on Brabant Island, and his father had been a winter-over member of another expedition. Do any of you know of any other family where three generations have all wintered-over? Francois is the father of twins, one of whom has been handicapped since birth. It was tear-wrenching to hear this dedicated father tell of his resolve to bring his handicapped son to Antarctica despite his disability.

### **Book Reviews**

*Innocents on Ice: A Memoir of Antarctic Exploration, 1957*  
by John C. Behrendt, 1998, University Press of Colorado

#### **Editorial Comments by Paul Dalrymple**

This long-awaited book, over forty years in the making, tells the story of what happened at Ellsworth Station in 1957. It is not only an account of what happened that year, it is also the strongest indictment ever written about an Antarctic camp leader. Because that camp leader's immediate family members are treasured Society members, it has created a real dilemma in finding a knowledgeable Antarctic who could give a non-partisan review.

Steve Dibbern, a long-time close friend of both Ruth and myself, was given the unenviable task of reviewing the book. Steve, a polar transportation expert who championed the use of hovercraft in Antarctica, is probably the best-read Antarctic I personally know in the United States. He is a very decent chap, one without built-in prejudices like someone I see every morning when I shave. Steve

was not shown flashcards as he wrote this review nor asked to soften or harden his comments. What you read is his unbiased opinion.

I know you will find this book extremely interesting. The tide alone tells so much about those of us who went to the Antarctic at the beginning of the International Geophysical Year (IGY). Of all the U.S. stations, Ellsworth may have had more interesting, budding scientists of note than any other station. Certainly the author, John Behrendt, has had a most distinguished career, remaining in the forefront of U.S. scientists in the international Antarctic arena. Considering John's credentials and those of his fellow "innocents," there is a high degree of credibility to be found in the pages of this book.

#### **Review by Steve Dibbern**

Until this year many of the books written about US Antarctic operations during the IGY were by expedition commanders or station leaders and were written in the somewhat "sanitized" fashion of die day that either ignored problems or deliberately adjusted facts and sequences of events for political or more usually self-serving purposes. Readers today who are familiar with the current structure of the US Antarctic program will strain to comprehend the structure during the IGY. The prevailing cold war situation had naval expeditionary forces building and operating bases and a relatively small number of civilian scientists, or "sandcrabs" as they were referred to, "doing the science."

life at Ellsworth Station near the base of the Weddell Sea is the setting of this eminently readable book, which is based on the diary of John Behrendt. He was one of the seismic party during die construction of the station, die first winter of the IGY, and die summer traverse to the interior. The raw diary, while interesting, is made much more coherent to the reader today by the author's extended comments, which are printed in a different type face so that the reader will never be left to wonder what was the thinking in 1957 and what is die contemporary interpretation.

I must confess that this is one of die most fascinating books that I have had die pleasure to read in years. As an Antarctic history fan I had long been aware of the kind of pressures and conflicts that plagued many or most isolated Antarctic stations. Each group dealt with these conflicts with greater or lesser degrees of success. The winter of 1957 at Ellsworth was

rumored for years to have been a particularly stressful one and now, at last, we have a "sandcrab" version of what happened there. The base leader, Finn Ronne published his version soon after the actual events and even the casual reader got the impression that his account was a bit self-serving; indeed all three of his books were a little of that. Most non-IGY people were unaware of the severity of the personnel conflict at Ellsworth. However, hints of problems can be discerned by a careful reading of books by Ronne, Kevin Walton and Jennie Darlington about the earlier private Ronne expedition to Stonington Island.

Ronne appears to have had serious problems with the exercise of authority. It is difficult for the casual reader to conceive of the depths of mistrust and paranoia that were exhibited by Ronne's actions. In particular, the modern reader will have difficulty understanding the level of control of communication that he exercised over his men to prevent word of the conditions at the station from leaking out. The parallels between Ellsworth and the fictional destroyer in the "Caine Mutiny" literally leap off the pages. Some of the reactions of the sailors and scientists were less than admirable, and, in fact Behrendt admits that after a period, no matter what Ronne did, it was interpreted as evil.

This book might be subtitled the "Triumph of the Sandcrabs" since, in spite of the petty, mean behavior of their commander, the scientists still strived to do their scientific work. Behrendt makes it clear that the bulk of the Navy personnel were most supportive and helpful. The traverse inland was the main focus of their summer science, and both the tedium and the excitement are vividly described. It is here that some of Behrendt's current commentary is most helpful because, although he never had another commander like Ronne, he did return to do other traverses and a lot more scientific work in Antarctica.

One area that is completely new to me is that both Ronne and Behrendt assert that the Air Force expedition lead by James Lassiter was a CIA mapping operation. There are a number of times when the cold war surfaces in both the diary entries and his contemporary comments. This spooky sideshow to Antarctic research is a ripe area for research.

Behrendt, a still active veteran of the IGY, has done a great service in writing about his experiences during a very trying and under-reported era. Not much has been written about one of the most significant periods

of Antarctic history. There are other books of this era that should be written, and now! You writers know who you are...get to work, you're not getting any younger and the story is worth telling. You'll have a really good example against which to measure yours in John Behrendt's excellent book.

*The Endurance: Shackleton's legendary Antarctic Expedition* by Caroline Alexander, Alfred A. Knopf/American Museum of Natural History, New York 1998

### **Review by Steve Dibbern**

The first impression of this book is to be in awe of Frank Hurley's photography of the Imperial Trans-Antarctic Expedition. The photography alone is enough to put this on any Antarctic history buffs "must have" list. Hurley too often takes an historical backseat to his counterpart on Scott's second expedition, Herbert Ponting. This, sadly, is at least in part because no one died, heroically or otherwise, on the *Endurance* expedition. Hurley's visual record contains a drama and power that I personally find lacking in Ponting's. Hurley's portraiture in particular gives us a window into the men who were the heart of the expedition.

Often the accompanying text in an album such as this is just a set of captions, but here is the best surprise, the text is a fresh new telling of the very well-known Shackleton story which throws new light on how the expedition survived and on Shackleton's character and leadership. It was a bit like watching the movie, *Titanic*; you knew how it ended, but were fascinated with the telling. Ms. Alexander's writing is full, clear and dramatic. The writing gives the reader a slightly antiquated feeling that contributes to an understanding of the time in which the action took place. Beyond all this is the skilful use of a great deal of diary entries never before available to the earlier chroniclers of the Shackleton *Endurance* story; Shackleton himself, the Fishers, Lansing, or even Huntford.

I have only two criticisms. Ms. Alexander's text mentions Hurley's use of color photography several times. A spin-off article in the *National Geographic Society Magazine* reproduced a few. Even at the risk of increasing the cost of printing I think that several should have been included, they were crisp and fresh-looking in the NGS publication and would have made the photographic record complete. My second criticism is aimed not so much at Ms. Alexander's

book as maybe at Shackleton and Hurley (though I don't have access to the film record). I wish there had been a portrait of Chips McNish, he wasn't easy to deal with but he deserved better.

Also on the racks but not yet reviewed by us is former Antarctic Society President, Ron Naveen's, latest book, *Waiting to Fly: My Escapades with the Penguins of Antarctica*. This book is published by William Morrow & Company, NY.

### The Long Farewell

VXE-6 Navy Squadron (aka Ice Pirates)

1955-1999: Disestablished 31 March 1999

Closing Ceremony Prayer

*Almighty God, Navy Victor Xray Echo Six is prepared to land. Grant us clear deck in the known world, for the Pirates have conducted their final raid on the Icy Continent, and are bringing their treasures home. Treasures gained from the 44 years of soaring skies above terrain few others have seen. Treasure born of devoted and courageous aviators sharing a mission unlike any other, and the memories of what we did together for the benefit of humankind. Though we as a squadron will not fly Antarctica again in planes, we will continue the flight in the stories we have to tell.*

*For like any aviators before us, we have loosed the surly bonds of earth and been blessed to reach out and touch your face. But we have also held your hidden handiwork in trust, and seen crystalline sparkles of what could almost be your frozen tears of joy from the day of creation. Some of our own tears remain there also, for so do the spirits of our comrades who did not return with us. May their memories be ever sacred in our hearts as we remember their sacrifice, and as we pass this trust of your treasures on to those who will continue the adventures we must leave. Bless all who discover the wonders of your creation, and keep them safe wherever they now go in your name and mercy, Amen.*

Chaplain Mark W. Smith

## Penguin Prattle

By Kristin Larson

Lots of newness all 'round. A new home for us, a new era of Antarctic flight, Sir Ernest gets a new lease on life, IAATO is under new leadership, new fish species coming up in Antarctic nets, a new set of support options for the U.S. Antarctic Program, a new Antarctic climate record to scrutinize, and new buildings at South Pole; that's a lot of gloss to ponder.

But, don't you think it's kind of nice the way we Antarcticans hang together like a worn but elegant tuxedo topcoat? We tend to regard incremental change as were it an ephemeral caking of hoare frost on a grizzled beard. Perhaps it's the immutable character of Antarctica that forms the weft of our collective affection. Or perhaps it's the thrill of being part of a population that still numbers less than the crowd at Camden Yards on a good day. We, of the polar mentality, (as the New Yorker recently put it) whose "very sufferings apparently, are joys in memory," give our own meaning to the mercurially changeless landscape.

In any case, we strive to pay at least passable lip service to democracy. And for that reason we have provided you, our valued members, with a chance to help us shape our near future. Enclosed with this newsletter is a questionnaire. Take a minute to reveal your thoughts. If we like what you say, we may just use it!

### A New Breed of Pirates in our Midst?

Would it be a toothsome fish that tickles yer fancy? Apparently many gourmands think so and are willing to pay handsomely to get it. A recent scan of the international newswires produced a daunting number of filings on an Antarctic species not usually among those classified as "photogenic mega-fauna" (you know, like penguins and orcas). No, these reports concern the Patagonian Toothfish. Unlike the new fish species described below, the Toothfish is so well-known (usually by some other name like Chilean Bass) that one dire prediction places this species in the commercially extinct category within three years. That is, unless strong protection measures aren't soon adopted. In point of fact there is a very strong and innovative regulator framework in place to protect all seagoing Antarctic

species. That framework is part of the Antarctic Treaty System, and is known fittingly as the Convention on the Conservation of Antarctic Marine Living Resources, or CCAMLR.

It would appear, however, that a number of non-signatory nations, and maybe even some who are signatories (but are re-flagging their ships to avoid detection), have been raking in this tasty treat in a ruthless manner and running the sleek bounty to waiting processors. Given the apparently high level of illegal, unreported and unregulated fish pirating in the vast and trackless Southern Ocean, it would seem that the CCAMLR signatories have their enforcement work cut out for them; a job made all the more urgent by the astronomical number of petrels and albatross that are killed each year as by-catch in the illegal Toothfish long-lining operations.

Many solutions have already been floated by CCAMLR nations such as vessel tracking, port inspections, and ocean surveillance activities. The U.S. will also be introducing a new certification program during a special CCAMLR meeting next month. In short, the U.S. seeks a solution that will deny market access for Toothfish unless it can be demonstrated that the fish were caught legally. It may be a bit premature to check your grocery store shelves for Albatross-safe labels, but the Prattler will keep you apprised.

The new Antarctic gravelbeard plunderfish *Arteididraco glareobarbatus* is about 6 inches long. Image by Danette Pratt, Onto Univ. College of Osteopathic Medicine.

### Nouveau Fishe

This past season netted a rich reward for OPP researcher Dr. Joseph Eastman. In a series of twenty trawls made from the *Nathaniel B. Palmer* over the past two seasons in the Ross Sea, a remarkable four new fish species were brought up. Polly Penhale of NSF/OPP said these fish help buoy the idea that Antarctic waters form an evolutionary island within the rest of the world's oceans. Because of the strong geothermal and chemical differences encountered below the Southern Ocean's convergence line (roughly parallel to 60 degrees south latitude), it is thought that this particular group of notothenoid fish

have not ventured beyond Antarctic waters nor have other groups of fish entered the competitive arena. In a manner that Penhale likened to the adaptive radiation of the Galapagos Island Darwin finches, this group of notothenoid fish have evolved to fill ecological niches that would normally be occupied by unrelated species in less isolated ecosystems.

### With Barely a Spate...

On January 25\* out on a big ice hummock in West Antarctica the two-year-plus drilling program known as Siple Dome was locked in a race with logistics.. a drawn and bitter battle that ended happily. With just six hours to spare, the Siple drilling team hit bedrock after producing a core of over 1000 meters in length. Since early November 1998, drilling teams have been working 12-hour shifts, seven days a week during each austral season. What's down there anyway? It is thought that the ice formed at the 1000-meter depth could be composed of snow layers as old as 80,000 years. By analyzing the gases, dusts and other materials trapped in these tree-ring-like ice records, much can be learned about the past climates. The core extracted this past season will "relax" on-site for a year in special trenches because it is too brittle when it first comes up from such pressure to safely transport. From Antarctica, the core will then go to several researchers and also be archived in the National Ice Core Laboratory in Denver.

The Siple Dome core is one of two full cores that members of the West Antarctic Ice Sheet (WAIS) group hope to extract. The second, as yet unfunded project, is planned for a site further inland where it is hoped that a record extending as far back as 100,000 years will be produced. For a great deal more information check out:

<http://www.naxey.dri.edu/WRC/waiscores>.

## NOONER COMING SOONER!

Life on Ice:  
A Journey to the Frozen Deserts of Antarctica

Dr. Robert Wharton

September 20, 1999, 12:00 noon  
National Science Foundation, Room 110  
4201 Wilson Boulevard, Arlington, Virginia 22230  
Ballston Metro Station

Bob Wharton is a Research Professor at the Desert Research Institute's Biological Sciences Center in Reno, Nevada. He has an international reputation for his studies of cold desert environments in Polar Regions, and is particularly well-known for his research of perennially ice-covered lakes in Antarctica. He is a veteran of 11 research expeditions to Antarctica, and is a member of the National Research Council's Polar Research Board. Bob developed and led the NSF-funded McMurdo Dry Valleys, Antarctica, Long-Term Ecological Research (LTER) project for five years which involved extensive field work, and led NASA/NSF-supported studies of ice-covered lakes in the Arctic and Antarctica as terrestrial analogs of early Martian environments. In addition to many important scientific publications, Bob's work was featured in the October 1998 issue of The National Geographic magazine.

NEW ZEALAND ANTARCTIC CALENDARS FOR THE MILLENNIUM, ORDER NOW! We are again offering what we feel is truly the best of the photographic Antarctic calendars, those put out by Hedgehog House, published by Betty "Smiles" Monteath, featuring the excellent photography of her husband, Colin. We highly recommend their calendars as they feature the pristine Antarctic environment. The price, the same as last year - \$11.00, includes mailing anywhere in the U.S. or Canada. Checks should be sent directly to the Antarctic Society, 7338 Wayfarer Drive, Fairfax Station, Virginia 22039.

## Brash Ice

In the good old summer time anything goes, and here we go. First we want to thank all of you who responded to our questionnaire. We actually heard from about a fifth of our membership, and the answer came back loud and strong to continue with our present format, not to go electronic. And the new double column layout appeared to be a winner, too. Majority rules - Ruth, Kristin and I have settled into a comfortable triumvirate, and we probably weren't going to do much more changing anyway!

Let me say something about our constituency and our history. About fifteen years ago, over two-thirds of our members had geographical features named for them in Antarctica, which means that they supposedly had done something worthwhile in Antarctica. And then take it back another fifteen years, and our Society was really a Good Old Boys Club. Now our face is changing, and that is why we brought Kristin aboard two years ago, to bring us up-to-date on Antarctica today. She has spent many suns and moons in Antarctica in the past ten years, and knows many of the new players.

Anyway, some of the Latter Day Antarctic Saints wanted less ancient history, and perhaps a bit more in the way of current events. And yet there is still the old guard, a significant other, who requested more info on the good ol' days. One guy asked for more on Deep Freeze I and II, another asked for news on cargo ships of the old days, like the ARNEB. Also in recent years, with the environmental protocol coming into effect, the flourishing of tourism, we are getting a lot more, shall we say, Antarctic Eco-tourists and enviro types as members. We see our mission as covering the ice front...a little bit of everything, some old, some new.

We have elected not to cover the story of the medical doctor at the South Pole because it is too sensitive a story, the press has already given extensive national and

international coverage of the airdrop, and there are rumors floating around which we cannot validate, so we are abstaining.

And we are bending a bit in this issue by including an obituary of a very distinguished Congressman who had a lot to do with Antarctic funding, and Antarctic science. This obit was written by an Antarctic, one of our members, who requested to remain anonymous. This person served on his staff, and knew him well. I also had the pleasure of knowing this very distinguished man and gentleman, as once upon a time I was gainfully employed by the government and was involved in the drafting of the National Climate Plan, which he championed. His company must have enriched those of you who met him when he visited Antarctica.

There is another anonymous spread— on the late Mary Swithinbank — a very touching tribute by a person who knew her quite well.

*Foothold on Antarctica* by Charles Swithinbank is now available from Charles (7 Home End, Fulbourn, Cambridge CB1 5BS, Great Britain) for only \$35 surface, \$40 airmail. This is the third volume on his illustrious Antarctic career, and is about the first international expedition The Norwegian-British-Swedish Expedition to Maudheim, 1949-52. This will be reviewed in the next newsletter, but we can assure all readers that anything by Charles is going to be really outstanding. Never in the history of modern mankind have so many famous polar people been on one expedition - such as Gordon Robin, Valter Schytt, Fred Roots, Gosta Liljequist, Ove Wilson, and Charles Swithinbank.

Charles needed a little diversion after Mary's death, so he came to the States and had lessons to learn how to fly a jet fighter. Charles is 72, going on 27.

While on the sorrowful topic of those passing to the beyond, we must sadly add

the name of two other Antarctic notables: Captain Price Lewis, Jr. (write-up follows), and Dr. Harrison Holt Richardson. Dr. H.H. Richardson, of the U.S. Antarctic Service Expedition, 1939-41, died on 17 July 1999 at his son's home in Claiborne, Maryland. Besides being a medical officer, he also served as a dog team driver and as a meteorological observer. But he is probably better remembered as being the first to take color movie film images in the Polar Regions.

Eagle Scout Bob Wharton wrote in and volunteered to give us the upcoming Antarctic Society lecture. We applaud his initiative and beseech others to follow in his footsteps. We are always seeking good Antarctic lecturers, and encourage any of you who would like to address our Society in Arlington, Virginia. If so, please contact our Honorary President, Mrs. Ruth Siple at the address on our letterhead.

Tom Frostman, a micrometeorologist at Plateau Station back in the late 1960's, continues his work as director of training and development for the Prevention Research Institute, living in Colorado and working in states like Kentucky, North Dakota, Iowa, Georgia and South Carolina. His program focuses on the prevention of, not treatment for, the ills of alcohol overindulgence. Some states mandate Frosty's program for their DUI offenders. In November, Frosty goes to Sweden to start a massive training for all military officers, including the Supreme Commander himself. What about Antarctica?

Jean Portell, daughter of the late Ambassador Paul Clement Daniels, architect of the Antarctic Treaty, wants you folks with any tidbits of information about scrimshaw by Antarctic whalers to pass it along to her. Jean is an art conservator with expertise in the care of ivory. She recently gave a presentation on historic scrimshaw at the 8<sup>th</sup> Annual Scrimshaw Collector's weekend at the Kendell Whaling

Museum in Sharon, Massachusetts. Write to her at 13 Garden Place, Brooklyn, NY 11201 or [ieandp@aol.com](mailto:ieandp@aol.com).

**TRIBUTE TO MARY** (Anonymous). Heroes of the Soviet Union were decked with medals, but other heroes - the wives of Antarcitians - are seldom honored. The fact is that some Antarcitians owe their careers to the women in their lives. How else could they raise a family while treading where no man ever trod before? Charles Swithinbank ("Forty Years on Ice") lost his wife Mary to the big C in March this year. Back in 1960, with already two Antarctic winters under his belt, he had briefly appeared in the Northern Hemisphere to marry her, then later to father their first child, and again to begin their second. This time, a month before she gave birth, he left home to spend 18 months with the Soviet Antarctic Expedition.

While history records that some wives in similar circumstances have written: "Don't expect to find me when next you consent to come home", Mary was smiling when, 18 months later, she presented Charles with the 18-month old son he had never seen. And so it continued for his next 20 sojourns in Antarctica. Never did she attempt to dissuade him. Homecoming, of course, had its compensations. To a friend she confided that few women are privileged to enjoy twenty honeymoons - particularly with the same man.

A key feature in Mary's background was that she was bred in Alaska, where absentee menfolk were the norm. Having once lived in a log cabin in Denali Park, it was no big deal to bring a son into the world in the dead of winter in the bedroom of Charles's unheated house in England. The walls were hung with photographs of Antarctic scenes and there was ice on the inside of the windows. Her recipe for survival was to laugh about such things.

After Charles retired, Mary accompanied him on several Antarctic cruises, finding -

to nobody's surprise - that she loved the place as much as he did. When she died, a nephew wrote simply: "God danced on the day that Mary was born. Now she is dancing with Him."

**PRICE LEWIS, JR. DIES.** A man of the sea and ice, Navy Captain Price Lewis, Jr. died at age 79 of congestive heart failure on August 10<sup>th</sup> at his home in Thurmont, Maryland. He commanded icebreakers in both Polar Regions, and finished his government career as a program manager for polar operations in the Office of Polar Programs at the National Science Foundation. He served in the Navy for 24 years, was in both WWII and the Korean War, was a schooner master in the South Pacific for the Congregational Church, and taught at Columbia University where he received a master's degree in management. His interests included restoring old houses, botany, and tree farming. His widow and six living children (one died in 1997), a brother and five grandsons will carry on his legacy.

**ED TODD IS ALIVE, SORT OF** (E. Todd). My primary activity for the past couple of years has been a desperate attempt to keep the medical profession solvent. A year ago, in May, I fell and dislocated and broke my left shoulder. In December, I had several heart attacks and wound up with a triple coronary bypass. More recently I had some rather adverse reactions to chemotherapy.

Sometime last year, Barbara and I decided it was time to give up trying to take care of a big house so this past February we moved into a retirement and continuing-care facility called Westminster at Lake Ridge, a part of the city of Woodbridge, Virginia. A nice setup. My address is now Edward P. Todd, 12242 Cathedral Dr., Lake Ridge, VA 22192-2232, and e-mail is [epaytodd@aol.com](mailto:epaytodd@aol.com). The hard part of the move was my fixation on antique tools, but a friend of mine in Kansas City bought the most important machine tools, and the

boys from the local collectors' club also had a field day.

**THE HONORABLE GEORGE E. BROWN, JR.:** March 6, 1920 July 15, 1999 (anonymous). Representative Brown in his 18<sup>th</sup> term in the House, was Ranking Democrat on the House Science Committee and a senior member of the House Agriculture Committee. He was the oldest current House member and the longest serving member of the House or Senate in the history of his home state, California. He was Chairman of the House Science Committee during the 102<sup>nd</sup> and 103<sup>rd</sup> Congresses, and was probably best known in Congress for his work on science and technology issues.

Brown was a recognized leader in creating the Federal Government framework for science and technology. In the mid-1960's and again in the 1980's, he led an effort to restructure and strengthen the National Science Foundation, enhancing NSF's portfolio in engineering research, science and engineering education, and development of advanced technologies. He also developed legislation shaping the permanent science advisory mechanism in the Executive Office of the President, established in 1976 as the Office of Science and Technology Policy. To foster environmental preservation and science technology in the service of society, he was instrumental in the establishment of the Environmental Protection Agency and the Office of Technology Assessment in the early 1970's. Later in his career, he promoted international scientific cooperation, authoring legislation to establish joint research programs between U.S. researchers and their counterparts in Mexico and Russia.

Representative Brown participated in a congressional delegation visit to Antarctica in 1968 to review the facilities of the U.S. Antarctic Program and the contribution of Antarctic research to science and society. He received the NSF Distinguished Public

Service Award in 1990, on the occasion of NSF's 40<sup>th</sup> anniversary. Following his death, Dr. Rita Colwell, Director of NSF, said, "George Brown was the wise man of science in Congress. In his long and distinguished tenure with the Science Committee he was the most articulate spokesperson for continuing investments in science and technology for the nation's long-term well-being."

**HISTORY OF THE BUILDING OF MODERN ANTARCTICA BEING WRITTEN** (Dian Belanger). Historian Dian Olson Belanger and members of the Antarctic Deep Freeze Association have obtained a grant from the National Science Foundation to assemble and preserve the history of a landmark era, when the foundations of today's endeavors on the polar continent were established.

This project will document the United States Navy Seabees' construction and operation of seven scientific stations on the ice during the first years of Operation Deep Freeze in the mid-1950s, so that the Antarctic aspects of the International Geophysical Year, July 1957 - December 1958, could take place. I will outline the scope and accomplishments of the IGY, which in turn, led the participating nations to formulate a legal basis for devoting the region to the peaceful, cooperative pursuit of scientific research. The story will conclude with the signing of the Antarctic Treaty. A brief introductory chapter sketching American and other exploits in the southern high latitudes since the eighteenth century will set the context and a final chapter will provide some of the results and consequences of these mid-century developments and suggest issues of continuing and emerging significance.

The first year of this 30-month project has focused on gathering the oral histories of a wide variety of Antarctic veterans. I have already interviewed more than thirty participants representing all seven U.S. IGY stations and numerous professional and technical specialties. These have included construction mechanics, pilots, medical

officers, scientific leaders, electricians, radio operators, graduate students just tasting polar careers, policy makers, construction engineers, builders, and others.

Using the oral histories plus extensive documentary research as source material, I will write a history of this important time and place. My work will meet the professional standards of historical scholarship, but I also intend for this lively, engaging human story to appeal to broad audiences. The writing should be completed early in 2001, with publication to follow. The author welcomes personal Antarctic journals and other appropriate private papers as resources. Photocopies that need not be returned are preferred. Please contact me, Ms. Belanger, at [dobelanger@aol-com](mailto:dobelanger@aol-com) or 301-258-0708.

## BOOK REVIEWS

**THE FIRST ANTARCTIC WINTER.** In the last newsletter we reviewed John Behrendt's excellent book, *Innocents on the Ice*, a first-hand account by a distinguished American Antarctic scientist and policy maker about his experiences in an early IGY station (Ellsworth in 1957). Now comes along another interesting book, which in a way is sort of a companion book to John's, although it is about an expedition that occurred decades and decades ago: The Southern Cross Expedition of 1898 - 1900. There are certainly similarities in both camp leaders, Finn Ronne and Carsten Borchgrevink. This book, *The First Antarctic Winter* by Janet Crawford, granddaughter of physicist Louis C. Bernacchi, who wintered over at the expedition headquarters on Cape Adare, was published last year in New Zealand. It is only the third book ever written on the expedition. Basically the book consists of the written words in Bernacchi's diaries, which were said to be sort of in the vein of a "father confessor," writing down incidents which he found unsatisfactory to talk about more openly. Sort of a forerunner to e-mail! The book is quite elegant with a striking

laminated jacket, embossed gold-foiled front, new maps in a rear packet, over 300 supporting notes, pen and ink drawings and many previously unpublished photographs. You can get a copy of this book from Colin Bull, Polar Books, P.O. Box 4785, Rolling Bay, WA. For \$50 plus mailing charges, or from the publisher, South Latitude Research Ltd., PO Box 36-269, Merivale, Christchurch, 8001, New Zealand for about \$30 U.S..

**THE FRIGID MISTRESS** by George A. Doumani (John Spletstoeser). George Doumani has a knack for writing, and is also fair in what he writes. The book recounts events in George's life during five expeditions to Antarctica, beginning with 1958 when the IGY was already underway, and ending in 1965. George wintered at Byrd Station in his first year, and also participated in the over-snow traverses in Marie Byrd Land, exploring new territory along the way. Much of the contents of the book revolve around personality differences among everyone involved, some of it reflecting the interactions among Navy and civilians, station life and its associated problems of isolation and confinement during the winter and also the little things that become enlarged into big things for no apparent reason. For example, the choice of the daily movie at the station, choice of music played and its volume during meals at the station, minor peeves that flair up into words that one regrets later; and so on.

Knowing George personally it is easy to understand that he would often be the mediator, and would control his words and temper. Much of that comes out in his book. He is also a hard worker, which makes a big difference in situations where everyone is expected to "pull his own weight." (Pulling *her* own weight did not apply at that time in the U.S. Program— "she" did not appear until the 1969-70 season, and then every season since).

Considerable discussion is paid to food and cooking, natural subjects for discussion in Antarctica, whether at a station or in the

field. George's culinary experience shows through, and is also well received by his mates. Considering all his expeditions, George's credentials as a scientist and author are shown by his research in paleontology, resulting in significant contributions to the literature of the genera and species of invertebrates. His selected list of "Recommended Reading" provides details. Black and white photos provide details of station- and traverse-life. George's sense of humor appears at numerous places in the book, as evidenced by the "smell" that is the common denominator of anyone doing fieldwork in Antarctica. After finishing his traverse, George and others returned to Byrd Station and were confronted by a station individual who complained about the way they all smelled. George's thoughts on it are as follows: "I cannot describe the smell. It is probably diesel fumes deeply impregnated into our clothing, plus a mixture of cooking smells from the wanigan with a dash of body odors, a whiff of smelly socks and underwear, and a sprinkling of dandruff for seasoning." (page 133).

The part about the book that made me think of the realities of this kind of life-explorer, scientist—which often takes a considerable toll on family situations, is told by George in the final chapter, Coming Home, in which he raises the subject about Antarctica, The Mistress. Many of us know "The Mistress" he talks about so well, because it is difficult to ignore the magnetism of that part of the Earth. In George's case, he talks about the consequences that are sometimes inevitable—divorce. He says, "This is a terrible price to pay for the pursuit of exploration and knowledge, a price that is never factored into the overall cost of these achievements." And so it goes.

**USS GLACIER AGB-4.** There is such a proliferation of military groups of ancient and honorable Antarcticans that we just can't keep up with them. Ben Koether, who served on the Glacier back in 1961, founded

the Glacier Society, which is an organization dedicated to restoring the USS/USCGC *Glacier* as an operational museum honoring all those who served on the ship in both Polar Regions. I would think that anyone who ever served on a forever-rolling ship like an icebreaker would want to bury it in Davy Jones Locker...but then again those folks have hard heads, are slow learners, or just plain enjoy suffering. They hope to bring her back to Bridgeport, Connecticut to serve not only as a tourist attraction but also as a school-ship "learning platform for K-12 students" involving science and a bunch of other things too numerous to mention. Right now the *Glacier* is docked near San Francisco undergoing restoration. If you are interested in helping support this monumental effort or want to volunteer, contact Ben at: Glacier Society, PO Box 1419, Bridgeport, CT. 06601, ph. 203-375-6638, fax: 203-386-0416, or e-mail: [benkoether@mindspring.com](mailto:benkoether@mindspring.com), or website [www.glaciersociety.com](http://www.glaciersociety.com).

And if you are really into it, there will be a *Glacier* reunion in late September. If you like wine and cheese, gambling, reminiscing, Budweiser beer, bus tours, animals galore and a couple of meetings, this could be just the excuse you need to be in good ol' St Louis for the autumn colors. The reunion is planned for September 22-26, Radisson Hotel, St. Louis Airport.

**TOUR GROUP UPDATE** (Denise Landau). The International Association of Antarctica Tour Operators (IAATO) is a member organization founded in 1991 to advocate, promote and practice safe, environmentally-responsible, private travel to Antarctica. This year the 10th IAATO General Meeting was hosted in Hamburg, Germany by IAATO member Hapag Lloyd on June 28 -30, 1999. A total of 58 people from 9 different countries attended. Participants included full and associate members, expedition leaders, lecturers, ship's officers, Non-IAATO member tour companies, government reps, NGO's, university

professors and researchers. IAATO is in the process of updating its membership list. A new list will be placed on the IAATO website during the month of August. During the General Meeting, the new Executive Secretary, Denise Landau was voted in. Darrel Schoeling has served IAATO well since its beginning in various capacities, but decided to pursue his educational book business, *Longitude*, on a fulltime basis.

IAATO's new contact details are as follows: PO Box 2178, Basalt, CO 81621, phone: 970-704-9178, fax: 970-704-9660, website: [www.iaato.org](http://www.iaato.org) e-mail: [iaato@iaato.org](mailto:iaato@iaato.org).

### **Penguin Prattle**

Well, this "summer edition" has slipped almost into autumn and for that I must shoulder most of the blame. My excuse? I was dragged, kicking and screaming, to Italy where, for all of June and a good part of July, I was force-fed gelato, pasta, Titian, Botticelli, Etruscan ruins, and oh yes, some coursework on European Trade law. All-in-all, a splendid kidnapping, though a far cry from those moonlit solstice nights in McMurdo. Never can, nor want to get those pixels out of my brain.

The folks at NSF's Polar Programs have also had a busy summer. At the moment, they are putting the final touches on the Annual Science Program Plan. This is the volume that describes upcoming ice research projects, so we will wait until our next newsletter for highlights of the upcoming ice field season. NSF staff has also been pouring over at least five multi-volume proposals submitted by teams who hope to win the Antarctic support contract. This competition occurs every ten years, and generally attracts nationally ranked companies. As if this wasn't enough, NSF also organized an unusual mid-winter airdrop mission earlier this summer in response to a medical need at South Pole. They are also continuing close oversight of the complex construction effort of the new South Pole Station.

One upcoming project that we do know about involves an extensive international effort in conjunction with the Antarctic Pack Ice Seals (APIS) research program. The U.S. component will rely on the R/V *Nathaniel B. Palmer*, which will support onboard helicopters for the first time! More on that in the next edition.

**MANAGERS' REVELATIONS.** Few Americans have undertaken a wider array of roles in Antarctica, and distinguished themselves more consistently than Captain Al Fowler (USN, ret.). Al served as Captain, Naval Support Force Antarctica (CNSFA) between 1972 - 1974, and then went on to be Deputy Director of Polar Programs from 1974 through 1988. Recently, Al completed his impressive tour of duty, stepping down from his post as the Executive Secretary of COMNAP (Council of Managers of National Antarctic Programs), where he served from 1988 through 1997.

Captain Fowler has done us all a tremendous service by capturing his Antarctic experience in a new book, *COMNAP: The National Managers in Antarctica*. The book's manuscript is currently under review by an international group, and we shall notify our readers when it comes off the press. It will, no doubt, provide a revealing glimpse into the inner workings of the Antarctic program decision-making process.

**WINFLYING.** John Lynch from Polar Programs has kept us up-to-date on the progress of this year's "winter fly-in," which commenced August 20. The first flight touched down at the Pegasus blue-ice runway less than five hours after leaving Christchurch! During the Winfly operations temperatures at Pegasus ranged from -40 to -50F, and were a little warmer in "town" (McMurdo). A reconnaissance party to Cape Roberts is already underway and early season research has been initiated.

One of the most intriguing Winfly projects each year involves ozone depletion research. Through the combined efforts of the U.S. "balloon fliers" from Wyoming and the Italian lidar project, both of which are based out of the Crary Science and Engineering Center in McMurdo, excellent information on this annual atmospheric phenomenon is produced. Dr. Terry Deshler, Principal Investigator from the University of Wyoming, in Laramie, told me that during this first week of Winfly measurements had already indicated a strong presence of Polar Stratospheric Clouds, or PSCs. These clouds are closely correlated with ozone depletion because they provide a substrate for the chlorine-ozone chemical reaction. Recent research efforts have focused on determining the nature and composition of the PSCs, which change seasonally. They hope to better predict what types of conditions favor ozone depletion. Dr. Deshler also said that the level of depletion has more or less stabilized in recent years, which he attributes to the fact that the earth's atmosphere is now at a "chlorine maximum." Because of the worldwide ban on the chlorine-containing substances that cause ozone depletion Dr. Deshler expects that in the next decade, or even sooner, the level of ozone should start returning to natural levels. Certainly something to look forward to, eh?

**SHACKLETON SAILS SOUTH.** Okay-so I lied, or actually was misled into lying. The *James Caird* is coming to Washington DC after the wonderful Shackleton exhibit leaves its New York mooring. Earlier reports (that are thankfully wrong) had it that the little cork of a boat would be returning to its home in England, and that the National Geographic Explorers Hall show would feature only the photos and memorabilia of the expedition. Not! We just got word from a reliable inside source that the *Caird* will be gracing the local show, and I can't urge you strongly enough to get thee there. Until you stand in the room with the boat that made the most amazing sea passage possible, it's hard to

Imagine the effect that it has. Please don't take my word for it! The National Geographic exhibit opens on November 16 and runs through February 6. Caroline Alexander, the curator of the New York Natural History Museum show and author of the newest book on Sir Shackleton will be presenting two lectures in conjunction with the show on the evenings of December 2 and 3. For information and tickets for the lecture call 202-857-7700. Early reservations are strongly recommended!

**BACK-TO-BACK ANTARCTICA.** While on the topic of the National Geographic Explorers Hall programming, please take note of another Antarctic-flavored show that follows closely on the heels of the Shackleton exhibit. Running from February 25 through June is the exhibit that was put together by the Minnesota Museum of Science and has been on the road. This is a comprehensive exhibit covering most aspects of Antarctica's natural history and geography. The details of the Washington show have yet to be worked out, but we will include updates as they come up.

**POLE CATS MAKING GREAT PROGRESS** (excerpted from Antarctic Research Hearing). On June 9, the House Science Subcommittee on Basic Research held an oversight hearing on the U.S. Antarctic Research Program. Karl Erb, Director of NSF's Office of Polar Programs, testified that Congress had provided almost all of the funding needed to complete the modernization, enabling "substantial advance procurement." He reported that both the modernization (totaling \$127.9 million; construction to be completed by 2005) and the upgrades (\$25 million; through 2002) are on schedule and on budget and "proceeding vigorously." Questioned about the impact on the science programs of diverting resources to construction, Erb said that although the program's ability to "deploy large new research projects certainly will be curtailed over the next three years," as anticipated,

"the capability for research embodied in the new station will more than compensate for the short-term impacts." Donal Manahan, Chair of the National Research Council's Polar Research Board, noted that "the Board had solicited input on this question from a range of scientists, and overall, the responses were very positive." Most scientists, Manahan said, felt no negative impacts from the modernization. The largest impact was experienced by geoscientists, which Manahan said was not unexpected because of their requirements for extensive logistical support. Other issues discussed were the unique research opportunities in Antarctica, the need for improved weather forecasting to reduce the number of logistics flights turned back, the imminent obsolescence of some communications satellites used by the program, and the impacts of increasing tourism on Antarctic research.

**SOUTH POLE VISUALS.** For some great images and personal "war stories" from the South Pole Station, the Prattler suggests taking the following cyber tour:  
<http://alizarin.physics.wisc.edu/rschwarz>  
<http://people.delphi.com/billspindler/>  
<http://205.174.118.254/nspt/>

**CREATURES FROM THE ICE LAGOON.** New life forms continue to emerge from the least likely locations in Antarctica...like the story line from some thriller (chiller?), Dr. John Priscu describes the new "biotica" from recently discovered liquid water inclusions in the 4-meter thick ice cover of Lake Bonney. These meltwater pockets form in response to solar heating of wind-borne sediment particles that become trapped within the sea ice. The sediment particles then serve as nutrient-enriched microzones that allowed the establishment of microbial communities. The most amazing part is that these communities are phylogenetically and ecologically different from those in the water column and in the sediments. These microbial communities carry out processes such as photosynthesis, nitrogen fixation

and decomposition within the inclusions. This study shows that life near the freezing point can be both active and complex. The research findings were reported in *Science* (Vol. 280, pp. 2095-2098, 1998).

And while we have you thinking of murky places covered in ice and filled with alien life forms, try this one on for size....It is now thought that microbes that are completely unknown to scientists may exist in "Lake Vostok." Wait a minute! *Lake Vostok*???? The map of Antarctica clearly shows a Vostok Station (and if your map is old like mine it says that Vostok Station "belongs" to the USSR). Yes right, Vostok Station is the one high up on the polar plateau, which besides serving some of the most horrendous vodka (origin = bathtub?), is best known as the place that has recorded the lowest temperatures on earth (-126.9 degrees Fahrenheit). As part of a joint U.S. French - Russian project scientists have drilled down through the polar plateau producing the world's longest ice core, and in the process discovered that at the base of the ice sheet was not mud or rock but water and lots of it! Lake Vostok is roughly the size of Lake Ontario. Drilling over the lake was stopped approximately 120 meters above the water to prevent contamination, and now researchers are examining options for further exploration of the lake waters and underlying sediments in a manner that won't contaminate them.

A recent NSF press release states that "there are several reasons other than the possibility of discovering unknown forms of life for exploring the lake. Water below the ice, which has been cut off from the outside world for hundreds of thousands of years, may have a unique chemical composition. There may also be an active tectonic rift below the lake, which may be warming its waters. Or sediments at the lake bottom may contain a record of ancient climate conditions". Robin E. Bell, a geophysicist and a co-editor of the report entitled *Lake Vostok: A Curiosity of a Focus for Interdisciplinary Study*, says it "illustrates the emerging importance of the lake for

understanding the processes which may have triggered the evolutionary explosion on earth and perhaps on other planets, as well as deciphering the geologic history of Antarctica."

**POLAR MAIL.** Not all of you will know what PolarMail was, either because you were in Antarctica too early or too late. For a long period of time, ending only in the past few years with the advent of reliable e-mail and voice communications, PolarMail served a vital function in many of our lives. It was a volunteer communication service provided by dedicated souls, and often made the difference between a tolerable winter of separation and one of degenerating gloom! Long-time ice man, Al Oxtan wrote to us recently that the PolarMail folks could use some cheering-up of their own so I have taken the liberty to forward an excerpt o] Al's message so those of you inclined can dash off a letter to the former Queen and King of Ice Communications!

**From: A. J. Oxtan**

oxton@atsvax.rsmas.miami.edu or  
[ajo@TheCatDragdlnn.org](mailto:ajo@TheCatDragdlnn.org)

Louise and Rick (PolarMail) Johnson were there when we needed them, handling messages between us on the ice and the folks at home before e-mail usurped their most important role. Rick and, at times, his children relayed messages, typed seemingly endless letters, scrimped and scrounged for the equipment and postage to keep the mail moving. And Louise ran PolarFlowers, PolarGifts, PolarShovels with a personal touch that the internet has not matched.

Rick was more than once the first "ice" person to know when someone's parent died and then had the task of sending a message: Call Home—I can't tell you why... Now they need us. Louise needs us especially. She is gravely ill. They can be contacted at Louise & Rick Johnson, 909 Briedinger Road, Nazareth PA 18064-9352, or [polar@epix.net](mailto:polar@epix.net).

# THE ANTARCTICAN SOCIETY

Mr. Amory H. "Bud" Waite, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

## Memorial Lecture

In Collaboration with the National Academy of Science  
Polar Research Board

### *Early Exploration of the Poles: A Pictorial History*

By Dr. Donal Manahan

October 27, 1999, 5:30 pm

The National Academies' Georgetown Facilities  
Room 118, The Green Building  
2001 Wisconsin Avenue, NW  
Washington DC

(Reception to follow)

Donal T. Manahan is currently chair of the Polar Research Board. He is an environmental physiologist from the University of Southern California where he is the Director of the Marine Biology Section in the Department of Biological Sciences. He works in the Antarctic, as well as in temperate regions and deep-sea hydrothermal vents. His research includes physiological ecology of early stages of animal development, animal/chemical interactions in the ocean, and the genetic bases of physiological processes. He is also director of an international training course in Antarctica, "Integrative Biology and Adaptation of Antarctic Marine Organisms." Dr. Manahan has an avid interest in the history of exploration of both poles.

---

### **Last Chance: Antarctic Calendars for the New Millennium!**

We still have some of these better-than-ever calendars remaining, which promise to take you and your friends into 2000 with startlingly beautiful images. These calendars, published by Hedgehog House of New Zealand, feature the photographs of Colin Monteath and numerous other talented artists. The price is \$11, which includes mailing anywhere in the U.S. and Canada. Send checks directly to Antarctic Society, 7338 Wayfarer Drive, Fairfax Station, Virginia, 22039.

## Special Announcement

Ray Arnaudo of the State Department has received copies of a book on the demographics of Antarctica, which he is kindly making available to interested members of the Society. The book, entitled *The Structure and Dynamics of Antarctic Population*, was written by Juan Carlos Beltramino, a retired Argentine diplomat with a long history in Antarctic Treaty work. The 100-page book, published in 1993, provides a brief history of Antarctic population trends and is illustrated with charts and tables on expeditions and stations.

If you would like a copy of the book please contact Ray:

**Via mail** (with a self-addressed mailing label):

Office of Ocean Affairs, OES/OA, Rm. 5805, Department of State, Washington DC 20520

**Via e-mail:** [arnaudorv@state.gov](mailto:arnaudorv@state.gov)

**Via Facsimile:** 202-647-9099

---

**Brash Ice.** This issue is brought to you through the courtesy of Kristin Larson tossing it together in a hurry, with Ruth Siple once again doing all the stuffing, in a hurry.

We want to bring to your attention that we still have beaucoup numbers of the New Zealand Hedgehog calendars. For an Antarctic souvenir calendar of the millennium, this one can NOT be beat. I was blessed this summer by the visit of three South Pole sitters, the Logans of Maine and the German physicist scientist, Robert Schwarz. Their collection of aurora photographs, taken at the South Pole in recent years, is unquestionably the best ever from Antarctica. One of Robert's spectacular pictures graces the month of June in the new Hedgehog calendar. For \$11, the calendar is a steal.

This newsletter is brought out at this time in order to get a notice on the street of a very interesting lecture being given by Donal Manahan, Antarctic researcher and current Chair of the Polar Research Board. We encourage you to support this function. In past years, especially in the 1970s and 1980s, we worked closely with PRB in co-hosting our annual Memorial Lectures, and it was great for us. We invite all Society members to show up for this provocative lecture and also to demonstrate support of their meeting.

This newsletter has a central theme, which can be attributed to our friendship and cooperation developed with Valmar Kurok, who is the Montreal Antarctic Society (4633 Harvard Ave, Montreal, Quebec, Canada H4A 2X3). He writes, edits, publishes, and mails their newsletter, *The Seventh Continent*. It is an excellent newsletter, with very timely articles on Antarctic happenings that you will not find elsewhere. One of his realms of interest is music, and we dare say without any fear of contradiction, that he knows more about Antarctic music than any other person. So we asked him if he would summarize the state of the art relative to what has been composed on Antarctica.

Valmar is a very nice, cooperative guy, and he really put together the primary substance of this newsletter for us. Thanks Valmar. But on the way to the Forum - they still play hockey in Canada on occasions- Valmar omitted mention of his own very recent CD production, *Antarctic Arrival*. It is a collaboration between Valmar and Marc-Andre Bourbonnais, recorded by Platinum Heights Sound Design in Montreal. We asked Ed Williams of Roanoke, Virginia, a very distinguished surgeon who just happens to be an excellent videographer, (whose main success is in combining photographic artistry

with music) 10 comment on Valmar's new music production. Ed tells us that *Antarctic Arrival* is just great.

Valmar's CD features songs with titles like Antarctic Arrival (announced by a howling blizzard), Never Mind the Icebergs, Flight of the Albatross, Antarctic World Beat Theme, Underwater Waltz, Penguin Stroll, Seekers of the Poles, Aurora Australis, March of the Glaciers, and White Winter Curtain. And as for myself, I told Valmar, "Your music is very danceable," and he thought that was a most worthy comment on his music.

We are thinking of other possible central themes for succeeding newsletters, and our next one will probably list as many Antarctic web sites that we can assemble. Your ideas and input for favorite sites will help us materially in putting together the best possible listing. Send yours to either Kristin (k\_larson@earthlink.net) or me (pcdal@midcoast.com) via e-mail.

As this is approaching the holiday seasons, may we remind you that there are many excellent Antarctic books out there by Society members that would make excellent Christmas gifts. Charles Swithinbank, John Behrendt, George Doumani, Ron Naveen, and Al Fowler have all authored recently. You don't have to buy another book on Shackleton, there really are other Antarcticans besides Sir Ernest.

**Penguin Prattle.** You will quickly note that the form and function of this particular newsletter departs significantly from our norm. And as mentioned above, there were several good reasons for doing so, not the least of which was our desire to get word out on the PRB lecture featuring Donal Manahan. Having seen several of Donal's presentations I can recommend this event unequivocally.

We will be back in your mailbox very soon with another letter bringing you up-to-date on deployment and research plans for the current ice season, more info on the Shackleton exhibit, some great book reviews and other important

developments south of sixty. Now, on to the main event.

### **ANTARCTICA EXPERIENCED THROUGH MUSIC - Capsule Comments on some currently available CDs about Antarctica. Compiled by Valmar Kurol, Montreal Antarctic Society.**

*There is no other music like the toneless music of millions of years of accumulated silence, through which come bars of unearthly colours. There is no need for ears to hear the fugues played on this ice organ. Here nature has set aside for man a domain of beauty and inspiration such as he cannot know elsewhere on this planet -Rear Admiral Richard E. Byrd (The National Geographic Magazine, Oct. 1947).*

In his 1986 treatise, **The Ice - A Journey to Antarctica**, American author and history professor Stephen Pyne argues that "traditional fiction could not find enough material in the Antarctic experience or the Antarctic environment to construct typical novels. The range of potential experiences was much smaller than elsewhere, the opportunity for surprise much less. Modernist literature was more inclined to follow Joseph Conrad into the Heart of Darkness than to pursue Robert Scott into the Antarctic's Heart of Whiteness. Instead the Antarctic has been largely a wasteland for imaginative literature."

If one substitutes *music for fiction/literature* the above comments may be just as appropriate. The visual and spiritual superlatives of Antarctica are now frequently expressed through photographs and coffee table books but to a lesser extent through music. What kinds of tunes and rhythms does the seventh continent inspire? Is there an Antarctic sound? Whatever the answers to these questions, it seems that there is a scarcity of Antarctic-themed music for those with an appetite for it. The classical repertoire appears to be minimal and it is the pop artists who have been making more Antarctic musical noises, in some cases literally. The following is a

consumer's guide to what has been available in the past few years directly in stores and through the Internet in North America. There are few discs devoted entirely to Antarctica, but quite a few with individual songs entitled *Antarctica* or something similar.

**SINFONIA ANTARTICA (Seventh Symphony)**  
by Ralph Vaughan Williams.

Perhaps you have seen the vintage 1949 film *Scott of the Antarctic*. The background music, by one of Britain's greatest 20<sup>th</sup> century composers, was later arranged into his Seventh Symphony, which premiered in 1953 and is considered to be the granddaddy of Antarctic music. The scoring includes a wind machine and conveys the struggle and desolation of Robert Scott's final journey. It is a deep, dreary and depressing work, not to be played on a Walkman. There are many recorded versions and listeners may find their individual tastes and preferences among the various issues.

One of these, issued in 1997, conducted by Andrew Davis with the BBC Symphony Orchestra, contains a very illustrative booklet with historical photographs of Scott's expedition. Teldec 0630-13139-2

Also notable is the Raymond Leppard version with the Indianapolis Symphony Orchestra, issued in 1993, which uses narrated excerpts from Scott's own journals. A useful booklet is also included. \*CossKC2214

Another recent CD was released in 1998. The Bournemouth Symphony Orchestra recording of this work, on the budget-priced NAXOS label, is a real bargain at a third of the price of some of the more expensive ones. The booklet notes are informative but why, oh, why feature a cover photo of Greenlanders hunting in the ice, when this is supposed to be the South? Naxos 8.550737

The second release in 1998 of this classic Antarctic music, performed by the Halle Orchestra, conducted by Sir John Barbirolli, is no spring penguin. The full symphony was premiered in January 1953 by Barbirolli and the present performance was recorded in June 1953. This

reissue on CD is now the oldest of the nine or so performances of the Symphony currently available on disc. EMI 7243 5 66543 2 7

**SIR PETER MAXWELL DAVIES**

Of special interest to classicists, the British Antarctic Survey and the London Philharmonia Orchestra have commissioned prolific British composer Sir Peter Maxwell Davies to compose an Antarctic Symphony, his 8<sup>th</sup>, for its premiere in 2001. In 1997-98 Sir Peter spent three weeks at Britain's Rothera Base on the Antarctic Peninsula experiencing life there. The BAS said "Through this commission we hope to raise awareness of Antarctica as a unique scientific laboratory among people whose interests normally lie within the Arts. In turn we at BAS very much look forward to learning more about the world of serious music." Sir Peter's eloquent Antarctic diary is available at his web site at <http://www.MaxOpus.com>

**ANTARCTICA - Suite for Guitar and Orchestra** (1992) by Nigel Westlake. Guitar played by John Williams.

Westlake, an Australian, wrote the score for the IMAX film *Antarctica* and later reworked it into this longer guitar concerto in four movements. Highlights are the stately Wooden Ships and a shimmering piece called Penguin Ballet, which captures emperor penguins frolicking beneath the ice. Sony Classical SK53 361

**LULIE the ICEBERG** - Music by Jeffrey Stock, Story by Her Imperial Highness Princess Hisako of Takamado of Japan (1999).

Based on the Princess<sup>1</sup> children's book, written after she saw a lone iceberg drifting off Greenland, the "magical tale centers around a quest for the origins and destiny of life as seen through the eyes of an innocent and very brave iceberg, Lulie, as he embarks on a courageous ocean journey between the Arctic and the Antarctic, the two oldest living continents on the planet". One of the movements is entitled *South Pole*.

Recorded at Carnegie Hall, the performance is narrated by Sam Waterston and the musicians include the Orchestra of St. Luke's, Betty Baisch's Choral Associates, Yo-Yo Ma (cello), Pamela Frank (violin) and Paul Winter (saxophone).

This CD is hard to miss with the colourful iceberg, emperor penguins and humpback whales on the cover. Produced in cooperation with UNICEF and Icebridge, a forum of scientists and educators dedicated to the promotion of knowledge about the polar regions and the oceans. Sony Classical SK61665

**ON THE LAST FRONTIER** by Einojuhani Rautavaara(1999).

This Finnish classical composer has become well-known to North American audiences in recent years, particularly for his haunting 1972 *Cantus Arcticus*, an ode to the land of the Arctic Circle.

*On the Last Frontier (A Fantasy for Chorus and Orchestra, 1997)* is based on the composer's interest, going back to childhood, in Edgar Allan Poe's *The Narrative of Arthur Gordon Pym*. Published in 1837, this novella about Pym and a group of sailors marooned on a tropical island at the South Pole with a race of savages is considered to be seminal in Antarctic fiction and has spawned numerous like-minded stories. As Rautavaara approached his 70<sup>th</sup> year, he took the book's closing plot and developed his own rich musical themes of imagined lands not yet explored. Ondine ODE 921-2

**ANTARCTICA** by Bemie Krause (1998).

This is a CD of natural sounds from the field produced by Douglas Quin for the *Wild Sanctuary* series of wildlife recordings. Stereo/surround microphones were used to record Weddell and leopard seals, orcas, and emperor and Adelie penguins. Of special note are the creaks and groans heard from the Canada Glacier and Wind Harps from the Taylor Valley. "To create this kind of magic with natural sound takes time, enormous

patience, perseverance, and a keen compositional sense to make lyrical the material heard on this album. Sounds from the Antarctic present the ultimate test." Miramar 09006-23113-2

**ANTARCTICA** by Vangelis (1983).

Synthesizer music from Koreyoshi Kurahara's film of the same name. Best song is the title track, *Theme from Antarctica*, which still remains the definitive Antarctic mood music. Nothing else on the disc matches this magnificent throbbing and pulsating piece which is the perfect accompaniment for sailing down the pristine Lemaire Channel or Gerlache Strait. Many amateur videos of the Antarctic have probably borrowed this theme for background music. Polygram 815732-2

**POLAR SHIFT - A Benefit for Antarctica**, various artists (1991).

A compilation of New Age instrumental and vocal music dedicated to the conservation of Antarctica. Performers include a number of single-name artists such as Vangelis, Yanni, Enya and Kitaro, along with ET's John Tesh. A very enjoyable and soothing palette of sounds. Informative liner notes give reference sources for further reading though some of the addresses are now out of date. Private Music BMG2083-2-P

**ANTARCTICA** by Ian Tamblyn (1994).

Tamblyn is an Ottawa-area Canadian pop-folk artist and currently an arctic tour lecturer.

This recording is associated with the CBC radio documentary, *Notes from the Bottom of the World*, based on his trip to McMurdo Sound. The music is a combination of new age/folk-rock/jazz influences played with crystalline, vibrant instrumentation, at times including penguin brays and Weddell seal squeals. The most memorable song is *The Penguin came from Pittsburgh*. Attractive emperor penguin cover picture. North Track NTCD3. In the U.S. this CD is available as NorthSound NSCD 29532

**THE BODY NEEDS TO TRAVEL** by Ian Tamblyn(1997).

Ian Tamblyn's latest CD is a collection of folk songs composed while he was on Adventure Canada expeditions, largely in the Northern Hemisphere. Included is *The Emperors*, written in 1992 during his trip to Cape Evans, Antarctica. The song is about the advice given by three emperor penguins encountered. "There I thought of poor old Scott and how he must have felt, wandering through a land where no man belongs and dying with his hands reaching out, oh but the Emperors they belong here and they gave me this advice, oh don't go reaching for that brass ring when you're walking across the fields of ice." North Track Records NT-20

**ANTARCTICA** by Richie Beirach (recorded 1985, issued 1994).

Beirach is an American jazz artist who improvises on elements of eclectic modern music. This solo piano *Antarctica Suite*, according to the liner notes, "unlike the musical pablum that assaults us daily, isn't programmed to make you consume or conform. Only feel." Titles include *The Ice Shelf*, *Deception Island*, and *Neptune's Bellows*. ECD 22086-2

**ANTARTIDA** by John Cale (1995)

This is a musical soundtrack to a Spanish-American film by Manuel Hueriga, not so much about Antarctica as a place but rather, as a state of mind. Cale is a former member of the rock group Velvet Underground. The music consists of short, sparse, haunting, melodic themes - Antarctica seems perfectly suited to be a source of inspiration for minimalist composition. Les Diques du Crepuscule TWI-1008

The theme song for this soundtrack has its origin in a Cale song, *Antarctica Starts Here* found in his 1973 solo recording *Paris 1919*. Reprise/Warner Bros, Records Inc. 2131-2

**THE THING** by Ennio Morricone (1982). The soundtrack to the popular Antarctic sci-fi movie of the same name. Morricone has composed many highly regarded film themes but this tuneless electronic noodling is entirely forgettable. Varese Sarabande VSD-5278

**ANTARCTICA The Last Wilderness** by Medwyn Goodall (1993).

Goodall, who lives in Cornwall, England, has recorded many CDs for the Dutch new age music label, Oreade Music. It's a pleasure to hear one of the few all- Antarctic CDs we have come across. There are six extended synthesizer and other instrumental pieces with titles such as *All White*, *Endless Emptiness* and *Snow Kingdom Forever*. Dreamy, peaceful music and gentle to the ears but we're not entirely convinced we've been transported to Antarctica through the music. Mar 3812

**Individual songs entitled *Antarctica* also appear on the following commercially available discs:**

**LAST DAYS OF THE CENTURY** by Al Stewart - (1988, reissued 1997).

This is the swingiest Antarctic song we have heard to date, with lyrics such as- "Who knows what the powers may be that cause a man to go mindless of the dangers out across the virgin snow."

The Scottish soft-rocker introduced his song in concert as follows: "In England, just south of where I was born, there was a fascination with going to the South Pole: we had two explorers that tried it at the beginning of this century. There was Shackleton, who was the punk-rocker of polar exploration; he believed in making minimal preparation, just going, putting on a warm sweater and seeing how far he got, and needless to say, he never got to the South Pole. He nearly died a few times, but never made it.

There was another man called Scott, who was a boyhood hero to English people because he died on the way home. He actually got there, but that wasn't important. What was important was that he died coming back again. In England we revere people not for what they've done, but for whether or not they died while they were doing it.. .of course, this song isn't about any of this, it's about a very cold and frosty woman." EMI 7243-8-21616 22

**BLUE SKY MINING** by Midnight Oil (1990). Australian eco-rockers sing "there must be one place left in the world where the water's real and clean, where the skin says it can breathe, where we can be". Columbia CK-45398

**SAME RIVER, SAME SONG** by Kym Pitman with Ibis (1993). Mellow nature-attuned acoustical folk music from an Australian group. Their haunting, melancholy song *Antarctica* ends with the farewell wish, "so stand pure and free you southern land, forever left to mother natures hand, there is so much we all can gain, by leaving this windswept land unstained". Available in North America as Small World Music, Inc. NS 1431 CD

**GREATEST HITS** by Men Without Hats (1996). This Montreal-based techno-pop group had a string of international hits in the 1980's and their song *Antarctica* was originally released as a single in 1982. Aquarius Records Q2-00579

**CINEMATIC** by Adrian Borland (1996). Spacey American rock music. Setanta, Inc. SET US-003

**THREE DAY WEEKEND** by Evan Marks (1998). Funky American jazz-tinged rock. Verve Forecast (Polygram) 314 537 690-2

**EARTH: VOICES OF A PLANET** by Paul Winter (1990). A tribute to the 20<sup>th</sup> anniversary of Earth Day by this prominent, spiritual, earth-friendly jazz

musician. The disc includes songs dedicated to each continent, including Antarctica. Living Music Records, Inc. LD 0019

**SEA POWER - A GLOBAL JOURNEY** by Michael Whalen (1993). This is the soundtrack to a joint U.S./Japanese/British television series of the same name, which examined the power and mystery of the oceans, including the frozen pack ice of Antarctica's Weddell Sea. Narada Cinema ND 66005

**"JUNGLE" JACK BANNA'S WORLD -** (1996). Another musical journey across the continents, composed and played by Mark Frye and inspired by Hanna's wildlife television specials. Included is *The Antarctic Voyage*. "At the bottom of the world lies a continent of glacial peaks, icy water; and soaring birds that inspired this music." High Chief Records 7 243 8 41557 28

**MUSIC FOR THE FRIENDS OF THE WHALES** by Gregor Theelen (1995). Theelen is a Dutch composer-musician whose New Age orchestrations take us on a soothing whale-seeking journey. One piece is entitled *Antarctica*, an arrangement of an Eric Satie composition. In an act of pole reversal, the accompanying track notes indicate "Life of the whale underneath the ice of the South Pole. There they go to feed." Oreade ORN 5239-2

**SOUND OF THE WHALES - MUSIC FOR RELAXATION** (1997). Whale calls are combined with tranquil mood music composed for the oceans by David Britten This "will take you on untold journeys that will leave you feeling relaxed and renewed." One of the pieces is entitled *Antarctic Chorale*. SUMCD4154

**LIBERTY** by Duran Duran (1990). 1980's glam-rockers from Britain included a pleasant song called *My Antarctica* on this CD -

"in this place nothing changes, my Antarctica."  
Capitol CDP 7 94292 2

**GAMES PEOPLE PLAY** by the Peechees  
(1997).

American grunge-rock group thrashes its way through a song called *Antarticists*, mangling geographical references to the North and South Poles, penguins, seals and ice. Kill Rock Stars 285

**NOT WE BUT ONE** by the Mike Nock Trio  
(1997).

This jazz trio, led by Nock, a New Zealander now resident in Australia, includes a piece called *Antarctic Ice*. Naxos Jazz 86006-2

**DESCANSO DOMINICAL** by Mecano (1988).

This Spanish pop/dance group's *Heroes de la Antartida* may possibly be the world's only dance track homage to Robert Scott and his group's fateful return attempt from the South Pole. Ariola 8516-2-RL

**BONZAI GERMANY COMPILATION - Volume 1** (1998).

A collection of synthesizer dance club music from Germany including a track called *Fire and Ice - Antarctica (Land of Illusion)*. This awful music will pound you into stupefaction or boredom, whichever comes first, but at least the song title got our attention. Bonzai CD 001

**OCEANSCAPE** by William Goldstein (1986).

According to the liner notes, this is one of the first CDs to be recorded directly from computer via synthesizers to a digital master. The numerous brief orchestral compositions on this Sony Music disc include a very short jumpy piece called *Window to Antarctica*, noteworthy only for the title. Synthesized musical sounds have mellowed considerably since the era represented on this disc. PEG03 I/A 33937

**CARNIVAL OF CHAOS** by GWAR (1997).

This American theatrical shock-rock heavy-metal group slashes and burns from their opening number, *Penguin Attack* ("stumbling from the ice age, they were last in flight, they would write a new page, if they could only write rumbling from the ice age they were last in line, they would start a new age if they could just tell time"), and then does further damage to the ears with *Antarctican Drinking Song*. GWAR (apparently God What a Racket) have been known to cause moral panic and the music takes a back seat to the visuals. Metal Blade /Attic Records 3984-14125-2

An earlier indignity is their video, **LIVE FROM ANTARCTICA**, issued in 1990. And no, it's not live in Antarctica. Important R-1814

**ACROSS THE WHITE PLAINS** by Deborah Liv Johnson (1995).

This San Diego-based folk artist entitled her CD, and one of the best songs on it, to our ears, in honour of the American Women's Antarctic Expedition, whose four members achieved the South Pole in 1993. In a crystal clear voice, with understated, top-notch musical backing to the haunting melody, she sings, "There are no trees, There is no grass that grows, There are no flowers, No autumn leaves to blow, But there's a distance, Where my heart must go, Across the white plains, Across the white plains.. .And in my home on ice, I feel the silence of the night, Sleep has missed my eyes here tonight, The wind will bring the morning, The wind will close my eyes tonight." Mojave Sun Records MS 1233

**SINGIN' SONGS OF SCIENCE** by J. P.

Taylor and the Academics (1998). Florida-based Taylor has written a CD of rockin' songs to help students learn serious science concepts, such as plate tectonics and laws of motion. Included is *Antarctica*, based on his own trip there. The song explains the Antarctic food chain and "well it gives me a thrill, to tell you 'bout krill". SSI00, web site: •[www.singinsongs.com](http://www.singinsongs.com).

## JOURNALISM ON ICE: How Polar Research Plays in the Press

by  
Curt Suplee

Science Reporter and Horizon Editor  
Washington Post

Saturday evening, December 11, 1999

The Cosmos Club  
2121 Massachusetts Avenue, NW  
(Massachusetts and Florida Avenues)

Social Hour 6 PM - Dinner 7 PM - Lecture 8 PM

*Black Tie or Dark Suit suggested*

The cost of dinner, including tax and gratuity is \$50 a person.

Make check payable to ECWG, and send to:  
Roger L. Payne, 47762 Hammerstone Way, Potomac Falls,  
VA 20165-4769

No reservations or cancellations after December 8, 1999

Curt Suplee, The Washington Post science reporter and editor of the Post's acclaimed Horizon section, has worked in both polar regions and will tell us why some expeditions get great press, some lousy, and some not at all. Mr. Suplee is a winner of the AAAS science writing award and the author of two books, "Everyday Science Explained" and "Physics in the 20th Century." He is informed and highly articulate about science and the news business, and we can look forward to a stimulating talk and a liveh question-and-answer session. In addition to his 23-year career with the Post, Curt contributes to National Geographic and "lives in Silver Spring with his wife and two highly adventurous daughters."

We still have some Antarctic calendars - \$11 each. Send your check payable to Antarctic Society, to Ruth Siple at the address above.

## BRASH ICE

We are going to initiate something new with This issue, presenting a listing of some of our members' favorite web sites. This may not be overly popular with those members who don't have computers, but it should play with those who do have computers. Besides, we aren't going to force-feed you a whole newsletter of web sites. Well start out with old Art Ford who has been an active Antarctic since time immemorial.

Have you noticed the proliferation of women Antarctic writers? Caroline Alexander has broken all records for Antarctic sales with *The Endurance*, Shackleton's Legendary Antarctic Expedition. And probably the number one runner-up, Sara Wheeler's *Terra Incognita*. Currently Sara is working on a biography of Apsley Cherry-Garrard, which will no doubt be another big seller.

Another Brit, Diana Preston, published *A First Rate Tragedy, Robert Falcon Scott and The Race to the South Pole*. L.C. Bernacchi's granddaughter, Janet Crawford, has written and edited a beautiful edition of *That First Antarctic Winter, the Story of the Southern Cross Expedition of 1898-1900*. In the wings, Susan Solomon of Antarctic ozone fame, is working furiously on Scott's last expedition, a book destined to come out "late next year or the following year." Diane Belanger, who is doing a study for NSF on oral history of Antarctica, will publish a book after the completion of her contract. And there are several other women authors and editors of Antarctic books worthy of note.

We are running newspaper accounts of two well-known Antarcticans. Margaret Lanyon outlasted Walt Seelig in Christchurch, and is legendary to thousands of Antarcticans who passed through Christchurch during her thirty-six year tenure. The other article is an interesting interview at the Pensacola National Museum of Naval Aviation with old Gus Shinn, who was the very first pilot to land at the South Pole. And, naturally, we all were saddened to read about the death of one of today's most legendary Antarcticans, Bunny

Fuchs. I was fortunate enough to be a wintering-over resident at the South Pole when he and his colleagues dropped in for a five-day change of underwear, hot meals, coffee, and non-moving beds back in January 1958.

Please note that our third wheel and Penguin Prattler, Kristin Larson, has not taken leave of this newsletter (nor her senses). She helped get this one out the door but will wait until our next issue to bring you up-to-date info on USAP research projects, Southern Ocean fish stories and the like.

Late holiday shoppers! We still have some excellent millennium calendars of the Antarctic. Send checks to Ruth, \$11 per calendar! Hurry!

**RAYTHEON AWARDED \$1.12 BILLION USAP SUPPORT CONTRACT** (adapted from Raytheon's web site). Raytheon, based in Lexington, Massachusetts, is a \$28 billion corporation that made its name in the defense industry. The contract, one of the largest awarded by the federal government, is to provide science, operations and maintenance support to the U.S. Antarctic Program, including the bases at McMurdo, Pole, and Palmer, two research vessels and numerous field camps.

According to Bob Valentine, a Raytheon spokesman, the new contractor will attempt to retain many of ASA's current employees. "We'll be meeting with the incumbent work force to talk to them with the objective of hiring as many of them as possible," Valentine said. He said company representatives will soon be visiting the Ice to begin preparations for next year's changeover. Valentine described Raytheon officials as "elated" by the news of the contract award.

In a statement to ASA employees, Karl Erb, the director of the Office of Polar Programs at the NSF said, "ASA has been critical to U.S. Antarctic Program success in many areas over the years, and I thank you all. There remains much to do in Antarctica. I hope many of you will stay with us as we move into the future with Raytheon."

**POP ICE WOMAN FINISHES UP** (Adapted from June '99 article contributed by Walt Seelig). Christchurch woman Margaret Lanyon's entree into the fledgling U.S. Antarctic Program began with a flat rejection from her prospective bosses. She flunked the US Navy Antarctic Support job interview because she was "too quiet." Instead she was referred to the U.S. National Science Foundation. There she became personal assistant to the foundation's bosses, including the popular Walter Seelig.

So began an enduring love affair with a cast of thousands. As fate would have it, the woman destined to manage NZ civilian contractors to American ice operations was later assigned to a six-month stint as administrative assistant to the US Navy Antarctic command. Her boss "gleefully" told her that the military were now "very sorry" about their initial rejection.

Morale and a multitude of research projects depend on the unhindered passage of staff and their vital lifelines. Over 36 years, until her retirement last month, Margaret Lanyon helped shift almost 20,000 scientists and support personnel to and from McMurdo Base, and back to the US. With each contractor change, Margaret, Lanyon acquired another portfolio and in 1974 was appointed the foundation's contractor manager for NZ operations. Moving men and women - about 2000 of them in the latest six-month summer drop - kitting them and transporting them was a mammoth and complex exercise fraught with its own perils.

Such was the TV coverage in the late 1970s of an airlift of live penguins from the ice to the San Diego Zoo. Refrigerated trucks, back-up power units and a special permit to "import" the birds into NZ were arranged in a meticulous planning exercise which required

hydrating the feathery cargo with specially made ice blocks. The permit stipulated the penguins be contained in a restricted area at all times. "The birds were closely attended at all times by the curator and other scientists," she recounts. "One felt confident nothing could wrong."

It was big news - television coverage featured a Hercules landing - and penguins which appeared to be standing on the tarmac, a piece of creative editing, which riveted the attention of the NZ permit and quarantine squad, not to mention the civilian contractor manager. Panic ensued. The permit team turned up early next day, but was swiftly reassured.

Margaret Lanyon was recently honored by colleagues, compatriots and associates at the USNSF Christchurch Airport base. Friends from the entire airport community from air traffic, Customs and freight to the Bank of New Zealand and the airport motor inn mustered at the all-male turnout. She is one of the few foreign nationals in American Antarctic annals to be given the honor of a mountain named after her - a rocky peak in St. Johns Range in the Victoria Upper Glacier Lanyon Peak is officially listed with the US Board on Geographic Names. In a northwest Christchurch home stands a black and white framed photograph of the stark sentinel surveying the captivating beauty of the silent waste.

**GUS SHINN RECALLS FIRST SOUTH POLE LANDING** (Adapted from article in the Ocala Star Banner, 10/31/99, contributed by Kirby Hanson, Meteorologist, SP '58)

They flew 800 miles from McMurdo Station or the Antarctic coast to the South Pole on Oct. 31, 1956 in an aging R4D, affectionately and sometimes derisively called a "Gooney Bird." It was the Navy version of the piston-powered twin engine DC-3 airliner that had gone into service 20 years earlier. The R4D had none of the sophisticated navigation gear nor the power of the turboprop LC-130 Hercules the New York Air National Guard used to pick-up Dr. Jerri Nielsen from a research station at the South Pole last month.

Shinn, originally from Eden, NC was one of seven Navy men aboard the R4D, including Rear Adm. George Dufek. The 77-year-old Shinn, now living in Pensacola, recalled his flight in an interview at the Museum of Naval Aviation where the plane is on display. It was named *Que Sera Sera* - French for whatever will be will be - the title of a then-popular song. The name turned out to be very appropriate, Shinn said. Just as the Air Guard did this year, the Navy waited for winter to wane before attempting a polar landing, although not long enough for Shinn. The Cold War had literal meaning in the Antarctic. Dufek was in a hurry, worried that the Russians might get there first.

An earlier flight in another R4D to seek a refueling site between McMurdo Station and the pole nearly ended in disaster. Flying into a valley, the plane got caught in a windshear and began falling. Fortunately it was equipped with small rockets called JATO for jet-assisted take-off. Shinn fired all 11 JATO bottles to stop the fall just as the wing tip hit the ice. There was "lots of noise, lots of fuss" but damage was minor and the plane flew fine. Dufek did not want to go to the pole with a bent wing so they borrowed *Que Sera Sera* from another crew.

The polar landing was a bit rough, but not unusual for the terrain, recalled Strider, 69, from his home in Newport News, Virginia. Strider is the only other surviving member of the landing party. Their JATO assisted takeoff appeared uneventful to those watching from an Air Force C-124 Globemaster that circled overhead. It was not.

The high altitude of the ice cap- about 10,000 feet at the pole- starved engines of oxygen and robbed wings of their lift. That, along with the plane's 28,000-pound weight, made JATO necessary to take off in the best situation, the JATO bottles usually were fired after the plane hit 30 knots, but "*Que Sera Sera*" remained stuck with the engines at full power. "We just sat on the ice like an old mud hen," Shinn said. To break loose, Shinn fired four JATO bottles. That did the trick, but he was worried about having enough JATO left to get

airborne. They barely made it only to be enveloped in ice and snow. We couldn't see anything, but that was no big deal," Shinn said. He relied on instruments to keep flying.

#### **WEATHER NOT AN ALLY OF CAPTAIN**

**SCOTT** Susan Solomon and Chuck Stearns have collaborated on an analysis of weather encountered by Scott's party, and averaged data measured by Chuck's automated stations on Scott's route to the South Pole. It seems that Scott picked a bad year to be late in departure and return, as meteorological data collected by his party showed abnormally colder than normal temperatures for the return trip. Amundsen evidently benefited by much better mid-summer conditions. Solomon and Stearns have published their analyses in a short report in the November 1999 issue of the *Proceedings of the National Academy of Sciences*. Susan's forthcoming book on the expedition will go into it in much more detail.

Susan was quoted in an interview published by *USA TODAY* to the effect that even though Scott made many mistakes, "these alone would clearly not have been sufficient to cause all of them to die had the weather been normal." In a *London Times* Article by Science Editor Nigel Hawkes, quoted Susan and Chuck as writing that falling temperatures "likely contributed substantially in the exhaustion and frostbite Scott and his companions endured, and their deaths were therefore due, at least in part, to the unusual weather." But on the other side of the street, there are some of us Doubting Thomases who feel within their own hearts that both Birdie Bowers and Edward Wilson could have gone on if Capt. Scott had been physically able. However, as the very observing Charles Swithinbank wrote us, "it is nice for once to hear something supportive of Scott's view.

#### **FOOTHOLD ON ANTARCTICA, THE FIRST INTERNATIONAL EXPEDITION (1949-1952)**

by Charles Swithinbank. (Review by Paul Dalrymple). For real Antarcticans, those who want to tie the heroic era in with the scientific era, this, *Foothold on Antarctica*, is the book to read. Unlike many books on Antarctica today which are written by women who are much

more familiar with Trafalgar Square than the Great White Continent, this book is actually written by a member of the expedition, Charles Swithinbank, who was only 22 years old when he was selected to go on the Norwegian-British-Swedish Expedition.

Now, some fifty-one years later, mellowed by time, hardened by five continuous decades of Antarctic research, viewer of more of Antarctica than any man or woman in history, and probably the world's leading authority on Antarctica, Charles has blessed us with the first, first-hand account of the expedition. The expedition leader, John Giaever, wrote the official account of the expedition, *Maudheim*, but he wrote it from the bowels of the camp, never participating in any of the countless exploratory scientific sledge journeys away from the station. And this expedition was truly one of science in the field, and Charles brings it all alive to its readers.

The expedition was unique in so many different ways. It was the very first multi-national expedition to Antarctica, and was a prelude to the International Geophysical Year, a blueprint for how the Antarctic Treaty was supposed to work.... and did. It was really the last hurrah for working dogs in Antarctica, when dogs played a major role. Vehicles such as two lonely weasels were supporters, and aircraft were only summer adjuncts flying reconnaissance trips. This book is about men and dogs and science in its purest form, working in unknown territory, writing their own scripts, day to day. There was no master plan, per se, but young, ambitious, studious men who were willing to work until exhaustion.

The expedition was small, totaling only fifteen men. Three were married. One had his doctorate. Five more were to earn their doctorates from their scientific results. Several, including the author, were to become very well-known internationally, and their names will live forever in polar archives. Never before, or after, have so few achieved so much, and readers can experience their adventures and rewards by reading this very fine book. The book has tragedy, as three lives were lost when a weasel plunged off the

ice shelf into the bay. The book has drama of the very highest order, when the staff medical officer had to remove an eye, tooling his own instruments, training his colleagues to administer the anesthesia, monitor the patient's blood pressure, pulse, and heart rate, passing the right instruments on command. After two hours and forty minutes of high tension, the operation was successful, and the man's other eye was saved. It was an epic story, probably the greatest victory in the annals of Antarctic medical history.

This book has an excellent library of photographs taken on the expedition, which, fortunately, are placed in juxtaposition with the text, so you can read about the portrayals on the same page. Expedition members have an up-front and personal mug shot, so you know exactly what they looked like - fifty years ago. I don't know of any other Antarctic book where there is such a good marriage of people, events, and text.

It's fun to read something written by a true Antarctic, not something written by an outsider who has a way of putting words together which can boondoggle an innocent reader into buying their books. Charles spoke early on in his book about the quietness of Antarctica, and I couldn't help but remember the words of the American George Denton who appeared as the lead in an Antarctic science film, speaking about how Antarctica was such a silent continent. Yet the Antarctic IMAX film of perhaps a decade ago portrayed Antarctica with a continuous howling wind. Read this book, enthrall in its excitement, live the traverses. It was one of the great expeditions of all time.

For those of you who may want to buy this, and others of Charles' fine Antarctic books, it is better and cheaper to buy direct from Charles, and he will sign your copy if you request it. He says "\$ and checks are welcome."

FOOTHOLD ON ANTARCTICA: The First International Expedition (1949-1952). Through the Eyes of its Youngest Member. UK, The Book Guild, 1999.  
\$30 + \$5 = \$35 (surface) or \$30 + \$10 = \$40 (airmail)

AN ALIEN IN ANTARCTICA. USA, McDonald & Woodward, 1997. \$50 + \$7 = \$57 (surface) or \$50 + \$16 = \$66 (airmail). This can also be obtained from the publisher (McDonald & Woodward, 325 Dorrence Road, Granville, OH 43023) at \$49.95 + \$3 for shipping.).

**SIR VIVIAN DEAD AT AGE 91** (Charles Swithinbank). Sir Vivian Fuchs - Bunny to his Antarctic friends - died at his home in Cambridge on November 11th at the age of 91 years. His interest in polar exploration was aroused by his tutor in Cambridge, Sir James Wordie, who had been with Shackleton in the *Endurance*. Wordie led an expedition to East Greenland in 1929 with Fuchs as geologist. Although best known as Leader of the Commonwealth Transantarctic Expedition of 1956-58 and Director of the British Antarctic Survey from 1958 to 1973, Fuchs had earlier spent most of the 1930s working in the East African Rift Valley. After war service he joined the Falklands Islands Dependencies Survey (later renamed the British Antarctic Survey) as overall field leader, wintering over at Stonington Island in 1948 and 1949.

When the Ronne Antarctic Research Expedition arrived at Stonington, Ronne issued a decree that there would be no fraternisation between the British and the American bases situated 250 yards apart and speaking the same language. For the most part, both sides ignored this, though it meant that communications had to be furtive. A strained truce prevailed throughout the time that Ronne was on the island. Much pleasure can be had by comparing three published accounts of the same events: Finn Ronne's *Antarctic Conquest* (New York, Putnam & Sons, 1949); Jenny Darlington's *My Antarctic Honeymoon* (Frederick Muller, 1957); and Vivian Fuchs's *Of Ice and Men* (Anthony Nelson, 1982).

Fuchs had spent the winters at Stonington dreaming of reviving Shackleton's grand

design of 1914-16, the Imperial Trans-Antarctic Expedition, which had been thwarted when *Endurance* was beset and later sunk. Within the UK he had an uphill struggle against opposition because resources were already stretched by the funding of FIDS and also by funding the proposed British IGY station at Halley Bay. Sir Winston Churchill, however, was impressed by Fuchs's persistence and arranged for a substantial government grant. This was soon followed by financial support from New Zealand, South Africa, and Australia.

Following Shackleton's plan, the expedition was divided into two parts, a Weddell Sea party led by Fuchs and a Ross Sea party led by Sir Edmund Hillary. Hillary's party, like Joyce's in 1915-16, was to lay caches on the Ross Sea side to provide for the Weddell Sea party after they passed the South Pole. Hillary set out the caches but then, against Fuchs's instructions, used some of the supplies to lead his own party onward to the South Pole. When the crossing party arrived at the pole later than expected, Hillary advised Fuchs to break his journey and accept an American offer to evacuate the party by air. Fuchs chose to continue as planned but Hillary had already gone public, with the result that their differences were inflated beyond recognition by the media.

Fuchs' and Hillary's account of the expedition was *The Crossing of Antarctica* (London, Cassell & Co, 1958). Later, a less restrained account was published by Hillary under the title *No Latitude for Error* (London, Hodder & Stoughton, 1961).

Following the successful completion of the TAE and the publication of its scientific results, Fuchs became Director of the British Antarctic Survey until his retirement in 1973. He is remembered with affection by his TAE and BAS colleagues as an inspiring leader, a good friend, and the right person to be with in times of crisis. From the American point of view he is regarded -with some justification-as favoring spartan conditions for men in the field, while from his point of view he saw USAP-living standards as unnecessarily extravagant.

For many years he played a constructive part in Antarctic Treaty affairs, and in UK circles he served-among other things-as President of the Royal Geographical Society. Fuchs's autobiography was published as *A Time to Speak* (Anthony Nelson Ltd, 1990). He is survived by his second wife and by a son and a daughter from his first marriage.

SHACKELTON STILL BESET AT SEA. White Mountain Films has had two ships, the *Akademic Shuleykin* and the *Laurel* in Antarctic waters for the past two months shooting films for two productions about The Boss. One is going to be a two-hour documentary expected in 2001 via the U.S. Public Broadcasting System, the other for [MAX theaters around the world.

Both ships worked in and around South Georgia in early November and got what they wanted. However, the weather at Elephant Island was so bad, which is normal, that they had to temporarily abandon the area. Both ships then went into the Antarctic Sound area where "Iceberg Camp" was reconstructed on an ice floe and filming undertaken. The *Shuleykin* then traveled into the Weddell Sea and did some more filming on pack ice some 250 km southeast of the Antarctic Sound. The *Shuleykin* went back to Elephant Island where replicas of the *James Caird*, *Stancomb Wills*, and *Dudley Docker* were used for a series of reconstructions. The weather turned bad again, and the three replicas were lost while under tow from the ship! The next day, November 21<sup>st</sup>, they cancelled further filming, and the operation was terminated, to be continued in the arctic at a later date.

POLAR URLs - Art Ford's list The contributor's credentials include a 40-year Antarctic career and extensive research that has led far beyond the web: Ph.D., Geology, Univ. Washington (1959), for first geological investigation of the active volcano Glacier Peak in the high North Cascades, Washington. Then, first job, Asst. Prof. Geology, San Diego State Univ. (1958-60), escaped academia and in 1960-63 led expeditions first studying ranges nearest South Pole (Patuxent Range, Pecora Escarpment, parts of Thiel

Mts). And on and on....leading eventually to taking folks ashore on zodiacs to exotic Antarctic sites.

Mr. Amory H. "Bud" Waite, Jr.  
Dr. Charles W Swinbank  
Dr. Paul C. Dalrymple

## BRASH ICE

As you can readily see, this newsletter is NOT announcing a speaker program, as we have not lined anyone up, nor have any of you stepped forward announcing your availability. So we are just moving out with a newsletter based on some facts, some fiction, some fabrications. It will be up to you to ascertain which ones are which. Good luck!

Two more Byrd men have been struck down -- Al Lindsey, the last of the Byrd scientists to die, and Steve Corey, Supply Officer, both of the 1933-35 Byrd Antarctic Expedition. Al was a handsome man, and he and his wife, Elizabeth, were a stunning couple. Because of his many honors, we have devoted a large part of this newsletter to telling you about an Unsung Antarctic Hero. Steve Corey was a live wire, pepper pot who appeared much younger than his years. And his widow, younger than Steve, was a work of art in herself. If you visit the Navy Museum on the Anacostia River in Washington, D.C. you will see much of Steve's expedition material.

There are only four Byrd men still alive. The indefatigable Norman Vaughan, is the only survivor from the first Byrd expedition, and he and Carolyn have no immediate plans for putting him into the ground. I don't even think they have a long-range plan for it. The three survivors from BAE II are Bill "Whirlybird" McCormick, who cracked up the first helicopter-type aircraft taken to Antarctica, Guy Hutcheson, and Olin Stancliff, who is not in good health.

B15, the large iceberg that broke off the Ross Ice Shelf around March 19th, was big - twice the size of Delaware, being approximately 4250 square miles (170 miles by 25 miles). It probably exceeds the large iceberg sited by the Glacier in November 1956, and may well be the largest berg known by mankind in the polar regions. Stand by for some big rams!

Life is also very fragile. We're all mere mortals here on borrowed time. At least fifteen years ago, the redoubtable Dave Bresnahan said to me. "Why should I join the Antarctic Society? All you have is a bunch of old fossils." At the time I wondered what secret plan lurked in his stomach to prevent himself from soon becoming fossilized. I still wonder, and he must, too, as time is catching up with him. Antarctica is ageless. It may be for the young, but there is still a place for a Buck Wilson; still a place for an Art DeVries; still a place for a Bill Cassidy. We try to make our newsletters for all ages, but this one slipped into Ancient History. Read it. You might even find that you actually enjoy it.

**EDITORIAL ON ADMIRAL BYRD.** PBS recently showed a documentary on Admiral Byrd where Bolling Byrd Clarke, Steve Corey, Joe Hill, Lisle Rose, one of Bernt Balchen's ex-wives, the archivist at Ohio State, and, hic, a biographer of Byrd, were interviewed at some length. This was a much better presentation on Byrd than the British hatchet job of two years ago, but still some things piqued me.

I first want to address the final word in the script on Byrd being a "heavy drinker." I knew a lot of the Byrd men, corresponded with many others, and also talked to some. It is an invalid assertion to say that Byrd was a heavy drinker, as he was strictly a social drinker. I happened to see the battery of questions that the above unnamed biographer sent out to all living Byrd people prior to writing his book, as I was at Henry Harrison's house when it came. Henry was a meteorologist on BAE I. and was the Commander's bridge partner. Henry and I became close as we were both Worcester (Massachusetts) boys; we were both self-proclaimed baseball experts; and we both had worked in Antarctica as meteorologists. The questionnaire was heavily slanted towards trying to prove Byrd was an alcoholic, and that he was an incompetent navigator. Henry was very upset about the questionnaire, as were many other Byrd survivors. Malice before thought. Byrd had his faults like all of us, but drinking was not one of them.

Before I continue, I want to direct your attention to two rather length<sup>y</sup> discourses on life with Byrd that have appeared in these newsletters. First, Charlie Murphy's "Some Vagrant Recollections Of An Elderly Antarcticist" (April 1982). Charlie is long since deceased, but he was a good friend of mine. Now, as an aside, Charlie could really be called a heavy drinker. His funeral service ended with his cronies all assembling at one of his favorite watering places in Washington, D.C.. the Army-Navy Club! Charlie had credibility. He was, without a question of doubt, the most famous writer to ever winter over in Antarctica. Besides being a biographer of the Windsor's, he was an editor of FORTUNE, and was a most distinguished writer on politics and national security. For more about Charlie, see our April 1982 newsletter.

He wrote about "dastardly attempts to blacken Byrd's reputation." and vehemently denied Balchen's claim "that Bennett had himself made

to him a deathbed confession of the fraud." Charlie was with Balchen and Bennett on the flight that ended in Bennett's death. They were flying in a drafty Ford trimotor in 1928, on their way to Labrador to retrieve the crew of the German monoplane BREMEN that had been forced down off the coast. Bennett came down with a raging case of pneumonia, and they took him to a hospital when they landed on the ice of a frozen lake in Quebec to refuel. Balchen and Charlie continued on to Labrador, and while they were gone Bennett died. There was no deathbed confession.

Elsewhere in this newsletter, you will read a lengthy obituary about the last Byrd scientist to die, Al Lindsey. We want all of you to read it, as Al was a most distinguished scientist, and few, if any, of Byrd's compatriots have been so honored in their lifetime as Al was in his career. But he also wrote a long treatise in our newsletter of January 1998, entitled "Inside Byrd's Second Antarctic Expedition." It's a great article, and before he got into his story about BAE II, 193335, he addressed Byrd's flight over the North Pole. It is very interesting, and he referenced mechanic Pete Demas's carefully prepared 15-page typed manuscript "Eyewitness Facts About Byrd's North Pole Flight" that is in the National Archives, but is never referenced in print. On Pete's last trip to Washington, D.C., I know that writer Christine Russell, then of the Washington Star, interviewed Pete at some length. However, the great silver-tongued Antarcticist, Larry Gould, was in town, and he stole all the headlines. Christine never published any-thing about Pete. Then she went into the medical arena, and Lord only knows what happened to her notes on Pete.

Al wrote extensively about Byrd being "widely and highly respected" during his life and afterwards. Since the "higher one gets in the world, the harder the wind blows. (Byrd) he has also been criticized, even vilified, but almost exclusively by those who never visited Byrd's arena of action. The world's leading explorers have long been favorite targets of professional detractors." We beseech you to reread the words of two honored, highly respected men - Murphy and Lindsey, who went to the ice with Byrd, and see how they came back with only the greatest of respect for him.

Byrd had his distracters in the pilots. Pilots are something like relief pitchers in baseball; they

are a bird of another feather. But one of the most ironical things in the history of Antarctica, is that Byrd and his chief antagonist, Bernt Balchen, are buried side -by-side in Arlington! It's truly unbelievable. Here is the great American polar explorer buried with the standard, simple, white cross. Believe all it reads, as I recall, is "R. E. Byrd." It is just like nearly all of the other graves in the famous cemetery. Balchen died some sixteen years later, and, as I wrote above, he even stalked Byrd to his grave, being buried right next to him! Not only that, but a giant monument rises above Bernt! One day I was in the National Archives reading personal letters, and I ran across one from Byrd to Paul Siple, relative to Balchen, saying "always know who your enemies are." Byrd better not look to his right, as he is going to find him!

**ADDENDUM.** A most valuable collection of twenty letters from Charlie Murphy, BAE II, to PCD has been unearthed. They provide much insight into the interpersonal relationships between Byrd and Harold June, Larry Gould and Bernt Balchen. More to follow.

**AL LINDSEY STARTS ON ANOTHER GREAT EXPEDITION.** On Saturday night, December 18, 1999, Elizabeth Lindsey, bride of Antarctic Alton Lindsey for over sixty years, sitting at his bedside, holding his hands, implored him "to not hold back, go ahead and start on another great expedition, and I'll be along soon enough to join you." The following day Al did just that, thus ending his career on this earth as one of the most environmentally conscious ecologists in this country, who used Antarctica as his springboard to an illustrious college career as a biology professor.

He was on Byrd's Second Antarctic Expedition. 1933-35. where he was a colleague of Paul Siple, and served as the expedition's vertebrate zoologist. It was an interesting expedition with several men who went on to fame. But something happened in the past few years that upset Al tremendously. Some Brits came to this country to do a television documentary on Admiral Byrd, and as the most erudite of the living Byrd scientists, they spent over three hours interviewing Lindsey. But they never used a solitary word of Al's, as they weren't interested in anything complimentary on Byrd, they wanted to do a hatchet job on him, the sensational

tabloid-type thing. Al wrote many letters to the media about this, which may have helped in this film not being shown on some major outlets.

We turned our newsletter in January 1998 over to Al, and for ten pages he told us about his life in Antarctica on the Byrd Expedition. Al was sort of a Latter Day Edward Wilson in a lot of ways; both were deeply religious, both were strong naturalists, both were devoted to their leader, both were men with an artistic ability - Wilson with sketch pencils and artist brushes; Lindsey with a poetic flair, which sometime overran its bank with terrible puns. But our issue on Al ended with one of his poems, *The Outward Breed*, in which he addressed things close to his heart. This could very well have been the closing eulogy at his memorial service. We feel that it is very appropriate that he was the last Byrd scientist to die, as if someone much higher predestined him to close the book on their careers. And what a career it was!

The Ecological Society of America named him "eminent ecologist for 1976," saying at the time "few investigators, past or present, have achieved excellence in such varied aspects of ecology." A new genus and species of animal was named after him, the *Lindseyus coastus*, in 1973. The University of Arizona named the oldest dated wood in the American Southwest, The Lindsey Ancient Tree Site. The wood. in El Malpais National Monument, was traced to 190 B.C. through radiocarbon dating. Off the coast of Antarctica, in the Amundsen Sea, lie Lindsey Islands. 73° 37' S, 103° 18'W. And two months before he died, Purdue University dedicated the new Alton Lindsey Field Laboratory at its Ross Biological Reserve which Al founded fifty years earlier!! It was said that Al protected that reserve from encroachment from other departments at Purdue, preserving it strictly for biological research - nine Ph.D. dissertations have resulted.

The Lindsey Fellowship in Environmental Education was established at Goshen College in 1985. The Lindsey Graduate Research Fellowship in Ecology at Purdue University was created in 1992. The Park Service first presented the Alton A. Lindsey Award in Science and Resource Stewardship in 1998. Instigated by his pioneering research, he was influential in the establishment of the El Malpais National Monument of 114,400 acres near Grants, New Mexico. He was the chief scientific consultant

which led to the preservation of the Indiana Dunes National Lakeshore for the National Park Service. He also served in the Arctic studying permafrost on research sponsored by both the U.S. and Canadian governments.

Al was a graduate of Allegheny College, preceding Paul Siple by a couple of years. He got his Ph.D. at Cornell University in 1937. He was at the first NSF Tropical Ecology Institute in Costa Rica in the summer of 1961, and the following summer attended the first sessions of the Radiation Ecology Institute at the Oak Ridge National Laboratory. He taught at five different universities, but is known primarily as a Boilermaker, being at Purdue from 1947 through his retirement in 1973. Both Allegheny and Purdue granted him Honorary Doctor of Science degrees.

In the late 1940s Al became an early and strong proponent of the natural areas preservation movement. He was a charter member of the Nature Conservancy and its Indiana chapter. He is credited with establishing the Pine Hills Nature Preserve and the Big Walnut Natural Area in Indiana.

Al wrote ten books, fifteen magazine articles, and seventy technical papers, as well as serving as the editor of numerous magazines and journals. The New York Times obituary, a four-column spread on December 23, 1999, was very poignant, saying "Alton A. Lindsey, 92, dies. Ecologist left global imprint." We have given you the whole ball of wax on Al, as first, he was a most distinguished American scientist, he is relatively unknown to modern-day Antarcticans in spite of being our first true naturalist on the ice, he was the last of the Byrd scientists to pass away, and we liked the guy, as we do his wife, a truly lovely person. It may interest the Byrd family to know that the Admiral rushed through a briefing on Capitol Hill just so he could attend their wedding in Alexandria. May your current expedition be as exciting as the one you gave us, Al. Thank you!

#### **SUPER STAR SUSAN SOLOMON SCORES.**

Knighthoods of adventurers are something entirely foreign to Americans, but occasionally, very occasionally, we honor some of our top scientists, even Antarctic scientists, as if going there in itself was not enough of an award. Take

Larry Gould, for instance, he received among many honors, twenty-six honorary doctorate degrees. But recently one of us, Ms. SOS, Susan "Ozone" Solomon, received a most prestigious honor, being the recipient of the National Medal of Science from our president, Bill Clinton, in ceremonies at the White House on March 14, 2000. Susan is in very select company, as only 374 scientists and engineers have been bestowed with this medal. She was honored for her keen insights into explaining the cause of the Antarctic ozone hole that changed the direction of ozone research, and for providing exemplary service to worldwide public policy on ozone research. The evening before, Secretary of Commerce William Daley, Presidential Science Advisor Neal Lane, and NSF Director Rita Colwell honored all attendees with a black-tie banquet.

Susan Solomon is a senior scientist in the Aeronomy Laboratory at the National Oceanic and Atmospheric Administration in Boulder, Colorado. In 1986, Susan and her colleagues suggested that chemical reactions occurring on the surface of polar stratospheric clouds could greatly enhance reactive chlorine compounds in the Antarctic stratosphere. This mechanism is now firmly established as the key first step in producing the ozone hole. In 1986 and 1987 Susan led a scientific expedition to the Antarctic where she made measurements not only of ozone, but also of other critical chemicals, particularly chlorine and nitrogen dioxide. She and her colleagues provided the first direct observations pointing towards such chemistry as the cause of the ozone hole.

Susan also demonstrated the important role of volcanoes and chlorine in affecting ozone outside the polar regions. Surface reactions similar to those occurring on polar stratospheric clouds can take place on sulfate aerosols resulting from explosive volcanic eruptions, affecting ozone over mid-latitude locations. Susan also showed how to compare the impacts of proposed substitutes for ozone-depleting gases to one another. She put the research for replacements on a solid scientific footing and clarified the basis for international protocols on substances that deplete the ozone layer.

One personal downer for Susan was that her mother passed away from cancer in December, and wasn't able to celebrate this great honor with her daughter. Susan thoroughly enjoyed the

association with the other eleven medallists who were to a person, remarkably bright, thoughtful, and pleasant to be around." Susan thought President Clinton was an amazing speech-giver, and said to him at her presentation, "You really seem to enjoy this job," to which he replied to her, "Yes, I do." Susan enjoyed the tour of the East Wing, and said, "I particularly like the early paintings of Indians, which were probably presented in the very early days and showing early impressions of the wild frontier."

Susan's presentation coincided with her completion of the draft of a book on Captain Robert Falcon Scott and his victimization by weather, and she was about to sign a contract for its publication as we went to press. Susan has also written an Antarctic novel, so she is a very versatile National Medal of Science honoree. Our Society hereby takes time out not only to congratulate Susan on this most prestigious award, but to also say "Thank you" from all Antarcticans for what she has done to enlighten us, and the rest of the world.

**IT'S SIR WALLY HERBERT** (by John Spletstoesser). Wally Herbert received word of his Knighthood at the end of last year, and what a way to end 1999. Wally got the word on the very day of the funeral of Sir Vivian (Bunny) Fuchs, the only man since Ernest Shackleton to receive the Knighthood 'For services to Polar Exploration.' He received a letter from the Prime Minister's Office to say that he would be honoured with the same citation on the last day of the old Millennium. What does all this mean, considering Wally's life has been a hubbub of traveling in polar regions, and is now sequestered in a rather private part of Scotland to continue writing books and painting? He will find out, when the 'Investiture' will be held on 27 April at Buckingham Palace, and he gets the sword treatment from the Queen. His wife Marie and daughter Kari will be there, of course, to savor the moment. It turns out that Wally's honour is that of Knight Bachelor, the most ancient form of Knighthood and the oldest honour in Britain. The list of famous polar explorers includes every notable British explorer from Frobisher to Shackleton and Fuchs, with only a few exceptions. So what did Wally actually do? Well, for one thing, along with three others, made an historic dog-sledging trip from Alaska to

Spitsbergen, across the ice of the Arctic Ocean on a 16-months journey in 1968-69, which included reaching the Pole of Inaccessibility and the Geographic North Pole along the way, both "firsts" by foot. One of Wally's companions on that trip, Roy (Fritz) Koerner, had just become a father, and his wife and new baby daughter became guests at my house in Columbus, Ohio where my wife tenderly consoled her with the fact that Fritz would be away for only sixteen months, and (hopefully) would return.

But about Wally. On the other side of the world in an earlier part of his career, he was a member of the British FIDS in the late 50s and early 60s, and mapped on foot and dogsled some 46,000 square miles of new country. You might say that he knows the summit plateau of the Antarctic Peninsula like the back of his hand, because he was on the first team to transit the whole thing, from north to south. One of their treks in the Transantarctic Mountains was to duplicate and map the route that Amundsen made on the Axel Heiberg Glacier in 1911, on the famous first arrival at the South Pole. So what hasn't he done in polar regions? Along with others of us, he has also been on the lecture team on tour ships, and has seen the ins and outs of the comfortable way to see the Arctic and Antarctic. We're still not sure what all this means -- is he now Sir Wally, or how do we address him? Probably no change in his life except that he has finally achieved something long deserved and well worth waiting for.

**SOUTH POLE WOMAN BAPTIZER, LOIS JONES, DIES** (by John Spletstoesser). Dr. Lois Jones, leader of the first all-female field party in the U.S. Antarctic Research Program passed away on March 13 after a long illness. Lois was a geologist with a Ph.D. degree from Ohio State University, and happened to be in the right place at the right time when NSF and the U.S. Navy relented from their males-only policy and approved females in Antarctic field projects. Dr. Colin Bull, then Director of the Institute of Polar Studies at Ohio State, was instrumental in providing the proper amount of persuasion to make it happen. Lois went to McMurdo for the 1969-70 field season, along with three other females -- Christine Muller-Schwartz, who worked with her husband, Dietland, at Cape Crozier; Pam Young, a New Zealand biologist who worked with her husband in the New Zealand

program; and a reporter from a Detroit newspaper to cover this historic event. Lois, plus six of the seven women on the ice, were the first females acknowledged to be first at the South Pole, when they were transported there by LC-130 prior to the field season. Christine was already in the field with Dietland and missed the event. I was at McMurdo that season, and also at a helicopter field camp, but remember the reaction of all the males at McMurdo to this sudden influx of womanhood. You can imagine a bunch of guys wintering over, and a plane arriving with seven women on board. All were immediately popular. Lois returned to Antarctica only once, on a cruise ship last year. After her Antarctic season in the Dry Valleys, she taught at the University of Georgia, then worked for sixteen years for Conoco in Oklahoma. She then moved to Kansas State University for a teaching job before retirement back in Ohio.

### **BOOK REVIEW**

**VIEW FROM THE SUMMIT** by Sir Edmund Hillary (Doubleday, 1999, 370 pages). (Reviewed by Paul Dalrymple) This is a very interesting book about the first man to have tripled, standing on top of Mt. Everest, the Geographic South Pole, and the Geographic North Pole; the first apiarist to be a High Commissioner to another country, the first Antarctic to see his own portrait on a five-dollar bill while he was still alive; and probably the first father to have talked by phone to his son on top of Mt. Everest, as well as at the South Pole.

But in many minds his humanitarian efforts on behalf of his friends in the Himalayas will be his greatest legacy of all. As the book went to press Hillary's Himalayan Trust had been responsible for establishing twenty-seven schools, two hospitals, twelve clinics, many, many bridges, piping fresh water into many villages, and assisting in the rebuilding of monasteries. As a humanitarian, it could be said that Hillary was the Nansen of the Southern Hemisphere. Antarcticans like myself will find the book interesting if for no other reason than his account of his tractor journey to the South Pole in 1957-58. Even though I was on the scene when both Hillary and Fuchs arrived at the South Pole, I don't think any of us at the time, realized the true gut feeling that Ed had for Bunny as revealed in the pages of this book. Ed does not miss a chance to belittle Bunny, and

consequently the book has not been very well received by the polar community in the UK, especially since it came out when Fuchs was on his deathbed.

We at the South Pole were very fond of Ed's radio operator, Peter Mulgrew, who was the only member of Hillary's party to stay on at the South Pole. Peter was a very close personal friend of Ed's, and after Hillary lost his wife in a plane crash in the Himalayas, and after Peter lost his life in the ill-fated DC-10 crash on Mt. Erebus, Ed eventually married Peter's widow. But I thought it was a rather low blow, although very truthful, for Ed to bring up the fact that the Mulgrews were having marital problems. Let it not be said that Ed held any punches in his autobiography. He never copped out!

I was at McMurdo when Scott Base was being erected in January 1956, and remember how our chief scientist, Bert Crary liked to tell about visiting the station and seeing this guy hammering away with his mouth full of nails. It was Ed Hillary. As this book will tell you, Ed had a close relationship with Admiral Dufek, a much better one than we IGYers ever had, so he could get any support that he wanted from Dufek. After Ed returned to Scott Base from his trek to the Pole, the next incoming plane brought us a ration of grog from Hillary for services rendered! I was back at McMurdo thirty years later, and was surprised when I visited Scott Base not to find a single picture of Ed on their walls. Fame is fleeting!

Hillary brought his own mountain climbing guru to Scott Base - Harry Ayres. It is interesting to note that both had sons who followed them to Antarctica. And, of course, George Lowe, a boyhood chum from New Zealand, who was on Everest with Ed, was also on the British Commonwealth Transantarctic Expedition. although with Fuchs. On the 40th anniversary of building Scott Base. George and Ed went back to the station. Fuchs's radio operator. Ralph Lenton, had wished to end up at the South Pole, so one of his sons, working for the U.S. contractor, took his Dad's ashes back to the station. A close-knit family, outside of Ed and Bunny!!

I had my own two minutes with Hillary. Being married at the time to a Bermudian, I had a Bermuda flag with me. I got Ed to pose with me

holding the flag in front of his wanigan. - I think it was the first British flag at the South Pole since Capt. Scott's. My other minute with Ed was spent in the aurora tower looking out over the snowscape to see if we could see Fuchs's party coming on in to the station. We could!!

Knowing that he scaled Everest, I think it was totally unrealistic of Bunny to think that Ed would pack up his bags and go back to Scott when the South Pole was in his gun-sight. Our impression of Hillary is that he is a very nice guy, and perhaps it's not inconceivable that a beekeeper and a scientist might not be totally compatible at all times. It's a good book, with a great picture of Ed on the cover. He is leading a life that we mere mortals can only dream about, so best you buy and live his life with him through some very interesting happenings.

**CONGRATULATIONS** are in order for Jerry Marty, Jerry Huffman and Polly Penhale, having been cited by their respective colleges as most distinguished alums.

## PENGUIN PRATTLE

KRISTIN LARSON

Another mid-winter celebration is almost upon us, and, as is usual, much has changed but much remains the same. Antarctica is like that; a glacially slow background tempo overlaid by the frenetic staccato of the breeding (and research) season. It's winter in Antarctica now, and everyone is taking a breather, especially the new support contractor who officially took over the reins on the first of April (more on that below). Antarctic toothfish are also breathing a big sigh of relief as the new CCAMLR conservation measure protecting both species goes into effect early in this month. The Prattler provides an overview of that new development as well as a panoply of other bite-sized updates on all things south.

**EXPLORERS, HURRY!** The Antarctica exhibition, currently running at National Geographic's Explorers Hall in Washington, DC, is on for another month (ending June 4). It's a fabulous expose, of natural history on the Seventh continent, and it is now at the end of its United States sojourn.

By the way, billboards around town and handbills promoting the Nat. Geo. exhibit features a wonderful photo by NSF/OPP -Scripps Institution researcher Jerry Kooyman. The image captures that decisive moment in every emperor penguin chick's life: the grand departure out to sea. In this case, it's a line-up of hundreds of chicks on the top of a high ice cliff waiting to make the 30-foot plunge... the caption reads: *Antarctica, It's A Long Way Down.*

**SPEAKING OF JERRY.** Last month Scripps Institution (with some help from NSF) celebrated the life and times of Dr. Jerry Kooyman, whose Antarctic research career has spanned more than 30 years and inspired countless new research endeavors. Jerry is best known for his work on the diving physiology of emperor penguins but has also examined Weddell seals, tropical turtles, whale sharks and cormorants.

And what a fitting fete it was. After a daylong seminar given by former and current students, colleagues, and mentors from several continents, the guests were treated to a stupendous sunset view of the La Jolla coastline and a genial reception. But don't be fooled, the R-word (as in retirement) had no place in this wonderful event, nor is it a part of Jerry's lexicon. We can all look forward to more terrific research and beautiful pictures!

**DON'T BE ECLIPSED AGAIN.** Those of you lamenting the fact that you stayed home on New Year's to experience the Y2K-bug non-event, and missed the celebrations in Antarctica, will soon have another reason to put Antarctica on your travel itinerary (as if we really need a bonefide excuse). Mark your calendars for the total eclipse of the sun, visible in Antarctica November 23 and 24, 2003!

The swath of total eclipse centers in the southern quadrant of the Indian Ocean (near Kerguelen and Heard Islands), makes landfall near Russian Mirny Station, and will cast shadow over a small arc of the continent. For more information, the Prattler recommends visiting <http://eclipse.span.ch/2003.htm>.

**PROTECTION THAT REALLY BITES.** In a pattern that has become alarmingly familiar, Antarctic toothfish (also known as Chilean Sea Bass in the United States, Mero in Japan, Bacalao in Spain

and Black Hake in some other countries) have joined other embattled fish populations throughout the world threatened with collapse. Appetites for this ugly but tasty fish have risen steadily since it first appeared on restaurant menus three years ago, to the point where it now occupies a solid, yet unsustainable, niche in world trade flows. On May 4, 2000 a new toothfish conservation measure went into force in all CCAMLR nations. It provides protection for two species of Antarctic fish: *Dissostichus mawsonii*, which occur exclusively in the Southern Ocean; and *Dissostichus eleginoides*, whose range includes not only the Southern Ocean but extends slightly north to waters off of Chile and Argentina.

Throughout the latter half of the 1990s efforts were made to limit the toothfish harvest to sustainable levels by the Commission on the Conservation of Antarctic Marine Living Resources (the CCAMLR guiding body). Despite these efforts, researchers and environmental groups continued to predict that the fishery would soon disappear if more effective controls failed to be enacted and enforced. In response to these concerns, the 23-member CCAMLR Commission approved a toothfish conservation measure on November 9, 1999 that has been described as "the most restrictive and detailed scheme ever imposed to protect a high seas fishery." The toothfish measure sets up a comprehensive paper trail specifically targeted at international trade, and is meant to eliminate market access for illegal, unregulated, and unreported IUU toothfish catches.

The embattled toothfish has caught the attention of a broad array of conservation groups (it is listed as one of the World Wildlife Funds key issues for Earth Day 2000), policy makers and even filmmakers. One film, entitled "White Gold," was released by the United Nations Environment Programme (UNEP). For more information surf over to <http://www.isofish.org.au>.

**THE BIG CHANGEROO.** On April first of this year the US Antarctic Program changed support contractors, and has now installed Raytheon Polar Services Company. They have retained the Englewood, Colorado headquarters, formerly occupied by Antarctic Support Associates (ASA), and many of the accomplished and experienced employees have also signed on.

For all intents and purposes, the changeover has hardly caused a ripple, except perhaps for the fresh ideas a new contractor can bring. However, the transition period could better be characterized as a real tempest. For instance, Chemical and Engineering News reports that the contract losers filed a bid protest against NSF with the US General Accounting Office, which eventually ended up in the Court of Federal Claims. There ASA filed a "blizzard of motions" including a restraining order that effectively stopped the flow of information vital to Raytheon's smooth transition into the driver's seat. Ultimately, the judge ruled in NSF's favor and Raytheon is now officially in. They have assumed the distinguished mantle as supporters of this high profile and challenging government program.

**GREAT MINDS ARE GOING TO WASTE.** This year *Mission Antarctica*, an international environmental expedition lead by British Explorer, Robert Swan, visited Bellingshausen Base (Russian) to assist in waste removal and clean-up of abandoned huts and equipment. In all, the five-year expedition expects to remove more than 1,000 tons of material and is comprised, in part, of 44 young people (one from each of the nations, which are signatories to the Antarctic Treaty). The estimated cost (including offsets from recycling in Argentina) is approximately \$12 million, and will assist the Russians in meeting their obligations under the Antarctic Treaty.

Swan is the first man to walk unsupported to both the North and South Poles, and has recently been appointed by the United Nations as an Ambassador to Youth. This cooperative effort between the Russian Antarctic Expedition Service and *Mission Antarctica*, is supported by a 67-foot BT Challenge racing yacht (a Bermudan Cutter) named "2041" after the year in which the Antarctic Treaty expires and will be revised. Their progress can be tracked online at <http://www.missionantarctica.com>.

**TRAILING EDGE.** Julie Palais, OPP Program Manager for Glaciology has been asked to give a presentation at the October meeting of the American Polar Society on the role of women in polar regions. She is looking for photos, anecdotes and interviewees (both genders!). Please drop her a line with any of the above: [jpalais@nsf.gov](mailto:jpalais@nsf.gov).

# THE ANTARCTIC SOCIETY

7338 Wayfarer Drive

Fairfax Station, Virginia 22039

HONORARY PRESIDENT ---- MRS. PAUL A. SIPLE

---

Vol. 00-01

October

No. 1

---

**Presidents:**

Dr. Carl R. Eklund, 1959-61  
Dr. Paul A. Siple, 1961-62  
Mr. Gordon D. Cartwright, 1962-63  
RADM David M. Tyree (Ret.), 1963-64  
Mr. George R. Toney, 1964-65  
Mr. Morton J. Rubin, 1965-66  
Dr. Albert P. Crary, 1966-68  
Dr. Henry M. Dater, 1968-70  
Mr. George A. Doumani, 1970-71  
Dr. William J. L. Sladen, 1971-73  
Mr. Peter E. Bermel, 1973-75  
Dr. Kenneth J. Bertrand, 1975-77  
Mrs. Paul A. Siple, 1977-78  
Dr. Paul C. Dalrymple, 1978-80  
Dr. Meredith F. Burrill, 1980-82  
Dr. Mort D. Turner, 1982-84  
Dr. Edward P. Todd, 1984-86  
Mr. Robert H. T. Dodson, 1986-88  
Dr. Robert H. Rufford, 1988-90  
Mr. Guy G. Guthridge, 1990-92  
Dr. Polly A. Penhale, 1992-94  
Mr. Tony K. Meunier, 1994-96  
Mr. Ron Naveen, 1996-98  
Dr. Paul C. Dalrymple, 1998-2000

**Honorary Members:**

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

## BRASH ICE

We are a little bit late getting out of the gate with this one, as we are entering a transition phase, one where Ruth and I will be more or less phased out over the next two years. On the whole it has been a good run, but our time has come. When I look back at where the Society was in the Fall of 1978 when Ruth more or less opened the portals of her home for the Society, a lot of positive things have happened. This is our 23<sup>rd</sup> year, and Antarctica has changed immensely in those years. Back then, it was almost a small, tight little fraternity; now Antarctica is much bigger, very much bigger than the sum of its parts.

There have always been voices raised as to what roles the Society should fulfill. Maybe it was never a happier group than when they met in the basement of the founding father, Carl Eklund. It was a good old boys' drinking club, and this continued through the reign of Harry Dater, who kept a locker full of suitable libations for Board meetings. Can't say that those meetings weren't happy ones. Ruth and I had a very peculiar idea, that the Society should only consist of members who had paid their annual dues, and, as such, people like Roger Tory Peterson were given their walking papers. We grew from about 160 to over 650 members, although now we have dropped back to slightly over 500.

In the early days, the newsletters were produced maybe once a year. This number increased along with the Society's membership, and then were produced for each and every meeting, five or six times a year. We used to have an annual picnic each summer, and after a phenomenal growth in membership in our first few years, Bert and Mildred Crary gave Ruth and me a small toy trophy for our accomplishments. When the astute Bert handed it to us, he said, "You know you have created a monster." No truer words were ever spoken, and it has been impossible to keep the ball rolling. No one really wants to put in the time and effort to

---

Special Notice: 2001 ANTARCTIC CALENDARS. We have only 200 of the beautiful New Zealand Hedgehog House Antarctic calendars, and they are again, most spectacular. A fantastic jade iceberg that you won't believe, and most wonderful shots of King penguins at St. Andrew's Bay and Chinstraps at Baily's Head, and more! We are selling them at the same old price of \$US 11.00 (in the U.S. and Canada) Order early by sending your check to the Society's address, 7338 Wayfarer Drive, Fairfax Station, VA 22039. They will be mailed out pronto from a redoubt in Maine.

---

write. No one wants to take the flak, which often comes when you tell the truth that may embarrass someone with thin skin. No one really wants to put in the time and effort that Ruth Siple has so elegantly and diligently done on behalf of the Society. Now she is closing in on ninety, has macular degeneration in one eye, and even though her flesh is more than willing she is going to have to slow down.

However, Ruth and I will keep on going for the next two years, as Ruth is very fond of our new President, Kristin Larson, and wants to work with her. There is an element of the Society who would like to see more organization, and they will no doubt take over in two years. I will be the first to admit that we used strong-armed dictatorial rule within the last ten years, as I never saw much good coming out of Board meetings. And I felt that those who did the work should have more than just a vote, as only those of us who did the work had a keen appreciation for what sold.

I want to use this space to talk about a common man who has been a godsend to this society for all of our twenty-three years, Peter Barretta. He has been struck down by bad health in recent years, but there is no person in our Society who loves Antarctica more than Pete. Even today, in poor health, Pete still sends weekly clippings on Antarctica to this office, as I am sure he does to Brian Shoemaker and his *Polar Times*. By a strange coincidence, Pete comes from the same town as Ruth: Meadville, PA. But there were no similarities in their backgrounds: Pete rode shotgun back in the days of bootlegging booze during prohibition! However, today Ruth and Pete are very much alike: kind, considerate, giving do-gooders. We need more Ruth Siples and Pete Barrettas.

**JOHN SPLETTS DOES THE SPLITS.** John Spletstoesser (whose book review appears later in this newsletter) is a former Antarctic geologist and, for the past twenty years, a premier lecturer on miscellaneous and sundry high latitude cruise ships. He went to the well, almost one time too many this past summer. While on a helicopter sightseeing run at Novaya Zemlya, he and eight other passengers were returning to the Russian Icebreaker *Kapitan Khlebnikov*, when the "stuff started to hit the fan tail, so to speak crudely. The chopper crashed on the deck, with all propellers being claimed by Davey Jones. However, St. Peter

was not then accepting any new recruits, that is to say, all passengers miraculously survived and John opted to have his broken ankle repaired in Rockland, Maine.... seventeen days after the crash. So he has lived to give another lecture or two or more, but not until 2001.

**A Note from Incoming Antarctic Society President: Kristin Larson.** I remember well the moment I first became cognizant of the urge to visit Antarctica. It was in 1984; the impetus was Eliot Porter's photograph of Bull Pass in the Wright Valley, near McMurdo Station. The other-world quality of this stunning image, the surreal illumination and total lack of anything familiar about the landscape compelled me to see this place with my own eyes! I made a personal resolution to go there in my lifetime. Little did I realize then, that I would be standing atop Bull Pass less than five years later.

From that high point, the transition was easy. Antarctica quickly went from being a mere avocation to an all-out vocation! Two winter-overs, six summer seasons and numerous ice miles followed. I served first as McMurdo Laboratory Supervisor (in the Eklund Biological Center and then in the Crary Science and Engineering Center), later at NSF assisting with Antarctic environmental compliance issues.

In thinking back over the ten or so years I have been associated with Antarctica, I feel that it is as much about the people as it is about the landscape that makes the place special. Rare 'is the job that allows you to rub elbows with a senator, helo pilot, artist, scientist and heavy-equipment operator, all in the space of a single afternoon! In my capacity as lab manager, I was particularly fortunate to have extensive contact with the full cast of characters. As point-of-contact for hundreds of researchers representing the full gamut of scientific disciplines, not only was the lab staff exposed to their research ideas, but also played vital roles in the success of their scientific missions. To this day, I continue to take great pride in the job we did in helping to facilitate what I consider to be some of our nation's most important scientific priorities. From hemostats to here hours, we planned, allocated, strategized, optimized and almost always got it right!

During my tenure on the ice (which I'm certain is not forever done with!) USAP marked many

significant milestones, the least of which was the beginnings of the major infrastructure modernization, now well underway. Although it wasn't always easy discarding the traditions of "expeditionary science," the changes have brought about an amazing array of new and expanded scientific capabilities. And not only has scientific capability undergone tremendous change during the past ten years, but also noteworthy has been the attention paid to environmental protection issues, continent-wide. It was this aspect of my work (associated with NSF's implementation of the Antarctic Treaty's Protocol on Environmental Protection) that set me on my current professional trajectory, in the field of international environmental law.

Currently I am a beltway denizen and law school student, but this has not dampened my enthusiasm or involvement in Antarctica. I continue applying my "ice lessons" and maintain an active interest in the development of "Antarctic law." Also, I have been able to draw on my ice experience to assist the US Environmental Protection Agency in drafting regulations for tourist activities in Antarctica, and to assist private bidders respond to NSF's call for a new USAP support contractor.

However, my most favored Antarctic-related activity has been involvement in The Antarctic Society. By writing a column on current ice events for the newsletter, and by attending meetings, I have stayed in touch with what's going on down on the ice. Moreover, I have met some of the most influential policy makers, explorers and researchers, all of whom have played vital roles in shaping the infant continent into the relatively easy-going "cozy" place that it is today. Involvement as a volunteer in this organization has proven to be one of my most satisfying commitments, and I truly feel privileged to be a part of this illustrious membership!

As incoming President, I have many goals, the most important of which is to preserve the style of the Society. Based on my observations, the Society largely reflects the character of our involvement in Antarctica. In its early years, the Society was a rough and tumble gang of explorers and hardy field scientists...as the number and diversity of ice sojourners changed so has our Society. I would also like to resurrect the practice of regularly-scheduled, Society-

sponsored speakers, and to encourage more contributions to the newsletter in addition to the excellent input that we already receive. Feel free to contact me any time through our Honorary President, Ruth Siple (letterhead address) or via e-mail: k\_larson@earthlink.net.

**R. TUCKER SCULLY RETIRES** (Ray Arnaudo). Tucker Scully retired from the State Department last month. As is often said of those who make a difference, the landscape will not be the same without him. Certainly the polar landscape will be different.

Tucker Scully has been an extraordinary public servant, and a friend of the oceans and the poles, but especially Antarctica. His 35-year career, first as a Foreign Service Officer and later as a member of the Civil Service and the Senior Executive Service, is marked by innovative leadership and extraordinary accomplishments in foreign affairs, and particularly in international oceans and polar policy.

After tours in the Middle East and Mediterranean, Tucker worked in the Bureau of Oceans and International Environmental and Scientific Affairs, recently as Deputy Assistant Secretary for Oceans and Fisheries, and prior to that as Director of the Office of Oceans Affairs and chair of the interagency policy groups on oceans and Antarctica. He has led the interagency development of comprehensive U.S. oceans policy for negotiations, such as the United Nations Convention on the Law of the Sea and its accompanying 1994 Agreement on Deep Seabed Mining Agreement, and with regard to Antarctica, he is best known for his role in negotiating the Convention for the Conservation of Antarctic Marine Living Resources, the Convention for the Regulation of Marine Antarctic Mineral Resources, and the Environmental Protocol to the Antarctic Treaty.

Most important to friends of Antarctica, however, was Tucker's work to help the US Antarctic Program. He testified many times before Congress in support of USAP, and NSF will always be grateful for his support for South Pole station funding. NSF awarded him its highest honor when he retired.

What may be less well-known by Antarctic Society members is that Tucker, more than any other individual, has been responsible for many

treaties and agreements involving the oceans in general. In addition to those polar agreements mentioned above, he negotiated the Oceans Chapter of Agenda 21, the UN Environment Program's Global Program of Action, Regional Seas Agreements for the Caribbean and South Pacific, maritime boundary agreements with Mexico, Canada, several Pacific island states, and Russia, the Protocol Amending the 1972 London Dumping Convention, and the nearly-concluded Multilateral High Level Conference on Conservation of Highly Migratory Stocks in the Central and Western Pacific Ocean. In the North, he took the U.S. into the Arctic Council, and, perhaps fittingly, in one of his last official acts, negotiated a bilateral agreement to protect polar bears.

Perhaps the citation for lifetime service by Secretary of State Albright said it best:

"His consensus building and managerial skills, combined with his mastery of the issues, have made him and his office the focal point within the government on oceans and polar issues. His unique blend of conceptual innovation and practical problem-solving abilities make him an extraordinarily effective exponent of U.S. interests. Almost no aspect of current U.S. oceans policy or practice exists apart from his artful hand. In fact, we believe him to be one of the Department's most talented and versatile negotiators."

It is safe to say that very few oceans or polar agreements in the past two decades do not bear his mark. Those of us who have the pleasure to work with him can only say: "He made a difference and he will be missed."

#### **FORMER PALMER STATION MANAGER DIES**

(Kristin Larson). Kirk Kiyota, stalwart supporter of the U.S. Antarctic Program and unswerving friend of many, died suddenly, early this month. He was 43.

Kirk's introduction to the ice started as a snowmobile mechanic in McMurdo Station, where his prior experience supporting the national motorcycle racing circuit was of great benefit to scores of field parties. He knew well that the success of a scientific mission, and even the difference between life and death,

depended heavily on the quality and care of vehicles being sent into remote field conditions. It wasn't long, however, before his calm, fair, service-oriented personality was recognized for the strengths it would lend to the program's leadership. Kirk rose quickly through the ranks serving as managers of transportation, and the international Weddell Sea Ice Camp. Ultimately, he served for several years as Station Manager at Palmer Station, during both the winter-over and summer seasons. More recently he was named Deputy Director of Operations at Johnston Atoll Air Base in the South Pacific.

While Kirk's contributions to the success of the USAP are innumerable, it is really the outstanding quality of his friendship that makes his loss so great. I know I speak for many in saying that his kind smile and quick wit will be missed.

#### **OLDEST ANTARCTIC BOY SCOUT DIES**

(Robert Dodson). Arthur E. Owen, 73, a veteran of the Ronne Antarctic Expedition (1947-48), died on May 13, 2000 in Buffalo, NY, of prostate cancer. As a geologist for Berea Oil and Gas Corporation of Buffalo, for whom he had worked for the past eighteen years, he had been outstandingly successful in finding and developing new deposits, particularly hard-to-find pockets of gas, in the northeastern U.S. and overseas. Born in Prescott, Arizona, he lived for most of his youth in Beaumont, Texas before joining the Navy and serving with the Pacific Fleet towards the end of World War II. In January 1947 he was selected from a group of Eagle Scouts in Beaumont to join the Ronne Expedition where he became a leading dog-team driver.

During a three-month period in late 1947 and early 1948 he, together with Walter Smith (now of Tampa, Florida), Doug Mason and Ken Butler of the Falkland Islands Dependencies Survey (FIDS, now the British Antarctic Survey) carried out one of the great dog-team journeys of Antarctic history. In the course of a round-trip journey of 1180 statute miles they surveyed the western shore of the Weddell Sea as far as the Bowman Peninsula, turning back at a point just short of latitude 75° south. Together with the Ronne Expedition's aircraft, providing ground control for its aerial photographs, they had contributed to the survey of the world's last significant stretch of unknown coastline, helping to fill the gap on the western and

southwestern coast of the Weddell Sea. With typical modesty, Art Owen, in his report, stated: "Most of the credit for its successful completion fell to our twenty-seven Husky friends, and to the aircraft that laid the vital caches for us, and last but not least, to my comrades, Butler, Mason and Smith."

Art Owen was the finest of companions, easygoing with a beguiling Texas drawl, staunch in the face of hardship, extremely courageous, never complaining, unassuming and modest to an extreme. There was nothing glib about him. Later in life, although he never returned to the Antarctic, the experiences of 1947-48 remained a lifetime highlight. His love for the Antarctic was matched only by his love for the mountains. During his lifetime he climbed more than 300 peaks, most or them in the U.S., Canada and Mexico. Fittingly, a mountain in the Antarctic is named for him. It is Mount Owen, at the head of Nantucket Inlet near the base of the Antarctic Peninsula on its East Coast, at about 74 degrees 30 minutes south.

**FORMER POLAR PROGRAMS BUDGET OFFICER DIES** (Walt Selig). Oscar (Butch) Vigen came to Polar Programs in the National Science Foundation in the late 1960's after serving in the Army where he was a Lt. Col. He graduated from the Army's Command and General Staff College at Fort Leavenworth, Kansas. During WWII he participated in combat operations in the Pacific, and later served with the occupation forces in Japan and with combat units in Korea during the Korean War. He was awarded the Legion of Merit, Bronze Star, two Purple Hearts and the Combat Infantryman's Badge. After retiring from the Army in 1968, Butch was the Budget Officer for Polar Programs for 18 years. He was a genius in managing money, and he kept us solvent during several periods of major money crises. How he could foresee some of the problems we were never able to figure out. He had a wonderful sense of judgement and it was no problem for him to separate the wheat from the chaff and come up with a very logical solution everyone was happy with.

**ANTARCTIC EXPLOSION.** Everyone who has a word processor or can write seems to have written a book on Antarctica, or at least has one in the mill. There is a veritable smorgasbord out there to be sampled, and it is hard to decide on

which books to grace your pallet. If it is Roland Huntford, if it is Alan Gurney, if it is Charles Swithinbank, if it is Tim Baughman, then the book immediately attracts my attention. Then we look for non-Shackleton books, as we already have a shelf of The Boss!

But there are some interesting, very interesting books coming out on the likes of Robert Falcon Scott, Cherry-Garrard, Sir Douglas Mawson, Birdie Bowers, Frank Wild, and Tom Crean. Sir Hubert Wilkins once told me that his favorite polar explorer of all time was Mawson, and there has been surprisingly little written about him. A historian by the name of Philip Ayres has recently come out with MAWSON: A LIFE, published by the Melbourne University Press. Of all the true Antarctic explorers, he may have been the very best natural scientist. Jean Baptiste Charcot was a very eminent doctor, but we'll take Mawson. This book by Ayres sounds like a must-buy for all Antarctic hero-worshippers.

Then the books on Bowers, Wild, and Crean should shed more light on these luminaries. Two of the books, THE FIFTH MAN, HENRY K. BOWERS by Charles H. Lagerbom (to be reviewed in our next newsletter), and FRANK WILD by Leif Mills, are both published by Caedmon of Whitby, and may be hard to find, even though they were published in 1999. The Collins Press in Cork is publishing the book on Crean, due out in September. Some of you true Antarcticans may know Lagerbom, as he worked for the U.S. Antarctic contractor for two austral summers in the early 1990s. He became enthralled by the story of the ill-fated Scott expedition, and when he came back home decided that he wanted to write a book on Birdie Bowers, and so THE FIFTH MAN was written and published. Charles is now a secondary school teacher in Belfast, Maine, the chicken capital of the state!

Another book by another Antarctic, Susan Solomon, is due out later this year. The title is THE COLDEST MARCH, and Yale University Press is the publisher. As the title indicates, and as the press publicized last winter, Susan's interests centered on how Scott's party was victimized by an unusually cold summer. She uses a unique way of introducing each chapter; and you must buy to find out what it is! At last, a book on Scott with positive overtones.

another BOOK on the horizon, by the well-known Antarctic author, Sara Wheeler, is going to be on the life of Cherry-Garrard. If you are like us, you can't wait to read this book, to find out how much Cherry-Garrard is Cherry-Garrard, and how much Cherry-Garrard is George Bernard Shaw; his neighbor and close friend. This should be a winner.

Already on the street are books by Tim Baughman (PILGRIMS ON THE ICE, Robert Falcon Scott's First Antarctic Expedition); Alan Gurney (THE RACE TO THE WHITE CONTINENT); Michael Rosove (LET HEROES SPEAK, ANARCTIC EXPLORERS, 1772-1922); and Bernard Stonehouse (THE LAST CONTINENT, DISCOVERING ANTARTICA). John Spletts reviews the Stonehouse book below. Michael Rosove is participating in the Shackleton Commemorative Crossing of South Georgia from King Haakon Bay to Husvik Harbor in November 2000. He hopes to celebrate his 52nd birthday alive and outside of a crevasse. Another book is a paperback by an ex-Navy Captain, former Deputy Director of NSF's Division of Polar Programs, former Executive Secretary for the Council of Managers of National Antarctic Programs, and current amateurish golfer and husband, father and grandfather, Al Fowler. His book has an almost non-title, COMNAP, published by the American Literary Press.

There are other new books out there, one on Bernt Balchen, which is another Byrd-bashing book. Marty Sponholz has one on the internet about being a micrometeorologist at Plateau Station in the late 1960s (which he may or may not publish). Charles Swithinbank, who is about to enter Antarctica for his seventh consecutive decade, is working, sometimes, on his fourth biographical book, this one to be titled A YEAR IN THE ANTARTIC WITH THE RUSSIANS. Jeff Rubin has a new edition of the Lonely Planet Guide to Antarctica. Great buy, loaded with great stuff, but he left out the eateries in Ushuaia! There is also a biography on L.E.G. Gates that is currently awaiting a publisher, and lastly, Susan Solomon is considering doing a book on Byrd.

If you are interested in buying any of these books, many are available through Longitude Books in New York City. Contact Darrel Schoeling (800-342-2164). Also, if you visit the famed Mt. Washington Observatory in New

Hampshire, you will find a large collection of Antarctic books given to them by Rudi Honkala (who recently returned his house to his wife, who somehow put up with him through three winter-over years). Tim Baughman, by the way, is now Dean of the College of Liberal Arts at the University of Central Oklahoma in Edmond, Oklahoma.

**THE LAST CONTINENT: DISCOVERING ANTARCTICA** by Bernard Stonehouse (John Spletts to review). Bernard Stonehouse has written a book particularly with tourism in mind, but there is much more here as well. It is a marvelous production of glossy paper and color photos, plus a detailed text discussion on virtually every facet of Antarctica. It also includes locations outside Antarctica that are typically part of tourist itineraries: the Falkland Islands and South Georgia. Bernard's experience in Antarctica goes back a long way, as a biologist/scientist who once said that he intended to be a meteorologist but after surviving an aircraft incident, switched to something more to Earth that would not involve a lot of flying. He thus became a biologist. An anecdote, perhaps, but Bernard's experience transcends all science when it comes to Antarctica, and it shows in his book. He is known for, among other things, determining the unusual breeding cycle of King penguins (which raise two chicks over three years) by living in a colony long enough to figure out how and why they do it. Being a proponent of environmental concerns of the continent, he led field teams beginning in 1991 to sites in the Antarctic Peninsula as part of Project Antarctic Conservation (PAC) to study tourism effects on wildlife and the environment, a project that continues today. Many years of data were accumulated to assess sites that tourists visit, with some results discussed in the book. Much of the field work of the PAC staff was made possible by means of transportation on tour vessels, which provided Bernard the means to not only travel to sites for study but also to contribute his vast knowledge by lecturing on cruises. I can attest to that, having traveled with him and hearing his presentations on birds.

The Stonehouse book provides a thorough evaluation of the numerous sites that tour vessels visit, so the reader knows what to expect on arrival. It is bound in a stiff-paper cover, has 288 pages, more than 130 color

photographs, 15 color maps, and is priced at \$24.95. Copies are probably available by now in U.S. bookstores (ISBN 0-9537907-0-3), but you can order a signed copy by the author (if requested) by contacting Ms. Irene Burns, Scott Polar Research Institute, Lensfield Road, Cambridge CB2 1ER UK. Enclose a check for US\$36, to cover airmail postage.

**SOUTH POLE CONSTRUCTION STATUS** (Jerry Marty). The construction of the new South Pole Research Facility remains "on schedule and within budget" as we embark on the 2000-01 season. During the past three seasons construction crews have completed the new Fuel Storage Facility (45 each 10,000 gallon steel tank farm and fuel distribution system), a new Garage/Shop Facility (capable of performing maintenance and repair of station vehicles as well as providing for industrial utility maintenance shops), and began construction of the New Power Plant.

Last year represented a very busy yet successful construction effort. During that time, both the Fuel Storage and Garage/Shop complexes were completed and approved for occupancy (December 10, 1999), and are currently in operation. Construction of the new power plant, with a 1-Megawatt peaking power capacity, also began during winter season. This work represented construction of the envelope steel arch (200ft x 55ft diameter), as well as the building footings, foundation and shell. Construction also commenced for the new station water and sewer utility distribution sub-surface tunnel, and an ancillary science research facility located in the Dark Sector. The water and sewer tunnel is a 6-foot wide by 10-foot high opening cut into the ice by using a tunneling machine. The total length of the tunnel will be 1850 feet, and at its lowest point will be 40 feet below the surface. The new science facility (Dark Sector Laboratory) is a 3,750 square foot, two-story facility. Construction of the sub-surface passageway and vertical tower (to the new elevated station facility) was completed to include the footing and foundation pad for the new elevated station facility.

During the winter season, construction personnel have been working on the interior of the new power plant (installing the power plant generators, switchgear, fuel piping, electrical feeders, etc) with completion scheduled for

November 2000. Final inspections, equipment and systems testing and facility acceptance of the new power plant are scheduled for the months of November and December 2000. Occupancy and activation of the power plant is scheduled for mid-January 2001, at which time it will become the source of station power. Concurrent with the completion of the power plant is construction of the elevated facility. Specifically, work will commence on wings A1 (50-person housing) and A2 (food service and mechanical systems), and during the upcoming winter-over, work on the interior of these wings will occur, with occupancy at the end of next summer. Steel test assembly was performed in the US last summer representing major components of the assembly, in order to minimize on-site issues with connections, sequence, and labor familiarity. Completion of the water and sewer tunnel will also occur during this summer. Construction this coming summer will also include activation of a 9-mete: antenna, MARISAT/GOES T-1 Earth Station Communication project. The project is scheduled for acceptance and activation mid-January 2001.

The current winter season became the second in a row to have continued construction activity (interior), bringing the total South Pole winter-over population to 50 total (an all-time high representing 10-science, 20-station support, and 20- construction). The upcoming summer season will bring another year of record population peaking at 220 (50-science, 85-construction, 69-station support, and 6-inspectors/vendor reps/NSF, and 10- special projects).

## PENGUIN PRATTLE

Another ice season is upon us, and lest some think I am giving short shrift to the long and dominant winter season, let me quickly add that the coming ice season follows on the heels of an eventful and productive winter-over. Of particular note, this was the first, and by all accounts successful, winter season for the new support contractor, Raytheon Polar Services. As noted above, by Jerry Marty (NSF Construction Manager), the new South Pole Station work has continued apace during the winter contractor transition period, as have the formidable forces of nature found in Antarctic latitudes. This year, these forces produced at least two newsworthy stories, which are

highlighted below (ozone and icebergs). Plans for the coming summer season include many interesting research projects and other developments that will be highlighted in the next newsletter.

**The No-Ozone Zone Enlarges.** Not long after the sun sent its first rays of the year beaming down over McMurdo Station in late August, ozone scientists were noting that the extent of ozone loss over Antarctica was abnormal. Not only were total ozone concentrations falling off faster than normal, but the hole appeared much deeper than observed in recent years. By September 12, the hole was measured to be nearly 33 million square kilometers, an area more than three times the size of the United States! This shatters the record set in 1998 of 27 million square kilometers. For the first time, the hole opened wide enough to expose populated portions of South America to dangerous levels of ultra violet (UV) rays. UV, which is known to cancer, and damage plant development, is normally filtered before reaching the earth's surface by the layer of upper atmospheric ozone molecules.

Scientists think that the unusual ozone depletion pattern observed this year is attributable to the record-low temperatures in the stratosphere. These temperatures, in combination with the strength of this year's circumpolar winds (known as the polar vortex), allowed the physical and chemical conditions favoring the ozone depleting chemical reaction to occur to a greater extent than in the past. Human-made chlorine and bromine compounds cause most ozone depletion, and thanks to the 1989 Montreal Protocol limiting production and use of these compounds, it appears that their concentrations are leveling-off, or slowly decreasing. However, because of these chemicals' long persistence in the atmosphere, it will be many decades before their influence is no longer noticeable.

**Peripatetic Bergs May Threaten Shipping Route.** Back in March, a mass of ice calved off the Ross Ice Shelf not more than 200 miles from McMurdo Station, which is considered to be among the largest ever observed (11,007 square kilometers, or about the size of Connecticut). NSF is supporting the work of researchers who are modeling the potential path of the iceberg (given the forgettable name, B-15), which could get pushed by ocean currents and winds into

the narrow region north of McMurdo Sound, sealing off sea-based access to the McMurdo Station. For those not in the know, both McMurdo and South Pole Stations, as well as New Zealand's Scott Base, rely heavily on the annual resupply vessels that bring in food, fuel and other vital science and infrastructure cargo each January.

And, as if B-15 was not causing enough excitement, a second, smaller comrade, named C-16 has joined the mix, calving-off near the same location in late September. C-16 (approximately 900 square kilometers), is "of particular interest" says National Ice Center Navy liaison, Lori Butcher, "because of its proximity to Ross island...and may drift enough to impact the area where ships will be operating."

For those interested in tracking these icebergs from the comfort of your own desk some web sites are provided below. The first web site is particularly interesting because it provides animated depiction tracing the route of the large iceberg.  
<http://uwamrc.ssec.wisc.edu/amrc/bergmovie.html>  
<http://www.natic.noaa.gov/IcebergB-15.htm>  
<http://nsf.gov/od/lpa/news/press/00/pr0012.htm>

**Penguin Repatriation.** While Cape Town, South Africa is slightly outside the usual reporting area of this newsletter, the Prattler would be remiss for failing to report that more than 19,000 "African" penguins (also known as Jackass or Blackfooted penguins), which were rescued in the wake of a massive oil spill, have recently been released back into the wild. While in captivity, the International Fund for Animal Welfare provided top-notch room and board conditions, including regular recreation. Unfortunately, -10% of the population died, but this is far less than the near 50% mortality rate that occurred in the aftermath of an 1994 oil spill in the same region.

**Admiral Byrd to be Honored and You Are Invited!** The Richard Byrd Community Library in Springfield, Virginia will be celebrating Byrd's birthday on Saturday October 21(11 am), by hosting a viewing of the Academy Award winning silent film, *With Byrd at the South Pole*, refreshments included. We know this is short notice, but if you are interested please call the library (703-451-8055), at 7250 Commerce St., Springfield, VA (no charge).

# THE ANTARCTIC SOCIETY

Mr. Armory H. "Bud" Waite, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

*Special Note: On December 11, local Virginia, Maryland and Washington D.C. members of the Antarctic Society were invited to attend a special lecture given by Dr. Phillip Law, a veteran of nearly three decades of Antarctic exploration. Dr. Law, an Australian, was in town for a brief visit, and we were honored that he took time from his travels to address our Society. With Dr. Law's permission, we have reproduced his lecture for this newsletter so that those living beyond the beltway may benefit from his insights on an important Antarctic era, an era in which he played a major role.*

## Introduction

Phillip Law is responsible for establishing Australia's permanent presence in Antarctica. Joining the Australian National Antarctic Research Expedition (ANARE) in 1947, he became the first Director of the newly-created Antarctic Division of the Commonwealth Department of External Affairs in 1949, a position held until 1966. He designed and developed the Antarctica Division, and the ANARE programs. He also led the expeditions that established Australia's three Antarctic stations: Mawson, Davis and Casey.

Over the years, 1954 to 1966, Dr. Law led voyages that explored and mapped 3000 miles of the Antarctic coastline, while the wintering parties at ANARE stations under his direction explored more than 700,000 square miles of previously unknown territory. During the Law era, an extensive variety of scientific programs were developed including Australia's Antarctic contributions to the International Geophysical Year.

Phillip Law has received wide recognition for his work, including Australia's highest award (the A.C.), the British C.B.E. and Polar Medal, the Founder's Gold Medal of the Royal Geophysical Society, honorary doctorates from three Australian universities, and a number of other awards. He is a fellow of the Australian Academy of Science, and the Australian Academy of Technical Sciences and Engineering. Dr. Law has published four books on Antarctica.

---

**Fire Sale: 2001 ANTARCTIC CALENDARS.** We have remaining a handful of the beautiful New Zealand Hedgehog House Antarctic calendars (which are spectacular), and are willing to sell them at a small loss (rather than have them molder in Maine). Yours for the unbeatable price of just \$US 10.00 (in the U.S. and Canada) Order NOW by sending your check to the Society's address, 7338 Wayfarer Drive, Fairfax Station, VA 22039. The calendars will be mailed out pronto from a redoubt in Maine.

# One Hundred Years of Australian Involvement in Antarctica

A lecture given by Dr. Phillip Law  
December 11, 2000  
in the National Science Foundation auditorium

I am greatly honored to have been invited to lecture today to the Antarctic Society. I do not feel a complete stranger here. Looking at the notice for today's meeting, I see, in your list of Presidents and Honorary Members, the names of a number of my personal friends and Antarctic acquaintances: Dr. Carl Eklund, Dr. Paul Siple, Mr. Gordon Cartwright, Admiral Tyree, Mr. George Toney, Mr. Mort Rubin, Dr. Albert Crary, Dr. Henry Dater, Dr. Bill Sladen, Dr. Ken Bertrand, Mrs. Ruth Siple, Dr. Bob Rutherford, Dr. Larry Gould, and Dr. Charles Swithinbank. I am lucky enough to have survived to become a veteran of the exploration era of Antarctic endeavor - that period between 1945 and 1970 - when the major exploration of Antarctica took place, and the great explosion of scientific research following the International Geophysical year was initiated.

Australia has a distinguished record of exploration and scientific research in the Antarctic but few Australians are aware of the extent of the work. Most of them know that Douglas Mawson was one of the early Antarctic Explorers and that, today, ships go off each year to take men and supplies to some bases that Australia has established on the coast of Antarctica; but a fog of ignorance obscures the events leading up to Mawson's first expedition (AAE in 1911) and the developments subsequent to his last expedition (BANZARE in 1931) that have led to today's activities.

Even less widely known is the fact that Norwegian, United States and Soviet Union explorers have made valuable contributions to knowledge concerning that part of Antarctica that we claim as Australian Antarctic Territory. Then there are the various contributions that Australia and Australians have made to Antarctic expeditions organized by explorers from other nations. The nature of Australian work has been very different from that of other nations, except the USA and USSR.

Australian interest in the Antarctic goes back more than 150 years. The earliest ventures were those of sealers and whalers, who were motivated by visions of quick profits rather than by any sense of geographical curiosity. Amongst the pioneers were Frederick Hasselburgh, who discovered Macquarie Island in 1810, Richard Siddons and D. Taylor who took sealing expeditions in 1820 from Sydney to the South Shetland Islands, and Samuel Harvey who in 1831 pushed south from Hobart to reach 72° south latitude in what was later to be called the Ross Sea.

A number of famous Antarctic voyages of various nationalities called at Sydney, Melbourne or Hobart on their way south during the 19th century: Bellingshausen (1819 - 21), Balleny (1838 -39), Dumont d'Urville (1837- 40), Wilkes (1838 - 42),

Ross (1839 - 43) and Nares (1872 - 76). A sealing venture from Hobart, led by Captain Robertson in the "Offley," operated at Heard Island in 1858.

The first Australian Antarctic Exploration Committee was set up by the Royal Society of Victoria in Melbourne in 1886. It worked for twenty years trying to stimulate interest in an Antarctic expedition and to raise the necessary funds, but without success.

It was left to a Melbourne resident of Norwegian nationality, Henrik Bull, to solve the financial problem. He persuaded the Norwegian whaling magnate, Svend Foyn, to sponsor a purely whaling expedition to the Antarctic in 1894. A young Norwegian immigrant who had been in Australia since 1888, Carstens Borchgrevink, applied to Bull for a position as scientific observer. Bull took him on as a general hand but, despite this, Borchgrevink devoted a lot of his time on the expedition to scientific observations.

Bull's ship, the "Antarctic," flying the Norwegian flag, reached the Antarctic continent and Bull landed briefly with a party at Cape Adare, at the entrance to the Ross Sea, in January 1895. This was the first recorded landing of a party on the Antarctic mainland, earlier landings on the Antarctic Peninsula having been on islands or ice shelves.

Borchgrevink, his enthusiasm fired by his Antarctic experience, went to England and succeeded in organizing a British expedition in the ship "Southern Cross" with the sponsorship of a publisher, Sir George Newnes. On its way south the ship called at Melbourne, where it took on a young Tasmanian physicist, Louis Bernacci, who had been working on the staff of the Melbourne Observatory. He was to become the first Australian-born person to land and winter on the Antarctic continent.

The Borchgrevink expedition set up and occupied a station at Cape Adare in 1899, the remnants of which can still be seen there. They made valuable observations in zoology, geology, meteorology and terrestrial magnetism. However, the steep terrain behind their base denied them access to the Antarctic hinterland.

The years 1900-14 saw great progress in Antarctic exploration through the activities of the famous expeditions of Scott, Amundsen, Shackleton and Mawson. To each of these, except Amundsen's, Australia made important contributions.

Scott's "Discovery" expedition of 1901-3 obtained a grant of £250 from the Australian Antarctic Exploration Committee and £1000 from the Queensland Government. Scott enlisted Louis Bernacci as physicist.

When Shackleton brought the British Antarctic Expedition to Melbourne in the "Nimrod" in 1907 he was in debt and in danger from bailiffs. Professor Edgeworth David, of the University of Sydney, persuaded the Australian Government to donate £5000 to the expedition and, when the New Zealand Government contributed

£1000, Shackleton's main financial worries were over.

Shackleton enlisted Douglas Mawson of Adelaide as physicist and B. Armstrong of Melbourne as a general hand. Professor David and one of his geological staff, Leo Cotton, signed up for the round trip on the "Nimrod," however, when they arrived at McMurdo, Shackleton persuaded David to remain for the whole year as his chief scientist. One of Shackleton's men, Raymond Priestly became the first Vice Chancellor of Melbourne University. The first officer of the "Nimrod," John King Davis of Melbourne, later became master of this ship and of Mawson's "Aurora" and "Discovery". (He also captained the "Aurora" on the relief expedition that rescued Shackleton's Ross Sea party in 1917).

David and Mawson made notable contributions in geology and geophysics to the achievements of Shackleton's expedition. A six-man party led by David and including Mawson made the first ascent of the Antarctic volcano, Mt. Erebus (altitude 12,450 feet). Later, a three-man party of David, Mawson and MacKay man-hauled a sledge to the South Magnetic Pole, a return journey of 1,260 miles in 122 days. This was a major achievement and one that has never been adequately recognized.

Scott's second expedition, in the "Terra Nova" in 1911-13, also obtained a grant from the Australian Government, this time of £2500. Two Australian scientists accompanied Scott - Griffith Taylor and Frank Debenham. (Taylor later established the first Department of Geography in Australia at the University of Sydney, and Debenham became the foundation Director of the Scott Polar Research Institute in Cambridge.)

After returning from Shackleton's expedition, Mawson set about organizing one of his own. He obtained financial assistance from numerous private sources in both Australia and England and donations over a two-year period from the Commonwealth Government of Australia (£13,000), the South Australian Government (£5000), the New South Wales Government (£7000), the Victorian Government (£6000), the Tasmanian Government (£500), the British Government (£3000), the Royal Geographical Society (£600), and the Australian Association for the Advancement of Science (£1000). His Australasian Antarctic Expedition (AEE) of 1911 - 13 established three stations: Macquarie Island, at Commonwealth Bay (George V Land) and on the Shackleton Ice Shelf (Queen Mary Land).

In February 1912 the "Aurora," commanded by Captain J. K. Davis, sailed along off the coast of Antarctica between 140° east longitude and 90° east longitude, naming Wilkes Land, Queen Mary Land, the Davis Sea and the Shackleton Ice Shelf. Sledging parties from the Western Base mapped the coast of Queen Mary Land, while others from Commonwealth Bay explored 150 miles west, 300 miles south and 300 miles east of their base. The scientific reports of the expedition filled twenty-two volumes.

Shackleton's Imperial Trans-Antarctic Expedition of 1914-17 also included Australians. Shackleton took with him Mawson's photographer, Frank Hurley, and his Ross Sea party included Australians R. W. Richards, A. K. Jack, and C. O. Gaze Richards was the hero of that party and was awarded the George Cross.

The Australian adventurer, Sir Hubert Wilkins, became famous because of his pioneer flight over the North Pole. In 1921 he joined Cope's British four-man expedition to Graham Land and in 1922 he was with Shackleton's last expedition. He and pilot Eielson made the first flight in the Antarctic in November 1928, 1,300 miles over Graham Land. He later accompanied the U.S. explorer, Lincoln Ellsworth, on his 1935-36 and 1939 expeditions in the ship "Wyatt Earp," which later, in 1948, took me on my first Antarctic voyage.

When Mawson returned from his Australian Antarctic Expedition, the outbreak of war in 1914 precluded any further Australian activity in Antarctica for some years. In the 1920s Mawson led a resurgence of national interest in Antarctic exploration and, following discussions between the British and Australian Governments, it was agreed that Britain would make available the ship "Discovery" for an expedition, to be led by Mawson in the summer of 1929-30, that would strengthen any claim the British might make to Antarctic territory in the so-called Australian sector. Thus arose the British-Australian-New Zealand Antarctic Expedition (BANZARE), a private expedition supported by the three governments concerned and private donations.

Two voyages were made in the summers 1929-30 and 1930-31. The "Discovery" visited Macquarie Island, lies de Kerguelen and Heard Island in the sub-Antarctic and cruised along the coast of Antarctica between Terre Adelie in the east and Enderby Land in the west. A landing was made at Proclamation Island (Enderby Land) where Mawson read a statement laying claim on behalf of King George V of Britain to all lands between longitudes 47° east and 73° east and south of latitude 65° S.

Other landings were made at Cape Bruce, Kemp Land (where a copy of the Proclamation was deposited beneath a cairn) and at Scullin Monolith, MacRobertson Land. A number of flights were made in a Moth aeroplane, discovering from the air the BANZARE coast and Princess Elizabeth Land and confirming the existence of the Knox coast, but much further south than Wilkes had described it in the 19th century.

Another Australian, John Rymill of Adelaide, made important contributions to Antarctic knowledge, although the expedition he led was a British one. This was the British Graham Land expedition of 1934-37, which carried out high quality scientific work and cartography in the Antarctic Peninsula region.

Following Mawson's BANZARE expedition in 1929-31, further Australian work in Antarctica was precluded, first, by the economic depression of the 1930s and,

second, by the Second World War.

After the War, Mawson approached the Government and urged that Australia should resume scientific research and exploration in Antarctica. Herbert Evatt, Minister for External Affairs, became enthusiastic about the proposal. Consequently, the Department of External Affairs convened an inter-departmental committee that met, together with Mawson and a representative of the Council for Scientific and Industrial Research (CSIR), on 2 December 1946.

The main accent of Mawson's argument was on the political need to consolidate the Australian territorial claim that had come into effect in 1936, particularly in view of Norwegian exploration in the Australian sector during the 1930s, and the growing interest of USA in Antarctica during the 1940s. The major part of the Australian Antarctic Territory was still unexplored. But Mawson was primarily a scientist and he continually stressed that any expedition sent to Antarctica for political reasons should take the opportunity to carry out as much scientific research as the logistical limitations of the expedition would allow, for the Antarctic was an almost virgin field for investigations in a number of scientific disciplines.

The committee of 2 December 1946 recommended that the departments concerned should develop concrete plans for an expedition to Australian Antarctic Territory, using a naval ship equipped with a suitable aircraft, with the object of finding an ice-free area on the continent that could be used as the site for a permanent base. Mawson suggested that the ship "Wyatt Earp", owned by the Navy but lying uncommissioned in the Torrens River at Port Adelaide, be refitted for use by the expedition. Cabinet accepted this recommendation on 20 December 1946 and proposed that an executive committee be formed to develop plans and estimates for an expedition in the 1947-48 summer, that Mawson should act as adviser to this committee, and that an executive officer be appointed to organize the expedition. The first meeting of the Executive Committee on Exploration and Exploitation was held on 4 January 1947, chaired by the permanent head of the Department of External Affairs, Dr John Burton. Thereafter events moved swiftly. With various personnel and under several different titles a number of committee meetings were held, and finally the following proposals were put forward to the Department of External Affairs:

- that an Executive Planning Committee be formed under the department;
- that preliminary plans for an expedition be drawn up at an estimated cost of £250,000;
- that the "Wyatt Earp" be refitted by the Navy; and
- that Group Captain Stuart Campbell, RAAF, be seconded from his position in the Department of Civil Aviation to act as Executive Officer of the expedition.

The British Government, which had been advised by the Australian Government of the moves being made, asked that any expedition plans should include the occupation of Heard Island, far south in the Indian Ocean. Sir Douglas Mawson also suggested that his old base at Macquarie Island be re-occupied.

In July 1947, Phillip Law was appointed Senior Scientific Officer of the expedition, which, soon afterwards, was given the official title of the Australian National Antarctic Research Expedition (ANARE). The word Expedition was later changed to the plural, Expeditions. Law was asked to draw up a scientific program for consideration by the Executive Planning Committee, whose meetings he was invited to attend.

The outcome of all these deliberations was that the Australian Government approved recommendations that scientific stations should be established at Heard Island and Macquarie Island and be maintained for at least five years and that a reconnaissance of King George V Land should be carried out to seek a suitable site for a permanent Antarctic station. It approved the use of two naval ships - HMAS "Wyatt Earp," captained by Commander Carl Oom, R.A.N., for the Antarctic voyage, and HMLST "3501," captained by Lieutenant Commander George Dixon, R.A.N.V.R., for the two island voyages. The CSIR was to accept responsibility for the financial aspects of the ANARE and the Royal Australian Air Force was to act as purchasing agent. The scientific plans were to include meteorology, and geomagnetism and geology by the Commonwealth Bureau of Mineral Resources.

The stations at Heard Island and Macquarie Island were successfully established in December 1947 and March 1948 respectively, but the "Wyatt Earp" broke down on her first voyage in January 1948 and her delayed resumption was too late in the season to enable her to reach the Antarctic Continent.

In January 1949 Stuart Campbell relinquished leadership of the ANARE and was succeeded by Phillip Law who continued searching for a ship suitable for use in an assault on the Antarctic Continent. In the meantime he visited Antarctica with the Norwegian-British-Swedish Antarctic Expedition in 1950 to gain first-hand experience with the Antarctic environment.

In 1952, Law learned that the Danish shipping company, J. Lauritzen Lines, had just built an ice-going vessel, the "Kista Dan" that would be suitable for Antarctic work. In February 1953 the Australian Government approved Law's plans for setting up an Antarctic station using the "Kista Dan" and this was accomplished on 13 February 1954, when Law named the new station "Mawson".

Thus, in 1954 and 1955, Australia maintained three stations - Heard Island, Macquarie Island, and Mawson. However, scientists of many nations were planning an International Geophysical Year to commence in 1957 with one of its principal objectives being an assault on the Antarctic Continent. Law persuaded the Australian Government to approve the establishment of a second continental

station, this one at the Vestfold Hills, Princess Elizabeth Land, which offered one of the best sites in Greater Antarctica for a scientific station. Law led the expedition that set up this station and on January 13, 1957, named the new station "Davis" in honor of Mawson's captain, John King Davis. Meanwhile, in 1955, the Heard Island station had been closed because of ANARE's growing responsibilities in Antarctica.

At the end of the IGY, during which the Australian stations had distinguished themselves with scientific work of outstanding quality, the USA found itself overstretched in manning a number of bases. Law was able to persuade the Americans to offer their Wilkes Station to Australia instead of closing it and, on 4 February 1959, he formally accepted administration of the Station from the U.S. leader of the American relief expedition.

Over the next few years the temporary buildings of the Wilkes Station deteriorated to the point where the establishment had to be replaced. Under Law's direction a new site was chosen and work commenced in 1965 to build, nearby, the station named Casey. It was opened in 1969. This was later rebuilt as the present Casey Station.

During the "Law Era" (1949-66) Australia's greatest Antarctic contributions in exploration and scientific research were achieved. The Antarctic Division was created and built into a vigorous and efficient organization. Law led the expeditions that set up the Mawson and Davis stations and that took over Wilkes Station from the Americans. Patterns for the provision of chartered ships and for logistical and scientific support of the stations were developed

Year after year the ships relieving the ANARE stations extended their voyages to include coastal exploration along the full extent of Australian Antarctic Territory. ANARE field parties working from Mawson, Wilkes and Davis traveled hundreds of miles inland to extend this exploration to embrace a total area in excess of a million square kilometers. Law himself led eleven voyages of coastal exploration, making 28 new landings. ANARE aircraft, flown by RAAF personnel in the first instance and later by commercial pilots, carried out photo-flights covering vast areas of Australian Antarctic Territory and transported field parties of surveyors, geologists and glaciologists to remote regions.

Australia has been able to secure the three best sites for Antarctic stations that exist over a distance of 4,000 miles of coast and to forestall much of the extensive work that USSR expeditions were to do in this region.

Australia's Antarctic Division has coordinated scientific programs, in a multitude of disciplines, keeping Australia's international reputation at a high level. It can be said that the "Law Era" established an enduring platform for Australia's continuing Antarctic endeavors and completed the broad exploration and mapping of all unknown areas of Australian Antarctic Territory.

## Academies Polar Research Board Public Lecture

### Climate Change: From the Poles to the World

by Dr. Richard Alley

Pennsylvania State University

Thursday, March 22 - 6:00 p.m.

Room 104, Green Building  
2001 Wisconsin Avenue NW

The National Academies  
(Georgetown Campus)

Dr. Richard Alley is a glaciologist and a leader in the field of glacier dynamics and ice-core research on paleoclimates. He is especially interested in the two big questions of glaciology: What was the world like in the past? Will the ice sheets melt into the ocean and flood the coasts? He studies past climate change by analyzing ice cores from Greenland and Antarctica, and has demonstrated that exceptionally large climate changes have occurred in as little as a single year. His work seeks to understand the causes of such changes. Dr. Alley is Evan Pugh Professor of Geosciences at the Pennsylvania State University's Earth Systems Science Center. He is currently a member of the Polar Research Board and is chairing the

NRC's Committee on abrupt Climate Change.

Check the PRB's website at [www.national-academies.org/prb](http://www.national-academies.org/prb) for further information, or call (202) 334-3479.

## Brash Ice

This is the first newsletter put to bed outside of the Washington, DC Area, as it was put together on Midcoast Maine. Thanks to modern technology, we conscripted John Splettstoesser, Jerry Marty, Julie Palais, Polly Penhale and Steve Dibbern to send us material over the lines. We decided that we had better go ahead with this end-of-the-season newsletter without the usual inputs from our President, Kristin Larsen, whose Penguin Prattle column is not appearing as she is on the west coast studying for her bar exams.

Incidentally, dues are now do-able. If you owe, you should have received a notice in the mail. For another year, our dues for U.S. and Canada members remain ten (\$10) dollars per year. Remittance to the address on our letterhead.

This person has always taken a dim view of adventurers hitting orange golf balls off the top of some Antarctic mountain, but in the great proliferation of adventures that made Antarctica a continental highway this past austral summer; finally something really significant was accomplished. Two Norwegians, Erik Sonneland and Rolf Bae, successfully completed an

UNSUPPORTED crossing of Antarctica from Troll Station, Draining Maud Land, to Scott Base. A crossing of 2,900 km in 107 days. But they over calculated the ordeal, as they finished with three breakfasts, seven lunches, and fifteen days of fuel. They were hastened, perhaps, by using their sails on three days while crossing the Ross Ice Shelf, making a remarkable 210 km one day! Siberian ponies, eat your hearts out!!

We hope all of you in the Washington area will take advantage of the open door policy of the National Academies' Polar Research Board Public Lecture by Dr. Richard Alley of Perm State University on Thursday evening, March 24, 2001. Our society kicked in with a small contribution towards liquid libations and hors d'oeuvres, so enjoy before you hear one of this country's hottest items talk about climate change. We recently heard him speak at Bowdoin College, and if you want to know everything there is to be known about Ice Ages, be sure to be there. Even if you don't, come and socialize.

HOPE YOU ENJOY OUR FIRST-  
EVER COLORED PICTURES!

## Follow that Iceberg!

*(Julie Palais/NSF)*

In March of last year a large iceberg (295 km/180 mi. by 37 km/25 mi.) about twice the size of Delaware, broke off the front of the Ross Ice Shelf near Roosevelt Island and began drifting into the Ross Sea. The iceberg, designated B-15 (following the convention of the Joint Ice Center which tracks icebergs that are at least 10 nautical miles long. The letter refers to the quadrant of Antarctica and the number is for how many icebergs have been observed in that sector since the center first started tracking icebergs), subsequently broke in half, with one portion being

designated B-15B and drifting north and the other piece, called B-15A, drifting along the front of the Ross Ice Shelf toward Ross Island and McMurdo Station. Along the way it was moved by winds, tides and currents and from time to time was seen, with satellite imagery, to collide with the front of the Ross Ice Shelf, spawning new icebergs along the front of the ice shelf, in what have been called sympathetic calving events. One of the large icebergs that were formed in this process, C-16 then began drifting westward toward Ross Island in front of B-15 A.

During this past austral summer field season (2000-01) the National Science Foundation funded a group of researchers from the University of Chicago and the University of Wisconsin to instrument the B-15A iceberg with automatic weather stations (which are measuring wind velocity and direction, relative humidity, surface temperature and barometric pressure) and global positioning system (GPS) units which will track the exact position of the iceberg. The scientists, Douglas MacAyeal of Chicago, and Jonathan Thorn of Madison, Wisconsin were transported in late January from McMurdo Station on the U.S. Coast Guard icebreaker, Polar Sea to the iceberg and erected three stations on the ice surface, roughly 45 meters (150 feet) above the surface of the ocean. These instruments will allow scientists to track the progress of the icebergs more precisely than they were able to before with just the satellite images. Because storms and cloud cover often obscure the field of view, scientists sometimes lose track of the iceberg for days at a time. The new instruments will allow researchers to better understand what determines the motion of these icebergs and how they are affected by weather conditions and ocean currents. Several weeks of data from the sensors have already been collected by satellite.

MacAyeal said he expects soon to begin analyzing the iceberg's motion and the effects of collisions between the berg and the shoreline and ice at Cape Crozier in Antarctica. The weather stations, assembled at the University of Wisconsin, are equipped with batteries and solar panels. Based on their use elsewhere in Antarctica, they could be expected to operate for as many as five years.

Scientists do not really know what causes these icebergs to calve in the first place. Although in the Antarctic Peninsula a similar phenomenon can be convincingly attributed to local warming in the region, the reason that so many large icebergs calved off the front of the Ross Ice Shelf this last year remains unclear. Scientists speculate that the large rifts which cut through the ice shelf, and which propagate with time, weaken the ice on the ice shelf. This causes the large tabular icebergs to be generated once all of the rifts become interconnected. The actual calving event is probably triggered by a combination of tidal forcing and weather conditions. Future research may allow scientists to better understand these mechanisms and allow them to predict when the next major breakout will occur.

## The South Pole

*(Jerry Marty/NSF)*

Major construction projects in support of the National Science Foundation's Amundsen-Scott new South Pole scientific research station were completed this FY01 summer season despite extreme weather conditions in Antarctica that have hampered cargo flights. This FY01 season represents the fourth season of construction. During the past 4 years the following agencies have assisted NSF in meeting the project goals: Pacific Division Naval

Facilities Engineering Command (PACDIV) have assisted NSF in the design management. The Architect for the project is Ferraro Choi. US Army Cold Regions Research and Engineering Laboratory (CRREL) has provided technical oversight.

The new power plant (NPP) which went on line January 20, 2001 will increase the station's peak generating capacity to one megawatt of electrical energy, while providing three levels of back-up redundancy. The completion of the NPP also completes the last of the three SPSE (South Pole Safety and Environmental) projects. The new Fuel Storage facility which converted the previous 9 each 25,000 gallon fuel bladders to 45 each 10,000 gallon storage tanks (with secondary containment, leak detection, and fire suppression) was completed January 1999. The new Garage/Shop facility was completed for occupancy December 1999. Both the Garage/Shop and NPP facilities included winter-over construction with crew sizes up to 20 persons (total station population being 50 with the added 20 support and 10 science, as an average).

The construction of a new satellite ground station, MARISAT/GOES and supporting RF building began during the month of November. The project was completed on January 18, with station personnel conducting a successful test of the ground station. The nine-meter satellite dish will connect the Pole with the commercial MARISAT-F2 and NSF's GOES-3 satellites. The system will transfer the large quantities of scientific data gathered each day in support of the year-around work at the South Pole, back to universities and laboratories in the U.S. for analysis. The new capability will supplement coverage provided by NASA and US Air Force satellites. Employees of Raytheon Polar

Services, NSF's logistical contractor in Antarctica, worked closely with a number of government agencies and sub-contractors to achieve the success.

The first major construction season for the elevated station (food service, housing, science, administration, medical, communication, work stations, emergency power facility, multipurpose area, and meteorological) began this summer season. The summer scope was to frame (structural steel) the exterior for wings A1 (50 person housing) and A2 (mechanical & electrical on the first floor and food service on the second floor), and enclose the wings in support of winter-over interior work. The connecting vertical tower was also part of the summer scope, which functions as the connector link between the surface elevated station (SPSM) and the sub-surface industrial facilities (SPSE). See **figures 1 and 2 in newsletter**. A 20 person construction crew is wintering and interior work is proceeding (again a 50 person station winter population, including 11 science and 19 support).

The water and sewer system design provides for "bulbs" to be located 1850 feet from the new station. For safety and ease of maintenance the utility lines will be placed in a tunnel (6 x 10 ft.) under the surface, which will allow for access year around. The tunnel work began last season and was completed on schedule this summer. The tunnel was constructed (machine design by CRREL) some 40 feet below the surface. Installation of the piping will be performed as part of the winter-over work this winter.

We asked Jerry Marty some specific questions about this whole project, as it is such a massive undertaking that us folks back in Peoria have a hard time getting a handle on what is going on and when. Us taxpayers are having our blood drawn out over a period of years

so that it won't hurt quite so much, just longer. The total cost is going to be \$152.9 million, with the station modernization cost \$127.9 million and the so-called safety and environmental upgrades a cool \$25 million. It will all be completed, hopefully, in the austral summer of 04-05, with dedication of the station sometime in January 2005. The first housing occupancy will be in the year 2003. All rooms will be the same although the design will have provisions to move walls to accommodate couples and separate male and female bathroom facilities. This is the third wintering over season representing full winter interior work. Eat your hearts out, Seabees!!

## Palmer Station

*(Polly Penhale/NSF)*

The 2000/2001 season at Palmer Season was highly successful on all fronts: science, operations, and public outreach. I spent a month on station (See **figure 3 in newsletter**) during January and February as the National Science Foundation Representative Antarctic Peninsula before joining the U.S. Antarctic Treaty Inspection Team for its work in the Antarctic Peninsula region. During the month, there were 37 people on station under the leadership of Station Manager Ron Nugent. Cara Sucher was the Laboratory Manager and Molly Hutsinpillar was the Physician.

The main science project conducted during my time on station was the Palmer Long Term Ecological Research Program (PAL-LTER) which is an interdisciplinary project focusing on the marine ecosystem in the Antarctic Peninsula region. The theme is the influence of the inter-annual variation in sea ice on the biological components of the ecosystem, with a focus on phytoplankton, krill and seabirds. The project consisted of both station research (under the leadership of Station Science Leader Bill Fraser, Montana State University) and a January research cruise (under the leadership of Chief

March 2001

Scientist Robin Ross, University of California, Santa Barbara).

The at-sea component was conducted on the *R/V Laurence M. Gould*, on a cruise track which reached from Palmer Station south to Rothera Station in Marguerite Bay. In the Palmer Station vicinity, January proved to be a poor month for krill, with Robin Ross finding few krill in the local area. At Rothera, scientists from the British Antarctic Survey joined the ship for some joint research activities as part of an ongoing cooperative project to link local coastal research with the broader marine ecosystem research of the LTER.

The on-station component focused on seabirds, with an emphasis on population biology and foraging ecology of Adelie penguins. The PAL-LTER seabird team under Bill Fraser saw the lack of local krill populations reflected in the diet samples of Adelie penguins. The state of digestion of krill indicated that the birds were foraging quite a long distance from the station. Utilizing satellite tags, new research on the foraging of giant petrels nests, indicating an interaction between the birds and commercial fishing activities.

A major accomplishment of the past year was the completion of the GWR (Garage, Warehouse, Recreation) building remodeling project, which was conducted by both summer and winter personnel. Both past (Antarctic Support Associates) and present (Raytheon Polar Support Company) contractors deserve congratulations for the project's completion. At one time, the space on the upper floor of WR (one of the two major buildings on station) consisted of berthing, the lounge, offices, storage rooms, the gym, the station store, the ham shack, and the laundry facility.

In the past few years, as the space on station has been consolidated, it became feasible to improve the quality of life and safety through renovation of living and recreation space. For example, all the bedrooms are doubles (no more four-person rooms!) and now the berthing and recreation are separated at opposite ends of the floor (much

quieter!). Fire sprinklers were installed in the building. The new medical facility on the first floor of GWR is a vast improvement over the cramped quarters, which were formerly located in BioLab (the other main building on station). There is now double-door access to the medical facility from the outside, a larger examination room/medical lab, and a separate storage closet for medications. The station store is also now located on the first floor of the GWR.

The station's public outreach program included a visit by Maria Stenzel, a photographer from the *National Geographic Magazine*. She joined the program in Punta Arenas for the cruise to station, where she spent a few days photographing seabird research conducted by Bill Fraser. Maria left on the *Golden Fleece*, a yacht operated by Antarctic veteran Jerome Poncet, for a month's trip of photography in the peninsula region. Prior to the Palmer Station visit, she spent six weeks at McMurdo Station and vicinity. A feature on the U.S. activities in Antarctica will be published by the *National Geographic* in the December 2001 issue.

Palmer Station also hosted twelve visits by tour ships and several visits by ships of various Antarctic Treaty nations during the summer season. Tour ship visits are scheduled through the coordination between the NSF and IAATO (the Antarctic tour operators organization) and provide a means for NSF to inform the public about the research conducted on station and in the Antarctic Peninsula region. A half-hour lecture with slides is presented on board ship, followed by a station tour and visit to Torgersen Island, home to 4,500 Adelie penguin pairs. On station, visitors can collect literature on the U.S. Antarctic Program and sample the famous Palmer Station brownies.

On the social front, Sunday became the day of gourmet food, as station personnel took turns cooking dinner on the "cook's day off". Station Manager Ron Nugent became known for his New Orleans style cooking and electrician Dan Weisblatt's specialty was hand-cut pasta. OAE Tony Amos, who came to Palmer Station to install a new tide gauge, prepared Shepherd's pie, made the traditional way from Tony's childhood in England. That is, there was a layer of baked beans in between the meat layer and the mashed potato layer on the top. It was just terrific! My contribution to dinner was an industrial size pan baklava. And the station continues its traditional end to the January LTER cruise with "cross-town pizza", where station and ship personnel join together for pizza cooked in the gallery and served in the GWR lounge.

Station personnel have a keen sense of history and a community project involved decorating the lounge with our historic collection of pennants and plaques from visiting ships and scientific expeditions. Plaques commemorated the visits of ships from other Antarctic Treaty nations, from the U.S. Coast Guard, and from tour ships. The earliest dated plaque is from 1969 and many date from the 1970's. Pennants also dated from the 1960's and commemorated various ships, other Antarctic stations, yachts, and universities. Memorabilia from the *R/V Hero*, a replica of the *R/V Polar Duke* and photos of the current USAP ships the *R/V Nathaniel B. Palmer* and the *R/V Laurence M. Gould* complete the historical collection.

# Ice Bound: A Doctor's Incredible Battle for Survival at the South Pole

by Jerri Nielsen, with Maryanne Vollers  
(John Spletstoeser/IAATO)

Anyone who has not heard this story did not have a TV set last year. The time was last winter at the Amundsen-Scott South Pole Station, where 41 people were wintering over, an annual procedure for this U.S. station since its presence at 90S latitude in 1957-58. The population was a bit higher this winter than normal because of a construction crew who were in the stages of building a new facility. What makes this story different, and worthy of a book, is that shortly after the last LC-130 aircraft left for the season, thereby shutting down flights until the station reopened next spring, the station doctor, Jerri Nielsen, discovered a lump in her breast. In a standard summer season of operations, a quick flight from McMurdo Station would have gone to the Pole, picked her up, dropped off her replacement, and whisked her to New Zealand and the U.S. for evaluation. Not so this time. In winter, you might as well as be on the Moon, for no one is coming to get you because of what Antarctica is famous for in winter— total darkness, unusually low temperatures, storms, and just plain isolation. Because we know the outcome, the reason for reading this book is the suspense of events which ultimately resulted in an airdrop of medical supplies in the dead of winter, and a miraculous winter flight to the Pole to pick her up after it was determined by doctors in the U.S. who were in communication with the author that she did indeed have cancer. Not only that, the background of why this 46-year-old emergency room physician

chose to apply for the job, was quickly selected, and left for 'The Ice' shortly after is a vital part of the story. No surprises that a bitter divorce, resulting in her children having nothing to do with her, would drive a person to seek isolation and a totally different way of life in a place she was totally unfamiliar with, a not uncommon scenario for many who winter over in Antarctica. After a period of getting used to living and working with people who were mostly younger than her, some a bit eccentric as well, she adapted so well that becoming a 'Polie' was an essential part of the experience, and she never regretted it. The part that reappears in the story is that of her former husband and children who apparently ignored her, even with the news of her life-threatening condition. Why none of them even acknowledged her plight, and consistently did not respond to e-mail messages from her, is unknown. The author sets out some painful history of her marriage, and puts it in the context of a husband who was apparently unwilling to see her gain the fame and publicity of a stranded heroine at the Pole - after the Press media discovered who she was, reporters constantly hounded her parents and former husband about anything that would add to the story. According to the author, her former husband told reporters that it was just like her to fabricate the whole story in order to gain attention!!

Aside from all that intrigue, living and working at the Pole is a suspenseful part of the story as well. Occasional power outages, personalities interacting in a closed environment, friendships developed, and day-to-day living make good reading. Because she was the only doctor at the station, she had to instruct others to help her take a biopsy, for example. The book is not about science at the South Pole, although the individuals who work their way into the story are identified as technicians doing

their job on science projects. It is interesting that of the 41 people at the station, the individuals listed in the book, with their specialties, number only 34. The list is prefaced by the statement that '...some participants do not appear in the book, and others prefer not to be named.' That could be an interesting story by itself.

Anyway, get the book and read it. Its' jacket price is \$23.95, published by Hyperion Press, 77 W. 66<sup>th</sup> St., New York 10023, and was just published (2001, 362 p., 16 black-and-white photos, ISBN 0-7868-6684-5). The book appeared at about the time that Jerri appeared on national television talk shows, giving a perspective of the doctor as a person. It's worth having on your Polar bookshelf.

## A Lifetime Loving the Ice

This was the most suitable obituary headline in THE PRESS, published in Christchurch, on January 18, 2001, covering the passing of Jim Caffin. He was an international authority on the Antarctic, and amassed a huge collection of information about the continent. I had the honor of meeting Jim back in the 1980s, and was enthralled by his breadth of knowledge at what was going on at all of the Antarctic station. He was truly a gold mine of information on Antarctica. His interests in Antarctica were awakened when he interviewed Admiral Richard E. Byrd on his way to Antarctica on his 1933-35 Expedition.

He became editor of the ANTARCTIC, an excellent news bulletin published quarterly by the New Zealand Antarctic Society. First published in 1956, it was most unique, as it was the only privately published journal in the world specializing in international coverage of Antarctic affairs. Jim's service to

Antarctic journalism was recognized in 1983 when he was awarded the MBE. He retired as editor of the ANTARCTIC at the end of 1981.

He actually had a legitimate job outside of his Antarctic love, working as a journalist on the *Christchurch Star and Times*. He was a correspondent for United Press International and for the Sydney Daily Telegraph. He also contributed to the American news journals *Time* and *Life*. On the Press he worked as an aviation correspondent, as a Parliamentary reporter, as a leader writer, and as a theater critic. As chief reporter for the Press, he was known for his vast knowledge of local events and personalities, and for his insistence on brevity and accuracy in the work of his staff.

He was notable as an incessant talker, and his conversation often raced down several tracks at once. On social occasions in the presence of his wife, Carol, she could often be heard recalling him to his main theme, "Just the main river, Jim. Not the tributaries." She was a piece of art in herself. My visit coincided with the publishing of Elizabeth Chipman's *WOMEN ON THE ICE*. Carol hypothesized that a better title might have been *FRIGID WOMEN!*

We lost a real good one in Jim Caffin, dead at 88, predeceased by both his wife and their son.

## U.S. Antarctic Treaty Inspection

(by Polly Penhale/SNF)

A cornerstone of the Antarctic Treaty is its provision for the right of all parties to inspect any and all areas of Antarctica to ensure compliance with all aspects of the Treaty. This includes setting Antarctica aside exclusively for

peaceful purposes, including the prohibition of military activities, freedom of scientific research and protection of the environment, hi February 2001, the United States sent its eleventh U.S. Antarctic Treaty Inspection Team to the field, with a focus on stations in the Antarctic Peninsula region. The inspection coincided with the 40<sup>th</sup> anniversary of the entry into force of the Treaty.

The ten person U.S. Inspection team was led by Raymond Arnaudo, Department of State, with deputy team leaders Evan Bloom and Douglas Boerman (also from Department of State). Other members of the team were Katherine Biggs and David Lopez (EPA), Peter Ward (U.S. Fish and Wildlife Service), George Dupree (U.S. Coast Guard), Bernard Link (U.S. Embassy, Chile), Al Sutherland and Polly Penhale (both from the National Science Foundation).

The inspection was conducted from February 2-16, using the *R/V Laurence M. Gould*, NSF's research vessel in the peninsula, as transportation between stations. The stations visited during the inspection were Arctowski (Poland), Ferraz (Brazil), Vernadsky (Ukraine), Juan Carlos I (Spain), St. Kliment Ohridsky (Bulgaria), Frei (Chile), Artigas (Uruguay), Jubany (Argentina), Great Wall (China), Bellingshausen (Russia), and King Sejong (South Korea).

Using the Inspection Checklist developed by the Antarctic Treaty parties as a guideline, me team collected information on the following characteristics of each station: its history and physical description, personnel, scientific research program, station facilities (fuel storage/usage, water system, power generation, medical, hazardous chemical storage), firearms/explosives, military support activities, emergency response

capability, environmental impact assessment, waste management, conservation of flora and fauna, management of protected areas, understanding of Antarctic Treaty provisions and tourist and non-governmental activities. Discussions with station personnel were followed by a walk-through of the station facilities.

The team was cordially welcomed at each station and station personnel were genuinely interested in providing an open inspection. Station personnel viewed the inspection process as a positive tool to help improve their ability to adhere to the provisions of the Antarctic Treaty. There was a high degree of environmental awareness at all stations and cooperation in many areas, including scientific research and logistics, was in evidence. While the overall findings were quite positive, improvements in areas such as fuel management and emergency preparedness would be a worthy goal for the future. A complete report of the Inspection will be produced by the Department of State for circulation to Antarctic Treaty parties.

## Three Diaries

(by Steve Dibbern/OAE)

Diaries are a favorite medium for understanding what happened on a particular expedition. For the last two Christmases my daughter has managed to find two jewels, and I've added a third to round out the review. ***THE QUIET LAND - THE ANTARCTIC DIARIES OF FRANK DEBENHAM***, edited by June Debenham Back, Bluntisham Books, 1992 is the first and the second is ***WITH SCOTT THE SILVER LINING*** by Griffith Taylor, Bluntisham Books, 1997 (originally published by Smith, Elder & Co., 1916) More about the third later.

Both Debenham and Taylor loom large in the history of scientific exploration during the Heroic era of Antarctic

exploration. They were not after the Pole, although Taylor had hoped to be part of the Southern Party to explore the mountains in the area of the Beardmore Glacier. Both men ended up doing the pioneering exploration of the Dry Valleys and spent two summers as the "Western Parry". Taylor's famous narrative has been reprinted, and Debenham's daughter has recently published her father's diaries from the Scott expedition.

Both diaries are fascinating reading. Together they give insights into what went on that would be missing from a single narrative. Taylor was the leader of both trips, which was a disappointment to Debenham who had hoped to lead the second trip. That both trips were as harmonious as they were speaks volumes to the character of the two Australians.

What adds immeasurably to both books is that both men were turn of the century geographers, and as such had been taught to sketch both the terrain around them and details that photography was not yet adept at recording. These details were not limited to geographical subjects but to wonderful details of their equipment as well as themselves. The drawings, maps and sketches are visit personal views of their two western trips. To me the best parts are the exploration of the

dry valley now called Taylor Valley. This was an area that could not be traversed in the normal fashion with a sled as there was no snow. They were ill equipped for backpacking but were so fascinated with the terrain and its formation processes that they left their sled and explored for a number of days with only what they could carry. The dry valley is also the subject of a number of their best drawings.

Taylor's book is a longer and more complete narrative. He is clear, funny at times and easy to read. Other than Cherry-Garrard's wonderful book, I believe Taylor's diary is easily the best book to have emerged from the last Scott expedition; it deals not in hardship and tragedy but in science, unique field work and human relationships.

Debenham's diary was not written for publication so it is not as complete as Taylor's but it makes up for it in great sketches and maps, and it also can be used to see a second perspective on the same situations. Read them together and you won't be sorry.

The third and last diary for this review is *MY SEASON WITH PENGUINS - AN ANTARCTIC JOURNAL* by Sophie Webb, Houghton, Mifflin Co., 2000. Ms. Webb's book is a thin tome purported to be for those "age 10 and up" and I can heartily recommend it for the standpoint of the "and up" crowd! It

is a beautifully illustrated diary of a summer (one of three we are told) spent at Cape Royds observing, tagging, ways, and many other activities with the Adelic penguins in the world's southernmost rookery. She describes the life at a modern biological field camp. Her water colors are the main feature of the book and are delightful. They illustrate more about penguin behavior in a few pages than many more academic books do in the hundreds. I could be accused here of being a bit over the top here, but I DO believe that a picture IS worth a thousand words and that a painted one is even better to emphasize detail. And they are Charming! As is the text. Buy it for yourself; buy it for your grandchildren, but buy it! It'll be the best \$ 15 bucks you've spent this year.

The theme that binds these three books together is they are all three interestingly illustrated diaries. Taylor's is the most historically significant while Debenham's lends a human touch and detail to the story. But Ms. Webb's is the most pleasing to the eye and to the soul. And in the end of all three diarists crossed paths in the McMurdo Sound.

*Our Society wishes to thank Tami Crane of TLC Creations in Port Clyde, Maine, for doing this beautiful newsletter.*

## Annual Dinner Meeting and Lecture

In conjunction with the Explorers Club and Society of Woman Geographers

**Saturday, December 1**

**Cosmos Club**

2121 Massachusetts Ave. NW Washington DC

Cocktails 6:00 Dinner 7:00

Black tie Preferred

Please join us for this very special event and hear stories about one of Antarctica's foremost explorers and artists

**Dr. David M. Wilson**

Great nephew of Dr. Edward Wilson

Dr. David Wilson will present slides and lecture about his great uncle, Edward Wilson of the Antarctic (1872-1912) who was on both of Scott's Antarctic expeditions and died with him on the return from the Pole. Dr. Wilson (the elder) is widely regarded as one of Antarctica's finest artists and pioneering scientist-explorers. He served as assistant surgeon, vertebrate zoologist and artist on the 1901-1904 'Discovery' Expedition and as Chief of the Scientific staff on the 2<sup>nd</sup> Terra Nova\* expedition. David's topic is particularly timely given that this year marks the start of the centenary of the 'Discovery' expedition, which represented the first major penetration into the Antarctic Interior.

Dr. David Wilson is accomplished in his own right. He earned his "doctor" title studying the philosophical problems of inter-culturalism, and is devoted to locating and protecting polar archives, as well as preserving stories of Antarctic exploration history. Like his great uncle, David is a keen ornithologist, and has frequently lectured on cruises to Antarctica. Dr. Wilson has also co-authored two Antarctic books: *Cheltenham in Antarctica: the Life of Edward Wilson*, and *Discovery Illustrated: Pictures from Captain Scott's first Antarctic Expedition*. The Penguin Prattle Section, at the end of this newsletter, gives info on obtaining these books.

To participate in this special event, please **send this coupon** to Markie Hunsiker, 5705 Nevada Ave. NW, Washington DC 20015. Reservations must be received by Nov. 28 and no cancellations or refunds will be made after Nov. 29.

Please reserve \_\_\_\_\_ spaces for \_\_\_\_\_ (name) and \_\_\_\_\_ (guest)  
Enclosed is a check for **\$45.00 per person**, payable to "ECWG."

## Brash Ice

September 11, 2001, A Day of Infamy, Pearl Harbor II. A day that we will always remember, and we will always remember where we were as the planes struck. I was with a dear friend from Little America V, 1957, Hugh "Blackie" Bennett, watching the video of Bert Crary's Memorial Service, when a neighbor called with the news. I can remember being at Dye II on the Greenland Ice Cap when news came over the radio that President Kennedy had been assassinated. I can remember being in a German POW camp when the Germans called us all out on to a hillside to tell us that our President, Franklin Delano Roosevelt had died, and that someone by the name of Harry Truman was now our new president. So we have a general idea what it must have been like at our American stations in Antarctica to hear that dreadful news of September 11th. We are running a colored picture of our station at the South Pole taken shortly after the tragic happenings, with our flag at half-mast.

There was a tremendous out flowing of sympathetic messages from abroad that poured into our Antarctic headquarters in the NSF building in Arlington, Virginia. Our Antarctic colleagues wished to show their support, and at the same time were expressing their own sad feelings. From one of our ex-presidents, Polly Penhale, we learned of the terrific impact that those messages had on the staff. Antarcticans had again rallied around one another to show that we were truly united as one, one continent, indivisible, under the Antarctic Treaty.

We are showing two more colored prints, which came from a British Antarctic Survey press release of a fire at Rothera Station. One picture is of the station before the fire, with its majestic setting on Adelaide Island, just off the Antarctic Peninsula, south of the Antarctic Circle. The same aircraft that brought out the sick doctor from the South Pole in early winter used Rothera as its staging base. The other picture is of the Nigel Bonner biological laboratory in full blaze. Thank God there were no deaths.

Sara Wheeler's highly anticipated book on Cherry-Garrard has hit the streets in the UK and early reviews are highly favorable. This should be a good one, considering both the author and the Lead Man.

**OAEs and OTHERS.** Norman Vaughan is still alive, but this should not come as any surprise as he is only 95 and has a lot of living planned for the future. We saw him here in Maine in August when he and Carolyn were visiting Vinalhaven Island for a granddaughter's wedding. He is still active each winter on a 700-odd-mile memorial serum run of the Iditarod. If you have a team of dogs or a snowmobile, and want to join Norman, contact him now.

Like the Marines, there is still room for a few good men/women.

Norman had something interesting to say about a fellow member of the first Byrd Antarctic Expedition, one Victor Czegka. Vic Czegka, machinist on the first Byrd Antarctic Expedition, 1928-30 was recently honored in his home town in Czechoslovakia on the occasion of his 120th birthday. A half-bust statue from his waist up was unveiled. Unfortunately arrangements could not be made for Vic to attend to his own unveiling, as it seems he has been dead for quite a few years, and is incommunicado. Too bad, as I think Vic would have enjoyed it all. Norman Vaughan was asked by a Czech in Anchorage if he and Carolyn would like to attend, they said "yes," but promised tickets never materialized.

Louie Quam has died at age 95. He was top dog hi the Office of Polar Program, 1967-72. Louie was a geologist and a geographer, a past president of the Association of American Geographers, whose real interest was in the arctic. How he ended up at NSF we will never know. Maybe a marriage of convenience. His wife was quite ill at the time, and, if our memory is correct, he retired to take care of her. Visiting hours for Louie are being held at Quam Heights, 71° 03' S, 167° 48' E. A quiet, unassuming, gentleman who did not create waves. Say goodbye to Louie.

Tony Meunier is not exactly an OAE—although he did w/o at the original South Pole Station—but this past president had a heart bypass this Fall. It must have been one hell of a large bypass, more like bypassing the Panama Canal. In fact, he had two operations, one in the morning, one hi the evening. Seems in recovery, they decided that they had not done a complete job, so wheeled him back in for an encore of ripping his chest apart and doing another one. The real problem was that all of those cashews Tony ate when looking for meteorites with Bill Cassidy had come back to haunt him, closing up an artery by over 90%. He is now a very svelte 222.

Believe it or not, there is something now called the Old Antarctic Explorers Association. There is no indication how "old" you have to be, how much of an "explorer" you have to be. Presumably just having been there is enough. They have an interesting membership dues structure. Annual dues are ten bucks, but if you are 81, you're in for a five spot. Then they have lifetime memberships based on your age, from \$110 if you're 45 and below to \$10 if you between 76 and 80!! If interested e-mail [penguin64@worldnet.att.net](mailto:penguin64@worldnet.att.net) or write OAE Association, Inc., 4615 Balmoral Drive, Pensacola, FL 325041

Scott did not have a very long run at the Savoy Theatre in London, closing up after one month. The play, ANTARCTICA, by David Young, opened in Toronto in 1998. Supposedly it is "an inspiring play, taking you on a powerful journey to the ultimate destination- the human spirit". The polar fraternity enjoyed the nuances, but the critics were not too kind. Curtains.

Get your 2002 Calendars NOW

We are again offering the New Zealand Hedgehog Antarctic calendars for sale, but we have a limited number this year. Only 100. First come, first served, with no reordering. As those of you who have been privileged to own one or more of the Hedgehog calendars, you know that they feature the very best of Antarctic pictures. Price is \$12.00, which includes mailing to your door stoop. What a bargain!! Order NOW from Ruth Siple at our Society's address shown on our letterhead.

Book Review: The Coldest March, by Susan Solomon, reviewed by Murray P Hamlet, DVM. Thirty years ago I was intrigued by the story of a British explorer who tried to use horses to get to South Pole and died in his attempt, while a Norwegian successfully used dogs to get to the Pole and back. What folly I thought; how foolish when horses can't eat horses whereas dogs can eat dogs. Over the years, I have read numerous accounts of both expeditions defining the planning, the crew selection and the motives of the two leaders. I don't think my opinion of either has changed, but this book defines the potential of an extremely cold winter as the major cause of Scott's failure.

The author vividly describes frustrations and resource-consuming side trips creating diversions that sapped the mental and physical strength of Scott's crew, while Amundson appears to have been much more goal directed. She describes in detail the trials, failures, and exhausting efforts of extremely brave men. She gives due credit to Scott's admission of leadership failures and mistakes that he made. She lays out the circumstances and timelines to allow the reader to make value judgments on the impact of these events. She makes a good argument for cold injury, infection, scurvy, and altitude illness adding to the deaths of some members.

Her compelling and vivid description of the travails of these powerful men is gripping. Although each had his shortcomings, each had unique strengths and added value to his expeditions. The author makes it clear that Scott overextended these men on trivial missions, which severely sapped their energy and compromised their ability to make the final push to the Pole. Her major premise is that the reason for Scott's failure was that he ran into the

coldest winter in history, but it was Scott's poor leadership skills that accounted for the failure of the expedition and his demise. True it was cold, but he started late with mentally and physically exhausted men and horses, and with equipment that was doomed to fail.

Amundson, on the other hand, started early with rested, healthy men, powerful dogs, and a focused mission in mind. Men of both missions were probably quite similar in motivation, but the leadership, planning and preparation by Amundson was quite superior to that of Scott. Amundson, as part of his planning, avoided the hard winter that killed Scott. He anticipated the potential of a hard winter, started early, and was confronted with severe weather only at the end of his trip. All these things point to superior leadership.

Although the author's comparison of the expedition records of temperature and wind with subsequent meteorological records, clearly defines the severity of the winter, the impact of its role on Scott's failure is hard to assess. It should be considered as only one of many events that led to the deaths of Scott and his man.

ADDITIONAL THOUGHTS ON SUSAN SOLOMON'S BOOK. Our review of Susan Solomon's book was done by one of this country's foremost authorities on cold weather injuries, and an expert on polar clothing, Dr. Murray Hamlett. He is Almost Retired, having officially hung it all up at the Army's Research Institute of Environmental Medicine, but he remains active as a retired annuitant and consultant. Anyone who has ever heard Murray give a presentation on any subject will recognize in his review above, that he has mellowed in retirement. Perhaps we should have sent along a case of beer with the book!

Susan's book was very meaningful to me as I had wintered as the micrometeorologist on the Ross Ice Shelf at Little America V in 1957, and I had served in the same capacity at the Amundsen-Scott South Pole Station in 1958. So I was somewhat familiar with the terrain and conditions experienced by Scott. Plus the fact that I had an association through Dr. Heinz Lettau with Chuck Stearns, who was the architect of the network of automatic weather stations that Susan used in her comparison studies. And I have to confess after fifty odd years of taking weather measurements all over the globe that there is a certain inbred reluctance on my part to accept any unattended automatic weather observations from a severe climate! However, time has long since passed me by, and somewhat begrudgingly, I have to admit that Chuck's automatic readings are probably as good as those taken by Scott's party on the trail. The easiest job in the Polar

Regions, as well as one of the hardest, is to take an accurate temperature reading over snow in the sun.

And I think Murray's comment about Susan's book not changing his opinions on the expeditions of both Amundsen and Scott will be quite valid for most of us. Time has not been kind to Scott, but he makes out quite well in Susan's book. Certainly Huntford's most thoroughly researched book on Scott and Amundsen did nothing to enhance Scott, as he was pretty well defrocked by the end of that book. However, if you have read Huntford's NANSEN and his SHACKLETON, you know that he writes with his sword out of its sheath, no holds barred. If you can't stand the heat, stay out of Huntford's kitchen.

My ADVICE is if you want to know about Scott, read Huntford, if you want to read about a once in a century abnormally cold march, read Solomon. I think Susan's book will be a big seller, maybe in the top five of all Antarctic books. In spite of the resurgence being experienced by Shackleton in recent years, Scott is still an Antarctic demigod. It is a book for all ages, too, as even kids should know about people from the Antarctic Heroic Age. And to know something about weather should not corrupt anybody, either. Buy, read THE COLDEST MARCH, alias Weather or Not!

**FIRE IS THE SCOURGE OF ANTARCTICA.** But it could have been worse at the British Antarctic Survey Station, Rothera, on the Antarctic Peninsula. Fire was detected at 1:00 am on 28 September 2001 in the loft of the Bonner Laboratory. The building was evacuated and no one was at risk. Darkness, snowdrifts, and 50 kts winds meant that the fire could not be brought under control, and they had to let it die out naturally after efforts to put out the fire with a snow blower and a small fire engine were futile. Winds picked up to 75 kts forcing the twenty-one wintering over personnel at the station to return to the safety of their main living accommodations. After all, the bottom line on any Antarctic fire is the safety and welfare of its people, and here there were no casualties. Well Done, Rothera.

Rothera is the center for the British biology, geoscience, and atmospheric science programs. The Bonner Laboratory opened in January 1997, and was equipped with sophisticated scientific instruments, a dive facility, and a marine aquarium. The main research programs supported at the Bonner Laboratory were Life at the Edge-Stresses and Thresholds and Antarctic Biodiversity: Past, Present, and Future. Both programs were studying the ability of organisms to cope with the harsh Antarctic

environment at a time of global warming and environmental change. (Excerpted from a British Press Release, see website [www....](http://www....) For additional details).

**THE GREAT HERSHEY HOAX.** Hershey Chocolate labors under the impressions that all people are fools, as they are displaying a Hershey bar which they claim came from the South Pole, buried there some 60 years ago. That's a pretty good act considering no one was at the South Pole from 1912 to 1956. Some explorer by the name of Douglas Troup- who's he? - found it in January 2000.

**ANOTHER CHOCOLATE STORY.** Back in the mid-fifties, this Antarctic Sandcrab read that people in Antarctica developed this craze for chocolate. So he entered into a personal agreement with Hershey for two large cartons of chocolate bars. These were placed into a large Conex container with his scientific equipment, locked and delivered to Davisville, Rhode Island for shipboard transportation to Little America V. In due time both the Sandcrab and the Conex container were on the Ross Ice Shelf. When he went to check out the container, lo and behold it had been broken into, and the two cartons of Hershey chocolate bars were missing! Then and only then did the Sandcrab realize that some Navy guy was really looking out for his health.

**SOUTH POLE IGY REUNION.** It seems that all reunions are popular, although the 50<sup>th</sup> may be the best as your clock is running down...and fast. Towards that end the Brits from Stonington Island in 1949-50 recently met in, of all places, Stonington, CT. And they invited their American cohorts from over the hill, members of the Ronne Antarctic Research Expedition, to join them. The worm turns, as in the beginning the word was put out from the American commander that the Ronne contingent was not to associate with the fellows over the hill! (note: we will provide a full report on what transpired at this reunion in our next newsletter).

A couple of months ago an ex-Navy man whom I was at the South Pole in 1958, one Ed White, thought that he would try and locate some of the civilians who were at the Pole with him. As he was computer literate, he went on the internet and asked the whereabouts of the oddest civilian name at the station, Dewitt Baulch. And it coughed up one name, that of Dee Baulch out in Colorado. But that was good enough, and Dee gave Ed my name, and now we are going to have an All Hands Reunion of all personnel who wintered-over at the South Pole in 1957 and 1958, the International Geophysical Year.

Altho it won't be our 50<sup>th</sup>, too many of us are dropping like flies and others are critically ill, time is of the essence. Taps have sounded for Paul Siple, Jack Tuck, Palle Mogensen, Vernon Houk, Steve Fazekas, Ron Mozetic, and Donald Norman. Eight out of thirty-seven gone, not a very good sustaining average, slightly less than 80%. And some of us still alive might be said to be The Walking Wounded, on our own Baatan March, Two of us, Kirby Hanson and Jim Burnham, have been fighting Parkinson for over a decade. When you get right down to counting the Able Bodied, well less than half. So is it any wonder that we are going to meet in Forest Hills, Georgia, next spring. The spear heading up this reunion is that same Ed White.

We now know where all but one of the winter-overs is located, so Ed has a great handle. That guy may not be altogether missing as much as being detained, as he was one of two of us who ended up serving time. Interesting talking to these folks about what they had been doing in the interim period since the South Pole. We all have read hi the papers and magazines about the accomplishments of the 1958 station doctor, Vern Houk, who made headlines for many years for his research at the Center for Disease Control in Atlanta. I don't think any of us who put up with him in 1958 ever picked him to achieve fame and glory. Another surprise was John Guerrero who was at the Pole hi 1957. He became a very active war correspondent in the Middle East for a Swiss news agency. John actually got shot up in Yugoslavia, but is aok now.

Not many people still working. Charlie Greene, '58, owns his own company and can not afford to retire. He is the only one still working in the polar regions, as he has made a lifetime out of studying sounds of whales in the arctic. Mario Giovinetto is still doing polar research, but from behind a chair at NASA in Greenbelt. A couple of years ago he was awarded a very distinguished medal/citation by his homeland, Argentina. Bob Benson, '57, is also working full time at NASA in Greenbelt, and Arlo Landolt, '57, is a full time professor at Louisiana State University.

One of the amazing things about the IGY Pole Cats is that many are repeaters, with at least two, Ed Flowers, '57, and Jim Burnham, '58, coming back to the South Pole in later years. Mario came back to the Pole on the first America over-snow traverse, and Kirby returned several times when he headed up the U.S. Clean Air Facility programs around the globe. Another interesting factor is that many new PhDs came out of those two years, seven in number. It is going to be an interesting Non-50 Reunion.

### **MISSING IN ACTION—MARINE EXPEDITIONS.**

About six short years ago Marine Expeditions was carrying about a third of the Antarctic tourist business to the ice on a fleet of suddenly available Russian ships. The> were charging the lowest fares of any of the Antarctic cruise companies and appeared on the surface to be doing fairly well financially. Then they expanded the company to include subsidiary outliers handling global trade. And suddenly their bubble burst, and hi spite of frantic sleight of hand efforts to salvage what had been a successful operation, they had to go belly up, declaring bankruptcy on June 6<sup>th</sup> of this last summer.

The TORONTO GLOBE AND MAIL of 9 June 2001 had a great understatement that read "Marine Expeditions had a checkered history." The company was formed by a young entrepreneur by the name of Sam Blyth, who took over a previous low-cost adventure cruise company called Polar Cruising Corporation. They seemed to keep their head above waters with their Antarctic operations, but when they started up the World Cruise Company, that was the beginning of the end.

Several of the members of our Society served as lecturers from time to time, besides myself who was with them for three seasons, Brian Shoemaker, Jeff Rubin, and Bob Dodson also lectured. There was a certain charm about lecturing for Marine Expeditions, but Pay Day something of a Russian Roulette. However, the travelers were of the finest kind, being in many cases low income people who had saved a few dollars to fulfill an Antarctic fantasy. There was none of this talk like I experienced on my first cruise where dinner conversation revolved around how many cruises each of the passengers had been on during their lifetime.

If I had a complaint about Marine Expeditions, it is that occasionally they did not hire qualified lecturers. I served two seasons where the so-called penguin expert had never seen a solitary penguin until they arrived hi Antarctica! And I was on three cruises where some of my fellow lecturers walked off the ship at the last minute. Once I found myself as the sole lecturer when the ship pulled out of Ushuaia! So life was both very exciting and very interesting with Marine Expeditions, but I thought their passengers were just great. I am truly sorry to see Marine Expeditions go belly up, I deeply appreciate the opportunities they gave me to return to Antarctica, and I loved their passengers. Thanks for the memories, they were glorious, especially on the old DISKO!

PENGUIN PRATTLE  
(KRISTIN LARSON)

"Today we are all Americans"...a phrase that resounded in all quarters of the globe in the aftermath of the attacks...and perhaps nowhere more acutely than in that emptiest of quarters: Antarctica. With the first rays of the sun on, or just below the horizon, and winter-overs full of excitement and dread about their pending release from the ice, September is already a very poignant time. This year particularly so.

Big ugly news hits wintering populations particularly hard. I know this from my own gripped emotions as news of the massacre in Tiannamen Square filtered in, and again when we learned of the fall of the Berlin Wall (not ugly but plenty big). The isolation of Antarctica gives both comfort and anxiety. When you are protected by an almost insurmountable buffer of time, temperature and space, fears of bombs and anthrax take on an almost surreal quality. On the other hand, the feeling of vulnerability and helplessness that comes with the happening of an absolutely unknowable and unthinkable event is greatly magnified and trenchant in winter Antarctica. Almost instantaneously a web of comradeship races out across the continent joining points of humanity at all outposts...the feeling of community is powerful and indescribable.

But now...it's November, the winter is long past for all but South Pole. A new research season is well underway, and from the sounds of it, impacts on the program have not been substantial. Some cargo planes have been diverted to other missions, some National Guards, who support flights to and within the continent, have been called to duty, and scientists traveling home with samples may face difficulties. These inconveniences seem trivial in comparison to the mental changes wrought by the altered landscape. And, as with other global aneurisms, we will remember just where we were when we heard the news, especially if we were part of that non-demoninational winter-over community.

## ARTANTICA

### *Random News about Antarctic artists and writers*

**Dr. David Wilson's Books: How to Get 'Em:** *Cheltenham in Antarctica: the Life of Edward Wilson*, is a concise biography of Dr. Edward Wilson, published by Reardon Publishing in December 2000. It is co-authored with David Elder, a local Cheltenham librarian, who helped with the Cheltenham research (Uncle Ted grew up in Cheltenham). This book can be ordered directly from David

via airmail if you would like a signed copy. It works out to US\$21 with postage and packing. Dr. Wilson's other book, which is due out this week (also from Reardon) is *Discover Illustrated: Pictures from Captain Scott's first Antarctic Expedition* is co-authored with Judy Skelton (the main expedition photographer's granddaughter) for the 'Discovery' expedition centenary and contains over 500 pictures of the expedition and extracts from Skelton's and Wilson's diaries. This is a heavy book to post and is cheapest by surface mail (delivery in 4-6 weeks). Signed copies via surface mail, are US\$75. This centenary issue of the book is limited to 2,000 copies. There is also a collectors edition which is hand finished, boxed, numbered and limited to 100 copies at US\$120. Both books should be available through Barnes and Noble or Dalton Book Dealers, except for the special issue, which is not available via bookshops and is already over half sold.

TO ORDER: David cannot accept personal checks, however he is happy to accept dollars in cash, or alternatively he can accept international money orders in sterling (£14 for "Cheltenham in Antarctica" and £50 for "Discovery Illustrated; £80 for the special edition). The address is: 71 Myddelton Avenue, Enfield, Middlesex, EN1 4AQ. United Kingdom.

**PAINTERLY POLAR-PHILES.** A wonderful show highlighting the beauty and whimsy of life in Polar Regions is now on at the Meridian International Center in Washington DC (1624 Crescent Place, NW), through January 4. It features the work of NSF grantee Alan Campbell whose beautiful paintings of many Antarctic quadrants gives great reinforcement to the ongoing sponsorship of artists by NSF's Office of Polar Programs. The show also includes the prints of Inu'it artist Jessie Oonark and the huge photographs of Icelander Pall Stefansson. So for those of you in the hinterlands, this should serve as evidence that there is more to do in the nation's capital than contemplate gas masks and argue budgets!

**WU GETS WOWS.** Norbert Wu, recipient of several Antarctic artist-writer grants for his exquisite underwater photographs and cinematography tells us that his upcoming film, *Under Antarctic Ice*, will air on PBS in February or March 2002. The script was developed by Michael Parfit (the well-known author of *South Light*), and is narrated by film star Hilary Swank. Norbert, who was present for film's<sup>1</sup> premier at the Jackson Hole Film Festival, feels that the film moves along nicely and accomplishes the goals that he set out for this latest project. It vividly captures both the underwater community of McMurdo Sound along with telling tales from the local human community. Norbert's searchable database of images can be found at [www.norbertwu.com](http://www.norbertwu.com) or [www.norbertwustock.com](http://www.norbertwustock.com)

## TREATY MATTERS

**HOME SWEET HOME.** For those of you who follow such things, the fact that the Antarctic Treaty finally has a place to hang its bunny boots, is pretty exciting news. Unlike most other treaty-created organizations, the Antarctic Treaty System (ATS) has been homeless since its establishment in 1961, relying, instead, on the rotating host country for its annual meetings and coordination.

There are several reasons for the peripatetic nature of the ATS, one is that it has not always been as complex as it now is; complexity brought about by the increasing need for coordination of environmental protection protocols, growing membership, and a trend towards complicated multi-nation scientific missions. The other reason is steeped in historical rivalry that has existed between the United Kingdom and Argentina. It seems that over the past decade or so, the prime candidates for the Secretariat have been Australia or Argentina. However, Australia is already the home for CCAMLR (Convention on the Conservation of Antarctica Living Resources), so the general consensus has increasingly favored Buenos Aires...that is, for all members but the UK. Recall the small matter in the Falklands Islands. However the landscape has apparently thawed and during this year's annual Antarctic Treaty Consultative Meeting in St. Petersburg, Russia, it was announced that Argentina would be the Antarctic Treaty's new home base. When's the house warming?

**SPEAKING OF NEW HOMES.** Looks like our Czech friends may soon be joining the swarms of Antarcticans at King George Island and become the 10<sup>th</sup> nation to build a scientific base there. Their 10-person summer base is planned for Turret Point on the island's southeast end. Break out the Pilsner Urquell!

**OF BIRDS AND FISH.** There is not too much in common between these denizens of two vastly different realms, but a new international agreement protecting Southern Hemisphere albatrosses and petrels has been signed precisely because of their linkage to one another. The purposeful mortality of one (the fish) has led inadvertently to a precipitous decline in the other (the birds). The new agreement comes under the 1979 Convention on the Conservation of Migratory Species of Wild Animals, and protects 21 albatross species and seven petrel species. While this new albatross agreement focuses primarily on habitat and pollution control, it is complemented by recent developments under the CCAMLR agreement. In their meeting last month parties to CCAMLR devoted considerable time to discussing methods that will minimize the huge bird by-catch

problems associated with toothfish (Chilean Sea Bass) long-lining. Polly Penhale, one of the US Delegates to that meeting will provide details in our next newsletter. So if you like your sea bass on a plate, but also enjoy leaning over the rail of your favorite ice breaker watching those acrobatic albatross wheel in your wake, hope may be at hand.

**CRUISE NEWS.** While we plan to give you a full report on the current cruise season in our next letter, there were a few tidbits that seemed worth gnawing on in the interim. According to a recent story on the Australia-based Antarctic website ([www.antarctican.com](http://www.antarctican.com)), the International Association of Antarctic Tour Operators (IAATO) is in the process of "revamping" their membership options to include two new categories. One of the new categories is for "big ships" that can carry upwards of 500 passengers to Antarctica. Under the old rules, membership in the highly effective IAATO organization was limited to ships carrying less than 400 passengers. One of the primary reasons for the change that allows for bigger ships is that these behemoths would probably have cruised to Antarctica anyway...what is it they say-about the devil you know? The other notable new travel category is "air cruising" which is set up to accommodate a new plan for flying tourists to Antarctica to meet ships for shorter duration cruises, thereby circumventing the memorable Drake. More on all this soon. But while I am on the topic, thanks again to Greg Mortimer of Aurora Expeditions for taking time during the June IAATO Meetings in Washington DC for sharing slides and thoughts about his tasty little adventure ventures in Antarctica.

**ICE-CESSIVE.** Reports are coming in that this year's wintering crew in McMurdo never saw open water in front of the station!!! Hard to imagine that, I mean open water is: one of the privileges of wintering...taking those stunning photos of mist rising off the sound into caramel colored light with the dome of Mt. Discovery in the background. But, according to Dave Bresnahan, the big ice berg, known (or, in some cases, cursed) as B-15 has lodged itself into a position that greatly tempers wind flow into McMurdo Sound. Without the usual winds and associated wave action, the so-called annual ice around Ross Island has failed to break-up and float out as it does most years. As a result, the ice in front of McMurdo Station is already 10 to 15 feet thick and growing and also covered in rough sastrugi and pressure ridges. This is in contrast to the usual 3-5 feet thick, smooth annual ice that is perfect for ice runways and Weddell seal foraging. This development will undoubtedly have impacts on both the logistics and science of the coming season, and we will be keeping tabs. To monitor the ice from the comfort of your desk go to <http://uwamrc.ssec.wisc.edu/amrc/icebergmain.html>.

South Pole Station, September 2001

Bonner Laboratory  
Rothera Research Station  
January 1997 - September 2001

The Bonner Laboratory at Rothera Research Station has been completely destroyed by fire. Burning stopped in the early hours of Saturday (29 September) local time following heavy snowfall. The cause of fire is still unknown-investigations are underway.

# THE ANTARCTIC SOCIETY

7338 Wayfarer Drive Fairfax  
Station, Virginia 22039

**HONORARY PRESIDENT - MRS. PAUL A. SIPLE**

Vol. 01-02

January

No. 2

## ANTARCTIC SOCIETY CHANGES

### Presidents

Dr. Carl R Eklund 1959-61  
Dr. Paul A. Siple 1961-62  
Mr. Gordon D. Cartwright 1962-63  
RADM David M. Tyree (Ret.) 1963-64  
Mr. George R. Toney 1964-65  
Mr. Morton J. Rubin 1965-66  
Dr. Albert P. Crary 1966-68  
Dr. Henry M. Dater 1968-70  
Mr. George A. Doumani 1970-71  
Dr. William J. L. Sladen 1971-73  
Mr. Peter F. Bermel 1973-75  
Dr. Kenneth J. Bertrand 1975-77  
Mrs. Paul A. Siple 1977-78  
Dr. Paul C. Dalrymple 1978-80

Dr. Mort D. Turner 1982-84  
Dr. Edward P. Todd 1984-86  
Mr. Robert R. T. Dodson 1986-88  
Dr. Robert H. Rutford 1988-90  
Mr. Guy G. Guthridge 1990-92  
Dr. Polly A. Penhale 1992-94  
Mr. Tony K. Meunier 1994-96  
Mr. Ron Naveen 1996-98  
Dr. Paul C. Dalrymple 1998-00  
Ms. Kristin Larson 2000-02

### Honorary Members

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

We have good news and we have bad news. First, the bad news, Ruth Johannesmeyer Siple is aging. Now the good news, she is still alive at age 90. But she has macular degeneration of the eyes, and cannot see to perform all the editing and typing of the newsletters which she has done at no cost to the Society for the past twenty-three years. And you know what, even though she is not a typist, she could type a ten-page newsletter in one day, without a single typo error. The Society had a gold mine in Ruth, but the time has come for us to put her out to pasture, and for us to stand on our own two feet as a Society. Damn, double damn.

So we are in a transition period. Most of you know John Spletstoesser, who has been on the Antarctic scene as a scientist, as an administrator, as a lecturer, as an editor for over forty years. Right now he is sort of an experiment for this orthopedic surgeon here in Maine who is trying to put his ankle back into one piece. He broke it some sixteen months ago when he was aboard a helicopter, on a Russian cruise ship, which crashed near Novaya Zemlya, on a return flight to the icebreaker. Recently he had to have the ankle rebroken, which means that this excellent editor is nearby and can fill Ruth's editing shoe for at least two newsletters. So we are putting this together on midcoastal Maine, which looks sort of like the Antarctic with snow and ice.

But a nearby neighbor is in the computer business only for money, so we have to reimburse her for services rendered. For so many years, our Society has kept its dues at a ridiculously low figure, as we had franking mail privileges, which meant we were getting the newsletters out for mere pennies. Then the Postal Services had to find a way to finance Lance Armstrong's bicycling and the Olympics, and we had to go first class mailing. But we kept the same old dues for some stupid reasoning. And we compounded that by putting colored pictures in our last two newsletters. We never should have done it, as you liked it. So we have created a new monster. Now you are going to have to pay for it, or at least part of it, as we are going to raise our dues. It is only going to be a couple of dollars right now, but we could take a lesson from the Postal Service and put it up every two years! Our billing period is now going to be by calendar year, so you are getting six months gratis. Look for your bill in the next month, and please note that they are to be returned to this address in Maine (*P. O. Box 325, Port Clyde, ME 04855*). Ruth will officially still be our treasurer, but her eyesight is such that she can no longer see well enough to handle your checks.

*' Whirly Bird' McCormick, autogyro pilot on the 2<sup>nd</sup> Byrd Antarctic Expedition, died at age 88 on October 23<sup>rd</sup>.  
Probably last surviving member of the expedition. Obituary will follow - See Page 7.*

**BRASH ICE.** There has been a proliferation of Antarctic books during the last six months, and this issue of the newsletter is reporting on three of them. But there are others which we could have covered except we ran out of space. Simon and Schuster has come out with **SOUTH WITH ENDURANCE**, Shackleton's Antarctic Expedition 1914-1917, The Photographs of Frank Hurley. If you have an acute case of Shackleton Mania, buy this one, especially if you love Frank Hurley, only \$50.00. Then there is **DISCOVERY ILLUSTRATED**, Pictures from Captain Scott's First Antarctic Expedition by J. V. Skelton and D. F. Wilson. If these names ring a familiar bell, they are descendants of their famous Antarctic uncles. Published by Reardon Publishing, it sells for \$75.00. There is also a luxurious special edition. Add another \$100 for that one.

We would like to mention again **THE COLDEST MARCH** by Susan Solomon, published last September by the Yale University Press, \$29.95. **CBS'S SUNDAY MORNING** gave it priceless publicity, devoting over ten minutes to the book and to Susan's career. In this newsletter I fell in love with **CHERRY**, a great book by Sara Wheeler about Apsley Cherry-Garrard. Then you will find a review of an excellent profusely illustrated encyclopedia type book on Antarctica which everyone should own. \$60.00. And the piece de resistance is a \$2,500.00 work of photographic artistry reviewed by Charles Swithinbank. PLEASE read the newsletter, as there are a couple of news articles which we accidentally slipped in.

**RUTH J. SIPLE, AN ENIGMA.** How do you write about a person ninety years old and make it sound like she was still living? And how do you write about a person who never exposes herself, who keeps her own thoughts to herself as if they were classified TOP SECRET.

I have probably known Ruth Siple closer than any member of our Society, as we have worked as a twosome running the Antarctic Society business end since 1978. But I don't really know Ruth Siple, and Ruth Siple does not really know me. When I became Ruth's close friend, Ken Moulton uttered the truest words ever spoken. "What is Ruth Siple doing with you?" But we had a common denominator, the Antarctic, and through it and the Society we both grew to enjoy working with one another. I knew her late husband Paul as we both worked for the Army, and he was responsible for giving me the opportunity to take my program, micrometeorology, from Little America V in 1957 to the South Pole in 1958. But I never met Ruth until the mid 1970's.

A lot of you people just see Ruth at our functions, and you treat

her Queenly befitting her personality. And you probably think Ruth has a multitude of close friends. Negative. She is so inward that she hardly even knew her own neighbors in Arlington. The Antarctic Society became her life after the National Geographic retired her prematurely on account of her age. She was our treasurer, she deposited your checks, she was our editor, she was our typist, she was our mailer of everything from calendars to newsletters, she handled our correspondence, and other unassigned duties which she took upon herself.

Now is the time for you guys and dolls to write her a short note of appreciation. If you have not sent her a Happy Birthday card, do so now. She's counting, has 41 as of today! She isn't exactly a happy camper, can no longer drive, has difficulty with her mobility, occasionally falls, needs a walker to get around, and is more or less confined to her second floor apartment which is attached to her granddaughter's home outside of the Beltway in Washington. She is not aging gracefully, wishing to be in her sixties, not her nineties. As the oldest of seven children, she finds herself as one of two survivors. Even if you don't know her, make her day, write her and say "Thanks" for her Society efforts. (**Ruth J. Siple, 7338 Wayfarer Drive, Fairfax Station, VA 22039**)

**PRELUDE TO CHERRY.** To us one of the most interesting characters to have ever gone to the ice was a man with the unlikely name of Apsley Cherry-Garrard. It wasn't that he was over qualified to go and brought some unusual expertise to the ice. To the contrary, he had no basic skills at all. His forte, if anything, was hunting. But he cut quite a circle when he got to the ice, and was a select member of the first mid-winter party to visit Cape Crozier, which eventually resulted in the best known and appreciated book on the Antarctic. Cherry also led a two-man party which went out to meet Captain Scott's party returning from the South Pole, and Cherry became infamous for returning to Cape Evans as his supplies started to run out, not knowing that the last three living members of the South Pole party were in deep, deep trouble a scant twelve miles away.

So nearly everyone who knows anything about the history of the Antarctic is well aware of the name of Cherry-Garrard. But no biography had ever been written on Cherry. The well-known British polar biographer, Roland Huntford, admitted that he had no interest at all in doing one on Cherry, and he told Sara Wheeler, another Brit, another Antarctic, who was the author of a very popular book, **TERRA INCOGNITA**, that Cherry's

bio should be done by a woman. Now read this opinionated Antarctic review of the biography that Sara very recently did on Cherry, which has received excellent reviews in the U.K. The book will not be available in the USA until this coming spring.

**CHERRY. A LIFE OF APSLEY CHERRY-GARRARD** by Sara Wheeler, published by Jonathan Cape, London, 2001. 354 pages. (Reviewed by Paul C. Dalrymple.) This fine book is exceedingly readable, written plainly and simply, about a simple man who had the fortune to be highly selective of a father who inherited wealth and prestige, extensive land and house holdings and whose ancestral tree revealed a cousin, Reggie Smith, who had the proper connections to put young Cherry into contacts with the proper people. One of the doors which Reggie opened for Cherry found the famed Antarctic naturalist, Dr. Edward "Bill" Wilson waiting to meet and guide Cherry. An adjacent side door found the leader of the DISCOVERY Expedition, Robert Falcon Scott. And Cherry himself could not have hand picked a better neighbor for his future life than an accredited writer with the initials GBS. Yes, George Bernard Shaw lived next door!

Sara's book is very interesting, it is very exciting, and it is fast moving. Many of the key players in Cherry's life are household names to most Antarcticans, so you are reading about the Kathleen Scotts and the Sir Clement Markhams, a cast of players already well known to us. Cherry was a sailboat without a rudder in early life, but he was interested in adventure, and through his cousin, Reggie, applied for the TERRA NOVA Antarctic expedition. Reggie suggested that he might enclose a check for a thousand pounds, as it was no secret that the expedition needed money, and it was no secret that another man, Gates, had bought himself onto the expedition. Cherry still got turned down, but he did something which visibly impressed Capt. Scott, he left his check for a thousand pounds on the table. Cherry was ACCEPTED.

Cherry had what amounted to a free ticket, but he was such a willing and diligent guy, with a cheery disposition, that he found his time over-subscribed. But through it all Bill Wilson remained his faithful mentor, and was Cherry's Southern Cross. Wilson selected Cherry and everyone's All-Antarctic, Birdie Bowers, to be his assistants on a mid-winter journey to study the emperors of Cape Crozier. It was a bastardly trip weatherwise, but it bonded Wilson, Bowers, and Cherry forever. It wasn't an all natural bonding, as both Wilson and Bowers were deeply religious persons, and Cherry avoided the church (except his checks always found their way to the pulpit). This trip became the main story in a book which Cherry

later published, **THE WORST JOURNEY IN THE WORLD.**

But the trip made Cherry. Everyone held him in such high regard that he was always near the top of the list for anything hazardous. He went with Scott onto the South Polar Plateau but lost out to Oates for the South Pole on a seniority judgment call. Cherry had traveled 575 miles, pulled his sledge beyond 85 degrees South, and had risen about 7000 feet. At the end of the expedition he had sledged 3,059 miles, more than any other man. He had clocked thirty-three weeks and four days on the Barrier (Ross Ice Shelf) and been away from base camp at Cape Evans for forty-eight weeks and four days.

But in spite of all the great things that Cherry did, one thing haunted him for the rest of his life, that he never made an attempt to go beyond One Ton Depot searching for his two closest friends, plus The Owner (as Scott was called). One must read the book to get the details of what happened, what did not happen, but it pretty well exonerates Cherry of any failures on his part. He wasn't a great skier, and he could not navigate, so perhaps he wasn't the best choice to go to One Ton Depot. However, one must remember with many people out in the field, there wasn't much choice. But the press was not kind to Cherry. And he carried his burden of not making an attempt to his grave, and it wore very heavily on his shoulders. He was not a happy man, nor was he a healthy man, in later life. But on The Best Journey of the World, a cruise, he, at age 53, finally met and married the right woman, Angela Turner, thirty years his junior. Cherry had dated a voluminous number of ladies along the way, but had never met one with whom he wished to share his life until Angela came along. He died twenty years later, not from trying to satisfy a young woman, but from many illnesses that plagued his late years.

Cherry's best years were on the ice, and what really made him famous was his book, **THE WORST JOURNEY IN THE WORLD.** It is hard to tell how much influence Shaw had in the writing of this book. Originally Cherry had picked out its title as NEVER AGAIN, SCOTT, SOME PENGUINS AND THE POLE, but Shaw convinced him that it should be called **THE WORST JOURNEY IN THE WORLD.** In Shaw's later life he claimed that the whole book had been his wife Charlotte's idea. Sara wrote "But without the Shaw's encouragement, **THE WORST JOURNEY** may have remained an official document; and perhaps the dullest story in

die world." Be that as it may, it was the bottom line for Cherry's one claim for fame. He was universally respected and loved by most members of the expedition, and he deserved a better fate than what life dealt him in his late years.

This book would make a most fantastic movie, as it is full of high drama, and is melodramatic throughout. There is not much in the book to laugh about, but then Cherry's life was never a barrel of laughs. One thing which Americans who went to the ice via Christchurch in early Deep Freeze can equate to was when the TERRA NOVA docked in Capetown en route to the Antarctic, and Birdie Bowers and Cherry picked up two sisters. Cherry admitted to "making hay" with one, so he was human after all. The only other funny thing in the whole book was when Bill Wilson once asked Cherry if he had cold feet, and Cherry answered that they were "very cold." To which Bill replied, "That's all right, so are mine!"

The book is GREAT. Buy it and enjoy it.

**CAPE CROZIER PENGUINS, WHERE ART THOU?** What is going on with the penguin colonies on Ross Island? The numbers are just not there this summer. When Jerry Kooyman and other researchers arrived at Cape Crozier in early November, "We found a few abandoned eggs and a few dead birds. It was a sad scene. Emperors have very little mobility when they are incubating eggs. They seek a stable, quiet place, and that has all changed. The bottom line is that the colony did not fledge any chicks." Winds and currents moved the large icebergs off Ross Island (see the December 2001 issue of the **NATIONAL GEOGRAPHIC**) during the Antarctic winter, crumpling the smooth sea ice and disrupting the males with their chicks. The McMurdo sea ice was slow to break up this season because two large icebergs kept ocean swells out of the sound.

The icebergs and sea ice are threatening one of the continent's largest collections of Adelie penguins. Numbers of Adelie penguins at Cape Crozier, about 130,000 breeding pairs in most years, are at the low side of the normal range according to David Ainley. The small Adelie colony at Cape Royds will "fail totally" this year, he says.

Must be the first setbacks that Shackleton has had in years!

**GLOBAL WARMING WITH AN ASTERISK.** The UN Intergovernmental Panel on Climate Change has concluded that there has been a net rise of 0.1 degree Fahrenheit per decade in the 20\* century, a calculation which includes Antarctica. BUT, scientists working in the Dry Valleys of East Antarctica have found that

temperatures have been dropping there at a rate of 1.2 degrees Fahrenheit. This at a time when huge bergs have been breaking off the Ross Ice Shelf, and where temperatures have been rising significantly on the Antarctic Peninsula with mass disintegration of the Larsen Ice Shelf. Peter Doran of one of NSF's Long-term Research projects said that the temperatures get warmer when the wind blows and when there are clouds in the sky. He said as the air rolls down off the Antarctic Plateau into the Dry Valleys, it compresses and heats up, very similar to Chinook winds here in our western states. But Michael Oppenheimer, chief scientist for Environmental Defense Fund, warns about jumping at any conclusion, saying "there's simply not enough data to make a broad statement about all of Antarctica."

### **HEAT WAVE MELTS ICE, FLOODS VALLEYS (THE ANTARCTIC SUN, Melanie Conner)**

On December 30, 2001, the temperature at McMurdo reached 5 IF (10.5C), an all-time high for the station. The previous record was 49F (9.4C) during the mid-70's. The warm streak did not end there. In the first week of January the temperature reached 50F (10C). "It often reaches temperatures in the 40's in the summer, but it doesn't usually stay in the 40's for a long time," said Jim Frodge, meteorology manager at McMurdo Station.

Meanwhile, resident-workers at Amundsen-Scott South Pole Station are experiencing a similar heat wave this month. Last week, the temperatures climbed to plus 5.4F (-14.8C). "The last time it was above OF was in January 1985," said John Gallagher of the South Pole meteorology department. "It's quite rare to be on the plus side of zero here." In November, five daily high temperature records were broken at the Pole and the temperature hovered about 5 degrees above normal throughout the month, bringing the average up to minus 32F (-36C) for the month. "But the real warm weather has been in January," said Gallagher. "The average temperature so far for this month is minus 8.7F (-23C), which is warmer than it ever got during the past two summers."

Scientists in remote field camps at the Dry Valleys, 60 miles northwest of McMurdo, are experiencing their own transportation woes as glacial runoff has saturated much of the area by turning pathways into impassable rivers, streams and lakes. "Last year the streams didn't always make it all the way

to the lakes," said grantee Chris Jaros of the University of Colorado - Boulder. "This year, you have to wear gaiters to get around."

According to Jaros, the excess runoff forces them to travel around the water to collect the data from the streams. To navigate the area, many scientists are resorting to using precious helicopter time to fly around the once-walkable lakes of the Dry Valleys. "Instead of walking for eight hours a day around the water, we have to helo from place to place," said Jaros. Despite the difficulty getting around, scientists are puzzled and fascinated by this year's warm temperatures, as they consider the rarity of the flash-flood-like waters in the Dry Valleys. For example, one small stream that flows into Lake Fryxell was reported by scientists to flow at a rate of 38 cubic feet per second (CFS). Last year the same stream had a maximum flow of 5 CFS.

**ANTARCTICA AND THE ARCTIC** by David McGonigal and Lynn Woodworth, published by Firefly Books of Toronto, 608 pages, 2001. (Published in Australia and New Zealand as **ANTARCTICA - THE COMPLETE STORY**, The Five Miles Press.) This is a FANTASTIC BOOK at a FANTASTIC PRICE, packaged in a FANTASTIC BOX. Anyone who calls themselves a Pole Cat, especially an Antarctic, should have this in their library as over 90 percent of the book is devoted to the Seventh Continent.

The boilerplate for this book had to be another Australian production, the Readers Digest's **ANTARCTICA**, published in 1985. If you liked that great book, you are going to love this one, as it has been choreographed to near perfection. Plus a feature which we believe has never been done for a polar book, a CD-ROM! So you can pop the CD into your computer, and it will all become very much alive in breathless color reproduction right on your monitor. Keep your book, but loan the CD to your mother-in-law in Peoria.

The book is a team production resulting from the collaborative efforts of thirty experts on the polar regions, most of whom are Australians. However, they were kind enough to allow our own Art Ford to write the chapters on such things as rocks, ice sheets, glaciers, and to hypothesize on what will happen when those things which melt do melt. A couple of other Americans show up as contributors, Gary Miller and Rob Stephenson, plus the Canadian icebreaker extraordinaire, Pat Toomey. It is always reassuring to see that the most highly respected Antarctic historian from the U.K., Bob Headland, had his hand in this production. And we must not forget Bernard Stonehouse, an expert on everything Antarctic. But I must question why they asked Peter Hillary to write the chapter on global warming, although the good news is that it is limited to one page. We were disappointed that Paul Lehmann, atmospheric physicist, did not

find room in his chapter on ozone to mention our own Susan Solomon.

There are five main parts in the book: Ends of the Earth, Polar Regions, Polar Wildlife, Polar Exploration, and Life at the Poles. The wildlife section is especially good, with ten pages on the albatrosses, another fourteen on the fulmars. Whales, dolphins and porpoises occupy twenty-nine pages. The part of the various Antarctic regions was quite good, although the parts on the various explorers, divided into early, heroic, and modern, did not compare with the Readers Digest's coverage. For example, Admiral Byrd only merited two pages, the same as devoted to Sir Hubert Wilkins and to Mawson's pilot, John King Davis! But Byrd was NOT born in Australia!

But what makes this tome so outstanding is that it marries some of the most beautiful pictures you ever saw of Antarctica with legible maps, all interwoven into the text consisting of 159 chapters. I am a visual man, as well as a geographer, and took great personal delight in the seven full-page maps, including one on, believe it or not, "non-existent Antarctic islands." That just goes to show you the completeness of the book! There is one double page map of Antarctica, as well as eighty thematic maps of Antarctica showing wildlife distributions and explorer's routes. There are individual special notes on more than 100 animals.

There are 46 full-paged photographs. I have never seen such illustrations/graphics, really beautiful. And they seem to be enhanced even further on the CD. The book contains over a thousand stunning photographs! But I would have loved to have seen some of Ed Stump's great photos taken in the Transantarctic Mountains, as well as some of the majestic pictures I've seen of the interior of the crater of Mt. Erebus. There is only one picture which does not belong in the book, one of a woman lying on the snow surface with a penguin. One of the beauties of this book is that the environment is front and center. Some of the photos are not identified, as they stand by themselves as works of art. It is fun to recognize places dear to you, such as the grandeur of the mountains and glaciers seen from Petermann Island. God, what pictures!!

If you only want one Antarctic book in your library, it should be this one, as it has everything in it that you will ever need to know about the continent. Tourists no longer must go to Antarctica, they don't have to endure the Dreaded Drake, all

they have to do is buy this book, read this book, and enjoy its photographs. This is a book for COMPLETE ENJOYMENT, COMPLETE FULFILLMENT.

If you want this book, you should contact **Firefly Books Ltd., 3680 Victoria Park Ave., Wfflowdale, Ontario M2H 3K1**. Attn: Lesley Anderson. If you wish to place your order by phone, call Lesley (416) 499-8412 (133). Her e-mail address is: [lesley@fireflybooks.com](mailto:lesley@fireflybooks.com). Oh yes, the price, \$60, US style. Lesley is handling and shipping all books at no charge to members of our Society, and they will be shipped in a handsome presentation box. I put my wallet in my mouth, bought six copies!!

**ANTARCTICA** by Pat & Rosemarie Keough (Nahanni Productions Inc., 2002). Reviewed by Charles Swithinbank.

This is the first Antarctic book that may require a Sherpa to bring it to your home, a lectern to display it, and a special bookcase to put it in. But make no mistake, it is something that you will treasure for life.

It is not the first large-format volume of superfine Antarctic photographs by professionals who have spent years traveling in the Antarctic. What distinguishes this is the unmatched quality in every aspect of its production. The book is published in a limited edition of 950 leather-bound volumes, each one signed by the authors and by Her Majesty Queen Noor of Jordan, Honorary President of BirdLife International. It was unveiled on January 14<sup>th</sup>, 2002 during a reception hosted by HRH Prince Charles of St. James's Palace, London. The authors have agreed to give the net proceeds from **Antarctica** to BirdLife International for their Save the Albatross campaign. An incidental consequence of current longline fishing practices is that 16 of the world's 18 species of albatross are now at risk of extinction. Attracted to the baited hooks, seabirds are hooked or entangled and then drowned as the trailing lines sink behind the fishing vessels.

**Antarctica** weighs 12.6 kg (27.8 lb.) in its linen-bound presentation case, and 8.6 kg (19 lb.) by itself. The book itself measures 44 x 34 x 6 cm (17 x 13 x 2.5 inches), contains 330 color images taken by the authors, a 15-page narrative, a map and a glossary of ice and snow terms.

The Keoughs have assembled a stunning and eclectic portfolio of such artistry that your reviewer was left speechless. It embraces wildlife, landscapes, abstract patterns in nature and touches of man from the heroic era through the heyday of whaling to the present. I was transported from the windswept interior plateau to the

mountainous coast, from off-lying islands to the icy seas and the stormy ocean. The volume is a stress-free way to experience the wonders of Antarctica with all its savagery and beauty. For connoisseurs of photographic art and for collectors of fine books, **Antarctica** will greatly please.

My own regret is that I was not able to rummage through the Keoughs trash bin on the morning after they made their selections for the book. I could have sold my redundant camera. But remembering Herbert Ponting and Frank Hurley before them, I expect they will have fueled their log fire in the backwoods of British Columbia with most of the rejects.

The authors traveled to the Ross Sea, the Weddell Sea, Ellsworth Land, the Antarctic Peninsula and South Georgia. The book includes a map of the continent with insets of the Ross Sea and the Antarctic Peninsula showing place names mentioned in the text. South Georgia, being peripheral to the main theme of the book, has no map of its own.

Each image has a brief but adequate caption. Most of the scenes would look fantastic on an IMAX screen. Having myself been to most of the places that the Keoughs visited - some in their company - many of their photographs brought a pang of nostalgia. But as I lack the eye of an artist, I had looked but seldom appreciated the stark beauty of what I was seeing. If tempted to tear out the pages to frame, Antarcticans will discover that with a properly bound book like this, it is almost impossible.

As I watched the Keoughs in the Antarctic, they almost always had their cameras on a tripod, surely a major factor in creating such pin-sharp images. The authors themselves inspected each page of every book (some 400,000 pages in all) before sending them to the bindery. To make the high quality binding, some 2000 goatskins from India were specially tanned in Scotland. To counter the squeamish, we are told that semi-wild goats are destroying plant diversity, and that fewer goats equate to a healthier natural environment.

The images are printed on custom-made acid-free and chlorine free heavy paper, hand-sewn with Irish linen thread using centuries-old techniques. Treated with care and kept in dry and pollution-free conditions, the book should last for 1000 years. It is the first photographic art book in the world to have been printed with 10-micron stochastic spots, a leading edge printing

technology with three times the resolution of traditional high-end lithography.

Pat and Rosemarie's company, Nahanni Productions Inc., have previously published six books featuring their images exclusively. Titles include *The Nahanni Portfolio* and *The Niagara Escarpment*.

**Antarctica** is the first of their Explorer series. The book can be yours for \$2,500 US and is obtainable from Nahanni Productions Inc., 400 Meyer Road, Salt Spring Island, British Columbia, Canada V8K 1X4. (Phone: 250-653-4993; e-mail: [keough@saltspring.com](mailto:keough@saltspring.com)) In buying the book you will help to ensure that your children may live to see the albatross still wheeling and soaring over the ocean - no longer threatened by the greed of man.

**ANTARCTIC TOURISM**, as told by the IAATO Secretariat, Denise Landau.

In 1991, the increase in number of operators and concern for the environment resulted in the formation of the International Association of Antarctica Tour Operators (IAATO) by seven companies, in order to act as a single voice in concerns of tourism and to advocate, promote and practice environmentally responsible private-sector travel to Antarctica.

Today IAATO has grown to 49 members representing 12 countries and one U.K. overseas territory. Members are mainly all business competitors of one another. This in itself is a unique situation and not found to such an extent anywhere else in the world. The members comprise ship operators, one land-based operator, one fly-cruise operator, travel companies who charter ships, one helicopter operator, adventure-type travel agencies, ship agencies and government tourism offices. Many of the operators also offer trips in the Arctic and the same guiding principles are applied in both Polar Regions.

IAATO comprises Full, Provisional, Probationary and Associate Member categories. Until June 2000, members of IAATO could not operate vessels to Antarctica WITH CAPACITIES OF MORE THAN 400 passengers. In June 2001 at IAATO's annual meeting in Washington, B.C., IAATO Full Members boldly agreed to lift the 400-passenger ship limit and develop new categories in order to encompass the changing nature of Antarctic Tourism.

The present seven categories of membership include: 1) Expedition Ships or Yachts that carry less than 200 passengers. The limit of 100 passengers ashore at one site at one time remains in

force; 2) Vessels carrying 200-500 passengers who are intending to land passengers. Stringent restrictions on landing activities of time and place could apply. The limit of 100 passengers on shore at one site at one time also applies; 3) Cruise ships making no landings (cruise only). Cruise ships carrying more than 500 passengers are not permitted to make any landings; 4) Land Based operations; 5) Air Operations with Over Flights only; 6) Air/Cruise Operations; 7) Associate Members (remains unchanged).

The increase in membership does not coincide with tourism numbers skyrocketing. What it does show is that companies are becoming increasingly aware of IAATO and want to be members of an environmentally sensitive organization that addresses environmental concerns.

Sea-borne Tourism for the last 10 years ranged from about 6,700 passengers in 1992-93 to 12,100 in 2000-01, with a peak season of 14,600 in 1999-2000. An additional 900+ in the latter season visited Antarctica on a ship that made no landings. Land-based tourism has been relatively consistent throughout the last 10 years, averaging 70-140 tourists per year. Projections of sea-borne tourism through the 2005-06 season indicate a gradual increase to about 20,000 visitors, but figures may fluctuate based on market conditions, declines as a result of the 9/11 terrorism incident, and factors such as large ships that visit Antarctica but make no landings. The current season shows estimates of about 13,000 sea-borne visitors on 20 tour vessels.

**WHIRLY BIRD'S WINGS CLIPPED.** William S. McCormick, autogyro pilot of the Second Byrd Antarctic Expedition, finally died at age 88 on October 23<sup>rd</sup>. He very well may have been the last survivor of that expedition, as efforts to locate Olin Stancliff and Guy Hutchinson have been futile. If so, that leaves Mr. Indestructible, Norman Vaughan, as the sole surviving Byrd Man. Whirly Bird was a nice guy, a very nice guy. He earned his pilot license at the age of 16, and was the youngest licensed pilot in the USA. When he was twenty, he accepted a position with Byrd as his autogyro pilot. After rooming with the likes of Bud Waite, he returned to California where he roomed with Glenn Ford and performed as an extra in a number of Hollywood films. Whirly Bird then became a commercial airline pilot for Western Air Express, then flew for American Airlines for thirty-three years.

The last four years of his career were spent flying servicemen and women as part of the Vietnam Airlift. Besides flying his favorite things were classical music, dancing to the big bands, playing the piano, and golf. But it is said that his greatest love was Mimi, who he looked at across the breakfast table for close to sixty years.

In the fall of 1988, there was a polar gathering at The Ohio State University, and quite a few Byrd men showed up to hear Peter Anderson give our annual Memorial Lecture, this one on Admiral Byrd. The late Al Lindsey also spoke on another evening about life on the 2<sup>nd</sup> Byrd Antarctic Expedition. There was a cocktail party reception on one of those evenings, and Whirly Bird walked in and was completely flabbergasted to see one of the wings from his plane which he had cracked up on the ice! He took it home with him, and is probably cutting quite a figure with it upstairs!

**AN ANTARCTIC DEVOSAURIAN DEES.** Edwin H. Colbert, an authority on paleontology who was formerly curator of the American Museum of Natural History in New York City, died on November 15<sup>th</sup> in Flagstaff, Arizona at age 96. In 1969 Ned was part of a field expedition to Antarctica that discovered and identified a 220 million-year-old fossil of a *Lystrosaurus*. Since *Lystrosaurus* was not a swimmer, the discovery lent evidence to the theory that the present-day continents must have been part of a large landmass or supercontinent that slowly separated over millions of years.

**A NONAGENARIAN: PHIL LAW.** Phil Law, Mr. Antarctic in Australia, had a banner year, one befitting a young man in his prime. To begin with, he still plays tennis thrice weekly, that is weekly, not weakly. And he fulfilled a life long dream and bought a sports car, a Toyota 2000 Celica coupe, in March he accepted the Clunies Ross National Award for lifetime contributions to science and technology. In October he saw himself unveiled at the Melbourne University Sports association. A well-known Australian sculptor by the name of Michael Meszaros had bronzed him, and this portrait will be hung in the foyer of the Sports Centre at the University. Sounds like Cooperstown's Hall of Fame. Then in November, the Victoria College of the Arts named a room in his honor. He had played a central role in the establishment of the College. In between showing up at these festivities and acting honorable, he was all over Australia; the highlight might have been a fortnight's tour of the six states of Australia in a 10-passenger Cessna. As the year ended, there was no confirmed sighting of him at his home.

**CLOSURE.** Our apologies to our president, Kristin Larson, whose popular column, PENGUIN PRATTLE, did not make this newsletter, as did several others of our own. Another newsletter will follow in two months, without book reviews!

## POLAR RESEARCH BOARD AND ANTARCTICAN SOCIETY ANNUAL LECTURE

### *EYE OF THE ALBATROSS: STATUS AND TRENDS IN WORLD FISHERIES*

Presented by:

DR. CARL SAFINA

VICE PRESIDENT FOR MARINE CONSERVATION  
NATIONAL AUDUBON SOCIETY

MONDAY, APRIL 8<sup>th</sup>

7:00 p.m. - 8:00 p.m.

THE NATIONAL ACADEMIES (Georgetown Campus)

Room 104, Green Building

2001 Wisconsin Avenue., N.W.

WASHINGTON, D.C.

Reception to be held before and after lecture

6:00 p.m. - 9:00 p.m. in the South Foyer

In 2000, Dr. Carl Safina was in the Antarctic as a participant in the National Science Foundation's Antarctic Artists and Writers Program, where he began writing a book using albatrosses as a vehicle to explore how the world's oceans are changing. In this talk, he will use the Antarctic as a starting point to discuss the major source of biological change in the sea: fishing.

After exponential rises in world fish landings earlier in the 20<sup>th</sup> century, catches leveled off in the 1990's; the limits of the once-limitless seas had been found. In many regions, fish populations have crashed, causing widespread social dislocation. Excess capacity has brought fishing power to twice that necessary to take the annual catch. The overcapacity has brought down the profitability of fishing: to catch \$70 billion worth of fish, \$124 billion is spent. Government subsidies largely plug the deficits. The reduced profitability of fishing is exemplified in the U.S. where depletions cost the gross national product \$8 billion annually, and 300,000 jobs. In the last few years, \$120 million in federal disaster relief was sent to fishing communities in New England,  
(Continued Pg. 2)

## **DR. CARL SAFINA** \_

the Pacific Northwest, and the Gulf. However, recent good news indicates that these trends are beginning to reverse in some areas, with some recoveries underway due to improved management, and public awareness is up significantly.

Dr. Safina is the Vice President for Marine Conservation at the National Audubon Society. He started his scientific career studying at-sea feeding ecology of seabirds. Since 1990 he has worked to put ocean fish conservation issues into the wildlife conservation mainstream. Dr. Safina is author of more than a hundred publications, including the books "Song for the Blue Ocean" (1998) and "Eye of the Albatross: Visions of Hope and Survival" (May 2002).

**BRASH ICE.** We want to thank all of you folks who sent cards and letters to our Honorary President as she entered into her 90\* year and semi-retirement. She enjoyed every one of them, but is not in a position to thank you all, so this is a big THANK YOU on behalf of her. Be sure to read the next column, as it pertains to something special which one of you folks did for her on Valentine's Day. The good news is that Ruth is doing much better than she did last month, and now can actually walk without a walker.

Remember as you read this newsletter that it is clearly up to you to decide if you are reading the truth. We continue not to let the truth get in the way of a good story. You have a responsibility as much as we have a responsibility!!

**FOUR EMPERORS SERENADE AN ADELIE.** It was around 10 a.m. on the morning of February 14<sup>th</sup>, Valentine's Day, and Ruth Siple, our Honorary President, was sitting in her living room when she thought she heard some birds pecking on her door. So she went to the door, and sure enough, four extremely large emperor penguins stood there, waiting to be admitted. They just had to be emperors as men don't go around wearing tails at that time of the day. And she said, "Who are you, anyway, and what are you doing here?"

One emperor had a very strong resemblance to Pete Bermel, looked a lot like him, although was a bit heavier, and even talked something like him, although a somewhat older, more matured voice. He answered, "Ruth, we know who you are, as our families once knew your husband when he was in Antarctica, and we recently heard about you and your 90<sup>th</sup> birthday. Please forgive us for being late, but we had a terrible swim crossing the dreaded Drake Passage. We come from two different colonies, one on the Bermel Peninsula (68° 27' S, 65° 22' W), which is our summer home, and another on the

Bermel Escarpment (85<sup>U</sup> 17' S, 89° 30' W), where we raise our families. But we are here on behalf of the millions of all penguins in Antarctica. So please sit down so that we can get on with our singing Valentine to you, as we must return to the muddy Potomac and start our swim back home as our families await our safe return."

So Ruth sat down, and one emperor came forth with a special penguin Valentine card with a penguin holding a heart, another brought her a dozen long-stemmed American Beauty red roses, still another a heart-shaped box of chocolates, and the emperor who looked like Pete even gave her a stuffed penguin. Ruth was beside herself, overjoyed, almost speechless, and then one of the penguins had a pitch pipe, blew a note, and lo and behold, these emperors could actually sing. And how they sang!! The first song was HEART OF MY HEART, and every time they sang "I love you" Ruth would say very loudly, "I love you, too." And then they sang another, LET ME CALL YOU SWEATHEART. These emperors were looking with jaundiced eyes at a room full of penguin memorabilia, thinking for awhile as if they were still home. As they left, Adelie Ruth gave each emperor a big hug. As they waddled down the steps, one emperor looked at the others and said, "You know, this was worth that long, long swim."

That evening before going to bed, Ruth saw this card on the floor. She picked it up, read it, it had a name on it, an address. Said "Fairfax Jubil-Aires, Society for the Preservation and Encouragement of Barber Shop Quartet Singing in America, Inc. SPEBSQSA." She thought for a few seconds, wondering, and then shaking her head, she said to herself, "No, it could not have been Pete and his buddies, those were real penguins, I know emperors when I see them." And Ruth danced in her sleep that night, recalling the most perfect Valentine's Day that any 90-year-old lady could have possibly enjoyed, and the singing Valentine from Bobbie and Pete (who, incidentally are still on their honeymoon after some 47 years of trying it out).

{P.S. On a trip to the South Pole in 1963, Pete found a stray 2x4, and nailed a SPEBSQSA insignia onto it, stuck it in the snow, and thus created the Southern Most Chapter of Barbershop Singing in the whole wide world. Today there are 33,000 members in 800 chapters, which include the four emperors from Antarctica. There are national groups in England, Ireland, Netherlands, Germany, Russia, South Africa, New Zealand, Australia, Norway, Sweden, and Japan. The latest effort is China and Pete is going there the last half of September as part of a 100-person singing group. You are truly an EMPEROR, Pete.}

## **NEWLY CONSTRUCTED GLACIAL ICE RUNWAY AT McMURDO.**

The U.S. Air Force has certified a new ice runway near McMurdo capable of handling large military cargo jets. A U.S. Air Force C-141 Starlifter cargo plane landed safely on the compacted snow pavement of the existing Pegasus runway near McMurdo on Jan. 20, 2002.

Among the aircraft's 103 passengers was Charles J. Swindells, the U.S. ambassador to New Zealand, on his way to visit USAP installations and field camps.

Preparation of the runway pavement required the use of 100-ton pneumatic tire rollers to compact a thin snow cover, turning the snow into white ice, a material sturdy enough to handle four-engine military transport aircraft. The addition of this white ice pavement allows all-season landings of wheeled aircraft in the Antarctic for the first time in history. Currently, ski-equipped LC-130 Hercules cargo aircraft transport much of the cargo and many of the passengers to Antarctica. The new runway greatly enhances airlift capabilities to support USAP activities.

The newly developed compaction process protects the runway from sun damage while having the structural strength necessary to withstand the stresses imposed by the landing of large aircraft such as the C-5 Galaxy, one of the world's largest aircraft; the C-17 Globemaster, the newest air force cargo plane; and the older C-141s. Without a cover of snow as protection, the warm temperatures and high sun angles during summer would have damaged the runway.

Prior to the U.S. Air Force's certification of the Pegasus runway to handle the larger cargo aircraft, wheeled aircraft were able to land on the continent only very early and very late in the research season on runways that at other times of the year are useable only by ski-equipped planes. The principal austral summer research season begins in October and ends in February.

## **NEW SOUTH POLE STATION DOING JUST FINE.**

Everything is on schedule for the completion and dedication of this beautiful \$155 million dollar state-of-the-art polar research facility for January 2006. It probably has the world's largest beer can, six stories high, with a Foucault pendulum rotating in the enclosed stairwell. In an era where corporate America is paying millions to have their name attached to sports arenas, just think if the government had sold its soul to Anheuser-Busch to have the now silverized beer can painted to look like a can of Bud, the price of construction could have probably been reduced by forty million - forty million more for research, plus free beer for the camp!

This past austral summer an 85-member construction crew worked

nine hour shifts around the clock, six days a week. On the seventh day, they must have gone to Disney World. The main focus was to complete the subsurface water and sewage utility tunnel. Said tunnel is six by ten feet, opening some forty feet below the surface providing a utility corridor for piping construction from the new station to the sewage bulb and water well, called by some Rodriguez wells. The project represented three summers of work and 3,071 feet of tunneling. The transition from the previous used dome water well and sewage bulb was also completed.

The structural steel framing and exterior shell framing/paneling for two of the multi-purpose elevated station wings were completed. Interior work was also done on another wing which is to house 50, as well as still another wing, this one for food service and mechanical. Presumably this must translate to kitchen and dining rooms. This whole building project seems to survive in spite of being strangled by a multi-lettered acronym, SPSE/SM (South Pole Safety and Environmental Upgrades & Modernization Project). Only the government could come up with that one!!

The austral summer population for the past season was 220. Besides the aforementioned eighty-five construction workers, there were fifty scientists, seventy-five in station operations, five supporting construction, and another five representing the Head Shed, NSF. As for the current wintering over season, the population has dwindled down to fifty-one (science, nine; construction, 21; operations, 21). The construction people are working inside, needless to say, in three of the wings. The transition from the current dome station will begin next summer, with the occupancy for fifty persons now scheduled to begin in February 2003. This will be followed the next summer by occupancy for food services, medical, and science.

The new elevated station has a design life of around forty to fifty years. They estimate they won't have to raise the footing (ten feet) for twenty-five years. And they are prepared for two more raisings in later years. The design and budget of this new station was approved with the demolition of the dome. Why don't they sell it to Anne Kershaw and let her make a hotel out of it. As Barnum said .....

## **LAKE VOSTOK, HIDDEN TREASURES.**

Radar maps of the Antarctic interior made in 1996 revealed that a lake lay under the ice sheet. Lake Vostok is thought to be one of the world's largest, 48 kilometers (30 miles) wide by 225 kilometers (140 miles) long and 914 meters (3,000 feet) deep. Its waters have been sealed from air and light for perhaps

**LAKE VOSTOK....** as long as 35 million years under the tremendous pressure of the continental ice sheet. An ice core - one of the world's longest - was drilled by a joint U.S., Russian, and French team at Russia's Vostok Station on the lake's western shore. But coring was stopped roughly 100 meters (328 feet) above what is thought to be the surface of the water to prevent contamination of the lake. The ice layers reveal a 400,000-year environmental record with microorganisms present throughout most of the core.

During the 2000-2001 Antarctic research season, NSF supported a detailed aerial mapping of the lake by specially equipped Twin Otter aircraft flown by the Support of Office for Aerogeophysical Research at the University of Texas at Austin. The radar sounding, laser altimetry, magnetics, and gravity surveys were a first, non-invasive step to explore Lake Vostok.

Lake Vostok, which lies buried under thousands of meters of ice high on the Antarctic Plateau, is thought to be home to unique habitats and microorganisms. Confirming the existence of life forms and unique biological niches without contaminating the pristine lake waters, however, is a difficult scientific and technical challenge with international ramifications.

According to a paper published in the March 21 issue of Nature, the hydrodynamics of the lake may make it possible to search for evidence of life in the layers of ice that accumulate on the lake's eastern shore. Scientists say such a possibility would provide another avenue for exploring the lake's potential as a harbor of microscopic life, in addition to actually exploring the waters of the lake itself.

The paper was authored by Robin E. Bell of Columbia University's Lamont-Doherty Earth Observatory and her colleagues. Their research revealed that although the lake is perhaps millions of years old, its waters are relatively young. Bell's paper demonstrated that over a period of 13,300 years, all of the water was removed by the overlying ice sheet and replaced from other sources. The lake water captured by the moving ice sheet was carried as layers of ice over Lake Vostok's eastern shoreline, and then eastward away from the lake. Exploring those ice layers, they argue, is equivalent to exploring the lake itself.

Bell and her team analyzed the radar data and determined that the ice formation in the southern half of Lake Vostok holds buckling patterns frozen into the ice sheet as it flows over the lake. Following the trends of the buckled ice patterns, scientists were able to construct movement trajectories across the lake. They then calculated the time it took ice to move from the west side of the lake to the east - 20,000 years over a distance of about 56 kilometers (35 miles). By examining the ice flux out of the lake, the team determined that every 13,300

years the ice sheet removes the equivalent of the entire volume of Lake Vostok.

As the ice sheet removes lake water like a continuous conveyor belt, lake waters must be replenished, either by melting of the ice sheet or by subglacial meltwater. The source of this water remains a mystery.

"Our study is a critical step in the exploration of Lake Vostok," Bell said. "These frozen lake water samples will record the passage of the ice sheet and the processes across the lake. The data show that the location of the current research station on the lake may not be optimal for biological studies."

Bell added that "Lake Vostok is absolutely devoid of interference. The youngest water in it is 400,000 years old. It doesn't know anything of human beings, fossil fuels, or plastics. It is a window into life forms and climates of primordial eras."

#### **TWENTY-FOURTH ANTARCTIC TREATY CONSULTATIVE MEETING (ATCM) by Ray Arnaudo**

ATCM XXIV was held July 9-20, 2001, in St. Petersburg, Russia, after a gap of two years since the previous ATCM in Lima, Peru, in 1999. Although it was Poland's turn to host the meeting, they declined to schedule a meeting in 2000. The Dutch stepped forward and volunteered to host a Special Consultative Meeting in The Hague in September, 2000, in order to hold a meeting of the Committee on Environmental Protection, as required by the Protocol. All of the 27 Antarctic Treaty Consultative Parties, except Ecuador, participated in the St. Petersburg meeting.

The two major issues were progress on a liability annex to the Environmental Protocol and agreement to proceed on establishing an Antarctic Treaty secretariat. The parties endorsed the U.S. proposal to take a step-by-step approach to the negotiations rather than try to negotiate a comprehensive annex on liability. As for a Secretariat, consensus was finally reached on establishing a permanent headquarters in Buenos Aires, Argentina, when the British finally agreed to let the process go forward.

After receiving the advice from the Committee for Environmental Protection (CEP), which held its fourth meeting, the ATCM also looked at a number of other issues. These included: the collection of Antarctic meteorites, cumulative impacts of human activities in Antarctica, environmental evaluations, *(Continued Page 5)*

**TWENTY-FOURTH ANTARCTIC TREATY** \_\_ specially protected species and areas in Antarctica, diseases of Antarctic wildlife, historic sites and monuments and handling of pre-1958 historic remains that had not been recorded. For further information, go to the Russian website at [www.24atcm.mid.ru](http://www.24atcm.mid.ru). All the working and information papers are there including the final reports for ATCM XXFV and CEP IV. The Argentines announced their intention to set up a permanent website for the Antarctic Treaty at some point in the future. You will also find more information at the State Department's website [www.state.gov/g/oes/ocns](http://www.state.gov/g/oes/ocns), including the commemoration of the 10<sup>th</sup> Anniversary of the adoption of the Environmental Protocol. At the end of the meeting, Poland offered to host this year's ATCM in Warsaw, September 10-21.

**COMMISSION FOR THE CONSERVATION OF ANTARCTIC MARINE LIVING RESOURCES (CCAMLR) by Ray Arnaudo**  
CCAMLR held its twentieth meeting in Hobart, Australia, October 22 - November 2, 2001. All twenty-four Commission members attended, including Namibia, which attended its first meeting as a Commission member. The Commission chose a new Executive Secretary, Dr. Denzil Miller of South Africa, who replaces Estaban de Salas of Spain, who served in that post for ten years.

The Commission adopted a number of new conservation measures, focusing especially on the problem of overfishing of Patagonian toothfish, or *Dissostichus eleginoides*, better known in restaurants as Chilean seabass. The Commission implemented its Catch Documentation Scheme to monitor trade in toothfish products in 2000, and continues to work on improvements to the system. Stopping illegal fishing in CCAMLR waters is difficult, but CCAMLR members agreed that the current CDS system is having a positive impact on addressing illegal fishing activities, as all toothfish imported into CCAMLR countries must have appropriate catch documents. Check the State Department website (or [www.noaa.gov](http://www.noaa.gov)) for more information. You will also find there the text of the 20<sup>th</sup> Anniversary Declaration. The text and further documentation on the meeting, conservation measures and the organization are available at the website at [www.ccamlr.org](http://www.ccamlr.org).

#### **TRINA BALDWIN, WRONG TIME, WRONG PLACE.**

Some of you know Trina Baldwin, who was the O.I.C. of the wintering over personnel at McMurdo in 1990-91. She is a Naval officer, and once had serious aspirations of eventually becoming an admiral, but fate struck down her career on July 18<sup>th</sup>, a bicycle vs. car door incident/accident. She was coming home from her naval duties in San Diego, riding her bike, and bango, it happened Witnesses reported that she cleared the top of the car before landing in the street. She has no recollection of the entire event, including the ambulance ride to the San Diego trauma center. The good news is that there were

no broken bones or bleeding inside her skull. The bad news is that she received a "mild traumatic brain injury" and some torn ligaments in her hands/wrist. It took more than a week before Trina realized she had some brain damage. The Navy sent her to the Defense and Veterans' Head Injury Program at Balboa. The good news there was that tests showed where she was damaged and they believe she has a very good chance to recover much of those areas. The bad news was that Trina has brain damage.

She was removed from her job as the Desert Operations Officer, and put into a less stressful job, on limited duty, working a maximum of four hours per day. The Navy has plans to send her to Guam this summer. Meanwhile she realizes her opportunities in the Navy are no longer golden. Now she dreams of returning to McMurdo (after her military retirement) as the night baker! She wants to go back to enjoy the beauty of the place. Although she did not ask us to tell you people what happened to her or her condition, I am sure that she would like to hear from any of you, especially those who served under her. Trina's address is CDR M. K. Baldwin, CEC, USN, 536 G. Avenue, #4, Coronado, CA 92118-1640. Good luck, Trina, and God bless.

#### **STONINGTONIANS GO TO STONEVGTON.**

What were the odds back in 1948 that the Brits and the Yanks on Stonington Island would be breaking bread and toasting one another some fifty three years later at another place called Stonington? Well, whatever the odds, it happened in Stonington, Connecticut on October 13<sup>th</sup> and 14<sup>th</sup>, 2001. Of the w/o personnel, Kevin Walton, Dick Butson, and Bernard Stonehouse of the FIDS (Falkland Islands Dependencies Survey), and for the Americans, Jackie Ronne, Bob Dodson, and Georges de Giorgio, were in attendance. Another FIDS, who had been at Stonington in other years, showed up, Ken Blaiklock.

That year at that station will go down in history for many reasons. But, most noticeably, for being the location where two young brides, Jackie Ronne and Jennie Darlington, became the first two women to ever winter over on the ice. Jennie became the first woman to be impregnated on ice with child in the winter night, although the girl was born back here in the States. (See Reader's Digest 'Antarctica' for the comment by one of the Brits on hearing of two women on the island "Send more women".)

Three widely read books were written on that year on Stonington. One by Finn Ronne, commander of the U.S.

(Continued Page 6)

**STONEINGTONIANS** .... station, one by one of the brides, Jennie Darlington, and one by the Brit, Kevin Walton. They are often referred to as the Antarctic Trilogy. Three books on one year, all presenting entirely different stories about the year 1947-48! Which is most accurate? All depends on which side of the house you were living.

But they all had one common denominator, being located on the beautiful and magnificent Marguerite Bay. It doesn't get any better in the Antarctic, although it might be equaled by Almirante Brown. Isn't it a bit ironic that two beautifully situated stations both had personnel problems?

The reason that they went to Stonington, Connecticut, was to see if they could locate Nathaniel Palmer, the ex-American whaler whose boat, the HERO, sailed out of Stonington. They did visit the Nathaniel Palmer House, but Nathaniel was not there that day. The Stonington Historical Society owns and cares for his house. Several decades ago, NSF was going to bring back a large Antarctic rock and give it to the town as a memorial piece. But when they approached the town fathers, no one had ever heard of Nathaniel! But after this visit of true Antarcticans, perhaps the town now is much more cognizant of the relationship between the town and Antarctica.

The reunion was a grand success, and Mark and Sue Hamilton of Inuit Dog International actually brought eight huskies. Once upon a distant past, in the early 1960's, Ken Blaiklock held the Antarctic record for most miles sledged with dogs, something like 5,000. Sunday was a day of presentations and discussions, and guest speakers were author Michael Parfit, long-term Antarctic bureaucrat Guy Guthridge, and Kenn Black, a summer resident of Port Lockroy, representing the Antarctic Heritage Trust. Brigid Wainwright told them about her project to compile an electronic database and photo album of the thousands of dogs that served the Brits in Antarctica.

Ken Kother, former officer on the GLACIER, spoke of the efforts to get the GLACIER back into private service and, possibly, hic, a high class polar cruise ship. Bill Latady's son showed some of his father's slides, and Latter Day BASers at Stonington, Peter Kennett and Chris Edwards spoke of life at Stonington in 1963 and 1974, respectfully.

About fifty people attended and enjoyed one great reunion.

### **ANTARCTICA AND THE OLYMPICS.**

Probably the very first winter-time gold and silver "medals" for achievements in organized sporting events were awarded by the very distinguished French doctor and expedition leader, Dr. Jean-Baptiste Charcot on the POURQUOI-PAS? Expedition, 1908-1910. Charcot founded the Antarctic Sporting Club and on May 9, 1909, they held

their opening ceremonies. For some unknown reason, CNN did not carry the events which consisted of, for the skiers, three races. One was a "flat" race, another was a race down a steep slope, and the third was "a fairly long race in which one might go as pleased." In other words, a slalom, a downhill, and a cross-country. Charcot wrote "in the evening I distributed the gold and silver medals, cut out of preserved food boxes, and the cardboard medal." A sailor by the name of Geuguen captured the gold, followed by another sailor, Thomas, winning the silver. Coming in third was Frachat, the motor engineer.

The next Olympian that we are aware of is the redoubtable Norman D. Vaughan of the USA. This ex-college drop out, now sporting an honorary Ph.D., participated in the 1932 Winter Olympics at Lake Placid, NY. Sledge dog racing was a demonstration sport for that Olympic, and Norman, an ever ready opportunist, fresh off the first Byrd Antarctic Research Expedition, was more than willing to demonstrate his capabilities as dog team driver. He spent parts of eight decades in the 1990's driving dog teams, and, presumably got it right. Norman was also a guest of the USA at the Winter Olympics in Grenoble.

The next Olympian, Peter Schoeck, comes with an asterisk, because our only verification of his being an Olympian are words that came from his very own lips. Peter, a German, no shrinking violet, he, carried a heavy load on his shoulder, trying to live up to his own manifestations. When he applied to go to the Antarctic during the IGY, "I asked Larry Gould to give me the most difficult job in the Antarctic." He ended up as head of both the aurora and glaciology programs at Little America V in 1957, that is, until he, unfortunately, hic, fell into a crevasse near Roosevelt Island and had to be air evacuated back to New Zealand. But long before that event, he had regaled us with stories of how he was on the German Olympic cross-country team. During the four months without sun - we refuse to call it midwinter darkness - Peter would ski out of camp, get himself lost, and then set up a rescue pattern which would eventually, much to the chagrin of the camp, bring him back home! One thing we do know, he was a hulk of a physical specimen, so perhaps he really was an Olympian!

Now let's go next-of-kin Olympians. Steve Den Hartog, known universally as Denny, has been to the Antarctic several times, been to the winter Olympics several times. But this w/o scientist at Little America V in 1958 was a spectator, as his own blood and water daughter skied for the USA cross-country team in not one, not two, but three winter Olympics. She, Dorcas Wonsavage, did admirably well, (Continued Page 7)

**ANTARCTICA.....** considering she was an American. The top thirty positions are always reserved for Eastern Europeans, then they let the others cross the finish line. She hung it all up after competing in Lillehammer in 1994. After all, she was 29, and everyone knows that by that age we are all washed up. So she married another skier, who became a dentist, and they are now living in Maine.

Another Antarctic connection in the Olympics is from the Outcrops of the Family of Fords, this model being a Model A as in Art Ford. Between many trips to the Antarctic, he fathered a daughter Jody, who eventually went off to college, and met a diver on campus nicknamed Flip. And how this guy, Phil Boggs, did flip. He won the gold medal in the 3-meter springboard at the Montreal Olympics in 1976. They got married and were very happily married until he got struck down by non-Hodgkins lymphoma in 1990. Jody is now Assistant Professor in the Department of Surgical Oncology at the University of Miami.

**LARSEN ICE SHELF COLLAPSING (See Back Cover) by Associated Press, Joe Verrengia**

An enormous floating ice shelf in Antarctica that has existed since the last ice age 12,000 years ago collapsed this month with staggering speed during one of the warmest summers on record there, scientists say.

Satellite images show that a piece of the Larsen Ice Shelf collapsed during a five-week period that ended March 7. It splintered into a plume of drifting icebergs. The piece of ice that broke off was designated Larsen B. It was 650 feet thick and with a surface area of 1,250 square miles, or about the size of Rhode Island. The ice shelf is on the Antarctic Peninsula and extends about 1,000 miles closer to the tip of South America than the rest of the Antarctic continent.

"We're seeing a very rapid and profound response by the ice sheet to a warming that's been around for just a few decades," said Ted Scambos of the National Snow and Ice Data Center at the University of Colorado. "We can use this as a sort of a guide for what's going to happen if the rest of the Antarctic should begin to warm because of climate change," he said.

The Larsen Ice Shelf has been under careful observation since 1995, when its northernmost sector, known as Larsen A, collapsed in a similarly dramatic event. The Larsen Ice Shelf now is about 40 percent of its original size. Previous measurements showed the Antarctic Peninsula has warmed an average of more than 4 degrees Fahrenheit during the past half-century, a rate that is as much as five times faster than the global average. But the overall climate picture

in Antarctica is anything but consistent. In fact, glaciers elsewhere on the continent are both thickening and thinning as temperatures show conflicting climate trends.

In 1995, when Larsen A broke off, the summer melt had persisted for 80 days, about 20 days longer than average. As for Larsen B, satellite images show that ponds of melted water were forming atop the ice in recent months. Later images showed the water was seeping into the ice sheet's interior, accelerating its demise. The next portion of the ice shelf is known as Larsen C. It is losing stability and could suffer the same fate in the coming years if the warming trend continues, researchers said.

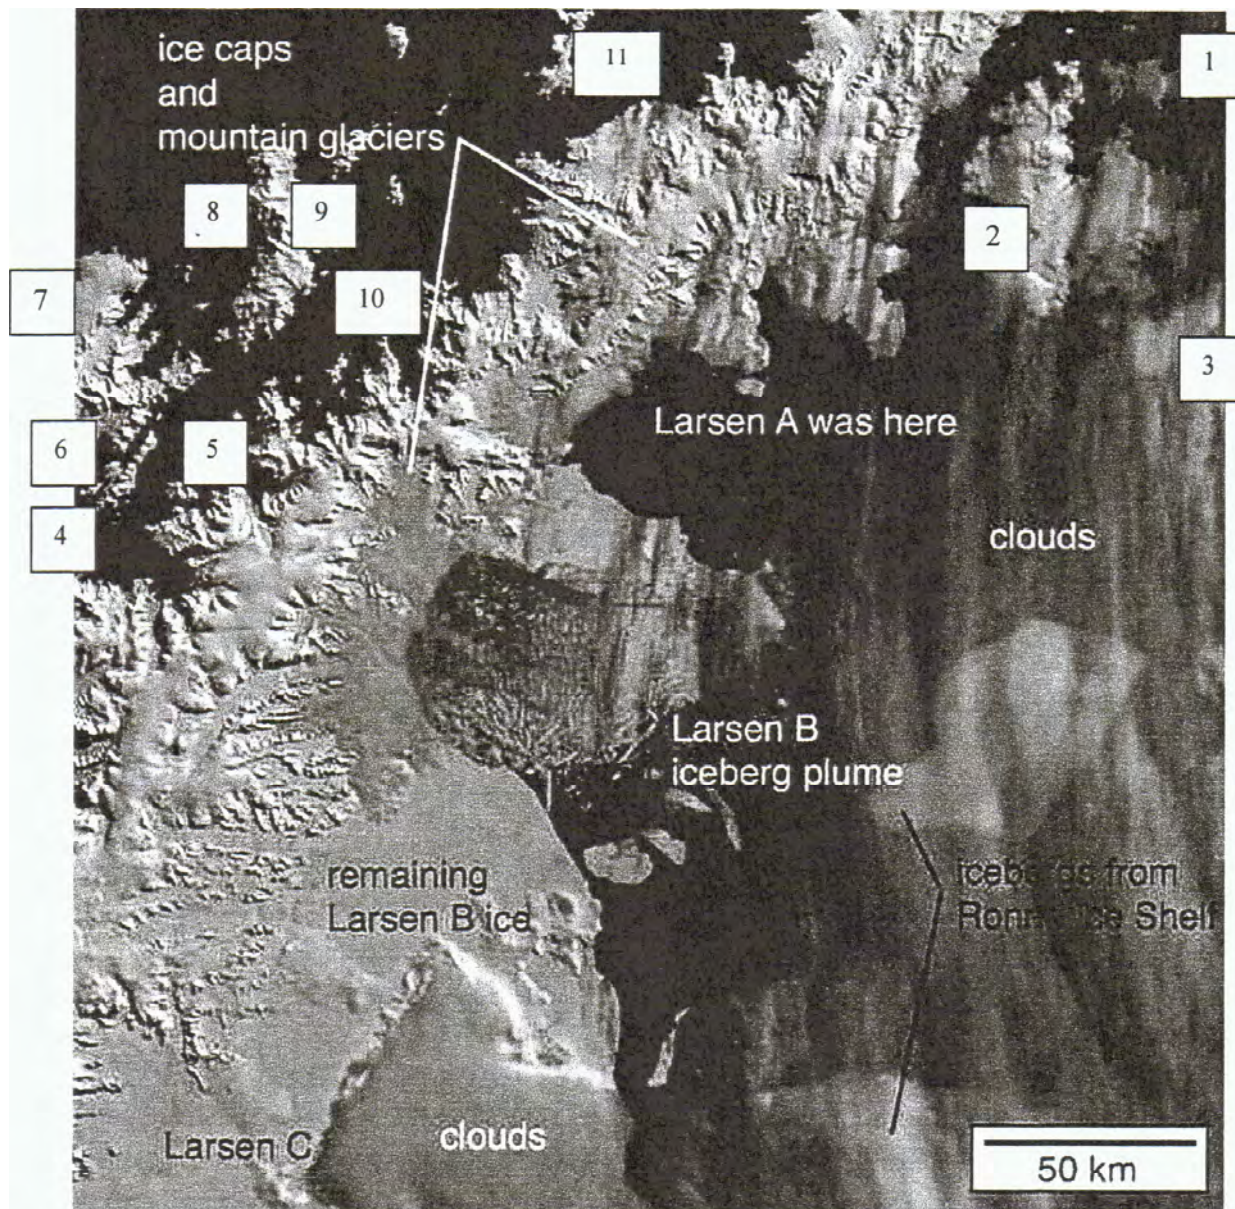

**FROM WASHINGTON POST, 20 March 2002.** The disintegration of the ice shelf- 1,260 square miles in area and 650 feet thick - was most alarming to some because of the extraordinary rapidity of the collapse. The shelf is believed to have existed for as long as 12,000 years before regional temperatures began to rise, yet it disintegrated literally before scientists' eyes over a 35-day period that began Jan. 31.

**LATE BREAKING NEWS.** Another iceberg, B-22, broke off from an ice tongue in the Amundsen Sea. The berg is located at 74° 56' South, 107° 53' West. It is 40 miles wide and 53 miles long, covering 2,130 sq. miles.

**ANTARTICA IS IN CONSTANT AND SURPRISING MOTION (NASA and the Canadian Space Agency)**

Twisted patterns of ice move outward from the center of the continent in all directions. In some places the flow is faster than 1 kilometer per year, while in other places it creeps at less than 10 meters in a year. Kenneth Jezek of Ohio State University's Byrd Polar Research Center said that satellite imagery points out previously unknown ice streams hundreds of kilometers long. We've seen one ice stream network that sends more than 19 cubic miles of ice to the sea annually - an amount equal to burying Washington, D.C. under 17,000 feet of ice every year. LET'S GO ICE STREAM!!!

Shackleton, Arts & Entertainment, April 7<sup>th</sup>, 8 p.m. EDT  
\*\*\*\*\*

5 March 2002 image of the northeastern Antarctic Peninsula

The northern part of the Larsen B ice shelf has disintegrated, sending approximately 720 cubic kilometers of icebergs into the ocean. Because the ice was already floating, it does not affect sea level. The southern edge of the break-out tracks to the melt-pond boundary observed in the 31 January image.

Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

## BRASH ICE

You will note that the official address of the Society remains as printed on our cover sheet of the newsletter, that of our Honorary President, Ruth J. Siple (7338 Wayfarer Drive, Fairfax Station, Virginia 22039). But the address on our envelopes has been changed to this redoubt on mid-coastal Maine where the newsletters are put together and mailed, where we keep track of the membership and treasury. Incidentally those of you who are delinquent on your dues will get your "last notice" included with this newsletter.

We are unhappy to report that Norman Vaughan is having some physical troubles, and has been hospitalized for the last several weeks in Anchorage, evidently some complications after he had another pacemaker put in. Now for the good news, he seems to be recovering and his son reports that the old twinkle has come back to his eyes. We did not realize it until Jeff Rubin brought it to our attention, there is another 97-year-old American Antarctic, Olin Stancliff of BAE II, in Erie, PA. Norman, Olin, and Guy Hutcheson in Texas are the only three living Byrd men. It is rather hard to run down the people who are alive from the Antarctic Service Expedition, 1939-41, but Bob Dodson found one, Bob Palmer, of East Base. We have a good handle on who is alive from the Ronne Antarctic Service Expedition, as Bob keeps close track of his fellow men and fellow women. Nine of the original twenty-three w/o personnel are definitely alive, with one person unaccounted for.

So as the numbers decrease, some of us move up the ladder and become older in spite of ourselves. Toward that end, those of us who w/o at the South Pole during its first two winters, during the International Geophysical Year, had our first combined Navy-civilian All-Hands reunion this past April. This is written up in detail on another page, but I must tell you that I did not fare too well. Walking into this conference room where we were supposed to convene, all I saw was a bunch of real old men, one of whom was totally unrecognizable to me. I actually felt pretty good with myself until this completely honest guy walks up to me, looks me square in the eyes, and said, "You know, you have changed more than anyone else." So reunions can also have a down side!!

Remember the last newsletter was written to be enjoyed, and we strive to make certain that the truth does not get in the way of a good story. You, Ron Taylor, had better start reading the newsletters, as twice you have written us this spring bringing our attention to two new books, both of which had already been reviewed in our newsletters.

**OUR FOUNDING FATHER.** As many of you know, the spiritual founding father of this Society was a good old boy by the name of Carl R. Eklund, who parlayed his relationship with the South Polar skua, the Eagle of the Antarctic, into a Ph.D. degree (1959) at the University of Maryland. He was also the Scientific Leader at Wilkes Station in the Banana Belt of Antarctica in 1957. Of all the U.S. scientific stations in the IGY, this was the one with the greatest camaraderie. In spite of having two Jesuit priest scientists w/o, it was one hell of a nice place to be and there was universal respect and appreciation for all. Anyone who knew Carl is convinced that a lot of the credit was a result of his presence.

They had a lot of fun at Wilkes Station. Carl was married to as much a fun-loving person as he was. Her name was Harriet, and she, too, was universally loved. On May 18, 1957, she sent Carl a poem by ham radio which read "*Hail to the husband who loves his wife and stays at home instead of on the ice, Hail to the wife who his money will squander if to the South Pole the old man must wander.*" There was more than a little bit of truth in the poem, as when he got home he found the bank account needed a transfusion, so he had to go onto the lecture circuit.

Carl started this Society as a gold-old-boys drinking club. George Llano wrote that when they first started getting together, they used his membership card at the Cosmos Club in Wash., D.C. for their gatherings. George said the bills were so high that they had to change the venue to the basement of the Eklund's home. Carl had an elephant's foot, and that became the treasury which kept the drinks flowing. I just wish that I had been in Washington at that time, as this Society had a lot of fun, Eklund-style, in its youth.

Wherever Carl was, fun wasn't very far off. Prior to the IGY, all hands met at Davisville, R.I. for an indoctrination and outfitting of clothes. There was one watering place in nearby Kingston, and nearly all hands adjourned there for informal talks (hic) after dinner. As we were quartered on a military base, we needed an I.D. to get in and out. Carl had left his back in his room, and borrowed that of Sir Hubert Wilkins, who returned to his room. As we left Carl exclaimed "Sir Hubert will make out tonight!"

Unfortunately Carl died a much too early death. He had given a lecture in the City of Brotherly Love, returned to his hotel room, and died during the night (4 November 1962, at age 53). He, like the Architect of the Antarctic Treaty, Ambassador Paul C. Daniels, and the Deputy Chief Scientist for the Antarctic Treaty during the IGY, Bert Crary, knew how to get the most out of an evening on the town. Larry Gould wasn't far behind, either!"

### **NOT ANOTHER HUGE ICEBERG!!!**

(NSF Fact Sheet, May 2002.) Two new and very large icebergs broke away from the Ross Ice Shelf in early May in a natural

'calving' process that returned the edge of the shelf to its pre-exploration position of the early 1900s, researchers say. The icebergs were designated C-18 and C-19 by the Suitland, Maryland-based National Ice Center (NIC), a joint operation of the U.S. Navy, NOAA, and the U.S. Coast Guard. Using data collected from the Defense Meteorological Satellite Program, NIC said that C-19, the larger of the two icebergs, is 199 km (108 naut. mi.) long by 30.5 km (17 n.m.) wide. C-18 is roughly 75.9 km (41 n.m.) long by 7.4 km (4 n.m.) wide.

Unlike B-15, which calved from a different location on the Ross shelf, C-19 broke away relatively close to Ross Island, home of McMurdo Station. B-15A and C-19 are now floating at right angles to each other, adjacent to Ross Island.

Researchers at the University of Wisconsin and meteorologists at McMurdo almost simultaneously noticed the break in the Ross shelf where C-19 calved. Linda Keller of the University's Department of Atmospheric and Oceanic Sciences noticed the crack while posting daily images on their web site. Both the forecasters and the University subsequently notified the NIC. Douglas MacAyeal, an NSF-funded researcher at the University of Chicago, who placed automated weather stations and tracking devices on B-15 A, an enormous fragment of the larger iceberg, said that the satellite and other technologies are allowing science for the first time in history to observe the calving of large icebergs like C-19 and B-15. The process, he noted, is part of a natural cycle in which ice shelves grow and then calve icebergs over geological time scales.

Researchers also noted that the developments on the Ross shelf are markedly different from the process underlying the widely publicized collapse of the Larsen B Ice Shelf much farther north, on the eastern (Weddell-Sea) side of the Antarctic Peninsula earlier this year. While still not fully understood in terms of glaciological history, scientists believe that the Larsen B collapse is tied to a documented temperature increase on the Antarctic Peninsula. NIC reported that another huge iceberg (D-17), roughly 55.5 km (30 n.m.) long by 11.1 km (6 n.m.) wide, calved in the Weddell Sea on May 17.

Although the fate of C-19 is unknown, Charles Stearns, Emeritus Professor of Meteorology at the University of Wisconsin, said the calving brings the Ross Ice Shelf to rough!; the size it was in 1911, when members of British explorer R.F. Scott's party first mapped it. Stearns also noted that while the calving of C-19 was fairly rapid, the fissure from which the iceberg broke away from the shelf has been known to scientists since the 1980s.

## **TRANS-GLOBE BALLOONING IV ANTARCTICA.**

(NSF Fact Sheet, May 2002.)

The National Science Foundation, through its Office of Polar Programs, supports long-duration balloon (LDB) flights in Antarctica to conduct astrophysical experiments. Circling the continent on unique stratospheric winds at altitudes of roughly 37 km (22.9 mi) for periods of up to 31 days, experiments operate in an area that is almost free of atmospheric interference. For some experiments, this provides scientists with conditions equivalent to flight aboard a satellite or the space shuttle, at much lower cost.

Two unique geophysical conditions above Antarctica make LDB flights that circumnavigate the continent possible during the austral summer: (1) **A nearly circular pattern of gentle east-to-west winds** establishes itself in the Antarctic stratosphere lasting for a few weeks. The circulation is generated by a long-lived high-pressure area caused by the constant solar heating of the stratosphere. This allows the launching and recovery of a balloon from roughly the same geographic location and permits a flight path that is almost entirely over land. (2) **Because the sun never sets during the austral summer**, the balloon is illuminated continuously, both directly and by reflection from the underlying clouds or snow. As a result, the balloon maintains a constant temperature and is able to maintain a stable altitude. In other areas of the world, the daily heating and cooling cycles change the volume of gas in the balloon, causing it to rise and fall and expend ballast, severely limiting flight times. As an international zone under the Antarctic Treaty, balloons can be launched, flown and recovered anywhere on the continent without diplomatic complications experienced in other areas of the globe.

Since 1988, NSF and NASA have developed techniques for flying and recovering large balloon payloads - in the range of two tons - at altitudes of roughly 37 km (22.9 mi) for extended periods. Over the past decade there have been LDB flights in most Antarctic research seasons — roughly mid-December through mid-January - frequently with two balloons being flown during the season. During the 2001-02 Antarctic research season, the balloon-borne Trans-Iron Galactic Element Recorder (TIGER) experiment, designed to search for the origin of cosmic rays, achieved a flight duration record over Antarctica. Launched at 0630 EST on Dec. 20, 2001, the balloon traveled approximately 1,400 km (869 mi) before landing, 31 days, 20 hours later, at 0303 EST, Jan. 21, 458 km (284 mi) from McMurdo.

The Antarctic research season spans the period from October through February. However, regional weather does not normally stabilize until early December. Because recovery aircraft are more in demand near the end of the season, the Antarctic balloon launch window lasts only about six weeks. By early February, icebreakers have created a channel through the sea ice that rings the continent

to allow a supply ship to bring in heavy equipment for the next season. This cargo often includes truckloads of helium for the following year's balloon flights.

**WHALING IS NOT DEAD YET.** (Ray Arnaudo) The recent International Whaling Commission meeting in Shimonoseki, Japan (May 13-17), produced no change on whaling in Antarctica. There was some progress on developing a new Revised Management Scheme, but commercial whaling is still prohibited. Although the Scientific Committee doesn't support the Japanese effort to take whales "for scientific purposes," the Japanese intend to harvest another 400 minke whales in Antarctic waters next year. The major news of the meeting was the Japanese-led effort to block the setting of a subsistence harvest level for bowheads for U.S. Alaskan natives. The U.S. came up one vote shy of the required three-fourths majority needed.

**ANTARCTIC TREATY NEWS.** (Ray Arnaudo) India has finally ratified Annex 5 of the Environmental Protocol to the Antarctic Treaty ( Protected Areas) and this brings the Annex into force, effective May 24. This Annex was concluded after the negotiation of the Protocol and its original four annexes. As a result, it required a separate ratification notification by Parties to the Treaty. The Protocol itself entered into force in 1998.

## **CANCER, AN INSURMOUNTABLE CREVASSE.**

Fifty-five years ago Pete Peterson thought that his number had been called, as he was over a hundred feet down, wedged in a crevasse, almost ten miles from camp. This was on the Ronne Antarctic Research Expedition in July 1947. Pete and Bob Dodson had been up on the plateau when they got caught in a blizzard. Afterwards Bob wrote "I believe Pete was the most courageous person I ever met. During several days and nights of extreme blizzard conditions immediately preceding the crevasse incident, Pete was a bastion of strength and courage: winds gusted over 100 mph, finally taking our tent." Pete died in some place called San Francisco, but he chose to be buried in Peru, a country he loved. His wife, Zoila, is a Peruvian. And now there are nine known survivors from that expedition.

**SOUTH POLE IGY REUNION.** The International Geophysical Year was from 1 July 1957 to 31 December 1958, although there was a follow-up to that called the International Geophysical Cooperation, 1 January to 31 December 1959 (IGC - 59). Regardless of when, the people who first wintered over at the South Pole in 1957 gathered with those who

*(Continued from Pg. 3)*

followed them in 1958, for the First All-Hands IGY South Pole Reunion in late April at a resort called Forest Hills in Dahlonega, Georgia. Sandcrabs and Swabees united as one. A total of thirty-six people wintered over at the Pole during the IGY, but seven of them have passed along, including both station scientific leaders and Navy leaders. Eighteen showed up for the reunion, with twelve bringing wives or in one case a significant other. Four additional people had made reservations, but had to withdraw the last second because of such nuisances as a heart attack. For an event some forty-seven years later, it was well attended.

What happens to a group of twenty-nine survivors? - about twenty-nine different things. One, Mario Giovanetto, is still doing what he did at the South Pole, analyzing snow and ice data. Whether he will ever get it done is very doubtful, but he is having a hell of a good time getting paid for it by NASA. Arlo Landolt has been a college professor at Louisiana State for more than forty years. He loves his work, which frequently takes him into the Andes of Peru and Chile, and, if he ever does retire, it will only be a paper retirement as he rolls onward. Charlie Greene found the perfect solution for a happy career, forming his own company, GREENRIDGE, working for himself, supervising himself and others, and going to the Arctic each and every summer studying the noises of whales. A fourth still punching the clock is Bob Benson, former aurora specialist, who now is very, very happy at NASA analyzing data from a new satellite. He has no intentions of ever retiring, and is happy as a clam at high tide.

But there is also a down side among the noted thirty-six. Two had run-ins with the law, but both have paid their debts to society. Two have Parkinsons, namely Kirby Hanson and Jim Burnham. Both have had it for close to twenty years, and both have fought it gallantly. They each showed up with their better halves. There is an interesting story connected with Kirby. Once he was a taxi driver, and while at the airport to pick up a customer, he used to visit the US Weather Bureau airport office to kill some time. But he got interested in weather and meteorology, and that was a springboard for him going to the ice where his determination and dedication impressed the Bureau so much that they sent him off to college after the IGY, where he picked up his bachelors, masters, and PhD degrees in meteorology at the University of Wisconsin. Later he was placed in charge of the Clean Air Facility stations, and in that capacity, had a chance to revisit the South Pole, one of the stations in his network.

Several of the people at the reunion, besides Kirby, have been back to the Antarctic. Jim Burnham came back for a second year at the South Pole, as did Ed Flowers. Mario was on the first US oversnow traverse from McMurdo to the South Pole. Floyd Johnson went back to Antarctica for one year with the Argentines at old Ellsworth Station, but when ice conditions locked him in from relief, he had

to stay another year! But in Floyd's case, it was hard to tell whether the additional year adversely affected him, as he always was a character, not your normal human being. Mel Havener came back for a second year at McMurdo, and I, Paul Dalrymple, was a guest on a VIP flight to the South Pole thirty years after the IGY. Tom Osborne came back to the Pole, and also w/o a third year at Byrd.

The one common thread that we all seemed to have, as each told his own post-IGY resume, was travel. One unusual one, although he wasn't at the reunion, was John Guerrero's job as a war-time correspondent for a European news agency, which got him wounded in combat!! No one was masquerading as an explorer with a beard, as each was sure of his credentials and did not have to impress anyone. Some of us had expanded waistlines, and bore little or no resemblance to the person with our names under our pictures in the Deep Freeze yearbooks.

What happened at the reunion besides a lot of beer drinking? Mainly story telling, and probably the best session was when each one was asked to tell the weirdest or funniest happening that they could recall. Bob Benson brought along an excellent video of movies he had shot at the South Pole in 1957, never before shown outside of his personal family. Although not there, Dee Baulch's video, which he shot the second year, was also shown and that is a good one, too. We were honored and blessed by the presence of Jerry Marty of NSF, who for the past twelve years has had the responsibility of managing the South Pole Station. He came out of his own pocket to tell us all about the magnificent new South Pole station being built by you tax payers for possible dedication in the year 2006. We also had some culture, as Alan Campbell, most distinguished Antarctic artist, who lives in Athens, Georgia, brought over seven or eight Antarctic oils, seven or eight Antarctic watercolors, and gave a presentation on his three trips to the Antarctic. Someone brought along a trunkful of Antarctic books, including all the Deep Freeze yearbooks for 1957 and 1958, all the pertinent books published on Antarctica during the IGY, the best of the coffee-table books, and a half-dozen of the more recent prominent books on Antarctica.

Several things became very evident as the people who w/o at the South Pole in 1957 revealed these priceless memories. One was the strong conviction that they all felt that they had very strong camp leadership in Paul Siple, and that this resulted in a happy baptismal year at the South Pole, so much so that many of them chose to w/o again. Another feeling gleaned was that Siple had a very young and inexperienced cadre of people at his station. Two, Ken Waldron and Mel Havener, walked

*(Continued from Pg. 4)*

out of the corn fields of Iowa, less than forty miles apart, and were chosen for the Antarctic when they were only twenty years of age, and a third, Herb Hansen, came out of the same general area. Two future PhDs came out of the group, the aforementioned Landolt and Benson. When the Annals of the South Pole are written, it will have to be said that the first year of human habitation at the South Pole was very successful, in spite of the harsh feelings between the admiral and the station scientific leader. Another first that occurred at the South Pole in its first-ever w/o year - Cliff Dickey made USN Chief Petty Officer while there, the first CPO made while sitting on a spinning/rotating pole.

The second year of occupation at the South Pole bore little resemblance to the first year. The strong leadership provided by Siple was no longer there, and the year was more one of individualistic accomplishments. Where the 1957 crew planted the seed, the 1958 crew came along to reap the profits, being there when Sir Edmund Hillary met Dr. Bunny Fuchs on Bunny's crossing of the continent, the first time ever, thus fulfilling Shackleton's objective of 1915-16. There were some strongly dedicated people who used that year, 1958, as a springboard to go on with their education. Five Ph.D. degrees resulted - Greene, Hanson, Giovinetto, Dawson, and Dalrymple. The house doctor and Navy leader, Vernon Houk, went on to have a most distinguished professional career with the famed Center for Disease Control in Atlanta. Three Navy men made Chief Petty Officer — Lou deWit, Gerry Dubois, and Stan Greenwood.

The whole reunion was put together by Ed White, who picked a great place, and a good time of the year. But, unfortunately, Ed suffered a cut eye about a month before the reunion and was damaged goods. His wife Marge drove him to the reunion, but his pain forced them to leave before the end of a great reunion. Most folks were clamoring for a repeat, but perhaps we should rest on our laurels. *(We talked to Ed White on the evening of 30 May, and he appears to be making a slow but complete recovery from his health problems. He expects to be able to drive to their summer home in Roanoke in about ten days.)*

**FIRST LEADER AT THE SOUTH POLE.** It is fitting in this issue of the Newsletter that we honor Paul Siple, inasmuch as we could sense that he was at the recent South Pole reunion, although not visible in the photos. A short biography of Paul is excerpted here from an account by Bob Benson, £05 (AGU), 2 August 1994. He began his polar career by being a Boy Scout, in fact, at 19, an Eagle Scout. As a result of a highly publicized contest from among thousands of scout applicants to participate in the first Byrd Antarctic Expedition (1928-30), he was selected not only because of his 60 merit badges, his stature (6'1" and 167 pounds), but possibly because

the search committee saw in Paul Siple the characteristics of a hard-worker, leadership, and a future scientist. The expedition was the first of 4 winters and 10 summers that Siple would spend in Antarctica. On Byrd's first expedition, Paul performed a wide variety of tasks in addition to serving as taxidermist - many specimens were brought back to the American Museum of Natural History. He returned to Allegheny College, Meadville, PA, where he completed his B.S. degree in 1932, gave many lectures, wrote a book (for a symbolic royalty of \$1 in compensation), and afterward accompanied Byrd on the second expedition, 1933-35. Siple was chief biologist, and led a 3-month dog-sledging party into unexplored regions.

In 1939, between expeditions, Siple earned his Ph.D. degree in geography from Clark University. His "Wind-Chill Index" was introduced in his dissertation, in attempts to quantify the relationship between wind speed, air temperature, and cooling effects on the body. He was also an expert in designing cold-weather clothing, which earned him a commission in the Army Quartermaster Corps. When he left active duty at the end of WWII, he had attained the rank of Lt. Colonel, returning to the Army as a civilian scientist. A major challenge arose when Admiral Byrd persuaded Siple to lead the first w/o party of 18 men at the planned South Pole station. Siple and his second-in-command, John ('Jack') Tuck Jr. formed an ideal leadership team. Among all the hardships to be endured at the South Pole especially in winter, it was difficult for any station member to complain about the conditions when Siple - many years their senior—was outperforming them by his industrious attitude of long work hours in the bitter cold.

After returning from Antarctica, Siple resumed his role as special advisor to the Director of the Army Research Office, wrote a book about the first w/o at the South Pole, and accepted a position as the first U.S. scientific attache to Australia and New Zealand. He died in 1968 at 59 after struggling for more than 2 years to keep working despite partial paralysis resulting from a stroke. In addition to the numerous honors and medals he received - including a cover picture on *Time Magazine*, in 1956 — an Antarctic station and other features were named for him. Paul's widow, Ruth, has four gold medals that we know of in a bank safety deposit box representing only part of what Paul's distinguished career as a polar explorer/scientist achieved.

**TEA AT PALMER.** (Polly Penhale)

NSF brings science into the classroom through its TEA (**Teachers Experiencing Antarctica**) program, which match\*

*{Continued from Pg. 5}*

teachers from local school districts throughout the U.S. and researchers in a partnership on the ice. The goal of including a teacher as part of a research team in Antarctica is to provide a real life experience of how scientists go about their work. The teachers actively participate in the research program and then bring this first-hand experience and knowledge into the classroom via e-mail and a web-based daily journal written by the teacher while on the ice.

Susan Cowles, a teacher at Palmer Station, was the first teacher of adult learners, through her work in a high school completion program in Corvallis, Oregon. Susan's students ranged in age from 16 to 40, and they came from different educational and skill backgrounds. All had their formal education interrupted for one reason or another and have returned to school to complete a high school equivalency program. Working with NSF Representative David Bresnahan and others at Palmer Station, Susan designed math problems for her students. In one example, she had the students calculate how many brownies the cooks had to make in order to feed 100 passengers from a tour ship arriving for a station visit. Another problem related to a calculation of water produced for the station in the reverse osmosis system when the pressure was increased.

In addition to creating math problems, Susan wrote a daily journal describing station life, the people she worked with, the science programs, the wildlife in the area and the visitors to Palmer Station. The Antarctic experience she described provided the students with the ability to improve their reading and computational skills, while learning about a fascinating and important part of the Earth. Adult learners are an important part of the communities. As Susan explains, "they are workers, voters, taxpayers, parents and grandparents." To share in Susan's adventure, a description of her stay at Palmer Station and her daily journal entries can be found at her website at <http://literacvnet.org/polar/pop/html/home.html>.

**ANTARCTIC TARTAN BY CELTICS ORIGINALS.** (Charles Lagerbom) ([www.celtictartans.com](http://www.celtictartans.com).) This small business in the Isle of Mull, U.K., has come up with an Antarctic tartan, which can be viewed on the above website (click on the link 'Antarctic', and you'll see a genuine British Antarctic scientist wearing the tartan on Bird Island, South Georgia). The design is based on the Antarctic's geography. White represents the ice-covered continent, ice flows, and the edge of the Southern Ocean. Gray represents outcropping rocks, seals and birds. Orange represents lichens, and Emperor and King Penguin plumage. Yellow also represents penguin plumage and the summer midnight sun. Black and white together depict penguins and whales. Pale blue represents crevasses in the ice and shallow blue icy waters on the ice shelves, whilst dark midnight blue represents the deep Southern Ocean and the darkness of the winter. The light square

of white at the edge of the sea (variant 01 sei) represents the light of the Antarctic summer on the continent. This is quartered by threads of pale blue, which represent 0°/360°, 90°, 180°, and 270° lines of longitude. The point where they cross represents the South Pole. Two bands of gray surrounding the white heart depict nunataks, mountain ranges, and exposed coastal rocks. Around the coast Antarctica's life forms are found so the colors that follow in the sett-orange, yellow, black and white—represent the wealth of animal life on land and in the seas. Each sett is separated by a thin band of white that represents the edge of Antarctica. Where these cross, the Southern Cross is depicted. This viewed diagonally also represents the Scottish saltire (a cross design in heraldry), tribute that 2001 is the centenary of Scott's first expedition to the Antarctic in 1901. Products available in the above designs include ties, scarves, squares, sashes, cummerbunds, stoles, travel rugs, and framed tartans.

**ANTARCTIC TREASURES.** (*Christchurch Citizen*, March 14, 2002, Tim Cronshaw, forwarded by Margaret Lanyon.) Antarctic plunder including two 90-year-old biscuits taken from an historic hut will be returned to the frozen continent thanks to an American with a sense of history. Former Navy man Ed Phelps handed over an 1899 Latin-English book, a 1909 book of short stories, a carved container lid and two extremely hard biscuits to the Antarctic Heritage Trust in Christchurch yesterday. He had lifted them in the 1950s during a visit to Scott's hut at Cape Evans. During a 6-month stint, Phelps spent life aboard a U.S. Navy vessel clearing pack ice and assisting with the evacuation of staff wintering on the continent. The souvenirs had been a reminder of a special time for him. (Just in case there is anyone else out there with similar souvenirs, it's not too late to get them to their proper place.)

**EARTH DAY AT PALMER** (Polly Penhale) For the third year in a row, Palmer Station personnel conducted an "Earth Day" activity, as part of a worldwide network of organizations interested in promoting a healthy planet. The activity on March 9 was a "clean-up" of bits of debris left behind from the removal of former stations, Old Palmer (U.S.) and Base N (U.K.). Clean-up efforts also included the removal of jetsam found at Norsel Point near station. Seventeen people brought trash barrels, trash bags and magnets to pick up the material. Despite winds at 20 knots and blowing rain, spirits were high and the clean-up turned into a treasure hunt. Shards of dishes, flatware, and small plumbing bits were included in the debris.

**OLD ANTARCTIC EXPLORERS ASSOCIATION.** Another Antarctic organization has been founded, one which sort of crosses boundaries with the early Deep Freezers. Although we all know that the real old Antarctic explorers have long since departed this world, there are evidently a bunch of icemen who have formed under the umbrella of Old Antarctic Explorers, and they are planning a "First Reunion Symposium" in Pensacola, Florida on November 6, 7, and 8. I don't think it is exactly going to be a "symposium" in the truest sense of the word, but it is going to be the first mass gathering of their membership. They have done some pretty healthy recruiting, so have a relatively large group. With Billy-Ace Baker one of its king pins, you can be sure that the organization will flourish. If you like to tell and hear Antarctic stories, some of which might actually be true, this is probably your club. If you want "their" information on the OAEs, check them out on [www.oaea.net](http://www.oaea.net), or e-mail [penguin64@att.net](mailto:penguin64@att.net).

If you want to go to their conclave in Pensacola, you must first become a member. Annual dues are only \$10 per year, but they have a very enticing and unique way of scaling life membership dues. The older you are, the less you pay. It appears if you are older than 100, they might even pay you. If you are 45 or younger, you can buy in for life at \$110. If you say you are 56 to 60, then you're in for \$75.00. By the time you reach 76, a ten spot will do it, and after 80, \$5.00!!! Their address is Old Antarctic Explorers Association, Inc., 4615 Balmoral Drive, Pensacola, FL 32504.

**VODKA ON ICE; A YEAR WITH THE RUSSIANS IN ANTARCTICA**, by Charles Swithinbank. (Review by John Spletstoesser) At last we have the fourth and final(?) volume on the professional career of the author, one of the world's foremost glaciologists. This volume is an account of his wintering period with the Russians at the base Novolazarevskaya in 1963-65, including time at Mirnyy, Vostok, and Molodezhnaya in the summer. Charles was an exchange scientist at the time, no easy feat in gaining that position, but for him it was the chance of a lifetime to live in an area of Antarctica in which he had the opportunity to measure ice movement where no one had done so before, interact with Russians who accepted him as one of their own (eventually), and learn to converse in a language that to him was virtually unknown at the beginning of his assignment. This book is not a scientific account of his time there, but instead is an interesting story about life in a remote part of Antarctica with 13 others from a country with politics that are totally different from much of the world. Charles was very much aware that once the last ship left, he was there for a year and there was no way out if anything went wrong. By the time his year was up, he was fluent in Russian, even presenting a summary of his work in Russian before the Director of the Arctic & Antarctic Institute in St. Petersburg on his return. He also taught classes in English for some of the Russians. The wintering meant personal sacrifice, leaving a

wife, two children, and a third on the way for an extended period of time. It also meant improvising his field work as needs arose, including equipment, supplies, and anything else to perform his research. Numerous color photographs on glossy paper tell much of the story. Food on the ships en route, and at the station, were mostly routine and 'Russian', but even for a young man used to English cooking, was part of the hardship. After his return, loading up on long-awaited meat and protein produced gastrointestinal problems that took some time to overcome. Days of nothing but boiled potatoes, and the ever-present 'compote' (dark 'mystery' broth) at many meals, interrupted by cabbage soup, caviar, 'cardboard fish', and similar delicacies, took a toll on Charles. A parallel experience might be being released from prison following wartime, and finally getting back to a normal diet.

Because of Charles's earlier experience and background, already proving himself as a scientist on the Norwegian-British-Swedish Antarctic Expedition, 1949-52, in Queen Maud Land and with the U.S. Antarctic Program, he fit in well with fellow Russian colleagues who also had considerable polar experience. One of Charles's talents that made him useful was his experience as a 'driver' of tractors to transport equipment between Soviet supply ships and bases—apparently Russians never considered that to be a vital part of their required experience, and Charles was good at it. Charles includes in this book some of the political and ideological differences that produced a few divisions between him and the wintering crew, but they remained minor. As polyarniks are aware, once on the ice, politics and nationalities become insignificant. He took part in Russian holiday celebrations, attended political meetings, all the while gaining a feeling for the lives that his cohorts lived full-time back in their native country. There appeared to be no complainers, however, as the Russians took life as it came without complaint. Many of the friendships gained during his experience lasted throughout later life, as Charles maintained correspondence with several of the men, although what appeared to be guarded messages and letters he received indicated that the overriding policy of government censorship, and his friends' awareness of it, dampened the situation.

This book is required reading for those interested in the life of an experienced polar researcher, as well as the politics and interactions of the experience. It is available from book dealers and the publisher (The Book Guild Ltd, Sussex, U.K.-ISBN 1 85776 646 6, 2002, 165 p.), as well as from Charles directly in Cambridge, U.K. Write to him at 7 Home End, Fulbourn, Cambridge CB1 5BS, U.K., with a check for \$33 (surface mail) or \$37 (air mail), which includes shipping, and receive an autographed copy.

**Top photo:** 1957 w/o personnel, first group ever to w/o at the South Pole. Back row: Cliff Dickey, electronics; Earl F. Johnson, utilities; Bob Benson, seismology; Floyd Johnson, meteorology; Front row: Mel Havener, mechanic; Herb Hansen, meteorology; 'Moose' Remington, glaciology; Arlo Landolt, aurora; Chet Segers, cook. ### BRASH ICE

#### Motto: Don't let the truth get in the way of a good story

Mid-Winter Day has come and gone, and WINFLY will soon be upon us, and before you know it our 47\* year on the ice will be here. How time flies. One who was there in the very beginning, Alison Wilson, has passed away, and Walt Seelig wants to keep her obit on the serious side in keeping with her life style. So be it. But I have to tell one story which the IGY Early Birds will appreciate. Back in 1956 there was no such thing as a big polar shed like NSF, and things were sort of done with bailing wire, scotch tape, and Underwoods. They needed another secretary badly, and who answers the announcement but this gorgeous creature out of the hills of West Virginia. Alison sat there listening to Bert Crary interview her, and as she sashayed out the door, Alison said with great emphasis, "YOU aren't going to hire HER are you?" and Bert's reply was "Hell, yes, she can type ten words per minute!" And so the near legendary Yum Yum came on board, became instantly famous, particularly with the young scientists going through Washington en route to the Antarctic. And Alison kept typing, and typing, and typing still more, long into the nights!

Before anyone yells at me for the above quote from Bert Crary, please let me inform you that Yum Yum herself told me over the phone that it was probably a close approximation to the truth, and not to sweat it. Yum Yum is still a sheer delight to talk to, and she may become a frequent contributor to these pages as sh(esays, "I know a lot of real good stories!" I bet she does, as she hobnobbed with some of the power kings of the IGY. But she had one question of her own, who named a Sno-Cat after her, and where is that cat now? Anyone know? It sounds to me like Blackie Bennett or Wild Bill Cromie, although these are just educated guesses based on associations.

This newsletter has some interesting stuff in it, particularly if you like the melodramatic side of the ice. It seems that doctors who go to the South Pole are predestined for immortality in one way or another and this year has not been an exception. And what happened this winter gave us an excuse to invite our own Charles Swithinbank to personally recall one of the most touching human-interest hero stories ever performed on the ice. Be sure to read all about the clever and nerveless Ove Wilson. It will warm your heart, and make you justly proud of Antarcticans.

This newsletter is basically a collection of articles put together by a cadre of people friendly toward us. The newspaper articles were sent to us by our faithful and loyal buddy, Pete Barretta, who makes these newsletters timely.

## **2003 ANTARCTIC CALENDARS**

We hesitated a bit on this calendar, as Hedgehog in New Zealand has been great in the past for keeping people out of the focal length of their cameras, letting the so-called pristine beauty of Antarctica speak for itself. But this year two kayaks sneaked into one picture, plus the bust of Richard E. Byrd at McMurdo. However, the centerfold picture from the top of a mountain overlooking a bay on the Antarctic Peninsula is one of the best shots that we have ever seen. Probably the best centerfold since a soda jerk by the name of Norma Jean made a big splash. We only bought a hundred this year in protest of the kayaks, plus we were getting sick and tired of begging you people to buy the calendars. This is only a nickel and dime operation for us, so really not worth the effort, but for those of you who want the best of the Antarctica calendars, send in your check for \$12 to the Antarctic Society, P.O. Box 325, Port Clyde, ME 04855, and it will be on its way.

## **SOUTH POLE SURGERY VIA SATELLITE (By Frank D. Roylance, *BALTIMORE SUN*, July 19, 2002).**

The repair of a meteorologist's ruptured kneecap on July 5 was the first "telemedicine" surgery ever attempted at the United States' Amundsen Scott South Pole Station. "It went very well, exactly as we planned," says Dr. Bertram Zarins, chief of sports medicine at Massachusetts General Hospital, who supervised the surgery from Boston. The patient - 29 year-old Dar Gibson - is said to be making a full recovery.

Without timely surgery, Gibson faced permanent damage to his knee and a lifetime of limited mobility. Zarins headed a team of physicians enlisted by the National Science Foundation and by Raytheon Polar Services. Their job was to evaluate Gibson's injury and consult with the station's sole doctor, Dr. Timothy Pollard, 46, of Seattle. The team also included Dr. Vicki E. Modest, an anesthesiologist at Massachusetts General. Consulting before the surgery were Drs. Frank J. Frassica and John H. Wilckens at Johns Hopkins Hospital in Baltimore; and Brian A. Smith, a surgeon at the University of Texas Medical Branch at Galveston.

Gibson, from Manchester, Vt, slipped on ice June 28 after taking surface observations outside the station's domed shelter. His left knee was stiffened by minus-90-degree temperatures, and apparently bent too far, separating the tendon that connects the kneecap, or patella, to the lower leg. It can be repaired successfully by suturing the tendon back onto the kneecap, Zarins says, but only "if you operate right away, before the anatomy has changed and the thing is scarred into an abnormal position." Through conference

calls and e-mail exchanges, the consulting team gradually concluded that Pollard had the skills, the drugs and the equipment to perform the surgery safely.

Modest quizzed Pollard about the drugs and the equipment he had. She sent him numerous memos outlining things that could go wrong. She discarded the favored anesthetic approach - an injection into the femoral nerve in the leg. "The femoral nerve is directly next to the femoral artery," she says. A mistake could send the drug into the artery, producing life-threatening seizures and cardiovascular collapse. She and Pollard opted instead for a spinal anesthetic that would numb everything below Gibson's waist. Pollard had performed the procedure several times before. Zarins, meanwhile, gave Pollard a short course in knee repair. "We spent several hours on the telephone, and I explained the procedure in detail and asked him to tell it back to me," he says. "He demonstrated knowledge of the steps involved. He knew what to do."

After a dress rehearsal, a portion of the station's clinic was cleaned and sterilized. Physician's assistant Tom Barale and the station's cook - a former veterinary technician (who was not identified) - scrubbed up to help Pollard. The surgery had to start and finish during the six-hour "window" when the communications satellite was overhead.

Zarins and Modest had a clear, detailed view of the operation. The sound quality from the operating room was spotty, but they managed to converse with Pollard and his patient, who remained conscious. The satellite link was lost several times during the surgery. Each time, contact was quickly re-established using a satellite telephone. Pollard never missed a beat, Modest says. "Even when we were out of communication.... he just continued on." In three hours his work was done. Pollard said his patient is progressing well and has begun physical therapy.

## **A MAN HAS TO DO WHAT A MAN HAS TO DO (by Charles Swithinbank)**

News about an operation at the South Pole to fix a ruptured kneecap reminds me of a hair-raising operation that I witnessed on my first Antarctic expedition (1949-1952). While taking samples, a chip of rock flew into the eye of geologist Alan Reece. Our Swedish physician Ove Wilson consulted a specialist by radio, who advised that Alan's damaged eye must be removed if he were to have any chance of saving the sight of the good eye.

Ove had never witnessed an eye operation but now there was no choice. He set to work preparing a set of instruments for the purpose, modifying some dental tools and making a number

of completely new instruments by filing and polishing pieces of welding wire. We built an operating table out of old boxes and fashioned an oxygen mask out of tractor spares. Then Ove trained his theatre assistants. Photographer Hallgren was chosen as anesthetist and practiced by injecting people with vitamin solutions. Geologist Roots was to assist Ove in the most delicate task of all, actually removing Alan's eye. Glaciologist Schytt was taught the duties of theatre nurse, handing the right instruments to Ove when he called for them. Radio operator Rogstad learned how to monitor blood pressure and muscle reflexes. Meteorologist Liljequist would monitor heart rate and keep records.

Sterility was in insoluble problem. The operating theatre was the open space between rows of cabins in the command hut - a most unsterile place. Aprons and facemasks were made by cutting up sheets which were then sterilized by boiling them in the cook's biggest saucepan. Final preparations looked every bit as professional as a hospital training film. There was a long and thorough scrub-up with nail brushes, soap and boiled water, and then, hands held high, all donned sterile rubber gloves.

I had been briefed to take still and moving pictures, so I was called into the operating theatre at the same time as Alan. Now Alan was strapped to a mattress to restrain any violent reflexes and Hallgren inserted the needle.

Ove's written report says it all: "Slowly but surely Hallgren submerged our patient in ever deeper sleep. My operating knife made the first incision in die pupil. Roots assisted with swift and cool precision, Schytt passed the instruments with absolute assurance, Rogstad followed the blood pressure. Gosta Liljequist kept the records and took the pulse, Hallgren maintained the anesthesia always at the right level. The tension was tremendous. Suddenly I found the first eye muscle, which I retracted by means of my homemade instruments. Directly after, I had severed all the eye muscles. The most dramatic moment came when I was looking for the optic nerve. The only audible sound was the ticking of the film camera in the background. After a while I was able to sever the nerve and take out the eyeball, then tie up the muscles and close the wound."

After two hours and forty minutes of tension, it was all over. Alan was carried to his own bunk and slept. The next day we all visited his cabin to congratulate him on his remarkable courage. Ove too enjoyed universal praise for his masterly management of the surgery. Alan's good eye was now saved, and he later took part in some major inland journeys before returning home the following year. Eventually he acquired a glass eye and recovered his driver's license.

Fourteen years later, while serving as a glaciologist with the Soviet Antarctic Expedition, I told the station physician at Novolazarevskaya of my earlier experience, when the doctor had no choice but to take out a man's eye. He capped that by relating how in 1961

L.I. Rogozov, the doctor at Novolazarevskaya, had taken out his own appendix with the help of a mechanic and a meteorologist. It was a harrowing story. At the time, a blizzard was raging and it was impossible to get medical help from any other station. "The patient" recognized in himself the symptoms of peritonitis. He prepared syringes and instructed his assistants that, if he lost consciousness, they were to use the drugs and administer artificial respiration. Then he propped himself in a semi-reclining position, injected Novocaine, and made the incision. Throughout the operation, one of the assistants had to kneel holding a mirror so that Rogozov could see what he was doing. The doctor developed vertigo after 30-40 minutes and had to pause for rests.

Rogozov later reported that "after resection of the severely diseased vermiform appendix (a 2x2 cm perforation was found at its base), antibiotics were introduced into the peritoneal cavity, and the wound was tightly sutured." The operation took two hours and the patient made a complete recovery.

### **STUCK IN THE ICE (Peter Baker, WASHINGTON POST Foreign Service, WASHINGTON POST, July 21,2002)**

For essentially the entire month of June, a team of Russian scientists trying to get home, along with the crew of the *Magdalena* sent to fetch them, remained trapped at the bottom of the world. Surrounded by walls of ice that its engines were not powerful enough to cut through, the ship was left to the mercy of the elements. Food was running out, electricity rationed. Not until the end of June did rescue arrive, in the form of helicopters that sliced through torturous winds to reach the ship. After recent financial cutbacks, Russia staffs just four of its eight stations on the continent, housing about 90 year-round residents. A similar number joins them during summer months.

The *Magdalena* was not the first ship to become trapped by ice, but this was the first time in years that such a massive rescue operation was undertaken. With the Southern Hemisphere winter fast approaching, the window for leaving was closing when the 74 Russians boarded the ship, with a crew of 33 sailors and pilots, and headed out on May 30. Within hours of their departure from Novolazarevskaya, a coastal station that Russia maintains in Antarctica, the German owned supply ship *Magdalena* became trapped. On one side was the continental ice barrier rising 130 feet into the air: on the other, a frozen ocean and more than a hundred icebergs, some emerging from the water as high as 60 feet and one an estimated 29 miles long. The winds howled and visibility sometimes dropped to zero. The Russians said this year's environment was no worse than usual, but the

*Magdalena* was substituting for their normal icebreaker and simply wasn't up to the task. For 11 days, they were carried along helplessly, unable to maneuver amid floes that pressed up against the vessel - - and unable to find a route out.

At first, crewmembers tried to handle the problem themselves, desperately searching for a way around the ice. After more than a week, on June 7, the Russians said they insisted on checking the food stores, only to learn that they had enough for just three more weeks. They began cutting back at mealtimes but soon ran out of sugar, butter and even bread until they made their own. They also ran out of cigarettes, leaving many of the stranded men all the more on edge.

Perhaps the most tense moment, some said, came on June 11 when they were drifting toward a formation of ice jutting out from the continent. Crewmembers were looking for a break in the ice to steer the ship into Muskegbukta Bay, where they could take haven and wait for rescue. "That was a very critical moment," said V. Martyanov, 50, assistant director of the Russian program and the senior expedition official on the ship. "We had only one chance, perhaps 1 percent chance of succeeding. Fortunately, everything came together. Two weeks earlier or two weeks later, meteorological conditions wouldn't have allowed it, but exactly when we came to that spot, the ice moved apart."

Only then did the *Magdalena* call for help. South Africa dispatched the polar ship *Agulhas* to try its first-ever mid-winter voyage, carrying two long-range Oryx helicopters. The ship got no closer than 185 miles away on June 27 when the helicopters managed to make a single run each to the *Magdalena*, dropping off supplies (cigarettes were unloaded first) and extracting about a dozen men each. Driven back by a storm, the *Agulhas* tried again the next day, this time sending four flights. Martyanov was among the last few taken away on the final two flights on July 1.

A skeletal crew of 17 remained to wait for the Argentine icebreaker *Irizar* to arrive and finally slice the *Magdalena* free. The Russian researchers made their way home to St. Petersburg and Moscow. After the ship returns to port, an investigation is to examine why it failed to cut through the ice. For Yuri Medunitsin, this would be a triumphant coda to a long, distinguished career in polar expeditions. At 66, the radio operator was the oldest man on the *Magdalena* as he wrapped up its ninth mission. His wife, Irina, 70, was petrified while waiting to learn whether he would make it back. "I don't want him to go again," she said, stroking his arm in their small apartment. "Nine times is enough." And if the Institute call again? Medunitsin smiled. "I'll convince her." More details of this episode can be found on a website from Scott Polar Research Institute, which leads you to additional websites.....

## **ALISON WILSON, A BUILDING STONE, CRUMBLES** **(Walt Seelig and others)**

Mary Alison Wilson (1927 - 2002) was born in Oklahoma on March 19, 1927 but grew up in Washington. In 1955 she began working at the National Academy of Sciences on the IGY program. It was there that her lifelong interest in polar matters started. Her experience there led her to the Polar Archives of the National Archives and Records Service, established in the mid 1960's to preserve records of the U.S. activities in and relating to polar regions. While at the Archives, she was a very important member of a strong polar team of Dr. Herman Friis, Jerry Pagano, and herself. They were not only very helpful to many of us who used the facilities, but were most instrumental in building up the large collection of memorabilia, including journals, of OAEs.

Friends and associates describe Alison as a private person, but most generous with her knowledge and widely recognized as one of the leading experts on polar history. She was particularly adept at locating sources for others to use. Evidence of her expertise is provided by the many, many acknowledgments she received from authors inside and out of government, who cite her assistance in their books and reports. She was associated with National Archives scientific records until she retired in October 1994. Because of her expertise and knowledge of the Antarctic, in 1975 the Secretary of the Interior appointed Alison to the Advisory Committee on Antarctic Names (ACAN), serving first as a member, and, from 1986 to 1993, as the Chairman of ACAN. She was an advisor to the group until her demise. The United States Board on Geographic Names approved the naming of the Antarctic feature Wilson Pass in her honor. Alison passed away at age 75 on June 17, 2002.

### **OTHER DEATHS.**

Tom Osborne, builder and a stalwart member of the first wintering over crew at the South Pole, 1956, recently died following a long bout with cancer. Both station leaders, Dr. Paul A. Siple and Lt. John Tuck, predeceased Tom, but the other fifteen live on. John Eklund, brother of our Founding Father, recently died. Although a newspaper man by profession, he also maintained a deep interest in all polar activities.

**Galen Rowell**, age 61, renowned nature photographer, who wrote **POLES APART: Parallel Visions of the Arctic and Antarctic** (1995), died with his wife Barbara, a friend, and their pilot in an airplane crash as they approached his home Town of Bishop, California, on 11\* of August. He received a grant from NSF in 1992 to travel around Antarctica with

scientists and photograph their activities. One of his more striking photographs was taken inside an ice tower formed from fumaroles at the summit of Mt. Erebus. Galen kindly offered to speak to our Society for his fee of \$4,000, but we reluctantly had to turn him down as this was \$4,000 more than we had ever paid anyone, including Sir Peter Scott.

#### **NORMAN PERSEVERES** (Carolyn Muegge)

Norman is now home! We did go to the cabin and see the fireweed. Had an entourage of 8 including 2 CCU nurses. It was lovely and warm with grand views of the mountain. He did very well - relatively speaking. It was such a treat to be there after 7 months! He has been getting stronger every day and will probably outlive the Energizer bunny! His kidneys are back to normal and liver seems to be fine too! No more pain. He even walks short distances with his walker.

Plus his appetite is back! Recently we drove a couple of hours south of Anchorage to the restaurant where he had his picture taken for the Vanity Fair spread His eyes just gleamed as the lamb chops were brought out. Another beautiful day with an aquamarine glacial-fed lake. Brilliant, blazing pink fireweed lined the road all along the drive. He's anxious to get back to his favorite lunch time hangout, Fletchers. He does still need a lot of assistance and the doctors say his heart is shot - but what do they know... they haven't factored in spirit. His cardiologist said, "He'll probably live to 100 after all and wind up 'relieving' himself on my grave." So he keeps pattering along and enjoys every opportunity he has to get out of the house. I even feel comfortable enough to go back to work as soon as I can find someone to be with him during the day. Maybe the next time you hear from me he'll be getting his wheelchair ready to hookup behind a dog team! Now there's an idea for a new race!

#### **PRINCE OF ASTURIAS AWARD** (Polly Penhale)

The Scientific Committee on Antarctic Research (SCAR) has won a major international award for its contribution to Antarctic science. SCAR is the advisory committee to the Antarctic Treaty and meets every two years to organize international science programs and to provide guidance on science and environmental topics. This year's SCAR meeting was held in July in Shanghai, China and was attended by a U.S. delegation of fifteen from the Office of Polar Programs, NSF and the academic community. Dr. Peter Clarkson, Executive Secretary for SCAR said, "SCAR is deeply honored by this illustrious award that recognizes its contribution to international Antarctic science and cooperation for almost half a century." The Prince of Asturias Award is bestowed annually upon individuals or institutions whose achievements have contributed in a significant way to mutual understanding, progress and brotherhood among nations. HRH Crown Prince Felipe of Spain will present the prize of 50,000 Euros on October 25, 2002 in Oviedo, northern Spain. Bob Rutford will

attend and accept the award. SCAR President Rutford has stepped down, replaced by J. Thiede (Germany).

#### **A REVIEW OF MICHAEL H. ROSE'S** **ANTARCTICA, 1772-1922; Freestanding Publications** **Through 1999** (Charles H. Lagerbom)

It was with great excitement I finally got my hands on Michael H. Rosove's new bibliography entitled ANTARCTICA, 1772-1922; Freestanding Publications Through 1999. To any avid south polar book enthusiast, the concept of such a comprehensive listing of all publications related to the classic and heroic ages of Antarctic exploration made one's mouth water, but what seemed to be a dauntingly ambitious if not near-impossible task. Spence, Renard, Conard and other earlier bibliographies had set a pretty high standard in bibliographic completeness, but one which now Michael Rosove has impressively surpassed. With ten years of research, he has produced a masterpiece no doubt destined to become the new standard for Antarctic bibliography with its extensive accounting of just about every published work regarding Antarctic history from Cook to Shackleton. In fact, by early spring of this year I noticed booksellers and libraries had already begun to use Rosove citations in their catalogs and databases. Furthermore, knowing that Antarctic bibliography does not remain static, the author has invited comments, corrections and contributions for a future "Additions and Corrections" supplement.

Rosove developed a four-tiered-hierarchy for his classification system to ensure a sense of consistency for the numerous variety of freestanding publications. Thus, with only a few items that might otherwise prove difficult to classify, his approach hugely succeeds by neatly categorizing most works and simplifying the burden for any reader, researcher, or collector. In Section I, he uses "Entry" to denote all published forms of a single work or body of work; "Group" for editions and printings that are very closely related; "Number" for each edition within a group; and "Variant" for differences in binding, edges, endpapers and so on. Section II is a 25 page comprehensive listing of other Antarctic titles with brief descriptions numbered 1000-1355. An included 25-page index is also very helpful. The result is a format that one can easily make use of and navigate. With this in mind, the true wealth of information and depth of details of Rosove's research becomes readily apparent.

The book, produced as a numbered edition of five hundred copies, was printed on high quality acid-free paper, has been Smyth-sewn and measures 29 cm. It is hefty with 537 quality pages and 10 plate leaves (5 of which are color). All copies of the book are signed on the limitation leaf by the author. The

SI 50 price is a great bargain for the amount of material and its wealth of details. It is available from Adelie Books, Santa Monica, California. ISBN 0-9705386-OX. This book will appeal to anyone interested in the history of pre-modern Antarctica and deserves a place on every south polar enthusiast's shelf.

### **NO ANTHRAX IN THEM THAR STABLES (Nicola Holmes, New Zealand Antarctic Institute)**

Speculation was raised last month that live anthrax spores were in the stables at Scott's hut at Cape Evans, Antarctica after University of Waikato scientists initial molecular tests indicated a positive reaction with probes to anthrax DNA.

The National Center for Disease Investigation followed up with further testing. NCDI director Dr. Hugh Davies, said NCDI tests failed to isolate anthrax in the samples they tested. Anthrax was not isolated from any of the six samples (of which four had shown a positive reaction with anthrax DNA probes) provided to them by University of Waikato scientists.

It is possible that there is a kind of fetish about digging around in stables and latrines at the bases of early explorers. George Meyer and others sampled latrines in 1961 at early camps on Ross Island, and analyzed them for organisms. Several kinds of viable organisms were found, and after thawing, there was no doubt that the investigators had truly found the latrines. George published his momentous work in the Canadian Journal of Microbiology (1963), for those readers who have a similar fetish. If you remember George from his presence at McMurdo in about 1960 or so, you might recall that somehow it all falls together. And now, George, it might be anthrax... what next?

### **PENGUINS IN ALASKA?**

We all know that penguins are found only in the Southern Hemisphere, except for the species in the Galapagos Islands on the Equator, right? Well, not all penguins (17 species) read those bits of trivia, as one of them, a Humboldt penguin normally found off the coast of Peru and northern Chile, apparently made its way across the Equator (eating what???), and was found by a fisherman in his net off southeast Alaska, west of Ketchikan. The penguin was hauled aboard, it appeared to be healthy and robust, was photographed, and returned to the sea. Penguin specialist Dr. Dee Boersma, University of Washington, Seattle, commented on this unusual find, and suggested that it might have been transported by boat. Dee's specialty, by the way, and a result of her Ph.D. Degree at Ohio State University, is the Galapagos penguin, so she knows a Humboldt when she sees one in a photo. Anyone else can attribute this to global warming, El Nino peculiarities, and other buzzwords... or just a plain, lost penguin. More at <http://www.adn.com/front/story/1516491p-1633674c.html> (front page story in Anchorage newspaper).

### **RAY ARNAUDO OF THE US STATE DEPARTMENT WRITES ABOUT SECRETARIAT (not the horse).**

The Antarctic Treaty continues to move towards establishing a Secretariat. It was agreed to do so at the 16<sup>th</sup> Antarctic Treaty Consultative Meeting (ATCM) several years ago, but no consensus had been reached on the location. At last year's annual meeting in St. Petersburg, all Parties agreed to setting up a small, cost-effective secretariat in Buenos Aires. The Argentine Government hosted an informal meeting this past June to begin planning and drafting of the various necessary documents, such as staff regulations, a headquarters agreement, financial arrangements, etc. They have also offered to establish a temporary facility until all governments act officially and the Secretariat is up and running. Further action will be one of the main topics at the upcoming ATCM in Warsaw. The other big issue of the Warsaw meeting will be the Liability Annex. The Chair of the Drafting Group, New Zealand's Ambassador Don MacKay, will be circulating a re-draft of his latest attempt to bridge differences between the US proposal and the old text, which had seen little progress over the past few years.

Environmental Protocol: Annex V of the Protocol, which covers protected areas in Antarctica, has finally entered into force. India, the last country to approve the Annex, informed the US, the Treaty Depository, that its Government had taken appropriate steps to ratify the last Annex. The Protocol and the other four annexes came into force in January 1998.

### **NATIONAL ICE CORE LABORATORY (NICL) RECOGNIZED (Julie Palais)**

The National Science Foundation (NSF) and the United States Geological Survey (USGS) jointly manage and operate the National Ice Core Laboratory (NICL) in Lakewood, Colorado. This facility has proven to be vitally important for researchers from the ice core community. NICL not only provides a state of the art ice core processing area for investigators to conduct research funded by NSF and the USGS but also have the ability to maintain the integrity of ice core archives by providing a safe and controlled environment to preserve ice cores for future researchers. These ice cores provide the basis for our current understanding of climate change on both long time scales and short time scales (i.e. abrupt climate change).

A National Research Council (NRC) panel visited numerous geoscience archival centers, including NICL, in the past year to address the problems with archiving of various types of cores (i.e. rock, sediment, ice). Their report "*Geoscience Data and Collections: National Resources in*

*Peril*" which came out in April mentioned NICL as an example of a "success story" in an article in *Science* (v. 297, p. 181) on the challenges in storage of geological information: The article said, "There are a few success stories. The NRC panel holds up the National Ice Core Laboratory (NICL) in Lakewood, Colorado, as a model facility. Funded by USGS and the National Science Foundation, the lab has a Web-based catalog, well-documented cores, and a clear policy for removing materials from the collection so that little core is wasted." The NRC committee also recommended that the government fund three new centers.....modeled after NICL to house core and other material.

## **ANTARCTIC AUTOMATIC WEATHER STATIONS 1980 TO 2002 (Chuck Stearns, U. Wise.)**

### Part 1. History and Installation

The National Science Foundations Office of Polar Programs funds the placement of automatic weather station (AWS) units in remote areas in Antarctica in support of meteorological research, applications and operations. The basic AWS units measure air temperature, wind speed and direction at a nominal height of 3 meters above the surface. Air pressure is measured at the height of the electronics' enclosure. Some units measure relative humidity at 3 meters above the surface and the air temperature difference between .5 and 3 meters above the surface at the time of installation. The data was collected by the ARGOS Data Collection System (DCS) on board the National Oceanic and Atmospheric Administration (NOAA) series of polar-orbiting satellites.

The AWS unit was designed and initially constructed and deployed under the direction of Prof. Peterson of Stanford University and turned over to Charles Stearns at the University of Wisconsin in the summer of 1980. The AWS units are located in arrays for specific proposals and at other sites for operational purposes. Any one AWS may support several experiments and all support operational meteorological services for weather forecasts for aircraft flights.

We did not see an AWS until we got to McMurdo during November of 1980. We found that we did not know anything about computers, digital electronics, machine language programming or anything else related to the system we had passed on to us. By the second year we were starting to understand the system. By the third year we were starting to modify the system. We also found out that the Stanford programming was not always correct. By the fourth year we had doubled the amount of data the AWS could collect including snow temperatures, relative humidity, and the vertical air temperature difference.

The Ross Ice Shelf lacks features that are named and can be used to designate the AWS location. In the table the units along the Adelie coast are named after the location or the designation of the sites based on traverses by the French who take care of these units. The units

that have female first names are usually children, wives, and numerous girl friends all of which have passed out of the scene. Linda works with us, Gill is the female pilot in command of the LC-130 that landed at the site, Manuela worked for us, and Elaine was one of the secretaries in the department office. Henry, Harry, Doug, and J.C. were the Win Otter aircraft group, and a great help to us. The sites with last names such as Swithinbank, Limbert, Lettau, and Schwerdtfeger are people who have been active in Antarctic research and are particularly important to us. Whitlock was a navy meteorologist who volunteered to install the AWS on Franklin Island while leaving Antarctica on the icebreaker. We never heard from his again and we do not know if he is aware of the great honor that has been bestowed upon him by us. The unit operated for many years.

Upon arrival at McMurdo for the first field season the only work space was in the cages of the USARP cargo building next to the Berg Field Center. We did not try to do a lot of work on the AWS units other than to prepare the units for the helo flights for installations. The second year we were going to make changes and needed a place to work that was clean, well lit, quiet, with all the characteristics needed of a high tech laboratory for working on fussy electronics. What we got was a dirty cage in the USARP cargo building with the doors opening to let in Boris, the front-end loader. This guaranteed that anything in our minds was erased instantly and would not be replaced before Boris would come in the doors again. During the second year we discovered that the aerovanes used for wind speed and direction had a pinched wire that would break and we would not have wind speed data. We rebuilt every aerovane we had except for the pieces that fell between the floorboards of the cages and we could not reach.

On the reverse site of this sheet, you will find a map provided by Chuck Stearns of all the 2002 Antarctic automatic weather stations. Mother 1, Mother 2, and Daughter are GPS units placed on iceberg B-15A, and Mark 2 is another GPS on iceberg C-16. Strictly for tracking purposes.

In conjunction with the Explorers Club  
and Society of Women Geographers

Saturday, December 7

Cosmos Club

2121 Massachusetts Ave. NW Washington, DC

Cocktails 6:00 Dinner 7:00 Lecture 8:00

## ENVISIONING ANTARCTICA

BY

WILLIAM L. FOX

ANTARCTIC ARTISTS AND WRITERS PROGRAM

NATIONAL SCIENCE FOUNDATION

Mr. Fox is interested in the Antarctic as an environmental and a cultural bellwether. He discerns the histories of art, exploration, and science coming together in a visibly unique fashion, the result of all three fields undergoing profound shifts when the Antarctic was being explored. This visual intersection of exploration and intellectual change compromises artworks that the public has not seen to any large degree. The tuning for an illustrated lecture that extends far beyond Antarctic enthusiasts couldn't be better.

In 2001, he was selected to work in Antarctica with the National Science Foundation's Antarctic Artists and Writers Program to research a book, which the University of Georgia Press will publish. His lecture will detail how Antarctica is represented through visual images, tracing the historical lineage of Antarctica art, cartography, and exploration, explaining how it is related to today's activities, and pointing to its future value.

In 2002 Mr. Fox, an independent scholar who lives in Portland, Oregon, won a Guggenheim Fellowship to study the perception of space in Antarctica.

Please send this coupon with check to Markie Hunsiker, 5705 Nevada Ave. NW, Washington, DC 20015.

Reservations must be received by Nov. 28 and no cancellations or refunds will be made after that date.

Anyone drinking will be billed later. Magic number is 353-91EC.

**RESERVATIONS FOR SATURDAY, DECEMBER 7, 2002**

Please reserve \_\_\_\_\_ places for William L. Fox

Name: \_\_\_\_\_

Guest(s) Name(s): \_

Dinners @ \$55.00 \_\_\_\_\_

Enclosed is a check for \$ \_\_\_\_\_ payable to ECWG

*Late dinner reservation, after Nov. 25<sup>th</sup>, cost will be \$65.00*

**BRASH ICE.** A little bit of a twist with this newsletter, as one of our stalwarts has indicated that we have lost our panache, that our newsletters have become like one extended web site, and that he was being put to sleep while reading them. On the other hand some people are writing to say that they are now reading them. So what do you do, punt or try a quarterback sneak?

We have a new old president, who will introduce himself below. However, he really needs no introduction, as he has been around for a long, long time. He was in the Washington area when the Society was a newborn, meeting at Catholic University, in the early 1960s. We have been familiar with him since he was a key administrator for Dr. Colin Bull in The Ohio State University's Institute of Polar Studies (now Byrd Polar Research Center). In the last twenty years he has been a premier lecturer on Antarctic cruise ships, and has served as Spokesperson and Advisor for IAATO (International Association of Antarctica Tour Operators). He is our first president from outside of the Washington area and our first president with more than ten letters in his last name. If you can't spell or pronounce his last name, John does answer to "Spletts."

Valmar Kurol, Guru of the Montreal Antarctic Society, recently sent us a set of the beautiful new Canadian stamps on the Highest Mountains on the Seven Continents, plus Canada's highest mountain. And, of course, Mt. Vinson is included in the set. A gorgeous set, in a great folio. BUY.

Our honorary president, Ruth J. Siple, has recently been hospitalized and is currently in a nursing home. She may require around the clock care. Cards should be sent to **7330 Wayfarer Drive, Fairfax Station, VA 22039.**

Regret to announce passing of expert polar geologist, Duwayne M. Anderson, age 75, at home in Hamilton, Washington.

**CALENDARS.** We still have some for the next forty lucky souls. Those who have bought have thought they were again outstanding. Remember you are getting them dirt cheap, as after shipment here and to you, there is no real profit for the Society. They are only \$12.00 each, so you can't go wrong. Great for both young and old at Christmas. Send your order and check to the Society at PO Box 325, Port Clyde, ME 04855. BUY AND ENJOY.

**INTRODUCING OUR PRESIDENT, JOHN 'SPLETT'S'** (By John Spletstoesser). John 'Spletts' speaking for himself, says that it's always nice to win an elected office when there was no election and no competition - something like that happened recently in Iraq, although in that case there was an election, with a tremendous turnout. In a situation

when no one really wants the job, there has to be a message. Actually, my name was proposed, and a small, select group in the Washington area, concurred. I wish all elections were that simple. When I was informed that being President of the Society carries no workload and no responsibilities, and all I had to do was shut up and listen. I felt duly qualified. I had been doing most of those things since my teenage years. However, I do know how to spell 'Antarctica', and I know where it is. Enough for qualifications.

I started the Antarctic tour, as most of our members have, by going there, in my case in the 1960-61 summer season to work in the Jones Mountains as a geologic field assistant for project leader Prof. Cam Craddock. Our field team comprised mainly University of Minnesota students, including Bob Rutford, former Society President with a polar career that must be some kind of a success record. Through the years, I spent a couple of summers in the Ellsworth Mountains, and four in helicopter camps in the Transantarctic Mountains. Home base during those periods included the University of Minnesota, The Ohio State University, and University of Nebraska. In the 1990s I taught geology at College of the Atlantic, Bar Harbor, Maine. In 1983 I became a 'tourist', when the Lindblad group asked me to join the *Explorer* as a geologist/naturalist/lecturer, which became an almost annual event with further lecture assignments on a variety of vessels, including Russian icebreakers. About 100 cruises later, I have been to most parts of the Antarctic coastline, including a circumnavigation. Consulting for IAATO included some white-knuckle moments in testifying on Capitol Hill before the U.S. Senate and House of Representatives on legislation that was proposed to ratify the Environmental Protocol. Neither of those two bills passed, not related, however, to my testimony. Representing IAATO at six Antarctic Treaty Consultative Meetings (Bonn, Venice, Kyoto, Seoul, Utrecht, Warsaw) involved lots of listening and sitting while Treaty delegates made Antarctic policy. 'Retirement' in Spruce Head, Maine, means watching the lobster boats below the cliff where I live at the coast, helping Paul Dalrymple with the Newsletter, and looking at life in the slow lane. Keep in mind, though, that Newsletter content, including R-rated material, was not in my job description. Only editing and proofreading were on the list. It will be a pleasure to fill the slot as your President, although you will probably never see me in Washington at meetings. However, I am pleased to help.

**GLOBAL WARMING IS HERE!!** (by John Spletstoesser) Send a check for \$3 to the Byrd Polar Research Center, Ohio State University, and you will receive a poster that says "The world is warming and it is

foolish to pretend that it's not." The author of that quote, Dr. Lonnie Thompson, should know, because he and his wife, Dr. Ellen Mosley-Thompson, have been studying glaciers in obscure parts of the world that reveal what some researchers still have trouble believing. Lonnie's glacier studies have included primarily recovering ice cores from glaciers in the South American Andes, the Chinese Himalayas, Mt. Kilimanjaro, Antarctica, Greenland, Alaska, other places that have substantial glacial (and climatic) records, and also places that show considerable glacier retreat. Readers should have heard about Lonnie by now, because his research has resulted in the 2002 Commonwealth Award of Distinguished Service (jointly with Ellen), he was named one of the Top Ten Scientists of 2001 by CNN and Time Magazine, and was recently awarded the 2002 Vega Medal....previous recipients have included Bert Crary and George Denton (Univ. of Maine-Orono). However, 2002 also brought Lonnie recognition that many of us can associate with, the Heineken Environmental Award (in Amsterdam). Awards are one thing, but a lifetime supply of beer is another, because Lonnie suspected that he might have to rent a large beer truck to collect the award. Not so...a very healthy cash award comes with it....find out the amount in the following website. Congratulations, Lonnie!  
[www.acs.ohio-state.edu/units/research/archive/glacgone.htm](http://www.acs.ohio-state.edu/units/research/archive/glacgone.htm).

### **ANTARCTIC SCIENTIST MULCHES HIS OWN TOES** (clippings from Art Ford).

Paul Sipiera (no relation to the late Paul Siple), who wears seven Antarctic campaign ribbons, said after an incident in his own home yard that he made a mistake, he should have never dialed 911, but should have called for a 'toe' truck.

It seems that he was at his summer getaway home in Galena, Illinois, and decided to mow his lawn. He was cutting along the side of his house, and backed up to get a better approach. That was the undoing of this 53-year-old geology and astronomy professor from Harper College, as he tripped over a railroad tie. He just thought it was a stupid mistake, nothing more, until he looked down. The better part of three toes were gone, although there was no immediate pain, almost as if his body had pumped him full of natural anesthesia. Paul never felt the actual cut!

As he fell he put one hand out to brace himself, but the other kept hold of the mulching mower. The blade tore through the leather-topped tennis shoe on his left foot and tore off his big toe along with the two toes next to it. Evidently his toes must have been mulched pretty well. Remember several years ago some malcontent damsel with a sharp knife out of her kitchen drawer did a little artistry on an appendage of her lover, took the end product and threw it out of her car window into a ditch. Said item was later retrieved and sewed back on and everyone (?) loved happily ever after. No such luck for Paul, the mulching machine did what it was supposed to do.

The accident is forcing Paul to postpone a planned April 2003 trip to the Arctic, an exciting chance to explore the other end of the globe after seven trips to the Antarctic. During his last trip to the ice, in January of this year, he and his team of scientists found 33 meteorites that were about 4.5 million years old. Paul figures that one of the space rocks could possibly be a piece of Mars. The team also "discovered an underground lake", which was later named Lake Paula after his daughter.

Even though he lost those toes, his ears were not affected, and he was quoted as saying "the meteorites are just so exciting, and I can hear them calling me right now". Baseball had a pitcher, Mordecai "Three-Fingers" Brown. Looks like Antarctica now has Paul "Two Toes" Sipiera.

### **WEST ANTARCTICA, FOR THE NINTH TIME (Guy Guthridge)**

Nobody can say, yet, if the ice sheet on West Antarctica is going to let loose and raise sea level in a big way. But it's not for lack of trying. Some of the best minds in that line of work met at Algonkian Regional Park in Northern Virginia for 61 presentations and posters over 3 days in late September. It was the ninth such annual workshop. Robert Bindshadler of NASA's Goddard Space Flight Center organized it with National Science Foundation support.

Much of the meeting was devoted to the process of science, with talks like, "Using kinematic GPS profiling to assess a satellite-altimeter-derived Antarctic digital elevation model." Progress comes, of course, from presentations like this, and that's why workshops are held. Still, this non-specialist came away with impressions of change that anyone will appreciate.

For example, glacial ice in the Ross Sea embayment, which has received close scrutiny for a long time, seems to have stabilized in the last century after receding from a front that at the end of the last ice age extended all the way to Cape Adare. On the other hand, ice that drains into the Amundsen Sea is melting, thinning, and retreating at a rate that's among the largest documented changes in Antarctica.

Change that's made the news got attention. This year's highly publicized collapse of the Larsen B Ice Shelf into the Weddell Sea was a red herring, though, if you think it's a harbinger of collapse farther south. The *mechanism* of its quick collapse - surface melting that sends water down crevasses to refreeze and wedge the ice apart- was the subject of one presentation. Likewise, bergs so big they have names - like B-15 and C-16 - were discussed because new data show precisely how they are moving, or rather not moving. C-16 has parked,

and B-15 sashays with the tide just north of Ross Island, going back and forth kilometers a day but otherwise inclined to stay put for no one knows how long.

There were other mysteries. The Ross Sea was reported to be freshening since 1985 after a long time of staying the same from year to year. Warmer air, less sea ice, faster currents, or glacial melting are possible causes, with the aforementioned glacial melting in the Amundsen Sea an unindicted co-conspirator.

So a tenth annual workshop seems likely, motivated, as before, by the "low probability, high impact" collapse of the West Antarctic Ice Sheet into the ocean - some 20 feet worth of sea level rise. I went away glad a few dedicated scientists have devoted entire careers to a question whose complexity seems almost infinite.

**OZONE SPLITS, DECLARES DIVIDENDS** (*Wall Street Journal*, or was it *Barrens!*). The ozone hole over Antarctica was markedly smaller this year than in the past few years, and has split in two. The so-called "hole", actually an area of thinner-than-normal ozone, was measured at 6 million square miles in September. That compares with around 9 million square miles on September measurements over the past six years, according to researchers at NOAA and NASA. In 2001 the Antarctic ozone hole was more than 10.2 million square miles, larger than the entire area of North America!

This year's improvement was attributed to warmer-than-normal temperatures around the edge of the polar vortex, the circular wind pattern that forms annually in the stratosphere over Antarctica, according to Paul Newman, a researcher at NASA's Goddard Space Flight Center in Greenbelt, MD. Craig Long, a meteorologist at the NOAA Climate Prediction Center, said the stratosphere over the Southern Hemisphere was unusually disturbed this year by the wind, causing the hole to split.

**A REASON FOR LIVING ANOTHER 50 YEARS** (AP out of Sydney, Australia).

There's good reason for all Antarcticans to hang in there for another fifty years, as there is a good chance that if you do, you will have outlived the Antarctic ozone hole. At least that is what we are hearing from Down Under. They are saying that chlorine-based chemical levels in the atmosphere have peaked and might be declining, and that the hole should come to a close within 50 years.

Who are "they"? One is Greg Bodecker, a Kiwi ozone researcher, who said that measurements from a number of sites around the world by several research groups "have confirmed that stratospheric chlorine levels have indeed peaked."

Another "they" is Paul Eraser of CSIRO (Commonwealth Scientific and Industrial Research Organization) in Australia, who said "the recovery is a result of international efforts to ban ozone-depleting chlorofluorocarbons (CFCs) in the mid-1990s. CSIRO's monitoring has found that chlorine from CFCs leveled off in the troposphere two years ago, and is now falling for the first time. Fraser said the ozone hole will start closing within five years, and it should fully recover by 2050.

### **PROBLEMS WITH ESTABLISHMENT OF ANTARCTIC AUTOMATIC WEATHER STATIONS, 1980-2002 (Chuck Stearns)**

Four units were sent to the British Antarctic Society (BAS) for installation in the Antarctic Peninsula area. BAS wanted to put one unit in the mountains. We agreed with them the site might be useful. Within one month the unit was possibly covered with frost or ice and we lost the wind speed. Then the snow started to accumulate, the unit was buried and the solar panel no longer would charge the batteries. This was our first two-year study of the wind flow and air temperature under the snow!

The AWS unit at Dome C stopped, so during the field season we flew to Dome C by LC-130 to replace the AWS unit and put a Nansen sled in the base kitchen, loaded with liquor and electronic equipment to be picked up by the Russians on a traverse. We replaced three AWS units. The air temperature was about -40°C. Everybody was moved to the rear of the LC-130, and we roared along the runway, reaching a speed of 40 knots. After two more tries the pilot decided we better put on the JATO rockets. The engineer was complaining that we were going to run out of fuel if we take too long to put on the JATO rockets. After installation of the JATO rockets we roared down the runway until we once again reached 40 knots. The rockets were turned on and we got up to 55 knots when the rockets cut out. Fifty-five knots is not the take-off speed of a LC-130, but the pilot pulled back on the stick and the nose ski of the plane came up off the snow and we were on our way to McMurdo where we made a safe landing. The AWS unit was transmitting and did so for more than 12 years.

We were on an icebreaker for the installation of an AWS unit on Scott Island. The island is at 180° long., so as we cruised around the island in the fog it was Christmas day, and then Christmas eve. At 3 a.m. the fog lifted and we went to Scott Island to install the AWS unit on a snowfield. The helicopter left us on the island with our equipment and the plan was to call the ship when we were finished. Everything went as planned and we had a very enjoyable time. During the next year the wind

system froze up, then thawed, then froze and then it was going backwards. We knew it was not operating correctly so we made plans to visit Scott Island during the next field season. We reached the island by icebreaker and flew to the island by helicopter. The snow had moved, the AWS unit was tipped over and where the ropes supporting the tower had been there were four columns of ice 1.5 feet in diameter and ten feet high. We had great difficulty breaking down the ice columns so we could remove the AWS unit. The aerovane was totally destroyed. We knew that the standard AWS unit was not going to work on the Antarctic islands. We confirmed Vinji's rule about not putting wind systems at 60°S, as they were not going to last very long.

We built a small doghouse that had a lot of batteries, with the AWS electronics and antenna on the inside of the doghouse where air pressure was measured. On the outside we measured the air temperature and a solar panel charged the batteries. The unit weighed about 600 lbs so it would not blow away and was carried to the island on a sling below the helicopter. The Coast Guard had just received a very speedy new helicopter, and had made a rope sling for lifting and transporting the doghouse. During the one-year stay on the icebreaker there may have been some damage to the rope sling. At any rate during the next Antarctic field season the Coast Guard flew the doghouse towards Scott Island for installation on the top of the island. The helicopter was apparently going very rapidly towards the island when the whole apparatus started coming apart and was completely disintegrated within one minute. There was no satisfaction in knowing that the unit was working on the way to the island. The next year we made the slings out of 3/16" stainless steel wire and we have since not lost a doghouse, although several have been installed. The one at Mt. Siple has operated for ten years without any visits.

We installed an AWS unit near the Clean Air Facility at the South Pole. The next year we went to the South Pole and people at the station commented that the AWS unit was not doing anything. What it was doing at 3-hourly intervals was getting into the Global Telecommunications System (GTS) and representing the South Pole while the actual South Pole data collected by the station personnel was not getting into the GTS. Now who is not doing anything?

The AWS unit at South Pole was removed for installation at Dome Fuji because the unit was well tested at low temperatures. The unit went on a Japanese icebreaker for a two-

year cruise between Antarctica and Japan, and was then installed at Dome Fuji. A few days later we received a message from the Australian Bureau of Meteorology. The unit is not at the South Pole because it has a diurnal cycle in the air temperature and the air pressure is lower than at the South Pole. Where is it? We like these kinds of messages because they indicate that forward-looking people are actively using our data. We told them where it was and changed the data in the GTS to that of Dome Fuji. We had neglected to remove the AWS ID and location from the GTS records.

We supplied an AWS unit to some mountain climbers so they could put it on or near the top of Mt. Erebus. The unit was installed near the rim of the volcano and produced interesting data until eventually it was hit by a few bombs from the volcano and that took care of that (a project truly bombed-out).

2002 Antarctic Automatic Weather Stations list

### **ANTARCTICA IS...**

The following list (to be continued) was inspired by reading a quote from Valery Lukin, head of the Antarctic expedition at the Arctic and Antarctic Institute in St. Petersburg, who said "Antarctica is not a profession, it's a way of life." Touche. Now for the first of our ANTARCTICA IS ....

- My Honeymoon.... Jennie Darlington
- My Frigid Mistress .... George Doumani
- My Worst Journey .... Apsley Cherry-Garrard
- My Blizzard .... Douglas Mawson
- My Coldest March .... Susan Solomon
- My Forty Years on Ice .... Charles Swithinbank
- My Alone .... Richard E. Byrd
- My Innocence .... John Behrendt
- My South .... Ernest Shackleton
- My Crossing .... Vivian Fuchs
- My 90 South .... Paul A. Siple
- My Cold .... Larry Gould
- My Deep Freeze .... George Dufek
- My Great White South .... Herbert Ponting
- My Ice .... Stephen J. Pyne
- My Night.... Jack Bursey
- My White Dessert.... John Giaever

- ❑ My Conquest, My Command .... Finn Ronne
- ❑ My Splendor .... Frank Todd
- ❑ My Oasis .... Tim and Pauline Carr
- ❑ My Search .... Lincoln Ellsworth
- ❑ My Pourquoi Pas? .... Jean-Baptiste Charcot
- ❑ My Comrades .... Gil Dewart
- ❑ My Scout.... Dick Chappell
- ❑ My Lonely Planet.... Jeff Rubin
- ❑ My Quest.... Walter Sullivan
- ❑ My First Night.... Frederick Cook
- ❑ My Adventure .... Norman Vaughan
- ❑ My Assault on Eternity .....Lisle Rose
- ❑ My Ice Bird .... David Lewis
- ❑ My Convergence .... Alan Gurney
- ❑ My Crystal Desert.... David Campbell
- ❑ My Wild Ice .... Ron Naveen
- ❑ My Chronology .... Bob Headland
- ❑ My Errorless Latitude .... Ed Hillary
- ❑ My Cherry .... Sara Wheeler

You might have recognized actual book titles in the above list, many of which might be in your personal library. If you have 30 of the above, you can call yourself an Emperor. If you have only 25, you are a Rockhopper. If you have only 20, you are Krill. Below that, you are utterly hopeless, a masquerading Antarctic, nothing more than a snowflake.

**LLANO GOES TO WASHINGTON** (excerpted from a lengthy letter from George).

I received a letter from Dr. J. Kaplan at CALTECH with an invitation to present a biological paper at an Antarctic Symposium to be held at the National Academy of Sciences in Washington, D.C. in 1954. I was astounded at the invitation and immediately got in touch with Carl Eklund (Antarctic Society charter member). After some discussion I said I would limit my discussion to botany. Carl agreed to prepare a paper on zoology. These appeared in Geophysical Monograph No. 1, 1956. At the conclusion of the First Antarctic Symposium I was invited to join the IGY.

I met Dr. Hugh Odishaw, Executive Director of the U.S. National Committee for the IGY, and Mr. Ross Peavey, Executive Secretary of the Committee of Polar Research (CPR) and my immediate supervisor who assigned me to work with a retired naval officer, James M. Jones. At the onset I had no

clear function but in time began to prepare reports. Mr. Jones was a communication specialist with little experience in scientific writing and no contacts with the biological community. One of my projects was the volume "Science in Antarctica", consisting of 2 parts, Life Sciences and Physical Sciences in Antarctica prepared for the CPR. It was published after I transferred to the Library of Congress. In it I am listed as a member of the Panel on Biological and Medical Sciences. While with the committee I served as Secretary to the Biological and Medical Sciences panel, which consisted of Kaare Rodahl (Chairman), Carl Eklund and William S laden. A notable contribution of this Panel was a resolution proposed by Carl, which became the basis for the Agreed Measures for the Protection of the Antarctic Fauna and Flora. This was reported by Bill Sladen at the First Antarctic Meeting convened at Canberra, Australia in 1955. I understand that the manner in which this was handled apparently upset Dr. Larry Gould, but I never heard the details. I do recall the incident, however. In my earlier work in Alaska I was associated with a number of Arctic biologists whom I brought to the CPR panel of Biology and Medicine, and later enriched Antarctic research.

In 1957 I accompanied R.P. Goldthwait and Lincoln Washburn to McMurdo Station, Antarctica. We roamed around Ross Island and visited Capes Evans and Royds, and Marble and Gneiss Points. I spent about 10 days in Taylor Valley with two glaciologists, looking for lichens and recording mummified seals. A group of us sailed by icebreaker to Capes Hallett and Adare. Back at McMurdo I established some lichen growth sites in the area later occupied by the nuclear power plant. About this time Dr. Bert Cray invited me to his camp on the Ross Ice Shelf. Instead, due to bad flying weather I embarked on the Navy transport *Arneb* to Wilkes Station via Cape Hallett. Hallett was a most interesting lichenological site. It was here that the *Arneb* was tilted sideways so welders could patch her ice-damaged hull. At the same time black smoke revealed an electrical fire on a nearby icebreaker. A petty officer standing near me remarked "*Arneb* is ice-damaged, *A dak* is on fire and a damn fool is fishing for birds!" Carl, enroute to Wilkes, was trying to catch skuas with a fishing rod near the

shore.

At Wilkes I photographed the phenomenon of *Ted* snow alga and a profusion of lichen sites more natural in the Antarctic Peninsula. Altogether I acted more like a tourist than a scientist, but this broad survey of Antarctica was most useful when I began research objectives. I left Antarctica with the realization that the natural history of the seas was a more promising and productive research area than terrestrial habitats. While at NSF my annual sorties during the austral summers on *R/V Eltanin* and marine work on icebreakers gave me an insight into oceanography. It was my custom to visit biologists in the field and follow their work at home labs. This gave me an insight into their needs for instruments and continuing support. But above all I was curious to know what they had discovered. On returning to Washington in 1959 I wrote Dr. Gould of my successful Antarctic sojourn. He replied, "I am very glad that the Antarctic and New Zealand exposure was so rewarding to you - I knew they would be."

When the Academy's management of the IGY was winding down, Dr. Odishaw presented the Panel with some \$200,000. We discussed how to spend it before the IGY was dissolved. The Panel's function was purely advisory. It had no research experience or program. Consequently the members were at a loss on how to utilize these moneys. I had read J.G. Cragg's "Biological Studies in the Antarctic Regions" in *NEW BIOLOGY* 1959 in which Cragg noted that science is becoming more concerned with processes than objects. I proposed to the Panel to use the money to build a modern laboratory at McMurdo for experimental studies. This would provide a facility for field research and utilize the total sum. Once the plan was approved by the Panel, contracts were concluded for the construction of a laboratory and with the coordination of the Will Corporation of Baltimore, scientific equipment and supplies were provided. The laboratory at McMurdo was erected in 1959, and after Carl Eklund's death I dedicated it as the Eklund Biological Laboratory. Fortuitously Dr. Don "Curly" Wohlschlag at Stanford agreed to manage the laboratory with initial studies carried out by his "troop" of graduate students - Paul Dayton, John Dearborn, Hugh DeWitt, John MacDonald, George Somero, Art DeVries, and Jerry Kooyman. So under the patronage of the IGY the first formal U.S. Biological program in Antarctica was initiated.

Employment at the National Academy of Sciences taught me the value of its support in implementing scientific plans at

NSF. Because of my former association with the Academy I was often asked to recommend scientists to the Panel on Biology and Medicine. I made it my business to keep Panel members informed of my plans and needs. When acted on and forwarded to the Office of Polar Programs these NAS recommendations were more readily accepted than submitted otherwise. The programs in Polar Programs were geophysical, and to have access to major items like icebreaker or aircraft commitments for extended biological programs required a major effort.

The termination of the IGY at the Academy was marked by the transfer of IGY personnel to the Office of Antarctic Programs at NSF, which brought many back under Civil Service status. I sought similar status by obtaining a position as a Science Specialist with the Library of Congress in 1960. In 1960 Dr. Crary asked me to take over the Biological Program at the Office of Polar Programs as Program Manager. I agreed on condition I would be allowed to go into the field annually. He assented. When I reported to NSF he showed me my office. In rummaging through the files I found a memo from the Director of the Office, Dr. Tom Jones, in which he stated that George Llano was not to be transferred to the NSF at the close of the IGY. On questioning Dr. Crary he advised me to take the matter up with Dr. Jones. Dr. Jones charged me with construction of the Antarctic Biological Laboratory and initiating biological studies without his clearance. I pointed out that I received the funds used for the laboratory construction and biological studies from my superior at the Academy, Dr. Odishaw, and that my action was coordinated with the CPR Biological and Medical Panel. I was not in the official loop with NSF and had no contact with the Office of Antarctic Programs or NSF.

The Biological and Medical Program direction prior to my appointment was handled by Harry Francis and Mort Turner. They had been negotiating with Dr. Mohr at the University of Southern California on a biological oceanographic program, which included a sorting center at a cost of \$1,436,252. This would have deprived NSF of planning a national program.

## NEWSLETTER

HONORARY PRESIDENT - RUTH J. SIPLE

Vol. 02-03

January

No. 3

### PRESIDENT

John Spletstoesser  
P.O. Box 515, Waconia, MN 55387  
Tel/fax (952) 442-2604  
[spletts@usfamilv.net](mailto:spletts@usfamilv.net)

### TREASURER

Paul C. Dalrymple  
Box 325, Port Clyde, ME 04855  
[pcdal@midcoast.com](mailto:pcdal@midcoast.com)  
Fax: (207) 372-8571  
Phone: (207) 372-6523

### Presidents

Dr. Carl R. Eklund 1959-61  
Dr. Paul A. Siple 1961-62  
Mr. Gordon D. Cartwright 1962-63  
RADM David M. Tyree (Ret.) 1963-64  
Mr. George R. Toney 1964-65  
Mr. Morton J. Rubin 1965-66  
Dr. Albert P. Crary 1966-68  
Dr. Henry M. Dater 1968-70  
Mr. George A. Doumani 1970-71  
Dr. William J. L. Sladen 1971-73  
Mr. Peter F. Bermel 1973-75  
Dr. Kenneth J. Bertrand 1975-77  
Mrs. Paul A. Siple 1977-78  
Dr. Paul C. Dalrymple 1978-80  
Dr. Meredith F. Burrill 1980-82  
Dr. Mort D. Turner 1982-84  
Dr. Edward P. Todd 1984-86  
Mr. Robert H. T. Dodson 1986-88  
Dr. Robert H. Rutford 1988-90  
Mr. Guy G. Guthridge 1990-92  
Dr. Polly A. Penhale 1992-94  
Mr. Tony K. Meunier 1994-96  
Mr. RonNaveen 1996-98  
Dr. Paul C. Dalrymple 1998-00  
Ms. Kristin Larson 2000-02  
Mr. John Spletstoesser 2002-04

### Honorary Members

Ambassador Paul C. Daniels  
Dr. Laurence McKinley Gould  
Count Emilio Pucci  
Sir Charles S. Wright  
Mr. Hugh Blackwell Evans  
Dr. Henry M. Dater  
Mr. August Howard  
Mr. Amory H. "Bud" Waite, Jr.  
Dr. Charles W. Swithinbank  
Dr. Paul C. Dalrymple

**BRASH ICE.** Well, another year, another format for the cover page. Been some house changes since the last newsletter, As you will see if you shift your eyes to the left, our president heeded his roots calling, and moved on back to Minnesota - within a half-mile of where he was born, some time back in the (early) last century. Some people ask who in the world are responsible for what they are reading here, as we never have shown any names for fear of repercussions. But now we are letting it all hang out, with e-mail addresses for those who want to complain, or even for those who may want to submit something for the newsletter. A well-known Antarctic Brit, a former editor of the POLAR RECORD, accused us of writing taradiddle. It fell on deaf ears, as we had no idea at all what he meant, but then we found a dictionary with the word, and lo and behold, the guy was right. In recent years we have been actually putting in some real news items, but we want to keep the overall tone free and easy. Plus personal. With so many societies, so many publications, we feel that what makes us a little bit different from the others is that PEOPLE are our stories, our heroes. And as we keep repeating, we try not to let the truth get in the way of a good story.

There are a couple of new books out on two famous Brits from the Heroic Age, Titus Gates and Tom Crean. Both were written by Michael Smith. TOM CREAN was published by The Mountaineers Books in Seattle, ISBN 0-89886-870-X (pbk). I AM JUST GOING OUTSIDE was published by Spellmount, and its ISBN is 1-86227-178-X. This book makes a great companion piece to Sara Wheeler's CHERRY. The last chapter in this book will knock your socks off, as it appears that Titus should have taken an earlier walk in life. Reviews to follow in a later issue of the Newsletter.

We are including in this newsletter the dullest article ever published in 40 years of this newsletter, the one on South Pole Communications. The only reason that we are putting it in is to show you that there has evidently been a quantum leap in communications at the South Pole. The article is over-saturated with land mines, but please read through the acronyms and they probably won't hurt any of us—at least not for long. We assure you it won't happen again!

**MEMBERSHIP.** If you owe dues for this year, you should have received your bill in the past few weeks. We did not raise them, even though we will no doubt be operating in the red this year. However, we will no doubt raise them a year hence. If any of you want to get under the wire, even though you are paid up, you can pay for additional years at our current rate: \$12 for singles, \$15 for married couples, \$20 for overseas. The treasurer's address is shown on the left.

## **MASSIVE ICEBERG CREATES PROBLEMS (John Henzell)**

One of the world's biggest icebergs is continuing to create havoc in Antarctica, almost three years after it broke away from the Ross Ice Shelf. The 300km by 37km iceberg, dubbed B15 by researchers, has contributed to years of unusually thick sea ice around Ross Island, the location of Scott Base and McMurdo Station. The impact includes the United States having to use two icebreakers - at an extra cost of \$3 million - instead of the usual one to keep the sea-lane to McMurdo Base open for the supply ships that transport most of McMurdo and Scott Base provisions. The seasonal sea ice around McMurdo is now about 65km, about three times the usual limit.

The ice has meant that some of the most famous penguin colonies in the world, around the Ross Island huts used by Scott and Shackleton during Antarctica's heroic age, have had their breeding seasons devastated. This is because the birds have to travel up to 30km to find open water to gather food for the chicks.

The influence of B15 and other more recent icebergs is also thought to have caused an explosion in the number of pteropods, microscopic sea creatures that clogged the high-tech desalination system that provides McMurdo Base's drinking water. Filters that used to last two months were clogged in a day, leaving the base with barely enough water in reserve to meet its minimum firefighting requirements.

**HELICOPTER CRASHES AT McMURDO.** A helicopter flying in support of the National Science Foundation's (NSF) Antarctic research program crashed near McMurdo Station, on January 16<sup>th</sup>. The helicopter's pilot and a passenger, the only people aboard the aircraft, were injured in the accident, and were evacuated to New Zealand aboard a New York Air National Guard LC-130 cargo aircraft for medical treatment in a hospital in Christchurch, NZ.

The helicopter was shuttling cargo to science stations in the Dry Valleys, roughly 96 kilometers (60miles) from the station across the ice-covered McMurdo Sound. Petroleum Helicopters Inc., of LaFayette, La., operates NSF's helicopter fleet in Antarctica. The incident involved a seven-passenger Bell 212 helicopter.

PHI flies approximately 1,400 flight hours each season in support of U.S. Antarctic research. This is the first aircraft accident with serious injury for the U.S. Antarctic Program since PHI assumed responsibility for helicopter flight operations from the U.S. Navy in 1996.

P.S. Our illustrious president crashed in another helo in the Polar Regions over two years ago. His sympathies go out to the injured.

## **GLACIOLOGISTS NEVER DIE, THEY JUST CORE**

**AWAY.** Antarctica is a safe haven for glaciologists-they will never be unemployed as long as there is ice moving in Antarctica. For some inordinate reasoning, Congressmen/women take great delight in funding programs that may or may not determine in the next century if 1600 Pennsylvania Ave. will be under water as a result of climate change. So people like Charlie Bentley and Paul Mayewski have guaranteed grant funding for the rest of their life times. In that vein, Paul recently put another piece into the jigsaw puzzle when he completed an 800-mile trek from Old Byrd to the South Pole, arriving there on January 2nd. It was the first U.S. over-snow expedition to the South Pole since Bert Crary and his motley crew made it from McMurdo to the station in 1960-61.

Paul's trip was much, much different from Bert's. Bert had three vehicles (Sno-Cats) and Paul had a modern version of a wagon train, one made up of big sleds loaded with drilling, radar and other research equipment. They were pulled by two 13-ton Caterpillar tractors; the two-part train included a science lab, a kitchen, a caboose and a "polar pooper." They dug a pit at each stop, and pulled the outhouse over it. What sheer luxury! Bert had a party of eight men; Paul had a party often men. Whoops that is really not correct, he had a party often men PLUS three women. Things have really changed, as Paul also had satellite phones and navigation equipment, Internet connections, and a crevasse detector. Paul was on the trail for thirty-one days; Bert was on the trail for sixty-five days. Bert could have been out there even longer, as when he lost his teeth, he disdained stopping to search for them saying, "Let's keep on going, when we get to the Pole we will clean out the bilge, and then we will find them".

Paul's team of researchers is working with others from eighteen other countries, under the guise of the International Trans-Antarctic Scientific Expedition. The scientists are investigating changes in Antarctic temperatures, sea levels, precipitation, atmospheric patterns and other features going back pre-Norman Vaughan, in fact, 200 years. They are providing ground truth data for comparison with satellite data. They are tracing the fallout from far-off volcanic eruptions and the wind-deposited residue of marine organisms. They are also studying Bentley-like things, such as ice sheet melting, rising sea levels. Within a few years, they hope to understand how much such changes are part of a long-term natural process and what role human activity plays. Believe that from the WASHPOST, and we have a bridge we would like to sell you!

Paul and his intrepid band of meteorologists, geophysicists, atmospheric chemists, remote sensing specialists and glaciologists have been in Antarctica for the past four austral

summers. They have covered more than 1500 square miles and carried out eleven lines of scientific inquiry. They have probed more than fourteen miles into the atmosphere with research balloons, and drilled nearly two miles to the continental bedrock.

The centerpiece of the effort is collecting ice cores. During each stop, the team drills cores as long as 400 feet out of the two-mile thick ice mantle. We wonder if they have to file an environmental impact statement before they start every drilling. It looks to us taxpayers that we are going to end up with a pretty Holy Antarctica. Hundreds of samples are being sent home. But there is a limitation, as they were restricted by weight to keep the cores to about 7,000 pounds. Given enough time, and drilling of ice cores, ITASE will reduce the mass of the Antarctic ice sheet, promoting its slipping into the sea! Think about it!

P.S. We hope you all saw Paul and his train and his crew on "Sunday Morning", CBS, Jan 19<sup>th</sup>. Paul Mayewski is from the Collegiate Hockey Capital of the United States, the Univ. of Maine! Go Black Bears. Keep Coring, Mayewski!!

**SOUTH POLE REACHES A COMMUNICATIONS MILESTONE.** Amundsen-Scott South Pole Station, one of Earth's most isolated places, made a giant technology leap forward recently. The South Pole MARISAT GOES Terminal (SPMGT) achieved its design objectives for improved off-continent communications. MARISAT F2, TDRSS F1 and GOES-3 combined now give South Pole 11.5 hours of high-speed satellite communications daily.

South Pole depended on high-frequency (HF) radio for voice and low-speed teletype communications to McMurdo for many years after station opening in 1957. However, HF radio is slow, subject to interference, and can experience solar-flare-induced blackouts, sometimes lasting for days. ATS-3 and LES-9 initially demonstrated South Pole satellite communications potential. Increasing science and operational data transmission demands, the Internet, and e-mail showed the need for even faster service. TDRSS was the first high speed data communication satellite used by South Pole. MARISAT and GOES followed, adding capability that will support the station's intra- and intercontinental communications needs well into the next decade.

SPMGT upgraded the MARISAT and GOES data rates to T-1 (1.544 Mbps) slightly faster than the 1.024 Mbps available over TDRSS. The new MARISAT/GOES service lengthens the daily satellite window providing more telephone calls, e-mail, web browsing, and instant messenger opportunities, while higher data rates speed web access and file transfer, as well as improve telephone audio quality. Satellite ground stations in Clarksburg MD, Miami FL, and White Sands NM support links through MARISAT, GOES, and TDRSS respectively. Circuits

through Raytheon Polar Service (RPSC) HQ in Denver provide telephone and Internet network connectivity.

Originally installed during the 2000-2001 austral summer, SPMGT required considerable attention the first year and data throughout did not meet expectations. The following summer brought greater understanding of operating a 30-foot diameter, full-motion satellite tracking antenna in the harsh South Pole environment. However, improvements only increased MARISAT performance. GOES integration was another season away. System performance showed the antenna feed that collects and transmits radio signals required replacement. Over the austral winter, RPSC, NSF, and subcontract engineering staff developed a repair and modification strategy so SPMGT would meet design goals.

Repair and modifications began in late November with feed replacement the central activity. The task required a crane because of feed size, weight, position in the antenna, and sensitive interior electronics. Delicate, precise crane work permitted task completion by FEMC and IT personnel within an hour. Integration and testing brought SPMGT up to its full potential within weeks. Now, complete automatic control of SPMGT allows unattended system operation to minimize 4000-foot walks from the main station for service calls, a welcome system feature!

SPMGT represents the first large, complex satellite communications ground station of its type installed in an Antarctic interior environment. Engineering, installation, operations, and support personnel drew from a limited body of knowledge when designing, installing, and operating SPMGT. Their efforts made SPMGT a reality and brought South Pole a new communication system designed for the 21<sup>st</sup> Century.

(Editor's note: Not responsible for a truly amazing series of acronyms, most of which are complete mysteries.)

### **LLANO GOES TO WASHINGTON - Continued.**

Beginning an Antarctic program from scratch raised problems both scientific and logistic. Oceanographic studies were begun at McMurdo Station by utilizing sea ice as a platform in the absence of a ship. A variety of marine studies initiated by Stanford University graduate students (add Jack Littlepage to those listed earlier) under Dr. 'Curly' Wohlschlag's management of the Biological Laboratory were extended as individual grants toward doctoral studies. Since the 'BioLab' was furnished only with basic scientific items, additional special equipment was added to the inventory by retaining scientific apparatus provided grantees for field research. Over time this proved more practical in bringing the laboratory into a more functional role in support of experimental, physiological and medical studies.

In anticipation of oceanographic research on the *R/V Eltanin* a major activity was to arrange for a repository for receipt, storage, and recording of terrestrial and marine biological materials. Learning of the Smithsonian Institution's collaboration in the terminating Indian Ocean Oceanographic Survey, arrangements were concluded for a similar cooperative arrangement to curate Antarctic biological collections. Thus the Smithsonian Oceanographic Sorting Center (SOSC) was established to service the anticipated biological and other materials. A summary published in *Nature*, 1963, p. 1230 follows:

*"A service organization for the benefit of scientists and scientific organizations both within and without the Federal Government. Collections submitted for processing will now automatically become the property of the U.S. National Museum. Indeed it is the desire and the intention of the Smithsonian Institution to aid the interested scientific community to make an equitable distribution of all such materials, placing them in institutions throughout the country where they will most effectively advance the biological and geological aspects of the national oceanographic effort. "*

This arrangement resolved a number of problems. A critical one is to collaborate with a depository with some perpetuity, which has a function of a museum. In addition the Smithsonian had the necessary facilities and know-how in handling large marine collections and the means for the storage, safeguarding and systematic distribution of fauna and flora collections. The grant also included a subsidiary program for training technicians in primary sorting before specimens were forwarded to specialists for identification and the maintenance of a catalog of all pertinent data.

I was amazed to learn that Jim Zumberge, at the time President of the University of Southern California, who had since the IGY served as Member and Director of the U.S. Committee on Polar Research and later held distinguished international postings as President of SCAR and also represented the U.S. at Antarctic Treaty Consultative Meetings, had never been in the Antarctic Peninsula, probably the most contentious part of Antarctica. After my retirement, when with Society Expeditions, I invited Jim and his wife on a cruise through the Magellanic Channels of Chile and Argentina to the Antarctic Peninsula. One day on shipboard I spoke with Jim about letters from USC biologists who were concerned about a proposed action by his University to convert biological storage areas to other purposes. Jim remarked that the University was considering such a move. At that moment I was gratified by my cancellation of Dr. Mohr's 1960 proposal for a sorting center at USC, which would have required additional working space.

By the second year of the Biological & Medical program scientists, both biological and medical, from 15 universities

and other institutions were participating in a variety of studies at three U.S. stations—McMurdo, Hallett, and South Pole—and as exchange scientists at Australian and Russian stations.

By the third year oceanographic and hydrographic work was carried out on the U.S. icebreaker *Glacier* in sub-Antarctic waters. In 1963 marine biological research in the Southern Ocean began on the *R/V Eltanin*. Palmer Station was dedicated in 1965 to marine biological studies in the Antarctic Peninsula, thus providing U.S. workers access to the sub-Antarctic marine faunal zone and made possible *in situ* krill observations. The selections of the station leader for the first year proved more difficult. My first choice was a biologist who spent a year at McMurdo and later transferred to the Russian station Mirny. His final report was in Russian!! He agreed to serve at Palmer but only on condition that the Foundation hires a French chef!

Thus within the span of 5 years biological and medical programs vied with the physical sciences in investigating Antarctic phenomena. The flood of reports from Antarctic studies subsequently prompted the need for suitable publication. The Antarctic Research Series (ARS) was initiated in 1963 in collaboration with the American Geophysical Union. The Series currently lists more than 77 volumes providing an outlet for scientific treatises, serving both as a chart and compass of America's national Antarctic scientific and environmental endeavors. In my conceit, I like to think that the ARS continues the tradition of the Narrative of the U.S. Exploring Expedition of 1838-1842, our first national, expeditionary investigation of the south polar regions.

How I wound up in Antarctic research activities grew out of a series of unrelated events. During WWII I was associated with individuals who were influential in directing my attention to polar events and opportunities. These were, principally, Carl Eklund, Laurence Gould, Laurence Irving, Per Scholander, George M. Sutton, Carl Skottsberg, and Finn Ronne. A Fellowship to study lichenology at Uppsala, Sweden, brought me in contact with Europeans investigating lichens in the sub-Arctic. My doctoral studies at Washington University gave me access to Siple and Mawson's Antarctic collections. In the process I learned about polar history. My years at the Smithsonian brought me in contact with many specialists, notably Henry B. Collins, an outstanding Arctic ethnologist. An Arctic Institute of North America grant provided the means for extensive fieldwork from Barrow, on the North Slope of Alaska, to Attu on the Aleutian Chain.

My involvement with the IGY was recalled by Larry Gould in a 1977 letter to me: 'What a great debt we owe to that remarkable mutual friend, Carl Eklund - and what a fine record you made since that meeting.' Except for arranging

my itinerary in the Antarctic I had little in common with Bert Crary either at the Academy or in the Antarctic. I was flabbergasted when he named an Antarctic feature after me in 1958. Nor did I ever learn why he asked me to join him at the Foundation in 1960. In 1982 Bert wrote me "I don't deserve anywhere near as much credit for getting you into the Antarctic operations as you do for giving the whole program a bang-up job - often against odds—in your twenty years at NSF. In any event all's well that ends well."

**A REAL EXPLORER ABOUT TO RETIRE.** (John Spletstoeser) The famed *Explorer*, built in 1969 as the *Lindblad Explorer*, has reached the end of its tune in Antarctic tourism cruising, and will spend its last cruise in Antarctica in the 2002-03 season. As some (many) of us are aware, with age comes wisdom, and the ship somehow knew that its time had come to toss in the hawsers. This doesn't mean that its days at sea are over, as you will read below. Lars-Eric Lindblad was the first tour operator to commission his own cruise ship, with an ice-working capability and a size to reach remote areas, passenger capacity of 90-some to alleviate environmental stress, and a 'Code of Conduct' that evolved into more formal guides for protection of the environment and the fragile wildlife of Antarctica. Adventure cruising and passenger education were primary themes of Lindblad's tourism philosophy.

The ship was built in Finland in 1969, named the *Explorer* by Sonja, Lars-Eric's first wife, and after shakedown cruises hi the North, conducted three cruises in January-March 1970 in Antarctica. The ship was in service every season thereafter, although under different owners, was renamed the *Society Explorer* in 1984 (Society Expeditions) and *Explorer* (Abercrombie & Kent/Explorer Shipping Corp.) in 1992.

At various times in its history, crew came from the Tonga Islands, Philippines, Indonesia, and Sweden. When I was first on the ship, in Dec. 1983, the crew was Swedish. Books have been written about the 'Little Red Ship', by Lindblad and also Keith Shackleton, one of the premier lecturer/naturalists on her cruises. Highlights only can be included here, some of its setbacks, and also its 'firsts.' A grounding in Admiralty Bay, King George Island, hi Feb. 1972, required a tug to pull the ship free and tow it to Buenos Aires for repairs. On Christmas Eve, 1982, she left Paradise Bay and headed for Port Lockroy to celebrate Christmas. She hit a rock before the entrance to Neumayer Channel and was almost lost. All passengers had to abandon ship for rescue by the Chilean vessel *Piloto Pardo*.

*Lindblad Explorer* was the first passenger ship to travel to nearly 70 degrees latitude along the Antarctic Peninsula. In 1984 the ship became the first passenger vessel to travel the Northwest Passage. In Feb. 1997, *Explorer* circumnavigated James Ross Island on the northeastern side of the Antarctic

Peninsula, the first to do so, the result of Prince Gustav Channel breaking up its ice cover. During her 15 years with Lindblad, the ship cruised more than 1,300,000 nautical miles in its worldwide travels. Lindblad died in Sweden on 8 July 1994, and has a geographic feature named for him, appropriately in the Antarctic Peninsula. His widow, Ruriko, traveled frequently on *Explorer*, as well as other tourist vessels, primarily as a tour leader and interpreter for Japanese passengers.

Abercrombie & Kent, the present owner of *Explorer*, plans to replace the ship in 2003 with a newer, larger ship, *Explorer II* (now the *Minerva*, construction completed in 1996 when she entered service). The present *Explorer* has been sold to Kyris Shipping Ltd. for possible operation in Norwegian coastal waters, or perhaps it will be converted into a 'private yacht.'

#### **D-8 TRACTORS PART OF ANTARCTIC HISTORY.**

If you were part of the U.S. Antarctic Research Program in the 1950s and 1960s, you will know the name 'Phil Smith,' one of several individuals in the Office of Antarctic Programs (later Polar Programs) who made things work. The following is a slightly edited letter that Phil wrote from his home in Santa Fe, New Mexico, to Dave Bresnahan, also instrumental as a driving force in the U.S. program. Phil, sometimes known as 'Crevasse Smith' earned the name from experience, as you will see below. Phil writes, "I was delighted to learn of the austral summer's progress hi the U.S. Antarctic Research Program but even more pleased to learn that the venerable Caterpillar D-8 is being recognized for its contributions to the U.S. program. It came as something of a shock to me, however, that some of the D-8's now in service are the *original* D-8s that were involved in Deepfreeze I-IV when the IGY stations were built and in operation. Can this really be true? This makes the D-8s longer-term survivors than some of their drivers, I am sorry to say. ["Williams Field" airstrip at McMurdo and Williams Cliff at Mt. Erebus are named for Richard Williams, the Seabee who went through the ice on McMurdo Sound with a Caterpillar in January 1956.]

D-8s were important in the construction of several of the coastal stations built by the Navy for the IGY, but they played an especially critical role at McMurdo Station because of the ah- operations and at Little America V from which a D-8 trail party and two large D-8 trains with building supplies departed during the 1956-57 austral summer for a 646-mile trip to 80°S 120°W, the site for Byrd Station. Admiral George Dufek, the Deepfreeze Task Force Commander committed to two different strategies for the IGY inland stations. Byrd was to be attempted via an overland supply route and the South Pole by airdrop. Both

campaigns succeeded out with some mishaps along the way, including the tragic loss of Seabee Max Kiel and a D-8 in a crevasse on a first Byrd trail attempt in Deepfreeze I. The first tractor dropped out of a C-124 (Globemaster) was a stripped down D-2 weighing seven tons. It was the heaviest object ever dropped at the pole from a C-124, and it streamed in ingloriously, ending up in a crumpled mass of twisted steel, some thirty feet down, in a twenty-foot wide crater. It was from that same pit that the well-known geophysicist, Father Dan Linehan of Boston College, took the first -ever seismic shot at the South Pole on December 5, 1957. My own first involvement with Antarctica was as an Army officer assigned to Dufek to construct the trail to Byrd Station. After much aerial reconnaissance in R4Ds (DC-3s) we selected a crevasse-free route except for seven miles at the hinge between Marie Byrd Land and the Ross Ice Shelf. We were two, maybe three weeks at that spot blasting snow bridges and filling crevasses with snow to construct a route that was not much wider than a D-8 and a sled train. It was quite a scene involving our eleven-person trail party, a helicopter that was assigned to us for several daily recon flights, tons of explosives and an almost round the clock operation. As the Byrd Station site was being reached I flew back to the crevasse zone to meet the first, then returned to meet the second tractor train of construction materials to guide the Seabee drivers through the crevasse zone. We got Byrd Station built and installed the first IGY wintering team that included George Toney as science leader, Charlie Bentley and the late Ned Ostenso, among others.

The D-8 performed magnificently in those early years and has performed well ever since. Surely this is one of Caterpillar's most successful products ever! One of the early D-8s belongs in the Smithsonian!"

**DON'T SELL YOUR OCEAN-VIEW PROPERTY JUST YET.** An account by two of the world's professionals on the subject states that the West Antarctic Ice Sheet is not about to disappear into the ocean in the near future. Continuing research by Bob Bindschadler and Charlie Bentley and others is boiled down for the average reader in *Scientific American*, Dec. 2002. Their combined seasons in Antarctica, studying the Ross Ice Shelf, the ice streams feeding it, and the ice sheet in West Antarctica indicate that the latter will continue to shrink, but only over thousands of years. To residents of Florida and elsewhere, this means another meter of sea level rise every 500 years. In fact, southern Florida would disappear. Bob and Charlie know better than to state this as a fact, of course, and these 'conclusions' have the usual qualifying statements. Bob has 23 years at the NASA Goddard Space Flight Center, and has led 12 field expeditions to the 'Ice'. Charlie retired from the University of Wisconsin in 1998, but has lots of miles driving Sno-Cats and Ski-Doos, and

frequent flyer miles in Twin-Otter aircraft to know what he's talking about. Some people think that Charlie has spent more time in Antarctica than in Madison. The final word on this 'global warming' subject isn't over yet, folks.

On an allied subject, the 19 Nov. 2002 issue of *Eos* (American Geophysical Union) includes a large ad announcing a job opening at the Universidad de Magallanes, Punta Arenas, Chile. A doctoral degree in Earth Sciences is essential, with experience in glaciology. Fieldwork in glaciers and ice caps of Patagonia and Antarctica is part of the job, 'under rough weather conditions.' The latter part gives you some idea of what to expect, although the ad did not include what Shackleton said when he was hiring for his Antarctic expedition—"Safe return doubtful!"

**SOUTH POLE HAS MANY ADDRESSES, LOCATIONS.** The South Pole postal cancellation has been a prized souvenir for many philatelists for years, but do they always know what they are getting? Did the envelope actually reach the South Pole? As a matter of fact, did it even reach Antarctica? It may have gotten as far as New Zealand, but also it may not have gotten beyond New York City! In an attempt to update you on the history of the South Pole postal history, the current postmaster, Scott Smith, has given us an excellent review of developments since the inception of postal service to the South Pole. And we will excerpt from his e-mail.

Since 1956 there have been over 21 different canceling devices, hand stamps, and machine cancels. There have been five different addresses or zip codes. The original one, Pole Station, followed by the zip codes So. Pole Barracks New York, NY 10090, FPO AP 96692, FPO AP 96691, FPO AP 96598, and then APO AP 96598. The US Navy operated the postal facilities at the South Pole from 1956 to 1974. Thereupon, there was a two-year transitional period when civilian-engineering groups ran the operations. All mail at this tune was forwarded to McMurdo for cancellation and dispatch. Then the Navy came back into operation at the Pole, and a postal clerk handled all the traffic from 1975 to 1998. This was followed by the Air Force taking over, and they have continued to watch over postal operations.

The South Pole Post office usually opens for business around the first of November and stays open until mid-February. There has been a marked decrease in philatelic mail since September 11th and the anthrax incidents. All the mail that used to come addressed to Chief Scientist, Station Manager, Medical Officer and their likes no longer make it to the South Pole. All the mail is stopped in Christchurch and prescreened there for suspect mail. Only mail directed to a real live person at the South Pole makes it to the South Pole. Scott Smith graciously said, "If anyone needs an

address of somebody here at the South Pole, please feel free to use mine. I would be happy to take care of those requests." Then his name and address: Scott F. Smith, South Pole Station, PSC 468, Box 400, APO AP 96598-5400, USA

**CACHETS (SEE LAST PAGE).** The envelope commemorating the First Trans-Antarctic Crossing, 1957-58, is signed by quite a group of distinguished visitors to the South Pole. In the upper left hand corner is the autograph of a well-known New Zealand apiarist, Ed Hillary of Everest fame. At the middle of the envelope is the signature of his mountaineering buddy, George Lowe, who got an Oscar for the best documentary film of the year for his epic film, **THE CONQUEST OF EVEREST.**

Also on the envelope is the signature of Peter Mulgrew (P. Mulgrew), who lost not only both legs in Nepal, but also his life on Mt. Erebus when he was a lecturer on the ill-fated worst tragedy in Antarctic history when the Air New Zealand DC-10 crashed onto the lower slopes of Mt. Erebus on 28 November 1979, the day before the 50th anniversary of the first flight over the South Pole. Peter's widow is now Lady Hillary (Ed's first wife died in an airplane crash in the Himalayas). For those of us at the Pole at the time, Peter became a great friend, staying with us, washing dishes, pots, and pans for several weeks, while awaiting the arrival of Fuchs's party. We loved the guy.

The leader of the whole Commonwealth Expedition was a very well known geologist, Vivian "Bunny" Fuchs, who was later knighted by the Queen for leading the successful crossing. His radio operator and general all-around handy man who could do everything was Ralph Lenton. His name should be forever entwined with the South Pole, as that is where his ashes rest. He had a long and distinguished polar career at many of the British stations in Antarctica, and it was most fitting that his son, Anthony, who worked in Antarctica for the US contractor, took his father's ashes to the South Pole. Ralph was a good man, and it was an honor for me to stand up for him when he got married.

M. R. Ellis's name also appears. His family was in the mattress business in Dunedin. but they also made polar clothing, and at the time of the IGY, they probably manufactured the best down sleeping bag in the whole world. Murray Ellis was and is a buddy of Ed Hillary, and is still active, working with Ed on the Himalayan Trust My most delightful New Year ever was hiking with Murray and his lovely bride into the valley below Mt. Aspiring, climbed by both Murray and his father.

Hal Lister's name is also there. Some of us in the States got to know him better later on when he spent time in the Canadian Arctic, and came through our country. We believe he had a double connection with both Dartmouth College and the Cold

Regions Research and Engineering Laboratory at Hanover, New Hampshire.

One name there brings back a smile to those of us who witnessed Allan Rogers on the evening of the Fuchs party arrival at the Pole, walking backwards around the ring of empty diesel drums, which supposedly encircled the Geographical Pole. We asked him what he was doing, as there appeared to be a purpose to his madness. He replied, "I had a birthday three days ago, and I am walking back three days so that I can say I spent my birthday at the Pole!"

Hannes la Grange was the first South African to set foot on the Geographical South Pole, and he also led the first South African National Expedition, 1959-61. One way to describe Hannes would be to say he was as eloquent and polite as he was nice. The Australian Jon Stephenson is another fine young man, and has been back to Antarctica in recent years as a lecturer for an Australian cruise company.

Unfortunately, many of the Crossing Party are no longer with us. Besides the aforementioned Peter Mulgrew and Ralph Lenton, Bunny Fuchs, his deputy, David Stratton, Hannes la Grange, Allan Rogers, and Jeff Pratt are gone. The one person from the expedition who has never hung up his crampons and parka is Ken Blaiklock, whose name keeps surfacing as an Antarctic surveyor for the British Antarctic Survey. In the early 1960s Ken held the Antarctic record for most miles sledged behind dogs, some 5000 miles.

The other envelope, signed by the expedition leader, Vivian Fuchs, was the official souvenir cover of the Trans-Antarctic Expedition, 1955-58. Its design tells it all.

**NORMAN CLOSSES THE LOOP, COMES FULL CIRCLE.** The venerable, indefatigable Norman Vaughan, recently turned 97, still remains active in Alaska doing the commemorative serum run by dog teams. In late October 2002, this lone survivor of the 1928-30 Byrd Antarctic expedition was an eyewitness, along with his bride Carolyn, of the first flight of the only existing P-38F, "Glacier Girl", since its recovery from 270 feet down on the Greenland Ice Sheet. Norman and his dogs rescued the downed crew back in July 1942, and have been instrumental in the piece-by-piece recovery of the plane. Both Norman and the plane are relics, each one of its kind; both held together by technicians,

Dr. Charles W. Swinbank  
Dr. Paul C. Dalrymple

**BRASH ICE.** This is a special edition of the newsletter, one that has no current news, but one that more or less celebrates Ruth Siple and myself, Paul Dalrymple, being intimately connected with the Society for the past twenty-five years, as well as this edition, our 150<sup>th</sup>. I wanted to take time out and put on paper some of the things that have happened to us, the Society, and to the newsletters during this time, most of which have been FINE, FINE, FINE, thanks to many of you. I can't help but hark back many years, however, to a Society summer picnic at Stronghold when Bert and Mildred Crary presented a toy trophy to Ruth and me for our work with the Society. As they gave it to us Bert said, "You know you have created a monster?" Bert was always right, but in this case I hope it will not turn out that way.

To make this newsletter readable, we are including thumbnail sketches of some of the lighter sides of many famous, well-known Antarcticans who have contributed substantially to making our newsletters worthy. In some cases they have written in our pages about their years on the ice; in other cases we have quoted them extensively. Regardless, they have been a big part of our history. All are now dead, none is forgotten, or will they ever be. However space does not allow us to include all, so we have more or less limited this special edition to Byrd men.

Several OAEs have passed along, and we must mention them, with tributes to follow in a subsequent newsletter. First, Charlie Passel of West Base, Antarctic Service Expedition; second and third, Brig General Chuck Adams and Pete Peterson of the Ronne Antarctic Expedition; fourth, George Llano who wore many hats, including those from the Smithsonian, National Academy of Sciences, National Science Foundation, and the International Association of Antarctica Tour Operators; and fifth, Bob Hickerson, a veteran of the ice during the post -IGY era.

We want to thank those who have renewed, especially the 80% who renewed for multiple years. Karen Harrower and Ron McGregor renewed for ten years; Michele Raney and George Doumani each sent checks for \$100. Wonderful. Merci beaucoup.

**MILESTONE - BACKGROUND.** This issue of the newsletter is No. 150 of the so-called regime of Ruth Siple and Paul Dalrymple. Some people have referred to it as the Dalrymple Dictatorship, and we won't protest that calling, as there is/has been a segment of truth in that calling. But whatever the calling, some 1337 pages of "taradiddle" have been produced in the past twenty-five years, and been foisted upon a membership that has ranged from about 150 to 650 at a most nominal fee. The Antarctic Society actually got its start as a Good Old Boys Club, a fallout of the Antarcticans in the Greater Washington Area who were involved in the International Geophysical Year, about the time of the enactment of the Antarctic Treaty. Camaraderie ruled the day, with liquid libation loosening the tongues at evening conclaves. The Society was a most fitting outgrowth of the life style of its first president, the fun-loving skua bird, Carl Eklund. Whatever fun has happened in the past twenty-five years of the Society has been an outgrowth of messages being sent back down to earth by the spirits of Carl. The Society, hopefully, has been FOR and BY Antarcticans, and this umbilical cord to real Antarcticans has been what has separated us from some of the other polar organizations that number in the teens, if not more.

Twenty-five years seems like a long, long time to be involved in a non-paying avocation, but compared to the tenure of August Horowitz/August Howard, of the American Polar Society, this is only a yellow hole in a snow bank. He survived a much larger membership than ours for over fifty years (52), and his one-person dynasty produced over a hundred issues (101), including those of the Little America Times. How many Antarctic Society newsletters and bulletins have been produced altogether? About 173, starting with occasional annual bulletins in 1967. The well-known Antarctic historian, Ken Bertrand, started putting out regular newsletters in November 1975, and he produced ten in the next two years. He was Society president when he retired, and Ruth and I started out in the fall of 1978.

Harry Dater, another historian, had been more or less the kingpin of the Society, and it is said his Board Meetings always started with his unlocking his liquor cabinet. But, unfortunately, he died, and the Society was pretty much in control by the large segment of Antarcticans at the US Geological Survey in Reston. They were a bunch of fun-loving guys, led by Charlie Morrison, who is still active in our Society. I told Ruth that if we were going to get involved in an organization we had better well know who were paid up and who weren't, as records at that time were in a terrible state. Using our official polar ice axes, our membership was reduced from more than 400 to less than 200 bona fide members. We were ruthless, even showed the door to the likes of Roger Tory

Peterson. There were no tree lunches, everyone paid. And so the ship was steered.

**THERE ARE OTHERS.** Before we unceremoniously take false credit for all the newsletters, let us say that they only developed through the cooperation of a few real sweethearts who generously contribute many jewels to us. Several newsletters were done exclusive of the household of Siple and Dalrymple. A volunteer by the name of Elle Tracey from Seattle, who had wintered over in Antarctica, surfaced ten years ago as a possible replacement. She did one newsletter. Kristin Larson, a very comely, well developed Antarctic veteran with a decade of experience, put together at least one, maybe two, newsletters, and contributed to many, but she went astray and became a full-time lawyer. Even though a close friend of Ruth's, she actually did not have the time required to run the Society as some of us wanted it run.

**RUTH IS IT.** Let's get one thing straight, though, before we continue, the Society exists only because of the dedication of one person, Ruth Siple. Whatever the Society is today, it is because of Ruth, who took it into her home, where its Nerve Center existed until a few years ago when Ruth's family decided that she was aging and should be farmed out to a Granny Apartment in suburban Washington. Ruth was and is sort of an unpolished diamond who sheds the limelight and the glory. She did all the legwork, typed all the newsletters (although Ruth is not a typist, she could type ten pages a day without a single typo), handled the treasury, mailed out all the calendars, and kept the operations running smoothly and efficiently.

**SOCIETY HEYDAY.** That would have been in the late 1970's and early 1980's. The National Science Foundation was a block from the White House, and the National Academy of Sciences' Polar Research Board headquarters were several blocks away. The old All-American football player, Lou DeGoes, was the Executive Secretary of the Board, and he got their members active in the Society. So, at the time of one of their twice-annual Washington meetings, we had a banquet followed by our annual Memorial Lecture in the big hall at the National Academy of Sciences. We even got Phil "Crevasse" Smith to show up when Larry Gould spoke. That night we ate in the fantastic foyer in the National Academy of Sciences! What CLASS! The next year Charlie Bentley wowed the audience with humor that no one suspected rested within Charlie. All of our regular meetings were held in the 18<sup>th</sup> Street building that housed NSF, and we had Board meetings before each lecture. People came to the meetings, perhaps in part because parking was safe in that area. Ruth made the coffee, although it was

always too strong, and we had light refreshments. However, it all was a ball.

Then things started to go bad (term modified for PG audiences). Tim Hushen, who replaced Lou as the Executive Secretary, left town and we never again had the great relationship that we had with Lou and Tim. Finally, the Polar Research Board left Foggy Bottom and moved out onto Connecticut Avenue. We did, though, maintain a great relationship with Peter Wilkniss when he was director of the Office of Polar Programs. He encouraged all of his managers to support us, and they did. We could always walk into Peter's office, and he would give us an honest answer to any question. But in a politically motivated move, Congressmen from Virginia got the National Science Foundation transferred into their Commonwealth, moving them to Ballston. It never was the same again, as it just was not a popular place for our members to go for meetings. Now we are reduced to noon-time bag lunch meetings, with an occasional joint meeting with the Polar Research Board, plus an annual mid-winter conclave with the Washington Area Explorers Club and the Society of Woman Geographers.

**NEWSLETTERS.** The most interesting newsletter ever produced was on the ill-fated Air New Zealand DC-10 crash on Mt. Erebus on 28 November 1979, probably Antarctica's blackest day ever. We had established a good relationship with Jim Caffin in Christchurch, and this newspaper man forwarded copies of everything printed in their papers that related to the crash. It was particularly meaningful to many of us who got to know Peter Mulgrew when he was at the South Pole. This was followed by a special edition about the fantastic surgery performed on Jerry Huffman following his burn accident at a race track. We got permission from the Washington paper that published a detailed account of the accident and the surgery to put it into our newsletter. (See Society Newsletter of September, 1981, entitled "*The Jerry Huffman Story*")

Jerry, who once wintered over at Eights Station, had been with the Office of Polar Programs for many years, been to the ice regularly for many seasons, and I thought there would be a terrific response. I was terribly disappointed that we aroused little or no interest, and I began to wonder just how many people were actually reading our newsletters. Then I got a piece of very good advice from Mike Kuhn in Innsbruck—"Scroungy, for Heavens sake stop writing such long newsletters, limit them to ten pages, as that is all anyone will read." And this we did until franked stamping became almost as costly as first class, and we switched over. Now we limit each newsletter to eight pages, as that is all we can mail without a surcharge being added.

**SACRED COW.** One evening a bunch of us were sitting around Ruth Siple's living room shooting the breeze when some female said that I was picking on a certain female. The quiet, untalkative Ken Moulton, spoke up and said, "Wait one minute, you don't know Dalrymple if you think he said that just because she was a woman. He would have said the same thing if the person had been a man." Anyway, we only had one sacred cow, Admiral Richard E. Byrd. The reason that he was sacred was because I met a lot of Byrd people through Ruth Siple, and got to know several very well, namely Paul Siple, Larry Gould, Henry Harrison, Charlie Murphy, Bud Waite, Al Lindsay, Dick Black, and Howard Mason. In my own case, the Admiral pulled a long outdated letter from me out of his files, and said if I still had an Antarctic fever, these were the people I should contact for a position during the International Geophysical Year. The common thread seemed to me to be that he did a lot for man> people, especially AFTER they got back. It just happened that Ruth and I were at Henry Harrison's home in Asheville when this awful questionnaire came from a Virginian, a Byrd biographer-to-be, an ex-National Science Foundation employee, and Henry handed it over to me with "What do you think about this?" It was obvious the way the questions were slanted that all this guy wanted back was negative criticism of Byrd, which made me more determined than ever to protect Byrd should anything contrary come up.

**JACKIE RONNE.** Jackie and I have compromised on another noted polar explorer, her husband, Finn Ronne. I got a call one day from a woman who said, "This is Jackie Ronne." I gulped, fearing the worst. She started out by saying "I hear you have written about women in Antarctica in some newsletter, can I see a copy?" I replied that she could, but added "You must remember the context in which it was written. There were two articles side-by-side. I wrote about men in Antarctica, entitled '*The End of a (Great) Era*', and my friend Mildred Crary wrote a companion piece about women in hers, '*It's About Time*'." I thought I would never hear from Jackie again, but she called in two weeks and requested more copies of the newsletter. I knew then if I were not in trouble with the article about women, I would sure be in deep trouble for some of the things I had written about Finn. About a month passed before Jackie called again and she said "I recognize a stacked deck when I see one, and I am not going to join your Society". Naturally, I was more than a bit sheepish, as I would have said the same thing if I had been in Jackie's blouse. But I answered, "I'm sorry, Jackie, but your dear friend Pete Burrill is going to be our incoming president, and I promise you if you join, I will never again write anything bad about Finn." So the lady with the most beautiful penguin broach ever seen joined the

Society, as did their daughter, and we have all lived happily ever after,.....I think.

**RECOGNIZING SOME OAEs.** We thought that we should recognize some of the OAEs who helped get these newsletters off to a good start for Ruth and me. All of these people I knew personally, nearly all through Ruth. And I saw many up close and personal with Ruth at her home. What a wonderful way to get to know people. I regret that I only knew Paul Siple professionally, and the only time I had a chance to sit down and have a beer with him was in Stockholm when I joined Paul and Jack Tuck one afternoon in a lounge. Paul was long gone by the time Ruth and I got together on the newsletter. I also regret that I never met Bernt Balchen, although I got him to sign the program for *'Man Living in the Arctic!'* I know I have antagonized at least two of his widows, and for this I apologize. I know Bernt was outstanding and a fantastic pilot.

**AMBASSADOR PAUL CLEMENT DANIELS, ANTARCTIC TREATY ARCHITECT.** The Ambassador fitted in very well to the mold of the Society as established by Carl Eklund, as he himself never passed up too many cocktails. When they were hammering out the Antarctic Treaty, Walter Sullivan used to take him out to dinner with the hopes of getting some ideas about what they were discussing. But Walter told me that, even though he was a strong Yale man like the Ambassador, he never told him a thing! And, unfortunately, both died unpleasant deaths from cancer. The Ambassador had cancer of the tongue, and his widow, Teddy, once told me that whenever I talked about her husband, be sure to tell all pipe smokers to throw away their pipes. You are hereby told. I was the fortunate recipient of some of his monogrammed handkerchiefs as Teddy sent some to me where the Ambassador and I not only had the same initials, we were both Paul Clement. Teddy, incidentally, is still alive.

**LARRY GOULD, SUPERSTAR.** This is the man I referred to as the Antarctic Superstar. *'My 50 Years of Antarctic Exploration and Research'* was our Memorial Lecture on April 19, 1979. His way with words were nonpareil, such eloquence that I never heard from another penguin. Ed Todd said that Larry's book, *COLD*, has the best description ever written of a blizzard.

My initial entrance into Antarctica was made in his company, as he was aboard the USS CURTISS as we entered McMurdo Sound in January 1957. He was still there when I departed McMurdo some 23 months later, although I believe in his case that in between he may have actually gone home to Northfield, MN. Being from the dog sledge era, Larry was a good old boy, and male chauvinism ran deeply in his blood. Toward that end,

I once wrote something with tongue-in-cheek about how God created Antarctica just for men, and Larry loved it, repeating it often from the stage to my embarrassment. He also sent it to friends, and one, Charles Swithinbank, asked me if he could use it in one of his books. You don't say no to Charles who does so much for so many of us, so if you want to read some tomfoolery see page 123 of his *ALIEN* book.

I had one total failure with Larry, and that was when I tried to re-create a fabulous interview that the eminent Canadian polar geographer, Trevor Lloyd, did with Vilhjalmur Stefansson a couple of weeks before Stef died. I got Walter Sullivan, the Science Editor of the *NEW YORK TIMES*, to do the interview, and Larry said to me, "There is no one finer in the whole world for me to talk to about myself than Walter Sullivan," and I was congratulating myself for such a splendid choice. It was all set up at the National Science Foundation for a Saturday morning, and we had the proper props with the right maps and choice of books. They went down to the Head to prepare themselves, and the handsome Sullivan came back looking like a matinee idol; Larry came back still looking like a geologist. Ah well, roll the camera. Walter starts out saying, "Larry, I have been reading Byrd's book on your expedition just to refresh my memories before we sat down this morning, and I note that you are often referred to as Chips. This must mean that you were very adept at wood working." And Larry came back with, "I wish it were so, Walter, but there were two Goulds on that expedition, and one was the carpenter - he was the one called Chips." So much for Walter as the erudite interviewer!

Larry and I exchanged a lot of letters, some of which would shock some people at NSF who he did not champion. He was not one to hold back much. But let's fast forward to one of the last times I saw Larry, when he came east for an Academy's Polar Research Board meeting. Larry had chaired that Board for a long time, but now he had surrendered the chair to Gentleman Jim Zumberge, another All-American in so many different ways. The Board sat around the conference table, and Larry sat next to me in one of the chairs around the periphery of the room. Half way through the meeting, Larry leaned over toward me and whispered rather loudly, "Do you have Judy's telephone number?" He chose an inopportune time, as nothing was being said at the conference table, and everyone heard Larry. And everyone there knew this Judy, a beautiful, gorgeous damsel who once had been a partner-in-arms with the executive secretary of the Board. We won't complete the whole story, but I chaperoned Larry and Judy that night at dinner at the Cosmos Club, which had just made Larry their 18<sup>th</sup> Annual Cosmos Club Award Winner. It was a hell of an

evening as Pete Burrill had interviewed Larry over cocktails that afternoon for the Cosmos Club paper. Then Larry and Judy had cocktails in the lounge before I arrived for dinner. And then there were more liquid refreshments with the dinner, and no holds were barred. Larry got back home and wrote me, "Get in touch with Judy, and let's do it all over again on my next trip to Washington!" He was something else.

**NORMAN VAUGHAN, METHUSELAH OF THE ICE.** I hesitate to write about Norman, as he is in practically every newsletter and everyone thinks he is my father. Well, we will tell you a few things that you may not know. One is that Norman, in spite of his deviltry, is a very religious man. I have never heard him utter a swear word or an off-color word. He is a pretty straight arrow. I was once at a luncheon for Norman at the Myopia Hunt Club on the North Shore of Boston. I came in my standard rig, straight out of L.L. Bean, and was embarrassed to find myself in high society. The blonde next to me excused herself before dessert, saying she had to go to a meeting. I then asked someone, "Who's she?" Turned out she was the CEO of the Suffolk Down Race Track! Eventually all the dowagers left, and I was there with Norman and his daughter, and I looked at her and said in typical Dalrymplese, "You are one fine looking woman." She thanked me and said "Good looks run in our family". And how right she was, as old Norman will still be good looking if he ever decides it's time to die, which is highly unlikely.

**HENRY HARRISON - NO. 1.** Henry was my alter ego, as we were more or less cut from the same piece of cloth. We both came from a not-so-pretty place called Worcester, Massachusetts; we both got into meteorology in one form or another; we both were self-acclaimed experts on the game of baseball; we both dabbled at contract bridge; and we both liked to write. Henry was the glue that held together the members of the 1<sup>st</sup> Byrd Antarctic Expedition, and put out an annual newsletter about them. He was also Commander Byrd's bridge partner at Little America. After the Antarctic, he became associated with an airline as one of its forecasters. When the American Meteorological Society began certifying meteorologists as consultants, number one was given to Henry. A good-looking guy who verged on being handsome, he was a real nice guy, on the quiet side. It was a privilege to have known this fine person.

**AL LINDSAY, SEPLE'S COUNTERPART.** Al was the last of the Byrd scientists to pass away, and like his boyhood friend, Paul Siple, he left his firm imprints on the scientific world. Fortunately for all of us, he wrote a detailed account of events on the 2<sup>nd</sup> Byrd Antarctic Expedition (see *'Inside Byrd's Second Antarctic Expedition,'* Antarctic Society Newsletter,

January 1998). Like Tom Poulter of BAEII, he was highly acclaimed for his research, and was probably the best naturalist that Byrd ever had on the ice. Preservation areas have been established in this country in Al's name, and he wrote many environmental poems.

When he and Elizabeth got married in Washington, D.C., the Admiral was testifying before the Appropriations Committee, and as soon as it was over hopped into a waiting cab and rushed to their wedding. He missed the wedding, performed by Al's father, a minister, but he got there in time for the reception! Where else but in our newsletters would you get such trivial information?!?! Al did not die an entirely happy camper, as a result of a film crew from the UK doing a documentary on REB. They spent half a day taping him, but even though he was a strong Byrd supporter, the final film excluded Lindsay's remarks. Too bad, as he was the most coherent member of that expedition who was alive at that time.

**CHARLIE MURPHY, A JOLLY GOOD FELLOW WHO COULD WRITE.** Here was a good ole boy, and without a doubt, the best-known author to ever winter over in Antarctica. He was a close personal friend of Commander Byrd when the first expedition was organized, and Byrd wanted him along. As Charlie was just getting established professionally as a writer, he declined. But he did agree to go on the 2<sup>nd</sup> Byrd Antarctic Expedition, and had a key role in the decision making as to whether they should go out to Boiling Advance Weather Station and retrieve the admiral. His speech to the Society, *"Some Vagrant Recollections of an Elderly Antarcticist,"* was published in our April 1982 newsletter, and is great reading. He and I exchanged a lot of letters about Byrd, and as eloquent as Larry was with words, Charlie was likewise in putting them onto paper.

Charlie helped Byrd with his books on Antarctica and had a "heavy hand" in the writing of ALONE. He spent most of his career with TIME, LIFE, and FORTUNE. He was a passenger on an Egyptian steamer (ZAMRAN) when it was sunk in the South Pacific by a German warship. He wrote a dramatic account of the incident (accident) and the rescue of all 323 passengers. A three-part series on Churchill in LIFE attracted the attention of the Duke of Windsor, and it ended up that he became a very well known biographer of the Windsors. His later writings were in defense- and intelligence-related coverage. His account of the 1961 Bay of Pigs invasion in Cuba was highly critical of President Kennedy and incurred his wrath!

His wife was in ill health late in her life, and he found a place in New Hampshire where they were especially attentive to the ill, and that is where they retired. After her death, he fought off hordes of widows who were charmed by this most likable guy.

I am not a funeral person, but his, at the closest Episcopal Church to the White House, was a winner, with outstanding classical music, void of words from the ministry, just those from two grandchildren. The audience was a Who's Who in Political Washington. The church service was just an appetizer; the real service was conducted afterward at the nearby Army-Navy Club, which was Charlie's favorite watering hole in Washington.

**BUD WAITE, HUMANIZED ECHO SOUNDER.** Bud, as Amory was called by one and all, lectured on his expertise to our Society on January 6, 1969, presenting *'The History and Development of Radio Sea Depth Measurements'*. Here was a man, a real character, who had been in my life for years, and who continued to play a part until his death in 1985. I first met him in 1936 when he gave a lecture on the 2<sup>nd</sup> Byrd Antarctic Expedition in Thomaston, Maine. Fast forward then to Little America V at Kainan Bay, January 1957. As I arrived for the year, I found old Bud in sickbay, recovering from an accident. He had fallen off a sledge and it had been dragged across his chest, injuring some ribs.

When we both worked for the Army, I saw him off and on at meetings for the next fifteen years. I rode in a car with him from Hanover, NH to Boston, and I think he was the only person in the car who spoke, as he regaled us with hilarious stories about his family, which apparently did not have any normal people. He was quite famous for his research on echo sounding through snow, and I saw him quite often in Washington, DC. He wrote voluminously, but unfortunately, always in long hand. His penmanship could only be described as Early Penguinese.

He wrote often, and invariably always fortuitously predicting his pending demise. I always replied by assuring him that he had a long life in front of him, as "only the good die young." Then, finally, a real long letter of about ten pages arrived, and across the top of it read "FINAL LETTER." That convinced me that he might possibly die, and I sat right down and wrote him a special letter, this time telling him what he had meant to my life, thanking him for his influence and his friendship. But, unfortunately, he died several hours before the letter was delivered. However, I was able to do one thing that brought him to tears. As the last surviving member of the tractor party who rescued Admiral Byrd from his outpost, I contacted Senator Harry Byrd of Virginia about a special gift for Bud (to be presented to him at the 50<sup>th</sup> anniversary of BAE II). He had

a very nice picture of REB enlarged, framed, and signed with "thank yous" from the living members of the Byrd family. Bud was something else, and Ruth was always "dearie" to him.

**DICK BLACK, MR. DISTINGUISHED.** Here was the epitome of class among Antarcticans, and if he did not come from aristocracy, he sure portrayed it. He was the Shakespearian among us, and was very active in the Folger Theatre, immediately behind the Library of Congress on Capitol Hill.

Misfortune struck Dick on his first trip to Antarctica, as his wife died en route. His roommate on the ship was Bud Waite, and he took the message while working as the radio operator. However, Bud said he could not deliver the bad news, and told the admiral that he had to do it. Later Dick married this artist, Aviza, and they made a great couple. But what I really wanted to say about Dick was that he was, in my mind, the Poet Laureate of the Antarctic, writing a lot of poems about the Antarctic. The one on the demise of the BEAR was printed a couple of times in our newsletter, and is just great. There is another on the early explorers, such as Scott, Shackleton, and Amundsen. Another is in the form of a poem to his wife on the beauty of the colors he was seeing in the Antarctic when at East Base. There was another about being on the trail with dogs. These were all presented by Dick in his *'A Memorial Tribute to Men of the U.S. Antarctic Service Expedition of 40 Years Ago'* Memorial Lecture of May 13, 1981. He was a handsome devil, with mustache, carried himself well, dressed elegantly, and looked like an admiral, which indeed he became as he was retired. He hosted our first of several Antarctic Society summer picnics at his out-of-town estate in Woodbridge, Rippon Lodge. The event was very popular, but ended when Dick did not like the way members did not police the area afterward. He also hosted the 50<sup>th</sup> Anniversary of BAE II at the affluent Cincinnati Club in the District. Quite a guy.

**BOB NICHOLS - LET'S MANHAUL TODAY!** Bob Nichols was probably the man that Captain Scott wished he had been. As it was, Bob was Captain Scott's most devoted representative in this country, and he firmly believed that nothing of any merit was ever accomplished in the Antarctic unless it involved men sledge hauling. Just ask Bob Rutford or George Denton, both of whom sledged many miles with Bob. On May 13, 1981, Bob gave our Annual Memorial Lecture, *'Captain Robert Falcon Scott and His Last Expedition'*.

One year Dave Bresnahan got Bob to be the keynote speaker at what used to be an annual event, Antarctic Orientation. This was the season before Michele Raney was going to be the first woman to ever winter over at the South Pole, and she was red hot news. There used to be an evening paper in Washington then by the name of the WASHINGTON STAR, and they did a big spread that day on Michele going to the Pole. Bob flew down from Boston that afternoon, and had not had an opportunity to read the evening paper. Well, Bob was up there on the stage, this former Athletic Department Chairman, all six feet three inches, walking back and forth, wearing bright red suspenders, and he finished his presentation by bellowing out so he could be heard all the way to Foggy Bottom, "And what I love about Antarctica is its MASCULINITY!" I rushed up to Bob afterwards and quietly told him, "We have to rush you out of town before you get scalped!" Unfortunately, the scalping came later when his wife took this bona fide New Englander to retirement in Florida.

CONRAD FIELD, NICE GUY. Society member Conrad Field of Homer, Alaska, married to the lovely person answering to Carmen, has been chosen as the national recipient of a NOAA Excellence Award for Coastal and Ocean Resources Management - Volunteer of the Year. Award ceremony on Capitol Hill on March 19<sup>th</sup> if Conrad can scrounge a suit from a friend and borrow a necktie from another friend. Both items are somewhat foreign to his wardrobe. How to go Conrad, you are most deserving!!!

ANTARCTICAN SOCIETY BAPTISM (Anonymous)  
Future historians, in attempting to trace the origins of the Antarctic Society, will find the record silent as to just when and by whom it was founded. Rumors as to the existence of such an organization were in circulation during the early fall of 1959, and presently an anonymous notice was received by persons interested in the Antarctic, announcing that a meeting would be held at the Cosmos Club on the late afternoon of 8 October. Intrigued, some by the clause in the notice that membership in the Society involved no payment of dues, others by hints of liquid refreshment, a large number of the recipients converged on the Cosmos Club at the appointed time. Here arose another source of the confusion that troubles researchers in this matter, as it developed that a meeting of The Explorers Club was being held at the same time and place. Membership in The Explorers Club has long been held by its members to be a great honor, and the sudden invasion of their meeting by a whole lot of non-members, and the bafflement of the latter at the dirty looks which they were getting from the former, added further to the uncertainty as to what it was all about. The law of natural selection now manifested itself, through The Explorers Club members withdrawing from the presence of the

non-members, who thus found themselves milling about in an outer chamber, somewhat removed from the bar. A measure of order was presently restored by the circumstance that some members of The Explorers Club had received the Antarctic Society notice, and through their good offices, the non-Explorers were permitted to approach the bar, one or two at a time, though subjected to the withering stares of assorted rhinoceros hunters, world travelers, and similar notables.

Mr. Wayne Fisher of the State Department now began to whip some semblance of discipline into this leaderless mob, and under his sure guidance, a meeting was presently called to order. Everyone had meanwhile become increasingly aware of the presence of Ambassador Daniels, and it was apparent that whatever the Antarctic Society was, he was a large part of it. Not much further light was cast on this obscure topic by the meeting that followed, but everyone agreed that it was a great success, and thus the recorded history of the Antarctic Society began.

The next meeting of the Society was a more orderly affair. The Antarctic Treaty Conference [Consultative Meeting?], which began shortly after the occasion recorded above, involved long and weighty discussions on all aspects of Antarctic affairs, conducted by diplomats of great stature who were only slightly handicapped by the fact that hardly any of them had ever been to the Antarctic. It was felt that this handicap, negligible as it was, could be rectified by viewing an Antarctic film, and the infant Antarctic Society rose to the occasion. The auditorium of the National Academy of Sciences was procured for the evening of 19 November; invitations to the delegates to the Conference and to the members of the Society (construed to mean all those who had attended the opening meeting) were sent out, and the film "U.S. Navy Supports the IGY in Antarctica" was duly shown. The delegates who attended professed themselves greatly pleased. This event established a milestone in the Society's history, as certain expenses were incurred in mailing the invitations and meeting the NAS fee for janitor services, and it was borne in upon the membership that since it collected no dues, it had no funds and had better find some.

The mysterious forces that, from the smoke-filled room had been guiding the destinies of the Society, now sent out another notice, announcing a business meeting, to be held at the home of Dr. Carl Eklund on the evening of 8 January [1960]. The announced purpose of the meeting was to elect officers and a Board of Directors, and to adopt by-laws. It was duly called to order by the Chairman pro-tern, Dr.

Eklund, Mr. Fisher acting as Secretary pro-tern. At once it became apparent that a lot of thought had been put into the preparations for this meeting, and indeed a set of by-laws had been included with the notice. There was some debate about a few of these, in particular as to the definition of the word "person" in the clause defining eligibility for membership, but no conclusion was reached on this controversial topic. Other differences of opinion were ably arbitrated by Ambassador Daniels, but even his talents were unequal to resolving this problem. With minor revisions the by-laws were adopted as proposed. Next came the election of officers, which was carried out in a highly democratic way under the single-party system. One candidate for each office was proposed and elected unanimously, and these by coincidence included the two officers pro-tern. The successful candidates were as follows:

President - Dr. Eklund  
Vice-President - Dr. Wexler  
Secretary - Mr. Fisher  
Treasurer - Captain Cadwalader

The need for the latter position is explained in by-law No. 7, which established annual dues of \$1.00 to forestall any further embarrassment such as was experienced at the second meeting. Also included with the notice of the meeting was a slate of directors, who were likewise unanimously elected, no further nominations or discordant notes having been introduced.

Business being concluded, the host, Dr. Eklund, and his charming wife served a repast consisting of the residue from some of Carl's biological collections, which proved delicious. There was also a well-stocked bar. Altogether the evening was a pronounced success, and it was felt by all that the Antarctic Society, having at last come out into the open and established such a fine precedent for future meetings, was off to a brilliant and profitable career.

**GEORGE LLANO.** (Modified from *Washington Post*) One of the most significant and influential members of the Antarctic science community, Dr. George Llano, died of a heart attack following influenza Feb. 9 aboard a ship en route from Argentina to the Falkland Islands. He was 91. George was doing what he loved to do since his retirement in 1977, travel on a tour vessel and disseminate his vast knowledge of Antarctic lore to the general public. He spoke to our Society on June 5, 1980 on '*Tourism in Antarctica with the World Discoverer.*' George was involved in many things during his extensive career, from development of a shark repellent, discovery of the lichen (*Cladonia perforata*), whale research (a family of prehistoric whales is named for him), and managing U.S. research in Antarctica from the inception of the program

at NSF. He retired as Acting Chief Scientist and Program Manager, but he was more than that. He was on the U.S. National Committee for the IGY, which led him to the NSF polar program office in 1961. He was instrumental in major decision-making for research in a part of the world that had just opened up to investigators, and George had the uncanny ability to focus on topics that resulted in information new to science in not only biology but other disciplines as well. He knew exactly how to spend Federal dollars to get the most "bang for the buck." Countless numbers of graduate students owe their careers to George, for he funded numerous academics who directed their students into new territory. (For examples, see recent issues of the Newsletter for George's own words about this part of his life. We were fortunate in the timing by documenting this aspect of George, in which he freely told it like it is.) George was born in Havana, became a U.S. citizen, and left his mark on more than Antarctica. George was buried in the cemetery overlooking the harbor at Stanley, Falkland Islands, on 21 February. Next time you're in Stanley, pay him his well-deserved respects.

**GEORGE'S LETTER TO RUTH.** In a letter dated February 2, 2002, George Llano wrote the following letter to Ruth Siple:

*"Dear Ruth, Instead of your usual friendly note on my copy of the Antarctic Society [Newsletter] I got a note from your puckish By editor, Paul, needling me for my lack of respect for your 90 years and long service to the Society's newsletter. At 92 we are companions to the end and Paul, for once, lags far behind. But I am saddened to hear that you are troubled by macular degeneration; I am undergoing my second cataract operation this next week and am constantly alert to troublesome glaucoma. Old age is not th best of times, dear Ruth, despite Browning's proclamation in his poem, Rabbi Ben Ezra, but one has to do with what time and fortune leaves us.*

*Looking back I cannot recall when we first met but I early admired Paul Siple, the Eagle Scout with Admiral Byrd. I recall well when at the Missouri Botanical Garden, St. Louh in 19471 first viewed his lichen collections from Antarctica. I have always felt privileged that early in our acquaintance you accepted me as a friend, indeed as a colleague. I am most grateful for my relationship with the Siples which in a sense brought me into the brotherhood ofAntarcticans. I close with good wishes for all your days, Affectionately, George."*

## **POLAR RESEARCH BOARD AND ANTARCTICAN SOCIETY ANNUAL LECTURE**

## **WEBCASTING SCIENCE LIVE FROM ANTARCTICA**

Presented by:

**Dr. Mary K. Miller**

Senior Science Writer and Webcaster Producer  
San Francisco Exploratorium.

**TUESDAY, MAY 20th**

**6:30-8:00 p.m.**

### **THE KECK CENTER OF THE NATIONAL ACADEMIES**

**Room 100  
500 Fifth Street NW  
Washington, D.C.**

Located at 500 Fifth Street NW (bounded by Fifth and Sixth on one side and E and F on the other). The nearest well-known building is the Building Museum (kitty corner) barely a 1/2 block from the Judiciary Square metro station (red line).

**Reception to be held before and after lecture 6:00 p.m. - 9:00 p.m.**

Mary K. Miller of the Exploratorium science museum headed a group in Antarctica that in the 2001-2002 austral summer produced over 45 live webcasts to museum audiences in San Francisco and on the world wide web. The Librarians' Index to the Internet, which "posts only the cream," listed Exploratorium's project as one of its recommended web sites. Titled "Antarctica - Scientific Journeys from McMurdo to the Pole," the project was one of six scientific locales supported by a \$1.3-million grant from NSF's Education and Human Resources directorate.

Dr. Miller is the producer of six "Live @ the Exploratorium" webcast series, of which the Antarctic was one. She has been a senior science writer at the Exploratorium, assistant editor of ZooGoer - the magazine of Washington, D.C., National Zoo - and a freelance writer for numerous magazines, including *The Smithsonian*, *New Scientist* and *Natural History*. She holds degrees in biology and science communication from the University of California, Santa Cruz, and is a polar-qualified scientific diver.

The legacy web site is: <http://www.exploratorium.edu/origins/antarctica/>.

There is a great photo exhibit here now (and running during the May 20-21 meeting), "Under Antarctic Ice," photos by Norbert Wu taken during his participation in NSF's Writers and Artists Program.

**BRASH ICE.** In Light of the current political situations in several parts of the world, Antarctica no longer seems important. We can be thankful for something our diplomats did before us, enacted the Antarctic Treaty of 1959, which contains unique Articles that prohibit everything from nuclear testing to military maneuvers, as well as putting a hold on territorial claims. If only the Antarctic Treaty boundary of 60S could be moved northward 5 degrees of latitude every year, and its Articles adapted accordingly, eventually the entire world would have an "Antarctic Treaty equivalent." There would be no losers!!

I tried to think at this time of a suitable theme for this newsletter, something that would perhaps bring us closer to The Ice. I thought one way to do this would be to research some of the existing web sites on The Ice, where we all might be put back in contact with what is going on down south. Several summers ago I was blessed by the visit of a German physicist, Robert Schwarz, who had wintered over twice at the Pole, and was about to go back for an additional summer. Well, Bob is back at the South Pole again this winter, and you must visit his web site.

If you look at the web site for The New South Polar Times, you will find its first-ever on-line book, **AMONG THE .MAGI: RESEARCH TRACKS IN THE DESERT SNOW** by Marty Sponholz. This is all about Marty's most interesting life as a micrometeorologist at Plateau Station in 1966. Jim Waldron, VX-6 pilot in Antarctica in 1956-58, has also written a book on a website, but we don't have his website information. Any help from readers?

We hope that most of you Washingtonians attend the reception and lecture at the spring meeting of the Polar Research Board. Their new facilities on 5<sup>th</sup> Street NW sound real gorgeous, and parking should be no problem in that area. Don't feel guilty gobbling up some of the goodies at the reception, as our Society will make a small contribution.

**INTERSTATE 90S.** (Dave Bresnahan; Antarctic Sun, NSF/OPP) Work has begun on blazing a trail from McMurdo Station to Amundsen-Scott South Pole Station. Instead of blazing trees to mark the trail, though, this trail is marked with crevasses. This equivalent to the Trans-Alaska Pipeline road (about 800 miles, and marked by permafrost concerns) is about 1,000 miles long and is marked by some huge crevasses where the Ross Ice Shelf meets the McMurdo Ice Shelf, creating a shear zone (the Ross Ice Shelf moves faster). The objective of the 'road', more aptly a trail, is to show that tractors pulling heavily loaded sleds can be a viable way to move fuel and other cargo, thus providing more flight time for the LC-130 aircraft that have been supplying South Pole for many years. The flights are shorter, 825 miles, but tractor trains don't have to be concerned about weather curtailing flights, and can haul larger loads overall.

If you request route maps from AAA, they will tell you that you head east from McMurdo, then angle SE across the Ross Ice Shelf some 600 miles until you encounter the Leverett Glacier, hang a right and head up the glacier and south to the Pole. The first 30 miles were easy, turning off the Black Island road and heading to 'Shear Zone

Camp.' The next 3.1 miles took two months because of the flat, featureless plain of snow that hides a belt of 32 crevasses, the largest 26 feet wide and 110 feet deep. The advance team located them, blasted them open, and filled them with snow to provide a safe trail. The Leverett Glacier part of the trail has not been fully explored, but fewer crevasses are expected. Climbing from the Ross Ice Shelf to the Polar Plateau is the next challenge for the traverse. In 2004-05 the convoy will go the full distance to the South Pole and back, carrying cargo to demonstrate it can be done. If the trial run goes well, supply traverses could become a regular part of the Antarctic program. A convoy of Challenger 95 tractors pulling full trailers could deliver fuel to the Pole without using as much fuel as the LC-130s do (George Blaisdell, CRREL). Although it would take longer - 30 days instead of 6 hours, fuel and food do not need to be delivered as quickly as fresh food or people. Over the course of a season, six round-trip traverses could deliver 243,500 gallons of fuel, about half the station's needs. The cost of delivery would be from \$0.63 to \$0.84 a pound, compared with more than \$13 per pound by plane (CRREL estimates). (CRREL - U.S. Army Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire.)

So what's the bad news? The road won't be in the same place next year. Because the entire shear zone moves toward the sea at the rate of up to a meter a day, the road will have to re-marked. (For more of the story, see Antarctic Sun, <http://www.polar.org/antsun/Sun020203/traverse.html>.)

**ANDRILL.** (Scott Borg, NSF/OPP) Geologists from the United States, New Zealand, Italy, and Germany are working hard to develop plans for geological drilling to build on the recent success of the Cape Roberts Project. The new effort is called the ANDRILL Program (for ANTArctic DRILLing) and is envisioned as a long-term effort to address a range of important geological questions. The first phase of ANDRILL, as it is being discussed in the community, is to drill a suite of four targets in the McMurdo Sound region: New Harbor, the Windless Bight area of the McMurdo Ice Shelf, the MacKay Sea Valley in Granite Harbor, and a site between Black Island and Mount Discovery on the Southern McMurdo Ice Shelf. Many of the questions are aimed at understanding paleoceanographic conditions and the history of ice sheet development during critical intervals of the last 80 million years or so of Earth history.

This first phase is envisioned as taking 4-5 years beginning in the 2005-2006 austral summer, but much work has to be completed before a drilling phase can begin. Because the drill sites are in relatively deep water (up to about 1000 meters deep), a specially designed drill rig and riser system must be developed. This work is underway, with US participation through an NSF Major Research Instrumentation award of nearly \$1 million to the University of Nebraska (Dr. David Harwood) and Northern Illinois University (Dr. Ross Powell). New Zealand and Germany are also contributing significantly to the drill development effort.

Representatives of the national Antarctic programs of the US, NZ, Italy, and Germany met in Annapolis, Maryland, in late March 2003 to discuss how the McMurdo Sound part of ANDRILL might be supported and to outline the framework of an agreement that would have to be signed if the project is implemented. The science leaders are meeting during the AGU/EUG meeting in Nice, France, in mid-April to finalize their science plans. Also, the science leaders are putting the final touches on an internationally integrated science proposal to actually drill the four sites mentioned above. This proposal will be reviewed collaboratively by the nations whose scientists are developing the project. An international review panel will be convened to give advice that will then be used by the NSF Office of Polar Programs, Antarctica New Zealand, and the Antarctic Programs of Italy and Germany to make decisions about whether or not to proceed with implementing the program. If this proposal is successful, this project will definitely be one to watch because of the interesting problems it will try to address and because of the inevitable unanticipated discoveries that are made during geological drilling.

If this first phase of ANDRILL in McMurdo Sound is successful, scientists have their eyes on eventually moving the rig to other places around Antarctica such as the ice shelves of the Antarctic Peninsula and the Lambert Glacier region of East Antarctica. But that is a long way down the line - better to watch and see how ANDRILL unfolds in the short term.

**METEORITES ARE SOLELY FOR SCIENCE.** (Scott Borg, NSF/OPP) Effective at the end of April 2003, a new regulation under the Antarctic Conservation Act will protect Antarctic meteorites by requiring that they can only be collected for scientific purposes. The new regulation was published in the Federal Register on 1 April 2003 (but it's no April Fool's joke), and it requires any US expedition organizer who contemplates collection of meteorites to develop a collection and curation plan, subject to approval under the regulation, that will ensure that the scientific value of the meteorites is preserved and that they are made available for scientific research. For Antarctic expeditions that don't plan to collect meteorites but that find some anyway, collection is permitted but the regulation requires that a plan for curation be developed immediately after the expedition.

**SSSHHH! SOUTH POLE HAS A NEW SEISMIC STATION.** (*Science News* and Scott Borg, NSF) Following earlier attempts at recording seismic waves at the South Pole station (since 1957), during which the instruments picked up everything from generator noise, construction activities, and shuddering of windblown antennas, the new seismic sensors are located about 8 km from the facilities at the bottom of 300-m-deep boreholes. The first 2 months of operation revealed that the sensors can discern ground vibrations 100th the size of those that could be distinguished from seismic noise at the earlier observatory. It is now so seismically quiet at the new site that instruments can detect ground vibrations from snowmobiles 8 km away. Ssshhh!!

**SOUTH POLE CONSTRUCTION MOVING ALONG.** (Jerry Marty, NSF/OPP) Jerry Marty, Construction Manager for the new

South Station reported that for the first time in the history of the station, personnel will be using a dining facility "above surface" and with a view of 90S. First occupancy of the elevated station was on March 4, so they are no longer within the Dome. The AI building wing is designed to house 50 winter-over personnel in individual rooms, to include provisions for some removable walls to accommodate husband/wife winter-over personnel. The food service/dining facility is designed to accommodate the total 150-person summer population. Things have changed a bit since Paul Siple was Station Leader in the first winter (1957). Marty, by the way, operates in robotic fashion, using acronyms that only government workers are familiar with. He said that the SPSE/SM project schedule is on track. In our terms it means South Pole Safety & Environmental Upgrades and South Pole Modernization. Keep up the good work, Marty.

**SOUTH POLE DOME HISTORY.** (Jerry Marty) Jerry and his construction team came up with a real find, a bit of history of the Dome construction in the 1970s. A 4 ft x 8 ft piece of plywood was found that has the Deep Freeze 72, 73 and 74 names of all the USN Seabees who constructed the Dome and arches. The names were 'burned' into the wood. The plywood sheet was packaged and sent (via vessel this summer) to the Seabee Museum, Port Hueneme, California. Marty typed all the names and sent the list to Paul Dalrymple for Society Archives. Next time you're in Port Hueneme, have a look.

**BIG TOUR SHIPS IN ANTARCTICA.** (John Spletts) For the first time in about 90 cruises to Antarctica on tour vessels since 1983, on ships with passenger capacities ranging from 90 to 135, I went the way of the 'big casino' (pun intended) and was a lecturer on a large, 1,200-passenger ship that goes to Antarctica (about 4 days). The Antarctic leg is a 'teaser', for no stops are made, although a visit to Palmer included briefings by Polly Penhale (Mayor of Palmer), and her staff on board the ship. Most of the 3-week itinerary consisted of one-day stops in South American ports for shopping and excursions (all optional, at extra cost). A ship that includes two swimming pools, a large gambling casino, several restaurants, and a floor show in a large theater every night, can be said to be off its usual route in the Caribbean. It has happened several years now with an Antarctic itinerary, cruising by some of the highlights for a few days and then leaving. People are happy, the penguins are happy. In addition to giving 6 lectures, I also provided commentary from the bridge when the ship was in Antarctic waters (Palmer, Lemaire Channel, Deception Island, Antarctic Sound, Hope Bay, Elephant Island) and at Stanley. Ports included Valparaiso (start), Puerto Montt and Punta Arenas, Chile, Ushuaia, Buenos Aires, Montevideo, and Rio (end). Society member Charles Swithinbank did about the same on the sister ship on a reverse itinerary. Next season? Several more of the "Big ships" are planning visits. Perhaps a portent of the future.

**BILL MACDONALD, AN OLD ANTARCTIC USGS ICON.** (Walt Seelig, Bob Allen, Pete Bermel, Bill Radlinski) William R. MacDonald, "Mac", was one of those unforgettable guys that

everyone enjoyed talking to. He first joined the U.S. Geological Survey in 1942. After serving as a U.S. Marine in World War II he returned to the Geological Survey and became involved in a system of mapping from aerial photographs. It was called "trimetrogon" and involved three cameras with six-inch focal length metrogon lenses producing horizon to horizon photographic coverage. The system was developed by Jim Buckmaster and Jim Lewis, employees of the Survey, in response to an urgent need by the Army Air Corps to rapidly produce charts of unmapped areas of the world for the global war that was coming.

On Mac's return to the Survey after the war, he was placed in charge of that part of the mapping process that took existing ground control points and expanded them through a system of metal templates to locate photographic points that would position the new information. The trimetrogon mapping system was being used to map Chile, Mexico, etc. Mac's experience with all facets of the trimetrogon system made him indispensable. This was especially true when the attention of many nations focused on the last large unmapped world area, ANTARCTICA. Trimetrogon cameras were installed in U. S. Navy aircraft to obtain the aerial photography needed for mapping. Mac arranged for the visit of the Navy flight crews to the Branch of Special Maps where they could see first hand how important good-quality aerial photography was to the map-making process. When an area was selected for mapping Mac would lay out the properly spaced flight lines over it and select times for the photographing to minimize the shadows that would obscure detail. This resulted in the best quality aerial photography for map compilation. He served as an unofficial member of the U.S. Navy's LC-130 crew accompanying the photographic flights and taking the exposed film to Christchurch where he inspected it. Some of the flights originated in Punta Arenas, Chile, one of which lasted 21 hours. It was generally agreed that Mac had seen more of Antarctica than anyone else. Margaret Lanyon in Christchurch wrote "Mac enjoyed great rapport with flight crews who would make a point of stopping by the office on no-fly days to chat and good-naturedly banter with Bill".

Map making can be a slow process, and, in Antarctica, where the map coverage was practically nonexistent, there was an urgent need to provide maps on which the geologists, glaciologists and other field personnel could plan their field work and record it. Mac made a major contribution by initiating a system of "sketch maps" in which advance copies of the map bases were made available to field personnel long before the maps were published. Mac's responsibilities increased in keeping with his abilities and he was made Chief of the Branch of International Activities of the Topographic Division of the Geological Survey where, among other things, he oversaw the activities of the Survey field engineers in Antarctica.

In view of his accomplishments, the U.S. Board on Geographic Names approved the naming of MacDonald Peak in the Sentinel Range, Antarctica, in his honor. He was later asked to join the Department of Interior's Advisory Committee on Antarctic Names (ACAN), where his knowledge and experience contributed

significantly to the naming of Antarctic features. He was also the recipient of the McCormick Unsung Hero Award which is given annually by McCormick and Co. of Baltimore, to a distinguished citizen of Maryland.

Mac died in 1977 of cancer of the kidneys. He will long be remembered for his accomplishments in the office and in Antarctica, for his friendly outgoing manner, his subtle sense of humor, and his generosity, assisting wherever he could.

**WEBSITES - READ ALL ABOUT IT!! (Dave Friscic, NSF/OPP; Polly Penhale, NSF/OPP; Jerry Marty, NSF/OPP; Robert Schwarz, AMANDA, Univ. of Wisconsin)**

<http://www-bprc.mps.ohio-state.edu/> Go to the POLAR POINTERS section of the Byrd Polar Research Center website. There is a wealth of information on the many types of polar websites here.

[http://tea.rice.edu/science\\_education/researcher\\_opprojects.html](http://tea.rice.edu/science_education/researcher_opprojects.html) This site shows Current Polar Research Community Outreach Projects.

<http://www.glacier.rice.edu> GLACIER site. Explore Antarctica! Investigate the weather, oceans, ice and land of this frozen continent at the bottom of the world. Find out the weather for today at the South Pole, meet the researchers, discover what life is like on the ice, and more!

<http://205.174.118.254/nspt/home.htm> New South Polar Tunes Site. A newsletter written by the staff of the Amundsen-Scott South Pole Station at the South Pole, Antarctica. This internet newsletter provides students and teachers around the world with information on Antarctica, the scientific research taking place there, and fun facts about life at the station.

<http://www.wbur.org/special/antarctica/> This is a good one for Palmer Station, from the January 2002 National Public Radio journalist, Dan Grossman, now updated. The 'tour of the station' requires 'Flash and broadband connection'.

<http://amanda.physics.wisc.edu/rschwarz> Robert Schwarz is currently wintering over at the South Pole for his 3rd time, and this website includes photos from all of his three years. His aurora pictures are outstanding, so be sure to punch them up. You may have seen some of his photography in the Antarctic Hedgehog calendars of past years.

**MARTY SPONHOLZ ON PLATEAU AND BEYOND.** The New South Polar Times website has its first-ever on-line book, **AMONG THE MAGI: RESEARCH TRACKS IN THE DESERT SNOW**, one by a former colleague of mine, Marty Sponholz, who wintered over as the first meteorologist at Plateau Station in 1966.

I don't think the book was ever published in either hard-back or paper back, a loss. But at least it is available on line and many of our members, namely Rob Flint, Tom Frostman, Mike Kuhn, Walt Seelig, Phil Smith, Charlie Bentley, Chuck Stearns, and perhaps one or two others creep into the book. Marty wears his heart on his sleeve, and was outspoken, and let the chips fall where they may, even though you may not agree with him. No holds are barred, as he even dissects the shirt worn by one of the chief Antarctic scientists. He seemed to be successful in his scientific career, although at the same time he always seemed to be reaching for something he could not obtain. When push came to shove, he passed up a promising career as a research meteorologist to seek personal satisfaction and happiness while serving the Lord as a secondary school teacher.

Marty was a graduate student in the German-rich University of Wisconsin Meteorology Department, featuring such well known professors as Heinz Lettau and Werner Schwerdtfeger, under whom Marty studied, and Eberhard Wahl and John Kutzbach. Also on campus was Kirby Hanson who was the meteorologist-in-charge at the South Pole in 1958. Kirby was instrumental in talking Marty into applying for an Antarctic assignment, and Lettau the Elder threw his weight behind Marty's application. This was tantamount to his being on a plane to the ice, as Washington always listened to Lettau. Out of the blue one day, Marty was told by Kirby, "One last thing, comb your hair, and wear a suit!" Besides his two backing professors and Kirby, a senior meteorologist from Washington by the name of Mort Rubin who had wintered over with the Russians at Mirny, and I were there. It was fait accompli and for the rest of us it was more a celebration of finding another red-hot body for the ice. But for Marty, he thought he was being interviewed!

Marty was to be serving two masters, conducting a program in radiometry for my office, the Quartermaster Corps Research and Development Laboratory, and also being the station meteorologist under the United States Weather Bureau. And indirectly, he was also working for our current Society president, John Spletstoesser, who was an administrator at the Institute of Polar Studies at The Ohio State University. The only way I could get NSF money was to have it laundered through Ohio State, who bought the instrumentation that Marty was to use. Confusing, maybe, but it worked. So I saw Marty several times in conjunction with our program. He was young, looked even younger, was still wet behind the ears, and worried about why his instrumentation was still at our office. I had an ace up my sleeve in Lee Stroschein, who was an expert on instrumentation and recording systems, and he was going to Plateau Station for three consecutive summers!

Marty touches base on another interesting deal involving me. I had hired a red-blooded Mexican mathematician by the name of George de la Borbolla. My original selection was washed out by the head shrinks at the last minute, and George had been recommended by another government agency. But he and the Navy clashed wickedly, and every time the micromet system would get up and running, the Navy would foul up the generators so George would not get any good data. After the season, George demanded a hearing at NSF, and a bunch of us were called to Washington. The head of the Office of

Polar Programs was a nice guy, but rather naive, who was in over his head, (Louie Quam), and he innocently came to the meeting and said that he never realized that there ever had been any problems between the Navy and the civilians. Anyway, Marty wrote about this Hearing in his book. In retrospect, I think it may have been the first stepping stone towards civilian contractors replacing Navy as support in the Antarctic.

There are many great sentences in Marty's book. One is a dandy — "I know many of the modern taverns where new scientific ideas were derived." Several things bothered Marty, such as the power struggles going on. He mentioned that Uwe Radok and the University of Melbourne wanted to confiscate his data. Radok, who later worked for a while in the Office of Polar Programs, made a move on me at the end of our first year at Plateau to take over our whole program. After two years involvement, I was not ready for an intruder from the Outback to take over. Marty also felt another power struggle between Washington and the University of Wisconsin. I think any of us who have been on the ice can sympathize with Marty's feelings, as who wants to devote a year of their life to turn over their data to another? This all led up to his deep-rooted feelings about his religion. He wrote "I was stunned at the almost complete lack of interest in religion of any kind by so many of these scientists who now were my friends by virtue of the camaraderie established through frost bite, risk, and survival." We hope you read this book, appearing on the South Polar Times Website in its entirety, as it has a lot of good stuff which you will never find elsewhere, and it is *INTERESTING*.

**ANTARCTICA; A YEAR AT THE BOTTOM OF THE WORLD**, by Jim Mastro. Book review by Kristin Larson (KL), plus additional review comments by Steve Dibbern (SD). Bullfinch Press (Little Brown), Boston, 2002, 175 p. For those of you who have spent more than a few weeks in Antarctica, Jim's book is the diary you wish you would have kept. Those who have not been there will understand what it is about the place that keeps most of us returning many times. Jim's book successfully captures and recounts the full range of emotions; portrays the friends and furies; lays open the continent's beauty; and plumbs the depths of abject soul-searching that only an extended stay in Antarctica can inspire. Jim spent quite a bit of two decades there, 9 summers and two winters, and thus has much to draw on to cover the continent in all its moods, seasons and geographies. Jim's thoughtful prose, telling his stories in a warm, approachable tone as though you, the reader, were sitting at his kitchen table, is a writing gift. His writing is only half the story, though, as the stunning color photographs on every page of the book emphasize what the words are saying. Jim's book achieves an understanding of what life, adventure, and mis-adventure in Antarctica was like at the closing of the 20<sup>th</sup> century. (KL)

In addition to Jim's diary anecdotes, which spellbinds the reader, the photographs provide a seasonal account on their own, with examples of long-shadowed Fall and Spring subjects that summer visitors miss; whiter cloud-reflected glow from the lava lake in Mt. Erebus; and moon reflections. People and their relationships to the place they are in are a major part of the content. One thing that

doesn't appear to fit is the chapter on Bird Island, South Georgia. Although the photographs in that chapter are superb, it doesn't fit with the author's "Year at the Bottom of the World." However, Jim spent research time at Bird Island, and thus has included it as part of his overall experience. (SD)

#### **NEAR RECORD SQUID CAUGHT IN THE ROSS SEA.**

(Modified from *Sports Illustrated*, April 14, 2003). A bunch of Kiwi fishermen hunting for Patagonian toothfish came up with a killer squid which weighed 330 pounds and was 16 feet in length. Marine biologist Steve O'Shea said "from a science point of view, it's absolutely priceless." It seems it had attacked the fish being hauled on, and the fishermen gaffed it and hauled it aboard. It was only the second of its kind ever caught, and the creature had giant tentacles (yes, tentacles) with enormous toothlike hooks and the largest eyes - the size of dinner plates - of any animal. The female specimen was given to the Te Papa national museum in New Zealand for research. Eat your heart out, DeVries.

**GEORGE A. LLANO - ANOTHER SIDE.** (John Spletts) We have reached the end of available material about and from George Llano, the subject of several recent newsletters, and are pleased to add some detail about the many facets of this remarkable person. The following is excerpted from the two books listed, each available from internet sources. His service in the U.S. Air Force (1943-46) included field-testing sea survival equipment and life rafts for the USAF Air Proving Ground Command. On one occasion, he was testing a solar still under survival conditions at sea when his life raft got away from the PT boat tending him, and he was lost for two to three days in the Straits of Florida. He is co-editor of the USAF Survival Manual, which no doubt has examples of situations George lived through. He also authored two books on survival situations, one on sharks and another on sea survival in general. "*Sharks: Attacks on Man*," is an interesting account from the literature that George compiled for the contents. A paperback edition, 1975, 190 p., was published by Tempo Books (Amazon.com, \$3.00 plus S&H). "*Airmen Against the Sea: An Analysis of Sea Survival Experiences*," is a series of factual reports of what happened to men who bailed out or ditched at sea, and whose only refuge for days was a rubber life raft. A stiff-cover version published by University Press of the Pacific, Honolulu, in 2003, is reprinted from the original edition, and is priced at \$24.50 plus S&H.

The following paragraphs are from material that George sent to Paul prior to his unfortunate passing in February.

**TALES FROM PALMER STATION** (more from George Llano). Before NSF initiated biological studies in the Antarctic, benthic investigation began at McMurdo in 1959 through holes in the adjacent sea ice, which served as well as a ship's deck. Largely behavioral investigations of regional marine organisms and ecological surveys of the inshore and sea-ice habitats, these led to more sophisticated cold adaptation studies offish and other marine organisms. The lack of a salt-water aquarium at the Eklund Biological Laboratory barred some experimental and physiological

investigations, particularly of marine invertebrates. On the other hand, the Eklund Lab was ideal for taxonomical, physiological research, and for observing and monitoring environmental factors of High Antarctic marine ecosystems.

In the interface between the High Antarctic marine zone and the Antarctic Convergence, lies the most northerly extension of the continental ice mass, the Antarctic Peninsula known as the Sub-Antarctic life zone. This zone is characterized by a wealth of marine mammals, a splendor of bird species, singular, specialized fish species and a remarkable invertebrate fauna dominated by vast swarms of krill, or *Euphausia superba*. Because of the geographic remoteness of the Peninsula from the principal theater of operations at McMurdo and its rugged terrain it did not appear likely to warrant construction of a U.S. scientific station.

The situation was dramatically resolved when scientific drilling [in Bransfield Strait] revealed methane, suggesting possible oil deposits in a region of overlapping national claims, the cause of past political contention. The State Department, fearing that discovery of oil might renew past unrest sought an entree for regional U.S. presence by asking the Foundation to establish a research station in the Antarctic Peninsula, an area of numerous foreign research stations.

Dr. Tom Jones [NSF Director of Polar Programs] convened a meeting of the science and logistic managers to determine scientific objectives. He quickly found that the physical, glaciological, meteorological and earth sciences showed little interest. In representing the life sciences I argued that the U.S. program needed a marine station in the Sub-Antarctic, provided it included a free-flowing salt-water aquarium and a small, seaworthy ship to support the station and permit regional oceanographic work. The Sub-Antarctic life zone was a most promising area for krill research, which could be carried out independent of the boarding-house facilities at McMurdo.

Without delay a schedule was set to search for a suitable station site using the icebreaker *Stolen Island* under the command of Captain Price Lewis, accompanied by Captain Edwin McDonald. I was assigned as the NSF representative in the 1962-63 operation. For reasons I can't recall I had to withdraw but I proposed as my replacement, Dr. Waldo L. Schmitt, a retired marine crustacean specialist from the Smithsonian Institution and consultant to NSF's Antarctic programs. My nomination gave rise to questionable comments in the Division of Polar Programs when it was disclosed that Dr. Schmitt was close to eighty. Since his health was not faulted, I persuaded my Office to take a chance on "the old man". Waldo came on board. He was aware of my interest to initiate *in-situ* research on krill. Therefore, it was essential to find a site accessible to a ready supply of live krill and suitable for installation of a free-flowing salt-water aquarium. The Captain's responsibility was to approve a proper anchorage for the proposed supporting ship. I emphasized to Waldo the importance of finding a small, isolated land area unsuitable for expansion and away from other stations.

Knowing Waldo's obsession for collecting and because of his advanced age I made sure that there would be no biological collecting gear on the icebreaker. From here I paraphrase from material I gave Blackwelder for his 'Life of Waldo Lasalle Schmitt':

'...1963 was an open ice year, most favorable for collecting inshore and offshore. The lack of equipment was corrected by inducing the *Staten Island's* engineering department to improvise dredging and other over-side collecting gear, as well as Berlese rig for securing insects and other organisms in the Antarctic moss and lichen cover of exposed rocky areas. The cook most helpfully set aside no end of emptied glass jars, bottles and sizable tins for preserving marine invertebrates, algae and the stomach contents of seals. Of the several hundred fish taken in traps constructed earlier in New Zealand, together with a few that were hand-lined, some 85 to 90 fish were frozen for convenient transport back to Washington.

From Sick Bay Waldo scrounged all the formaldehyde and ethyl alcohol the Medical Officer would release. Whenever and wherever the opportunity permitted, all manner of collections were made, botanical and zoological. At the conclusion of the *Staten Island* cruise, Waldo brought back some 29,000 specimens, one of the largest collections ever made in Antarctica. Though largely a general collection, it was particularly rich in specimens of polychaetes, ascidians, and mollusks. I have Capt. Lewis's word that Waldo set a strenuous pace. He also enriched the lives of the *Staten Island's* crew who found the old man's exuberance and knowledge of sea things a welcome relief from the monotony of long days in a frozen sea. The purpose of the cruise to survey possible sites for a new, permanent, biological station was well fulfilled."

Arthur Harbor on Anvers Island has proven suitable as a new American marine station. Nearby Norsel Point used originally by the British as Base N in 1955 was marked by a small hut. Permission was granted by the U.K. to occupy Norsel Point and use Base N hut as a laboratory while construction of a new U.S. Station was in progress. The Seabees completed construction of New Palmer Station in 1968 in Arthur Harbor on a point later named Gamage Point. The British site Base N continues to be referred to as Old Palmer minus the British hut, which accidentally burned down while being renovated. "Palmer" commemorates the young New England mariner Nathaniel Palmer who in the 1800's sailed nearby Antarctic waters in a small shallop named *Hero*. Waldo's endorsement for a station-supporting vessel was helpful in the NSF decision to construct a 125-foot, oak-bulled, ketch-rigged, motor research vessel manned by a crew of 12. Named *Hero*, it sailed in the Atlantic north along the coasts of Argentina, discover big the Southern Right Whale breeding area in Golfo San Matias, in cooperative work with Chilean scientists in the Strait of Magellan channels as well as conveying supplies and personnel between all stations in the peninsular region and South American ports. Under its famed Captain Pieter Lenie, it charted safe approaches to uncharted areas, rescued Argentine personnel when Almirante Brown station [Paradise Bay] caught fire in 1984, assisted in other emergencies and in many ways served as the best ambassador for the U.S. in a region fraught with political

problems. So Palmer Station eased the concerns of the State department as well as supporting the Foundation's scientific programs. Without a runway and 2350 miles from the entrepot of McMurdo Station, Palmer Station has set a high standard for scientific work and international compatibility.

Bill Schevill of Woods Hole turned his attention from antisubmarine surveillance to recording marine mammal sounds. For his work at Palmer, NSF provided him with a small boat with especially designed propulsion and scientific instruments to record underwater marine sounds. Under Coast Guard supervision the boat was built at Curtiss Bay for about \$100,000. Bill named it the *Heroine*.

On the morning of January 29, 1973, a night watchman at Palmer descried a small boat bobbing in Arthur Harbor. On boarding it, station personnel found David Lewis of New Zealand unconscious in a partly flooded cabin of a badly battered boat, *Ice Bird*. When revived, Lewis said he had left Sydney, Australia, October 1972 alone, bound for Antarctica. Lewis finally left Palmer on the British supply ship *John Biscoe*. In his absence, the Station maintenance personnel undertook the repair of *Ice Bird*, which had a cement hull. In order to cushion *Ice Bird* against the dock, they used *Heroine* as a protective buffer. When I visited Palmer shortly after on the Coast Guard ship *Eastwind*, I found *Heroine* on land with its equipment intact. At this time I learned about *Ice Bird*. An officer on *Eastwind* experienced in salvage inspected the hull of *Heroine*, which he reported damaged beyond repair. In November 1972, Lewis returned to Palmer and sailed *Ice Bird* to Cape Town.

I had *Heroine* mounted on a cradle at Gamage Point with Palmer Station stenciled boldly along the hull. I understand that when Dr. Todd visited Palmer he had *Heroine* removed. That's life.

**COUSTEAU COMES TO PALMER.** (George Llano) Early in 1972 I had occasion to be in Los Angeles. A friend of Vietnam days met me at the airport, saying he had planned a dinner for a special guest he wanted me to meet. It was in this way I crossed paths with Captain Jacques-Yves Cousteau. Because of the casualness of the introduction it took several minutes for the Captain to connect me with the National Science Foundation. Then reprovingly he said "I wrote you at the Foundation for assistance in an expedition I am planning in the Antarctic." This I knew because I had referred his letter to Ken Moulton in the logistics section. Cousteau needed access to Palmer Station for re-supply and obtain water for his ship, *Calypso*, and jet fuel for his small helicopter.

The next day Michelle, Cousteau's son, drove me to one of their offices where the Captain waited for me, pressing for my assent to his request for assistance. I couldn't make father or son understand that this was not my decision. Both were visibly annoyed and at one point Michelle implied that I was acting like a bureaucrat. I questioned the Captain on the objectives of his expedition. It appeared that he had contracted to make a scientific documentary

about Antarctica. I mentioned the Foundation's scientific activities in Antarctica. "Ah, yes, but millions of people turn on ze boob tube, to watch Captain Cousteau!" As I suspected, the Foundation was not forthcoming. However, the U.S. Navy provided some communication equipment that proved helpful when *Calypso* was nipped in the ice and had to limp for port.

I was not witness to the following events. I learned about these from news accounts, or from conversations with Captain Lenie, Ice Master on the Greek cruise ship, *Illyria*, when we met in 1980.

The most tragic event of Cousteau's Antarctic expedition of 1972-73 was the death of a crew member who accidentally walked into the rear rotor of *Calypso's* helicopter. Cousteau frantically radioed the Argentine Station for assistance but when it was learned that the man was dead, the Argentines withdrew their assistance. A similar distress call to the Chilean Station was also withdrawn when the individual was reported dead. In reminiscing about the *Calypso* affair, Captain Lenie told me that the French had also contacted Palmer Station for help, and that he was preparing *Hero* to respond to the S.O.S. call when he learned that it was not an emergency but death. Lenie asked me if I had seen Cousteau's documentary film. "No, I replied, but I understand that it has some good underwater photography!" Lenie continued, "Well, it has a very sad end. Apparently the group was traversing a hazardous ice fall when one of the party disappears down a crevasse. The film closes as the remaining members, heads uncovered, draw together lamenting the loss of a comrade."

"But Lenie," I remarked, "it was my understanding that Captain Cousteau lost only one man?"....

On one of my last visits to Palmer, I discovered that *Calypso* had left on the Station several drums of helicopter fuel. These were parked uphill from the buildings in an open area used as a dump. I wondered why the Station had accepted aviation fuel when we only used diesel and some gasoline for outboard motors. I asked Captain Lenie if he could transport the drums on *Hero* to Harberton on the Beagle Channel for Tom Goodall, who had always been generous with his small plane when we needed it. Lenie canted a steel barrel on end, exposing a rusted rim. "George," he said, "this barrel may be leaking and that is probably why these were unloaded at Palmer. If they leaked it would be hazardous to take them on *Hero*."

Before the replacement of *Hero* by *Polar Duke* and the increase of station personnel and supplies, refuse accumulation at Palmer was negligible. Periodically, a Chilean naval ship would show up and take away damaged, rejected or replaced equipment, machinery or house-ware. I became concerned that the leaking aviation fuel might flow down hill toward the station area. The Chileans were not interested in taking the drums and we could not jettison the steel drums. So I systematically began burning off the aviation gas in the dump at intervals. Later, when I told a grantee, Bob Risebrough, who measured organochlorine pollutants in Antarctica of my action at Palmer, he laughed, saying that now he understood the source for the

high concentration of hydrocarbon residues in the snow samples he tested around Palmer Station.

**GREEN GROCER AT MCMURDO.** (John Spletts and NSF website) Luther Burbank is alive and well at McMurdo Station. Actually, his name is Robert Taylor, from Missoula, Montana, and at 34 years old, operates a hydroponic greenhouse to grow edibles for the McMurdo troops not only during the summer but also the winterovers. Products include cucumbers, peppers, tomatoes, limes, lettuces, basil, and parsley, all no doubt to prevent the scourge of scurvy. Scurvy, though, is not the issue, but instead, morale, as a means of providing fresh greens for McMurdo citizen all year-round. Annual harvest amounts to about 3,600 pounds, and includes only edibles, no glitzy flowering plants (pansies are grown, but are edible). Because insects cannot be introduced to the Antarctic Treaty area for pollination, Taylor does it by hand-pollinating. The last time I saw something like this was at the Greenpeace base at Cape Evans in the 1990-91 season, where a similar operation occurred. If only Scott's Hut would have had a similar 'farm' in 1911, think of the morale-boost that Wilson, Bowers, and Cherry-Garrard would have had on return from Cape Crozier and the search for emperor penguin eggs.

**STATE DEPARTMENT CHECKS IN.** (Ray Arnaudo) The 21<sup>st</sup> Annual Meeting of the Commission for the Conservation of Antarctic Marine Living Resources (CCAMLR) was held in Hobart, October 20-31, with a major topic of discussion being the illegal fishing of Patagonian toothfish, also known as Chilean sea bass if you see it in restaurants. The species continues to be fished because there is a demand for it, but the development of a 'black list' of illegal fishing vessels will identify those who fish for not only legal species but also toothfish. A Vessel Monitoring System plus a US-sponsored centralized reporting system for toothfish imports, are intended to provide further controls on a practice that could eventually lead to extinction of a species. Although the temperature range for the species is 2° -11°C, it has also been reported in Greenland waters, implying migration by deep currents (*Nature*, 6 Feb. 2003). If the species thrives there in sufficient numbers, Greenland natives could ultimately fish for it as an aboriginal (and legal) practice. Both CCAMLR and Art DeVries could find themselves operating in a different hemisphere. Art (the 'Mayor of McMurdo') has been fishing at McMurdo since 1960 or so, virtually every austral summer, and has landed cousins of the toothfish, the 'Antarctic cod' (both are from the subfamily Notothenioidei).

**BRASH ICE.** Although it may not be apparent, we usually try to find a reason for writing these newsletters, and this midwinter edition is more or less going to be related to a popular theme in Washington nowadays, the forthcoming International Polar Year, 2007-2008 (or as it is being abbreviated, IPY-4). This is probably catching many of you by surprise, as you wonder how IPY-1, IPY-2, and IPY-3 passed you by. And well you might as the first two polar years never got any closer to Antarctica than stations on South Georgia, and now what has been embedded in you for the last half century, the International Geophysical Year (IGY), now has an asterisk attached to it which shows that it was actually IPY-3. So we are going to devote much of this newsletter, plus others to follow, to show how unique the IGY really was and how it can never be re-created.

For all practical purposes, most of Antarctica was a virgin in 1957, just waiting to be taken like a fair maiden. We now may know more about Antarctica than we do about our own backyards. Back then Antarctica was FOR MEN ONLY. Oh, Jackie and Jennie had w/o once upon a not-so-golden time, but women scientists were verboten then. Now you can't ascertain whether the red-clad parka wearer is male or female. Their sexual determinations parallel that of penguins - they have to be inspected. Back then the military were there, including the Seabees, miracle workers who built most everything in the IGY and later. Nowadays, with the sole exception of the Coast Guard icebreakers, there are no militiamen. And who are building bigger and better homesteads on the ice- private contractors. There was also no central clearing house like the National Science Foundation funding aspiring principal investigators. One had to hitch oneself onto a falling star such the Arctic Institute of North America. With no Antarctic Treaty, you could even take a penguin home with you! Oh, what changes in less than fifty years. This is all a new ball game, no resemblance at all to the game played during the IGY - hic - the IPY-3. The only constants are a few derelicts like Charlie Bentley, John Behrendt, and Mario Giovinetto.

So let's go with the newsletter. And let's have some fun while we are at it.

**2004 ANTARCTIC CALENDARS.** Once again we are offering at a bare bottom price the ever-beautiful Hedgehog House Antarctic calendars. They don't come any prettier, any more economical, and they should be in stock at our redoubt in Maine ready for distribution early in September. Beat the holiday crush, order NOW. We only have a hundred. Same cool price as last year, \$12.00. Make checks payable to the Antarctic Society, and mail to the Society at P.O. Box 325, Port Clyde, Me 04855.

**ANTARCTIC TRAGEDY ON 22 JULY 2003** (British Antarctic Survey Press Office). It is with the deepest sorrow that British Antarctic Survey (BAS) reports the death of a marine biologist at Rothera Research Station on the Antarctic Peninsula.

Kirsty Margot Brown, 28, was attacked without warning by a leopard seal while she was snorkelling at her study site in the bay adjacent to the station. She was with her snorkelling 'buddy' when the seal pulled her underwater and contact with her was lost. The two-person shore-cover team saw the incident, and a rescue boat was launched immediately in an attempt to save her. Her colleagues were able to pull her from the water and begin resuscitation procedures in the boat whilst transferring her to the research station. Despite carrying out Cardio-pulmonary resuscitation (CPR) for one hour, the station doctor and colleagues were unable to revive her. Medical facilities include a surgery with emergency equipment.

Kirsty worked as a diver as part of Imperial College's Greenland Diving Expedition in 1995 and then as a Field Assistant in Greenland during the summer of 1996 for the Cambridge Arctic Shelf Programme and as a research scientist in Canberra. A keen diver, Kirsty had gained BSAC dive leader qualifications and a commercial HSE Part IV professional diver's qualification. She had experience of diving off Greenland, in temperate and tropical waters off Australia and in UK waters.

Director of BAS, Professor Chris Rapley CBE said, 'This is tragic and shocking. My heart goes out to Kirsty's family and her colleagues at Rothera. Kirsty was a vibrant, dynamic individual, committed to her science and with a promising scientific career ahead of her. The Rothera team reacted in a highly efficient and professional manner of which we, and they, can be proud. They are, however, shaken by the loss of a colleague and will need our support.'

Leopard seals are often inquisitive when they encounter humans. However, they are not generally known to attack humans unless provoked. BAS has been carrying out research involving snorkelling and diving for the last 30 years.

**EDWARD PAYSON TODD.** (by Al Fowler) We're told that America is losing its WWII veterans at the rate of 1,000 per day. To Antarcticans one of the ones that was lost on May 25, Ed Todd, was very special. Like the staunch and solid classic New Englander that he was, Ed recounted his memories and stories with wry wit and deliberate, slow-paced precision. That was the way in which he told me about his experiences as an Army Signal Corps officer assigned to the military port

director operation as the allies took over the port of Antwerp in 1944. Ed's Division Director's door, adjacent to mine, at Polar Programs in the 1980s was always open, and some of us would be treated to his wartime recollections, along with those of scenes and tales of his growing up in Newburyport, Mass. Over a span of 14 years I worked for all the Polar Programs bosses from Joe Fletcher to Peter Wilkniss. Ed Todd is best remembered for his reticent and dignified manner along with a totally professional, confident and unflappable management style. He was a wonderful man to work for.

At NSF Ed moved to the polar science division director job by taking a step down from a more senior position. With no previous polar experience he eagerly and deftly brought himself up to speed with the many international and interagency players, as well as winning the support of his home team. In my opinion Ed Todd's greatest contributions to polar science were probably the result of his skillful orchestration of multi-national, multi-agency, and multi-disciplinary projects. Two examples of his skill as a negotiator stand out. In those days Japan was the leading international partner in earth science at McMurdo. Professor 'Tak' Nagata, director of the polar institute in Tokyo, was Ed's counterpart who drove a hard bargain at his annual planning visit to Washington. Tak came loaded with ambitious proposals and demands, while Ed was well prepared with the USAP position. He firmly countered Tak's performance with a grandfatherly smile, and having concluded a fair and balanced program plan, let Tak depart thinking he had won.

The other example of Ed Todd's special brand of statesmanship involved the many cooperative agreements in the science and logistics of the Antarctic radar ice-sounding project. Danish, British and Soviet people along with Americans and others were involved. This was one of those events in Antarctic affairs during the Cold War that stands as a historic example of peaceful and productive cooperation that bridged the barriers otherwise dividing the World in that 50-year stand-off confrontation. Dr. Todd's diligence and perseverance in the negotiations, especially those surrounding the logistics (placement of fuel caches) produced successful annual plans that sustained the participation of the foreign players without critically draining the USAP logistic and financial resources. Ed's New England temper, although rarely on display, was known as a 'hot Toddy'. I do remember one time that Ed was really angry. His duties included many trips to the ice. On one occasion he, as USAP Director, escorted a group of very senior visitors. He lost his composure when his plans as host

were somewhat upset by the always gracious and eager Navy Captain at McMurdo.

One year while Ed was overseeing the program down south, his colleagues back home were thrilled to see a cartoon in the January issue of the *New Yorker*. It showed a man trudging through the snow, dressed in a full polar outfit including a scarf covering all of his face but his eyeglasses. A sign hung down his front from a cord around his neck. It read: "Hello, I'm Ed Todd." By the time Ed returned to Washington, we had contacted the artist, bought the original drawing, had it framed and presented it with great fanfare to the real Ed Todd!!

### **RETIREMENTS FROM ANTARCTIC PROGRAMS**

**OFFICE.** Retirement parties are always unique, as no two are exactly alike. But they certainly know how to spring people free at NSF. When Mother Superior, a.k.a. Helen Gerasimou retired, it was a gala occasion, although the only person not dressed fit to be killed was Helen, who looked like she was dressed for cleaning her own kitchen. When the aforementioned Ed Todd retired, it was another biggie, with at least three large floral masterpieces. There were a lot of wheels there from Capitol Hill, and the Todds got all sorts of presents, including the aforementioned cartoon about Ed Todd which had appeared in an issue of the *New Yorker*. There was a lovely piece of wall tapestry that some famous artist in New Zealand had made. As I used to give him rides home from our Society meetings, I walked up to him at his retirement, and said kiddingly, "Do you want a ride home today." And he said he did! He and Barbara had come to his retirement on the subway!! He always appeared very quiet and unassuming to both Ruth and me, and we couldn't help but have a deep feeling for him because of a family hardship which they both shared. In a way, it seemed fitting to his character that his hobby was a magnificent collection of antique tools. He belonged in his own collection!

**INTERNATIONAL POLAR YEARS.** One might say without much fear of contradiction that the first couple of Polar Years were snake bitten. The first so-called International Polar Year started, officially, on August 1, 1882. France had a station on Cape Horn and Germany had one on South Georgia. As far as the U.S. was concerned, we had one at Point Barrow and an ill-fated one at Lady Franklin Bay on Ellesmere Island. The second International Polar Year ran from August 1, 1932, through August 1933, right in the height of the depression, and before the start of World War U. Both events greatly affected IPY-2. Forty-four nations pledged, twenty-two sent expeditions beyond their borders. The South Orkneys is as close as anyone came to Antarctica. But the U.S. led all in

scientific publications, 113, followed by Germany with 97, then the Soviet Union with 52, Great Britain with 39.

There is some credence in referring to the IGY as the IPY-3, as the whole idea came from the tongue of Lloyd Berkner, former radio operator on the BEAR OF OAKLAND on its trip to Antarctica in 1933. At a dinner party at the to-become-famous James Van Allen on April 5, 1950, Lloyd proposed to a distinguished gathering, including the internationally renowned Sydney Chapman, that it was about time for another polar year. Three months later Berkner and Chapman presented the plan at a Mixed Commission on the Ionosphere. In October 1952, Chapman proposed that at the International Council of Scientific Unions, ICSU, in Amsterdam that the name be changed to the International Geophysical Year, and it was so approved. But evidently, unbeknown to most of us, the International Polar Year-3 was just lying dormant, never died, and now has come out of hibernation, or at least been resurrected, in the current year.

But what we think is most interesting is that from the time the IGY was born in October 1952, until the tune the U.S. had men in place in Antarctica in January 1957 was a mere four years and three months. And two of our stations, McMurdo Sound and Little America V, were actually completed a year earlier! This was all accomplished without any central funding agency, without a pool of candidates, with no game plan or road map. A series of US National Committees for the various disciplines in geophysics did wonders, and the IGY became, as John Behrendt so aptly entitled his book, INNOCENTS ON THE ICE.

**EVOLUTION OF THE IGY.** We hate to admit it, but looking at the literature, it looks like the IGY (IPY-3) was created through committee work. Walter Sullivan wrote that the core of the IGY Administration, the Comité Spéciale de l'Année Géophysique Internationale (CSAGI), was originally a three-man body consisting of the aforementioned Chapman and Berkner, plus the Frenchman, Marcel Nicolet. Later on one of our current Society members, Alan Shapley, became a member of CSAGI. And Alan was to remain a powerhouse on a lot of the US-IGY committees. In February 1953, he became the Vice-Chairman of the U.S. National Committee for the International Geophysical Year. In November 1954 he became the Vice-Chairman of the USNC Executive Committee for the International Geophysical Year. One other of our Society members shows up on both of those committees, A. L. "Link" Washburn. We have to mention both of these fine scientists, as both of them have somehow escaped to-date the dreaded trip which awaits all of us to some final resting place. So there are two people very

much alive who should be guiding lights in the planning for the IPY-4.

A very prominent man in our country during the IGY was Hugh Odishaw, who was the Executive Director of the USNC Executive Committee for the IGY. If you were on the ice during the IGY you became quite familiar with messages signed "Odishaw Sends." In his honor, some ingenious creative minds at Little America V composed a song, "Oh Odishaw, Oh Odishaw". A bunch of Arctic IGYers attending an international symposium in Helsinki in 1960 had the opportunity to serenade Hugh with his song when he walked in to a Helsinki restaurant where they were all enjoying a meal of crayfish!

There were all kinds of US-IGY panels, such as world days, solar activity, geomagnetism, atmospheric physics, aurora and airglow, cosmic rays, oceanography, meteorology, glaciology, gravity and seismology, longitudes and latitudes, nuclear radiation, earth satellite, arctic, antarctic, data processing and world data centers, interdisciplinary research, special research, and education. Those disciplines represented on the ice during the IGY were ionosphere, aurora and airglow, gravity, geomagnetism, seismology, meteorology, glaciology, and oceanography. During the IGY, 69 US scientists were on the ice. In 1958, there were 71. As four w/o for both years, there were 136 different qualified people who somehow had to be found, somehow had to pass physicals, somehow had to get by psychiatrists. By far the largest group were the meteorologists, mainly because of the large component of meteorologists in the Antarctic Weather Central at Little America V. About 40 percent of the IGYers on the ice were meteorologists. Two people who were there but did not show up in any specific IGY discipline were the physiologist and the Eagle Scout at Little America V, although they are included in our numbers who w/o'ed.

The selection of people for Antarctic service would fill a book, although you probably wouldn't believe half the stories. There was the German scientist at Little America V who wrote a personal letter to Larry Gould volunteering for the most difficult job on the ice. There was a miner in Montana who was reading about the IGY in a newspaper, saw Bill Field's name, and hopped across country to find him in NYC and convinced him that his desire would more than compensate for his lack of any training. There was a meteorologist who wanted to go so badly that he could taste it, but he had suffered severely frozen feet in an aircraft crash in Labrador. But he volunteered anyway. And the examining doctor never asked him to take off his stockings, so he passed! Perhaps the hardest discipline to find candidates was in glaciology, as there just

weren't any back in 1956. I was told by the highest authority that they had one who really was qualified, and then the psychiatrist failed to pass him! And even if you made the ice, you were not immune to tragedy. My program in micrometeorology was supposed to be two-pronged, with a counterpart doing similar research on the Chamberlain Glacier in the Brooks Range. But most unfortunately, after arriving on the ice, he became despondent and committed suicide. You sure find out a lot about people when they get iced down.

**VIP INVASION OF ANTARCTICA DURING AUSTRAL SUMMER 57-58.** A lot of distinguished scientists came to Antarctica during the IGY, and the austral summer of 57-58 saw tens of them. In alphabetical order we present Bill Field, Dick Goldthwait, Eddie Goodale, Larry Gould, Bob Helliwell, George Llano, Troy Pewe, John Reid, Alan Shapley, Athelstan Spilhaus, John Tedrow, James Van Allen, Link Washburn, Harry Wexler, Tuzo Wilson, and Gentleman Jim Zumberge. Looks like a Hall of Polar Fame. Zumberge showed unusual creative genius at his tender age, as he brought a whole foot locker of choice spirits to buy favors from the Navy. Needless to say, he was well supported at Roosevelt Island.

Here is a true human interest story. George Llano was slated to go to the Antarctic, but just before he was to leave, the Aii Force, facing a money crunch, withdrew their support of the Arctic, Desert, Tropic Information Center. So George was without a job, unemployed, you might say. He did not know what to do but his kind wife Barbara said, "George, don't worry about the family, you always wanted to go to the Antarctic, so go and we will worry about a job later."

One evening at McMurdo when a bunch of us were sitting around in a quonset hut, George asked Bill Field who he worked for, and he replied the American Geographical Society. Then George asked him how he made out on his travel vouchers, whether he made a little extra on the side. It was very obvious that Bill was somewhat embarrassed to be asked such a question, but he finally answered that people at the AGS just hoped to collect their true expenses. I took George aside the next morning to explain the facts of life to him, that the unassuming Bill was an extremely wealthy man, no doubt paid the salaries of all his staff, that on his side he was related to the Marshall Fields of Chicago, and that his wife was a Vanderbilt! On Van Allen's trip to Antarctica, the Russians put up Sputnik. This resulted in a new record for the fastest round trip by a VIP scientist to Antarctica, a record which still stands!

**HIGH-LEVEL FRICTION AND JEALOUSIES.** The Antarctic IGY was awash with high-level friction brought on by jealousies, but in spite of it all, everything somehow worked out. The biggest one was right at the top, with Admiral Dufek, called unaffectionately by many of the IGY as Admiral Defect, had no use at all for Admiral Byrd. It probably went back to Operation High Jump when Dufek was on his staff. Paul Siple was a strong Byrd man, which meant that Dufek and Siple were in juxtaposition. At the same time, Larry Gould was a very strong Dufek man. Byrd was a very sick man by the time the IGY came along. In fact, he died at Easter time preceding the official opening of the IGY on 1 July 1957. However Siple remained forever a Byrd man. And Siple had some clout of his own, too. Dave Canham, the head Navy man at McMurdo in 1956, became a strong supporter of Siple. Post IGY, I became a close friend of Canham and saw him occasionally, so got to know his inner feelings about Siple and Dufek. And if you have read 90 SOUTH, you know that Paul was greatly upset when Dufek and Gould and Company dedicated the South Pole Station at McMurdo and never sent him a wire to the Pole that the dedication ceremonies had taken place. It was only several weeks later after the McMurdo runway had been repaired and planes could bring in new personnel that Siple actually found out about the dedication. The Siple-Dufek rivalry lasted to the very end. When Paul came out of the Pole in early December, he was great copy for the press, but Dufek took off in a plane with all the press that day, with word that Siple must go out on the first plane!! Which he did.

Then Sir Hubert Wilkins angered the Admiral in the austral summer of 57-58 when he gave an interview in which he decried the condition of McMurdo, which truly was a mess, but Sir Hubert then went on to talk about the drinking at McMurdo and the morale of the men being much worse than anything that Scott and Shackleton had ever experienced. Naturally when it got published in the States, copies of the interviews were mailed back to McMurdo. When the Admiral read them, he ostracized Sir Hubert out of his living quarters and blackballed him from all flights to the Pole. So Sir Hubert never set foot on the South Pole. I know a little bit of what I writeth, as I was at McMurdo when Siple came out of the Pole, and I was a coworker of Sir Hubert at a government laboratory. Sir Hubert came back to his office in the States and wrote the perfunctory trip report that all government workers had to do when they ventured outside their front doors, and Sir Hubert, a kind soul by nature, really blasted Dufek. The Admiral heard about this trip report, and demanded of our Commanding General the opportunity to visit the Laboratories and answer Sir Hubert's charges. His request fell on deaf ears! The denial had nothing to do with one commanding general being married to a Dalrymple!

However, none of this ever actually affected the scientific programs, although there were many brush fires, some of major proportions, at Ellsworth station in 1957. Books have been published on what happened there, and it does not seem worthy of repeating what nearly all true Antarcticans know from their readings. But what may be of interest, is a thumb nail description of how one nation, in one international program, in one period, could have such diversified operating programs.

**FIFTY YEARS OF CHANGES AND PROGRESS.** As we approach the so-called IPY-4, we can look back on fifty years that have made Antarctica into everything that the Antarctic Treaty dictated, a scientific laboratory for peaceful purposes for all. No sooner had the IGY ended than we turned over two of our stations, Wilkes and Ellsworth, to countries who wanted them more badly than we did. Even though the IGY continued for another year as the IGC (International Geophysical Cooperation), the US Antarctic programs were still in a transition stage.

The biggest change in the last fifty years, without a doubt, was the introduction of a new species into Antarctica, 'Homo sapiens femella'. This doubled in quantity the available work force, and places like McMurdo, which were previously frontier cities soon had all the finer amenities of resort towns, minus street lights. The next biggest change was somewhat slower in coming, and that was replacing the military support with civilian contractor personnel. It made for a more unified, more stable work force. Although its impact was very minimal in Antarctica, another change since the IGY was the reduction in countries whaling in Antarctic waters.

After the IGY, the National Science Foundation's Office of Antarctic Programs came into existence as THE funding center for all Antarctic research, and a small but efficient small office, where Helen Gerasimou served as Mother Superior, eventually grew into a large bureaucratic stronghold with a manager for every cause, and maybe some non-causes! As Bert Crary once said, he was the victim of the St. Peters Principle, where he got repeatedly kicked upstairs until he reached an office of incompetence. But by then, the Office of Antarctic Programs was destined to flourish, and so it has. Byrd Station became the New Byrd Station in 1962, and then it finally perished. The U.S. was spreading its wings, and in January 1963 set up Eights Station in Wobegone Country near the base of the Antarctic Peninsula. That was short-lived, three years, and one of the reasons was the tremendous amount of snowfall they received, burying the camp. The

U.S. set up a high elevation station, Plateau, in East Antarctica, in January 1966. The annual mean temperature, as determined from a ten-meter core reading, showed it to be the coldest place in Antarctica. After three years the U.S. locked the door and somewhere out there in No Man's Land stands a lonely 200 foot walk-up tower. But a new permanent crown jewel station had been established on the Antarctic Peninsula, Palmer, on Anvers Island in March of 1965. Three years later, they established nearby a new Palmer. This station has had a very successful existence as the hub of our marine biological research on the Antarctic Peninsula. About this time, Siple Station was set up as the Southern Hemisphere conjugate station Roberval, Canada, 125 miles north of Quebec City. This was also in an area of heavy snowfall, but the station survived for quite a few years because of a large cadre of dedicated scientists from Stanford. And the Navy logistical station at McMurdo, through osmosis down through the years, had become another scientific station, one where Art DeVries has served as the pseudo austral summer mayor for over forty years. One might say that the U.S. posture in Antarctica following the Antarctic Treaty was a very aggressive one during the 1960s. So when you look to where we have been during and since the IGY (IPY-3), you wonder where else can we go in Antarctica for IPY-4?

And let's not forget the field parties. First there were a lot of traverses out of Little America V and Byrd and Ellsworth during the IGY. Then in the early 1960s, one went from McMurdo to the South Pole, followed by another from Byrd to the South Pole. Even in today's world, scientists are still doing the Byrd to South Pole traverse. Although it was not part of President Eisenhower's plan, an interstate is being built between McMurdo and the South Pole. AAA is not far behind. We have had scientists in the Transantarctic Mountains for many years, we have had more scientists picking up meteorites on the snow fields of the Polar Plateau, and we have even had people inside the crater of Erebus. On the perimeter of the continent, coastal areas have been visited by scientists on the ELTANIN, the HERO, the NATHANIEL PALMER, and the LAURENCE M. GOULD. There are blue ice runways all over Antarctica, and in recent years they have been able to prepare snow packed runways that can handle the largest wheeled aircraft coming to the ice. And during a lot of this time, we had airborne traverses flying hither and yon. Is there anything left to be done?

There is one big scientific change from the IGY. Prior to the IGY climate was a bad word. You could count the number of climatologists on the fingers of one hand, and after you said Charles Franklin Brooks, Helmut Landsberg and J. Murray Mitchell, you had said it all. Now the world is wondering if we are warming or just experiencing a natural cycling. In all

likelihood climate change is going to be the motor to drive the IPY-4. However, studies in glacial climatology have been a continuing study in Antarctica since the IGY, providing a real nice living for the Bentleys, the Dentons, the Majewskis, and many others. And for many, many years, studies have been conducted each year on the Antarctic ozone hole, whose discovery goes back to a Brit station in the 1950s. So is there anything really new for the IPY-4?

**U.S. IGY STATIONS.** The U.S. was involved in the operation of six IGY stations, plus the Naval Facility at McMurdo. However, one of the six stations, Hallett, was shared with the Kiwis. In fact only one American was there, Jim Shear, sort of a nondescript geographer from the University of Kentucky. He was a bon vivant type fellow, and did not create any waves, so you never heard much about Hallett, pro or con.

Little America V was the U.S. capital on the ice. It was the largest, the biggest, and actually was in operation in 1956. There was only one civilian there in '56, a meteorological technician by the name of Chet Twombly, who was more than anxious to leave when the CURTISS came in. In 1957 109 people occupied the station, with Bert Crary being the chief scientist on the ice, Willie Dickey being the senior military man. They weren't exactly alike, as Bert was pure scientist and Willie, a naval captain, went there with a prayer that the year might result into him finally getting his star. He never got it! But his runner-up prize was probably marrying a gorgeous creature that he met at a Scandinavian embassy. The next year there was great repose between Crary and the two Naval captains, and from all accounts it was a great year for all, even though Bert got dumped into Kainan Bay when part of the shelf collapsed with him on h.

There were 85 Navy personnel, twenty-four IGYers in 1957. There was no hard and set rule as to responsibilities, being more or less left up to each camp, although supposedly the Navy was there to support science. But it did not set well with the Navy that they were doing all the KP, so Capt Dickey went to Bert and told him that his men were unhappy, that they wanted the IGYers to also help out in the kitchen. Bert's reply was typical Crary, "Sounds like a good idea to me, Willie, what do you say that the two of us kick off the program tomorrow morning?" Needless to say, Capt Dickey was not about to do KP, and the issue was never brought up again. Little America V was more an international station than any of the other US stations. Weather Central was established at Little America V, and there were six foreign scientists there in 1957 and 1958. In 1957, Hans Bengard from Denmark was in charge of the

ionosphere, Peter Schoeck of Germany had the responsibility for aurora studies, and Herfried Hoinkes from Austria for the solar radiation research. The station was so large they had room for additional programs, such as the one in physiology, conducted by Fred Milan of the Arctic Aeromed Lab in Fairbanks, and micrometeorology which was my bailiwick. And for the first and only time since Siple w/o'ed as an Eagle Scout in 1928-30, Little America V had a truly fine one who has gone on to great deeds, Dick Chappell.

So we had the capital of the Antarctic at Little America V, with Crary as a hand's-off type of leader, who led by example. A day for Bert consisted of at least eighteen dedicated hours. The brunt of most of the ridicule in camp was the German Schoeck, who was born with the innate ability to aggravate people. His falling into a crevasse was greeted with mixed emotions, believe you me. Bert had only one disciplinary problem, Ellsworth Station, and he served as Chief Arbitrator for many a squabble. However, in nearly all cases they were solvable, as science dictated the proper answers. After all, this was the IGY.

**AMUNDSEN-SCOTT SOUTH POLE STATION.** There was no resemblance whatsoever between the South Pole and Little America V during 1957. Jack Tuck, the naval officer who had w/o'ed at McMurdo in 1956, came to the Pole as a strong Dufek man. But if you read the journals and diaries, you will see that within a few weeks Jack had converted to Siplism. Siple was very much a Unitarian, so everyone, regardless of position or rank, performed all the house duties. This decision by Siple may have led to his untimely early death at the age of 59, as he was by far the camp leader in terms of numbers of hours spent mining snow for the snow melter. He left a lot of weight at the Pole, and came home somewhat a shell of the man who went there.

The station was more educational than any of the other stations, and it was routine business for all scientists to present lectures in their fields of endeavor and their research at the station. It would have to be described as a unified station with high morale, although everything is magnified at the Pole. The influx of visitors, anxious to pose at the South Pole, creates sort of a false summertime environment. The weight of Dufek must have worn heavily on Siple's shoulders, and Paul must have grieved internally when Byrd died while he was at the Pole. Before Paul left for the Antarctic, he hopped on a plane to Boston to say his farewells to his Antarctic benefactor and long-time friend. When Paul left the Pole, he must have known that this was it, that he would never again celebrate a midwinter dinner on the ice. He shaved off his beard, put it in

a brown bag, and took it home to Ruth. Finally after over twenty years, she had her man home.

The second year of the IGY at the Pole bore no resemblance whatsoever to the first year, as the strong leadership which existed in 1957 vanished entirely in 1958. The net result showed that leadership is not as important as drafting a few good people, just like the Marine Corps! Young, strongly motivated people are going to overcome poor leadership, and so it was at the South Pole in 1958. But it was an exciting year, a terribly exciting year. First Ed Hillary and some of his mountaineering buddies from back home arrived at the South Pole, much to Bunny Fuchs' chagrin, driving hell bent for the Pole with old Ferguson farm tractors. Several weeks later Fuchs arrived by dog teams and Sno-cats, with a strong component of bona fide scientists. They stayed for most of a week, drank a lot of coffee, and with clean underwear moved on. Exciting stuff. Later in the year the first Russian plane to reach the South Pole skimmed over the snow surface, well below the GMD tower, wig-wagging its wings, whose tips were almost touching the sastrugi. There is hardly ever a dull day at the South Pole, the station with the purest and the best weather in the whole world.

**WILKES STATION** was something entirely different, being located hi the Banana Belt of the Antarctic. And a GREAT TIME was had by all, with Carl Eklund leading the way as a jolly good fellow. Speaking of camaraderie on the ice, here was where it was located. It was the only IGY station with dogs, and they fitted in well with the likes of Eklund and Rudi Honkala. The amazing thing about the Krt was how well people were distributed, and a lot of it was dumb luck. Most square people fell into square holes, and the round people ended up in round holes. However, someone slipped when they sent a Jesuit priest-seismologist to Eklund. However, it ended up a Mexican standoff, with neither side being converted. One of the nice things about this station was that they had an ulterior outlet when they established an interior auxiliary station up on the ice cap. Wilkes station, like Little America V and Ellsworth, locked their doors after the IGY, although the Aussies took over Wilkes as Casey, and Ellsworth was turned over to the Argentines as Belgrano. Honkala liked it so well at Wilkes that he even went back there for another year with the Aussies. But he never did have a very high IQ! If you wanted to go to the ice and have fun, go with Eklund; if you wanted an education, go with Siple; if you wanted to work, go with Crary.

**BYRD STATION.** This was the quietest station of all, and you never heard much about it. Maybe the reason was that

they were all mad when Little America V put only one (1) case of beer on the tractor train for the whole camp for the whole year. Evidently George Toney was a good leader, as there never was a mutiny. And they certainly had one of the pillars in the IGY in Charlie Bentley. They had the only black scientist in the American ranks during the Antarctic IGY, but most unfortunately, within a couple of months of leaving Byrd, he died from pneumonia on his next assignment in the Arctic. Many U.S. IGY scientists died shortly after leaving the ice, but he was the very first.

**ELLSWORTH STATION.** Oh boy, what do you say? John Behrendt said it all in his book *INNOCENTS ON THE ICE*. What made this station so different from the others was that Finn Ronne would only go to the ice if he could be both the scientific and military leader. And so it was, at least on paper. It was a terribly unhappy year for everyone, and the only saving grace for the scientists was that there was radio communication with Little America V where Bert Crary as senior scientist on the ice could arbitrate. A year later Bert and Finn accidentally met on a downtown street in Washington, D.C., and Finn's first words to Bert were, "I want you to know that you made that year at Ellsworth just miserable for me." To the best of our knowledge, it was the only bad year at any US station in Antarctica during and since the IGY. Some big Antarctic names came out of that year. One of the very brightest, Ed Thiel, died on 9 November 1961 in a tragic air accident when the plane he was in caught fire on takeoff at Wilkes Station.

**CAREERS.** Was the IGY, *nee* the IPY- a stepping stone or just another way station in life? If you look at those who came up through the academic mill, like through The Ohio State University's Institute of Polar Studies, then you will find a cadre of Antarctic returnees who became almost natives on the ice. However, over half of the non-meteorologists on the ice in 1957 and 1958 returned to get their PhDs and to go on as college professors or research scientists in other than polar endeavors.

What the IGY did, though, was to inspire many of them to go for advanced degrees. If there was an Antarctic success story, it had to be Kirby Hanson, meteorologist-in-charge at the South Pole in 1958. He was more or less a raw recruit who impressed everybody, and after his tenure at the South Pole, the US Weather Bureau sent him to the University of Wisconsin at Madison where he got his bachelors degree, then his masters degree, and topped it all off with his PhD. And later he became head of their network of climate change stations, where the South Pole's Clear Air Facility fell under his direct supervision.

Another man from the same station, from the same year, Mario Giovinetto, also struck it rich. The Wild Bull from the Pampas opted for The Ohio State University and got his bachelors degree there, and continued on through his PhD at the University of Wisconsin at Madison. He taught at such prestigious schools as the University of California at Berkeley, and became chairman of the Geography Department at the University of Calgary. To this day, he continues his research on Antarctica, working for NASA at the Greenbelt, Maryland facility.

The IGY man who has never left the ice is the occupant of the Albert P. Crary Chair at the University of Wisconsin, Charlie Bentley. We have no idea how many seasons Charlie has returned to the ice, as we have run out of fingers and toes counting them up. Although he is a professor emeritus at Madison, there is no indication whatsoever that Charlie will ever hang up his ice axe or conclude his research studies.

A somewhat similar case is John Behrendt, who continues on his Antarctic research, even though the U.S. Geological Survey caught him in their dragnet when they foreclosed on their Antarctic studies about a decade ago. He has been deeply involved in the U.S. plans and programs, both at the national and international levels.

One of our favorites IGY scientists on the ice was the late Fred "Mukluck" Milan, Little America V, 1957. He, too, returned to the states to finish up his graduate work, getting his PhD in anthropology at the University of Wisconsin at Madison. He went on to become the U. S. Head of the Health of Circumpolar People. He knew more about the rectal temperatures of Eskimos than any man alive. And the more he worked in the Arctic with Eskimos, the more he himself looked like one of them!

But before we close off this story about IGY scientists, it would be remiss not to mention the last Eagle Scout to w/o on the ice, Dick Chappell. If you knew the 18-year-old kid back in 1957, you would have realized then that he was predestined for stardom. The Navy gave him an ROTC scholarship at Princeton, and he took the easy way out, studying nuclear physics! When he got his PhD, he had to serve some military time, and who did he work for but a short guy about the height of a fire hydrant. His name, Hyman Rickover, an admiral of sorts. This was just the beginning of a professional career for Dick who later became a college professor at Hunter College where he has also been a very successful research scientist.

**SET ASIDE DATE:** December 6th, 2003. **WHERE:** Cosmos Club, 2121 Massachusetts Ave., Washington, DC

**FUNCTION:** Annual Dinner with Explorers Club Washington Group and Society of Women Geographers.

**SPEAKER:** Desmond J. Lugg, M.D. **TIME:** 6pm for cocktails; 7pm for dinner; 8pm for lecture. **DRESS:** If you are a penguin, come as you are. All others black tie, or closest equivalent, check your wardrobe. **COST:** Washington area members will get a separate announcement as soon as more details are known. Dr. Lugg is from down-under, a place called Australia, and for many years was the Head of the Medical Division of the Australian Antarctic Division, serving many times in Antarctica on research involving the reaction of humans to extreme environments. He has shifted gears only slightly, and has become a Washingtonian, studying somewhat the same things for NASA in its research on humans in space.

**BRASH ICE.** Another Antarctic austral summer is upon us, and that is good news for ozone hole watchers, plus all those folks lucky enough to spend northern winters down south. Antarctica is a privilege to be enjoyed, and it is hard to believe that some people are even getting paid good money to do what they should be paying to do. Some even have the pleasure of escaping Christmas. Wow!!

Our previous issue introduced you to the fact that the powers-to-be in this world have decided that it is time for another International Polar Year. Not now, but in 2007-2008. As that is downstream a bit, we will be foreclosing slowly on the International Geophysical Year, which sort of slipped by many of us as IPY-3, while painlessly introducing you to what is being planned for IPY-4.

It is with a great deal of pride and happiness that we see the name of Mike Kuhn among the list of distinguished international scientists who are on the ICSU Executive Committee's IPY Planning Group. Back in the mid-1960s we hired him, and sent him off to the Antarctic (Plateau Station) as a micrometeorologist. But he was actually trained and fine tuned by the late Dr. Herfried Hoinkes, Little America V, 1957.

Excellent reviews are being given the bearded Bill Cassidy's newly published book by the Cambridge University Press entitled METEORITES, ICE, AND ANTARCTICA. ISBN 0521258723. Supposedly a scientific book written in a delightful, understandable tone for the layman. We will review it in the next newsletter.

**CALENDARS.** Many of you are missing out on something good, an easy way out for your in-laws at Christmas. Antarctic calendars from Hedgehog House in Christchurch are not only beautiful, but our sale price of \$12.00 U.S. is impossible to beat. Send check, made out to the Antarctic Society, and mail it to P.O. Box 325. Port Clyde. ME 04855. Beat the rush, order now.

**YOUR NEIGHBOR MAY BE AN ANTARCTICAN.** (Guy Guthridge, NSF) A big season is in store for the U.S. Antarctic Program in 2003-2004. Someone not far from you is about to head for Antarctica. In 2003-2004 the U.S. Antarctic Program will field 156 science and related projects involving some 800 people. In addition, 1,500 or so support personnel will operate the stations, labs, camps, aircraft, and ships. We haven't tallied the universities and towns from which these folks will come, but it's a safe bet that nearly every state in the Union will be represented. Scientists of other countries will join the U.S. Antarctic Program, too. Here's a breakdown by discipline: biology and medicine, 60 projects; aeronomy and astrophysics, 32; geology and geophysics, 26; ocean and climate systems, 16; glaciology, 15; artists and writers, 7.

As to where they will be, McMurdo Station and the field sites reached from McMurdo will have 88 projects; Amundsen-Scott South Pole Station, 31; the research ships *Laurence M. Gould* and *Nathaniel B. Palmer*, 30; Palmer Station, 13; and other nations' programs, 6 from the USA. These numbers add to more than 156 because some projects will be at more than one location.

Turning to flight operations, U.S. Air Force wheeled planes — C-141s, C-17s, and a C-5 - are to make 55 round trips between Christchurch, New Zealand, and McMurdo starting 30 September and winding up in late February. In addition, an Air Force C-17 did three pre-season flights in mid-August to deliver early scientists, notably the ozone hole researchers, to McMurdo. Support staff went in, too, to help the winterers get the station ready for the summer season that starts 30 September.

The ski-equipped LC-130 Hercules are booked for some 400 missions within the Antarctic and between Christchurch and McMurdo. A big part of the airlift continues to be for rebuilding South Pole Station. The Hercs also will support remote camps including one for geology and paleontology at the Beardmore Glacier. Twin Otters are in the program again this season, also.

A cargo ship and a tanker, escorted by two icebreakers, will resupply McMurdo in early 2004. Two ships may not sound like much, compared to all those flights, but their arrival at McMurdo is mission-critical. In 2003, ships delivered 94.5 percent of the cargo and fuel used at McMurdo, South Pole, and camps.

**"LIKE A TWO BY FOUR JABBING INTO MY STOMACH"** (Abstracted from the *CHRISTCHURCH*

*PRESS*, 3 October 2003, forwarded by Margaret Lanyon to Walt Seelig). This was how Barry McCue, age 51, base environmental safety and health coordinator at the South Pole, described his feelings on August 25, 2003, when he suffered his first gall bladder attack. It doubled him over and he could hardly drag his body 15 meters to see the base doctor. Barry suffered a second attack a week later, and doctors in the United States recommended that he be flown out. Dr. Ron Shemenski, Raytheon Polar Services' medical officer, said "He had an infection in his gallbladder that was probably caused by blockage with a gallstone."

Barry, father of three, was concerned about his three children, and requested and was granted anonymity. The rescue by Canadian pilots, flying de Havilland Twin Otters, was delayed in Rothera by nearly a week of blowing snow. But one plane made it into the South Pole on September 21. Barry was then flown back to the states, was operated on for the removal of his gallbladder at a Denver hospital, and is now recovering at his sister's home in Chicago, home of the beloved Chicago Cubs.

My God, what would we do without those young, daring and proficient Canadian pilots rescuing our invalid troops from the South Pole? How to go, guys!!

**CFCs ARE IN A DECLINE, HOPEFULLY.** (Guy Guthridge, NSF) Annual consumption of CFCs dropped from 1,100,000 tons in 1986 to 150,000 tons in 1999, says a new World Bank report. Without the Protocol, consumption would have reached 3,000,000 tons by 2010, and 8 million tons by 2060. Atmospheric concentrations have peaked or are in decline, but it might take another 10 years of observation before we can be sure the Antarctic ozone 'hole' is shrinking. The 2003 ozone 'hole' above the Antarctic peaked at about 28 million square km, larger than in 2002 and slightly smaller than the record in mid-September 2000. (Shortened from "Montreal Protocol Benefits Cited," page 395, 30 September 2003 *EOS*.) Recall John Dudeney's comment that even if discovering the ozone hole and determining its cause had been the only antarctic research accomplishment ever, the benefit of the human presence in Antarctica would have exceeded its cost.

**SUNSPOT DECLINE** (Maine Sunday Telegram, 12 October 2003). Astrophysicists from the British Antarctic Survey reported that sunspot activity appears to be ebbing after a century of high activity- a development which may ease global warming. Lead researcher Mark Clilverd wrote in the journal *ASTRONOMY AND GEOPHYSICS* that solar contributions to the warming climate has been between

4 and 20 percent, leaving greenhouse gases as the primary cause. Clilverd's team predicts that solar activity is about to peak, then decline by two-thirds during the next century. Their assumption is that the solar heat output will also decline slightly.

**ANTARCTIC TREATY UPDATE.** (Ray Arnaudo) The Antarctic Treaty Parties held their 26<sup>th</sup> Consultative Meeting (ATCM) in Madrid from June 9-20, 2003, with 27 Consultative Parties and a dozen other signatory countries and observers attending. Ray Arnaudo of the State Department led the U.S. delegation, which also included other officials from the Department, the National Science Foundation and advisers from the science community, the tourism sector and environmental community. The meeting's most significant achievement was to reach consensus on the actual establishment of a Secretariat for the Antarctic Treaty System. While the idea was agreed in principle years ago, this meeting adopted a tentative budget, cost-sharing formula, headquarters agreement, and other measures necessary to create this small body with a staff of 4-6 people, which will be set up in Buenos Aires. Though the measures adopted to bring the Secretariat into existence will not take legal effect until ratified by all of the Parties, a process that could take several years, it was agreed to establish the Secretariat on a provisional basis utilizing voluntary contributions. Steps will now be taken to identify an Executive Secretary, who will be selected and hired at the next ATCM in Cape Town, South Africa, in May 2004. (Anyone interested in applying for this position should contact Fabio Saturni: [saturnifm@state.gov](mailto:saturnifm@state.gov)).

Antarctic tourism was also a major item of discussion at the ATCM. It is a subject of growing concern for a number of Parties, since the numbers of ship-borne and adventure tourists continue to grow. Norway agreed to host a Meeting of Experts in March to consider the issue in greater depth in preparation for action by the next ATCM in Cape Town.

**GEORGE LLANO REMEMBERED.** The family of George Llano invited many of his friends to the Cosmos Club on September 26<sup>th</sup> to celebrate his life, and they came from all across the country to revere his illustrious career which came to an end last February off the Falkland Islands. Besides his immediate family consisting of sons Charles and Chris and daughter Felise, there were approximately thirty others. Polly Penhale read a letter from Rita Colwell, Director of NSF, and John Twiss, a victim of Parkinson's, presented a long and moving tribute to his dearly departed friend and colleague. Others who spoke of their personal memories and professional associations with George were Sayed El-Sayed, Bob Hofman, and Dietland Muller-Schwarze. Well-known Antarcticans like

Jerry Kooyman, Ken Moulton, Jerry Huffman, Dick Cameron, Andy Cameron, Walt Seelig, and Phil Smith were there, plus the Rodger sisters, Mildred Crary and Suzanne Bush. And we must not forget one of his secretaries, Audrey "Yum Yum" Ross who came out of the hills of West Virginia to grace his early days in the polar office at NSF. George left his mark in the Antarctic, and this Society is happy that we published some of his choicest memories and thoughts in Newsletters in the past two years.

It is appropriate, in a way, that he is buried in the Falklands where he will serve as the Silent Monitor overseeing all cruise ships going into Antarctic waters. After all, he opened the lecture halls on Antarctic cruise ships, making it possible for more than ten thousand people each year being exposed to a potpourri of Antarctic experts! So long, George. Maybe some of us will meet you again in some smelly rookery in the beyond.

**BRAIN TRUST.** The U.S. Planning Committee for the International Polar Year (2007-2008) has been announced and confirmed. There are no similarities whatsoever with the U.S. National Committee for the International Geophysical Year, which was an all-male bastion. There has been a lot of progress in fifty years, except for the automobile industry where cars look somewhat like they did then, are still getting about the same mileage from the same fuel. But the new Committee is fueled by a woman chairman, Dr. Mary Albert, a research scientist at the U.S. Army Corps of Engineers Cold Regions Research and Engineering Laboratory. She also dubs as an adjunct professor at Dartmouth College. Her research interests cover the whole waterfront, including "the understanding of the atmosphere-snow-ice-ocean/land system, predicting effects of future environmental change on the atmospheric composition of the Earth, interpreting the ice core record, chemical signatures in ice cores used to infer ancient chemistry of the atmosphere, and measurements of snow properties, inert gas measurements, and interstitial ozone measurements that show the impact of physiochemical processes in snow on air-snow chemical exchange".

She is ably assisted on her Committee by three other women, Dr. Cecilia Blitz, physicist from the University of Washington, Dr. Jacqueline Grebmeier, biologist at the University of Tennessee, and Dr. Christina Takacs-Vesbach, microbial ecologist at the University of New Mexico. Another woman, Dr. Terry Wilson, an ex-officio member of the Polar Research Board, stands by with her expertise in geology.

Men on her Committee include some well known Antarcticans: Dr. Robert Bindshadler, geophysicist at NASA's Goddard Space Flight Center; Dr. David Bromwich, senior research scientist with the Polar Meteorology Group at The Ohio State University; Dr. George N. Somero, professor of marine sciences and the Director of the Hopkins Marine Station at Stanford; Dr. Gunter Weller, the aging Director of the Center for Global Change and Arctic Systems Research at the University of Alaska at Fairbanks; Phil "Crevasse" Smith, also aging, a consultant whose expertise on national and international science and technology were finely tuned at the National Academy of Sciences; last but by no means least the Distinguished Member of the Technical Staff at Bell Laboratories, Dr. Louis Lanzerotti. He has been around for quite a long time, and a list of his credentials would fill the rest of this newsletter.

Other members of this illustrious Committee include Dr. Igor Krupnik, ethnologist/research anthropologist with the Arctic Studies Center at the Smithsonian Institution. Igor was born in Russia and trained as a geographer and cultural anthropologist at Moscow State University. Dr. Peter Schlosser of Lamont-Doherty Earth Observatory at Columbia University is the Vinton Professor and Chair of Earth and Environmental Engineering. Dr. Doug Wiens is a professor of earth and planetary sciences at the University of Washington. Dr. John Kelley is a Professor of Marine Sciences at the University of Alaska at Fairbanks. Richard Glenn is with the Arctic Slope Regional Corporation where he is a specialist in geological studies. Then they have a news correspondent from CBS, Jerry Bowen, whose record shows, honestly, three days on a polar icebreaker, covering the O.J Simpson trial, covering the Rodney King beating and subsequent riots. We think his role is to referee any combat when this large and powerful Committee gets into conflicts of interest. It might turn out to be like the talent- laden Los Angeles Lakers where each star wants his own basketball!

Oh yes, two more ex-officio members of the Polar Research Board involved are Dr. Mahlon C. Kennicutt of Texas A&M University and Dr. Pat Webber, greying Arctic ecologist who has become interested, as we all have, in global change.

**A QUICK IPY HISTORY.** The First International Polar Year was inspired By Karl Weyprecht, an officer with the Austro-Hungarian navy. Weyprecht argued that polar expeditions should include teams of scientists who could make important discoveries by making observations on aurora, geomagnetism, and meteorological conditions. This was the first major international science collaboration and planning took seven years. Although he died before commencement of the First

International Polar Year, 11 countries participated in 15 Polar expeditions (12 to the Arctic and 3 to the Antarctic), fulfilling Weyprecht's dream and heralding a new age of scientific discovery.

The Second International Polar Year was proposed in 1928 at an international conference of meteorological service directors. Forty nations participated in Arctic research from 1932 - 1933 (the 25th anniversary of the first IPY), largely in the fields of meteorology, magnetism, aurora, and radio science. However, due to the worldwide depression, the second IPY was smaller than originally envisioned. What began as the Third International Polar Year (1957 -1958) was expanded and then renamed the International Geophysical Year. It was proposed in 1952 by the International Council of Scientific Unions, following a suggestion by NAS member Lloyd Berkner. The IGY included significant work in the Antarctic and some in the Arctic, as well as geophysical work around the globe. Sixty-seven nations conducted research during the IGY, including 12 nations that established and maintained 65 stations in Antarctica.

**UPDATE ON INTERNATIONAL POLAR YEAR PLANNING** (Chris Elfring, US Polar Research Board; Robin Bell, Lamont-Doherty Earth Observatory of Columbia University; Christopher Rapley, British Antarctic Survey) As mentioned in the last Antarctic Society newsletter, momentum for holding an International Polar Year in 2007-2008 is building rapidly. After a year or more of rumblings about how polar scientists might celebrate the 50<sup>th</sup> anniversary of IGY, there is broad enthusiasm for holding an International Polar Year in 2007-2008. IPY 2007-2008 is about engaging the future and not just honoring the past, and the past six months have brought an amazing burst of planning. Strong endorsements have been received from the International Council for Science, the Scientific Committee on Antarctic Research, the International Arctic Science Committee, the Arctic Ocean Studies Board, the European Polar Board, the US Polar Research Board, and, most recently, the World Meteorological Organization.

So far, the focus has been on establishing an underlying international structure to guide development of a coherent IPY strategy. Planning had been ad hoc, but leadership was conveyed to the International Council for Science (ICSU) in May 2003, when the ICSU Executive Committee formed an IPY Planning Group. Core members of this were selected over the summer and the group held its first meeting in July. The members are: Chris Rapley (Chair), British Antarctic Survey; Robin Bell (Vice-Chair), Lamont-Doherty Earth

Observatory of Columbia University; Ian Allison, Australia; Robert Bindshadler, USA; Gino Casassa, Chile; Steve Chown, South Africa; Gerard Duhaim, Canada; Vladimir Kotlyakov, Russia; Michael Kuhn, Austria; Olav Orheim, Norway; Prem Chand Pandey, India; Hanne Kathrine Petersen, Denmark; Henk Schalke, The Netherlands; Zhanghai Zhan, China;

As a first official action, the ICSU IPY Planning Group sent a letter to all ICSU nations in September, asking for those nations wishing to be involved to form a national committee to facilitate communication and planning. Some nations (Australia, Canada, U.S.) have already formed planning committees and begun the process of defining what their nations hope will be the science themes for IPY 2007-2008. The US National Committee for IPY 2007-2008, which is chaired by Dr. Mary Albert of the Cold Regions Research and Engineering Laboratory, talked by teleconference through the summer and met September 30-October 1 in Washington DC. The committee is working to communicate the goals of IPY to the US science community and, in turn, communicate US interests to the ICSU IPY Planning Group. It is also preparing information about IPY for widespread use - the PRB website is being updated to be a major repository of IPY information <see [nationalacademies.org/prb](http://nationalacademies.org/prb) and follow the links to IPY > or go directly to <http://dels.nas.edu/prb/ipy/>. The committee is preparing a report to summarize US interests and will circulate it for input late this year. They will also oversee preparation of a more general brochure.

At the international level, the ICSU IPY Planning Group has a tight schedule: it needs as much input as possible by December 2003 so that it can deliver a preliminary progress report to ICSU in January 2004. From there, if ICSU approves, it will oversee development of a science plan. The ICSU Planning Group is trying to foster an open process so that all interested groups can contribute ideas. Of course, the next (and difficult) step will be sorting the many ideas into some main themes so that the IPY effort can be coordinated. Efforts are also underway to inform relevant agencies and decision-makers of IPY planning to ensure that funding can be made available for IPY activities.

But a vision for IPY 2007-2008 is evolving. At its most fundamental level, IPY 2007-2008 is envisioned to be an intense, international campaign of coordinated polar observations and analysis: it will be bipolar in focus, multidisciplinary in scope, and truly international in participation. It is likely to contain a select number of scientific elements, incorporating elements of exploration, study of polar processes, and activities to monitor and

understand change and its human dimensions. Its goals would include galvanizing new and innovative observations and research, building on and enhancing existing programs and initiatives, attracting and developing the next generation of polar scientists and science leaders, and creating an exciting range of education and outreach activities that engage the public.

Why an International Polar Year? Most polar scientists know that the history of exploration of the polar regions is intimately intertwined with the history of polar science. The years 2007-2008 will mark the 125<sup>th</sup> anniversary of the First International Polar Year (1882/3), the 75<sup>th</sup> anniversary of the Second Polar Year (1932/3), and the 50<sup>th</sup> anniversary of the International Geophysical Year (1957/8). The IPYs and IGY were major initiatives, which resulted in significant new insights into global processes, and led to decades of invaluable polar research. The IGY resulted directly in the establishment of the Antarctic Treaty System. But in spite of the substantial investment of effort in polar exploration and research over the years, both by individual nations and through international programs, the relative inaccessibility and challenging environment of these regions have left them less well explored and studied than other key regions of the planet. This is despite the pivotal place of the Arctic and Antarctic in the Earth system and their many significant connections to questions of global climate, sea level, biogeochemical cycles, and marine and terrestrial ecosystems.

**SOCIETIES.** As this newsletter is about people and the forthcoming International Polar Year (2007-2008), we decided to include herein a showing of hands relative to organizations that people joined after the last International Polar Year (1957-1958). Our showing may not be complete, as there are all kinds of splinter groups. Then we will present several paragraphs on oral histories that have been done, are in the process of being done, or are in the wings to be done. The idea is to make Antarcticans more aware of one another, and maybe there will be some cohesion of groups. We have always thought that perhaps there are enough of us alive from the 3rd International Polar Year that perhaps, just perhaps, a group of us could go on a chartered cruise ship out of Port Lyttelton to McMurdo, doing a shake-down version of a 50th Anniversary Waltz (or Stagger).

**AMERICAN POLAR SOCIETY.** The longest existing American polar society is the only bipolar American polar society. It dates back to December 27, 1933, when August Horowitz published the first LITTLE AMERICA TIMES. It was described then as "a private self-sustaining amateur

publication'. August was employed by a local New York newspaper called the NEW YORK TIMES, and both the newspaper and the Society have survived to this date. August was very active in the Boys Scouts of America, and Eagle Scout Paul A. Siple of Meadville, PA being selected to go on Byrd's First Antarctic Expedition did much to fire August's interest in Antarctica.

THE POLAR TIMES 's first issue was back in June 1935, and it was published bi-annually through December 1947. But as OPERATION HIGHJUMP ended, so did the publication. There was a lapse until June 1955, when August then published Vol. 40. And it continued bi-annually through June 1986, Vol. 106. So for over fifty years August was the Voice of Antarctica in the media, an incredible endeavor by one man doing it all from his New York City apartment.

August passed away in 1988 at the young age of 78, and the heir apparent appeared to be historian Peter Anderson at the Institute of Polar Studies at The Ohio State University. But before he got the show back on the road, he had a stroke, and vanished as a participating editor. Brian Shoemaker surfaced as the Saving Soul, and after a lapse of nearly seven years, THE POLAR TIMES again appeared on our shelves. It had a new wardrobe, now resplendent in a glossy cover, and its innards were dressed up and featured a new, modern format. No longer was there a requirement for news clips, as the National Science Foundation was now coming out with their own annual news clips from the ice.

Brian did a tremendous job in the restoration of THE POLAR TIMES, but this aggressive dynamo couldn't stay long in any one place, and he heeded the call from afar, oral histories were beckoning. Captain Cliff Bekkedahl took over the reins in 2001, and he is served by an Antarctic editor, Jeff Rubin, and an arctic editor, Dave Norton. Everything is coming up roses for the Society, and as of mid-September they had 1,116 members, and are aiming for 2000 members. Cliff describes their current modus operandi as "collegial." In early October they hosted a symposium on the roles of women in the polar regions, held at the Byrd Polar Research Center at The Ohio State University in Columbus, Ohio. Anyone interested in becoming a member should contact Bob Kremenak, P.O. Box 464, Iowa City, IA 52244-0464. Dues are \$15.00 per year, and all members receive two issues of THE POLAR TIMES. It's a good buy.

#### **ANTARCTIC DEEP FREEZE ASSOCIATION (ADFA).**

This is the most exclusive and the most reasonable of all Antarctic organizations. In the beginning it consisted only of DF-I winter-over veterans (Little America V and McMurdo),

military and civilian, which made it real restrictive. After its first reunion in 1985, DF-II vets were immediately asked to join so all seven IGY stations would be represented. They later voted to accept all personnel from all phases of Deep Freeze. However, the hard core still remains the stalwarts who put the U.S. flag onto the ice back in 1955-1957. Dick Bowers, whose crew built the South Pole Station, writes that there are now 390 members in ADFA, most of whom are from the early DF years. Probably the station list should be extended to include the various Byrd and Siple stations, as well as Eights and Plateau. They have had seven reunions to date, with the next one scheduled for the Mississippi Gulf Coast in the spring of 2005 when it will commemorate the 50th anniversary of Operation Deep Freeze. They do NOT charge membership dues and funds are raised by donations, raffles, auctions, and the sale of ADFA related merchandise at their reunions. Their web site is <http://www.oaedks.net/adfa.htm>. We also recommend contacting Dick Bowers at [rbowersindy@comcast.net](mailto:rbowersindy@comcast.net) for those who want additional information. Dick told us that 18 of the original 24 Navy personnel who built the first South Pole Station are still alive. Considering that was back in 1956, that's a remarkable percentage of survival. Those guys must be doing something right.

#### **OLD ANTARCTIC EXPLORERS ASSOCIATION, INC. (OAEA).**

This is the youngest of all American Antarctic organizations, and it is the only one with a do-gooder plank built into its charter. Some may question the use of the word "explorer" in its title, but modern-day usage includes anyone old enough to vote who goes to the ice. The hard core of this relatively new organization, formed in late 1999, consists of many young Navy personnel, consisting of many who went through a lot on the ice, shared dangers, went into places and did things experienced by few human beings, doing things that had to be done. Currently they have 666 active members, and is open to anyone who has gone to Antarctica in support of science. That would have excluded the likes of Roald Amundsen, Sir Hubert Wilkins, Will Steger, Ann Bancroft, and many others who no doubt would have thought of themselves as explorers! They hold a symposium every other year, alternating between the birthplace of the OAEA, Pensacola, Florida, and the home ports of the Naval Support Force Antarctica and Antarctic Development Squadron Six, Port Hueneme/Point Mugu, California; Davisville/Quonset Point, Rhode Island. They also publish a quarterly newsletter, the EXPLORER GAZETTE. The do-gooder plank referred to earlier is that this organization supports an OAEA Educational Foundation Scholarship. They have a sliding membership fee, where it pays to be older, which may be the only benefit of aging

Antarcticans. For more information look them up at <http://www.oaea.net>. Inquiries should be directed to OAEA, 4615 Balmoral Drive, Pensacola, FL 32504. From what we have heard from those who have attended their gatherings, this is a fine outfit, a good group, headed by some very knowledgeable veterans.

#### **AMERICAN SOCIETY OF POLAR PHILATELISTS.**

The American Society of Polar Philatelists is an international organization of approximately 400 collectors of stamps and postal history relating to the Polar Regions. The Society was founded in 1956 and currently has 400 members worldwide, of whom 40% reside outside the United States. ASPP publishes a quarterly journal, *Ice Cap News*.

The Society holds an annual meeting in the United States at one of the national stamp exhibitions, where members can exhibit parts of their collections in competition with other stamp exhibits. The board of directors meets at these conventions, and a membership meeting is held that features a guest speaker. The 2003 convention was held in San Francisco in April and the 2004 meeting will be held in June in McLean, Virginia.

Members are interested in many aspects of Polar philately including mail from the expeditions of the Heroic Age as well as the most recent treks to the poles. Other interests include the Antarctic scientific research stations, famous polar explorers, Operation Deep Freeze, Operation High Jump, the expeditions of Richard E. Byrd to Antarctica, and the activity of the many countries that have active bases in Antarctica or that issue stamps related to the Polar regions.

The ASPP offers its members several services including a cover exchange, auctions, estate advisory information, and notification of where members can send postpaid return envelopes to obtain cancellations and other markings in the Polar Regions. Current membership dues are \$22 USD with the journal sent via surface mail anywhere in the world, \$32 USD for airmail to Central and South America and Europe, and \$37 USD for airmail service to Africa, Asia, Australasia, the Pacific, Russia and other CIS countries. A sample copy of *Ice Cap News* will be sent for \$3 USD and is available from the Secretary, Alan Warren, P.O. Box 39, Exton PA 19341-0039 USA.

For more information, see the website at [www.polarphilatelists.org](http://www.polarphilatelists.org).

**ANTARCTICAN SOCIETY.** For those of you who don't know who we are, a brief history. A bunch of the good old

boys in the Washington, DC area, who were involved in Antarctica in some capacity during the International Geophysical Year, formed the Society as a not-for-profit educational organization in 1960. A Naval Antarctic historian, Harry Dater, was very instrumental in its establishment, but it was Ruth Siple's deep devotion and hard work that resulted in the Society becoming more national in scope with a controlled membership of around 500. About six newsletters are published each year, and an annual Memorial Lecture is presented on some cutting edge of Antarctic science. The Society is heavily loaded with members who have been to the ice, and at one time two-thirds of its membership had features named for themselves. The newsletters are slanted towards Antarcticans, and human interest stories get a high priority. It has had a strong attachment to the National Science Foundation, although it has maintained its independence and is not beholden to NSF in any way, shape, or manner. Because of the newsletters coming out periodically, it means that it can keep abreast with news-breaking-events on a timely basis. Dues are a bargain at \$12.00 per year. A Society for and by Antarcticans.

#### **ANTARCTIC HISTORIANS: WHERE ARE THEY?**

When it comes to American Antarctic historians, they are AWOL. The best book by far on the history of Americans in Antarctica was written by the late geographer, Ken Bertrand, *AMERICANS IN ANTARCTICA, 1775-1948*. One would think that the IGY would have spawned many books, but none was written by Larry Gould, Hugh Odishaw, or Harry Wexler. The World is Waiting! Take heed, Tim Baughman. Perhaps the best book on the history of the Antarctic during the IGY was Walter Sullivan's *QUEST FOR A CONTINENT*, plus his *ASSAULT ON THE UNKNOWN*. Admiral George Dufek wrote *OPERATION DEEPFREEZE* and also *THROUGH THE FROZEN FRONTIER*, but neither are books that you are dying to give your grandsons.

There are several books that resulted from people wintering over. Perhaps the best known is by Paul Siple, *90 DEGREES SOUTH*, about man's first winter at the South Pole. The station AND military man-in-charge at Ellsworth, Finn Ronne, wrote *ANTARCTIC COMMAND* in 1961. Nearly forty years later one of the leading scientists at Ellsworth in 1957 published his recollections in *INNOCENTS ON THE ICE*. Only one book came out of Little America V, *ANTARCTIC SCOUT*, by Dick Chappell. Gil Dewart, who w/ood at Wilkes in 1957, has a new book coming out late this year or early next year on life with Carl Eklund and company. Gil previously wrote a book about his year with the Russians at Mirny, but that experience was

post-IGY. None ever came out of Byrd or Hallett. So when you get right down to it, hardly anything has been written by participants in the IGY-IPY-3.

**ORAL HISTORIES ARE FILLING IN SOME OF THE BLANKS.** The National Science Foundation has been funding two oral history programs, one by Dian Belanger, the other by Brian Shoemaker. The one by Dian is strongly oriented towards the Navy side of the IGY, whereas the one by Brian is sort of all encompassing, including both polar regions. Dian did the following IGY scientists: Charlie Bentley, Paul Dalrymple, Gil Dewart, Mario Giovinetto, Rudi Honkala, George Toney, and Buck Wilson. Brian did Nolan Aughenbaugh, Steve Barnes, John Behrendt, Ed Flowers, Arlo Landolt, Bill Long, McKim Malville, Ben Remington, and John Weihaupt. From non-U.S. stations, Gordon Cartwright, Mort Rubin, and Colin Bull were interviewed.

A pretty good cross-section of folks. Dian sat down with three members of the South Pole construction party: Dick Bowers, Charlie Bevilacqua, and Bob Chaudoin. The South Pole wintering-over crew from the first year was well covered, too, with Flowers, Landolt, Ken Waldron, Cliff Dickey, and Chet Segers. Five people were interviewed from the first year at Ellsworth: Behrendt, Aughenbaugh, Malville, Conrad Jaburg, and Walter Davis. All of the oral histories are being archived at the Byrd Polar Research Center at The Ohio State University. We understand that Ohio State has footed the bill. The project was designed and brought to fruition under the capable management of Laura Kissel, the Polar Archivist working for Dr. Raymond Goerler.

For a complete list of those interviewed, go to your computer, and punch up <http://www.lib.ohiostate.edu/arvweb/polar/oral/hist/interviewed.htm>. You will be surprised!! Unfortunately a lot of Antarcticans died much before their time, so you won't find Paul Daniels, Bert Crary, Paul Siple, Carl Eklund, Finn Ronne, Willis Tressler, Harry Wexler, Mary Alice McWhinnie, John Katsufakis, Mukluk Milan, Herfried Hoinkes, George Llano, and many, many others. There are also many biggies out there just waiting to be interviewed, we think, such as Art DeVries, Bill Cassidy, Susan Solomon, Gisela Dreschhoff, Michele Raney, Bob Helliwell, Ken Moulton, and so on. We understand from probably a reliable source that Bill Cromie of Harvard, formerly of Little America V, former Secretary of Scientific Writers of America, that he once did an oral history of Bert Crary which rests somewhere at Columbia University. If that is so, it must be a whiz banger, as you could not sit those two down together and end up with anything dull.

**POLAR SOCIETY MEETS, AND NEW ROCK REPOSITORY DEDICATED AT BYRD POLAR RESEARCH CENTER.** (John Spletts) The American Polar Society (APS) held its 2003 Symposium at the Byrd Polar Research Center (BPRC), The Ohio State University, in Columbus, on 9-10 October. A cross-section of individuals presented papers on the theme '*Roles of Women in Polar Regions: Past, Present, and Future*,' a tribute to those who were often overlooked and in some cases, discriminated against, in their efforts to conduct research in a 'man's world' in the polar regions. A total of 18 papers were presented. Speakers included 'barrier-breakers' such as the first female flight officer in the U.S. Antarctic Program (Mary Crawford); one of the first U.S. women to set foot on the continent and then winter-over (Edith 'Jackie' Ronne); and Colin Bull, who, as Director of the Institute of Polar Studies (now BPRC), assembled the first all-female research group in the U.S. Antarctic Program, and managed to have U.S. Navy approval and NSF funding to conduct its field project in the 1969-70 austral summer. Mildred Crary recounted earlier times when her husband, Dr. Bert Crary, was in the field, which was frequent. Others included native women from Alaska who reached professionalism in their careers as a result of proving their worth, and a speaker on polar expedition tourism (Susan Adie). Incoming President John Spletts replaced outgoing President Dr. Gisela Dreschhoff as President of the Society. Polar medals were presented to individuals who have had outstanding careers in their fields — Honorary Membership Awards to Dr. Ken Hunkins and Dr. Sayed Z. El-Sayed. Dr. Mort D. Turner, former Program Manager for Geology at NSF's Polar Programs received an Honorary Service Award. Two others, Dr. Tony Gow and Dr. James Van Allen, were unable to attend to receive their Honorary Membership Awards, which will be awarded at a later time.

The following day, 11 October, a newly constructed building next to Scott Hall, campus location of the BPRC, was dedicated as the United States Polar Rock Repository. This 4200-sq-ft building will house collections of U.S. scientists from Antarctica and the Arctic, along with associated materials such as field notes, thin sections, paleomagnetic cores, and so on. Dr. Barry Lyons, BPRC Director, Dr. Rosie Kyle, and Dr. Anne Grunow (repository Curator) spoke on how the building came to fruition (with NSF and University funding), and Dr. Scott Borg, Head, Antarctic Sciences Section at NSF's Office of Polar Programs, cut the red ribbon to make the building official. See <http://www-bprc.mps.ohio-state.edu/rr/projects/agd> for information on the repository.

**BRASH ICE.** Well, we finally got the holiday season out of the way so that we can go forward with enjoying life. John Spletts is out there in deep waters on one of those humongous ships lecturing to a thousand heads at a time on the glories of Antarctica.

Meanwhile it is time to write, but first a report on Our Ancient and Honorables. Our beloved Honorary President, Ruth Siple, has been moved to the Magnolia Care and Rehabilitation Center, 365 Johnson St., Wadsworth, Ohio 44281, where she answers, hopefully, the phone at (330), 334-0506. She had a bad stretch in December where she was hospitalized, but is in the process of recovering and looking forward to her 93rd birthday on January 16th. She is practically blind and her short-term memory is non-existent, but she is under the loving eyes of her youngest daughter, Mary Cathrin, who visits her daily. Meanwhile Norman Vaughan, Mr. Indestructible, celebrated his 98th birthday in mid-December, and is eagerly looking forward to his 100th birthday when his mountain climbing buddy, Vernon Tejas, swears he is going to put Norman in a sling and carry him to the top of Mt. Vaughan. When it comes to Norman, never count him out. His voice is strong, he's effervescent, and he still sounds like a bull in the pampas.

We are trying something different with this newsletter, we are abscinding with some of the articles from THE ANTARCTIC SUN published austral summery at McMurdo by the contractor, Raytheon Polar Services Company. Their weekly magazine can be read online or downloaded and printed in PDF format by visiting [www.polar.org/antsun](http://www.polar.org/antsun) But we are giving you hard copies herein on articles which seem particularly pertinent to this time when the Dry Valley' counterpart, MARS, is being inspected and analyzed by NASA.

Many of THE ANTARCTIC SUN articles are too long for our abbreviated newsletter. Such is a four-pager on the everlasting D-8, which was made by Caterpillar (Model SD-8 LPG, Stretch D-8 Low Ground Pressure). They were designed to carry heavy loads over snow, featuring a special cold-starting ability and a 54-inch wide track (instead of the 36-inch track found on modern equipment). They also had a drawbar pull capacity on snow of 30,000 pounds, compared to about 24,000 for the D-7.

The oldest D-8 in the current fleet is Mary-Ann, who once made a traverse to the South Pole. It may actually be in better shape than Mario Giovinetto, both survivors of the traverse. Others still in existence include Pam, Colleen, and Big John. Wonder if Big John was named for Big John Stagnaro, a very dedicated amateur radio operator out in Southern California who ran so many phone patches for Antarcticans in the olden days? Someone must know. There are quite a few of us in our Society, including Phil Smith who was on the traverse, when Max Kiel rode a D-8 tractor to his death in a bottomless crevasse en route to Byrd Station. When the 50th rolls around, the D-8s may be the most permanent niece of American hardware on the ice.

**METEORITES, ICE, AND ANTARCTICA**, by William A. Cassidy. NY, Cambridge University Press, 2003, 349 p. ISBN 0 521 25872 3 (Hardback). U.S. \$30.00. (Reviewed by Dr. Gunter Faure, Professor Emeritus of Geology, The Ohio State University).

Bill Cassidy is well known to all who passed through McMurdo on their way to remote field camps in Antarctica in the late 1970s to the mid-1990s. He and his associates are justly famous for the thousands of meteorite specimens they have collected in the blue-ice areas of the polar plateau. In this book, Bill tells how the idea came to him that meteorite specimens accumulate in the ablation area of the East Antarctic ice sheet and what efforts were required to carry out the annual searches in places where "no man has gone before." It will come as no surprise to those who have been there that the cold weather and the remote location of the polar plateau were the least of his worries. In fact, speaking of the annual transit of McMurdo by his field party he says: "It is always a great relief to escape...the...complicated hierarchy of procedures, requirements and rules...to a deep-field camp on the ice plateau of East Antarctica, where survival may be more difficult but life is simpler."

The book opens with a foreword by Robert Walker and is divided into three sections entitled: Setting the Stage; Field Results and Their Consequences; and Has it Been Worthwhile? Evidently, this is not merely an adventure story about heroic deeds in a hostile environment. The purpose of this book is to inform the reader about working on the polar plateaus, followed by detailed information about meteorites that originated from Mars and from the Moon, including all specimens collected world-wide by the spring of 2002. This section ends with a discussion of the origin of all types of meteorites and what we have learned from them about the formation of their parent bodies 4.57 billion years ago. In the final section, Bill compares the collection of Antarctic meteorites to modern falls. This comparison leads to the observation that iron meteorites appear to be less abundant in Antarctica (0.4%) than elsewhere in the world (4.2%). A similar discrepancy exists in the abundance of Antarctic achondrites. These kinds of observation can be used to derive conclusions about the processes that cause different types of meteorites to be delivered to Earth. In this section, Bill also discusses the way in which meteorite specimens are transported by the ice sheet to the ablation areas where they accumulate on the so-called stranding surfaces or meteorite traps.

The book ends with appendices containing the US-Japan agreement for sharing meteorites collected during the 1976/77 field season and a listing of the participants of the seventeen search parties Bill took into the field between 1976 and 1994, including Ralph Harvey and John Schutt who are continuing the recovery of meteorites in Antarctica. In addition, the book contains indexes of place names and subject matter that will assist readers to find specific information.

This book is required reading for all students of meteoritics and for those armchair explorers who may wonder what drives people like Bill Cassidy to leave the comforts of home to roam the polar plateau of Antarctica in search of meteorites. The motivation for this enterprise arises from our need to understand the solar system in which we live. This book is a lucid explanation of the benefits to be

derived by continuing the search for meteorites in Antarctica and elsewhere.

**ANTARCTICA: ALMOST OUT OF THIS WORLD**, (abstracted from the Antarctic Sun, Dec 29,2003), *Kristian Hutchison* and **LANDSCAPES IN ANTARCTICA'S DRY VALLEYS HELP DECIPHER RECENT ICE AGES ON MARS** (abstracted from NFS Press Release of Dec 18, 2003).

Dry streambeds, wind-carved rocks, red pebbles laid flat like paving stone — a landscape so alien it can be only Mars, or Antarctica.

Studies of the unique landscape in the Dry Valleys of Antarctica provide new insights into the origin of similar features on Mars and provide one line of evidence that suggests the Red Planet has recently experienced an ice age, according to a paper in a recent issue of the journal *Nature*. The National Aeronautics and Space Administration (NASA) comes to Antarctica to find out about space. More meteorites have been collected from the Ice than anywhere else, on Earth or off. Technology and people are tested in the harsh environment and NASA looks to the Antarctic to understand what life might be like on Mars or Europa. "Antarctica is more like Mars than any place else on Earth, and if you want to understand Mars, you start in Antarctica," said Carl Allen, astromaterial curator at the Johnson Space Center in Houston, Texas.

The distribution of hexagonal mounds and other features on the Martian surface at mid-latitudes similar to those in the Dry Valleys also supports previous scientific assertions that a significant amount of ice lies trapped beneath the Red Planet's surface. David Marchant, a Boston University researcher who has studied the Dry Valleys for 17 years, co-authored the paper in *Nature* with James W. Head (lead author), John Mustard and Ralph Milliken, at Brown University, and Mikhail Kreslavsky of Kharkov National University in Ukraine.

Although these polygon-shaped features occur throughout the Arctic and Antarctic, an unusual variety found in the western Dry Valleys region has received particular attention because it forms only in perennially frozen soils with significant ice content. These polygons form as sub-freezing temperatures fluctuate, causing the underlying ice to contract in a hexagonal pattern. As the ice contracts, fine sediments sift down into the cracks, leaving a coarse-grained deposit covering the ice.

Mars is a polar desert. Without water eroding the surface, any weathering is from wind or sun, just like the Dry Valleys, said Dean Eppler, a NASA consultant with Science Applications International Corp., who studied the weather patterns in the Valleys in 1983 and 1984 in order to better understand Mars. The Dry Valleys look almost identical to photos the Viking lander sent back from Mars "right down to the rocks that are there," Eppler said.

The last ice age on Mars began about 2.1 million years ago and ended as recently as 400,000 years ago," according to Head. Like ice ages on Earth, Martian ice ages are driven by variations in the planet's orbit, particularly the tilt of the planet's axis. But Martian ice ages, unlike ice ages on Earth, appear to begin as the polar regions warm, rather than cool. The *Nature* findings complement a paper recently published in the journal *Geology*, in which Head and Marchant argue that features on the surface of the Red Planet are remarkably like glacial features found only in the Dry Valleys. The findings not only have implications for the search for microbial life on Mars, but also may help scientists better understand the unique Polar desert environment of the Dry Valleys, and in particular the ancient climate record that may be stored in the landscape.

"These extreme changes on Mars provide perspective for interpreting what we see on Earth. Landforms on Mars that appear to be related to climate changes help us calibrate and understand similar landforms on Earth. Furthermore, the range of microenvironments in the Antarctic Dry Valleys helps us read the Mars record," said Marchant.

If the analogy between the geologic processes on Mars and those in the Dry Valleys holds true, then scientists may conclude that Mars may be more hospitable to microbial life than previously suspected.

Although the Dry Valleys were thought to be a virtual dead zone when first explored a century ago, new evidence suggests that the lakes and other landscape features support microscopic life.

The comparison between Mars and Antarctica shouldn't be taken too far. The most obvious differences are air and gravity. Mars air is a thin, unbreathable combination of mostly carbon dioxide and little nitrogen, with a surface pressure the equivalent of 100,000 feet altitude on Earth. The South Pole's surface pressure fluctuates between the equivalent of about 10,000 to 11,000 feet altitude. Gravity on Mars is 0.38 of Earth's, so 100 pounds would feel like 38 pounds. But the mass of things is the same.

Mars is also much colder and drier than Antarctica, according to Berry Lyons, lead of the Long-Term Ecological Research Project in the Dry Valleys. The LTER is one of 24 LTER sites funded by the National Science Foundation around the world. Taylor Valley gets about 3 cm of precipitation a year; Mars maybe 1 cm. While the temperature in the Taylor Valley averages almost -4F(-20c), the temperature at the equator of Mars averages around —55F. Mars also has a more extreme variation temperature, even within a few feet. The Pathfinder found that when the sun shone on Mars the ground could get to 65F degrees, while five feet up it was 15F degrees. At night the same spot would drop to -130F at ground level and —105F at five feet up.

Still, each time biologists working in the Dry Valleys find life -frozen into the lake ice, hiding in the sandstone — they turn toward Mars. If it's here, they say, it must be there. A decade ago microbiologist E. Imre Friedmann found lichen and cyanobacteria growing in tiny spaces between sandstone rock crystals, a few

millimeters below the surface of the rock. The cryptoendolithic organisms get just enough sunlight and water through the porous rock to survive. "That got the Mars people very excited," Allen said.

**DRAKES REVENGE** (The Antarctic Sun, November 2,2003), *Kristan Hutchinson* Just going to work makes Barbara Watson sick. It's a common problem among her fellow commuters, who pitch and puke with the waves during the 1,500-km ship trip from Punta Arenas, Chile to Palmer Station, Antarctica. The only way to Palmer is across the Drake Passage, where currents and storms meet in a tumult of wind and waves. At first, the rocking of the boat is lulling, making passengers sleepy. Then that thick feeling in the brain turns to pain, followed by an increasingly queasy stomach. The misery usually builds with the seas. "You get this knot in your stomach and you know if you don't lie down in the next 15 seconds you're going to be violently ill," Watson said. "The worst part is, once you've started being ill, it's all over unless you go to sleep and start over."

Marine projects coordinator, Skip Owen, has made more than 50 crossings and dealt with his share of seasick passengers. He says the illness has two stages. "The two stages of seasickness are when you are afraid you'll die," Owen said, "and then become afraid that you won't." Death is rarely a risk, though the nausea and inability to keep food or drink down can cause severe dehydration, said Dr. Kristin van Konynenburg. "That can become life threatening very fast," said Owen, who was aboard once when a passenger became so seasick they required an IV. He keeps an eye on all the passengers in bad weather, noting who is up and about, and who may be lying in their bunk in misery.

People who think motion sickness is all in the head are right. More precisely, it's caused by confusion between what we feel in the inner ear and what we see. As humans, we keep our balance with the help of three angled tubes in the inner ear. Fluid in the ears sloshes against tiny hairs, triggering signals sent back to the brain to tell us where we are in relation to the ground. On boats, planes or other situations where people get motion sickness, the inner ear says one thing while the eyes see another. "It's a miscommunication between the visual information you're getting and the inner ear cues," van Konynenburg said. Everyone has a threshold at which they will get motion sickness, according to studies. But some people have a lower threshold than others.

Women are more prone to motion sickness than men and the symptoms often decline with age. In studies, Asians have also shown a higher tendency to get seasick than Caucasians, and more intense symptoms, indicating a possible genetic susceptibility. People also can adapt to motion with constant exposure, as seasoned sailors demonstrate. James Bellanger, third mate on the Laurence Gould, was frequently sick his first three years at sea. "Most of the time I wouldn't wait to get

sick. I'd go into the bathroom and make myself get sick so I'd feel better," said Bellanger, who hasn't been seasick in recent years. The chances of seasickness increase with speed, wave frequency and the motion of the ship. While seasickness has sometimes been pinned on a ship's heave, or up-down motion, the most nauseating voyages involve a combination of up-down, side-to-side and forward-back motions, according to studies. The Gould's design is famous for inducing sickness. "It has this motion where you kind of feel like you're circling the drain the whole time," van Konynenburg said.

The treatment van Konynenburg usually gives out on the Gould is meclizine, which reduces the sensitivity of the inner ear. Many people bring their own, but Owen also leaves a bottle out on his desk for anybody who needs it. "The meds allow you to keep food down," said van Konynenburg. Other antihistamines work to stop the nausea, including promethazine, Benadryl and Dramamine. They leave people drowsy and dry mouthed, but sleeping through the trip is better than being miserable, say those who take it. Watson swallows Phenergan when she boards, then goes to bed for the rest of the trip. "It tends to put you to sleep, which is not a bad thing being on the ship," said Watson, who left her cabin only briefly during her voyage in September.

Being in bed you feel better," said Wendy Beeler, who took meclizine for her nausea on the trip to Palmer. "That's part of why you stay in bed." Other people come on board wearing dime-sized patches behind one ear. The patches administer low doses of scopolamine, a narcotic that helps prevent nausea, but can also trigger hallucinations, depression and dry mouth, "hi the 20s it was used in large doses during childbirth," van Konynenburg said. "It was called twilight sleep because the woman wouldn't remember anything." She tried it on one voyage, but found the side effects too disturbing. She couldn't focus enough to read or knit. "I got so tired of being out of it all the time and being sleepy," said van Konynenburg, who decided to try herbal remedies on her most recent voyage. She put an herbal oil called Motion-eaze behind her ears and took a homeopathic remedy called Trip-Ease. After meals she drank ginger tea to settle her stomach. "All I have to say is I can enjoy the side effects and I feel great," van Konynenburg said a day into the trip. "I've had two meals today." When the seas got worse a day later, she resorted to meclizine, which she'd packed just in case. On his first voyage, Steve Barten wore acupressure bands on his wrists to prevent seasickness. "I have drugs too, but I'm not taking them yet," he said. "I just step out when I'm feeling a little dizzy."

Fresh air and looking out at the horizon can help recalibrate the inner ear with the outer world if the symptoms are mild. Breathing slowly and deeply can also ward off motion sickness. If you must be inside and away from windows, it's best to be at the most stable point on the ship, at the center of the axis. On the Gould, that tends to be low and toward the middle. It's also

better to keep food in the stomach, even if all passengers can handle are crackers and water.

There is one guaranteed cure for seasickness - land. Most people are only sick for the two days that the Gould is actually crossing the rougher waters of the Drake Passage. And if they have been sick, they're more than happy to stay in Palmer for several months before making the crossing again. "I crawl out of bed every 12 hours, eat and then go back," said Jeff Kietzmann of his trip to Palmer. "I don't like it."

## **OZONE HOLE FOLLOWS ANTARCTIC WEATHER**

**TRENDS** (The Antarctic Sun, Nov 2, 2003), *Kris Kuenning* Like a fickle pop star, the ozone hole reinvents itself each year. Thanks to a global clean-up act, the world's most famous atmospheric trend is already going out of fashion. But in the meantime, the great gap is simply a slave to polar weather patterns. Last year, the hole in the ozone layer surprised researchers by being small and fragmented. This year, it's just short of the largest recorded size. But these variations are not related to the amount of ozone-depleting chemicals in the environment. Earth's protective layer of ozone is on track for a full recovery, but scientists expect a hole to appear around the polar regions once a year for at least the next 10 years. While the number of ozone-destroying chemicals in the atmosphere gradually begins to decline, variations in the size of the ozone hole are determined annually by polar weather. Ozone serves the planet by filtering the dangerous spectra of ultraviolet light. Ultraviolet-B light causes sunburn and skin cancer in humans. It also has the ability to change the genetic makeup of plants and therefore alter the food chain.

This year, with the ozone hole exceeding the size of the Antarctic continent and even exposing the southern tip of South America, its effects will be tangible for people living in southern latitudes. While weathermen alert Chileans to dangerous levels of ultraviolet light, Australians and New Zealanders should be spending another spring under a thick paste of sunscreen. Antarctica, in summer, is the temporary home for more than 2,000 sun-conscious people. Among them are scientists who track the levels of ozone above the continent. Terry Deshler of the University of Wyoming has been overseeing ozone research in Antarctica since 1986, one year after the ozone hole was first discovered.

Ozone is made up of three oxygen molecules (O<sub>3</sub>), brought together by the energy of the sun. From its equatorial breeding ground, ozone travels through the upper level of the atmosphere, the stratosphere, and some of it is transported towards Earth's poles. When the sun sets on the Antarctic summer, the dark air cools, causing a low pressure center called the polar vortex. Because of the Earth's rotation, warm air at the boundary can't get in to the low-pressure center. Inside the vortex, temperatures plummet to below -79 C. It is in this vortex that the systematic destruction of ozone occurs, so the size of the vortex determines the size of the hole in the

ozone layer. "The size and stability of the polar vortex is determined by the amount of tropospheric storm activity," Deshler explained. "A year with a lot of storms around the periphery of the continent of Antarctica can cause the polar vortex to become unstable and make it smaller."

Bad weather is good for minimizing the ozone hole, while less stormy weather brings a larger vortex. "In general, the vortex above Antarctica is quite stable and quite large," Deshler said. Last year's smaller hole was unusual. "Only two times in the last 15 years has the ozone hole been not as big as we were expecting." Last year's vortex actually split in two, causing two small ozone holes to go careening towards the edges of the Antarctic continent. Deshler said the vortex was sent into oscillation and then split in two by energy from frequent polar storms. This year, conditions conspired to make one big hole. Peaking at 28 million km square, it was the same size as the record hole in 2000, according to the World Meteorological Organization ozone bulletin in 2003. That's more than twice the size of Antarctica, its islands and ice shelves combined, or more than three times the size of the United States

With the launch of balloons into the stratosphere, scientists are able to tell exactly where ozone is lost in the atmosphere's profile. There may be a layer between 12 and 20 km above the earth where zero ozone is present, but above or below that, low levels of ozone still exist. The overall effect is more like a very thin layer of ozone than a true hole.

There are three factors that come together to wipe out ozone — naturally occurring polar clouds, human-released Chlorofluorocarbons (or CFCs) and the magic ingredient — sunlight. Ozone depletion is a result of human release of chlorofluorocarbons into the atmosphere. CFC's were first produced in the 1930s as a completely safe refrigerant. During World War II, they were used as propellants in insecticide spray cans. In 1947, the first automobile air conditioner was developed using CFCs, and production picked up further in the '50s and '60s, when it reached 60 million tons. Up to 70 percent of that went directly into the air. Wind currents distribute CFCs around the stratosphere. The chemical makeup of ozone is just one step away from the oxygen we breathe. When the CFCs get broken up by the sun's radiation, chlorine is released. The chlorine molecule then has the power to extract one oxygen atom from an ozone molecule, thus destroying ozone. "Chloride is an unhappy molecule because it's missing an electron," explained post-doctorate research assistant Jennifer Mercer. "It works as a catalyst to the ozone, stripping off an O."

In polar regions, the particles of polar stratospheric clouds provide an especially fertile staging area to convert chlorine, trapped in benign molecules, into an active state ready to destroy ozone. Because polar stratospheric clouds exist only at the poles, 90 percent of ozone destruction occurs there, Mercer said. The vortex forms in winter, but the destruction doesn't occur until

the sun comes out in the spring. By mid-October the warmer weather is already weakening the vortex to release its contents.

Although a seasonal Antarctic ozone hole is a foregone reality for at least the next 10 years, the news is not all bad. By phasing out the production of CFCs, the Montreal Protocol agreement reduced atmospheric CFC levels by more than 86 percent in 13 years. According to the World Bank's Montreal Protocol Status Report, released on Sept. 17, 2003, annual consumption of CFCs dropped from 1.1 million tons in 1986 to 150,000 tons in 1999. Without the protocol, the report estimates consumption would have reached 3 million tons by 2010. Deshler said the ozone story is a positive one. "A global problem created by local human activities was identified, and reasonable solutions were adopted by the world's leading countries to reduce and eventually eliminate the problem."

**LEOPARDS OF THE SEA** (Antarctic Sun, Nov. 9, 2003),  
*Kristan Hutchison*

People and penguins react the same when a leopard seal swims by. They get out of the water. It's a natural response to meeting a predator the size of a cow with serrated teeth and canines up to 2.5 cm long. "Usually the seal just seems curious, but when you've got a 10-foot-long (3 meter) predator a few feet away from you, you do worry he might get curious about what you taste like," said Chuck Amsler, a biologist who dives at Palmer Station.

This past winter a leopard seal did attack a science diver who was snorkeling near Rothera, a British research station on the Antarctic Peninsula. The researcher, 28-year-old Kirsty Margot Brown, was pulled under and drowned on July 22. It was the first time a leopard seal has caused the death of a person. Despite the attack, Amsler feels Antarctic waters are relatively safe. "In thirty-some years of people diving all over the Peninsula, there's been one attack," Amsler said.

Though leopard seals have never attacked before, divers around Palmer Station have always treated them as potentially dangerous animals. The dive tenders keep an eye out for leopard seals and if one is spotted in the area, the dive is called off. If the divers are already in the water, they generally back slowly up to a cliff or wall, so they don't have to worry about the leopard seal surprising them from behind. "Most of the places we're diving are very steep," Amsler said. "You get out as soon as possible, but you don't frantically run away like game that's been flushed." In 80 dives last year, Dan Martin met leopard seals underwater about five times. He began to recognize individual leopard seals. One was particularly curious. "This one guy would just come closer and closer until he was close enough to touch," Martin said. "I could have scratched his chin." To Martin, the leopard seals

have an almost dog-like demeanor. But unlike dogs, little is known about their behavior or how they react in a given situation. Martin has noticed that when he's seen leopard seals down deep they generally circle from a distance, watching. As he rises toward the surface, the seal's circle often tightens.

Though leopard seals rarely threaten humans in the water, they do have a taste for the inflatable rubber boats frequently used around Palmer Station. "They tend to just gnaw on them like a teething baby," said Doug Fink, the boating coordinator at Palmer Station. "You don't find things torn apart as much as you do scrape lines and pinpoint holes from their sharp teeth." In one week last year, leopard seals punctured four of the boats. Fink instructs boat operators to leave the seals alone and to take any sign of aggression or curiosity on the seals' part as a signal that it's time to leave the area.

Penguins have more reason to fear leopard seals than people do. Though leopard seals are primarily krill eaters, they get a taste for penguins and are skilled hunters who always seem to get their prey. "The only way a penguin gets away is if it gets to shore," said Susan Trivelpiece, a bird biologist on King George Island. The leopard seals often start patrolling offshore of the penguin colony about the time the penguins start making frequent trips in and out of the water to feed their chicks. The seals will hide behind icebergs or work in pairs to catch the penguins. Like cats, leopard seals sometimes appear to hunt for the sport of it, playing with their prey. Trivelpiece once watched for 45 minutes as a seal caught a penguin, over and over again. The seal had already killed at least a dozen penguins that day, so it clearly wasn't hunting out of hunger anymore. Like a cat with a mouse, the seal would grab the penguin and drag it underwater briefly. Half a minute later, the penguin would reappear, looking dazed and start swimming for shore. For a few moments the seal would follow lazily behind, then catch the penguin again. "We were rooting for the penguin toward the end, because the leopard seal didn't care if he ate it," Trivelpiece said.

Leopard seals have their fans too. Their sleek bodies are a silvery dark gray color with interesting spotted patterns, which lead to them being named after the spotted African cat. The seals live in the pack ice all around the continent and can live more than 26 years. They reproduce from September to January and by most recent estimates number about 220,000. Unlike other seals, the leopard seals use their large fore-flippers while swimming. Divers who have seen them underwater describe leopard seals as graceful and impressive. "In terms of just seeing one on land, the coloration and shape, in many ways you might say they're more beautiful than say, the elephant seal," Amsler said. "Underwater, the leopard seals are very maneuverable animals that can twist and turn. If you weren't worried about the business end, they would be fun to watch."

**BOTANISTS GATHER LEAVES AND SEEDS IN STONE**  
(Antarctic Sun, Dec. 28, 2003), *Kristan Hutchinson* Based

on bulk, the Taylors' plant gathering trip to Antarctica was a huge success for OAEs Tom and Edith Taylor. The paleobotanists shipped home about 4,000 kg of leaves, seeds, stems, roots and free trunks, all in rock. "We got a special award for taking home the largest chunk of the continent," joked Edith Taylor. It's the third time she and her husband Tom have been to the Beardmore Glacier, so they knew just what they were looking for and where to find it. The goal was to collect perimineralized plants, a rare form of preservation in which the cell walls remain and silica fills in the spaces. Even the embryos within the seeds can be seen. "It is the rarest preservation for plants," Edith said.

Antarctica is one of only three places in the world with such well-preserved plants from the Permian age, and the only site with plant fossils of that caliber from the Triassic. This time they were heading back to Skaar Ridge, near the camping site where Scott collected coal and wood fossils, where they've collected many important fossils before. "It's like a compost heap you've turned to stone," Edith said. The Taylors know which sites and rocks are likely to contain the fossils, but it's still a bit of a treasure hunt. "There's a great serendipity to it. You grab a rock, take a chisel, break it open and see what you find," said Tom. They look for rocks with clear layers and some black in them, indicating the presence of organic material. "It's luck," said Tom. "And persistence," said Edith.

Both have paid off for the couple. The fossils they collected on this trip will be added to the collection at the University of Kansas, already the second largest collection of Antarctic plant fossils in the world with about 50,000 rocks. Many fossils from their previous visits led to a greater understanding of ancient foliage. A fossil the Taylors left on display at the Berg Field Center has seed ferns pressed into its surface, as detailed as if they'd just been cast in plaster. The rock is 220 million years old "give or take a month," said Tom Taylor, with his usual humor. The seed fern is unique because it is part of an extinct group of plants with leaves like ferns and seeds like flowering plants. On a previous trip the Taylors found seed ferns with short shoots sprouting from them and seeds attached, similar to a ginkgo tree. It was a trait that had never been found in the fossil record before. "We carried that specimen back in our laps," Tom said.

Tom's specialty has been fungi. At the Permian site he found branches eight to 10 cm in diameter with clearly visible rings and cells. White holes were left throughout the petrified branch in a pattern recognizable as white pocket rot. The same fungus still lives in firs in the U.S., having outsurvived the trees in Antarctica by millions of years. The Taylors have also found free trunks with the rings still preserved, showing a growth record. The growth rings were 10 times wider than those found on trees in Alaska today, probably due to a warmer climate and the longer growing season. "These

plants were growing at higher latitude than any plants are growing today," Edith said. In the Gordon Valley, the fossil trunks of 99 *Dicroidium* trees stick up from the ground, all 0.75 meters to 0.9 meters tall. They still have root structures in the ground. "It's like you cut the forest off with a chain saw and then turned them all to stone," Edith said. She suspects the trees were killed by a flood.

The Taylors still have many questions to answer about how trees adapted to survive the long, dark winter. It is possible the trees dropped their leaves, had smaller leaves or had some other adaptation, Tom said. He hopes the answer is waiting inside one of the stones they shipped home. Most of their work will be back in the lab, where they'll oversee students slicing the rock with diamond blades and then using acetone film to collect the preserved plant cells from the fossil surface. "It's just one page out of a huge novel that you get to read when you open that particular rock," Tom said

#### **DINOSAUR HUNTERS DIG UP NEW BEAST** (Antarctic Sun, Dec. 28, 2003), *Kristan Hutchison*

Wielding hammers, crowbars and dynamite, the dinosaur hunters tracked down a new animal, but they couldn't get all their quarry home. Paleontologist Bill Hammer suspects the newly uncovered bones on Mt. Kirkpatrick could be the remains of a primitive sauropod, a type of herbivorous dinosaur with long neck and tail that lived from 248 million to 65 million years ago. Though Hammer won't know until he has time to study it back in the lab, it is likely to be a new species. "Anything we find down here is very different from other parts of the world," Hammer said.

The last time Hammer visited Mt. Kirkpatrick, 13 years ago, he dug up the remains of the first, and only, carnivorous dinosaur found in Antarctica. The 22-foot *cryolophosaurus* turned out to be the oldest of its kind from anywhere in the world. "We know very little about the early Jurassic, particularly on the southern continents," Hammer said. The only other Jurassic site in the southern hemisphere is in South Africa. With about 35 percent of the *cryolophosaurus*' skeleton, Hammer was able to create a model of the entire dinosaur. A month after Sept. 11 he picked up a full-sized reconstruction of the dinosaur skeleton from a Canadian maker and tried to drive back across the border. "It was too crazy a story to make up, but we still got hassled," said Hammer, who spent two hours convincing customs officials the dinosaur was legitimate. The skeleton is now displayed at Augustana University, where Hammer teaches. This month Hammer led a team of six back to Mt. Kirkpatrick, hoping to retrieve any remaining *cryolophosaurus* bones, and find something new. He found about 35 more bones at the *cryolophosaurus* site, including vertebrae and a toe. The bones may belong to *cryolophosaurus* or other dinosaurs from the same site. About 100 feet above the *cryolophosaurus*, mountaineer Peter Braddock sported another bit of exposed bone. He showed

it to Hammer, who identified it as either part of a pelvis or shoulder of a sauropod. Blaster Marty Reed set charges of dynamite near the surface of the rock at three foot intervals. A boom like fireworks exploded down the mountain, but only the six dinosaur hunters were close enough to hear it. The main thing is you have to use light charges so you fracture the rock," said Reed, who fractured the rock to within a foot of the bones. From there the team worked with pick axes, rock hammers, crow bars and rock saws to free the beast locked in rock. The team retrieved about 1,500 lbs of rock and bone, but left more buried in the hillside.

"I'm happy with what we found," Hammer said "There's still more going back in there. We probably have another whole season's work there." Hammer also wanted to visit five other sites where dinosaurs may be hiding, but bad weather kept him from flying there. He believes many of the ridges between the peaks may hold Jurassic bones. "There's actually a lot more out there than it appears on the map," Hammer said.

#### **FISHING FOR FOSSILS** (Antarctic Sun, Dec. 28, 2003), *Kristan\* Hutchison*

Loren Babcock looks at the bare rock in the Transantarctic Mountains and sees green forests alive with animals. "I see ponds, forests, somewhere down there eruptive fissures and some reptiles swimming around," said Babcock, a paleontologist from Ohio State University. "I see, in my mind's eye, something similar to the reconstructions you see in books." Babcock reconstructs the past from fragile fragments - an insect wing pressed in stone, the print of fish scales, the marks left by soft shells the size of sunflower seeds. "We're looking mostly for exceptionally preserved fossils," said Babcock, who was working with fellow paleontologist Steve Leslie and graduate student Alycia Rode. "Think about what it takes to preserve an insect wing. You know how delicate they are."

Most paleontologists look for bones, teeth and shells. Those are the hard parts of the body most likely to last long enough for phosphates or other minerals to replace the cell structure. But only 15 percent of the creatures in an ecosystem have hard skeletons, inside or out. The other 85 percent seldom leave a trace. "Our fossil record is strongly biased toward those creatures that had mineralized skeletons," said Babcock. He is trying to counter the bias by seeking out the rare specimens of softer body parts, particularly arthropods, the family of spineless animals that includes spiders, crustaceans and insects.

Antarctica is one of the very few places in the world where such insubstantial specimens have been fossilized from the Jurassic age, 160 million years ago. As the only high-latitude

site, Antarctica allows Babcock to look at differences in the lakebed biology of different latitudes during the Jurassic period. During a week on Carapace Nunatak, Babcock's group filled 14 boxes with slabs of rock wrapped in white rags, about 315 kg in all. With years of experience behind him, Babcock easily found fossils in the layer of tan rock stripping the red-brown basalt cliffs of the Kirkpatrick Formation in the Transantarctic Mountains. "One or two cracks with the rock hammer and it shows there's fossil," Babcock said. "It is incredible. These are some of the most fossiliferous rocks I've ever seen." He suspects similar deposits exist along the entire 1,280 km of the mountain range.

Many of the fossil rocks are flat slabs of fine-grained sedimentary stone, which the researchers will split open carefully in the lab and then look at under the microscope. They'll also do chemical analysis. The rocks are like history books. Babcock can see insects, crustaceans and plants on the cover, but is waiting to read the rest of the story on the pages inside. "Once these things are split back in the lab we expect to dramatically increase the number of organisms we know to be there," Babcock said. Even on the surface, many of the rocks show remarkably clear pictures of the past. An inch-long wing, shaped like a dragonfly's, is etched onto the surface of a sand-colored stone. The threadlike web of veins shows clearly. From other sites around the Beardmore Glacier Babcock's group caught six anchovy-sized freshwater fish, complete with eye sockets. "It's unusual to find complete fish like that with the scales on and everything," he said. "They look like someone just pulled them out of the water."

"We found stuff that had not been recorded (before) and what's really unusual here is we got a more complete set of creatures from sedimentary river beds than before," Babcock said. "They help to fill in some of the details of an ancient ecological community." "These kinds of deposits also give us incredible anatomical information about these sort of creatures, information that would normally be absolutely inaccessible to us," Babcock said. The fossils also tell researchers about the climate at the time. The remains of egg-laying creatures show the temperature was at least 10 C for a few weeks, since that's the temperature they require to incubate. The presence of fish shows it was warm enough for the water to be liquid for extended periods and flying insects also indicate a warmer "greenhouse" world, Babcock said. "Once we're done with this study, this will almost certainly be the best known Mesozoic lake deposit in terms of fossilization history," Babcock said.

**NEW SOUTH POLE MARKER** (Antarctic Sun, Jan 11, 2004), *Tracy Sheeley*

South Pole is returning to a work routine after the holiday season - and a busy one at that. January brings with it a high population, with visitors and workers coming in for the final push of the summer season.

On the first day of the year, the new marker was placed at the geographic South Pole. The ice sheet moves roughly 10 meters each year, and the marker is updated accordingly. Each winter crew has the honor of designing the pole marker for the following year. It is unmasked in a special ceremony on New Year's Day.

Work continues to make the new station grow and shine. The inspection for final occupancy of the new dining hall and berthing areas is scheduled for late January. Our goal is to receive conditional occupancy of areas under construction. Interior work will continue on those areas throughout the winter. The steel has been erected for the BI pod, and panels will go up beginning this week. Footers are being placed for A4.

The January flight schedule is starting off on a great note, with up to 7 LC-130 flights a day from McMurdo. We receive science and construction cargo, as well as our fuel resupply to last us through the eight-month winter with no flights. Anticipating winter also means it is time for rest and relaxation in McMurdo for the winter crew - a week to explore Mactown and breathe in warmer air at sea level before settling into the Pole winter routine.

The South Pole Remote Earth Seismic Observatory (SPRESO) is again host to the Ice Core Drilling Service. Five drillers are putting in a third hole to be used by the U.S. Geologic Service to gather their seismological data.

**PALMER** (Antarctic Sun, Jan 11, 2004), *Kerry Kells*  
Throughout the holidays, Palmer's group of seabird researchers continued to count and track nests every day. New chicks are hatching within the brown skua and giant petrel populations. Bill Fraser, the principal investigator of this research, arrives to join his group. Some of the researchers will leave on the Gould. Maria Vernet and Ray Smith's group, the phytoplankton and bio-optics component of the Long Term Ecological study, continues to sample the water columns at two spots, joined by the bacterioplankton ecology group. Hugh Ducklow, the principal investigator for this research, also arrived on the Gould. Members of both teams will leave station on the Gould for the Long Term Ecological Research cruise while their colleagues continue research based at Palmer Station.

Robin Ross-Quetin, who is a partner in the long-term research of Antarctic krill, will join Langdon Quetin, co-principal investigator. Ross began her research in Antarctica the summer of 1981-82. In this past week they have continued their acoustic searches and collections of krill. In another realm of science, Tad Day's group has collected 180 cores (plant and soil samples with Antarctic hair grass and Antarctic pearlwort) from Bischof Island. More samples need to be collected before their experiments can begin.

## RUTH J. SIPLE

January 16, 1912 - JANUARY 23, 2004

*"Death is the last chapter of life in time, but the first chapter in eternity."*

- Ruth Siple in a conversation with Anne S. Benninghoff on August 2, 2001

SPRING GATHERING OF THE ANTARCTIC SOCIETY  
WITH THE POLAR RESEARCH  
BOARD

### SOME MEMORIES OF THE FIRST LADY OF THE ANTARCTIC

Presented by  
**Dr. Paul C. Dalrymple**  
Antarctic Society  
Port Clyde, Maine

Wednesday, May 12, 2004  
6:30PM

Keck Center of National Academies  
500 Fifth Ave. NW, Room 100  
(kitty-corner from the old Pension Building)

This talk will be preceded by a full hour reception starting at 5:30 pm in the hall outside of the auditorium. It is hoped that all the Siple daughters will be in attendance. The short presentation on Ruth will be followed by a full lecture on the IGY and the forthcoming International Polar Year, speakers TEA. Limited parking under the building, enter on 6th St. between E and F. Submit your name 24 hours in advance to the PRB, (202)334-3479 and leave a message with your name. Be prepared to show a picture ID and BEWARE of traffic exiting the building. Please do NOT run over bureaucrats during an election year, as that will only result in a 2 for 1 replacement, bad for taxpayers.

## "I LOVE YOU, TOO!"

**[Editor's Note by John Splettstoesser: Because of the special relationship between Paul Dalrymple and Ruth Siple over many years, Paul has composed an entire newsletter devoted to Ruth.]**

The First Lady of the Antarctic departed us at breakfast time on January 23, 2004, at the Magnolia Care and Rehabilitation Center in Wadsworth, Ohio, one week beyond her 92<sup>nd</sup> birthday. Born in Ohio, died in Ohio, educated in Pennsylvania, raised her family in Virginia, and socialized with Antarctica. She was quiet and unassuming, but no matter what she did or who she met, she left a loving imprint of one who cared for people. She died with a clean slate, and was a rare individual who never had an enemy.

Before I go on, allow me to explain this newsletter, which will be entirely devoted to Ruth Siple, whose heart and soul rested with the Antarctic Society from the mid-seventies until the millennium. Some of you know her only as the widow of "Mr. Wind Chill", Paul A. Siple, but she went on after his death to carve out her own Antarctic career, which I want to honor with this newsletter. It is not altogether foreign to devote a whole newsletter to a single subject, as was done with the DC-10 crash on Mt. Erebus, Al Lindsey on BAE II, Charlie Murphy on BAE II, the miraculous life-saving effort by a doctor who saved Jerry Huffman's life, and a few others. But this is the first time a single issue has been done about a woman.

Ruth was loved by everyone she touched, and I think it is appropriate that some of our Society members be thanked herein for their contributions to her life. There were three wives of Paul's colleagues on the ice — Ruth Weiner, Elizabeth Lindsey, and Jane Wade — all of whom had well known Antarcticans as husbands. Mildred Crary always had Ruth in mind when she hosted a party. Anne S. Benninghoff called her often, and they had a special relationship. At NSF, Polly Penhale saw her as often as possible, and kept in close contact with her. After Ruth was moved into a Granny's Apartment in Fairfax Station, Karen Anderson Phaup became a very close companion, and did a lot to make Ruth's life more pleasant. Other names that come to mind are Betty Burrill, Jackie Ronne, Pat Wilson, and Kristin Larsen. As for men, there is one special friend, Pete Barretta, who came from Meadville and who attended Allegheny College. For someone who rode shotgun on the back of wagons during prohibition days, he seems like an

unlikely friend for Ruth. But for anyone who knows Pete he is as nice as Ruth, and has probably been our Society's biggest asset outside of the Nerve Center.

Ruth was a strong family person, and she was the cornerstone of seven siblings in the Johannesmeyer family. Although the oldest, five preceded her into death, The only surviving brother is Chuck in Hilton Head Island, who is a remarkable individual in his own rights. On May 7, 1982, he set a new world's record in the pentathlon for 64-year-old men when he amassed 1,654 points. In his eighties he is still a substitute school teacher. One of his sons was involved with the nuclear reactor at McMurdo. The Johannesmeyers had a family reunion in Upstate New York in the summer of 2001 and it was a wonderful time for Ruth. But tragedy struck almost immediately, as brother Gene, flying his own plane\* back home to Florida, was forced out over the sea by a storm, crashed and died. The quotation about life and death on the cover page came from a letter from Ruth, shortly after Gene's death, which she wrote to her dear friend Anne S. Benninghoff, widow of the very well known botanist, Bill Benninghoff.

Let me retell the wonderful story of Ruth's Valentine's Day in 2002. Many of you self-claimed so-called OAEs know Pete Beimele quite well from being associated with him on the ice. Pete leads at least a double life, as beyond being a scientist, he is a very accomplished barbershop singer, a member of the Society for the Preservation and Encouragement of Barber Shop Quartet Singing in America. The standard uniform for Pete's quartet is tails, so when they get dressed up, they look like aging penguins. So into Ruth's retirement apartment walks Pete and his fellow penguinites, carrying roses, a box of chocolates, and a stuffed penguin for Ruth, who fortunately was able to recognize Penguin Pete. They serenaded Ruth with the usual repertoire of Valentine's Day songs, and in I LOVE YOU TRULY, every time that the penguins sang "I love you", Ruth would immediately respond with "I love you, too."

Ruth was a very inward person, and even those of us who were privileged to know her, perhaps we really did not know the true Ruth Siple, as she wasn't one to expose herself to friends, or, for that matter, to family either. Those of you who saw her at Society functions saw a congenial, happy person, but in the outside world she led a somewhat secular existence. She wasn't one to initiate,

but she was one to respond. She prided herself on not being a doting grandmother, but on the other hand she never forgot the birthdays of her friend's children. Nor did she ever forget an anniversary. She was the oldest of seven siblings, and it was she who maintained contacts with all, who disseminated family news. In a way, the telephone was her best friend, and for those of you who heeded our pleading to call Ruth in her hours of need, I can assure you that she deeply appreciated those calls. It matters not that ten minutes later her failing memory wiped out your call, but for awhile your calls made her day.

Ruth was a loner, and she played that role to near perfection. As a senior citizen, she never hosted large dinner parties, had very few guests for dinner. But when she was younger, when Paul was alive, their guest book showed frequent visits by distinguished polar scientists from not only the USA, but from abroad, too. She measured everything in life, and never in the long-range. Every morning she would drive to the nearby Safeway and buy just what she planned to serve that day. Never fresh vegetables when she could buy already prepared frozen ones! Dinners were always parceled out in the kitchen, with each plate getting a woman-sized serving. There was no such thing in Ruth's home as seconds! It is no wonder that Ruth never put on any weight.

I have just finished writing about Ruth being a very quiet and reserved, inward person, but she also had the ability without knowing what she was doing to captivate groups of people. Al Fowler has had more careers than cats have lives, and one of his last retirements was from the American Geophysical Union. He was informed that he could bring one outsider to his retirement party, and he selected Ruth. He said that even though it was his day, and they were honoring him, that it was Ruth who stole the show from him. She captivated the gathering, and Al more or less faded into the background getting a big charge out of watching her sudden popularity!

Ruth never went to a mall, for those places were strictly alien to her. But she got tons of catalogues in the mail, and this was her way of shopping. UPS was an almost daily visitor. Although she lived most of her life in the Washington area, she had no concept whatsoever of the Beltway around the city. She treated it like a mine field. But she knew where Paul worked, as she drove him to work daily, and picked him up daily. The reason ~ Paul did not want to stay at work after hours, and he wanted that excuse,

"My wife is picking me up in five minutes." If you rode very often with Ruth, you knew that she avoided the big highways, and scooted around town, stop-and-go driving! Sometimes I got the feeling that God was her co-pilot as she seemed somehow to always avoid accidents.

Close friends, few and far between. Renee Cheney playing classical music on a local PBS station helped her through the day. She enjoyed her collection of classical CDs, but as she got older, this interest faded. There was a time when she was into yoga, and there was a time when she took physical therapy from a professional trainer. But for calling up a friend to go to Georgetown for lunch or shopping, NEVER. Her hobby was collecting beautiful bells. Many of the finest crystals. She was proud to be a member of the Theta sorority, as she felt they were the most beautiful women in the world. And I am sure Gentleman Jim Zumberge agreed with Ruth, as his wife was also a Theta. She sang in the chorus at Allegheny College, but something must have happened to her voice by the time we went together to church, some fifty years later! We always had light refreshments and coffee at our meetings on 18<sup>th</sup> Street, and Ruth always made the coffee. And what coffee, only fit for truck drivers on trans-continental drives.

One of the amazing things about Ruth was that she knew very little about her husband's professional career. Because of Paul's celebrity status, there was usually a call a week about this or that related to Paul. Invariably she would direct the caller to Jerry Pagano, who worked with Paul in the military and later was in the polar office at the National Archives. Jerry was a particularly good friend of the Siples, and was primarily responsible for the cataloguing and assemblage of 133 cubic feet of their archival material. Once upon a time when access to the archives was actually possible, it was great fun to go there and read things from the Siple files. But insofar as I know, Ruth never visited the stacks.

Ruth carried on Paul's torch for scouting, and became the best friend of the various scouts. Dick Chappell was our first choice to give the memorial talk on Ruth at the PRB evening session on May 12 of this year, but he reluctantly declined because he felt this soul should do it. Dick was very close to the Siples, and he had Ruth on his committees for selecting Antarctic scouts. Ruth became close to several of the Antarctic Eagles, especially Mark Leinmiller and Lou Sugarman. When Tony Meunier's son

Jeffrey became an Eagle, Ruth was a special guest of honor at the Eagle Court of Honor ceremonies of Troop 673 at the Great Falls Methodist Church. She presented Jeffrey with a copy of Paul's BOY SCOUT WITH BYRD, but Tony said that her influence went far beyond this, as the filled-to-capacity church had a lot of young impressionable 11-year-old scouts on their way up, and nine of the twenty went on to become Eagle! A phenomenal high percentage, and Tony thinks Ruth's presence and words encouraged them forward.

Ruth was religious, but only on her own terms. While Paul was at the South Pole, she thought that she had found her church when she visited the Episcopal Church in Williamstown. Mark Anschutz of Christ Church in Alexandria ministered to her every religious need in the seventies and eighties, but then her temples started to crumble. When they did away with the 1928 prayer book, she was heart broken; then women priests came into the pulpit and she was devastated, and the final straw was when women priests started serving communion. It was a catastrophe for Ruth, and thereby she lost her single largest support. She did find temporary relief in a Scottish minister who was conducting the old-fashioned service from the 1928 prayer book, but this was short-lived. She withdrew her membership from the National Cathedral when they allowed lesbians to hold meetings within, but would not allow advocates of the 1928 prayer book to convene there. Those were rough days for Ruth. She sought refuge in her own religious material, and would spend several hours each morning in deep meditation. Mark was no longer available to console her, as he had answered a call to a parish in New York City. It was a big fall for her when she could not accept the changes in the Episcopal Church. P.S. It was sure lucky she never was able to read about their new bishop in New Hampshire!!

Antarctic widows from the Byrd era have not always taken very kindly to their husbands passing along and leaving them behind. Jane Wade and Harriet Eklund almost took it personally. But Ruth had a deep spiritual feeling about Paul's death. She even wore white at his funeral, and she once told me that when he died, she felt that someone would come along in six months who would want to marry her. Well, it turned out that the 'someone' was actually the Antarctic Society.

Although Ruth was almost a plank member of the Antarctic Society, it wasn't until 1977 that she became our president, and then things started to happen. It was not

that she was aggressive, but I had become her friend after my employment had been moved to the Washington area, and I prodded her to make some overdue changes. Prior to Ruth's presidency, we had no real idea who the paid-up members were, so Ruth inherited the treasury by self proclamation from Sophie Dales. Unless members could prove they were in good standing, they were shown the door. From a total of 400 on the books, it was found only 150 were legitimate. Goodbye, Roger Tory Peterson. From once-a-year newsletters, the Society started having one with each lecture. During Ruth's presidency, the first year we had Mary Alice McWhinnie, Dick Black, Jay Zwally, Chester Pierce, and Larry Gould as speakers. And when Larry spoke, we had the grand auditorium at the National Academy of Sciences. How big an evening it was is testified by the presence of Phil "Crevasse" Smith. It doesn't get much bigger than that!

The Society was changing fast, its membership was growing by leaps and bounds. Louie DeGoes was the local head of the National Academy of Sciences Polar Research Board, and he brow beat all *their* members to become *our* members. It gave us some legitimacy beyond being a good old boys social club in Washington, DC, with an annual summer picnic. Larry Gould was head honcho on the PRB, followed by Link Washburn, in turn by Gentleman Jim Zumberge, all good friends of our Society. NSF back in the seventies and eighties was located one block from the Old Executive Office Building in downtown Washington, and we had our meetings at NSF. Wonderful spot, even if you had to hunt for a parking spot in Foggy Bottom. The Society was prospering, and meanwhile Ruth had invited us into her home at 905 Jacksonville Street in Arlington, Virginia, which became known as our Nerve Center. It was a fun time to be associated with the Society as all things were coming up roses, and Ruth was doing all the leg work. Ruth was duly recognized one evening at the dinner party preceding our Memorial Lecture when Gentleman Jim Zumberge grabbed the microphone and thanked Ruth on behalf of all Society members for what she had done for the Society in recent years. Our membership had surpassed the old mark, and when Tahoe Washburn joined, we had 500!

The Society had all the trappings of a legitimate Society, with an honest-to-God set of by-laws, and an approved-by-someone tax exemption. Somehow we survived in spite of ourselves, as the quickest way to utter disaster is

to run something by committees. I think the only reason we survived is because of Ruth, as no one wanted to go against her wishes. For a quiet unassuming person, she had a ton of clout, although she never realized it, even though she had become our Honorary President. Without Ruth, our future IS in jeopardy!

Some of you people probably do not know that Ruth once was a librarian for the National Geographic Society, a job she loved deeply until shown the door when they enforced their mandatory retirement age. Then Ruth worked for a short time for the Arctic Institute of North America in their Arlington, Virginia, office, but she was too nice for the job. The head man there had a drinking problem, and you never knew when or if he would show up in the morning. So working at no salary at home for the Antarctic Society was a relief, although strictly a labor of love. She was a marvel at turning out our newsletters. She was a very good editor, and a whiz at typing, even though she never was a secretary. She could type ten pages, single-spaced, in one day without a single error. Boy, have we missed her after she lost her eyesight. Altogether Ruth put together over 130 newsletters, over twenty-one years of sheer dedication and perfection. If there is a Heaven, and both she and August Howard are there, these two friends must be having one great time talking about leaving us mere polar mortals here on earth.

An association with Ruth was like having a life-time pass to Cooperstown's Hall of Fame, as through her portals walked the greats and the near greats of the Byrd Antarctic expeditions. God, it was great to be privy to so many visits by so many of the legends, and to accompany Ruth to the homes of others, such as Henry Harrison and Howard Mason. But without a doubt the 50<sup>th</sup> anniversary of the 2<sup>nd</sup> Byrd Antarctic Expedition, 1933-35, in Washington, D.C. had to be the most exciting, and it seems during the festivities that all came to Ruth's home as if they were visiting some shrine, paying respect to some Greek goddess, except in this case a Johannesmeyer whose ancestry came from a mountain village in Switzerland.. As many of you know, Dick Black, who retired as an admiral, a Shakespearian devotee and the Antarctic Poet Laureate, came from the landed gentry in the Commonwealth of Virginia, and he had clout. As a member of the historic Cincinnati Club, he had access to the plush mansion on Massachusetts Avenue in the District, and here was where the OAEs convened to eat and drink and talk and reminisce, probably with many stretched truths. It was truly a gala

affair, the very last gathering of Byrd people. The next morning they all were able to get out of bed, exhibiting great intestinal fortitude, and in the cool fall breezes, gathered at the base of Admiral Richard E. Byrd's statue on the Avenue of the Heroes at the entrance to Arlington Cemetery, where they placed a wreath at his feet. Although the Admiral is buried within, high up on a slope identified by one of the small, white crosses of commoners, there was a feeling among the old boys that he had come down the hill that morning to say his real final goodbyes and thank yous to the survivors who paced around his statue that morning. It was a very, very touching morning, and as they dispersed to go home, they had to know that this was their last gathering.

One thing happened that brought one of their least humble members down on his knees in tears. I am speaking of Amory "Bud" Waite, whom I had known personally since 1936. How it happened does not matter, but Senator Byrd heard about the reunion, was asked to do something special for Bud as the sole surviving member of the party who went out to Advanced Base and brought back the Senator's uncle. The good Senator obliged, had the favorite picture of Admiral Byrd's mother enlarged, and then got members of the Byrd family to inscribe their thanks and appreciation around the border. Old boys shouldn't cry, but in this case it was excusable. That whole 50<sup>th</sup> celebration meant much to Ruth, although it had to pull on her heartstrings where one special member of the expedition was not there.

At the 50<sup>th</sup> reunion, most of the wives and a lot of the widows showed up. Some of the wives were put on the maps by having features named after them, but their names got purged when someone with authority lined them out. I have always felt that this was a grave injustice to these women, and that their first names should be restored, so Mt. Siple could once again be Mt. Ruth Siple. And if you ever met Jane Wade, you would immediately know that the twin-peaked Mt. Wade should have been left as Mt. Jane Wade. It was well named originally. Shouldn't fool around with perfection.

The most exciting day in Ruth's life had to be January 9, 1975, when she, too, stood on the South Pole. Imagine the thrill of being at the Bottom of the World, where her late husband had headed up the first hardy group to ever winter-over in what one explorer incorrectly assessed as, "Great God, this is an awful place." To Ruth it was

golden, fulfilling all the first-hand stories that she had heard from Paul. It was a typical beautiful summer day with clear skies and the thermometer reading a balmy -8° F. Doesn't get any better than that, but it did. They took Ruth over to the old station that Paul had occupied as Station Scientific leader in 1956-57. Walt Seelig and Al Fowler were with her, and Walt remembers Ruth saying, "This is just the way that Paul described it to me." She asked if anyone knew which cubicle had been Paul's, and Walt said some young lieutenant still wet behind his ears seized upon the opportunity to say, "This one right here." Of course the kid did not know, but it was the perfect answer at the right time, and Ruth sat down supposedly on Paul's old chair at his old desk, and she had to think smilingly to herself that she had actually gone to Heaven.

I tried to find out who was responsible for Ruth being included in the VIP group invited to the South Pole to dedicate the Domed Station. I kind of thought that Jerry Pagano had perhaps instigated it, but wiser heads than mine pinned it down to the triumvirate of Larry Gould-Grover Murray-Vernice Anderson. Larry Gould has been off frequency for several years, and Grover joined him about six months ago. That left Vernice, and she never returned our call. But whoever, it was a sweet thing to do, and Ruth spent the rest of her life reliving that day.

On the way to the South Pole she carried an important package. It contained the original silver sphere that Paul had put on the barber pole above the South Pole Station. She gave it to the Antarctic Wing at the Canterbury Museum in Christchurch, and it was accepted by Mr. Baden-Norris, Honorary Director of the Museum. He is the gentleman with that awful scowl on his face sitting directly behind the radiant Ruth in the photo on p. 9. Instead of rejoicing over accepting a treasure, he looked like a man who could not wait for his afternoon double martini.

A kind gentlemen from Midlothian, Virginia, by the name of John Lenkey HI was responsible for Ruth being invited to Wellington, New Zealand, in 1993 for the rededication ceremonies in conjunction with the refurbishing of the defaced Byrd Memorial atop Mt. Victoria. There were two other invited guests: Boiling Byrd Clarke, one of the Admiral's daughters, and an Eagle Scout from Paul's former group, the French Creek Council of Erie, Pennsylvania. The day atop Mt. Victoria was cold, as it was the first day of winter, and the wind-chill made it seem like the Antarctic. John turned to Ruth and said "I wish they'd hurry before

Paul's wind-chill factor does us all in." The Lord Mayor overheard the remark, promptly wound up the perorations, and they rushed off to the City Hall where he properly hosted embassy and government officials. John could not accompany Ruth back to the States, but he made sure that United Airlines realized that they had a very important person aboard in Ruth, and lo and behold, they upgraded her to first class for her long flight home. John wrote that Ruth was as thrilled as a child with a new toy!

Another bit of excitement for Ruth was the two-day celebration of Admiral Byrd's 100<sup>th</sup> birthday at The Ohio State University on 24-25 October 1988. It was within the framework of two very interesting presentations that our president, Bob Rutford as officiator, inducted Ruth as our Second Honorary President. There were a lot of Byrd people there, including daughter Boiling and three grandsons, Robert, Leverett, and Harry, as well as several OAEs. The indestructible Norman Vaughan with his dog-sledging wife Carolyn, represented BAE I. Al Lindsey, Joe Hill, Whirleybird McCormick, and Erwin Bramhall all were there from BAE II. Al presented a lecture, "With Byrd and Siple, BAE II, 1933-35." As most of you know, the Siples and the Lindseys were close friends throughout their lives, and now only Elizabeth survives. But it was an interesting gathering of Byrd people, and from out of the blue someone walked in and presented Whirleybird with the wing of the chopper that he crashed on the ice! It brought down the house almost as fast as Whirleybird crashed the chopper.

As I recall, Rutford inducted Ruth prior to Pete Anderson's talk on Admiral Byrd. Ruth was resplendent in a beautiful dark blue dress and Bob had a special plaque made up commemorating the occasion, which he then presented to The First Lady. Pete Anderson was in the process of writing a biography on Byrd, and he was determined to present the whole book, page by page, paragraph by paragraph, that evening. I thought it was fantastic and was hanging on his every word. Rutford was going crazy, wondering if Pete would ever stop, as I think he was afraid that he might lose out entirely on his appointed round at a nearby watering hole. However, it was a great evening for Ruth, and she kept that picture of the plaque on a stand right outside of her bedroom.

Ruth's life started to crumble when she was beset with macular degeneration. She really did not have the intestinal fortitude to cope with it, and it really put her into

the dumps. It wasn't easy for her, a person who loved beauty and enjoyed nature, to see this veil being swept over her eyes, taking the things she loved and appreciated out of her vision. And how she hated to give up driving, being the very last person to realize that she was a detriment behind the wheel. God must have been sitting in her co-pilot seat at the end.

Finally, during the past fall, the youngest Siple daughter, Mary Cathrin, found a nice care and rehabilitation center near her home in Wadsworth, Ohio, and Ruth was happily moved there. If there is a blessing in Ruth's death, it is that she spent her last two months near a loving daughter who came to see her and sit with her on a daily basis. A lot of you people answered our plea for you to call her on her birthday, January 16<sup>th</sup>, and you did. And you have told us what satisfying conversations you had with Ruth at that time. She lasted one more week, dying at breakfast time on the 23<sup>rd</sup>. I talked to her the evening before. She knew who I was, but she was confused as to where she was and what she was doing there. I think I can accurately say that she did not die in pain, as they had her pretty well doped up with morphine at the end. And I know she died with a loving daughter almost constantly at her side. The exact cause of her death was probably congestive heart failure, which was first ascertained when Ruth was hospitalized in December.

We asked Polly Penhale and Jerry Marty if the flag at the South Pole could be lowered to half-mast for a short time on the 23<sup>rd</sup> in tribute to a very loving and caring Ruth Siple. Jerry complied immediately, and sent us several pictures via e-mail. We forwarded them to my good friend Ed Williams in Roanoke, and he produced a beautiful enlargement for the casket, plus others for her family. Quite a few Antarcticans made visiting hours at the funeral home, including two who were with her at the South Pole, Al Fowler and Walt Seelig, almost as if they were there to see to it that she completed that journey. And in that room at the funeral home with Ruth was something very special and dear to her from one of you. It was a piece of Mt. Siple, which Paul had originally named Mt. Ruth Siple. Wesley LeMasurier was working in the field there about ten years ago, and knocked off a piece of the rock, and sent it to Ruth. Ruth was eternally indebted to Wes for doing it, and she had it mounted in her living room on a lighted stand given her by Eagle Scout Dick Chappell, who also graced the visiting hours with his gentleman's presence.

Her service at the cemetery was befitting the wife of the Father of Wind-Chill. The temperature was around 15 above, but a howling wind brought the wind-chill reading to below zero. Befittingly, the ground was snow-covered. I had a South Pole baseball cap on my balding head, and as I stood there in the biting cold, a fleeting thought rushed through my mind. Open the casket, and put the cap on Ruth, as it must have been damn cold in there, too! And she did deserve my South Pole cap. Reluctantly I selfishly kept it on my own head, but oh, how I wanted to do it!

One last comment about that day, as the procession weaved its way from the funeral home in Fairfax to the cemetery in Falls Church, we went past the large Washington postal distribution center in Merrifield. How appropriate that her last vehicular ride on earth should go by that center, as this is where Ruth made many a run with newsletters to mail to you all. And it was always so much fun to go out there with her, as all the mail handlers got to know her and to love her, and there was always friendly banter and smiles back and forth. She was a lovely lady, and we all are going to miss her, something terribly. Over a month later, my heart won't let me commit her.

#### **A TRIBUTE TO RUTH (From a Society Member, no doubt typical of the lives she touched)**

To a lot of people Ruth Siple was Paul Siple's widow, the wife of the "Boy Scout With Byrd", "90 Degree South", etc., etc. Well I never knew Paul Siple, but I knew Ruth. She was my friend and one of the few people I knew who fully understood my passion for Antarctica and all things Antarctic (she once told me that she could remember every minute of the day she spent at the South Pole!).

Nothing was too obscure or arcane to talk to Ruth about if it had to do with Antarctica in some way. We shared frequent phone calls and the occasional visit and for me she was like an antarctic oasis in my life, which was primarily inhabited with folks who just didn't get it. Ruth did. Ruth also flattered me that I was somehow important to her and to the antarctic "scene". I was at best an obscure player there but she treated me as though what I thought mattered. I think that she made everyone feel that way but it meant a lot to me.

When a newsletter arrived in the mail I was usually more interested in what Ruth had written on the always present yellow post-it than the newsletter itself. God knows how

many of those things she wrote but she made a lot of people feel special with them. Another Ruth trademark was the birthday cards. I don't think that she met my children more than a few times, but we all got birthday cards and valentines, and although my kids didn't know her well they always knew she cared about them.

She and Paul Dalrymple became regular visitors on their way to Wintergreen. Their visits were special evenings for me as I truly learned more about antarctic history and about the personalities at those meals than in all of my reading and visits. I believe that the "antarctic experience" today is sterile of the history and background of how it came to be. Ruth provided the bridge between the "thens" and the now.

It was an honor to visit her in the "Nerve Center" on Jacksonville Street on occasion. It is hard to imagine the treasure trove of memorabilia — books, rocks, maps, photos, art, and on and on. I hope that someone in her family thinks enough of it to preserve it!

I will miss Ruth, she was my antarctic connection and a good true friend. I feel that I was special to her, but then maybe that was Ruth's magic, I think she made a lot of us feel that way no matter how important or maybe not important we were."

### **HONORING RUTH SIPLE**

The Siple Family talked to us at the time of Ruth's death about some means of honoring Ruth with contributions. We thought we had the perfect outlet where Ruth had once been a happy librarian and an exuberant visitor to the South Pole with a name familiar to all South Polies. We suggested to Jerry Marty that NSF consider naming the library in the now-being-constructed South Pole station after Ruth, and Jerry thought it was a wonderful idea. It never flew. It is too bad, as it would have been a good deal for us, it would have been a good deal for NSF, and it would have been a good deal for Ruth. NSF is looking at the International Polar Year in 2007 and the coinciding completion of the new South Pole station (also 2007) to incorporate naming of rooms and station wings" One important person, above Jerry Marty, indicated that "the Ruth J. Siple library was a good suggestion and would be considered as part of the effort" So I guess you could say that there is some good news as evidently our proposal will eventually be considered.

But should we hold our breath for three more years in hope that it might possibly be executed at that time, or should we look now for an alternative avenue while the memory of Ruth is so strong? We felt the library idea was a natural, and I think Jerry Marty felt the same way, too. It is a tough call now as to what we should do to honor Ruth. If you folks have any thoughts or ideas, one way or the other, please let us know, as you are part of the overall plan(s). In the meantime we hope you have enjoyed the newsletter, have perhaps learned a little bit more about a faithful and abiding housewife and mother who turned out to lead an All-Antarctican life of her own.

Dr. Paul C. Dalrymple

## STORM OF THE CENTURY, PERHAPS

(See page 7)

**BRASH ICE.** Midwinter Day has come and gone, and it looks like we won't have any medical evacuations from the South Pole this year, so one would think it was a dull year. But far from it, McMurdo had one of those once in a century storms, maybe once in several centuries storms. It was a most unusual storm, and synoptic meteorologists will be studying this one for some time. We have been in close contact with a meteorologist who once worked for me, Joe Zabransky, and he, in turn, has put me in touch with Matthew Lazzara, a meteorologist, at the University of Wisconsin. Both have warned us that because of the scarcity of meteorological observations in the Ross Sea Sector that we should be most careful in jumping at any conclusions about that storm of mid-May. However, it is all so exciting that for the first time ever we are devoting two pages to graphics on the storm. Sir Douglas would be pleased.

We are sad to report the death of several prominent US Antarcticans. Four were in their eighties (Jay Shurley, 87, Mort Rubin, 86, Mort Turner, 83, and Dick Conger, 82), which sort of strikes close to home where this writer is also in his eighties. The other was a mere child, Ed White, 68. We have missed a lot of them, as good old Louie Quam, the soft spoken geographer who once was the Chief Scientist of the Office of Polar Programs at NSF died two years ago at the age of 95. Deaths could fill *six* newsletters a year. Probably a good mix would be a new book review for every Antarctic obituary.

The over the horizon International Polar Year is getting a lot of attention with bureaucrats around the world. At this point in time, it is all in the planning stages, and for this newsletter, one storm buries a lot of words.

**RUTH J. SIPLE MEMORIAL FUND.** We have decided to go ahead with a **Ruth J. Siple Memorial Fund**, as without any drive, we have already had over seven hundred dollars sent in for the establishment of such a fund. As you folks who read our last newsletter know, we are hoping to combine two of Ruth's interests, libraries and Antarctica, into a campaign to have the new library at the new South Pole station dedicated to her when the new facility is dedicated in 2006. We have been given some encouragement by some people of influence, enough to go ahead with our wish. If the plan comes to fruition as we hope, the monies in the Fund will be used to buy books for the South Pole Library.

Darrel Schoeling, co-owner of **Longitude Books** (115 West 30<sup>th</sup> St., Suite 1206, NY, NY 10001), and former Secretariat of IAATO (International Association of Antarctica Tour Operators) has assured us that if our plan goes through, he will offer a 20% discount on all books bought by the Fund for the South Pole library. If we fail, and we are not planning on failing for lack of effort on our part, the funds will be used in accordance with the wishes of the three Siple daughters.

When the IGY started there was a most unique woman/explorer/polar adventurer/ geographer by the name of Louise Arner Boyd in California who broke the ice for Mary Alice McWhinnie, Gisela Dreschhoff, and other females by leading seven 20<sup>th</sup> Century expeditions into the Arctic. In 1955 Louise Boyd became the first woman to fly over either of the Geographical Poles. She came from an affluent family, and inherited her wealth at an early age when her immediate family were all burned to death when their home was ravaged by fire. One of the things she did at the beginning of the IGY was to supply the American bases with complete sets of the classic Antarctic books. It was her heritage gift to the Antarctic during the IGY. Perhaps now we can reincarnate the work begun by Louise Boyd with the **Ruth J. Siple Memorial Fund**, with this Fund supplying books for the new IPY-4. It sounds like a winner to us, and if the Fund is really successful, we can supply books to the other two US Antarctic stations.

If you are interested in making a contribution to this Fund, checks should be made out to the **Ruth J. Siple Memorial Fund**, and forwarded to the Antarctic Society, Box 325, Port Clyde, ME 04855. Updated information on the success of the Fund will be included in succeeding Newsletters.

**MRS. CHIPPY - ANTARCTIC PIONEER'S PET REMEMBERED.** Margaret Lanyon keeps us informed of many events that come up in the Christchurch, NZ newspapers, and this is an example. Christchurch Press, 28 June 2004, reports that the unsung hero of Ernest Shackleton's doomed Antarctic expedition has been remembered in a ceremony in Wellington, but Harry McNeish's family are disappointed that his part in the journey has not been formally recognised. McNeish was a carpenter on Shackleton's ship *Endurance*, and his beloved cat - known as Mrs Chippy but actually a male - became the ship's mascot. Nearly 100 people gathered to watch the unveiling of a life-size bronze statue of the cat on McNeish's grave at Wellington Karori Cemetery.

Despite the gesture, his family believes his contribution to the 1914 mission to the South Pole has been unfairly overlooked. "It's a terrible thing that he was denied a Polar Medal," said his grandson, Tom McNeish, 76, of Norwich, Scotland. "Every person who was there should have got that medal. He was

very, very badly done to." In 1997, the McNeish family lobbied the British Government to get him honoured, but they were turned down on the grounds that it was too long after the event. McNeish is upset that his grandfather's efforts have not been formally acknowledged. "If it wasn't for him they would have all perished. His skills got them to safety. But all you hear about the expedition is Shackleton, Shackleton, Shackleton," he told the Scotsman newspaper. "I think the cat was more important to him than the Polar Medal."

The tabby cat and the sledge dogs were shot after the ship became crushed by ice in the Weddell Sea, marooning the men 560 km from land. McNeish never forgave Shackleton for his cat's death and later led a brief rebellion against him.

At the unveiling, Baden Norris, Canterbury Museum's emeritus curator of Antarctic history, recalled meeting McNeish shortly before he died. "The only thing I ever remember him saying was that Shackleton had shot his cat."

**IAATO's 15th GENERAL MEETING**, by John Spletstoesser, Advisor to IAATO. The 15th General Meeting of IAATO was held in Christchurch, New Zealand, 27-30 April 2004, with Denise Landau, Executive Director, presiding. Since its founding in 1991, the International Association of Antarctica Tour Operators has grown from the seven founding member companies to 68 from 14 countries, as of the April 2004 meeting in Christchurch. This does not mean that there will be 68 companies operating 68 ships in Antarctica in the coming 2004-05 season, because many of the members, especially Associate Members, are not operators but provide service to the operators, such as port agents and the like. Nevertheless, it is apparent that the industry is growing, and so have the numbers visiting Antarctica. In the 2003-04 season, nearly 27,700 visitors went there, including seaborne (the larger part of the total), as well as land- and air-based tourism. The breakdown includes some 19,000 traditional seaborne visitors that landed, plus 517 air-land-based visitors, 4,950 who traveled on large vessels that made no landings, and about 2,800 involved in over-flights (some figures rounded). Visitors traveled on 28 tour ships and yachts operated by IAATO members, and an additional three ships were operated by companies that have not joined IAATO. An estimated 185 traveled there on some 20 yachts, although it is difficult to obtain information on all yacht travel, some of which is unannounced. Some IAATO members operate cruise vessels that visit the Antarctic Peninsula, but make no landings, whereas others conduct over-flights without making landings, so it is necessary to examine the numbers to determine how many people actually set foot on the

continent, and of importance to potential cumulative impact studies, for what period of time at each landing. Furthermore, their time ashore is minimal, as a shore visit might encompass 3-4 hours, after which all return to their 'hotel at sea', the tour vessel. In addition, not all visitors spend the entire allotted time ashore. Topics discussed at the Christchurch meeting included requirements for accreditation, a means of certifying that the industry is truly living up to what it says it does; that is, conducting activities that have no more than a minor or transitory impact on the Antarctic environment. The latter statement is now part of the IAATO Bylaws. A topic of growing concern to not only the industry, but also to the Antarctic Treaty Parties is that of high-risk adventure activities, which occasionally get into difficulties and are forced to rely on unanticipated support for search and rescue and evacuation.

Other topics discussed at the meeting included field coordination, a broad category that encompasses ship schedules, communication among vessels in order to avoid having more than one vessel at the same shore location, emergency response action and contingency planning, and support for Treaty Parties. During the 2003-04 season, some 152 scientists, support personnel and gear from various National Programs were provided transport to and from stations, field sites and gateway ports, plus transporting one of the Palmer Station personnel to South America due to a medical condition. Some \$234,000 (USD) were raised by IAATO members and their passengers on board vessels to provide support for a variety of Funds and Trusts, such as Birdlife International-Albatross; Save the Albatross-Australia; Antarctic Heritage Trust and donations to Ross Sea Huts preservation; Oceanites Site Inventory Project; and Grytviken, South Georgia, Museum, to name a few. Tour vessels also provide some of the transport for individuals involved in the Oceanites Site Inventory Project, managed by Ron Naveen for some 10 years in the Antarctic Peninsula Region. The 2nd Edition of a "Compendium of Antarctic Peninsula Visitor Sites" was issued this year, and presented by Ron at the XXVII Antarctic Treaty Consultative Meeting, Cape Town, South Africa, May-June 2004. Estimates for the 2004-05 tourism season include about 23,400 seaborne visitors, 4,500 on large ships that make no landings, 500 air-land-based, and 2,750 on over-flights, for an estimated total of just over 31,000. The 16th General Meeting of IAATO is planned for May 2005 in Amsterdam, Netherlands. For further information on IAATO and tourism statistics, see the newly-designed website at [iaato@iaato.org](mailto:iaato@iaato.org).

**MORT D. TURNER**, A Man of Many Shoes, dies at age 83. Mort Turner, one of our Society's ex-presidents, lived a full

and varied life. He was born October 24, 1920, in Greeley, Colorado. Although he retired from the government, at the National Science Foundation, 20 years ago, he never really retired, as he remained a very active research scientist in the Rockies for many years. It is hard to tell just what he was, who he was, as he was sort of Mister Interdisciplinary, although at NSF he wore the hat of Program Manager in Geology in the polar programs office. His bachelor degree was in Geological Engineering, and his advanced degrees were all in geology. But he also was a paleontologist and an anthropologist. Turner Hills in the Miller Range of the Transantarctic Mountains, the mineral Turnerite, a fossil plesiosaur and a prehistoric fossil sea mammal were all named after Mort. And in October 2003 the American Polar Society presented him with its Honorary Service Award.

Mort was one of the more interesting characters in polar operations at NSF. He went there in 1959, and shortly thereafter they sent him off to the University of Kansas to finish his doctorate. Some people thought that he was there an inordinate long period of time just to pick up a doctor's degree, and perhaps he was, but when he came back he brought not only his PhD degree, but a new Mrs. Mortimer Turner, having married the wife of one of his professors.

Mort never saw a junk pile, it was just undiscovered treasures to be uncovered. Often driving home from work, he had his eyes peeled for bundles on the sidewalks waiting to be picked up by the garbage collectors. On occasions he would find rare volumes of books, or valuable journals that he could then sell. Once when the USGS was having their maps printed in downtown Washington, he would go by and pick up discarded runs, which he would then roll up and mail off to geology departments across the country who were most happy to get them for use in their teaching labs.

During World War II when at the Aberdeen Proving grounds, he worked on missiles under Edwin Hubble. He worked for the California Division of Mines from 1948 to 1954, and then went to Puerto Rico to set up the first State Geological Survey. He served there as the first State Geologist, and was also active in geological mapping, assessment of mineral resources, and studies of beach erosion. He did research in geology and early humans in Montana, Colorado, and China. He was a Fellow Emeritus at the University of Colorado Institute of Arctic and Alpine Research, where he continued his research jointly with his wife Joanne, who, incidentally, also has a hobby of designing women's jewelry. They were a most interesting couple, and Mort will be sorely missed by a lot of descendants and many, many friends.

**OLD AND FAMOUS DICK CONGER SUCCUMBS TO COLON CANCER.** When you talk about OAEs, you had better put Dick Conger right up there at the head of the list, as he got involved in the Antarctic back in 1946 in Operation High Jump, and was the head photographer for the Navy in the early Deep Freeze days. Even if you never knew Dick, read the following brief biography about him, as he had a most fascinating career. He was on the quiet side, and his personality would not exactly ignite you, but he accomplished a lot.

He enlisted in the Navy in 1938, and was one of five people chosen to learn cinematography from the staff who made the "March of Time" newsreels, an experiment to see if non-Navy training would be useful for the military. On his nights off, he worked at LIFE Magazine to learn still photography. Assigned to aerial mapping, he photographed or filmed many Pacific islands and Japan during World War II.

On Operation High Jump, there was an inglorious crash on Thurston Peninsula (now Thurston Island) when a PBM Mariner plane off the PINE ISLAND, carrying an eight-man crew and the captain of the ship crashed. After the wreck was discovered 23 days later, a flight with Dick aboard was set out on a rescue mission. The closest place to land was 12 miles away, and the plane's commander and Dick took off in a life boat, threading their way through ice-laden waters, pulling a sled. They reached the crew, got the survivors aboard the lifeboat and arrived back at the plane just in time to take off before they would have been iced in. Six of the rescued crew members survived.

Dick made amphibious warfare training films. He developed underwater motion picture photography to make training films for demolition teams. In 1949 and 1950, he was loaned to 20<sup>th</sup> Century Fox to shoot underwater sequences for THE FROGMEN, starring Richard Widmark. In the early 1950s, he was sent to the Arctic to shoot photos for maps. And in 1963, he took the first combat photo team into Vietnam.

He retired in 1969 as a lieutenant after 28 years in the service. He had several interesting jobs after his discharge from the Navy. In 1974 he went to work in the micrographics department at the National Archives. And, believe it or not, worked in the 1990's at a tropical fish and pond retail shop in his home town of Ijamsville, Maryland. He has a near endless list of survivors, which include three great-great grandchildren. He regularly attended our meetings in Washington, although his reserve nature kept him in the background. However, his record speaks for itself.

## **EMINENT SOUTHERN HEMISPHERE METEOROLOGIST, MORT RUBIN, DIES AT AGE 86.**

One of the Antarctic meteorological kingpins of the IGY checked out on April 10<sup>th</sup> from complications from a hip replacement surgery on 1 April — no April Fool that. Mort was a close friend of the late Harry Wexler, Chief Scientist for the Antarctic during the IGY, and I think he was hand picked by Harry to assist him during the IGY in many aspects of personnel selection and the implementation of Weather Central at Little America V. When the main body of IGY scientists arrived at Little America V in January 1957, Mort was sitting at the desk in the met shack, checking us all in.

I met Mort back in the early 1950s when both of us were with the old U.S. Weather Bureau in Boston. Mort was very serious and very professional, and appeared more like a college professor than one destined for the Antarctic. He was about atypical Antarctic as anyone that I ever associated with on the ice, yet he was the second American to ever winter over with the Russians at Mirny. So it just goes to show that all Antarcticans are not out of the same mold.

More in keeping with his personality was a position he occupied as a scientific officer with the World Meteorological Organization in Geneva from the early 1970's to 1982. He was internationally recognized as an expert on the meteorology of the Southern Hemisphere.

Mort graduated from Penn State University and went on to receive his masters degree in meteorology from M.I.T. His career began in 1938 when he was a weather observer for the U.S. Weather Bureau in Pennsylvania. He spent the 1940s as a supervisory meteorologist in Peru and Chile while working for Pan American-Grace Airways. He began working for the U.S. Weather Bureau (later to be incorporated into the National Oceanic and Atmospheric Administration) in the late 1940s in Boston, and settled in the Washington area in 1955. Thereupon, he went on a reconnaissance trip of the Ross Sea area on an icebreaker in Deep Freeze I.

In the early 1960s, the Australians named a mountain in the Prince Charles Mountains after him. In appreciation for Australia naming a mountain for him, Mort reciprocated in kind in 1975 by offering his hand in wedlock to an Aussie, Rosa Dockett. And as the saying goes, they lived happily ever after. Mort enjoyed his retirement years by writing a series of excellent vignettes on the meteorology of various Antarctic stations, even handicapped as he was with rapidly failing eyesight. Mort was highly respected by his peers, and deeply loved by legions of friends. He will be sorely missed.

**JAY SHURLEY.** Dr. Shurley was internationally renowned as a clinical and research scientist in behavioral science. Areas of expertise included early use of insulin therapy for treatment of schizophrenia, sensory isolation and deprivation, and sleep disorders. This all took him to the South Pole back in the early days to study what men dream about at the bottom of the world. He evidently found out that men there dream about sharing their bunks with a female companion, as within a few short years NSF started sending females to Amundsen-Scott Station. Now if you read the *ANTARCTIC SUN*, you read about a Latter Day Shurley again studying what people are dreaming about down there. Meanwhile those of us here in CONUS are dreaming about being back at the South Pole. Dr. Shurley started a vicious circle which has no closure. You will find Jay in the Pensacola Mountains.

**ED WHITE.** Ed was a career Navy man who wintered over at the South Pole in 1958. On the quiet side, he never created any waves, and was a much deeper person on the inside than he appeared on the outside. While in the service, he got interested in the stock market, and ended up with more dollar bills in his hip pockets than nearly all of the IGY scientists at the Pole. Plus he found time to play golf as often as he wished. But he always remembered his days at the Pole, and he engineered the first and only reunion of both the Navy and scientists at the South Pole during the IGY. Unfortunately he had a severe eye infection at the time, and after two days at the reunion had to leave for medical help. He recently died at one of his homes, the one in Roanoke, as he was preparing for another delightful morning on the golf course. We will miss you, Ed.

**THE LAST GREAT QUEST: CAPTAIN SCOTT'S ANTARCTIC SACRIFICE**, by Max Jones. Oxford, Oxford University Press, 2003, 352 p. U.S.\$35.00. (Review by Dr. Tim H. Baughman, University of Central Oklahoma.) The reader encountering this book in the bookstore is likely to think one thing, but fortunately for the reader and for polar literature in general, the volume takes on a different and more useful topic. At first glance this volume would seem to be another re-hashing of a polar adventure, re-working the serious studies of others. Instead, while it goes over some familiar ground peripheral to its main purpose, this book provides useful insights into other aspects of the life story of Robert Falcon Scott and its impact on British polar history. Max Jones undertakes the task of explaining why the death of Scott and his four companions in 1912 had such a great impact on Great Britain and the rest of the world. As such, he has taken a topic worthy of study and one that illuminates a question that merits the attention both of author and reader. Along the way, he attempts to debunk Roland Huntford's view of Scott, an assessment that a growing body of work calls into

question. Jones takes serious polar enthusiasts into new ground that will interest many polar buffs.

After a cursory overview of the background to the 1910-13 race to the South Pole and a very brief account of Scott's last expedition, in chapter four the book begins to capture the reader's attention as Jones gives a fine account of how the Scott legend came into being, from the very first dispatch from Lt. E.R.G.R. Evans cabling news of the disaster from New Zealand. Jones then provides a careful assessment of the immediate reactions to the disaster, placing in the context of the then-recent *Titanic* tragedy and subsequently carrying the comparisons through the attempts of George Mallory to reach the summit of Mount Everest. Jones's assessment of Scott's planning shows balance, not whitewash, and certainly no spewing of bile in the direction of Scott. Jones then gives a careful account of such issues as the use of dogs and the publication (with some omissions) of Scott's diaries. His short chart of alterations (pp. 123-24) is a useful guide to these changes.

Using the setting of the memorial to the fallen polar heroes that took place at St. Paul's cathedral (14 February 1913), Jones demonstrates how the legend began. Noting the significance of the King's presence, Jones argues for the ceremony as lending credibility and relevance to both Scott and the monarchy.

For low latitude gazetteer fans, Jones elucidates the development and locations of the series of memorials erected throughout the British Isles to the fallen heroes. Jones even includes a type of flow chart of the commemorations to Scott's team (pp. 158-59). Jones also describes how Ponting and E.R.G.R. Evans carried the message of sacrifice and heroism in the name of science around Europe. Jones is persuasive in his argument that Scott was portrayed in the content of other great heroes of his era—men and women willing to die for a noble cause. The image of Scott as the model of what real men should aspire to become, became part of Scott's legend even before World War One.

In both world wars of the twentieth century Scott's example was used as a morale booster for troops at the front, often by employing motion pictures taken during the *Terra Nova* expedition. Scott's legend inspired two generations of wartime Britons.

Jones has made splendid use of a broad range of sources. As his endnotes indicate, he has mustered much new evidence inventively used primary source material in the development of his argument. He has also provided the reader with an excellent bibliography of books. His publisher deserves

credit for being willing to devote the space (and cost) to include both extensive notes (often cut or reduced in today's cost-conscious world of publishing) and a generous list of suggested readings.

Jones took on a worthy task—explaining Scott's legend, its development and its role in subsequent British history—and has produced a superb book. He has shown that an old topic can be reexamined from a fresh perspective to the benefit of the individual reader and to the body of polar literature.

**IMPROBABLE EDEN; THE DRY VALLEYS OF ANTARCTICA.** Essay by Bill Green; Photography by Craig Potton. Nelson, New Zealand, Craig Potton Publishing, 2003. ISBN 1-877333-07-7. 128 p., color illus. Hardbound. NZ\$59.95, reviewed by John Spletstoesser (modified from *Arctic*, in press, 2004).

This colorful book on the Dry Valleys is a striking example of one of the more beautiful parts of our planet. The area was first seen during Scott's expedition of 1901-04, and since the beginning of the International Geophysical Year (1957-58), numerous visitors have been to this remarkable place on the west side of McMurdo Sound. Why are the Dry Valleys considered to be so important? The ecosystem there contains geological and biological features that date back not only thousands but millions of years. The synergy of its location—a relatively short helicopter ride from McMurdo Station (U.S.) and Scott Base (New Zealand)—and the variety of compelling research projects has resulted in a large number of scientific discoveries; for a few examples, endolithic algae living within interstices of rocks; mummified seals that crawled inland from the sea to meet death upvalley thousands of years past; ice-covered lakes that are stratified by temperature and salinity (one of the lakes - Don Juan Pond - is so saline it survives freezing in winter); glacier-carved valleys once inundated by the sea, with concomitant studies of a complicated glaciated history; a terrain so analogous to Mars and the Moon that astronauts have trained there. The Dry Valleys are part of the Transantarctic Mountains, which forms a barrier for the ice sheet flowing slowly from East Antarctica toward the Ross Sea. That feature in itself has proved to be of tremendous value in the mining of thousands of meteorites that have been found west of the Dry Valleys on the ice surface. Although several other 'oases' of this sort (large areas free of snow and ice) exist in Antarctica (e.g., Bunger Hills, Larsemann Hills), none other has produced the wealth of scientific return than the Dry Valleys of Victoria Land.

Because of the pristine nature of the area, strict controls are placed on all visitors, scientists and tourists alike. (Tourists make annual visits to Taylor Valley under the guidance of New

Zealand and U.S. authorities, which manage their presence there so as not to interfere with science programs.) One of the valleys (Barwick) is off-limits to everyone in an attempt to isolate one of them as an example of an environmental baseline of what they all looked like prior to discovery, and a means of comparison with the other valleys where considerable presence for science has occurred.

This book, however, is not about science, although a few comments related to science find their way into parts of the text. The author (Bill Green), a chemistry professor from Miami University in Ohio, conducted research on geochemical processes in the ice-covered lakes in the Valleys in nine seasons beginning in 1968. Some of the content is excerpted from his field journals and diaries, put into terms that reflect the magic that he experienced while working there. The main text, p. 8-35, describes the uniqueness of the Dry Valleys and their charm, and the remainder of the book, starting with p. 37, consists of photos of Taylor Valley, Wright Valley, and Victoria Valley, three of the more prominent topographic expressions of the carved topography. Short captions accompany the photos. The photos, all in color, were taken by Craig Potton from New Zealand, a leading wilderness landscape photographer, as well as the publisher of the book. A map, or perhaps a satellite image of the area, shows the main features, bounded by about 77.25° to 78°S latitude and 160°E to 164°E longitude. The book's dimensions (29 x 35 cm) illustrate to full advantage the remarkable photo record of this part of Victoria Land. Errors are few and of no consequence, involving proper geographic names. I recommend this book for anyone who appreciates the beauty of wilderness areas, the photos that illustrate their attributes, and collects books on polar regions. This one should not be overlooked. It is worth the price for the 100 01 so color photos alone, all on high-quality paper. The price of NZ\$59.95 equates to about US\$42 in mid-2004.

**SOMETHING TO LOOK FORWARD TO, JOURNEY TO THE ICE AGE,** by Gil Dewart.

Reviewed from an advance manuscript draft provided by the author. (To be published late 2004.) It is a windfall for polar enthusiasts to see this book by a prominent scientist who lived the experience as a geophysicist at one of the five major U.S. stations in the Antarctic during the IGY and IPY-3. This station, Wilkes (about 110°E long., and now the location of the Australian station Casey), was west of the South Magnetic Pole (about 140°E), the latter being the region made famous by Sir Douglas Mawson's HOME OF THE BLIZZARD. Antarctic purists refer to this area as being in the so-called banana belt, but be that as it may, it still has

some of the most inhospitable and miserable weather on the continent.

The Wilkes Station Leader was Dr. Carl Eklund, who once shared a most enviable hardship Antarctic record with Capt. Finn Ronne for most miles sledged behind dogs, on the Antarctic Service Expedition, 1939-41. Of all the US IGY stations, Wilkes was the station with the highest amount of camaraderie, thanks to Eklund who knew how to mix science and good fellowship in such proportions that both sides benefited. And this book, by one of the youngest scientists, gives a most vivid account of how science should be conducted in the polar regions. It is a history that will never be repeated, as back in the Antarctic IGY, science and support was an admixture of both civilians and military men. Now the military has exited Antarctica in support of the U.S. program, and women are there working alongside men in a highly successful equal opportunity program. So readers of this book will get a keen insight as to how men survived without women on the ice, how things were done before satellites, and what it was like to build your own station in a virgin area never before explored by humans. And to make it more interesting, they even established and maintained an interior station on the ice cap, some fifty miles away, where science was not only conducted on the surface but in a 115-foot-deep shaft, dug entirely by pick and shovel.

The book is full of personal anecdotes of all twenty-six men, and readers will revel in how much fun science can be when the reins are not held too tightly. The book is very readable, very enjoyable, one that scientists and lay readers alike will enjoy reading. Dewart's scientific explanations are not only complete, but he makes them all very understandable to one and all. There are very few books written by Antarctic IGY scientists - you can count them on the fingers of one hand and still have a finger left over. So if you want to know how it was done in the preceding International Polar Year, buy Dewart's book and be prepared for an enjoyable trip and a great read. His earlier book on his life with the Russians at Mirny Station (published by Ohio State University Press) is an equally good account by this veteran geophysicist.

**A WICKED STORM.** Probably the worst storm that ever hit Antarctica is the one you yourself experienced in a tent far removed from McMurdo, or so it seemed at the time. But for those who weren't with you, the one that hit McMurdo in mid-May 2004 may go down on the record as the best-recorded vicious storm to ever hit inhabited Antarctica in the last century. The saving grace was that this instantaneous storm hit early in the morning at McMurdo when all God's little children were safely nestled in their bunks, not out around on their appointed duties.

When it comes to storms with high winds, the track record is never what it is supposed to be, as anemometers are more often than not malfunctioning, or even blown away, as winds approach 100 miles per hour. And so it was at McMurdo where the wind bird at Mac Center blew away at 96 mph, and the one at the lab gave up at 116 mph. However, all was not lost, as NASA Radarsat building recorded winds about 160 mph, and Arrival Heights speeds of 188 mph (see Fig 2). This is getting up there, as the world's highest recorded wind speed is 231 mph at the observatory on Mt. Washington, NH. One of our deceased members, Alec McKenzie, worked at the 'Misery Hill' observatory at that time. We currently have more than a half dozen former observers from Mt. Washington who made their way to the ice, proving that misery attracts more misery.

When it comes to Antarctic storms none will ever approach the gilded storm which encapsulated Scott's party out on the Ross Ice Shelf in March 1912, as his diary perpetuated that storm into eternity. In no way could Scott's tent have withstood the ferocity of the winds encountered at McMurdo this past May, as roofs were listed and much structural damage were encountered at McMurdo. Susan Solomon's excellent book, *THE COLDEST MARCH*, did much to debunk the storm that held down Scott's party. Sir Douglas Mawson's *THE HOME OF THE BLIZZARD* did much to create an awful aura about the ferocity of winds in the Antarctic. But one has to remember that he was writing about the unusually high katabatic winds experienced along the coastline of Wilkes Land. And again we are not sure of how high the katabatic winds may have reached there in the past, as they apparently haven't made an anemometer that can withstand their intensity. So what happened at McMurdo in May ranks right up there with the highest recorded wind speeds in Antarctica. The highest recorded wind speed on the continent is 203 mph at Dumont d'Urville in July 1972.

Last year, in the August 2003 and November 2003 NEWSLETTERS, Chuck Stearns wrote about the automated weather stations that he and his staff had placed in Antarctica over a period of many years. At that time there were twelve in the Ross Island area and another five on the Ross Ice Shelf. Although the storm conked out several of the stations, those that remained have been invaluable in supplying data on the mid-May storm. Cape Bird was out before the event, and Cape Spencer, off of White Island, and Pegasus North, south end of the Pegasus runway, went down in the storm. At the time of the highest winds shown in the traces at NASA radarsat, Black Island, about twenty miles from McMurdo, recorded speeds at 730AM of 117 mph, at

745AM of 142 mph, at SAM of 115 mph, at 815AM of 144 mph, and at 830AM of 101 mph. Minna Bluff had a maximum speed of 112mph. Now if you go away from McMurdo, looking south on the Ross Ice Shelf, you found a maximum speed at Ferrell of 45mph and at Marilyn of 60mph. Even at Gill, way out in the middle of the ice shelf, it was 54 mph. The strongest winds were in that 20-mile region from McMurdo to Black Island where the maximum amount of funneling occurred.

Before we go on, let's set the stage for the analyses which follow. First we contacted Joe Zabransky, a meteorology professor whom I hired fresh out of graduate school more years ago than I would like to admit. He, in turn, put me on to Matthew Lazzara, a meteorologist at the University of Wisconsin who works in the stable of meteorologists associated with Chuck Stearns and his array of automatic weather stations in Antarctica. Soon Arthur Cayette of SPAWAR, an NSF subcontractor forecasting for McMurdo, became involved, as well as another Stearnsfolk, Linda Keller, so along with Joe Zabransky and Matthew Lazzara, we had a team of experts analyzing data from the storm for our benefit. But one thing has remained a constant among all of those people, and that is that this was a major complicated storm, covering a large area, with only a minimum amount of information available, and that everything should be looked at with a questioning eye. Red flags are waving all over the place, yet we feel that we must tell you what the people working on the available data are thinking, or feel like they are thinking.

First of all, if you look at a map of all of Antarctica at the time of the storm, you will probably see a good representative weather map of the Antarctic in winter (see Fig 1), a series of intense storms circling off the coast. But if you look at the Ross Sea area, especially looking at the barometric map of the time, you will see an intense, widely spread low-pressure area. Figure 3 zooms in on the immediate Ross Ice Shelf area, including McMurdo Sound; Figure 3 also shows the wind data from the automatic weather stations.

Zabransky points out that the position and strength of the coastal low pressure center near McMurdo (<964 hPa) in Figures 1 and 3 are questionable. The satellite imagery for (0600 McMurdo time on 16 May) suggest a cyclone center somewhat to the south of the analyzed isobaric low center, near the evident "eye" of the cyclone over the Ross Ice Shelf. The pattern demonstrated by the observed wind field in Figure 3 further emphasizes this offset. The rapid onset of hurricane force winds at McMurdo also seems inconsistent with the isobar spacing depicted in Figures 1 and 3; this had to have been a very tightly wound up system.

There are simply too few observations to pinpoint both the center and strength of the storm. Moreover, the analyses shown in Figures 1 and 3 are not simply based on direct observations, but result from an adjustment of the too-few observations to grid points which are then computer-analyzed for pressure. In this specific case, the isobaric analysis represents an initialized sea-level pressure field produced by the global Forecast Systems (GFS) numerical model.

Cayette believes that the storm was around seventy-five miles wide, and that it crossed over Ross Island, headed south to north. He pointed out that the satellite image for 16 May at 0900, showed a "nicely wrapped low with a distinct center (eye) as it passed just north of Ross Island." He also e-mailed us that the storm indicated a large volume mass influx into the low pressure center. This was indicated by heavy northerly surface winds as the low advanced from the south. Typically McMurdo would see a light to moderate northerly flow, but this push from the south hit within the 15 minute readings (from the automated stations). With the sensors abrupt change in wind speed and the sudden breakage, he assumed that the storm onset was almost instantaneous. A typical McMurdo storm would have a cycling upwards that would last at least an hour. The upper air sounding for 14 May at 1200 McMurdo time, indicated a moderate southerly wind flow just off the surface. From this he assumed that the warm air above 3,000 feet finally broke through the surface inversion allowing the strong southerly flow to push into McMurdo.

The following was received from an unknown source at McMurdo who sent it to a friend who in turn sent it to another intermediary, who in turn sent it to us, but if you read it, you will get the general idea that it was a blockbuster of a storm. One of the old fuel tanks, used for tire storage, was completely destroyed. The entire roof, a 75-ft-wide 46,000 lbs solid piece of steel was lifted off the top of the tank and carried away. Support beams were bent all over the place and the bay door was destroyed. Milvans near the woodgrinder were blown "uphill" towards Fortress Rock. One of the milvans was a 40-footer. The vehicle maintenance facility lost a bay door. Building 126 lost part of its roof. Part of the roof of Dorm 155 came off, and some siding off of two lower case dorms were lost. At least twenty vehicles were damaged, many with windows blown out, and they no longer have any airporters. The above is apparently just the tip of the iceberg, that the damage was much more extensive. Photos showing some of the above can be downloaded at <http://www.southpolestation.com/mcm/storm.html>.

**BRASH ICE.** The Antarctic Society needs a rejuvenation shot as more of us are dying of old age than are being bred into the Society. As most of you know, we started out in 1960, following the IGY, 1957-58, and were more or less a good Old Boys Club in Washington, DC. Now we are coming up on another International Polar Year, 2007-2008, and we are going to have a new station at the South Pole to serve as its centerpiece. We have made contacts with many of the younger generation working in Antarctica, and we are beginning to have a feel for these people and what they are doing on the ice. Believe me, it's a totally new era. South Pole people are finding out who they are, thanks to Bill Spindler and Katy Jensen, who have been doing some high-powered arithmetic. Believe it or not, over a thousand people have wintered at the South Pole, including one who wintered five times. Another, Drew Logan, who lives not too far from where we put these newsletters together, may even have more months at the South Pole than anyone else. Meanwhile, a habitual summer research scientist at the South Pole since 1960, Marty Pomerantz, is coming out with what amounts to his autobiography. But the nature of our Society is going to rest with the younger people, so wish us luck.

This newsletter has a concluding report on the infamous mid-May storm at McMurdo which we covered in some detail in our last newsletter, an account by Matthew Lazzara, Linda Keller, and Arthur Cayette at the University of Wisconsin. This issue presents an analysis of the storm as interpreted by the very well known Antarctic meteorologist, David H. Bromwich, and one of his graduate students, Michelle Lambertson. Enjoy. Good news came out of New Zealand in late October when it was revealed that an inspection of the historic huts at Cape Evans and at Cape Royds suffered little or no damage from the storm which wrecked havoc on both the US and New Zealand stations on McMurdo Sound.

With this Newsletter, we are introducing someone whom we hope will become a frequent contributor to these pages, Katy Jensen of Minnesota and the Antarctic, although probably it should be Antarctica and Minnesota, as she has wintered over three times at the South Pole (her husband has wintered over four times). Please be sure to read her really great profile on Dr. Will Silva, a most interesting person who we had the pleasure and honor of meeting hi person last spring when Drew and Diana Logan brought him to our redoubt in midcoastal Maine.

**CALENDARS.** It is that time of the year to inform you that we have a deal for you, the best Antarctic calendar on the street, the product of Colin and "Smiles" Monteath of Hedgehog House in New Zealand. The cost of shipping went up considerably, well over a dollar per calendar, but we are offering you these calendars at a bargain rate of only \$13.00 each. We did not order what we consider extras this year, so we shouldn't come begging for you to buy later this fall. However, if you order now, beating the holiday rush, we can mail immediately as we have already received our shipment. One of the very best is by one of our favorite photographers, Robert Schwarz of Germany, who has wintered frequently whiter at the South Pole and takes fantastic pictures of the aurora. This year he has a photo with the new South Pole Station hi the foreground. This is one of the very best calendars that the Monteaths have ever put out, so get on the bandwagon and make someone happy with a beautiful calendar. Mail your checks, made out to the Antarctic Society, to the Antarctic Society, P.O. Box 325, Port Clyde, ME 04855.

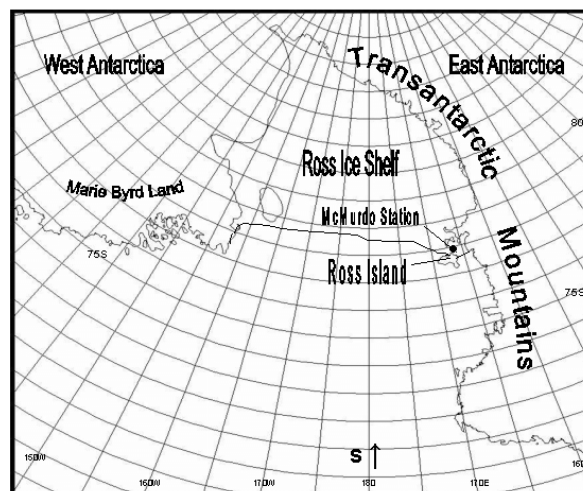

**THE RUTH J. SIPLE MEMORIAL FUND.** As you may recall, our Society has established a Fund in the name of Ruth, with an overall aim of supplying books for the South Pole library, hopefully in a library dedicated to her. Many of you have responded handsomely, and we have approximately \$1500 already in the till. Many of the checks have been for \$50 and \$100, and we are going to reward each of the big contributors with an extension of their membership, a year extension for each \$50.00 contribution. Ann Siple Johnson, the eldest of the Siple girls, acknowledges each donation, and the other two daughters, Jane DeWitt and Mary Cathrin Branon, are informed by yours truly. So far we have heard from such well known Antarcticans as Dick Chappell, Ron Taylor, George Toney, Bob Benson, Anne Benninghoff, Joe Dukert, Pat Wilson, Chester Pierce, Walt Seelig, George Watson, Bob Dale, John Spletstoeser, Art Ford, Tom Frostman, Ken Moulton, Bob Newcomb, and Fauno Cordes, as well as several lesser known penguins. Keep the Fund growing, as a reliable source at NSF tells us that our proposal is still on the board.

**POLLY PENHALE BECOMES ENVIRONMENTALLY SOUND.** (NSF Release.) Antarctic Society member Dr. Polly A. Penhale has been named to the new position of Environmental Officer in the Office of Polar Programs, effective September 19, 2004. As such, Dr. Penhale will have overall responsibility for implementing, overseeing, and evaluating the incorporation of environmental policies and procedures related to environmental management, monitoring, protection and conservation in polar regions. She will have overall responsibility for oversight of OPP research activities from an environmental perspective that provides appropriate protection and stewardship of the environment, working with OPP staff in all three Sections. In addition, Dr. Penhale will represent the United States in the International Convention for the Conservation of Antarctic Marine and Living Resources, and in the Committee on Environmental Protection of the Antarctic Treaty. Dr. Penhale will report to the Director, OPP, in discharging these important responsibilities. For the near term Dr. Penhale will be dual-hatted, continuing her work with the Antarctic Biology and Medicine Program while NSF conducts a search for her successor. She will report to the Section Head, Antarctic Sciences when working in that capacity. Polly has been a great asset to the Antarctic Society, and a frequent contributor to the Newsletter, informing us of news within the NSF network.

**THE TRUE TEST OF AN ANEMOMETER.** (Michelle Lambertson and David H. Bromwich, Polar Meteorology Group, Byrd Polar Research Center, The Ohio State University.) The mid-May 2004 storm that rocked McMurdo has piqued the curiosity of weather aficionados everywhere.

An intense synoptic-scale low developed to the north of West Antarctica, tracked across Marie Byrd Land and the Ross Ice Shelf and then turned northward along the Transantarctic Mountains. (See Figure 1 for a geographic layout of the region.) The most stunning feature of this storm is the particularly strong pressure gradient that set up east of the Transantarctic Mountains and the ensuing extreme wind speeds recorded near McMurdo Station.

As the low moved across the Ross Ice Shelf the central pressure was recorded at 946 millibars. Such low pressure was not observed in the immediate vicinity of Ross Island, however, since the low stalled temporarily to the southeast of Ross Island. See Figure 2 for a regional picture of the location of the low pressure system near Ross Island at 1800 GMT (6 pm Greenwich Mean Time, 12 hours behind local time) on 15 May. Strong pressure rises (around 12 millibars) were recorded farther to the west between Ross Island and Minna Bluff to the south between 1500 GMT and 2100 GMT on 15 May. The resulting strong east-west pressure gradient, constrained by the Transantarctic Mountains to the west, is most assuredly responsible for the dramatic southerly wind event that followed.

*Figure 1. Geographic layout of the greater Ross Ice Shelf*

Beginning at 1730 GMT 15 May wind speeds in excess of 115 mph were recorded at Black Island, just to the south of Ross Island. A peak wind speed of 144 mph was recorded there at 2015 GMT. (See Figure 3.) Just to put into perspective the sheer power of this storm, from Black Island south to the summit of Minna Bluff, hurricane force winds in excess of 100 mph dominated the McMurdo region until 0000 GMT 16 May. (see figure 2, page 3 )

One of the few anemometers (wind speed detectors) near McMurdo still operational after the onset of the storm, Williams Field, continued packing near-hurricane force winds for several more hours.

The Antarctic Mesoscale Prediction System (AMPS), a joint effort between the National Center for Atmospheric Research and the Byrd Polar Research Center (BPRC) of The Ohio State University, routinely provides weather forecasts in support of aircraft operations at McMurdo Station. AMPS employs a mesoscale atmospheric model (Polar MM5) adapted specifically for the polar regions by the Polar Meteorology Group at BPRC. Initial analyses reveal a credible forecast by AMPS for this extreme event. Figure 4 illustrates the mean sea level pressure forecast from AMPS versus the automatic weather station (AWS) observations at Williams Field close to McMurdo Station. AMPS impressively captured the significant decrease in pressure associated with the approach of the storm with only a small error in timing.

Curiosity certainly sparks an interest in understanding this dynamic situation. It is quite apparent that this was not a typical event that unleashed itself on the McMurdo region – even for the harsh conditions in Antarctica.

**Figure 2. Infrared satellite photograph for the Ross Island region at 1800 GMT, 15 May 2004.**

The forecast and observed pressure rose strongly in conjunction with the intense winds, illustrating the complexity of this event. Figures 5 and 6, respectively, show the predicted wind speed and direction in relation to the observations. The overall wind behavior (especially the direction) is well captured by the model, although the speed is notably underestimated during the strongest winds. In general, the winds are the most difficult aspects for numerical models to represent because of the very localized factors affecting their behavior. This event will be used to develop and test methods designed to improve the forecast skill of AMPS; of greatest interest here is the effective use of the vast amount and variety of satellite data.

**Figure 3. Wind speeds recorded at Black Island, Crater Hill and Arrival Heights.**

**ANTARCTIC 'SEEING'** (Margaret Lanyon/Christchurch Press) The best place on earth to watch the stars is one of the planet's most remote and barren locations: an Antarctic plateau that offers views bettered only by the Hubble Space Telescope. Stargazing conditions at the Dome C Antarctic research station, where temperatures are minus 54deg, are so good that telescopes become up to three times more powerful than similar models used at warmer latitudes. Research by an Australian team of scientists suggests that a permanent telescope there would become the most powerful ground-based observatory ever built, even if it were significantly smaller and cheaper than those already operating in Hawaii, Chile and the Canary Islands. Such an instrument would be capable of taking images almost as (continued on page 5)

**Figure 4. AMPS forecast for mean sea level pressure (MSLP) versus automatic weather station (AWS) data at Williams**

**Figure 5. AMPS forecast for wind speed versus automatic weather station (AWS) observations at Williams Field.**

**Figure 6. AMPS forecast for wind direction versus automatic weather station (AWS) data at Williams Field.**

sharp as those from Hubble, at a fraction of the cost, and would provide the best possible alternative to the ageing space telescope when it is scrapped, which could happen as soon as 2007.

Dr. Michael Ashley, of the University of New South Wales, who led the research, says an antarctic telescope would promise an astronomy revolution. "It represents arguably the most dramatic breakthrough in the potential for ground-based optical astronomy since the invention of the telescope," he says. "The discovery means that a telescope at Dome C could compete with a telescope two to three times larger at the mid-latitude observatories, with major cost-saving implications. "Dome C could become an important test-bed for experiments and technologies that will later be flown on space missions. Indeed, for some projects, the site might be an attractive alternative to space-based astronomy."

The most critical criterion for placing ground-based telescopes is a site with good "seeing" - calm atmospheric conditions through which light can travel with minimal interference. Interference from turbulent air is what makes stars appear to twinkle when seen from Earth - they do not twinkle when seen in the vacuum of space - and this effect can ruin the observations of astronomers. Most existing big observatories are sited at high elevations, which tend to have clear and dark skies. Ashley's team worked out that the Antarctic plateau had atmospheric conditions that should be even better. It is one of the coldest and driest places on earth, making the atmosphere exceptionally calm. Previous research at the U. S. Amundsen-Scott South Pole station, which lies on the plateau, has shown "seeing" at the pole itself to be rather poor. Dome C, a base operated jointly by the French and Italian Antarctic research organisations, is 3250m above sea level and 1100km from the sea, higher and further inland than the South Pole.

**COFFEE-TABLE BOOKS.** The SMITHSONIAN September 2004 issue had an eight- page spread on the photography of Rosemarie and Pat Keough's ANTARCTICA published by Nahanni Productions several years ago, which we cited at the time in one of our newsletters. This book probably caused more excitement in the art world than it did in Antarctic circles, as it was a work of art of the very highest quality, but its price of \$3000 (Amazon.com) sort of put it beyond the reach of most Antarcticans who do not have that deep a pocket or prefer to spend their dollars more prudently. There were only 950 books put together, so it is a very limited edition. All books are bound entirely by hand in fine goat leather and presented in a sturdy linen and velvet archival box. The photos are reproduced on luxurious, heavy paper using light-fast pigment and the world's highest resolution lithography. Not

exactly something to enjoy in a tent while out in the field, holed up by a blizzard, although it would be a wonderful conversation piece. It has collected 21 awards for photography and craftsmanship.

This book with 345 plates showing scenes from the subantarctic islands to all accessible locations via Master card or Visa were shot in two austral summers, those of 1999-2001. One noted Antarctic bemoans the fact that this wonderful book is almost entirely devoid of people, although to many of the rest of us, the so-referenced pristine continent's beauty stands on its own merit without habitation by intrepid scientists, their supporting arms, tourists, adventurers, and plain wanderers.

The first coffee-table book of any note during this Modern Era was ANTARCTICA by the eminent Swiss photographer, Emil Schulthess, published in 1960. For its time, a very important time as it included coverage of the reintroduction of science into Antarctica, one could say it was the benchmark into coffee-table books on Antarctica.

There hasn't been a real proliferation of all-purpose Antarctic coffee-table books, but there are enough for us to more or less make an effort to score those on our coffee table, although it turned out to be completely useless. Each one seemed to have many unusual pictures of great individual merit, with the sum of their parts seemingly constituting far more than the whole. It all boils down to our individual tastes. But we do want to mention two which we feel you all should own, Colin Monteath's ANTARCTIC published by Baron's Educational Series in 1997, and Frank Todd's ANTARCTIC SPLENDOR, by Hancock House Publishers in 1993. Both are GREAT.

But it seems like now we are in a period where coffee-table books are more specialized. There always have been photographers out there who want to market their pictures of penguins. The one which this writer particularly likes is Frans Lanting's PENGUIN, published in Japan by Taschen in 1999. I put my money where my heart was, buying *six* for presents for special friends. Recently our newsletter has reviewed Jim Mastro's ANTARCTICA, published by Bulfinch in 2002, and Bill Green's and Craig Potton's IMPROBABLE EDEN, The Dry Valleys of Antarctica, published by Craig Potton himself in 2003. Jim's book has a strong appeal to real Antarcticans, especially to those who have wintered over, as it includes many great pictures taken during the Antarctic night, which you would never find in any other book. With this newsletter, we are reviewing another of the specialized coffee-table Antarctic books,

Norbert Wu's UNDER ANTARCTIC ICE, published by the University of California Press just this past summer.

### **UNDER ANTARCTIC ICE, The Photographs of Norbert**

Wu. (University of California Press, 2004, 177 pages.) This excellent book is actually a by-product of two distinguished Antarcticans, the prime author, Norbert Wu, and Jim Mastro. One of Norbert's acknowledgments is priceless and no doubt truthful, a rarity not always found in acknowledgments. It reads "My wonderful parents, Dr. James and Mei Wu, have always supported me and my wild dreams and deserve acclaim for bringing up a difficult child. My wife, Deanna Mah, deserves kudos for putting up with the same."

When you review a book, I think you are indebted to the public to find something wrong so that the reader thinks you are a qualified reviewer. So to establish this falsehood, we did find something wrong, although it was the cartographer's fault. On the map of Antarctica (p. 2), the Filchner Ice Shelf became Finchler, and Amundsen Sea became Asmundsen. The other map (p. 12), of McMurdo Sound, has four errors on it, and we leave it up to you to find them. The ice shelf was actually discovered on the German Antarctic Expedition, 1912, led by Wilhelm Filchner. He named it after Kaiser Wilhelm, who in turn requested that it be named after the real discoverer.

This is one of the very best coffee-table Antarctic books ever printed, as it combines some outstanding underwater photography with science, truly a wedding of science with great photography. If you can't read or don't want to read, you can surely enjoy the photography. In a totally unsolicited endorsement, we are going to draw upon, without the author's permit, what penguinologist David Ainley e-mailed Bill Sladen on 19 September 2004. It read, "I want to tell you about a coffee-table book by Norbert Wu, "Under the Antarctic Ice", that just appeared and is a celebration of the McMurdo Sound and the southern Ross Sea ecosystem. It's one of the few such books or popular publications about the Antarctic neritic ecosystem. Of course, it is full of great pictures of the photogenic stuff, from cetaceans to fish to various benthic organisms. The text, too, is very well informed, which it should be, given the 40 years of marine research in McMurdo Sound and vicinity. The book comes at a time when we need to be more aware about what we could lose, before it is gone, should fishery pressure continue to mount." And here is another fine endorsement from another Antarctic penguinologist, Gerald Kooyman, author of DIVERSE DIVERS, PHYSIOLOGY AND BEHAVIOR, who heartily endorsed Wu's book, "With its exceptional photographs and lucid text, this book is about as close as you can come to visiting Antarctica without actually going there."

So how can you lose? You can't. And Norbert has a special deal for you all. You can get a personally inscribed copy of his book by spending a very small sum, only \$45.95 (less than the cost of two steaks at your local Outback restaurant) to Norbert Wu Productions, 1065 Sinex Ave., Pacific Grove, CA 93950. Be sure to indicate whom you would like the book signed to. If you have any questions, call Mike Ready at Norbert Wu Productions, (619) 299-3395.

### **PROFILE OF AN ANTARCTICAN: WILL SILVA (Katy Jensen)**

Ask Will Silva, MD what compels him to return to Antarctica year after year, and you'll see a familiar smile. "I love my job," he says. "It's a privilege to be in a position where I can help my community, and contribute to my nation's Antarctic research program."

Will has spent the last seven years balancing his time between contracts on the Ice and climbing mountains, hiking, and skiing all over the world. His passions—the four points of his compass—are music, mountains, medicine, and relationships. He tries to maintain a balance of all four.

Will grew up in a house full of music. His mother had a master's degree in piano from the Yale School of Music, and the family radio was usually tuned to WQXR, a NYC classical music station they could receive at home in New Haven, Connecticut. Will began to study violin when he was six, and though his interest has waxed and waned over the years, he says, "I always bring a fiddle to the Ice."

His passion for the mountains developed while he was in college. Though his parents had taught their children to ski a little, it wasn't until his sophomore year at Harvard that Will "cut [his] hair, sold the motorcycle, and got into backpacking." Soon the backpacking became winter camping, then ice climbing...and within nine months he was headed for the Yukon with his ice axe and crampons.

Will's wilderness experiences taught him how to anticipate and avoid problems. Climbing demanded a situational awareness that was quite different from life in a civilized zone, and he learned the importance of teamwork and trust.

Will graduated from the University of Rochester School of Medicine, and after his residency at Boston City Hospital, he worked as an emergency room doctor in a busy hospital near Boston. But he missed the continuity of knowing what became of his patients, and he soon moved west to Seattle to become a primary care internist. This was his passion...the work he had set out to do. "It was stressful, but I loved it."

But gradually, things changed. Health care in the U.S. was becoming less of a service and more of an industry. He says, "developing a therapeutic relationship with your patients takes time. But financial constraints were limiting the time spent with each patient." After a while, he was expected to think of patients not as people but as "units of production," and there was always pressure to become "more productive."

It all came to a head in the summer of '97, when two uncomfortable nights spent in an Alaskan snow cave gave him plenty of time to think about his situation. Will knew he had to get out of the clinic but he didn't know how. That's when serendipity stepped in: his sister told him about an ad in the *New England Journal of Medicine* that read, "Doctors wanted for Antarctic Research Stations." Will dusted off his resume and applied for the job. After fourteen years at the clinic this was a daunting proposition, but he discovered that the thought of quitting his clinic job and moving on to something more constructive "brought a sense of joy and optimism" he hadn't felt in years.

Will jokes about that first tour at Pole being the solution to his 'mid-life crisis,' but it has become more of a second career. He enjoys working at all three USAP stations because they're each so different. Palmer has the critters, and the boats, and the myriad shades of blue. The Pole is compelling, exotic, and otherworldly. McMurdo is more interesting medically because more people = more work, and "Mac General" has a whole team of medical professionals with whom to share ideas.

To stay prepared, Will constantly runs "fire drills" in his head, asking himself, "What if...? What if a patient presents with appendicitis or an ectopic pregnancy, requiring immediate surgery?" This is what inspired his "MED SURG 101" course, for which he handpicks a team of volunteers from the station crew and teaches them everything from communicating and working as a team to setting up an operating room, creating a sterile field, understanding how medications are packaged and administered, handling medical tools and equipment, and monitoring a patient's condition.

Each time he returns to the Ice, Will sees improvements in the station medical facilities. "Back in '97 we were just starting to talk about video-teleconferencing. Now we're doing it." Raytheon's and NSF's interest in improving Antarctic medical services, and the support of an MD Medical Director at RPSC's Denver headquarters has made a big difference. When Will first started with the program, he had to learn how to develop and interpret wet-film x-rays on his own. Now he can e-mail digital x-ray or ultrasound images to a radiologist in the United States for interpretation. Improved equipment and a formalized consulting arrangement with the University of Texas at Galveston have greatly enhanced the stations' medical capabilities.

Even so, there are challenges. Any time someone gets really sick, or seriously hurt, it's up the station physician to make some tough decisions. If transportation is available, is it better to treat the person on site with limited care, or to request a medevac, during which resources will be even more limited? It's a balancing act, and even having a team of expert consultants on the telephone doesn't make the decision easy.

When asked what advice he might offer, he says, "Work hard and master whatever you choose to do." At the same time, he stresses that it's important not to be monomaniacal about your job. Being a doctor is only a part of who he is...he works hard to improve his medical skills but he enjoys doing other things too. He aspires to the liberal arts model of the scholar athlete—the well-rounded soul.

Throughout his life, Will seems to have made his choices based on the types of people he hoped to spend time with. He chose Harvard because there would be "bright and interesting kids" there, and he enjoys working in Antarctica because "Ice people tend to be intelligent, highly-motivated, versatile individuals." A friend once referred to Antarctica as "a penal colony on an ice planet." Will says that all depends on one's attitude, and boss, and colleagues. With

the right relationships in place, it's no prison but rather, "A very funny Utopia." Relationships, the fourth point of his compass, form the structure that shapes his experiences and makes them all worthwhile.

Will Silva's Antarctic timeline: 97-98

Palmer summer & winter 01-02  
McMurdo summer 02-03 South Pole  
summer & winter 04-05 Palmer  
summer

**THE NEVER ENDING ISSUE.** As it was in the beginning, is now and ever shall be, is Antarctica in a stable state or is it melting away? It was an issue when Byrd and Gould went to the ice back in the 1920s, it was an issue when Crary, Bentley, and Siple went in the IGY, and all you have to do now is read the NATIONAL GEOGRAPHIC of September 2004 or the NEW YORK TIMES of September 24\* to know that some people are worrying about the future of New Orleans. Andrew C. Revkin wrote in the TIMES that some of the Antarctic glaciers have been spurred by warming of coastal air and waters, and that ocean levels might be irreversibly on the rise for centuries to come. Oh, my!

Richard Alley, our Memorial Lecturer in 2001, was quoted as saying in the TIMES that there was cause for concern, justifying a much more intensive survey of the world's thawing places. I think he was telling the government to keep funding him and Alley's Allies. Richard went on to actually say that there could be a short-term rise in sea level that would stop as new fringing ice shelves eventually put the brakes on the glaciers. But it was also possible that conditions would set off "complete or near-complete collapse over centuries or millennia", guaranteeing a flooding of coastlines far into the future.

P.S. A word to the wise. If any of you own any real estate on the eastern side of the Antarctic Peninsula, you had better put it up for sale on eBay. That's a particularly high risk area now, ever since the Larsen Ice Shelf started disintegrating several seasons ago.

**PENGUINS AT CAPE CROZIER - A STORY OF HOW IT BEGAN.** (Dr. W.J.L. 'Bill' Sladen) There is no argument about how and when the study on the Adelie penguin colony at Cape Crozier, Ross Island, began. Bill Sladen was a gift to the U.S. from U.K., where he distinguished himself with not just a Ph.D. (Oxford) with studies of Adelies at Hope Bay and Signy Island with the Falkland Islands Dependencies Survey (FEDS) in the 1940s, but also earned an M.D. and was medical officer.

Bill became instrumental for the location for his Johns Hopkins University penguin study at Cape Crozier, which included, over the years, "a wonderful set of mostly PhD and Masters students including Bob Wood, Richard Penney, Bob LeResche, Roberto Schlatter, Bill Emerson, John Boyd and, of course later, Dave Ainley, who endured the storms, enjoyed the research there and reveled in the rare days when the weather was clear and calm." Together, they banded thousands of penguins, resulting in numerous data that showed everything from arrival at the breeding site in spring to nest occupations. Bill has provided a complimentary review of a book by Dave Ainley, which, depending on your karma about penguins, is an interesting read and a vital part of your polar book collection. A wonderful tribute to Bill comes from Dave Ainley's book:

*"To Bill Sladen, who had one foot on the heroic side of Antarctic exploration the other in the modern scientific side. It was his passion and thirst for knowledge that helped to lead us into the modern age on Antarctic ornithology".* His review has been modified from one that was published in **BioScience - September 2004 / Vol. 54 No. 9.**

**THE ADELIE PENGUIN: BELLWETHER OF CLIMATE CHANGE.** David G. Ainley (illustrations by Lucia deLeiris). Columbia University Press, 2002. 310 pp. \$59.50 (ISBN: 0-231-12306-X cloth).

To those of us Antarcticans, the Adelie Penguin is one of the most appealing creatures of the South Polar regions. It is also amongst the most studied of all bird species. Dave Ainley, one of my former Johns Hopkins PhD students, brings it all together in a delightfully written volume that is certain to please the amateur birder, the polar traveler and the most serious academic ornithologist. It is also very readable, updating the out of print book that Ainley et al. (1983) published 11 years ago.

A study area at the Cape Crozier, Ross Island, Adelie Penguin colony of about 300,000 birds was selected in 1959 for our Johns Hopkins University team when I was sailing on the icebreaker *USS Stolen Island*. A few birds were flipper-banded at that time. Subsequently, up to 5,000 juvenile penguins were flipper-banded each year (1960-70) to build up a population of known-aged birds. Ainley inherited most of this population when they were reaching up to 8 years of age and did a magnificent job in analyzing the data and moving the research forward to what it is now, one of the most important long-term avian population studies. He will shortly be leaving (2004-05) for his 26th visit to Antarctica and the Southern Ocean.

The book's title is meaningful. Definitions give bellwether as, 'a wether or male sheep that leads the flock, usually bearing a belt, or 'something that takes the lead'; e.g. 'Paris remains the bellwether of the fashion industry. Climate change does not change overnight. Thus, the title is a good one. Something that justifies continued long-term research on Ross Island, Antarctica where a simple ecosystem prevails.

Acknowledgments are followed by eight chapters. 1. *Introduction* presents an extremely thorough coverage of the early research on the Adelie's natural history. The book is worth its price for this chapter alone, as well as chapter 2. *Marine Ecology* which summarizes the bird's marine ecology and much new information from areas of research that have seen much progress since Ainley (et al.1983). For example, the development and miniaturization of high-tech equipment to study diving and foraging behavior and from advances in genetic differentiation of populations that comes from the dating of penguin bones in extinct and extant colonies. Chapter 3. *Breeding Populations*, listing every known Adelie colony, summarizes the geographic, size and distribution of its colonies. Chapter 4. *The Annual Cycle* covers the basic chronology of nesting and population dynamics and the molt. Chapters 5 and 6, covering the *Occupation and Reoccupation Periods* add material from Ainley (et al.1983) presenting it in context with additional material from other researchers. These are useful chapters for the professional ornithologist. Chapter 7. *Predation* emphasizes that of the three listed, killer whale, leopard seal and skua, the leopard seal is the only really significant predator. The skua is a scavenger and mostly predares fish at sea. Chapter 8. *Demography* updates Ainley (et al.1983). An important conclusion is reached that flipper bands, the basis of our earlier studies, induced a small mortality during the first year after banding (as one might expect), but not thereafter. Chapter 9. *The Bellwether of Climate Change* comes to grips with the book's title, offering some fascinating hints on how Adelie populations may change in the future. Ainley details the way in which the Adelie natural history patterns have evolved hi relation to sea ice cover at various times of the season. In relation to global warming, I was hoping to learn more about the increase in Chinstrap Penguins at the expense of the Adelie along the Antarctic Peninsula. The Chinstrap breeds one month later; nests on steeper slopes; usually molts on land (instead of in the pack) and is more dependent on open water (Sladen 1955). I found some interesting comparisons in chapter 6 but not in 9.

The art by Lucia deLeiris is superb and could have easily displaced the rather poor photographic reproductions that, out of the many thousands that must have accumulated in 40 plus years, should have all been outstanding. Substituting a hard

back photographic cover for a paper cover was excellent but again the photos displayed could have been more relevant to the book title. My only other complaint is the inconvenience of each chapter having separate bibliographies. Of the 560 total references listed, many are duplicated. One bibliography would have been easier to use.

I cannot resist quoting a section of Ainley's introduction when he so eloquently describes the Adelie coming ashore, as I have so many times witnessed and filmed on the beaches of Cape Crozier:

*"I have always been amazed at the vivid change in demeanor each time an Adelie comes ashore. The act takes incomparable athleticism. It's as if the penguin knows that all the cards are stacked against it, if not this time then certainly the next; if not the leopard seal, then huge waves; if not heaving blocks of ice then an icefoot necessitating a leap of two or more meters. The penguin lands ashore in a bad mood, exasperated and seemingly oblivious to what the beach has to offer. Then as it shakes the water from its feathers its awareness of the colony and of purpose seems to take over. It is only then that the penguin completes the transformation from marine to terrestrial creature. Off it goes, unquestioning and unvarying, sometimes even muttering almost inaudible renditions of calls it will use to greet its mate or chicks."*

A final word about long-term bird population studies which this book exemplifies. Five decades ago it was the amateur independent individuals like Richdale (1957) (Yellow-eyed Penguins and Royal Albatross) and Margaret Nice (Song Sparrow) that led the way. It took a great deal of persuading government agencies to sustain long-term funding for the biological sciences, as they willingly did for the physical sciences. For example, you cannot spend millions of dollars on a telescope and then abandon it after a few years. Two projects that I was privileged to help activate — Lance Tickell's PhD albatross study on Bird Island, South Georgia in 1958 and ours, also Johns Hopkins, study at Cape Crozier in 1961— fortunately have so far survived: but not without some early gaps due to lack of funding. The albatross research continues under the watchful eyes of John Croxall, British Antarctic Survey, and, as presented in this book, the Adelie research continues under Ainley.

Both of these birds are in trouble. The ice, home for the Adelie, is diminishing. The Wandering Albatross, a bird that has evolved to mature at over ten years, lays only one egg, boasts a breeding cycle of 18 months and once abundant is now becoming endangered because of environmentally

unsound commercial fishing methods. Banding studies have shown that many birds are longer lived than we thought. A Wandering Albatross has been recovered at age 41; a Laysan Albatross, when rebanded in 2002, was 51 years old. One of our Cape Crozier South Polar Skuas reached the age of 38 in 2003. All these are long distance travelers.

Dave Ainley, if it had not been for you the mass of data we all helped to collect during the early days of our Crozier study (Ainley et al. 1983) would have never seen print. Now you have done it again. Jolly good show. Keep up the good work and be sure to enthuse young researchers to continue your work as you age. Long-term population studies should continue with all the support they need.

**POLAR CASTAWAYS: The Ross Sea Party (1914-17) of Sir Ernest Shackleton** by Richard McElrea and David Harrowfield Canterbury Univ. Press 2004 (Reviewed by Steve Dibbern) This book is a long overdue analysis of the overlooked portion of the Imperial Transantarctic Expedition led so famously by Sir Ernest Shackleton. This was the part that was so tragically led from afar by remote orders and was uniquely successful in its endeavor but lost its leader and two others in its success.

The story is enhanced by the availability of diaries which were unedited as so many were for publication of popular debt reducing books at the time. Thus we are allowed to hear of the perception that there was a prejudice against the Australian and New Zealanders in favor of the less physically fit (and possibly less intelligent) British members appointed by Shackleton. Certainly Mackintosh (the leader) takes quite a beating and a high level of anger was expressed by the survivors after his death. They felt that they (the australasians) had worked so hard to save his life only for him to throw it away on the obviously thin ice of McMurdo Sound and to take Hayward with him!

The veracity of some of Joyce's leadership claims in his 1920s book also comes in for some critical examination. Other previously under reported subjects were the mental state of many of the participants. Several deteriorated to hermit status and worse. The level of uncertainty after the shin was swept

away and the three deaths on the Southern Party led to such levels of depression in some that they ceased to function.

Another interesting section concerns the treatment of Stenhouse after the Aurora's survival. It is a tale of intra-expedition intrigue, backstabbing and governmental takeover. The book is fascinating to the student of that period of Antarctic history and is a strong cautionary tale of how not to run an enterprise. For all of the laudatory volumes currently extant on Shackleton's prowess as a leader, this was the expedition that he ignored in detail and maybe led badly by weak appointments.

It is well researched, well written by McElrea and very well illustrated by David Harrowfield with previously unpublished photographs. Aside from the photos, Harrowfield has also made a fine contribution of a number of excellent maps which made it easy for the reader to keep track of the narrative's multiple parties. A very good book on a long under-examined expedition. The only successful expedition Shackleton ever led, but also the only one that lost men.

(PS: POLAR RECORD, V.40, No. 214, July 2004, p 278 includes a review of the book by R.W. Richards, THE ROSS SEA PARTY, 1914-17, 2<sup>nd</sup> ed. 2003)

### **SEQUEL TO THE SLEEPING BAG - EAST IS WEST.**

(Art Ford.) In a tongue-twister similar to Herbert Ponting's "Sleeping Bag", where there is some dispute as to whether to use the sleeping bag with the fur side inside or outside, Art has offered the following:

"In parts of East Antarctica West Antarctica is east, in others west. This, of course depends on whether you are in east East Antarctica, or west. However, if you are in west West Antarctica, East Antarctica is west unless you want to go to west East Antarctica in which case it is east. The same holds for east West Antarctica only in reverse except that if you want to go to west East Antarctica, you still go east. No wonder we don't know what we found!"

[From a volume of Leg 28 of the Deep Sea Drilling Project (DSDP) of the Glomar Challenger, in the Ross Sea, the first ocean-floor drilling in Antarctica, in 1972-3, on which Art was one of the geologists.]

### **HERE'S ROB...OUR INCOMING PRESIDENT.**

I cannot imagine that there is a single individual who has visited Antarctica or who has worked in Antarctica or even has simply studied Antarctica for whom the experience has not been an important and perhaps a transforming part of his or her personal and/or professional life. The continent has been having a profound effect on people of all types ever since Captain Cook's circumnavigation. The purpose of our organization, it seems to me, is to provide a forum and a fellowship for those of us who have been so affected by the place.

Antarctica has certainly been a shaping force in my life. I was quite stunned on my 27<sup>th</sup> birthday to discover that I had spent more than one out of every twelve days in my life on the continent (as a result of two winters-over). I first wintered at Byrd Station in 1964 as an engineer for Bob Helliwell's Stanford University's VLF program, recording whistlers and other ionospheric phenomena. I also recorded magnetic micropulsations for a program directed by Sir Charles Wright — it is incredible to think back to this personal link to the heroic era of Antarctic exploration! I returned to Antarctica only ten months later to be the first scientific leader of Plateau Station, which, I am sure would have had the world's record cold temperature, if we had occupied the site for a longer time — it is a few hundred feet higher than Vostok. There were only eight of us at this small outpost - "Eight will dice with Cold Death" was the headline in the Christchurch paper. In retrospect, I am amazed to think that we eight - all so young - were entrusted with this most extreme outpost of the American Antarctic program. I am proud of the amount of scientific papers that resulted from our pioneering year and the two succeeding years that the station was occupied. (Incidentally, it is through his involvement with the micro-met program at Plateau that I first met former president of the Antarctic Society, perennial newsletter honcho, and all-round mover and shaker - Paul Dalrymple.)

By far my most exotic and interesting winter was the winter of 1974 that I spent as guest of the Soviet Antarctic Expedition at Vostok Station. It was a wonderful time to be there. The Nixon detente was in effect, and the Soviets still supported Vostok very well (kilogram this of caviar, e.g.). The station leader, Nicholas Strain, was the most aware and talented of any leader with whom I have worked. I loved the exotic situation and learning the culture and language of my hosts, and representing my country to this group of Russians. It was a transforming experience. I had been married since my previous Antarctic trips, and my wife, Susan, bless her heart, realized how important this experience was for me and took me back when I returned (and gave me two children subsequently). Igor Zotikov met us on the streets of Christchurch the day after my return from the ice, and asked Susan if she perhaps found me a bit more subversive as a result of my year with the Soviets! (Yes!).

My last four trips to the ice, between 1979 and 2001, have all been in support of the Automatic Weather Station program, first for Stanford (Allen Peterson), and later for the University of Alaska (Gerd Wendler) and University of Wisconsin (Chuck Stearns). These stations were originally developed at Stanford and then maintained and improved by Wisconsin. The first three of these trips were in co-operation with the French, and I came to know shipboard life and traverse life with French company. I liked the French attitude: "eat well first, then do good science." I enjoyed both. (Although on long traverse days the corollary attitude, "if you can't eat well then don't eat at all" was a little harder to accept.)

I have greatly enjoyed my experiences in Antarctica and with Antarctic related science. While I have moved on to real estate investment and volunteer conservation and education-related activities, I consider my time on the continent as high points of my life. I know that I share this fascination with all of our membership.

I am counting on past presidents, especially Paul Dalrymple and John Spletstoesser to keep us informed of each other's activities and of Antarctic news in our newsletter, as well as additions to the literature. I count on the membership to keep us on our toes, informed, and to share memories, anecdotes and the fellowship of our common interest in what former Polar Programs Director T.O. Jones at the annual orientation meeting used to call "the strange mistress" who bewitches us all. I thank you for your support.

**BOARD OF DIRECTORS.** We have a good cross-representation of the Society to serve our President. The sergeant-at-arms will be the man who closed the door at the old South Pole station, ending up picking up meteorites while munching on cashews, Tony Meunier. We also have on the Board the boss man who is building the new, modern South Pole elevated station, Jerry Marty. He really does not have time to serve on our Board, but he feels a firm responsibility to help us out. Thanks, Jerry. We even have an old man on the Board, Conrad "Gus" Shinn, who goes back to Operation High Jump. But he is better known as the first pilot to land a plane at the South Pole. Those who really know Gus know him as The Cat Man, as he never saw a cat that he did not like. Our youngest member is Diana Logan, who has wintered over twice in the past few years at the South Pole, and can give us the perspective of the Up and Coming. For continuity sake on the Board, we have extended Polly Penhale, who has been at NSF in the Antarctic Programs Office for a couple of decades. She is also one of our Past Presidents, as was Tony. The very well known historian from the University of Central Oklahoma, Tim Baughman, will bring a new outlook to the group. Another interesting addition is Charles Lagerbom, who got his Antarctic training in the Dry Valleys with the University of Maine's sweat shop group under George Denton. He is also an author, wrote a book on Birdie Bowers, and is Membership Chairman of the American Polar Society. A past McMurdo Biology Lab manager is Ron Thoreson of Montrose, Colorado, who has served as superintendent and head ranger at several national parks. He is our most athletic member, and most distinctive, once serving on the Honor Guard at Ft. Myers, tossing and catching rifles with fixed bayonets. He still has all his fingers, and never had a drop! And last but by no means least, a married man of some 50 years whose time at home with his wife only adds up to 25, our idol, Art Ford of Menlo Park, CA. To read about him, you must read the Newsletter.

**BRASH ICE.** As you might have possibly detected by looking at our cover sheet, we are reconstituting our old format. It's probably the right time to do it, as we have just completed a Quarter Century of Near Dictatorship under the realm of Siple and Dalrymple. With our beloved Ruth now gone, we can close that book, some three and a half inches high, some 155 newsletters, some 1448 pages. That's a lot, especially when you had to compose them, have them printed, fold and stuff them in envelopes, and handle the membership, the treasury, and put them all to bed.

Let's face the facts. Everyone loved Ruth, and we got away with murder because no one actually wanted to cross her. Ruth looked upon us as a team, and I was sacred as long as she lived. But now she is gone, God bless her, and now we have to go back to our By-Laws

and dust them off. Towards that end, at the suggestion of our Antarctic sage, Walt Seelig, we have put in a strong company man as our new President, Rob Flint. Besides being a most distinguished Antarctic in his own rights, wearing nine campaign ribbons, oak leaf clusters for wintering over at three interior stations, battle stars (perhaps scars) for working with the Russians and the French, he has served in high positions with such illustrious groups as the Sierra Club Foundation.

We became more national two years ago when we picked our first non-Washingtonian president, John Spletstoesser, and he led us carefully through our transition period, when our newsletters became grammatically correct. Now we will continue to go forward, somewhat reluctantly shedding our cloak as *a* Good Old Boys Club in Washington, D.C. But you can't possibly change the stripes of a leopard overnight, and as the key center of all Antarctic activities in the USA, Washington will no doubt remain the largest rookery in the mid-latitudes.

We have survived women going to the ice, the military being moved from the ice, NSF being moved from Wash. D.C. to Ballston, Virginia, and we have survived the Academy's Polar Research Board vacating Foggy Bottom. We have lost the greatest Antarctic polar scientist-explorer of all time when Bert Crary died; we lost the golden satin voice of the Antarctic when Larry Gould passed away. We have seen tourism invade Antarctica, twenty thousand a year, all with deep pockets. We have somehow even survived the onslaught of wide-eyed adventurers, some teeing up golf balls atop Mt. Vinson, some even parachuting to their deaths at the South Pole.

During our dictatorship, we have seen a lot, but none worse than the crash of the DC-10 in 1979, whose anniversary will be covered in this newsletter. Many of us who had been at the South Pole in 1958 mourned the death in the crash of the very personable Peter Mulgrew, lecturer on the ill-fated crash, whom we all had learned to love during his stay with us at the Pole. This issue will also include an obituary honoring one of the very best of the good old boys who made our Society what it is today, Charlie Morrison. Thanks, Charlie, for your constant support, and may your tenure with us as our Summer Picnic Bar Tender tend you in good stead up above. Be sure to make Ambassador Daniels' double.

We are going to try and be responsive to the modern-age Antarcticans, and towards that end we have been wooing Katy Jensen to make frequent contributions to our newsletter. And we welcome any other Katys to please step forward and help us out. This is a new era, a real new era. No longer does a Chief Gudmundsen have to set a charge and blast another thirty-foot hole below the throne. Now that creates one wicked-chilling experience for your appendages! And imagine now flying to the Pole, taxiing right up to a portal, and walking inside to a spacious heated room, just as though you were at Dulles. And who knows what is next, a we are about to enter into the 4\* International Polar Year. In the meantime, please support us, support President Rob, our officers, and our Board of Directors. They were carefully selected. Make this Society your very own, and be a part of it.

**NEW HONORARY MEMBER, MARGARET LANYON** (Walt Seelig) We are pleased to report that Margaret Lanyon of New Zealand has been inducted as an Honorary Member of your Society. To those of you who have passed through Christchurch, Margaret needs no introduction. Multitudes of scientists, support personnel, distinguished visitors and artists have benefited from Margaret's smooth operation of the facility at Christchurch, New Zealand.

The New Zealand office is one of the most diverse operations within the logistics system and their scope of work increased dramatically during the past decade as a result of the transition of functions from military to civilian. Margaret's wholehearted dedication, hard work and natural abilities resulted in her increasing responsibilities until the late 90's in charge of a large staff that provided all the essentials to operate multiple support services in Christchurch, together with the movement of personnel and cargo to and from the ice and other points. Margaret's desire to help and "can do anything" ability endeared her to hundreds and hundreds of Antarctic program participants over the years. Relaxing in her 5th year of retirement after a long career with the program, she enjoys many calls and visits from current and past associates.

In recognition of her importance to the program, the Advisory Committee on Antarctic Names named the Antarctic feature Lanyon Peak in her honor. Margaret continues her helpful role in providing e-mails and articles from New Zealand papers on items that might be of interest to the Society.

**RUTH J. SIPLE MEMORIAL FUND** continues with contributions now totaling over \$2500. Remember, if you haven't contributed, anyone who sends in a check for \$50 gets a one-year membership extension with our Society, if you contribute \$100 to the Fund, two more years. Society members who recently have sent in checks are Scott Borg, Peter Harrison, Karen Anderson-Phaup, John Lynch, Jeff Rubin, Myrt Eller, Carl Fisher, Luella Murri, Mildred Rodgers Crary, Bob Byrd Breyer, and Katy Jensen. We thank you all.

**GUY GUTHRIDGE REMINISCES.** Guy G. Guthridge will retire from the National Science Foundation in February after over three decades with the U.S. Antarctic Program.

Trained as an engineer and an English major, he started with NSF as editor of *Antarctic Journal of the United States* and is winding up as manager of the Foundation's antarctic information program. His projects that involved sending people to the Antarctic included artists and writers, Boy Scouts and Girl Scouts, and K-12 teachers joining investigators to enliven science instruction in the classroom.

Guys longest-running project was the *Antarctic Bibliography*. "I inherited it from Kurt Sandved, who started it in 1963 at the Library of Congress." A recompetition in 1999 moved the project to the American Geological Institute. All those years, the Library of Congress had made microfilm copies of the full texts of each publication cited in the bibliography. "Decades before the Internet," Guy remembers, "folks at South Pole Station had all the world's antarctic literature at their fingertips."

"The strangest meeting," Guy says, "was called by the Registrar of Copyright," the enforcer of the Nation's copyright law. "The Registrar was torqued because here was a unit of her very own Library of Congress, pushing the fair-use provision of the law far past what she thought was OK by making microfilm copies of thousands of published antarctic documents." At the meeting, which included copyright lawyers, the Library employee who ran the bibliography said, "The Library is so huge, and our project is so small. Couldn't you just look the other way?"

"After a pause, the Registrar said she'd get back to him on that," Guy recalls. "As far as I know, she never did."

The world passed microfilm by, though, and now much of the antarctic research literature is online. Some of Guy's best moments were running the Antarctic Artists and Writers Program. "When I was a student, I knew I was going to be one of those guys - the fiercely independent writer whose eloquence and insight moved nations. Instead I became the civil servant signing up writers like Barry Lopez and Stephen J. Pyne, and photographers like Eliot Porter and Norbert Wu, with the antarctic program. They did a better job than I would have done," he says.

Asked what he'll do in retirement, Guy says, "Reminds me of what Bert Crary said when he retired. 'It's none of your goddamn business, and if you weren't such a good friend of mine I wouldn't have told you that much.'" But Guy figures boats and the Chesapeake Bay will be part of the picture.

"I'll never stop paying attention to the Antarctic," he says.

**NEW COLD WAR ERUPTS ON SHORES OF LAKE VOSTOK.** ST. PETERSBURG, Russia - Russian and American scientists are engaged in a new Cold War of sorts more than two miles below the thick ice sheet covering East Antarctica. At the center of the dispute is Lake Vostok, a sub glacial body of water the size of Lake Ontario. Scientists believe the lake's water, which has been isolated from the atmosphere for as many as 30 million years, has microscopic life forms that could help researchers understand the effects of earth's climate changes.

A Russian team of researchers is determined to be the first to drill to Lake Vostok's surface. But a group of American and international scientists contends that the Russian drilling method may spoil the project and contaminate the findings. The Russians insist their plan is clean and they will proceed this Antarctic summer with drilling to reach the lake, some 2.5 miles beneath Russia's main Antarctica research station, Vostok, which is 775 miles from the South Pole.

The lake's surface could be reached as early as next year, but the work will be slow and under harsh conditions. It was at the station that scientists in 1983 recorded the lowest temperature on earth: -128.6 F.

The Russians say they have followed all the rules set out under

international treaties governing research and environmental protection of the icy continent. The Russian team, headed by Valery Lukin, will employ a drill rig that uses kerosene to prevent the hole from re-freezing as the drill bit punctures through the ice to the lake's surface. Opponents say that the Russians' water samples from the lake will be spoiled by contact with the kerosene mixture. They have urged the Russians to hold off until a better method can be developed through a consortium of international experts. "The ramifications of contamination would be immense," John Priscu, a geomicrobiologist from Montana State University, said via e-mail from Antarctica. There are some 150 sub glacial lakes on Antarctica's mountainous terrain. In recent decades, scientists have used radio waves and satellite imaging to determine the location and size of the lakes hidden beneath the ice.

Some researchers believe Lake Vostok may have existed when Antarctica was part of what scientist call Gondwanaland, a giant supercontinent that once included South America, India, Australia and Africa and Antarctica. Over hundreds of thousands of years and several ice ages, Lake Vostok was covered over with layers of ice, trapping the lake's water in an area 30 miles wide by 140 miles long. The lake is estimated to be nearly 4,000 feet deep at its deepest point, its water believed to be kept in a liquid state by geothermal currents venting from the lake floor. Ice covering the lake contain a more than 400,000-year-old environmental record of what happens when the Earth's climate changes.

The Russian drilling technique would use atmospheric pressure to draw the lake's water out of the drill hole once scientists puncture to the lake's surface. The pressure differential would force water from the lake up the hole like gas through a siphon hose. The kerosene would not mix with the water, but instead act as a plug moving upward through the drill hole as the lake water jets to the surface, Lukin said. But some believe the water will freeze on the ice sheet, ruining the scientific value of the sample. For more information: <http://www.azcentral.com/news/articles/1128antarctic-lake.html>

**HOLIDAYS ON THE ICE.** Katy Jensen. It is difficult to find anyone who goes to Antarctica who has not missed Christmas. Obviously, that's because the holiday falls smack in the warmest—and thus the busiest—weeks of the short austral summer. At least, that's what we tell our spouses (parents, siblings, and children) when we try to justify another deployment. But it might also be an indication that the type of person who gravitates toward the ends of the Earth often does so to get away from things like shopping, traffic, and crowded gatherings full of strangers wearing uncomfortable clothes. Funny, then, that the very introverts who shun the holidays at home are the first to embrace them when "home" is thousands of miles away.

Consider Sir Ernest Shackleton: the paragon of private souls. Before even dreaming of Antarctica, he spent most of his holidays at sea. But his love for his comrades (or perhaps his love for plum pudding) ensured he always had a portable Christmas celebration, regardless of his geographic location:

**1902:** Shackleton, Scott, and Wilson are slogging across the Antarctic plateau, suffering from scurvy and snow blindness, hoping to be the first men to set foot at the South Pole. In his journal, Scott laments, "But all our ailments together are as nothing beside our hunger, which gets steadily worse day by day." While a lesser man might turn his back on the others and snarf a selfish Christmas treat, Shackleton instead produces a spare sock containing plum pudding and a small sprig of artificial holly. All day, the men feast and walk, walk and feast, speaking fondly of family and enjoying the "reddest of all red-letter days."

**1908:** Shackleton is again slogging toward the Pole, and again, hoping to be the first ever to arrive there. He writes in his journal: "Tomorrow will be Christmas Day, and our thoughts turn home to all the attendant joys of the time." And what a day it turned out to be! "We had a splendid dinner. First came hoosh, consisting of pony ration boiled up with pemmican and some of our emergency Oxo and biscuits. Then in the cocoa water I boiled a little plum pudding, which a friend of Wild's had given him. This, with a drop of medicinal brandy, was a luxury which Lucullus himself might have envied; then came cocoa, and lastly cigars and a spoonful of creme de menthe sent us by a friend in Scotland. We are full tonight, and this is the last time we will be for many a long day.

Indeed. Two weeks later, the men planted their flag a mere 97 miles from the Pole and headed home because Shackleton knew they didn't have enough food to do otherwise.

1914: Aboard the *Endurance*, Shackleton and his faithful crew are full of eager anticipation as they glide through pack ice in the Weddell Sea. This time, the Pole is to be a mere rest stop halfway through an epic journey across the ice. After a merry celebration, First Officer Lionel Greenstreet writes, "Here endeth another Christmas Day. I wonder how and under what circumstances our next one will be spent"

**1915:** Shackleton, a month after the sinking of the *Endurance*: "Curious Christmas. Thoughts of home."

Shackleton's words strike a chord for many of us, who sometimes wonder why we stir up midwinter traditions from home in the middle of the Antarctic summer. Perhaps it's because Christmastime, more than any other time of year, is when we're reminded that each of us has at least two families: the one we leave behind when we head south, and the one we leave behind when it's time to head north again. A brave few have blended the two with mixed results. (At least it removes some of the annual Christian guilt from an otherwise splendid pagan celebration!)

So while those of you on the Ice are thinking of us back home, just know that we're sending warm thoughts your way, too. And, after saying grace, and taking a moment to appreciate our troops in harm's way, we'll take one look at Aunt Edna's gelatin surprise and dream instead of this year's South Pole Christmas Menu, courtesy of "Cookie" Jon Emanuel, who is presently at the Pole...The following is the actual menu for Christmas at South Pole Station:

Appetizers:

Smoked Scottish Salmon  
Fresh Assorted New Zealand, French, and Dutch Cheeses  
Brie en Croute  
Muffaletta Olive Relish  
Sundried Tomato and Arugula Pesto Spread  
Fresh Crudites

Main Course:

Beef Wellington with house demi glace  
Vegetarian Wellington  
Steamed Alaskan King Crab (or perhaps Spiny Lobster

Tails)

Real Mashed Potatoes  
Roasted Mixed Root Vegetables  
Fresh Asparagus

Desserts:

Pumpkin, Apple, and Pecan Pies with Fresh Whipped Cream

AHA! The REAL reason so many Antarticans spend Christmas on the Ice!

Happy Solstice, y'all.

**ANTARCTICA'S DARKEST HOUR** - Margaret Lanyon, from *Christchurch Press*, 29 November, 2004. Remnants of the crashed DC 10 on Mount Erebus have emerged from the Antarctic snow and ice as the country remembers its worst tragedy. A party that flew to the crash site for a 25th anniversary memorial service yesterday morning was stunned to see a section of the fuselage with the letter A and the Air New Zealand colours clearly visible. A jet engine and orange cargo netting lie further up the slope.

The wreckage has not been visible for years but a light snow year and an unusually warm spring have revealed a stark reminder of the tragic end of flight TE901 with the loss of all 257 people aboard. On a clear, relatively mild day those present could only ask again: how could this have happened? The jet, flying on the wrong coordinates and in whiteout conditions, struck Erebus just 500m above sea level.

hi a simple, poignant ceremony yesterday, water from Mount Cook given by Ngai Tahu, was sprinkled at a memorial cross on a bare rocky rise 1km above the speck of the wreckage. The water was a symbol of blessing and of love, the Very Rev Peter Beck, Dean of Christchurch, said. Three wreaths were laid in this place of unparalleled solitude and grandeur. Foreign Affairs and Trade Minister Phil Goff represented the government, chairman Paul Hargreaves, represented Antarctica New Zealand, and Scott Base services manager Major Graeme Tod stood in for Air New Zealand.

**DAVE BRESNAHAN REMEMBERS** (Margaret Lanyon, from *Christchurch Press*, November 29, 2004.) A Commemorative Service was held at Scott Base on the 25<sup>th</sup> Anniversary of the Air New Zealand tragic crash on November 29, 1979, on Mt. Erebus, taking 257 lives. The half-hour remembrance included hymns and readings, a specially commissioned poem by Bill Manhire read by Sir Edmund Hillary, and music composed by Christopher Cree Brown.

The ceremony was moved inside after the skies clouded and the temperature dropped to minus 12 degrees.

An emotional Dave Bresnahan, NSF representative at McMurdo, both now and at the time of the crash, spoke movingly, his voice breaking, of the frustration of not knowing what had happened. "We, just like those in New Zealand, waited and waited and waited. All afternoon. Shortly after midnight we got personnel to the site and learned that no one had survived. I can't express how I felt. I clearly remember walking from our control center back to my quarters about 2 o'clock in the morning. It was dead quiet. No wind. Very calm. People all over McMurdo were hanging out windows, looking out the doors, watching me walk across. Not a word was spoken. Everyone knew."

**\$365,000 BOOST FOR ICE HUT** (John Henzell) The preservation of Sir Ernest Shackleton's historic hut near Scott Base in Antarctica has been given a major boost, thanks to an American charity. The \$365,000 grant from the Getty Foundation will aid the Christchurch-based Antarctic Heritage Trust's goal of preserving the hut from which Shackleton and his men set off for the South Pole nearly a century ago.

Shackleton's hut has been listed as one of the 100 most endangered world monuments, but New Zealand's responsibility to preserve it and two huts used by Robert Falcon Scott - has been hampered by Antarctica's isolation and harsh environment.

Antarctic Heritage Trust executive Nigel Watson said the grant would be used for repair work to preserve the hut for future generations, and also to restore it to its original style. Restoration work will include putting back a canvas roof and replacing the windows installed in 1992 with ones in keeping with the originals.

"Without the support of the international community, we cannot hope to conserve these exceptional sites, which are remarkable symbols of humanity's courage and determination and the only surviving example of habitations built by the first humans to reach a continent," Watson said.

**BERNT BALCHEN FLIES AGAIN** (Review of Bess Balchen's **POLES APART**, published by Red Anvil Press, 2004. Soft cover, \$19.95). If you have trouble finding this book, try the author, Bess Urbahn, 115 Barnestown Rd., Camden, ME 04843-4016.

Although this year was the 75<sup>th</sup> Anniversary of Balchen flying Byrd over the South Pole, the very first flight ever over the South Pole, this is not an anniversary book issued for the occasion. It is more or less a book about the mid-life crisis of the most famous polar flier of all time, trying to set the record straight on one of the most distinguished polar explorers. The author is one of Bernt's three wives, the middle one, and she comes about writing naturall} as she was a professional writer in Balchen's homeland, Norway, when he married her. She wrote this book under the name Bess Urbahn. The book is a Litany of Who's Who in Polar Aviation, accenting Bernt's military connections plus his many celebrated friends.

Does the book try and create a Demi-God in Balchen? Far from it, as even though she writes that he was "one of a kind, a great man", she also points out his weaknesses. The central theme on the book seems to be the withholding of a star by the military, although this didn't seem to be such a catastrophe to Bernt himself. He, however, was visibly and physically upset by his underused situation by the military, and their failure to put him into important slots where his expertise could be used. Three things evidently kept his career on hold as a U.S. Air Force colonel. First, he had limited capabilities as an administrator, being more of a "can do" person. Second, it was commonly known that a rift developed between Byrd and Balchen, and because of Byrd's influence in Congress through his family representation, Balchen's supporters felt that this prevented his promotion to star rank. And third, Balchen had a penchant for booze, and was a heavy drinker. Probably when you get right down to it, all three entered into the equation.

As Bess points out, there are many books that include parts of Bernt's life, but very few good ones. It seems that Balchen never did much reading, nothing about himself, and this even pertains to biographies such as COME NORTH WITH ME. This paperback by Bess throws a lot of interesting stuff about Bernt onto the table for the readers to digest and then form their own opinions. Her marriage to Bernt was not everlasting, but she was there in his mid-life crisis. Although she does not come out and say it in just so many words, you are left with the impression that his drinking became too much, even for a woman who loved him dearly. There are sixteen pictures of Bernt, all very carefully chosen to depict his career. The cover has one of the watercolors for which he was duly famous, often selling out one-man exhibits in a few days.

In the past 25 years, we have mentioned at least twice in these Newsletters the irony of how Byrd and Balchen ended up, side-by-side in Arlington Cemetery — Byrd with a simple white cross like the common masses at Arlington, then Balchen with a very prominent, high stature tombstone overlooking everyone else. But I don't think there is much communication going on between the two!

**HISTORIC HUTS OF THE ROSS SEA REGION.** (John Splettstoesser, APS President) This handsome 44-page booklet, produced this year by Antarctic Heritage Trust (AHT), a New Zealand charity started in 1987, is designed to publicize the four major historic huts in the Ross Sea region, namely 1) Cape Adare hut, British Antarctic (Southern Cross), Expedition, 1898-00, Carsten Borchgrevink; 2) Discovery hut at Winter Quarters Bay, Hut Point, overlooking McMurdo Station, 1901-04, R.F. Scott; 3) Cape Royds Hut, British Antarctic (Nimrod) Expedition, 1907-09, Ernest Shackleton; 4) Cape Evans hut, British Antarctic (Terra Nova) Expedition, 1910-13, R.F. Scott. The mission of the AHT is to conserve the huts and contents for the benefit and inspiration of all. Maintenance of them is expensive, now that their ages have passed the century mark or are approaching it. As the name indicates, AHT is funded by tax-deductible donations, legacies and grants. The huts are visited by National Program individuals in the Ross Sea area (from McMurdo Station, Scott Base, e.g.), as well as many tourists on cruises. For several decades prior to their restoration, some hut relics

were "souvenired" by visitors, but through time, many have also been returned. If anyone is aware of relics that should be returned to the huts, please contact the Trust (email and website below).

If you would like to learn more about AHT or assist financially, contact AHT and consider joining their Antarctic Explorers Club. Further information can be found at [www.heritage-antarctica.org](http://www.heritage-antarctica.org); email [ahat@antarcticanz.govt.nz](mailto:ahat@antarcticanz.govt.nz), or write to the Trust at Private Bag 4745, Christchurch, NZ. The booklet will become yours upon joining this very useful organization. Alternatively, you can purchase a copy of the hut booklet for US\$12.00 (incl. P&P) by contacting AHT. All proceeds go towards the conservation of the huts.

**SHACKLETON'S FORGOTTEN EXPEDITION**, by Beau Riffenburgh. NY/London, Bloomsbury, 2004. 358 p. Reviewed by Tim Baughman.

I began reading this book with two preconceived notions. Sir Ernest Shackleton's own account of the *Nimrod* expedition, *Heart of the Antarctic*, is one of the half dozen greatest polar books. When teaching a course in polar history, I choose it if I can only include one full length firsthand account of south polar exploration. Thus Beau Riffenburgh has chosen to compete with among the finest literature in the field. The second assumption is that Dr. Riffenburgh would approach this material in a meticulous manner and would no doubt produce an excellent volume. His *Myth of the Explorer* remains one of the best books in the body of Arctic studies and offers insights into the whole era of pole seeking in the north. Despite these two assumptions, I am extremely pleased with this current effort.

Dr. Riffenburgh has made use of all the materials that have appeared on the scene in the century since Shackleton penned his account. Moreover, unlike the people who drop in on Antarctic history and whose main motivation to write about Shackleton is to make big bucks, Riffenburgh brings nearly two decades of research, writing, and lecturing about the polar regions to bear on his subjects. Too often Shackleton and other polar heroes have been subjected to what I call "The Antartophile Imperative," the desire of some people,— having learned a little about a polar explorer or having been briefly to the south polar regions—to return and write a bad book about Antarctica. Not so here, in *Shackleton's Forgotten Expedition*, true scholarship shows through.

The reader will be taken through the story of the *Nimrod* but not before the author has set the stage and, in particular, explained the impact of the *Discovery* expedition on Shackleton's emotional and personal development. Therein lies the key to understanding the real importance of the *Nimrod*, an expedition that when I lecture on it, I entitle the talk, "Shackleton's finest hour." Dr. Riffenburgh, too, believes that this expedition shows Sir Ernest at his best.

The author also does a superlative job of placing the expedition and its leader in the context of their times. Gone is the illusion often created in polar writing that all this activity is happening in a vacuum. The reader is taken through the period with pertinent

remarks about what else was happening in Great Britain and the world. Moreover, Riffenburgh's deep understanding of Arctic history provides the reader with insights often overlooked by those writers whose knowledge of the polar regions is transparently thin.

Riffenburgh also develops, with great sensitivity and perception, the complex nature of the marriage of Emily and Sir Ernest Shackleton. The reader sees how the explorer is torn between his desire for fame and fortune and his deep love for his wife and the need for the home she creates for him, even if, most of the time, he can be there only in his thoughts. Riffenburgh portrays Shackleton's passionate desire to return to the ice which has gripped his psyche as certainly as it did many ships of the period. Riffenburgh never loses sight of the fact that Shackleton remained, on certain levels, all his life, a little boy.

The story of the whole expedition is retold with a view to developing the complete story, with attention paid to the cast of characters, not just the star. The outline of the story is known to all polar enthusiasts, but this book gives us all a chance to look at the *Nimrod* again with fresh eyes. The author does a fine job of presenting all the figures from this expedition. We learn much more about Professor Edgeworth David than Shackleton himself would have told us because Riffenburgh has been able to mine much scholarship and other primary materials not available to the great explorer when he wrote. Similarly, the reader will find that other members of the expedition are now more fully and clearly fixed in one's mind, particularly J. B. Adams and Eric Marshall. The author's portrayal of Frank Wild demonstrates why he deserves to be seen as one of the great figures of the heroic era.

I might disagree with some minor points—Scott's motivation in invaliding Shackleton home or Sir Ernest's decision not to sail with the *Terra Nova* relief expedition—but these are issues open to contention and without the possibility of final resolution. I would have preferred the author to mention by name rather than the anonymous "it has been suggested" when discussing historical interpretations. The notes are more difficult to use than necessary, but this fault is that of the publisher. More important is the splendid manner in which he deals with certain complex topics like the controversy between Scott and Shackleton in 1907, about the winter quarters of the expedition and Wilson's role in that affair.

Riffenburgh offers some interesting thoughts about how Shackleton might have made it to the pole had his planning been different. These insights and a broader retelling of the story are what should compel every polar enthusiast to buy this volume and read it.

Riffenburgh chose a difficult task—setting himself up against Shackleton and his amanuensis Edward Sanders—but he has acquitted himself marvelously. In the process he has shown once again that he is a scholar of the first rate and that he had one of the qualities most appreciated by Heroic Era British explorers: he has pluck.

**JACKIE RONNE IS ON THE STREETS.** For the past three weeks we have been trying unsuccessfully to get a copy of Jackie's new book, *ANTARCTICA FIRST LADY*, but have failed as we go to press. We know of only one person who has read the book, and he

said his comments were strictly "off the record", which in itself must mean that the book will be of interest for what is included. Or for what perhaps may have been omitted!

When Jackie writes you assume that she is including the whole Ronne clan, from Martin Ronne down through her own grandchildren. Four generations, all whom have been to the ice!! But the book could also just be about Jackie herself, as she has had a singular career of her very own. So I guess you are going to have to buy the book and find out for yourself.

The publisher is Clifton Steamboat Museum and Three Rivers Council #578, Boy Scouts of America, 4650 Cardinal Drive, Beaumont, TX 77705. The ISBN numbers are 13:978-1-57579-298-2 and ISBN 10- 1-57579-29-2 . And Good Luck to you.

**ART FORD TELLS ABOUT HIS VERY INTERESTING LIFE.** Art's PhD (Geology) research, University of Washington (1958) was the first study of Glacier Peak, one of the North Cascades major, active volcanoes. In 1958 he, his wife, Carole, and 1-year-old daughter, Judy, piled everything they owned into an old Ford and headed south for his first job, as Asst. Prof. of Geology at San Diego State College (now University). He was happily teaching there when a cable arrived in August 1960 inviting him to take a USGS geologist position for an expedition to the unvisited "eastern Horlick Mountains" (85°S, 90°W), later named the Thiel Mountains after the late University of Wisconsin geophysicist, Ed Thiel. Art's great wife said "OK," and his department chairman gave him a six-month leave of absence for his temporary USGS appointment. Art eventually arrived at McMurdo in time for a Thanksgiving dinner and flew back across the dateline to reach Old Byrd Station in time for a second Thanksgiving dinner. What a great introduction to Antarctica! No Hercs then, he flew in a vintage DC-3 (US Navy, R4D8), and met other party members, including cartographic engineer Pete Bermel. Weeks passed waiting for the expedition leader, who was stranded in Christchurch by Navy medics, who suddenly found he had a medical problem and could not continue south. A cable to Old Byrd informed Art and Pete they were elevated to co-leaders of the expedition. The expedition was a success (all came back alive) and the USGS asked Art to stay on and lead the USGS geology program in the Transantarctic Mountains. So Art gave up a promising academic career for the government bureaucracy of USGS. Art returned as expedition leader for the 1961-62 summer in the Thiel Mountains. His work extended to previously unvisited parts of the Pensacola Mountains (Paruxent Range, 1962-63) and to Dufek Massif and Forrestal Range, 1965-1979, as expedition leader to study one of the world's largest layered igneous-rock complexes, the Dufek intrusion.

Art was a geologist on first explorations of the Lassiter Coast (southern Antarctic Peninsula) in 1970-1971; and, with the British Antarctic Survey in 1986-1987, on the Black Coast of the Peninsula, an area containing the last previously unvisited major mountain ranges left on earth. He was a geologist/sedimentologist on the first Antarctica cruise of the Deep-Sea Drilling Project ship,

D/V *Glomar Challenger*, on a 1972-1973 cruise into the Ross Sea that still holds the record for length of a DSDP cruise (75 days at sea). Drill sites in the Ross Dependency that showed evidence of hydrocarbon gases brought front-page news in New Zealand newspapers. In the middle of the Cold War, in 1976-1977 (Brezhnev, USSR; Carter, USA), Art was an exchange scientist on a USSR geological study of the Shackleton Range, working out of Druzhnaya ("Friendly") Base on the Filchner Ice Shelf.

Art is the only person who has participated in all nine of the SCAR-sponsored international symposia on Antarctic earth sciences, beginning with the 1963 Cape Town meeting and through Number IX in Potsdam, Germany, 2003. His abstracts and papers are in many of these volumes.

Art's numerous publications of reports and geological maps include Antarctica, Encyclopedia Britannica, 15th ed., 1974 (with periodic updates to 1995); and Geology and Crystallization of the Dufek intrusion, Pensacola Mountains, 1991, in Tingey, R.J., ed., The Geology of Antarctica, Oxford University Press. In 2003 he was contributor on rocks to the book Encyclopedia of Antarctica and the Arctic published in Australia.

In all, Art has spent 13 summers working with Ski-Doos out of tent camps in remote parts of Antarctica. Through all of that, as well as prior graduate school and later boreal field seasons in the North Cascades and Alaska for 35 years with the USGS, and succeeding years after retirement going on cruises to Antarctica and the North Pole as geology lecturer, his amazing and incredible wife hopefully will stay with him until next September 25<sup>th</sup> when they will celebrate 50 years of matrimony (but some 25 years together).

**CHARLIE MORRISON, A FRIEND TO ALL, SUCCUMBS AT AGE 77** (Pete Bermel) Charlie Morrison died November 27 at Fairfax (VA) Inova Hospital of complications from a massive heart attack suffered at home on the evening of November 17. He initially was placed on life support but never regained consciousness. The thought is that he was oxygen-deprived for too long.

Charlie was a long-time Antarctic Society member and a mainstay back in the 70's and 80's. When the Society used to have a summer picnic to celebrate Antarctica Mid-Winter Day, Charlie would make the arrangements at Stronghold Estate, and arrange for the catering from a local restaurant. He was on the board of directors and a prominent member.

Returning to Altoona, he found his high school diploma waiting for him. He enrolled in the Pennsylvania State University on the GI Bill, graduating in 1951 with a degree in forestry, marrying Dorothy, and beginning a 33-year career with the U.S. Geological Survey. He also began a lifetime obsession with Perm State football and wearing Perm State gear.

After a period of training, the USGS declared Charlie to be a topographer - a maker of USGS topographic quadrangle maps and all of the many varied surveys that make up topographic operations. The

early part of his career included field surveys in many of the states east of the Mississippi River, with assignments in the north during the summer and in the south during the winter. If you sign on with the USGS you had better be prepared to move. Nothing is less useful than a mapmaker after his map has been made. Charlie and Dorothy were in the field 12 years, and during that time they made 31 moves - and that is nowhere close to a record on the Survey!

Eventually he was assigned to the USGS research center in McLean, testing new field equipment for its potential usefulness and trying new methods of completing field surveys. And then he was transferred to the Branch of International Activities, leading to assignments in Antarctica, Saudi Arabia and Yemen.

Charlie's Antarctic assignments were all in the field away from base camp. Walt Seelig remembers meeting Charlie in Christchurch in 1964, when Walt was NSF rep there. And he also remembers hearing shortly after Charlie was at McMurdo that there was a new USARP that the Navy seemed to like and who could get anything for anyone who needed it. Charlie's time in the Navy was beginning to pay off.

In 1964 he went down as part of a USGS party to establish the Byrd Ice-Strain Network, a series of 1 km. quadrilaterals that were to stretch into Marie Byrd Land from Byrd Station. The corners were marked by 4x4 posts and by very accurately measuring the original net and remeasuring it at later dates, NSF hoped that the deformation would give glaciologists new information on how the ice sheet was flowing. Some hot shot PR type dubbed it the picket fence even though you couldn't see from post to post without a scope. Not a very adventurous beginning in Antarctica, but one that required living in the field and taking very accurate angular measurements.

Later that season he participated in a long-term project of taking astronomic observations at the South Pole before the advent of GPS to determine the rate and direction of movement of the ice there. South Pole Station was collapsing under the weight of ice and NSF was in the planning stages of a replacement facility. The life of the new station was planned at 25 years and NSF wanted the South Pole Station to be directly over the South Geographic Pole at its half-life of 12.5 years and they asked the USGS to help them determine where construction should take place to make this happen.

His next three assignments on the ice were more conventional for a USGS topographer. In Marie Byrd Land in 1966-67 and in Ellsworth Land in 1968-69 the mission was to establish geodetic control for more maps in the 1:250,000-scale topographic series. Two events are noteworthy: he survived a helicopter crash and conducted high latitude operations on the first GPS equipment designated as field portable (24 boxes which weighed 1,800 pounds). Charlie also told the tale of a fly that emerged from a frozen package of New Zealand mutton when it was thawed, and how the camp felt it was a scientific oddity and should be

preserved. Eventually the camp cook ended the discussion, but the story was typically Charlie.

In 1971-72 he was in charge of the USGS survey party that worked with a New Zealand party to establish control in the McMurdo Dry Valleys for larger-scale mapping. This was the first cooperative venture of this nature and resulted in the maps being jointly produced through photogrammetry and cartography and printing. As usual, Charlie worked well with everyone.

His work in Saudi Arabia was funded by the Kingdom's Ministry of Petroleum and Mineral Resources in an effort to locate minerals in the western Precambrian shield area to balance the proven petroleum resources in the east. Work in Yemen was part of an AID project intended to provide much-needed water resources to a water-starved nation. Although not as remote, culture and bureaucracy combined to make some aspects of the jobs more difficult and frustrating than Antarctica. For example, Yemen controlled all telephones in the country and for weeks held up entry of electronic distance-measuring survey equipment because they were equipped with phones that allowed operators to talk with each other while measuring distances between the units. Cell phones have probably solved this problem by now.

Charlie retired from the USGS in 1984, but not to a life of leisure. He became a volunteer guide at the USGS headquarters in Reston, taking school groups and others on tours of the building and explaining the mission of the Survey. His down-to-earth way of explaining things and his outgoing nature made him a favorite with students and teachers alike. And he knew everyone there - not just former coworkers, but the guards, cleaning ladies, and the entire cafeteria staff. He earned the title "Mayor of the National Center." On the annual USGS Open House dates, Charlie would help man the Antarctica exhibit.

He also volunteered as a driver for Meals on Wheels and no doubt was a bright spot in the day for many he visited. Charlie also made himself available to pick up and deliver to local hospitals emergency staff who were stranded at home during extreme snowstorms.

Charlie had a 1935 Ford 3-Window Coupe that was purchased new by a member of his family and he had it restored at a place in White Post, Virginia that has a national reputation for restoring antique autos. They take the car apart until there isn't a nut on a bolt and the entire car is just lying there. Any part that is damaged or missing is made in their machine shop and when the car is rebuilt the original owner would recognize it as the image of what he had bought years ago. Charlie entered his Ford in auto shows and at first the picky judges found bolts that should be painted, etc. Finally he got it perfect, bought a trailer to take it all over the country, and began winning all shows. After receiving the highest award given, he was invited to shows to participate but not to compete. He took a lot of pride in that old family Ford.

Charlie was very proud of being a docent at the new Udvar-Hazy Center of the Smithsonian Air and Space Museum near Dulles

airport. To be qualified to speak about and answer questions on all of the many aircraft in the huge facility boggles the mind. He spent much time and effort even before the center opened to become certified as a tour guide and he loved to tell about the people and the groups he met while giving tours.

He was extremely proud of his heritage and looked forward to celebrating it each year at the Scottish Days in Alexandria, and yes - he wore his kilt with the Morrison tartan. For a number of years he was the head of the local Morrison Clan, and would be pleased to let you know that John Wayne's real name was Marion Morrison.

In addition to our Society, Charlie belonged to the Old Antarctic Explorers Association and attended their first reunion in 2002 in Pensacola. Morrison Bluff in the Kohler Range in Marie Byrd Land was named in his honor by the U.S. Board on Geographic Names. NSF gave him the Antarctic Service Medal and the Department of the Interior presented him with its Meritorious Service Award.

Survivors include his wife of 53 years, Dorothy Irene Morrison, of Vienna, Va.; three children, and three grandchildren.

Services were held in his church in Vienna, and in addition to the minister, speakers were Rad Radlinski who talked about Charlie and his association with the USGS and the retirees group, a fellow docent from the Udvar-Hazy Center who had been paired with Charlie recently, Walt Seelig who spoke of Antarctica and Charlie's work there, and Pete Bermel who had personal remembrances and reminded people of all the lives Charlie had touched and to keep their memories of Charlie alive. Charlie was buried in Altoona in a Morrison Family plot.

**GORDON ROBIN, SMALL IN STATURE, GIANT IN ANTARCTICA** by Charles Swithinbank. Gordon Robin was a leading figure in British polar research throughout the latter half of the 20th century. Most of his polar work was based at the Scott Polar Research Institute (University of Cambridge) but he began with FIDS (the Falkland Islands Dependencies Survey (later renamed BAS - the British Antarctic Survey)). Australian by birth, Gordon was educated at Wesley College in Melbourne and the University of Melbourne. Graduating in physics at the height of the war in 1942, he joined the Royal Australian Navy. After being commissioned as a sublieutenant he served in a corvette before coming to England and serving in MTBs. Back in the Pacific, and now a lieutenant, he joined the submarine HMS *Stygian* and saw action in the closing stages of the war with Japan.

After being demobilized, Gordon sought to pursue research in physics. Professor Mark Oliphant (also an Australian) took on Gordon as a research student to work with the University of Birmingham's cyclotron project. It so happened that the Birmingham Vice-Chancellor was Raymond Priestley (also Australian) who had worked in the Antarctic with both Shackleton

and Scott. Admitting to a long-held ambition to visit Antarctica, Gordon was directed to Cambridge and to James Wordie. Wordie was the geologist with Shackleton's Imperial Trans-Antarctic (*Endurance*) Expedition of 1914-1917 and was now influential in supporting not only FIDS but also the Scott Polar Research Institute. These contacts led to an offer to join FIDS for one year as a meteorologist in the South Orkney Islands. Two weeks after signing on, Gordon was on his way south. Sailing from Montevideo in SS *Trepassey*, one of his companions was Ray Adie (later Head of Earth Sciences at BAS). Appointed base leader, Gordon's first task was to move the FIDS station from Laurie Island to Signy Island. On Signy he studied the synoptic meteorology of the area, also making a plane-table map of the island.

On leaving Signy in February 1948, his role as base leader was taken by Dick Laws (later the Director of BAS). Within months of rejoining the physics department at Birmingham, Gordon heard of plans for the Norwegian-British-Swedish Antarctic Expedition of 1949-52. The story of that eminently successful expedition has been told in John Gjaever's *The White Desert* (New York, E.P. Dutton & Co., 1955) and Charles Swithinbank's *Foothold on Antarctica* (Lewes, England, The Book Guild, 1999). Gordon was responsible for studies of upper winds over Maudheim during two winters and seismic ice-depth sounding during summer expeditions inland. His tractor traverse penetrated 620 km into the interior and measured ice thicknesses of up to 2450 m. These were astonishing results and beyond earlier estimates of ice thickness in Antarctica.

Returning to Birmingham in 1952, Gordon spent the next five years working up his Antarctic studies while at the same time teaching and doing laboratory experiments on factors affecting the velocity of seismic waves in ice. After earning his Ph.D in 1957, he was awarded a senior research fellowship at the Australian National University in Canberra. However, after only a few months in Australia he was offered the directorship of the Scott Polar Research Institute in Cambridge. Whereas earlier directors of SPRI had been part time, in 1958 Gordon became the first full-time director. This was during the International Geophysical Year, when several national expeditions (notably the US) extended Gordon's seismic work by conducting extensive inland traverses in Antarctica.

The success of the IGY in terms of international collaboration led in 1958 to the formation of SCAR, the coordinating body for Antarctic scientists. The Royal Society appointed Gordon as UK permanent delegate. Later he became secretary of SCAR and eventually president from 1970 to 1974. The friendships and associations established during this period were to prove of immense benefit to SPRI throughout the ensuing 30 years. As a small research institute, SPRI lacked any logistical capability of its own. Gordon saw that the key to future field work lay in developing original research programs of such quality that collaboration with SPRI was sought by institutions having stations, ships or aircraft. Ionospheric research at the British Royal Society's IGY station at Halley Bay had shown that radio waves were passing through the ice shelf before being reflected at the ice-water interface. This confirmed reports by Amory Waite (who had served in the

Antarctic with R.E. Byrd in 1934) that he had inadvertently measured ice thickness with a radio altimeter, and suggested to Gordon that it might be possible to design an instrument for measuring ice thickness. In 1959 Gordon recruited Stan Evans, who had wintered at Halley Bay, to design such an instrument.

Through collaboration with BAS, the SPRI Mark I radio echo sounder was successfully tested on the Brunt Ice Shelf in 1963. Later, in collaboration with the US Army, Gordon deployed a Mark II version in Greenland. He used the data to study the relationship between surface slope and ice thickness. Internal reflecting layers within the ice sheet were shown to represent time horizons, so that once dated, the depth of a given layer could indicate the rate of snow accumulation since it was laid down.

The logical extension to the new technique was to put the instrument in an aircraft, and this Robin and Evans did in 1966 with the collaboration of the Defence Research Board of Canada. This led to trials in Antarctica with the collaboration of BAS and led in 1967 to an invitation from the US National Science Foundation to use US Navy aircraft. Such was the success of these operations that they continued for several years, surveyed a substantial proportion of the ice sheet and brought in other collaborators. In order to assist with analyzing the wealth of data obtained, Gordon and Stan Evans took on a series of research students. The result was not only a steady output of publications but more than a decade during which the SPRI was producing more Ph.Ds in glaciology than any other UK university. None of this could have been achieved within the confines of SPRI's original 1934 building in Cambridge. Through his SCAR contacts, notably that of Dr Laurence M. Gould who had served with Byrd at Little America in 1928-30, Gordon secured a substantial sum from the Ford Foundation. With contributions from other donors, this allowed an extension to be built in 1968 which tripled the capacity of the institute. Quite apart from the institute's reputation for academic excellence achieved during Gordon's directorship, the new building will represent his most lasting legacy. Throughout his time at the SPRI, research in Russian studies begun by Terence Armstrong in 1946 has continued, and other groups concerned with Arctic geology, remote sensing, polar history, polar ecology and polar oceanography have flourished. A post-graduate teaching course in polar studies has resulted in more than 100 students graduating with an M.Phil. degree. Quite apart from directing these developments at the institute, Gordon's own research output in glaciology was prodigious. He made seminal contributions to the study of ice shelves; the history of the Antarctic ice sheet; the interaction between ice flow and sub glacial topography; temperature distribution and its bearing on climate change; satellite radar altimetry; sub-glacial lakes (which he discovered in 1967 while using USARP's R7V Super Constellation); and the attenuation of ocean waves in pack ice. Gordon Robin was born on 17 January 1921 and died on 21 September 2004. He is survived by his wife Jean and their daughters Caroline and Elizabeth. (Note: An excellent article on Gordon's life and times was published in *Polar Record*, Vol. 39, No. 208, 2003, p. 61-78).

### EREBUS VOICE

#### The Mountain

I am here beside my brother, Terror  
I am the place of human error  
I am beauty and cloud, and I am sorrow  
I am tears, which you will weep tomorrow  
I am the sky and the exhausting gale  
I am the place of ice I am the debris trail  
I am as far as you can see  
I am the place of memory  
And I am still a hand, a fingertip, a ring  
I am what there is no forgetting  
I am the one with truly broken heart  
I watched them fall, and freeze, and break apart

#### The Dead

We fell,  
Yet we were loved and we are lifted  
We froze,  
Yet we were loved and we are warm  
We broke apart.  
Yet we are here and we are whole

The above commissioned poem by Bill Manhire was read by Sir Edmund Hillary at the 25<sup>th</sup> anniversary commemoration of The Darkest Day in the history of the Antarctic, November 28, 1979, when 257 persons lost their lives when an Air New Zealand DC-10 crashed on the lower slopes of Mt. Erebus. Hillary was originally booked to be the Antarctic lecturer on this ill-fated flight, but was replaced by his very best friend, double-amputee Peter Mulgrew. Peter was known and loved by all the Americans at the Amundsen-Scott South Pole Station where he stayed for nearly a month in January 1958 while a support member of the New Zealand party of The Commonwealth Trans-Antarctic Expedition.. Sir Edmund, who lost his wife in a plane accident in Kathmandu, is now married to Peter's widow who opted not to attend the heart wrenching ceremonies.

**BRASH ICE.** When we start to think that it is about time to start another Newsletter, we often wonder where we will find the material. Such was the case this time, but slowly the pieces began to appear like pancake ice on the surface of the cooling Antarctic waters. It seems almost impossible to find something of interest for everyone because of our diverse membership formed over more than 45 years, but there are some ageless items that will appeal to all ages. Our cover page melodramatic poem about Antarctica's Blackest Day should move everyone. The story of the whereabouts of the B14 family of icebergs will hopefully tell you more than you have been able to read in your favorite home-town newspapers, and actually pinpoint where they were within the past month. The first hand account of life at Palmer Station by the erudite Dr. Will Silva will be a real revelation to old timers as well as current OAEs. He writes in a very appealing vein, off the cuff, letting the chips fall where they may. We love his honesty and his forthrightness. Following Will's story on Palmer Today, we have a flashback story dating back to Byrd Station in 1958, telling what has happened to an IGY scientist, John Annexstad in the intervening forty-seven years. We also have another interesting contribution from Katy Jensen, just back from the ice before her husband took off to winter-over at the South Pole for yet another year. It's a new ball game now with a large cadre of repeaters.

Jerry Marty informs us that the Domed South Pole Station is doomed to go to Port Hueneme, California, where it will become a part of the USN Seabee Museum. The NSF is proceeding with the cooperative planning with the US Navy for the disassembly and its reassembly, phasing out the old station in the austral summers of 2007 and 2008. How about mat!!!

#### **REUNIONS.**

**Deep Freeze Spring Fling 2005.** 22, 23, 24 April 2005, Dayton, OH. POC Edson B. Waite Jr ([ebw@thewaitegroup.com](mailto:ebw@thewaitegroup.com))

**Retired Seebee Association 11th annual reunion,** 29 April thru 1 May 2005, CBC Gulfport, MS. POC Bill Stroup ([stroup597@aol.com](mailto:stroup597@aol.com)) (228), 864-3270

**ADFA 2005 Reunion,** May 3-5, 2005. Biloxi. MS. POC Dick Bowers ([rbowersindy@comcast.net](mailto:rbowersindy@comcast.net)). Celebrating the Fiftieth Anniversary of Operation Deep Freeze.

**MEMBERSHIP.** Eighty-five percent of you folks have paid their dues, and those of you who haven't are getting another bill in this Newsletter. As this is a one-man operation, it would help the treasurer if you renewed for multiple years. And if

you want to go inactive, that is okay, too, but please return the form with the inactive line checked.

The earliest listing of members that we could find in the files is one of January 31, 1961. Ten of them are not only alive, but are still members. From the wintering over ice parties from the first year of the IGY, we have Gordon Cartwright of Mirny, George Toney of Byrd, and Herb Hansen of the South Pole. Of course the ancient and venerable Bill Sladen goes way back into the 1940's with the Brits, being our most senior member, Ken Moulton and Walt Seelig had long and distinguished careers with NSF; Phil Smith was with both NSF and the National Academies, and Bill Littlewood worked for the State Department. Two of our long-termed members, Len Dykes and Betty Didcoct Burrill, both worked for the government agency which we do not talk about. Of these old stalwarts, Betty was the prettiest, Ken the most handsome, Phil the youngest, Bill S. the most active, Walt the luckiest, George the most legal, Gordon the most international, Herb the most weatherwise, Bill L. the most philatelic, and Len the most underground.

**RUTH J. SIPLE MEMORIAL FUND.** Some big contributors surfaced since our last Newsletter in December, so the total has grown from slightly over \$2500 to over \$4000. People who contribute \$50 or more receive a waiver of a years' membership dues to the Society for each fifty dollars donation to the Fund. Many prominent, big-named Antarcticans came through during this last reporting period. You can find their names among Rob Flint, Phil Smith, John Middaugh, Lou Lanzerotti, Gisela Dreschhoff, Tom and Edith Taylor, Pete Barretta, Gracie Machemer, Ed Williams, Bob Dodson, Ron Thoreson, Mel Havener, Rosa Rubin, Steve Dibbern and Bill Spindler. On behalf of all the Siple daughters and the Fund, we thank you. We also hope to have some good news on the Fund by mid-summer, at the latest.

**OUR PRESIDENT HAS JOINED THE MAJORITY (ROB FLINT).** The majority of visitors to Antarctica nowadays are tourists - about 20,000 last year according to IAATO statistics. I remember seeing a promotional film in 1973 for Lindblad's Antarctic cruises - Lindblad was one of the first to offer a tourist trip. In the film, a waiter is serving at a beautifully appointed table while icebergs and mountains slide by outside of the window. It seemed a long way from the Antarctica that I knew. Now I have been to the tourists' Antarctica, too.

After nine expeditions spanning 37 years, working as an engineer in support of a variety of scientific programs, my 2005 trip to the continent was an opportunity to see the

continent from the tourist perspective, AND to take my family to a part of the planet which has had a profound influence on my life. I, my wife and grown children and their companions were passengers on the *Orion*, a comfortable, very modern (launched November 2003), small (106 pax), cruise ship for a 10 night round trip from Ushuaia to the Antarctic Peninsula. Much of the group were Yale and Harvard Alumni and spouses, though the passenger list was geographically diverse with fellow travelers from as far as Australia and Britain.

From the descriptions of other tourists and photos and brochures, I had a conception of how the trip might be run and what to expect, but I must say the actual trip exceeded all my expectations for spectacular scenery, profusion and approachability of wildlife, professionalism of staff and crew, and comfort of accommodations. We were very fortunate with weather - calm crossings of the Drake both ways, virtually no precipitation, and several days of bright sunshine. Elsewhere in this newsletter, Will Silva notes that Palmer Station has 90% cloud cover, but our morning there was cloudless and still. Lemaire Channel was, if anything, even more magical than its reputation.

Typically, we enjoyed a shore excursion morning and afternoon of each day on the peninsula - nine beach landings plus one Zodiac cruise among icebergs without landing. The shore excursions ranged from touring wonderful, crowded, noisy smelly penguin rookeries and seal wallows, to a some fairly strenuous hikes to overlooks, to science tours at Port Lockroy and Palmer Station, to historic sites at Deception Island and Paulet Island. And we had perfect weather for the S.T.T.T.D. - or Stupid Tourist Thing To DO - wallow in volcanically warmed water in Whalers' Bay at Deception Island (yes, it IS a kick!).

The lecturing and guiding staff were truly excellent. Each one was an expert in his or her field, and they were all personable and interested in giving the guests a quality experience. Of special note was John Annexstad of this Society whose Antarctic experience goes back to IGY. It was great to renew acquaintance with him. Warren Zapol, also of this Society was the lecturer for the Harvard Alumni group, and his lectures on his seal research were high points. (Another Antarctic veteran among the passengers was Dr. Bob Laird, who wintered at McMurdo for Dr. Wohlschlag in 1963.) Warren's wife, Nikki gave a good lecture on the legal status of Antarctica, and the Yale lecturer, Ron Smith, gave several talks on plate tectonics, global warming, and other subjects.

My impression was that the tourist operation was run very sensitively, both for safety and for minimizing tourist impact.

The staff took the IAATO rules very seriously and imparted that seriousness to the guests. I believe that tourism is a very good thing (with these controls) for increasing the constituency for the protection of the continent.

I asked my family for their impressions of the trip. My nephew Nicholas West writes, "I was impressed by the size of the mountains and the multitude of life in such an extreme place. The knowledge that this area is huge and practically untouched in this day and age is amazing. The sheer natural beauty was impressive - I think it can be hard to do it justice even with photos. (And I also learned how much those cute penguins can stink up the place!)"

My son Alexis writes, "I can't say my point-of-view would be that of a 'typical tourist' because the typical tourist hasn't grown up watching slides of his father's life on the ice down in Antarctica. This background did not however diminish my surprise in encountering the strange, alien nature of the Antarctic Peninsula. If anything it was heightened; here I was thinking I knew what 'Antarctica' meant, but actually what I knew was just the tip of the iceberg (sorry). The temperatures were higher, the wildlife was more numerous and varied, the forms and colors of the ice exceeded my imagination, and... grass? Never did I expect to see grassy slopes as far as 64 degrees south. Our voyage was one revelation after another, from the first iceberg to the last humpback whale."

My sentiments, too.

#### **B-15A AND ITS NEXT OF KIN (AL SUTHERLAND)**

"Only satellites and astronauts get views like this, an unprecedented look at the western Ross Sea, the Ross Ice Shelf, Ross Island, and the array of icebergs that originated from the Ross Ice Shelf, courtesy of Al Sutherland, NSF/OPP. The labels help with the locations of the major ones. For example, B15A, the large one near Drygalski Ice Tongue, has been moving a bit, but vacillating in movements. B-15K is a long, skinny one that is parallel to and south of B-15A (which has not moved since it came to its current position about a year ago). C-16 has its southern point in Lewis Bay on the north side of Ross Island and moved about 7 miles to the north in January 2005, but otherwise has stayed in the same area since Jan. 2001. B-15J is the one to the east of Cape Crozier (eastern Ross Island), and moves north, south, east, west and rotates, but doesn't leave the general area. Another figure is an enlargement of the first, taken on 2 Feb. 2005. Further breakout has occurred since then. The most recent image can be seen at <http://rapidfire.sci.gsfc.nasa.gov/subsets/7RossSea/>.

Breakout of sea ice to Cape Royds, showing the ship channel from Royds to Hut Point can be seen at <http://rapidfire.sci.gsfc.nasa.gov/subsets/7RossSea/2005045/RossSea.2005045.aqua.250m.jpg>. The freighter AMERICAN TERN completed its offload at Hut Point and departed McMurdo on 9 Feb. 2005 under the escort of the KRASIN and POLAR STAR. KRASIN, a Russian icebreaker out of Vladivostok, was chartered to provide additional horsepower to create the channel to Hut Point. Iceberg designations of 'B' and 'C' refer to the quadrant source for the iceberg; for example, 'B' icebergs originate from the 90° W to 180° quadrant, 'C' from 180° to 90°E."

## **ASTRONOMY ON ICE: OBSERVING THE UNIVERSE FROM THE SOUTH POLE**, by Martin A. Pomerantz. Xlibris Corp., 2004.

271 p. \$21.99 paperback; \$31.99 cloth hardback. Reviewed by John Spletstoeser. Anyone who spent enough time at McMurdo Station in the 1960's through the mid-1990's knows the name Martin A. Pomerantz, the quiet physicist who migrated from his home base in Pennsylvania to the U.S. station at the South Pole every austral summer for 26 years. Why would anyone do that, you might ask? Well, from an initial project to study cosmic rays resulting from an invitation to submit a proposal in 1960, Martin gradually developed a sophisticated observatory at the South Pole to include observations of the solar interior. He proposed that the high elevation of the Pole (9,300 feet/2,835 meters) and the uncontaminated air provides an ideal platform for an astronomical observatory, although at first he encountered considerable opposition from the scientific community. Ultimately, however, he has been proved right, as evidenced by numerous observations and experiments conducted at the world's southernmost observatory. Based at the Bartol Research Foundation of the Franklin Institute, located near Swarthmore College, Pennsylvania, Martin's research carried him to many parts of the world, much of it launching balloons to study the upper atmosphere. The South Pole, however, captured him early and, like the mysterious mistress that many Antarctic veterans experience, drew him back for the remainder of his career. His pioneering work has earned him the dedication of the Martin A. Pomerantz Observatory at 90°S. This book, in 19 chapters, covers his interesting professional career, and is published under the auspices of the American Polar Society. To order the book, contact the publisher at (888) 795-4274 x. 487 or x. 876. Buy the book - a bargain and very interesting reading.

## **INTERSTATE HIGHWAY 90°S ALMOST A REALITY.**

(clipping from Margaret Lanyon). The overland (sic) route to the South Pole had a big breakthrough this past austral summer. The 12-strong team reached the Polar Plateau, 480 km from the Pole, in January, and could have continued all the way to the station, a year ahead of schedule. However, bad weather was putting pressure on South Pole flights so they called a halt. Overland supply convoys will begin to the South Pole as early as next summer. Ultimately, it is expected that the overland route will free up between 20 and 60 cargo flights, making them available for science.

The American team had struggled for the first two years of assessing the route's viability. In the first year a heavily crevassed zone took weeks to make safe as a bulldozer filled in the crevasses. The next year, the team wallowed in soft snow as it crossed the Ross Ice Shelf and, by the turnaround point, had completed only 680 km of the 1600 km route.

**READY FOR WINTER** (Katy Jensen) Ah, February. For many of us, this is the month when we abandon our New Year's resolutions, replenish the holiday chocolate jar, and curl up on the couch to watch winter sports on television. For our colleagues in Antarctica, however, February is one of the busiest months of the year. The summer field season is still bucketing along in high gear, but

thoughts turn increasingly toward station closing and its related stressors, including prioritization (and reprioritization) of incoming supplies.

You can learn a lot about a person by asking them for their cargo priorities. Intellectuals choose science equipment, gastronomes choose freshies, and bacchanals choose beer. But in Antarctica, there is one thing even more essential than the quest for knowledge, more basic to our needs than nourishment or liquid courage. The lifeblood of our program is a stinky, straw-colored mix of hydrocarbons called "fuel." Without it, science and food become mere luxuries.

The totals for ship usage are elusive, but last year the USAP used 5.8 million gallons of fuel to provide power, heat, and equipment operations for the stations, camps, and aircraft. At 6.8 pounds and up to \$2 per gallon, that's a significant chunk of the logistical and financial requirements for pursuing science on the Ice. Energy conservation is paramount at all sites, and alternative energy sources are used whenever possible, especially at the field camps. But for now, at least, the USAP's success is utterly dependent on the availability of fossil fuels.

Palmer Station receives enough fuel to cover its 133,000-gal/yr habit in twice-annual resupply trips from the ASRV *Laurence M. Gould*. McMurdo and its camps (2.5 million gal/yr), South Pole (481,000 gal/yr), and New Zealand's Scott Base (124,000 gal/yr) all rely on the ability of a fuel tanker to reach Hut Point each austral summer. Which means they all rely on the capability of one or more icebreakers to clear a channel and escort the larger ship into Antarctica's southernmost port.

Until recently, the annual sea ice that formed near McMurdo would disperse enough for one icebreaker (usually one of the USCG sister ships *Polar Sea* or *Polar Star*) to cut a channel and escort the fuel tanker and the cargo resupply ship through McMurdo Sound. But the presence of two massive icebergs in the Ross Sea seems to be preventing the sea ice from breaking up and drifting away, allowing it to re-freeze each season into thicker, "multi-year" ice. What was once a relatively thin, 15-mile strip for the icebreakers to clear has grown progressively in amount and thickness.

In 2002, the sea ice was extensive enough that both USCG icebreakers were sent south to clear the channel together, hi 2003, the distance from McMurdo to the ice edge expanded from 15 miles to 40 miles. Again, NSF had to recruit a second icebreaker, this time the USCGC *Healy*, to help the *Polar Sea* break through. But the ice proved too thick for even the Coast Guard, and the MV *Richard G. Matthiesen* couldn't quite reach the McMurdo pier. NSF extended McMurdo's field season by two weeks, and crews clamored to set up a safe, efficient hose line to offload 6.6 million gallons of fuel across 4.5 miles of sea ice.

This year, the sea ice stretched an unprecedented 90 miles from McMurdo station, and icebreaking operations were complicated by

a leaky propeller on the *Polar Star*. With the *Polar Sea* in dry dock, NSF turned to the Russians for help. According to an NSF press release, the [Russian icebreaker] *Krasin* was the "only qualified ship available on the world market to assist the *Polar Star*." Together, the icebreakers' efforts were a success, and at the end of January they escorted the USNS *Paul Buck* to the pier at Hut Point, where crews offloaded 6.1 million gallons of fuel without difficulty.

Oh, and the cargo resupply vessel *American Tern* arrived shortly thereafter, delivering about 5,000 tons of other important things like science equipment and food.

#### **THERE'S LIFE AT PALMER, SHADES OF GRAY, BEAMS OF LIGHT**

(Dr. Will Silva) Palmer Station, Antarctica: 64.7°S, 65°W. 30 October, 2004. Riviera of the Ice. The US Antarctic Program's red-haired step-child. Gets hind-teat on the NSF sow.... Our little home on Gamage Point, on the southwest coast of 23 x 40 mile Anvers Island just off the Antarctic Peninsula is known in many ways. I suppose Outpost of Progress might be one. Transit across the Drake Passage from Punta Arenas, Chile aboard our supply vessel, the 1,600 ton R/*Laurence M. Gould* takes 4 days. We have no air strip. With only 45 beds on station, our project has a very different feel to it than Pole or McMurdo. In more ways than latitude, marine climate, and transit via Chile rather than New Zealand, it really does seem a world apart from the other stations. This is mainly a marine biology station, and many projects revolve around its being a Long Term Ecological Research Area. Researchers study the impact of regional warming and increased UV radiation on local flora and fauna. Some groups have come year after year to study terrestrial plants, plankton, krill, and population dynamics of the penguins, giant petrels, skuas, shags, and gulls. Others have come to investigate the few terrestrial insects here, and at times we have grantees looking at atmospheric and solar physics, glaciology, chemical defenses of marine invertebrates, and the substances that act as antifreeze in Antarctic fish.

Palmer's annual average cloud cover is 90%. There are quite a few partly sunny days most summers though, with a few clouds or high overcast in a pale sky casting hazy shadows. On those rare, really clear days the light is irresistible and I look for excuses to do something outside. Many evenings, a glorious sunset peeks out from under our typical 2000' stratus layer. We can see rain, snow, or something in between in any month of the year. Annual average rainfall is 30 inches and snowfall about 13 feet. Summer days average 35°F, winter days 23°F. Though annualized average wind speed is 11 knots, as an air sampler I can tell you that we go 10 days

at a time without seeing winds over 3. By the same token, we can have storms with winds sustained at 20 to 40 knots and gusting to 60 knots for a couple of days at a time. Peak recorded wind speed here was 93kts in June 1990. So while temperatures are very mild compared with those at Pole, the climate is often very, very harsh. I recall seeing the stars only twice during the winter of 2000.

It's so good to return here, after 4 years away that held a summer in McMurdo and year at Pole for me. I've been here for four weeks, with the first few seeing turnover activities between those finishing their winter and those of us arriving for the summer. Last weekend our supply vessel, R/V *L.M. Gould* arrived with the rest of our summer crew and the early contingent of researchers. We're up to 38 aboard now; we'll be at full capacity when the next vessel arrives in 2 weeks, and I'll have a roommate again after that. Most of us haven't slept in bunk beds much since childhood. Welcome to Palmer Station.

Things are so much better than last time I was here, and in so many ways that it nearly seems like a new place. For starters we've a lot of very decent folk here, and no knuckle-heads. It feels like a calmer, happier place than when I arrived 5 years ago. The place looks a whole lot better than it did then; and I think our Area Director Bob Farrell and station manager Joe Pettit deserve a lot of credit for that. We've enough sheets, forks and spoons, and cups. The changes are good for morale.

For me an even bigger change is that I've a much better medical shop to work in. It was just getting finished when I left in 2000. Add to that, enough new equipment that finding space to put it and organizing it for easy access has become a challenge. Some different than last time around! Instead of hand-dipping X-ray films in 5-gallon chemical tanks, we now have phosphor plates and a digital scanner like I was using at Pole last tour. We have good video-telecoms gear, slit-lamp, EKG, multi-function monitor/defibrillator, a modern IV infusion pump and a versatile ventilator, a well-functioning EktaChem bench-top chemistry analyzer that was down for most of my last tour, a new I-Stat bedside chem analyzer that runs blood gasses or basic chemistries in a couple of minutes, and I've recently taken delivery of an automated blood cell counter and an ultrasound machine that's the size of a 1995-vintage laptop computer. So many toys! But when evaluating a sailor with a dose of the clap (my most serious case to date), there's still no substitute for a microscope and a Gram's stained slide of the goo....

It's still a little wintry here. The bay remains choked with refrozen brash and fast ice, frustrating the scientists' ambitions. Our days are around freezing, nights a bit below. The skiing isn't great on the wind-blown glacier, but on the rare clear days the view's world class. Besides, I get more turns in one run here than I've ever had in a year at Pole. It's fun carving turns on an old pair of Hagens with Silvretta 404's, taking only a few minutes to travel over snowed up rocks and morainal mud that will bite the ankles in another month or two. Don't I wish I could go off ski-

mountaineering here! It's a pity we Yanks - and the NSF and Raytheon Polar - are so risk averse and given to CYA.

Summer is flying, and already the days are growing shorter. Today, the sun rose at 04:30 and will set around 22:15. Hard to tell where it is though through the gray sky and snowflakes. It rained hard a few days ago. We've had only a few days of brash ice since summer solstice, so parties of birders, buggers, and beakers have spent long days in the field making up for lost time. We had the same crew on station from mid-October until New Years, and we grew very comfortable with one another. It was a fun stretch. Medically things have been quiet, but owing to the ship schedule I had the fortune to be acting manager/ point man / fall guy for three weeks over the December holidays. This job presented different challenges than my usual work. We had two Zodiacs holed by brash during that time and put out a fire in a trash cargo container on New Year's eve, just a couple of days before Bob our Area Director and our new NSF Rep arrived. No worries, nobody got wet or hurt so all's well ends well.

Besides coordinating fire drills and teaching Heart Association BLS sessions, I've taught my MedSurg Assistants course and been involved with our SAR teams. I've managed the Glacier SAR team teaching roped glacier travel, crevasse rescue, and casualty packaging & transportation skills. I've helped with the Ocean SAR training and we've been out to the islands to swap out survival caches. We practice person-overboard recovery, rapidly getting into and out of boats in a big swell, finding other boats via radioed GPS coordinates, and towing. I've gotten out with birder friends a few times too, and for me that's the highlight to Palmer summer. It's been great to see the giant petrel chicks again! Wrangling and weighing these birds during the last 6 weeks before they fledged was the highpoint of my '99 - 2000 tour. The smell and cacophony of a penguin colony is something you must experience to believe. In January I got to visit Dream Island for the first time. It's 8 miles away though only a mile offshore, and has healthier penguin colonies on it than on the local islands though they're dwindling there as well. I helped Heidi, a friend from my last time here, and Dan with penguin chick counts and measurements. Holding one shit-covered 3kg black fuzzball of a chick as it squirted goopy white stuff all over her, she said "these guys take 'dingleberry' to a whole new level". I'd have had beer coming out my nose if I'd been drinking one for some reason. We saw a humpback whale on the way home, too.

Marine mammals I've seen during this tour: Elephant, Weddell, Crabeater, Southern Fur, and Leopard seals; Orcas, Minkes, and Humpback whales; Commerson's dolphins (in the Straits of Magellan on our way here). Birds: Magellanic (also in the Straits), Gentoo, Chinstrap, and Adelie penguins; Sheathbills; Kelp gulls; Brown and South Polar skuas; Giant, Wilson's Storm, Snow, and Cape petrels; Antarctic terns; Blue Eyed shags; and Wandering albatrosses.

Seven of us made a point to sit together one night recently at dinner. We are all veterans of the winter of 2000 here, and laughed hard at stories of what went down during that tour. It's easy to laugh now, in the company of friends and a crew of fine folk. The grantees who

arrived after New Year's have been a great bunch who integrated well into our community. We've had no knuckle heads or maintenance queens. What a difference from that earlier winter! I: life at an Ice station a very funny utopia, or a penal colony on an ice planet? It can go either way, and hinges on your work, your boss, even more so on your community, and most of all on your attitude. At breakfast this morning one of our grantees, a slight and usually quiet young woman got on a humorous rant. "Antarctica is like dating a dumb man who's really good looking," she said. "Looks good, but all empty inside". The Palmer area is much more interesting visually than the flat, white Polar plateau so it's easy to create expectations about it. I've found it best not to expect too much. It'd be different if we could go ski touring and climbing in the spectacular mountain terrain here, but when "look but do not touch" is the law of the land, I do well not to look too hard.

As some prepare to leave, my own thoughts are beginning to turn towards home. Helping Vinny our boating coordinator put a Zodiac in the water one morning recently, I felt a strong flash of northern New England. It felt like a perfect late October day that looks warmer than it is with a fresh west wind and clouds and sun. End of summer, time to pull the boats and the dock float. Water so clear, its blue tint barely tells just how hard it will bite your hands. A slight smell of wood smoke drifted by as Dave our mechanic got the charcoal started for a Sunday afternoon barbecue. Another time in another land. I think of friends.

Go well, friends, and stay well and keep in touch. I'll be home in April.

**STARLIFTER BIDS FAREWELL BEFORE BEING PUT OFF THE ICE.** (clipping from Margaret Lanyon) The make of jet aircraft that for years linked Christchurch to Antarctica has just taken its last Ice flight. C-141s were the first jets to land in Antarctica and have transported people and supplies to the United States' McMurdo Station in Antarctica for the past 40 years. In its almost half a century of service to the antarctic mission, the C-141 put in more than 45,000 flight hours as part of Operation Deep Freeze, which kept McMurdo and Scott Base stocked with people and necessary supplies.

While the aircraft was a workhorse and an integral part of antarctic history, it was not the most comfortable of rides, Harrison said. Seating arrangements inside the C-141 is so tight passengers sit facing each other with little room between the knees. The C-141 s had been replaced by a newer, larger and more comfortable C-17 aircraft. Despite its well-worn exterior and squashed interior, the Starlifter would be missed, Antarctica New Zealand chief executive Lou Sanson said. "The C-141 s have been an integral part of the New Zealand Antarctic programme...their arrival changed both the speed and volume of people and cargo that could be moved between Christchurch and Antarctica." "It's the end of an era and the passing of a significant Antarctic milestone."

The above view of McMurdo Sound , Ross Island, and a few wayward icebergs is a MODIS Aqua Satellite image from 2 February 2005, courtesy of Al Sutherland. As this constitutes the Midway of the Antarctic, nearly all of you have first hand information as to its geographical features. For those who need help, see the smaller scale image on p. 4. Polly Penhale has pointed out to us the fallacy which was perpetuated by the media that B15-A was blocking penguins from access to fishing grounds, when the berg was over a hundred miles north of the Cape Royds colony. Looks navigable to me, what do you think?

## WALTER ROY SEELIG

November 14, 1919 - April 29, 2005

"Most Gracious of all Antarcticans"

**Memorial Service, June 26, 2005, 1 p.m.**

**United Methodist Church  
Falls and Glen Roads  
Potomac, Maryland**

Mrs. Walter (Josephine) Seelig  
8909 Victory Lane  
Potomac, MD 20854  
Tel. (301)279-7728

**WALTER R. SEELIG.** *[Some of Walt's many friends contributed to the following obituary of a man known and loved.]* Walt passed away on April 29 at the age of 85 at Shady Grove Adventist Hospital, Rockville, Maryland, of pneumonia contracted after a hip fracture. He was born in Brooklyn, NY, received a B.S. degree in Geology from Brooklyn College, and started graduate work at the University of Nebraska, participating in geological digs. In 1941 he relocated to the Wash.D.C. area, working on maps for the Air Force as an employee of the U.S. Geological Survey, transferring in 1959 to the National Science Foundation to develop a plan for the mapping of Antarctica. Maps were a big issue at that time because the Navy's photography program required accurate control, and Walt knew about mapping needs, costs, and special equipment. Scientists working in the field had to have accurate maps, and Walt provided the go-between at budget meetings at NSF when Bert Crary, Rupe Southard, Mike Linck, Pete Bermel, and Walt discussed both needs and possibilities, all within budgetary limits. . Walt was the essential component who understood all the arguments from his previous experience with trimet mapping. Walt, in his highly professional manner, created an atmosphere where both sides trusted each other, forging a close bond between NSF and USGS that remains today. In his early years at USGS, Walt met a cute photointerpreter named Jo, who worked in the basement of his building. Being a man of action, he proposed on the Staten Island Ferry, and they were married in 1945.

Whereas Walt's 'detailed' move to NSF materialized into a position that recognized his invaluable resources, he eventually achieved a permanent position. Pete's words are some of the best to describe Walt, from their association of 45 years - "a gentleman's gentleman," "always calm, cool and collected," "never heard a cuss word," "a true friend always," and so on. Pete Bermel said that perhaps the greatest tribute to Walt came from his wife, Jo, after Walt died: "It was 60 years of the most perfect marriage." [*Pete Bermel.*]

Ken Moulton, who also worked closely with Walt at NSF for 45 years, mentioned Walt's association with Bill McDonald and others at the USGS to work with Navy pilots who flew the aerial photography missions to develop the long-range planning of the Antarctic continent. Anyone who has worked in the mountainous areas of Antarctica can thank Walt and Bill and associated military support for maps on which field research depended. Walt also represented NSF on the U.S. Board on Geographic Names, ensuring that military and civilian personnel were recognized for their service to the program by having geographic features named for them. It was only fitting that Mount Seelig, the tallest peak in the Whitmore Mountains, was named in Walt's honor.

Walt also served as the NSF representative in New Zealand for 11 Antarctic seasons, highly regarded as not only a scientific representative but also as an unofficial "ambassador", working closely with Margaret Lanyon in greeting arrivals from the U.S., and also after their return from McMurdo. For many years Walt also had the thankless task of developing the annual visitor (VIP) list and schedule for the upcoming austral summer season. Although what might normally be a frustrating task, Walt carried it out in his usual quiet and unassuming way. Many glowing letters in NSF files attest to the hospitality these groups received. Walt and Jo's friendship while he was NSF Rep at Christchurch will long be remembered, as he went out of his way to find time for an outing of some sort, whether it be a trip to Port Lyttelton to see what ships were in port, a walk in the Botanic Gardens and a visit to the museum, or simply encountering friends of his. Walt was indeed a "people person." [*Ken Moulton.*]

Margaret Lanyon's long association with Walt in Christchurch resulted in a warm friendship, laced with countless fond memories, many of which were relative to their "meet-and-greet" assignments. John Spletstoesser recalls the long flights from the U.S. to Christchurch on the way to McMurdo, stepping off the aircraft and seeing the smiling faces of Walt and Margaret with news of the ongoing flight to McMurdo. Sometimes it was the next day, other times there were delays, and hotel rooms in town had to be juggled to make room for

later occupants, or in some cases, spending a night at the airport's military barracks because of a hotel shortage and an early morning flight. Only Walt and Margaret could have pulled that off with their cheerful dispositions and helpful advice.

Walt was a long-time member of the Antarctic Society. As all of us, and anyone else who knew him, can say with feeling, "we will all miss him."

**BRASH ICE.** The Antarctic Society lost its most faithful loyalist when Walt Seelig checked out at the end of April. He was a plank member of our Society, joining in 1960, and several times turned down invitations to become our president. Yet, he remained in constant touch with our Head Shed, sending us weekly news items and evaluating each and every Newsletter in an effort to keep us on the straight and narrow. He personally introduced our current president, Rob Flint, to the Society, and it was largely due to his efforts and encouragement that he convinced Margaret Lanyon to accept an Honorary Membership in our Society. Ken Moulton of the Moulton Antarctic Clan most rightly described Walt as "the most gracious of all Antarcticans." In many ways Walt's character could be equated to that of our late Honorary President, Ruth Siple, one who was loved by one and all. And he wore that honor with no ego. Walt, you were one hell of a good guy, and we all are going to miss you. Like Margaret has said, "I can't turn on the computer without thinking that dear Walt will be there."

I had the pleasure of recently visiting another one of our Society's most wonderful persons, Pete Barretta. He has made a career out of sending Antarctic news items to all polar societies, and has been very close to us as he came from Meadville, Pennsylvania and Allegheny College, as did Ruth J. Siple. As far as I know, he is the only member of our Society who rode shotgun back in the halcyon days of prohibition. Now he is living at a Catholic health-care facility at 751 Hillsdale Drive, Apt 225, Charlottesville, VA 22901, where his wife is confined to a bed in their care center and Pete lives upstairs in an assisted living apartment. Each waking hour, with the help of a walker, Pete goes downstairs and sits at the bedside ALL DAY by his beloved Edna. What a loving and devoted guy. As many of you already know, Pete without comparison has the very finest collection of polar aviation cachets ever assembled, and now Pete is about to begin auctioning off his heart. It's ironical that such a devoted philatelist as Pete puts stamps on his own correspondence in a most haphazard way, as if the wind had blown them onto the envelopes. As with Walt, we tried several times to get Pete to run for our presidency, but he

refused, meanwhile doing all that he could to help both Ruth and me. They don't make them any nicer than Pete, and if you want to make his day, drop him a line, or call him in the evening after 7pm at (414), 978-4342. He would appreciate it. He doesn't have fun days any more. I love you Pete, you are a great guy. Not too handsome, still overweight, but you are still as great as you ever were, maybe even more so. Live on!

While in this nostalgic mood, let's reminisce a bit on the late departed Murray Ellis of the British Commonwealth Transantarctic Expedition. He was an important member of Ed Hillary's tractor party to the South Pole in 1957, and as an engineer was responsible for keeping those vehicles moving. What Scott or Shackleton would have given to have had Murray with them! His family owned and operated Arthur Ellis Company in Dunedin, the makers of the very finest down sleeping bag available at the time. After two years on the ice, the day after I arrived in Christchurch, I got on a plane to Dunedin to visit Murray and his wife, Shirley, who continuously brushed her long blonde tresses. Thirty years later, I had the pleasure of visiting them at their summer home in Arrowtown, which resulted in the best New Year that I had ever experienced. Shirley packed a great picnic lunch, Murray and I loaded the trunk with cold beer, and we took off towards Mt. Aspiring, a most beautiful mountain which the whole Ellis family had climbed many times. I wish that I could say that we climbed it, but we went as far as we could drive, then started hiking, fording a stream many times, before stopping and having lunch. Boy, it was fun, and so spectacularly beautiful. Murray had remained a close mountaineering friend of Ed Hillary, and made several trips to Nepal with him to help build school houses. During World War II, he served in the military with us Americans. Murray had a rugged body, was quite a physical specimen, and it is impossible to believe that the guy younger than me is now gone. Curses!

Antarctic Fossils. (1) The oldest known Antarctic fossil has been radiometrically-dated back to the early Miocene, and has been referred to in the literature as *alanormanvaughan*. Said by some authority to be approaching a century landmark this December, he is also looking for both financial and physical support in re-ascending his mountain on his 100<sup>th</sup>. Is there really any glory in being carried in a gunny sack to the top of a mountain where you have previously stood? (2) Hurricane Ivan did something which Antarctica's worst weather could not do. It tore the right wing and rudder, plus other things, off QUE SERA SERA, the first plane to land at the Geographic South Pole. However, it is rumored that she will be fixed up as good as ever, well, almost as good. (3) The icebreaker GLACIER will go down in history and on June 19 will be shown on the History Channel's program entitled Bone Yard,

which will depict how some of our nations greatest machines are being recycled rather than destroyed. The last segment will present the history of GLACIER, her rebirth, as opposed to meltdown. A program for all ages.

There were a lot of people who contributed to this Newsletter, which is truly "by and for all Antarcticans." To begin with, we would be lost without having the Antarctic guru, John Splettstoesser, for our editor. For the last couple of years he has made certain that everything not only makes sense, but is spelled correctly with the right punctuation. We also continue to get support from Polly Penhale, Jerry Marty, and Al Sutherland in the Office of Polar Programs. It is wonderful to have another great story from Katy Jensen, and to introduce another one of her fellow Polies, Lynn Arnold, in this issue. Billy-Ace Baker sent us the story on *Que Sera Sera*. We are indebted to three of Walt Seelig's closest comrades (Pete Bermel, Ken Moulton, and Margaret Lanyon) for supplying information and stories about Walt's life. We thank you, one and all.

**THE ICEMAN COMETH.** Lonnie Thompson, Professor of Geosciences at the Byrd Polar Research Center, The Ohio State University, has had an exceptional year in collecting more awards and honors. In April he traveled to the University of Southern California for the 2005 TYLER PRIZE, a prestigious award comparable to the Nobel Prize, walking away with half of the \$200,000 designated, the other half going to Charles Keeling, of carbon dioxide fame. On May 4, AAAS asked Lonnie and three other scientists to give presentations and spend the day one on one with U.S. Congressmen in a Climate briefing to discuss climate change issues. That week, Lonnie was elected to the National Academy of Sciences, perhaps the culmination of a distinguished career of a scientist who collects awards at about the same pace as he collects ice cores for climatic studies. And I'm sure he's not finished yet, with all that ice left in the world to sample. *JFS*

**THERE GOES GUY, HERE COMES KIM.** On May 2, 2005, Kim Silverman joined The National Science Foundation's (NSF) Office of Polar Programs, stepping into those big shoes left behind when Guy Guthridge retired in February. Kim now serves as the Program Manager for both Polar Information and the Antarctic Artists and Writers Program.

As the Polar Information Program Manager, Kim works with NSF staff and the larger community to meet responsibilities for NSF activities in polar regions, both north and south, while also managing the Antarctic Artists and Writers

Program. Kim comes to NSF with a breadth of experience gained while working for non-profit corporations, private-sector corporations, and other Federal Government agencies. Most recently she worked for NSF's Director of the Office of Information and Resource Management as the Communications Specialist. In this role, Kim was directly involved in the implementation of NSF-wide policy, planning and communications activities. Prior to joining NSF, she managed marketing and communications efforts in the operations support system division of a major telecommunications corporation.

Kim received her Bachelor of Arts degree in Art at the University of Massachusetts and received her Master of Arts degree in International Telecommunications at George Mason University.

**U.S. ICEBREAKER FLEET AND A CRUNCH IN NSF BUDGET.** (Excerpted from article by Jeffrey Merves, *Science*, 4 March 2005) Haifa century after agreeing to help the National Science Foundation serve up a banquet of polar research, the U.S. Coast Guard is getting up and walking away from the table. And NSF doesn't know if it can pay the bill.

NSF is responsible for U.S. science at the poles, which includes three stations in Antarctica and a growing presence in the Arctic. But it can't do its job without the Coast Guard's help in clearing the sea ice. That's a perennial need at McMurdo Station, the logistical hub for U.S. activities on the Antarctic continent. Although NSF pays for the fleet's deployment—some \$12 million last year—the Coast Guard has shouldered the much greater cost of building and maintaining two aging heavy-duty icebreakers that focus on McMurdo and a newer, less powerful research icebreaker that spends most of its time in the Arctic.

But that relationship seems headed for the deep freeze. Last month the Bush Administration told Congress in its proposed 2006 budget submission that NSF would henceforth be responsible for the ships, two of which are desperately in need of major repairs or replacement after 30 years of ice-crunching. Officials at both the Coast Guard and NSF say the policy shift was presented as a *fait accompli* last fall during budget negotiations.

The White House has tried to sweeten the deal with a one-time transfer of \$48 million to NSF from the Coast Guard. But that's less than two-thirds of the \$75 million the Coast Guard estimates it will cost to maintain the ships this year. And it's little more than a down payment on a possible \$600 million tab

to retrofit the 30-year-old *Polar Sea* and *Polar Star*—and even more to replace them. (The *Sea* is now undergoing an extensive inspection to determine what repairs are needed, and the *Star* is slated for the same major overhaul after next winter.) Not surprisingly, NSF officials fear that the agency's new duties could eventually wreak havoc with its overall budget, which shrank by 3.2% this year and has little chance of growing significantly next year. Three panels have been convened to study the issue from all angles.

"We need to look at the whole system, both short-term and long-term, and figure out what makes the most sense," says Karl Erb, head of polar programs at NSF. But some things—none of them good—are already clear to Sridhar Anandakrishnan, a glaciologist at Pennsylvania State University, University Park, and past chair of NSF's polar science advisory committee. "It's a huge crisis," he says. "And I don't know how we can solve it without additional funding from Congress."

The Administration says NSF should foot the bill because the icebreaking fleet mainly serves the academic scientific community. What's more, enabling science is a lower priority for the Coast Guard, now part of the Department of Homeland Security, than activities such as law enforcement, search and rescue, and fostering economic development. Accordingly, this year's 2006 budget request concludes that "it is unlikely that the Coast Guard could provide funding in future years for refurbishment or replacement of the icebreakers. That, in turn, threatens the research programs that depend on their services."

Indeed, funding lies at the heart of the problem. "We think that polar icebreaking is important," says Cmdr. Thomas Wojahn, ice operations program manager for the Coast Guard. "And we think we should continue to operate the ships. But icebreaking needs to be properly funded." Wojahn notes that soaring fuel bills, bigger repair bills, and recent extreme ice conditions in the Antarctic have boosted the cost of doing business without a commensurate rise in funding.

The new arrangement gives NSF a chance to break that vicious cycle, the White House says. Once the Coast Guard transfers responsibility for icebreaking, according to budget documents, "NSF will have flexibility to pursue alternatives to current operations." Those alternatives could include renting commercial or foreign icebreakers, as NSF did this winter to replace *Polar Sea* (*Science*, 21 January, p. 338 <<http://www.sciencemag.org/cgi/content/full/307/5708/338>>). A more radical approach would be to offload fuel, supplies.

and other materials at a spot that remains ice-free throughout the year and then haul the material over land. But the savings in annual icebreaking might be swamped by the cost of building a new station and extending NSF's supply lines.

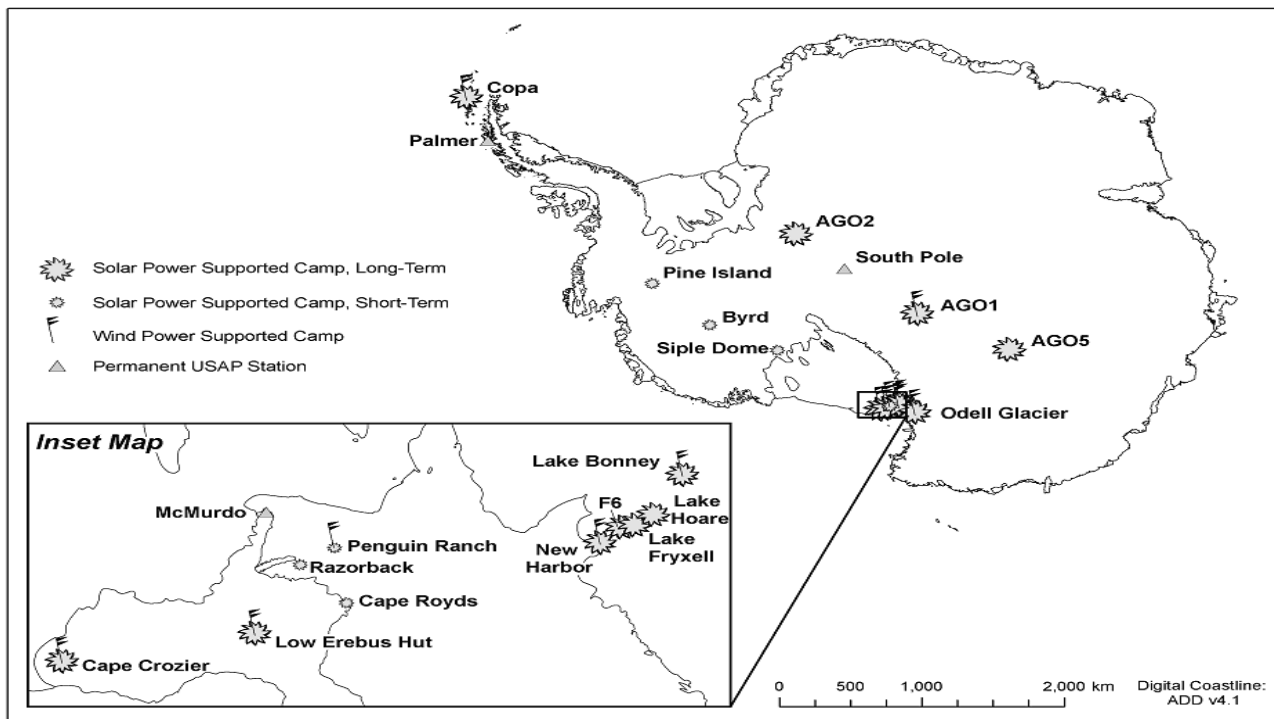

Anandkrishnan agrees that it makes sense for NSF to ensure access to its research assets. But he says nobody anticipated the "perfect storm" that has built up in the past few years. "We've known for a long time that it would eventually come to the point where the Coast Guard would say, 'You want us to do this? Then find the money!' But NSF is also in a bad way, financially." Although Congress could reverse the policy and block the transfer of funds, both the Coast Guard and NSF are proceeding on the assumption that it will take effect next year. A joint working group is drawing up a new agreement on how the three ships will be operated and maintained over the next few years, says Erb. At the same time, the National Academies' National Research Council is beginning a study of how the country's polar icebreaking fleet should be deployed, "including scenarios for continuing those operations and alternative approaches." Although the \$600,000 study will run until the end of 2006, Congress has asked for an interim report by September. Finally, Erb is assembling an NSF task force to weigh the agency's long-term prospects for operating in the polar regions. He hopes the panel will "at least start to narrow down the options" in time for NSF's 2007 budget submission to the White House in September.

**FIELD CAMPS IN ANTARCTICA GO GREEN.** (Pamela Toschik, Office of Polar Programs, NSF) The United States Antarctic Program (USAP) is moving towards its goal of operating field camps on 100% renewable energy. In the past, 5 to 60 kW generators powered with diesel fuel have supported the USAP's numerous field camps.

In recent years USAP has been experimenting successfully with solar and wind electrical generators of various sizes and with passive solar design for heating research huts.

One of the initial steps in converting field camps to renewable energy was an audit of energy use at the camps to evaluate wasted energy and required system size. In one instance, energy consumption was reduced by 80% by replacing light bulbs with windows and switching from standard desktop computers and monitors to laptop computers and flat panel monitors. This brought the energy consumption at the field camp from 5kW to less than 1kW, a level that could be served by a moderate solar power system. The USAP has implemented renewable energy at almost all field camps (see Figure 1), including those in the McMurdo Dry Valleys, on the sea-ice, on the polar plateau, and at one of the most unique and challenging sites in Antarctica, Mount Erebus.

**Figure 1.** Field camps operated by the US Antarctic Program in the 2004-2005 field season using renewable energy sources

In field camps, solar and wind systems have been sufficient to operate most camp amenities, including lighting, computers, communications equipment, microwave ovens, kitchen appliances, power tools, and laboratory equipment throughout the summer season. Laboratory equipment in use has included pumps, centrifuges, laboratory hoods, fans, incubators, live video feed to a television, and hot/cold water baths.

Research equipment deployed in the field has also been successfully operated using renewable energy, sometimes with solar and wind combinations providing power continuously through the year. Several research huts have been reconfigured for passive solar heat gain, which generally has worked from late November through the summer season. Success has been achieved for operating in most field camp situations.

Various combinations of solar, wind and passive solar have been used at different types of camps based on the needs of the researchers. The smallest system is a fully portable 400W solar and wind combination, often used by mobile research camps on the polar plateau that expect to move camp every few days. Semi-permanent camps in the dry valleys and sea-ice camps on the Ross Sea have 400W to 1kW wind generators, with varying size solar panels. A contractor hired to implement renewable energy systems customizes off-the-shelf products to meet the needs of each field camp. Renewable energy systems have several benefits over diesel generators. The impact on the environment is greatly reduced. The quantity of fuel being transferred from the station to the field camp is far less than required when running a field camp on a diesel generator, minimizing the possibility of fuel spills during transit to the camp and during transfer from storage drums to generators. In addition, emissions of air pollutants are greatly reduced when diesel is not being burned at the camps. Solar and wind systems also have the benefit of reduced noise. Scientists working in camps with solar and wind systems find work at the camp much more pleasant without the constant hum of the diesel generator. Some seal researchers have found that seals are more comfortable using breathing holes at their research camps on the sea ice without the noise of the generator running. For remote field camps, airlift requirements may also be reduced without the requirement for large quantities of diesel fuel to operate the camps.

Remarkable differences in fuel use at field camps have been realized. At one of the sea-ice camps, use of solar and wind power successfully reduced the amount of fuel used by the generators to less than 2% of the fuel used the previous year. Other sea-ice camps and camps in the McMurdo Dry Valleys have been operating on wind and solar, with no need to run the

camp generators at all during the summer. While the specific cost analyses have not been conducted, fuel transported to field camps is very expensive (more than \$US 16.00/gallon, or \$4.22/liter), and so it is reasonable to expect a cost-savings from installation of the renewable energy systems at remote camps. Repair and maintenance of the field camp renewable energy systems has been minimal compared to diesel generators, with only 1 to 2 service calls made yearly for the whole set of systems deployed in the field.

Researchers or camp supervisors operating the systems in the field often only need to turn the system on and off, monitor energy use (in case the backup generator is needed), and rotate solar panels (at some camps). Solar panels mounted flat on the roof of research huts on the sea-ice have been very effective, providing a constant supply of energy, alleviating the need to manually rotate the panels, and making the panel; less susceptible to wind damage. The renewable energy contractor working for USAP has developed an operating guide that is provided to people using the equipment in the field.

Field camps are just one aspect of the USAP's focus on reducing our impact. Energy reduction programs are implemented at all USAP facilities, utilizing technologies such as waste heat recovery and energy efficient design of new facilities. The USAP continues to explore new avenues for integration of renewable energy sources into the program

**"MIDWINTER REFLECTIONS".** (Katy Jensen, frequent Antarctic inhabitant) As the June solstice approaches, thoughts turn to our southern friends and the ways they are shaping our history on the Ice. Following are just a few examples of how this year's Antarcticans are driving toward the future while retaining close ties with the past.

At McMurdo Station, the 50\* U.S. winter-over crew has begun construction of the largest-ever power plant in Antarctica. The upgraded plant's Caterpillar 3516B diesel generators will nearly double the station's power capacity. Nearby, in Scott Base's tiny shop, a team is working with the Antarctic Heritage Trust to restore Vince's cross, the historical landmark constructed to honor a member of Scott's *Discovery* expedition who died in 1902.

Palmer Station's skyline is changing with construction of the new International Monitoring Station (IMS): a tall,

triangular building that will house current T-5 and Clean Air projects in addition to radionuclide sampling instruments for the Comprehensive Nuclear-Test-Ban Treaty Organization Preparatory Commission. Meanwhile, the Marr Ice Piedmont is disappearing at an astonishing rate, receding 500 meters since the mid 1960's and revealing islands that were originally thought to be "points." The retreating glacier offers both clues to Antarctica's geological past and warnings of rapid climate change.

Meanwhile, on the Southern Ocean, long gone are the days of the *Hero* and even the *Polar Duke*. Last month, the *Nathaniel B. Palmer* took on a 43-ton, 80'-high drill rig to bore deep into the continental shelf of Antarctica near the Antarctic Peninsula. At five times the normal load carried by the NBP, the SHALDRIL equipment required extensive stability studies and ballast modifications before proceeding. In addition to testing new drilling technology, this project should provide invaluable information about the Earth's cryosphere and climate history.

At South Pole, this year's winter crew has the dubious honor of demolishing some of the favorite buildings under the Dome. I imagine watching the Dome empty out is a bit like watching the glacier calve at Palmer Station... it's an exciting thing to witness, but it's also a reminder that things will never be the same. Fortunately for homesick Polies, at least parts of the Dome and some relics from the station will soon be on display at a new Seabee museum in Port Hueneme, California. I can just imagine Jerry Marty and Bill Spindler working there as tour guides, their blue sashes festooned with patches and pins.

Raytheon Polar Services is celebrating a milestone of its own, with April 1<sup>st</sup> marking the beginning of a 5-yr, \$546 million contract extension awarded by the NSF last October. Now comes the hard part: building on the experience of the last five years to ensure continual improvement until 2010...with hopes of successfully bidding on the next opportunity.

Whether you define Antarctic eras by climate, events, buildings, or agencies, it's possible that each new progression will bring a different type of person to the Ice, requiring returning veterans to change with the program or switch venues. Palmer's shrinking glacier may force hikers to become indoor adventurers who thrive on unlimited bandwidth, wide-screen movies, and the best brownies in the universe. Perhaps the connected corridors of the new South Pole station will turn the roughnecks of yesteryear into sandal-shod pacifists who shower *every single day*. With each new contractor, employees will have to reconcile their personal priorities with those represented by the logo on their paychecks.

And no matter how you remember the "good old days, there's probably someone older who thinks you had it easy in Antarctica. Yet we all share a common nostalgia for the place, leading some folks to spend more time on the Ice than anywhere else. Buildings, ships, and contractors come and go. I believe it's the inexplicable magic of the place, and the people who are drawn to it, that make Antarctica such a cool place to call home. References: *P.S. News*, vol. 5, issues 1, 2, and 3; *Raytheon Polar Services Company*; *SHALDRIL web site* <http://www.shaldril.rice.edu>

**SOUTHERN HOSPITALITY.** (Lynn Arnold, Recent Polie) The South Pole is full of surprises, from the medical use of super glue when curing the problem of dry, cracked fingers, to the simple procedure of coating eggs in vegetable oil to ensure their freshness throughout the winter. Even the Dome's "refrigerator" brings a wry smile to a person's face as it actually requires a *heater* to prevent its contents from freezing. But one of the most pleasant and wonderful surprises of all is the social aspect that develops when living in this frosty, remote landscape. Living in close quarters in isolation can bring out the best and the worst in people. It can make or break you. There exists the opportunity for either tapping into one's creativity and resourcefulness or succumbing to lethargy and depression as one undergoes sensory deprivation. One former "Polie" described winter like this: *"You will see the darkness in the hearts of men, but it will be the best year of your life"*. With the absence of color, smells, plants, animals, children, elderly, sunshine, and heat, it is a very bizarre existence, indeed. As the temperatures drop to unbelievable lows, ferocious storms churn out walls of snowdrifts that may barricade everyone indoors. Katabatic winds form sastrugi (waves of snow), which in turn become a magnificent ocean of ice. And the heavens above are a constant sea of spectacular stars routinely graced by the presence of magical auroras. The extreme barrenness possesses an intense natural beauty that must be experienced to be understood. And yet, it is truly an uninviting, "harsh continent", not meant for humans, thus finding the familiar is a comfort of the utmost importance. In short, group dynamics and occasions for distraction play major roles in combating the challenges of a South Pole winter. Just as the crew relies on each other in emergency situations, they rely on each other to provide social activities to live a *somewhat* "ordinary" life in the land of midnight.

Explaining the social life of Antarctica to anyone who has never deployed to this location is multi-faceted. People tend to have preconceived notions about sequestering the long, dark winter with nothing more to do than read, write, work,

eat, and sleep. Many do not realize that a library, a gym, a store, and a bar all exist at 90 degrees south. With work the only real obligation (i.e. no errands, no bills to pay, no children to watch over, no pets to feed, etc.) recreation actually becomes a significant part of life. The types of leisure activities actually available are largely based upon the passions of each crew to create the social atmosphere. When all is said and done, they are the ones who will dictate what occurs on station (and since all these folks have been told by a psychologist that they were "crazy enough to winter" the options are wide open©.) Therefore, it is up to each individual to contribute (or not) towards the greater good of the polar community.

The types of recreational choices available are largely based upon the USAP participants' interests combined with their willingness to donate their own time and energy. For example, classes may be offered in martial arts, aerobics, social dance, and knitting, and weekly calendars may include science lectures, movie nights, volleyball games (softer than volleyball), and radio darts (with other Antarctic stations) just to name a few of the unexpected opportunities provided by former staff. Within the social fabric of any society, special occasions are also planned to provide highlights that mark the passage of time. Casino Night, the Midwinter Celebration, Fourth Of July BBQ, Sunrise Party, Oktoberfest, Bingo Night, and the Art Show are just a few samples of past morale boosters.

The midwinter milestone on June 21 is quickly approaching. As the threat of winter monotony continues, one can rest assured that the current crew is doing their best to bring some degree of normalcy into the frigid wonder world they call home. The polar plateau is like no other place, but what truly makes the journey exceptional are the people who share in this glacial adventure. In the midst of a most astonishing existence, each crew rallies to provide entertainment and help each other survive the long dark night. The South Pole winter creates a deep bond amongst those who share it. If it's a good winter, they will discover the extraordinary in themselves and each other.

**THE MAGIC OF ANTARCTIC COLOURS; David Abbey Paige (1901-1978), Artist of the Byrd Antarctic Expedition, 1933 -1935**, by Reinhard A. Krause and Lars U. Scholl. Bremen, H.M. Hauschild GmbH, 2004, 126 p. \$29.50 plus tax (if applicable) and shipping. Available from Laura Kissel, Polar Curator, University Archives, The Ohio State University, 2700 Kenny Road, Columbus, Ohio 43210 (Review by John Spletstoesser)

This book reminded me of the wonderful water colors produced by E.A. Wilson on Scott's expeditions in the early

20<sup>th</sup> century, and is an excellent record of talent by the artist who accompanied Admiral R.E. Byrd on his 1933-1935 expedition to the Antarctic. An additional Antarctic artist of note was George Marston, who accompanied Sir Ernest Shackleton on his Nimrod and *Endurance* expeditions. David Abbey Paige (1901-1978) was not to be deterred when he applied to Byrd's expedition as an artist, even though he was at first rejected by Byrd because a major requirement for participation was a background in science. He was not discouraged, however, and then approached other members of the crew and expedition members, including Paul Siple. Eventually Byrd agreed to Paige's official role as expedition artist.

Paige decided against watercolors and oils because of the potential difficulties encountered in the cold, but instead did his work in pastels and pencil drawings. About 100 pastels were returned from Little America, forming the basis for exhibitions in California, where Paige lived following the expedition. Correspondence between Byrd and Paige evolved around the content of the exhibitions and lectures by Paige, because Byrd insisted that the subject be strictly about the art and nothing else related to the expedition. Eventually, those issues ended in 1939, and the pastels languished until the time of a SCAR meeting in 2004, hosted by the German Maritime Museum and the Alfred Wegener Institute in Bremerhaven, and most of the 100 pastels were placed on exhibition for the first time outside the U.S. The authors, Dr. Reinhard Krause of the Institute, and Dr. Lars Scholl of the Museum, assembled the book of 70 pastels, 13 sketches, and 24 photographs, a number of them rare, of the 1933-35 expedition into a book with high-quality paper and text. A four-page section on Admiral Byrd and the expedition is followed by the photographs, then eight pages of Paige's life.

The remainder of the book consists of the sketches and pastels, with labels for each at the end. Sixty of the pastels and other polar memorabilia of not only the Byrd papers but also those of Sir George Hubert Wilkins and the Frederick Cook collection, are housed at the Byrd Polar Research Center Archival Program at The Ohio State University. For further information contact Laura Kissel at the Archives and the web page at <http://www.lib.ohio-state.edu/arvweb/polar>.

**THE NINTH CIRCLE.** (Review by Rob Flint) John Behrendt's latest book, *The Ninth Circle: A Memoir of Life and Death in Antarctica, 1960-62* (the title is a reference to *The Divine Comedy* in which the ninth circle of Hell is the region of ice) opens with a hair-raising incident which took place on November 22, 1960, when John, as a graduate student, was the scientist in charge of an airborne geophysical survey operating out of Byrd Station in the area

of the Crary Mountains. Not to give away too much of the plot, he and everyone aboard his R4D-8 (military version of a DC-3) miraculously survive, which is a good thing, because without him the Antarctic and the world would have lost a distinguished scientist, a world-class explorer for over five decades, and, as the present volume again shows, an accomplished author. This book is John's memoir of his experience as leader of geophysical surveys of West Antarctica during the austral summers of 1960-61 and 1961-62. For the first summer, he was based at Byrd Station and during the second summer he led the Camp Minnesota to Antarctic Peninsula traverse. I very much like the format, which John also used on his earlier book, *Innocents on the Ice: A Memoir of Antarctic Exploration, 1957* (story of Ellsworth Station during IGY), in which he intersperses quotations from his journal kept at the time with comments from the perspective of forty years later. John brings a great deal of perspective to this work: he had leadership responsibility at a young age, and is one of the few people who have had involvement with Antarctic research in every decade from the 1950's to the present. The cast of characters include many well-known names in the history of Antarctic research — Bert Crary, George Toney, Charles Swithinbank, Ed Thiel, Ken Moulton, Charlie Bentley, Eddie Goodale, Bob Rutford, Campbell Craddock, Phil Smith, Sir Charles Wright, Art Ford, and others whose names will be immediately recognizable to those who worked on the continent in the decade after IGY or have read the literature on that period.

John describes his initial visit to McMurdo, and subsequent trips to Hallett, to Byrd Station, where he was based for the summer, and later to South Pole. At this time, all of these stations were essentially the same stations as had been built for IGY. He also describes the aircraft used at the time - the Constellation for the flight from Christchurch to McMurdo (one crashed at McMurdo when he was there), the C-124 for cargo drops at Byrd and South Pole, the P2V for remote sensing, the C-130 for trips to Byrd and South Pole, and the R4-D8, used for remote sensing and for open field landings at remote sites. By the end of the 60's, only the C-130 was still in use in Antarctica (as it is to this day). The main workhorse for his program was the R4-D. It was still a pioneering time: "Many of the flights we made during this and the following season were over totally unexplored terrain. There was no GPS or even inertial navigation available in the 1960's". During the 1961-62 summer, John was the leader of a traverse that began at Camp Minnesota in the Jones Mountains and continued to Camp Sky-Hi and thence on into the southern end of the Antarctic Peninsula. We get a feel for life on a traverse -the constant worry about crevasses in some areas, the continual challenge of equipment breakdowns and failures, periods of

frantic activity and nights without sleep to take advantage of good weather, and intervening periods of frustration and boredom when bad weather prevented movement and activity. And behind it all is the thrill of discovery, of being the first person to see certain mountains and the new understanding of the geography, geology, and geophysics that come with collecting data where none had been collected before. For instance, this traverse established that there was no subglacial ridge connecting the Sentinel Range to the Antarctic Peninsula, as had been suggested before.

The safety record of VX-6 was poor. The accident rate was eight times the rate of U.S. Naval aviation elsewhere in the world. In addition to his near miss and the Connie's crash at McMurdo, John talks about several non-fatal accidents involving the R4-D's and the horrific P2-V accident in 1961 that killed his friend and mentor, Ed Thiel. I am not sure how John was able to carry on and accomplish so much that summer after that tragedy. Safety was treated more casually in those days: dynamite for seismic work was frequently handled without extensive controls. Avgas, used in the R4-D's was very dangerous to handle. JATO (Jet-Assisted Take Off) rockets, used on many of the aircraft in open field or rough runway conditions were handled almost casually.

This book fills an important role in describing the life of a researcher in Antarctica in the period after IGY, but before the modern era of permanent stations, rigorous safety procedures, modern navigation tools, and women on the ice. I found this memoir especially interesting because it is about a time just prior to my first Antarctic winter, which was at new Byrd Station, just two years after John had been to old Byrd (which I also visited). I saw traverses come and go and did fly in an R4-D on a med-evac flight out of Byrd, and also spent some time at Old Pole. His descriptions of the planes and places are full and accurate. The book is illustrated with 66 black and white photos and eight maps and has a good index and bibliography.

University of New Mexico Press \$29.95 (hardcover). Book may be ordered by calling 1-800-249-7737.

**BIRDS & MAMMALS OF THE ANTARCTIC, SUBANTARCTIC & FALKLAND ISLANDS**, by Frank S. Todd. Temecula, California, Ibis Publ. Co., 2004. 138 p. \$29.95. (Review by John Spletstoesser.) This is the latest of the author's many books on mainly birds, but also a variety of wildlife species that Frank has worked with over the years in the field and also in zoos. It consists of a handy guide to what it says, all in color photographs plus a few paintings, each species with brief descriptions of its characteristics. There is little text, as the major benefit of the

book is to assist both amateurs and professionals to identify what is seen in the far south. Frank is an authority on penguins and waterfowl of the world, has worked more than 30 summer seasons in Antarctica, sub-Antarctic, and the Arctic, and is also a first-class photographer. He also is recognized as an authority on controlled-environment breeding of penguins, collecting their eggs in the field and returning them to Penguin Encounters at Sea World in San Diego, his proud creation several decades ago. As the eggs hatched, the penguins and other birds thought they were at home, so to speak, and breeding and further generations resulted successfully. This book also has a supplement, a plastic-laminated flip-chart (at \$17.95) of some of the book's content, that folds the 12 pages into a convenient size slightly smaller than that of the book. This book is a must for anyone planning visits to Antarctica, sub-Antarctic islands, and the Falkland Islands (Islas Malvinas), particularly aimed for passengers and staff on tour vessels. Realizing that other nationalities are included in those cruises, the last pages include the English-language equivalent names of wildlife in Spanish, German, and French. A short index completes the book

**IAATO's 16<sup>th</sup> ANNUAL GENERAL MEETING IN GERMANY.** (John Spletstoesser, Advisor to IAATO.) The International Association of Antarctica Tour Operators (IAATO), founded in 1991, held its 16<sup>th</sup> Annual General Meeting in Hamburg, Germany, 2-5 May 2005. The organization started with seven tour operators in 1991, and as of 5 May consists of some 78 members based in 13 countries plus the Falkland Islands (Islas Malvinas). IAATO's objective is to promote safe, appropriate and environmentally sound private-sector travel to Antarctic destinations. Its membership comprises a large segment of the Antarctic travel market, including ship operators, ship agents, land-based operators, travel agents, and one government office. The IAATO office is based in Basalt, Colorado, and is managed by Denise Landau, Executive Director, with assistance from an Advisor, plus many others who work on the day-to-day operation, and special projects that require specific expertise, mainly by several committees. Detailed Bylaws specify various types of tourism activities and their management, which operates under the umbrella of the Antarctic Treaty Parties plus self-imposed Guidelines compiled by IAATO for the protection of the environment.

The meeting in Hamburg illustrated its growth over the years since 1991 by its attendance of more than 100 representatives from members plus governmental organizations. The meeting was held in the offices of Hapag-Lloyd, one of the IAATO member companies. The growth of tourism can be seen by comparing visitors in the 1992-93 austral summer (6,700

individuals) with the 2004-05 season (some 30,200). The numbers must be qualified, however, to illustrate the varieties of tourism now available, including mainly shipborne (22,300 with landings), but also overflights with no landings (2,000), cruises with no landings (5,000), and a combination of air/land-based tourism (900). The major advantage of seemingly large numbers of visitors to Antarctica in summer, when compared with Treaty Party numbers in summer (5,000 or more) is that nearly all tourists arrive by ship and there are no land-based infrastructures, the ship providing the hotel, as it were. Tourism does not operate in winter, whereas a large number of stations are operated year-round.

IAATO sends a delegation to the annual Antarctic Treaty Consultative Meetings (ATCMs) in order to report on statistics, table relevant papers for discussion, and also respond to issues posed by the Treaty delegations from nearly 50 countries. One of the major issues discussed in Hamburg in May revolved around an accreditation and auditing system, whereby IAATO members are in the process of documenting the detailed guidelines compiled for safe and environmentally sound tourism (such as wildlife protection, ship operations, safety, communications, etc.). The objective, in a way, is to show Treaty Parties that we do what we say we do, and in an environmentally safe manner. The 2005 ATCM is scheduled for 6-17 June in Stockholm.

Because most tourism is conducted in the Antarctic Peninsula area, south of South America, numerous sites are visited by a large number of vessels from early November through mid-March, the period of summer tourism. In order to manage proper conditions for these visits, IAATO has developed a series of Site Guidelines for use by the members so that sites are not over-visited or visited in vulnerable parts of the summer (breeding time, e.g.). Land visits are conducted by use of air-inflated Zodiac boats from the vessels to transfer passengers ashore, where staff members provide guided tours to interpret what is there, and at safe distances from wildlife (penguins, seals). A staff to passenger ratio of 1:20 provides adequate control over the number of people ashore, which totals no more than 100 passengers at any one time.

IAATO has developed a sophisticated data base to keep track of annual records of visitors, sites visited, and nationalities of visitors. An attractive website at [www.iaato.org](http://www.iaato.org) provides detailed information on annual figures, directory of members, papers tabled at ATCM's, and a recently printed Newsletter, among numerous other entries. The IAATO Newsletter is listed under Information Papers, and references activities conducted in the 2004-05 season.

**BRASH ICE.** We are finishing up twenty- eight years of putting these Newsletters to bed, and to tell you the truth, the thrill is wearing off. It was fun doing it for the first twenty years when Ruth Siple was alive and at my side supporting all of our Antarctic Society activities. Now it is more like work, and it seemed like all we did last year was write obituaries about my contemporaries, many of whom were younger than me!

But we are in an interesting era, the ending of a century of Antarctic exploration and science, the ending of fifty years of concentrated science which began with the International Geophysical Year, 1957-58, and the beginning of a soon-to-be inaugurated Fourth International Polar Year, 2007-08. But what we will probably do with this issue is to reflect on the past fifty years and its changes, not so much on science, but on life style in Antarctica. Have things really improved with change, or have they just gotten more complicated?

But before we kick things off, how did you folks enjoy MARCH OF THE PENGUINS? Already this film is the second highest grossing documentary of all time, behind "Fahrenheit 9/11". Pretty super film, and great to see a full-length movie of the Antarctic without a backdrop of Mt. Erebus, without a C-130, without a frosted bearded scientist, in fact no people at all, until the credits rolled at the end, and the film team was shown in the field. Sensational, can't wait until we can buy a DVD of it. What tremendous shots, and when that first emperor came splashing onto the screen, didn't it bring you right out of your seat? If there was a flaw, it seems to me that it was of the mid-winter circling of the groupie, as it did not approach the same high quality of a Kiwi film of the same feature which they filmed near Cape Crozier about ten years ago.

Now for something which we really do not know how to handle, but where the NEW YORK TIMES saw fit to do a review of the book, we should at least mention its existence. It's a paperback by a man, Nicholas Johnson, who has recently spent five summers and two winters at McMurdo as a grunt in the U.S. Antarctic Program, and the name of the book is BIG DEAD PLACE. Movies have a category labeled "parental guidance". Well, this book, supersaturated with four-letter words, should be restricted only for grown-ups who have obtained "juvenile guidance" from their kids. It is too bad that this guy could not allow himself to write shock-free English, as this once-upon-a-time English teacher in Korea presumably had the wherewithal to write as most of us talk. This book, which has much worthwhile information about contract people probably defeats its own purpose in exposing conditions and people by the uncouth style of writing, which will drive many people to toss it into the ash bin before they have read deeply into the book. Too bad, as it is a most unique book, one of a kind by a support type person. I know of no other such book unless you want to consider an ex-South Pole doctor's product of her plight, another support-partv book. Read the review of the book by Steve Dibbern later in this Newsletter.

And speaking of language, one can't help but think of that Living Legend from the first Byrd Antarctic Research Expedition, Norman Vaughan, who is closing in on 100 years in mid-December. This deeply religious man, who has never sworn in his life, still has hopes of returning to Mt. Vaughan one more time, although they are now just faint hopes because of the monies involved. Hope breeds eternal with Norman, and he never gives up on any of his dreams. It is always a great joy to call Norman and hear him bellow out strongly "Norman Vaughan speaking."

**ANTARCTIC CALENDARS.** We are offering one more time the Antarctic calendars put out by Hedgehog in New Zealand, although they have sold the rights for distributing to Caxton Press in Christchurch. However, the calendar again features the beautiful pictures garnished together by Colin Monteath. We only ordered a hundred this year, and it is going to be first come, first serve, as we will be out of the country from mid-December to mid-January and we want it all wrapped up by our departure from CONUS. The price this year, \$14.00 each, with checks made out to the Antarctic Society, mailed to Box 325, Port Clyde, ME 04855. We expect the shipment from New Zealand by 1 November 2005, and will be mailing them out to you buyers by 15 November 2005. Although we have not seen an advance copy of the calendars, we are certain where they are Hedgehog that they will be the best Antarctic calendar that money can buy.

**PETER WILKNISS IS DEAD AT AGE 70.** Probably no leader of the Office of Polar Programs at the National Science Foundation was more controversial than Peter, but as far as the Antarctic Society was concerned, he was the best. He gave us more cooperation in his servitude there in the 1980s and 1990s than all the rest of their directors combined. He wasn't exactly loved by all the scientists, and I guess they helped to grease the planks which removed him from office. He went fast, as he presented the status of activities in the Antarctic to the Polar Research Board just before lunch break one spring day. That evening our Society had its annual Paul C. Daniels Memorial Lecture, and during the cocktail preliminary warm up, all the conversation was about Peter being shown the door that afternoon. After leaving the National Science Foundation in 1999, he moved to Alaska where he established a nonprofit institute, the Transnational Arctic and Antarctic Institute, a polar science and policy company.

According to the immortal Bert Crary, he, himself, brought Peter into the folds at NSF where he served as the director of the International Deep Core Drilling Program. Peter had a very masculine, robust body, and he played competitive soccer in the Washington area throughout his tenure there. As all of us

who have worked for the government knows, one of the hardest tasks of working in a Head Shed is how to minimize the activities of those who you feel are not performing up to your standards. Peter did the impossible, he removed several of his inheritants in the Office of Polar Programs from the government payroll! A miracle worker! This strong-minded man also had the flexibility of being able to change his mind. No one was more adverse to welcoming tourists at his Antarctic bases where he wanted no outside interference, but in a few short years he reversed his position when he discovered that many of the so-called enemies had a lot of political clout on Capitol Hill. But, in spite of himself, he never found the answer to conquering cancer.

Why did we love Peter? When he moved into the Head Shed, we walked into his office and solicited his help in getting the news for our Newsletter. He assured us his door would always be opened for us, that he would answer each and all questions that we had. He never reneged on that promise, even though our questions at times were rather pointed. And he personally took us to each of his Program Managers and beseeched each and every one to support our requests of them. What a guy.

In closing, let's quote Barry Lopez from Peter Wilkniss's obituary in the June 14, 2005 issue of the Anchorage Daily News... 'Peter tried hard to get people to understand the importance of polar science in a world in dire need of better understanding of global climate and the United States' effort to establish international cooperation in the wake of the Cold War. Peter believes in science...He is poised to put information together in a striking new fashion...He is passionate, disciplined, and someone with a vision.'

**DR. ROBERTA MARINELLI AT OAP.** (Scott Borg) Dr. Roberta Marinelli has been appointed Program Director for the Antarctic Biology and Medicine (AB&M) Program in the Antarctic Section of the Office of Polar Programs at the National Science Foundation. Dr. Marinelli comes to NSF from the Chesapeake Biological Laboratory of the University of Maryland's Center for Environmental Science. She brings a wealth of experience in biological and oceanographic sciences, and especially ecosystem studies, to OPP. She earned her PhD in the Marine Science Program at the University of South Carolina in 1991, and then served as Assistant Professor of Biological Oceanography at Skidaway Institute of Oceanography of the University of Georgia. Dr. Marinelli came to NSF as a rotator in 1997 and served as Associate Program Manager for AB&M. She left NSF in 2000 to become Assistant Professor, and then Associate

Professor, at the Chesapeake Biological Laboratory. Dr. Marinelli began duties full time in OPP on 4 September 2005.

**BIRTH OF McMURDO**, by Patrick "Rediron" McCormick, Builder Second Class Petty Officer, Operation Deep Freeze [I&II]. Fifty years ago this austral summer McMurdo Station was constructed by the US Navy Construction Battalion (Special). I was one of those Seabees. The station was initially called the Naval Air Facility, but was soon dubbed Williams Air Operating Facility after Petty Officer Richard Williams drowned when his D-8 tractor went through the ice. It was not called McMurdo Station until later.

On December 20, 1955, a temporary base of tents was established near Scott's Discovery Hut. Construction materials were hauled over several miles of sea ice to Hut Point where it was staged in a logical order for future use. The transfer of supplies continued until mid-February 1956. Before our berthing units were completed we all lived in "Tent City," where we slept in sleeping bags laid on air mattresses, shipping pallets or the ground, protected from the wind by the tents in which we slept. The only source of water was snow, hauled from the surrounding hills and melted. The snow was very dry, so the yield of water was very small in ratio to the volume of snow. We melted snow in food cans scrounged from the galley waste dump over small primus stoves for water to brush our teeth and wash our hands, face and feet. There were no showers for a month and a half<sup>0</sup> or more.

In an effort to expedite construction, we were organized into two shifts with each shift working twelve or more hours a day, seven days a week. Meals were prepared in a tent galley and eaten from mess kits. The cooks were preparing four meals a day for a couple hundred men and did the best they could. The Coast Guard Ice-Breaker *Eastwind* was very gracious in sending us bread and desserts now and then.

The town was laid out with two north-south streets, each about 50 feet in width. By the end of the winter of 1956 we had completed most of the buildings. The shell of the first building was completed on January 19, 1956. Foundations for the buildings were 6" x 8" x 5' timbers cribbed up and shimmed to achieve level floors. It was impossible to dig into the volcanic ash permafrost. All the buildings were prefabricated, consisting of Clements huts (4'x8' insulated plywood tongue and groove panels), Quonset huts, Jamesway huts and Atwell huts. Jamesways and Atwells are similar to Quonset huts but are canvas covered and smaller. We Seabees became experts at erecting the buildings, as we worked on them hour after hour, day after day for several weeks.

On the morning of February 16, 1956, the first meal was prepared and served in the permanent galley and mess hall, a definite boon for the cooks. The building and equipment would not be completed for a month or so, but we were sitting at tables out of the wind and cold and it sure beat the tent galley. February 25, 1956, "Tent City" was struck and stored. The wintering party of ninety-three, including me, moved into our new living quarters. We were now eating from normal military type trays washed by the mess cooks in the galley and mess hall. The mess cooking was a rotating detail that no one, not even the officers, were immune from. We were getting a short shower once a week in the completed power house. We had electricity and could now change clothes because we had laundry facilities. Living and working conditions were looking up as we began to settle into a normal day-to-day routine.

Eventually the power house was finished. It had two 100-kilowatt electrical generators each powered by a D-8 Caterpillar diesel engine. There were two large containers that were adapted so the hot exhaust from the generator engines circulated under the containers and melted the snow which was replenished from the snow field when needed.

The snow field was off limits to everyone except the people operating the only front end loader allowed there. This was an effort to maintain the snow's purity and prevent contamination. Water was never in ample supply and was not to be wasted. There were also some smaller generators used in selected buildings and shops so as not to overburden the main generators in the powerhouse.

Upon arrival on the Ice, most of us grew beards. But as time went on and water was more available we discovered beards were difficult to keep clean and trimmed, hoar frost would form on them and they didn't keep us any warmer. They began to disappear and soon the majority of us were clean shaven. On March 9, 1956, Admiral Dufek paid us a visit, wished us well, and departed for the United States. Our last contact with the outside world was gone and we settled in for winter.

The wintering party had five Clements huts constructed for berthing, each hut was divided into cubicles and an open area with a table and chairs. We used the open area to play cards, drink our beer, shoot the breeze, solve world problems and otherwise entertain ourselves. In the cubicles there were two bunk beds and four lockers resulting in four men per cubicle. The hut was heated by two oil fired space heaters with fuel being drawn from a tank outside which was filled each week

by rotating detail. The Clements huts had flat roofs and when high winds occurred, which was often, it had the effect of air passing over an airplane wing by lifting the panels off the ceiling trusses. We had to fasten them down to prevent them from flying off and secured a canvas tarpaulin over the outside top to prevent melting snow from seeping through the seams. We also constructed a vestibule on each hut to prevent warm air from escaping and cold air and wind entering while entering or leaving the hut. The door of the vestibule had to be closed before the door of the hut could be opened and vice versa, creating an air trap, which worked quite well. Linoleum was installed on the floors of some buildings for sanitary purposes, particularly in the galley. We kept a bucket of snow and water on each stove in an effort to humidify our quarters. It worked quite well and was also handy for thawing frozen beer.

The officers and chief petty officers had their own huts. The rest of us lived together with no attention paid to status such as pay grade. Each hut had a Hut Captain, usually the senior petty officer, who maintained order and assigned duties as needed. We were allowed to arrange and decorate as desired, as long as the majority agreed. A member of each hut would perform "compartment cleaning duty" such as sweeping and taking out the trash, for one week at a time. Each man was responsible for his laundry, bunk making, and personal item storage.

We also constructed one building that wasn't in the original plan for the base. Mysteriously, a stockpile of scrap building material began to accumulate at the end of the street near the base of Observation Hill. Chaplain Father John Condit, a rather free spirit, began to recruit "volunteers" to put this scrap together during their off time. We had no plans, but with Seabee ingenuity and a "can do" spirit, it turned into a chapel complete with steeple and belfry. The bell somehow made its way up the hill from an oil barge frozen in Winter Quarter's Bay to be placed in the belfry. On May 6, 1956, the chapel was dedicated to Our Lady of the Snows.

(ADDENDUM, pcd) Dave Canham was the station commander in 1956, and he was a good one, most highly respected by his workers and loved by one and all. His heritage sort of indicated that he would be a good leader. Some of you old timers may remember the well known editor of the CHRISTIAN SCIENCE MONITOR by the name of Canham. Well, Dave was of that family. And you football fans may remember the famous duo at the University of Michigan before World War II, Tommy Harmon and Forrest Evashevski. Who opened up the holes in the line so that they could run to stardom? Dave Canham. And probably the most famous athletic director in collegiate sports after World War II was Dave's brother at the University of Michigan, who

parlayed his career as their AD with the merchandising of sports equipment. After his military career, Dave became administrators for several large university research organizations. While serving in these capacities, I repeatedly succumbed to his tennistry on the courts, but losing to him was always an honor. This nice guy died a premature death about a decade ago.

**BIG DEAD PLACE: Inside the Strange & Menacing World of Antarctica**, by Nicholas Johnson, Feral House, Los Angeles, 2005, 260 pp. \$16.95 Paperback. (Review by Steve Dibbern.) My first reaction to "Big Dead Place" was that it was a diatribe by a dissatisfied employee who had the means to air his grievances in print; I think now that I was only partially correct. He was a disgruntled Raytheon employee but he also has considerable writing skills and weaves a fascinating story. It is a classic story to be sure, "Us versus Them". If the reader can get past his "Shock-Jock" use of particularly crude sexual references, a la Howard Stern we may learn a great deal about the most underreported of Antarctic stories, how the support staff lives, works, and feels at McMurdo Station.

Older readers may remember the IGY period when the roles were reversed and the Navy appeared annoyed that they had to have those pesky "Sandcrabs" messing about at their great military bases! Johnson is astute enough to see this pattern and weaves it into his narrative, particularly (no surprise) Finn Ronne's reign at Ellsworth Station.

Sharp readers will find a number of minor mistakes in historical reference, but make no mistake, Nicholas Johnson is a knowledgeable student of Antarctic history. His main failing is what Antarctic isolation does to many; he grossly exaggerates the importance of individual problems. I would however hope that the management of Raytheon and NSF would take this book to heart as a manual of how things go wrong...it is an honest, *if* exaggerated description of a classic blue collar "Us versus Them". As Johnson points out, what adds immeasurably to the problem is that the workers at McMurdo are frequently there for the "Adventure" of Antarctica and are allowed no adventure. They are also frequently over-educated, over-qualified and too intelligent for the sometimes menial jobs that are necessary to support our Antarctic program.

**RELATIONSHIPS ON THE ICE. (Kirk Spelman)** With the advent of women on THE ICE in the 1969-70 austral summer, the number of stories about 'coupling' have increased exponentially, many pertaining to those who winter over as well as the summer folk. The following was

contributed by someone who has 'been there.' In his own words, with minor editing, he starts with "... once the female population reached about 40%,... the number of male fighting incidents dropped drastically. I know that I certainly enjoyed the company of women during my deployments. My first summer at McMurdo I was not really interested in starting anything... but it was certainly available. My feeling of McM was that it was like a college campus without the schoolwork. People talk about the first month being the rutting season where everyone tries to catch their mate...for however long they like. This is not just the men. I get the feeling that there are many women who really thrive on the attention that they receive while on the ice. One of the other sayings that is somewhat appropriate is that, "the odds are good but the goods are odd."

What makes things interesting and different from working at GM in Detroit, for example, is that there is really no separation between work and private life. You are always at your work place, seeing the same people for months on end. This creates a lot of familiarity very quickly and can make things blossom fast. The other thing is that the sun is up all the time, the work is fast and furious, and there is lots of alcohol on station. I cannot think of another time when I felt more manic...that there was not enough time to get things done, and that I needed to capture every moment of time on station.

I also think that there is a certain kind of person who is attracted to working in Antarctica, either adventuresome or money hungry. But there are lots of people who have a love of travel and these folks can meet and plan new adventures together.

I think that a lot of the relationships on the ice seem to end not because of being incompatible but rather the geographic problems of return back to the states. You realize that the person you are with lives in West Virginia or Arkansas and you are a diehard Yankee or something along those lines.

While on the ice I have seen people quit and head home because they were without their love and either missed them too much...or did not trust them to be alone, seen both men and women cheat on their mates while on the ice, seen couples start long lasting relationships, and have seen couples who arrived together end their relationships. So it is just like life anywhere else.

I know that the stations are fairly well policed in terms of men harassing women...if it goes too far the men are gone on the next flight out. As it should be. I don't recall hearing any times

when women were sent out for harassing men, but it could very well happen.

I honestly don't think that anyone goes to the Antarctic to meet their mate. But I think that people go there for the adventure and that includes meeting people with comparable aspirations. I think that the "hooking up" for winter is a natural process that can help create a bond or shared experiences that can make the time easier and more enjoyable.

There are a few sayings that I have heard when it comes to the opposite sex on the ice. There is the saying, "you're either fast or you're lonely." "If you can't be with the one you love, love the one you're with." There is the term of "Ice Wife", or "Ice Husband" for relationships that are not expected to last beyond the time on continent.

**ANDRILL (ANtartic DRILLing)** is a multinational scientific drilling program which seeks to investigate Antarctica's role in Cenozoic global environmental change by recovering stratigraphic core records from two currently funded drilling projects set to begin in 2006 and 2007, respectively. The projects will be a focal point during the International Polar Year (2007-08).

These two projects, known as the McMurdo Ice Shelf (MIS) site (co-leaders Drs. Tim Naish (NZ) and Ross Powell (US)) and the Southern McMurdo Sound (SMS) site (co-leaders Drs. David Harwood (US) and Fabio Florindo (IT)), are expected to recover as much as 1000 meters of core, which will be used to interpret Antarctica's climatic, glacial and tectonic history over the past 50 million years and at varying scales of age resolution.

Besides the United States, the program's international partners also include Germany, Italy and New Zealand. Science teams for both the MIS and SMS projects will comprise more than 20 on-ice scientists and students, as well as numerous off-ice scientist and student collaborations from these nations.

In August 2005, ANDRILL was awarded \$12.9 million dollars by the National Science Foundation (NSF) to sponsor Antarctic research and drilling over the next five years. Overall, ANDRILL is backed by more than \$30 million in funding, including \$9.7 million in previous and on-going international agreements to support drilling operations and

nearly \$8 million from ANDRILL partner nations (including contributions from the U.K.) to support scientific research.

The NSF grant, to be dispersed over the life of the two projects, will be administered by the ANDRILL Science Management Office, located at the University of Nebraska-Lincoln. ANDRILL's operations management is headed by Antarctica New Zealand.

In October and November of 2006 and 2007, ANDRILL will deploy a powerful new drilling system to recover rock cores from the seabed in the McMurdo Sound area of the Ross Sea, using floating ice as a drilling platform. ANDRILL's drilling system, developed and operated by Antarctica New Zealand, will enable the Program to drill in much deeper water than during earlier Antarctic projects, such as at Cape Roberts. The drill is designed to punch through about 275 meters of ice, drop through 900 meters of water to the sea floor, and pull a continuous 1000-meter-long sediment core at each project site.

The program is proceeding in three stages. First, seismic surveys to determine the best drilling sites will be completed in October and November, 2005. In 2006, a scientific team led by Naish (NZ) and Powell (US), will drill from the McMurdo Ice Shelf. In the second drilling season, Harwood (US) and Florindo (IT) will drill from a site west of Ross Island. Once core is recovered, samples will first be examined by scientists at the Crary Lab in McMurdo Station and then stored at Florida State University's Antarctic Research Facility in Tallahassee, where they will be available for more thorough and on-going scientific studies.

For more information about the ANDRILL Program, including the MIS and SMS projects and scientific prospectuses, please visit the website at <http://andril.org>, or contact the ANDRILL Science Management Office at 126 Bessey Hall, University of Nebraska-Lincoln, Lincoln, NE 68588-0341 (tele: 1+402.472.6723).

**SOUTH POLE TELESCOPE BEING DESIGNED.** A new 10-meter-diameter telescope is being constructed for deployment at the South Pole. The project, which will help scientists reveal new details regarding a mysterious phenomenon called Dark Energy, is a collaboration between the University of Chicago, U.Cal.-Berkeley, Case Western Reserve University, the University of Illinois, and Smithsonian Astrophysical Observatory, and it is primarily funded through NSF OPP.

One of the most important discoveries in cosmology is that apparently much, if not most, of the mass of the Universe is *not* made up of stars and glowing gas, but of dark matter, which emits little or no light or other electromagnetic radiation and makes its presence known only through the gravitational force it exerts on luminous matter.

The South Pole Telescope (SPT) is designed explicitly for conducting large-area, high-sensitivity survey observations of the polarization of the Cosmic Microwave Background (CMB). South Pole's climate, atmospheric stability, and millimeter and sub-millimeter opacity are nearly ideal for studying CMB radiation.

The telescope's optics will support a one-degree-diameter field of view, and to further reduce signals due to scattering and spillover, the entire telescope will be deployed within a large reflecting ground screen attached to the South Pole's Dark Sector Laboratory. (To appreciate the size of the ground shield, picture the Dome flipped upside down and mounted on a pedestal.)

Construction of the telescope is underway, with deployment planned for late 2006, and first observations starting in early 2007.

#### **COMMUNICATION SYSTEMS AT SOUTH POLE.**

(Nick Powell, Satellite Communications Engineer, Raytheon Polar Services.) Under the South Pole Station Modernization (SPSM) program, a significant upgrade to station communications was started in 2000 and should be completed during the 2005-06 austral summer. The upgrade addresses all aspects of the communication infrastructure including the Local Area Network (LAN), intercontinental high speed voice and data communications, as well as traditional radio communications. Furthermore, communications operations will move from the old Comm office under the dome to the new Station Operations Center (SOC) on the second floor of the elevated station. This new location with its height and windows provides operators a good view of the skiway and surrounding area, thus enhancing safety and operations. Furthermore, new consoles will consolidate the various radio and communications functions into a single ergonomic improved system. The station LAN comprises a fiber optic cable backbone network supporting gigabit per second traffic. This fiber backbone connected through Cisco routers and switches provides connectivity to all station facilities including a seismic vault 8 km from the station. A copper-cable plant provides literally hundreds of network access points around

the station in offices, living quarters, and research facilities. Personnel can enjoy high speed computer connections in the rooms that give them access to a variety of capabilities including e-mail, internet access (when there is satellite connectivity - see below), instant messenger, etc. Also, Voice over IP (VoIP) telephony provides support on station communications and intercontinental calling (again when the satellites are visible). Station personnel can pick up a phone and dial home using a phone long distance credit card (available at the station store if they don't already have one). The station also makes use of Wireless LAN technology to service distant locations or as temporary emergency links when a cable is cut and until it is repaired. Bulldozers make excellent cable finders!

Intercontinental communications rely on satellite communications. Unfortunately, the earth's curvature blocks South Pole's view of communication satellites at geosynchronous altitudes normally used for this application. However, the station makes use of three old geosynchronous satellites (MARISAT F2, TDRS F1, and GOES-3) in highly inclined orbits that make them visible at South Pole for approximately 6 hours per day. During this 6 hour period the satellites rise above the South Pole horizon to maximum elevation angles of ~5 degrees, and then set 3 hours later. Since the coverage overlaps, the station gets approximately 11.25 hours of high speed (1.544 Mbps) satellite connectivity per day. This supports most off station data and voice communications as well as video teleconferences, particularly any needed for medical care. E-mail, internet access, and telephone calls take place during this daily satellite coverage window. In addition to high speed satellite communications, the station also uses Iridium for intercontinental voice service between satellite windows. However, this is reserved for high priority operations and emergency calls.

In addition to satellite communications, the station still relies on High Frequency (HF) and Very High Frequency (VHF) radio communications. HF radio provides point-to-point and broadcast communications for aircraft operations, comms with McMurdo, and deep field camp support during the austral summer. VHF radio supports line of site air-to-ground operations and local area ground communications. Ham radio (South Pole call sign KC4AAA) plays a role in supporting station morale activities and as a tertiary emergency radio system. During the austral summer when most activity takes place, the best chance of hearing it is between 23 to 03Z near 14.243 MHz. 20m propagation into the US (particularly the eastern seaboard) typically works well that time of day. SPSM has funded a major upgrade to HF and VHF communications systems. A new suite of antennas including 3 directional log-

periodics, 1 Near Vertical Incident Skywave, and 1 Conical-Monopole antenna will be installed for HF system this next year. Four Ham radio antennas (6 element 20m beam, 3 element 40m beam, two multi element 10-15-20m beams) will be installed in the next year. Antenna installation also includes new antennas for VHF systems as well. Radio equipment gets an update as well. State of the art commercial HF, VHF, and Ham radios replace equipment that is over 20 years old this austral summer.

**REGIONAL CONCLAVES.** This past spring when we found out that our illustrious president would be spending some vacation time in New Hampshire, we decided that it might be a good idea for him to meet the strong contingent of Latter Day Polies living in midcoastal Maine. What started out to be a small gathering got out of hand, and our net captured many New Englanders, and some from beyond the Connecticut River who had close friends in our area. We ended up with over thirty on July 22<sup>nd</sup>, and it was a wonderful admixture of some really old has-beens as well as many kids still wet behind their ears. But age was no factor, as the love for Antarctica brought them all together and we found out that there was great mutual respect for each. It all ended with us wondering if we could have other regional conclaves where we have a significant concentration of Antarcticans, such as in the Bay Area, or perhaps the Denver-Boulder Corridor.

Let's look at the great diversity of Antarcticans who attended. Amazing. Starting out we had one of the widows (Bess Urbahn) of the famed polar aviator, the very first man to ever fly over the South Pole, Bernt Balchen; one of the three daughters (Jane DeWitt) of famed polar scientist Paul Siple and the widow of an Antarctic ichthyologist, Hugh DeWitt; the grandson (Leverett Byrd) of the Admiral of the Poles, as well as Senator Leverett Saltonstall. How about that for name dropping?

We had a goodly collection of really old has-beens. We will start out with one of the last of the bona fide dog team drivers, Bob Dodson, geologist on the Ronne Antarctic Research Expedition in the late 1940s. Incidentally the youthful looking Bob is far older than he appears in real life. Then we had one of the last of the iron men who man-hauled sledges, Bill Meserve. This man had no other choice, as he went south with Bob Nichols who strongly believed nothing of significance was ever accomplished on the ice unless it was done by husky young studs pulling their own sleds. A man (Bill Marshall) who sort of disappeared from sight, but who was the first glaciologist involved in the deep

core drilling program in West Antarctica, and was also influential in introducing Tony Gow to Antarctica, surfaced and enjoyed himself tremendously. And we had one of the builders of the original South Pole station, Charlie (CB) Bevilacqua, who is still on his Antarctic honeymoon.

We had quite a few from the IGY, many of whom continued on to make Antarctica their careers. Ken Moulton was there before the IGY started, and kept going back under the aegis of the National Science Foundation for well over thirty years, during which time he set a Cal Ripken type record which will never be broken, Christmases at McMurdo. Tony Gow was introduced to the ice during the IGY, and he was never able to live a normal life thereafter. Another Antarctic of notoriety who showed up was Steve Denny" Den Hartog, who has kept active on the ice until recent years. My expanded ego demands that I include myself, whose chief note to fame being that I was the only American married man to spend both years of the IGY on the ice. Says little for my intelligence, I know, but I loved every minute of those two years.

Then we had a bunch from shortly after the IGY. Bob Dale commanded the VXE6 squadron in 1959 and later worked in the Office of Polar Programs at NSF. Rob Flint started his Antarctic career at about the same time; one that was to see him winter over at Byrd, at Plateau, and at Vostok. On top of all that, he made countless other summer expeditions to the ice for the USSR, France, and the USA. We had the former station scientific leader from Eights, Jerry Huffman, who later became a program officer in the Office of Polar Programs at NSF.

Then we had some tweeners, who are almost young enough to be called neophytes, but are more old than young. One, Lucia de Leiris, is a well-known Antarctic artist, and she captivated the hearts of all who had not already lost their hearts to her. Steve Dibbern, polar transportation expert, Antarctic historian, champion of the use of the hovercraft, came and was enthralled by meeting so many of the old, so many of the young. Charles Lagerbom, one of the most congenial of all Antarcticans, who was in the Dry Valleys with a Univ of Maine team, manned the grill.

Then we come to the Modern Era, and we will start out with Bob and Marie Hurtig, who were at the South Pole back in the 1980s. Marie is the author of a small booklet of Antarctic poems. Another married couple with years and years of South Pole experience - and still counting- Drew and Diana Logan, attended, a most delightful couple, whose most wonderful dog, Dory, also graced the party. Drew has tallied four winters at the South Pole, and Diana will probably be spending her third

winter there this coming year. Kirk Spelman, who was at the Pole in the late 1990s and his friend, Meghan Prentiss, Polie in the year 2000, came much to our pleasure. Now for one of my favorite Antarcticans, Lynn Arnold, school teacher in Singapore, who wintered over at the Pole in 2003. Knowing my lack of husbandry, she came three days early to help convert my household from utter chaos to respectability. And last, but by no means least, Dr. Will Silva, who is one of my all-time favorite Antarcticans. He is a sweetheart of a person, and will be returning this coming year for his 3<sup>rd</sup> winter at the South Pole. He also has served time at both McMurdo and Palmer.

We regret to inform that Rudy Honkala of Wilkes, Casey, and Palmer had a leg amputated that week, that Chet Langway's doctor told him that he could not drive three hundred miles to get here; Hal Boras was in France giving a paper; Dr. Chester Pierce was being honored by his medical organization for his fifty years of faithful attendance. Anyway, we think it was successful, and even twenty odd but tired people showed up the next morning at a local emporium for breakfast. It was FUN!

**WEATHER PREVENTS RESCUE OF ARGENTINIANS IN ANTARCTICA.** Buenos Aires, (Prensa Latina) Adverse weather conditions on September 19<sup>th</sup> interfered with rescue efforts for the two Argentinians who fell into a glacial crack in Antarctica, lessening hope they will be found alive, reported Argentine Defense Minister Jose Pampuro.

The accident occurred on September 17<sup>th</sup> when five men riding snowmobiles crossed an ice field on their return to a Uruguayan Base in Antarctica, and two, a soldier and a scientist, fell into a crack in the glacier.

Their three companions, Captain Jorge Pavon and Lieutenants Mario Leohnard and Alejandro Carballo, tried unsuccessfully to rescue them, but their 165-foot cord did not reach the bottom of the fissure. The other three were rescued on Sunday after surviving some 30 hours on the ice field, but 38 mph winds, a temperature of 22 degrees below zero and very poor visibility have made it impossible for experts at Esperanza Base, 125 miles away, to reach the site by airplane. Sergio Marensi, director of the Argentine Antarctic Institute, said that "all possible alternatives" will be attempted to rescue them, but so many hours without any contact or signs of life has reduced hope they will be found alive.

Mr. John Spletstoesser 2002-04

**BRASH ICE.** This is the Newsletter which has been beset with more problems than you can shake a stick at, culminated this weekend by a dead body washing up on my rocks with his yacht submerged in shallow waters nearby. The good news is that the dead body was not identified as yours truly.

A real live body is that one who answers to the name of Norman Vaughan, who will be 100 years old on December 17<sup>th</sup>. He had hoped to spend it atop of Mt. Vaughan, and his close friend, famed mountaineer, Vern Tejas, had indicated that he would see to it that he made it, even if he had to carry him up there in a gunny sack. But the money was not forthcoming, so they are having a celebration in the Lower Forty-eight, in Telluride, Colorado. His family and friends are gathering there in the Hotel Telluride for a reception the evening of the 16<sup>th</sup>, a formal dinner the evening of the 17<sup>th</sup>. And Society members are invited! If interested, the contact is Bob Henricci, who can be reached on his cell phone at (617)650-1546, How often can one break bread with a hundred year old dog team driver who took both Admiral Byrd and the late Pope for a ride? We can't guarantee that you that you would be able to drink with Norman, as he does not partake in anything stronger than Ovaltine. It is hard to believe that a man who does not swear, does not smoke, does not drink can possibly survive that long . It must be Carolyn who keeps him alive,

This year seems to be one for the Emperor Penguin, as the feature film on the March of the Penguins captivated audiences around the world, and since its opening there has been a flotillas of articles in various newspapers and journals about penguins.. One in the NEW YORK TIMES of September 13<sup>th</sup> entitled "March of the Conservatives: Penguin Film as Political Fodder" resulted in a flood of letters to the editor. Then there was another one on October 11<sup>th</sup> in the NEW YORK TIMES on "DNA Studies Suggest Emperors is Most Ancient of Penguins" plus a real neat one in the October 22<sup>nd</sup> issue of SCIENCE NEWS on "Cool Birds, How Can Emperor Penguins Live Like That" We have abstracted freely from each of the later two articles. We hope that you will enjoy both, and trust that you won't regurgitate afterwards. If you want to buy the DVD on the March of the Penguins, it will be available on November 29<sup>th</sup>, an expensive Christmas stocking stuffer.

We always pick up our incoming phone calls with a certain amount of apprehension, as bad news travel fast. And so it was the other day when we got a call from Jean Portell, the daughter of the architect of the Antarctic Treaty, Ambassador Paul Clement Daniels, telling me that her mother, Teddy, had passed away at the age of 91 on September 21th. Many of you Washingtonians may remember Teddy from attending our almost-annual summer picnics. Others may recall meeting her at the State Department's ceremonies connected with the issuances of the Antarctic Treaty stamps. Teddy was a most delightful lady, befitting with great grace the gregarious Ambassador. In recent years she has fallen into bad times, not even being able to recognize the immediate members of her own family. She will be remembered fondly by all of us who were blessed with knowing her and the Ambassador.

It was with deep personal regret that I had to write the obituary of my old Little America V, 1957, roommate, Ron Taylor. He was ten years my junior, and died much too early of a massive heart attack. Some of you may take exception to my obituary on Roger Oble Nan, but I won't be concerned with your objections, as I wrote the obituary just for him. Although he was never a man of the cloth, I know, just know, that he will read this obituary and in his own inimitable fashion, get back to me with corrections! Our deepest sympathies go to his beloved Ming-Ying.

**CALENDARS.** We still have twenty more Hedgehog Antarctic calendars for 2006 in our stock bin. Per usual, they are photographic masterpieces, ones to keep and treasure at the end of the year. Price is a real bargain at \$14.00, check made out to the Antarctic Society, address is Box 325, Port Clyde, ME 04855. First come, first serve, as we are closing up shop in mid-December.

**LOGISTICAL HIGHWAY TO THE POLE** (George Blaisdell). A surface traverse capability, connecting McMurdo and South Pole, has been under development since 2002. This project will likely be completed this season (2005-2006) with a self-sustained round trip, delivering several pieces of heavy equipment to South Pole that otherwise would have required disassembly and multiple LC-130 flights to deliver.

The traverse so far has made excellent progress, achieving:

1. Establishment of a safe route connecting McMurdo to a point on the polar plateau less than 200 miles from South Pole,
2. Evaluation and refinement of a variety of equipment to arrive at a selection of vehicles that represents approximately 80% of what is assumed to be an "optimal" solution for mobility efficiency,
3. Discovery and exploitation of a suite of remote terrain monitoring tools that provide for safe and very efficient evaluation of the 1000-mile traverse corridor.

The initial focus for the USP traverse capability is obviously movement of fuel, routine resupply items, and construction materials between McMurdo and South Pole.

**ALTERNATE WAYS TO THE POLE, Skinning The Cat.** (Katy Jensen, via shameless pilfering from Bill Spindler's web site). There is more than one way to get to the South Pole, as evidenced by the motley parade of contraptions aiming for 90 South... some tested, some true, and some straight from the pages of Dr. Seuss:

...by air:

For only \$33,500 (from Chile) ALE and ANI will fly you to the South Pole for a pit stop and a hero shot, ([antarctic-logistics.com](http://antarctic-logistics.com)) Or you could pay Travelquest \$36,400 to camp overnight at 90 South and spend the next day meteorite hunting in the Patuxent Range. Just remember, the Antarctic Treaty "does not allow for the private removal of meteorites." ([tq-international.com](http://tq-international.com)) Or you could hitch a ride with Gus McLeod ([gusmcleod.com](http://gusmcleod.com)) who plans to cross both Poles in his single-engine Firefly this season. But why waste all that money and risk your reputation when you could get the National Science Foundation to pay you for going to the Ice? Just ask McMurdo shuttle driver Lonnie Clayton, who, at the tender age of 71 is celebrating the 50th anniversary of his first trip to McMurdo as an electrician on the *USS Wyandot*.

...by skis:

For those who have a lot of money AND a lot of energy to spare, ALE and ANI are again offering their "Ski the Last Degree" (60 miles = \$38,500) and "Ski South Pole All the Way" (730 miles = \$67,500) programs, ([antarctic-logistics.com](http://antarctic-logistics.com)) Børge Ousland is offering a similar, "two-degree" trip for those who are so inclined:

([ousland.no/english/trips\\_south\\_pole.html](http://ousland.no/english/trips_south_pole.html)) Other folks planning to arrive on skis include American WAVE Vidmar ([southpolesolo.net](http://southpolesolo.net)), Norwegian Rune Gjeldnes ([extreme-planet.com/exp/seal](http://extreme-planet.com/exp/seal)), Australians Rob Porcoro ([lassothemoon.org](http://lassothemoon.org)) and Matt McFadyen ([spl.net.au](http://spl.net.au)), a team of five Venezuelans [www.proyectocumbre.com](http://www.proyectocumbre.com). ve/#1 The Pole to Pole expedition will begin at South Pole this year and ski to the coast for the first leg of their adventure to the North Pole, ([pole2pole2000.com/home.html](http://pole2pole2000.com/home.html))

...by foot:

A two-man Malaysian team plans to stop at the Pole on their hike across Antarctica ([antarctica.mir.com.my](http://antarctica.mir.com.my)) and a five-man British team is re-creating Scott's historic trek using exactly the same route, technology, clothing, and food (insert your own morbid joke here— [southpole2005.com](http://southpole2005.com))

...by "other:"

Three Australians teamed up with New Zealand master inventor Peter Lynn to develop hi-tech, recumbent-seated "kite sleds" for their trip, ([kitesled.com](http://kitesled.com)) The three-man Spanish Transantarctic Expedition will use kite-powered sleds to cruise across East Antarctica.

([tierraspolares.es/catamaran/2003\\_4\\_i.htm](http://tierraspolares.es/catamaran/2003_4_i.htm)) And then there is the Ultimate Road Trip: the South Pole Traverse. This USAP-sponsored parade of heavy equipment is scheduled to hit the 1,020-mile Ice Highway from McMurdo to South Pole on Veteran's Day. For traveling in comfort, try the Ice Challenger, described by Bill Spindler as "a 1996 7.3 liter diesel 14-passenger Ford E-series van, heavily modified into a 6x6 with solar panels and a 110-gallon fuel tank." Woof! ([4x4offroads.com/south-pole-6x6-ice-challenger](http://4x4offroads.com/south-pole-6x6-ice-challenger)) Ultralight? Hot air balloon? ATVs? Sky-diving? The Russians have you covered with their National Youth Action SKY ODYSSEY Mission of the Peace ([poletim.ru/eng](http://poletim.ru/eng))

Don't laugh at these out-of-the-box thinkers - even the recent *Report of the OPP OAC Subcommittee on U.S. Antarctic Program Resupply* resurrected suggestions for creating a hardened ice runway at the Pole and using blimps to deliver supplies: ([nsf.gov/news/news\\_summ.jsp?cntn\\_id=104354&org=OPP&from=news](http://nsf.gov/news/news_summ.jsp?cntn_id=104354&org=OPP&from=news))

Sources: Bill Spindler's excellent web site: [southpolestation.com](http://southpolestation.com), Antarctic Sun 10/30/05, available via the just-recently launched [usap.gov](http://usap.gov) website

**HOW IT HAPPENED. (Marty Pomerantz)** I felt greatly honored by Paul Dalrymple's gracious invitation to tell you fellow Antarcticans ".....just what the hell you did." at South Pole. That this is a long story is attested by my recent book *Astronomy on Ice: Observing the Universe from the South Pole*. Furthermore, I wonder what I can tell people, many of whom know more about Antarctica than I do, that they don't already know? So this will have to be quite personal, as, incidentally, was requested by Paul.

It took me, a cosmic-ray physicist, a long time to convince NSF to do astronomy at South Pole Station. My proposals, not coming from a card-carrying astronomer, as well as a host of political shenanigans, jinxed my idea from being properly tested. Qualitative observations made with a couple of small borrowed telescopes over a full year by a cosmic ray winter-over had shown earlier that Pole might be at least as good as Palomar for optical astronomy.

But the irrefutable clincher came when I built an unprecedented vertical telescope, using optics provided by the Royal Swedish Solar Observatory, and electronics for the guiding system in thermally controlled packages developed in my laboratory. An exceedingly precise instrument for filtering out all the solar light except for a precise wavelength,

borrowed from the Max Planck Institute of Astronomy in Germany, was also housed in a heated box. A winterized 35mm camera attachment was at one end, and a quartz window at the other.

Around Christmas, 1978, I smuggled this equipment, labeled *cosmic ray detectors*, to South Pole. I did not feel too guilty about this bootlegging, since the Sun occasionally produces higher energy cosmic rays than those observed more frequently by other means, and Pole is the best accessible site in the world for studying them. In January, 1979, a Swedish colleague and I photographed the sun every ten minutes without interruption for 120 hours, although the good weather lasted longer. The measured resolution was at the calculated limit imposed by the telescope. We also made some other quantitative standardized checks of the seeing with borrowed instruments. And Larry Randall of the previously hostile Astronomy Division, the first NSF Rep, South Pole, was even more excited than we were at the quality of the pictures. The opposition melted.

The first authorized full-scale experiment, a collaboration with Eric Fossat and Gerard Grec from Nice, France, was fielded the following summer. With their instrument package for measuring Doppler shifts attached to our vertical telescope, viewing the sun as a star, the new field of *helioseismology* was born. This technique takes advantage of the fact that internal clappers (sunquakes) make the sun ring like a bell. Precise measurements of the frequencies of these solar oscillations provides the only method for "looking" at the solar interior. The rest is history (sounds like a plug for the book!) In a nutshell, similar collaborations with astronomers from home and abroad revealed that Amundsen Scott South Pole Station is also the best place on earth for observing radiations with wavelengths longer than the visual limit at the red end of the spectrum, as well as exceedingly high energy particles and electromagnetic radiation. During our final helioseismological campaign in 1994, there were 37 astronomers at the Pole!

Why did the germ of the idea that South Pole might be a good place to do astronomy hit me during my first (longer than planned) visit in January, 1960? Anyone who has worked there has experienced the physiological effects. Because it is so cold, you feel as though the altitude is significantly higher than that proclaimed by the placard posted at the Ceremonial Pole—higher than many observatories. And the sky is circumpolar. Hence, every target beyond the solar system remains at a fixed

inclination. The sun varies only slightly from day to day. So you can make long uninterrupted observations through a constant atmospheric path, thereby increasing the precision. And the water vapor content of the cold air is exceedingly low. On clear days, the unpolluted sky is deep blue, although there may be ice crystals which are invisible to the astrophysical experiments carried out at Pole. If you travel some distance from the dome, you don't see the heat and smoke rising from the station, and the terrain is uniform in all directions. Depending upon the nature of the experiment, there are additional esoteric advantages, such as the essentially zero speed of rotation of the earth's surface, or the characteristics of the ice deep below the surface.

And the beat goes on. A wide variety of astrophysical programs, involving many people, institutions, and, indeed, nations are being conducted in the Dark Sector on the side of the runway opposite the Dome. The fabulous new station will be dedicated next year. I am delighted that this assures the continuation of the world class science which has brought renown to Amundsen-Scott South Pole Station.

**ADDENDUM:** Physicist and astronomer Martin A. Pomerantz is director and president emeritus of the Bartol Research Foundation of the Franklin Institute, his scientific home for more than half of the twentieth century. Leader of many cosmic-ray expeditions, especially to both the north and south Polar Regions, Pomerantz completed 26 campaigns "on the ice," and in his new book, *Astronomy on Ice* (ISBN#1-4134-6861-6; 289 pages), he tells the story of how a combination of luck and propitious decisions took him to Antarctica. Professor Pomerantz has received numerous honors for his pioneering astrophysical research at the South Pole. Dr. Pomerantz has served on national and international boards on space science, geophysics, and polar research, and was chairman of the U.S. Committee for the International Years of the Quiet Sun, 1964-1965. He lives in San Rafael, California.

*Astronomy on Ice* describes the life-long journey leading Pomerantz to establish the South Pole as the best site in the world for a broad diversity of astrophysical research. The book shows how, after years of rejection, the author finally aroused interest in Antarctica within the astronomical community, how he fostered the evolution of the United States Amundsen Scott South Pole Station into the premier site for many different types of astronomical observations, and what he did to prove the validity of his innovative ideas, starting with the first observations of the sun's interior. Readers of *Astronomy on Ice* will share the thrills of overcoming obstacles in a hostile environment to experience those Eureka moments of scientific discovery.

**ANOTHER VETERAN,** John Annexstad. In this section, we are introducing a continuing series highlighting of some of the individuals who served in the IGY. We kick it off with Dr. John Annexstad, enjoying retirement in Walker, Minnesota, with some of the following in his own words. It is said that John never met a meteorite that he didn't like! Rather than writing a book of his experiences, the following is worth a look at what this remarkable IGYer did in his impressive career. Like many IGYers, John is a 6-decade person who has a continuing interest in Antarctica. In 1957-58, he did some work at Little America V and then wintered at Byrd. In 1960-61, he was on loan to the Chilean Antarctic expedition, and built and supervised the establishment of a geomagnetic and seismological observatory at Gabriel Gonzalez Videla Station, Paradise Bay, a location well known to tourists. Then, like many other IGYers, John went to graduate school at the University of Alaska-Fairbanks, obtaining a MSc. Degree in 1966 on micro-pulsations in Polar Regions. Summers of 1966-67 and 1967-68 he worked on conjugate point micro-pulsations at Macquarie Island as a member of the Australian National Antarctic Expeditions. From 1968 to 1986, he was Associate Curator for Lunar Samples and Meteorites at the Johnson Space Center, Houston, Texas. Six summers were spent in meteorite searches with the U.S. Antarctic Program, 1978-79 intermittently through 1988-89. In 1982-83, his daughter, Kris, accompanied John as a field assistant, perhaps the first father/daughter team to work in Antarctica. John's aspirations led him to the Ph.D. degree in glaciology and meteorites at the Johannes Gutenberg Universitat, Mainz, Germany. John left NASA to start a second career as Professor at Bemidji State University, Bemidji, Minnesota. His career highlights include not only working in the IGY, but also through the period of Apollo to the Moon, and meteorite discoveries. Leading a tamer life, he has worked as lecturer on the tour vessels *World Discoverer* (1998) and *Orion* (2004-05). Annexstad Peak is named for him in the Executive Committee Range, West Antarctica.

**COOL BIRDS.** (Abstracted from article by Susan Milius in the October 22, 2005, issue of SCIENCE NEWS). This is a good companion piece to the movie MARCH OF THE PENGUINS which was essentially an above water version of the life of the Emperor Penguin, where Cool Birds is its underwater equivalent. Gerald Kooyman of Scripps Institution of Oceanography at La Jolla, California who is known by many of our members, dismisses dives of 265 meters as being "modest." Studies have observed Emperor Penguins going as deep as 500 meters. Most

dives are in the modest range, and last only five or six minutes, but the birds have been known to remain underwater for as long as twenty minutes.

Paul Pongasis, another Scripps researcher, studies how deep-diving penguins manage their oxygen. They load up on it by taking advantage of an abundance of the compound myoglobin in their tissues. Also, Emperors have some 100 milliliters of blood per kilogram of body weight. The penguins also ration their oxygen stores using physiological tricks unavailable to landlubbers. When an Emperor Penguin dives, its heart slows, as does its use of oxygen. Penguins nearly deplete the oxygen in the special avian air sacs attached to their lungs, often dropping below 20 millimeters of mercury. . Penguins don't seem to suffer from their dives, and not only avoid the bends, but exit the water with great flair.

The article goes on with detailed information on their dieting. Fasting is a way of life when incubating their egg, and it is also associated with summer molting. To see where penguins go to fatten up, Barbara Wienecke's group fastened satellite trackers and dive recorders at two colonies on the Mawson Coast. Nine birds went on great feeding expeditions of 22 to 38 days. On the longest trip, a penguin traveled as much as 1,900 kilometers and reached points 600 km from the breeding site!

Emperors grow much denser feathers than do flying birds. Emperor feathers maintain an air layer for insulation when out of the water, but during diving, the water compresses the outer layer of oiled feathers so that it loses much of its insulation power. Even a modest dive subjects the birds to 20 atmospheres of pressure. Emperors, like all penguins, replace all their feathers in a single month. A molting penguin will actually drown if it ventures into water.

**FLIERS TURNED INTO SWIMMERS AS WINGS BECAME HYDROFOILS.** (Abstracted from article by Carl Zimmer entitled "DNA Studies Suggest Emperor Is Most Ancient of Penguins" in the New York Times, October 11, 2005). "Penguins are some of the most improbable animals in the planet. They have wings and feathers but cannot fly. They are not fish, but they have been recorded as deep as 1,755 feet underwater. And the most improbable is the Emperor Penguin, which waddles across 70 miles of Antarctic ice to reach its breeding grounds. Penguin ancestors probably began their evolutionary search while Tyrannosaurus rex walked the earth. Researchers at the Royal Ontario Museum concluded that penguins diverged from the ancestors of petrels and albatrosses about 71 million years ago."

Ewan Fordyce, paleontologist at the University of Otago in New Zealand, has studied the oldest known penguin fossils,

dating back to 60 million to 62 million years. These proto-penguins were not as adapted to diving as today's, Their wings could still bend at the elbow, "the joint was starting to become stiff, so the wing was starting to evolve into a hydrofoil" said Dr. Fordyce.

Dr. Sergio Luiz Pereira of the Royal Ontario Museum found that Emperor and King penguins belong to the oldest living lineage, while other species are more recent. Canadian researchers found that the penguin's common ancestors existed 40 million years ago - more than 30 million years after they think penguin evolved. Early penguins did not have to survive brutal travel conditions as Antarctica was covered in forests, much like we see in New Zealand today.

The ice age came later, about 35 million years ago. Geologists suspect that the change occurred as a result of South America and Australia drifting away from Antarctica. The ocean currents began to circle the continent, isolating it. The cooling climate may have killed off the older penguins. Not all penguins became extinct, Dr. Pereira said that "penguins had to adapt to conditions in Antarctica, or they had to leave." Dr. Fordyce is skeptical about the evolutionary timing, pointing out that the oldest fossils that may belong to the living lineage of penguins are only 30 million years old.

The history of penguins - partly driven by a cooling climate - is now running in reverse. Ocean waters are warming, and it is hard for scientists to forecast how they will affect penguins. Adelie penguins feed on krill that feed on algae that grows on ice. Adelie penguins have decreased by 70 percent the past thirty years off the Antarctic Peninsula, possibly as a result of retreating sea ice. They are being replaced by booming populations of chinstraps and gentoo penguins which can switch from eating krill to fish and squid. Dr. Giannini of the American Museum of Natural History has said "This will create an immense instability in the system with unpredictable consequence and that is not good."

**LITTLE HARRY DIES.** Roger-Oble-Nan was his handle, but his birth certificate showed that he was born as Ronald Charles Taylor. His baptism actually took place at Little America V in 1957, where he served as a forecaster in the first ever Weather Central in Antarctica. But he was known to many as Little Harry, as unfortunately he had a body which strongly resembled that of the Chief Scientist for the Antarctica during the IGY, Harry Wexler. . And he took meteorology with all the

seriousness of Wexler. But there was one big difference, Ron had a great sense of humor, something which no one ever accused Wexler of having in surplus. This writer got to know Little Harry somewhat, as we shared quarters at Little America V where most of the IGYers lived. Being ten years his senior, I confiscated the lower bunk. Weather Central was run like a Stateside operation, with forecasters practically chained to their chairs or stools. And its boss was a real misfit. Ron came to the ice with a foot locker full of books on meteorology and physics, and when he came off duty, he reached into the locker, pulled out a book, and retreated to his upper bunk, where he read until he fell asleep, most of the time fully dressed. Presumably he must have taken his clothes off some time during the winter to shower, but we don't even have an official confirmation of that either.

Weather Central was a most unique place, and its researchers went forward in different directions. One became a minister, one became a high ranking admiral in the Argentine Navy, another an oceanographer on a Soviet ship, two remained with the now defunct U. S. Weather Bureau, and Ron went on back to school, getting his Ph.D. in meteorology and then teaching at the University of Hawaii, then the University of Rochester, followed up by the University of Maryland. While at UCLA as a graduate student, a funny thing happened. He was asked to chaperon a bunch of Soviet meteorologists attending an international conference in Los Angeles to a military base outside of L.A. where there was some highly classified research going on. It happened that a childhood friend of mine from Worcester, Massachusetts, was with the FBI in Los Angeles, and he was assigned by his office to tail the Russians. So I had one FBI buddy tailing another one of my buddies escorting the Russians!

The Chairman of the Meteorology Department at the University of Maryland was a very eminent climatologist, Helmiut Landsberg, and he suggested to Ron that perhaps he might like to advance himself by applying for this open position at the National Science Foundation. Ron got the job and it changed Ron into a big time bureaucrat, although I don't think it changed Ron's stripes very much. Gene Bierly, past president of the American Meteorological Society, said that Ron had the reputation for supporting high-risk studies, sometimes outside the traditional world of academia, that led to developments of instrumentations to observe atmosphere electricity. At the same time, he steadfastly refused to become a participant in e-mailing colleagues! While at NSF his life was improved immeasurably when he met a fellow meteorologist, Ming-Ying Weei, and the two of them lead a very enjoyable, loving existence in the Washington area.

It would not be fair to Ron not to mention his mistresses, as they were numerable. Some were real classics, some were bound in real leather, but all were used and gave him many hours of happiness. Yes, he was a real bibliophile. Once I was the cause of a near catastrophe in his apartment. He invited Ruth Siple and me over to hear some of his fine music, as we were on the verge of getting a CD system. First he played some piano concertos, then he wanted us to hear the 1812 Overture. So he turned up the volume, it sent out a terrible vibrating blast which sent a whole wall of books in an adjoining room cascading onto the floor. He took it very calmly, said that he preferred to pick them up individually by himself.

But we will miss him for many reasons, and one is that now we have no one to write us after each Newsletter telling us what was wrong, what was omitted, what we should have said in better grammar. Letters were always in long-hand, on elegant stationery. And he supplied us with book reviews from the UK publications which came into his home. Ron was one of a kind, we are really going to miss him, although we haven't seen much of each other. In closing may I say that Ron lost weight as he matured, so he did not remain the Alter Ego of Harry Wexler!!

### **THE SHORE WHALING STATIONS AT SOUTH GEORGIA; A STUDY IN ANTARCTIC INDUSTRIAL ARCHEOLOGY**

by Bjorn L. Basberg, Novus Forlag, Oslo, 2004 (reviewed by Steve Dibbern).

This book chronicles the work done over a several year period to study, record and interpret the ruins of the shore whaling stations at South Georgia. It covers a short history of industrial archeology in general, the whaling history on South Georgia and then goes into detail about the remains of the stations as they are today. Basberg also describes his methods of collection and collation of data in enough detail to give the reader an understanding of the problems overcome relating to time available on site and equipment needed on a remote site.

To say that the book succeeds is an understatement. It is lavishly illustrated with historical photography, current color photography and detailed diagrams and maps of each station on the island. The text is detailed enough to teach you how the whale rendering process worked and how the people, primarily Norwegians lived. Have you ever seen a floor plan of Antarctic pigsty or grishus or how about the hydro-electric station at Grytviken? This

is an industry that has been roundly vilified in recent years but that should not deter a reader with an interest in Antarctic history from reading it. Basberg does not seek to glorify the industry but rather to explain how it worked and record its ruins, industrial archeology.

If you have been lucky enough to either work on South Georgia or visit as a tourist this is the book to explain what you saw, and it has better pictures than you probably took.

A couple of small criticisms; it has no index and although it is very logically arranged and has a very nice table of contents, still an index would have been a help. Even though the whaling was the scope of the book, some small coverage of the government buildings at King Edward Point would have completed the scene at Grytviken.

Seldom is a book better than you expected when bought sight unseen as this was for me. But Dr. Basberg's book is a beautifully executed record of some really sterling field archeology. It is available for about \$50 plus shipping (\$75 total by airmail) from the publisher Novus forlag at: Novus Forlag, Herman Foss gate 19, NO-0171 Oslo, Norway or by email at: [novus@novus.no](mailto:novus@novus.no)

**WHO IS THE REAL NICHOLAS JOHNSON?** Nick sent us an e-mail asking for a copy of the last Newsletter which had a review of his book, **BIG DEAD PLACE**, by Steve Dibbern, a prodigious reader of all Antarctic books. Naturally we sent him a copy of the Newsletter, but at the same time I asked him, "Do you talk as you write, or were you just trying to sell more copies of your book?" You might be interested in his reply.

"I smoke like a chimney and swear like a sailor. So to answer your question, I'd say I talk "worse" in real life, Frankly, it's amusing to me that people are so concerned with the language, when this really is just basic daily blue-collar language. It astounds me that the blue-collar perspective is so unaccounted for in Antarctic literature that the first bad words that come up are so shocking to some .....I have been a blue-collar worker off and on for fifteen years, and this language is just a drop in the bucket. I underplayed the language, but I was certainly conscious of including enough so that the writing would have credibility with a blue-collar audience, an audience usually ignored. One's tastes are one's own, and there is no arguing that. But I believe that those shocked by the "bad" language in the book are often indicating their non-recognition of typical working-class behavior, thus suggesting they are 1) middle class. 2) professional, white-collar, or of the more groomed

positions in society, 3) blue-collar but with family and children, and 4) among the older generation."

It looks by his own definition that the only people who will be thrilled by his book are those young to middle-aged SINGLE blue collar workers, which must constitute a small minority of all workers on the ice. And I seriously wonder how many of them actually buy and read books. Anyway, I am still to read the book, so can't really comment on the book. But I have several valued friends, who I think are broad minded, and each and every one has gotten disgusted and fed up with the contents of the book before they finished reading it.

However, our e-mails have gotten off onto other themes. He actually is a very nice guy to communicate with, and he writes very well and cleanly, too. He has a sincere interest in history, being somewhat of a scholar on World War II, although he is only 32 years old. When he found out that I had been a POW in Germany during that war, he wanted to know everything about it. So I have ended up with some sympathy for him, would like to drink beer and talk with him some night, but that doesn't look likely in the near future, as he is about to leave for employment in Iraq.

**GUESS WHERE WE'RE GOING.** We have a wonderful escape from Christmas, and all those never-ending carols and bell-ringing, preposterous looking Santa Clauses, kids with outstretched hands, et cetera, et cetera, thanks to John Spletstoeser. He has asked Tony Soper and me to join him on the very luxurious ROTTERDAM of Holland American Lines, on a twenty-day cruise to Antarctica, via the Falklands, ending up viewing the Chilean fiord coast. It's been five years since I have been there, and I can't wait to sail through the Lemaire Channel one more time. I will have a perfect holiday season, and I hope yours is not too bad, either.

Each year they have a South Pole specific and year specific patch. These patches are in addition to the standard USAP patches. This year's South Pole patch will reflect the change from the Dome to the new Elevated Station (a one hundred percent occupancy by January 2006). Each insuing year's patch will have the corresponding year changed. It seems the Siple Barber Pole with silvered globe remains a 50 year constant. Patches are for sale at the South Pole Station.

**BRASH ICE.** Norman Vaughan is DEAD... well, not exactly, but sort of, as the papers have carried his obituaries and we have attended a Memorial Service for him in Hamilton, Massachusetts. However, Norman is going to live on perpetually, as his personality and character will perservere forever more. The Memorial Service which I went to was one of great celebrations of his life, stories galore, much laughter. No sadness, no tears, just a good old fun time. Norman, even though the record books will describe him as a dog team driver, came from Boston aristocracy, and both the church and the Myopia Hunt Club were filled with dowagers and handsome old men dressed to the gills. I was the sole male there who did not have on a tie and a sports jacket, but I wanted Norman to be able to recognize me if he should drop down to see how things were going.

Norman was the son of a wealthy leather tanner and shoe manufacturer, and lived a truly exciting life. I never met a man like him, and the reason was simple, when they made Norman they threw away the mold. He lived a hundred years without swearing, without smoking, without beer or alcohol. That is until his hundredth birthday when he had a sip of champagne, only to exclaim that it was awful tasting. His idea of a real celebration was to have something with an ice cream base. His life was sort of an open book, as not only did he write two books about his life, but the media made a folk hero out of him in his later years. One thing that I did learn from his obituaries was that he went to Iran as manager and coach of the U.S. Polo Team in 1972, a celebration of their 2500th anniversary of monarchy. And he refcreed the games, in which Iran won three, the US two. Only Norman could referee games against his own team and come out on the short end! His life changed dramatically when he moved to Alaska in 1973, but the best thing which ever happened to Norman was his fourth marriage , eighteen years ago, to Carolyn

life style. Norman once was exclaiming to me about the glories of climbing 10,320 feet Mt. Vaughan in the Antarctic, but I had to interrupt him by saying, "Norman, that wasn't such a great feat climbing your own mountain, but what was it after you did it, you got to sleep with Carolyn on the summit (as she, too, had summited Vaughan).

Let's take a look at where Norman has been, in chronological order Guatemala, Newfoundland, Labrador, Little America, and Greenland. Baffin Island, Iceland, England, Scotland, Ireland, Belgium, France, Italy, Saudi Arabia, India, Thailand, Philippines, Egypt, Jerusalem, Peru, Argentina, Chile, Brazil, West Indies, Japan, Pakistan, Greece, Italy, Germany, Denmark, Norway, Algeria, Azores, and Bermuda. He holds the record for the longest single trip in a snowmobile, from Fort Yukon, Alaska, to Boston, a distance of 5,700 miles, covered in 40 days and nights. He was also involved in 1990, at age 85, in going down a 266 foot shaft into the Greenland Ice Sheet to retrieve a P-38 fighter which had bailed in during World War II, a plane in which he had rescued its crew back in World War I! He participated in 13 Iditarods, running his first one at age 72, his last one at age 84.

Some people at NSF never got to know or understand Norman. They looked at him as a pure adventurer who could cause them problems. But he was much more in real life, although adventure is what fed him and drove him on to so many great deeds. Some were slightly offbeat, like dog sledging the Pope and breaking into a presidential inaugural parade - he was the official State of Alaska invitee to one. One bureaucrat who took the time to get to know Norman was Ray Arnaudo of the State Department, who gave Norman a stuffed husky for the top of his back pack which he carried to the top of Mt. Vaughan. There is going to be at least one more gala Memorial Service honoring Norman, this one in Alaska on March 3<sup>rd</sup> at the start of this year's Iditarod race. Norman never won an Iditarod, but he never lost any of them either...time just ran out on him, as it did on December 23, 2005 He dreamed big, and he wasn't afraid to fail.

George W. Gibbs, Jr., died on November 7<sup>th</sup>, 2005. His name probably does not mean anything to most of you, but he was the first African-American to visit Antarctica. He was a member of the Antarctic Service Expedition in 1939. He was one of 40 Navy men selected from 2000 applicants to go south on the BEAR, and went on three cruises to the Antarctic. Following Navy duty in the Pacific during World War II, he graduated from the Univ. of Minnesota and moved to Rochester, NY where he worked for IBM. The first African American to winter over at a US station was a meteorologist at Byrd Station by the name of Johns, who left the station at the

end of 1957 to go to an arctic station desperately in need of a meteorologist. Shortly after getting there, he came down with pneumonia and died, being the first IGY Antarctic scientist to die.

Some people appall me, simply amaze me, and one such person was an unknown member (to me) of our Society for the past eighteen years by the name of Alan D. Stone. He recently sent me a copy of a biography of Larry Gould, which he had put together for friends in Washington, D.C; it seemed it all started when he sent his friends a copy of one of our Newsletters. Then the husband wrote back that he had gone to Carleton College when Larry Gould was its president and that he considered Larry as his mentor. Alan wrote that our Newsletters had resulted in him (Alan) knowing of Larry's significance and achievements, so he decided to do this historical review of Larry's life. Well, the resulting biography of Larry is something else, truly amazing. There are two hundred and fifty pictures of Larry, although most are poor reproductions. Then there are short paragraphs describing what is depicted. Most of the material was gleaned from the archives of Carleton College. I have never seen anything exactly like it, and it's fascinating stuff and most interesting. You did one heck of a good job, Alan, and we thank you for the biographical copy about the Silver Tongued Orator. We will treasure it.

We have again lost another prominent Antarctic scientist, Sayed El-Sayed. Sayed and I had a common interest in tennis. He was Boris, and I was Pete, as in Becker and Sampras. In his last letter to us, on October 3, 2005, he expressed his appreciation for the kind words that we had written in behalf of the late Peter Wilkniss, in which he wrote that he found Peter "to be charming, engaging, and likable, and at times humorous. At any rate, I am glad you showed us the other side (Dr. Jackyl!) of him."

Had a letter the other day from John Roscoe, one of the older Antarcticans now at age 87. He was a photogrammetrist on Operation High Jump in 1946-47 and then on Operation Windmill in 1947-48. Afterwards he was scientific advisor to the director of the United States Antarctic Program. But he became infamous for producing a publication, which showed no authorship. It seems back in 1951 he was working for the U.S. Navy, and he produced the first and most complete bibliography ever done in this country on the Antarctic. At the time, the Navy had a policy of not showing its authors, and so ANTARCTIC BIBLIOGRAPHY went to press. But John circumvented the Navy and its policy, by showing the publication in the

bibliography, and listing himself as its author! John, you were a clever rascal.

Big John sent along a reminiscence which is too good to leave out, but where it involves a relative of one of our members; we are leaving out the name of the person to protect the family heritage. It seems that this well known Antarctic at West Base in 1939-41, and his comrades stopped off at a South American port on their way home for a little R&R, but let's let John tell the rest of the story, "The men rushed off the ship to find women. In those days the only available ones were in the houses of ill repute. (John Doe) walked off the ship, took his time, and bought a small house of ill repute, lock, stock, and barrel -owner, wife (madam), four daughters (the girls), bar, etc. I think he recovered his investments by entertaining the other crew members in succeeding days." Sort of reminiscent of a lecture given our Society by my very good and most special friend, the late Admiral Mike Benkert, U.S. Coast Guard, in which the city of Valparaiso made him their Honorary Mayor after an extended visit on their way back from the ice.

Also in a recent Mail Bag came a copy of an oral history on **Charlie Bentley** conducted by one of his colleagues, Katrina Dean of the University of Bristol. This history is entitled *Seismic and Radar Soundings of Antarctica, 1956-1980*, but in actuality it is far more extending time wise. We have seen half a century of research since the IGY, and as far as I am concerned, Charlie amounts to Mister Antarctica for this time period. If you took the number of working trips to Antarctica, the number of days working in the field (ice), the significance of his findings, his impact on Antarctic science, there can't be another who can hold a candle to Charlie. So it was a great revelation to read this oral history, especially having known him personally over many of his years. In an innocent sort of way, I feel sort of a kinship to Charlie, as he and I, plus Bert Crary and Mario Giovinetto, were the only four Americans to spend both IGY years on the ice. Plus I am indebted to him for proposing my name for a majestic Antarctic feature! So I have to elevate Charlie to the highest!

Once upon a time, our Society used to have some great lectures in Washington, D.C., with some of our presentations being in the main auditorium of the prestigious National Academy of Sciences. Charlie gave a wonderful presentation there, and he had the audience in an uproar with his light humor about life on the ice. I am sure one of his stories involved the nude picture in the galley of the girl friend of the cook at Byrd station in 1957. This comes up in the oral history, although not under seismology. Back in those days, atmospheric allowing, communication with the home front was by single side band,

finding an amateur radio operator near your family. One day they established contact with a ham operator near where the cook's so-called girl friend lived. And the cook got all excited about his upcoming conversation with his beloved, and heard the operator on the other end dial her up, ask her if she would accept a collect call from the Antarctic. Her reply was "How much will it cost me?" And the ham replied "Fifteen cents." Her answer was "No." Charlie's comment in the oral history was to the effect that the cook was a sour person ordinarily, but after that he was practically unlivable. A book, which will never be published, is *Fone Patches from the Antarctic*.

It is pretty common knowledge how the United States ended up at the South Pole, The Chairman of the Secretary-General of the International Union of Geodesy and Geophysics, Colonel Georges Laclevere, declared at their international assembly at the Paris Observatory in July 1955, that the United States was going to the South Pole. No discussion, evidently, that was it. Charlie Bentley said something interesting about the South Pole station in his talk with Katrina. He said when Bert Crary was Chief Scientist in the Office of Polar Programs that he took a good hard look at the science being done at the station and then realized that there wasn't much. Bert said something to the effect that the U.S. wasn't getting their dollar's worth out of the station, and that it should be closed down. Word of this got around and the Soviets said okay, go right ahead, we'll take it over from you. And that killed it, as the United States was not about to yield the station to the Soviet Union. Friendly as things were in the Antarctic, they weren't that friendly geopolitically. And so, all during the Cold War, there was a strong political reason for being in the Antarctic

In closing this runaway Brash Ice, we did find out from Charlie's oral history something that we had long suspected, that we weren't really of library quality. CRB is Charlie, KD is Katrina. CRB: Same outfit as Paul Dalrymple. If you want more information, you should talk to him. Is he on your list? KD No, I don't know him. CRB: Oh boy (laughs). He is the biggest Antarctic enthusiast you will ever run into in your life. He knows everything about anybody who ever been down in the U.S. KD: Good. CRB: He puts out the Antarctic Society Newsletter. Have you ever seen that? KD. I haven't, no, this is a U.S. publication like a club kind of thing? CRB: I am sure there are people across the ocean that are subscribers. KD: Yes, I'm sure. They have it at the Scott Polar Research Institute in the library, there I'd say. CRB: It's probably not considered library quality. KD: Oh okay, No, but I think. CRB: But some individuals will certainly have it. KD: Yes, I think Scott Polar has a lot of

little stuff like that. CRB: They might have it" ..... How about that, not really of library quality. However, this does not shock me at all. As all I am concerned with is making it interesting for all members of a family who may have gone or are there. I want it read, not archived in the stacks gathering dust. This has been my labor of love, but now I want to play.

**MEMBERSHIP:** Mailings went out just prior to the Lincoln Birthday Northeast, so those of you who owe for the current year should have your bill. We really made another mistake by not raising our dues, as not only did we have a raise in postage in January, but the Postal Service is going to push it up another notch with another raise within a year. If anyone who did not get a bill, and may want to extend, *our* current dues are \$12.00 for singles, \$15.00 for couples, and \$20.00 for overseas members. We treat Canadians like Americans, as we are hockey fans. We encourage all to renew for multiple years as the Antarctic Society is basically a one-person shop where membership, treasury, putting together Newsletters, stuffing envelopes, mailing Newsletters, selling calendars, answering mail et cetera are all done here on midcoast Maine. So you can help us out, by renewing for multiple years.

**SAVED EL-SAYED (1926 - 2005) SCAR NEWS.** With the death of Sayed El-Sayed, Antarctic oceanography has lost one of its pioneers, and most enthusiastic supporters. Sayed was born and educated in Egypt, graduating in Zoology and Geology from the University of Alexandria in 1949, where he was also awarded an MSc in Oceanography in 1951. In 1953 he moved to the Scripps Institution of Oceanography, the leading oceanographic institution in the US, as a biologist in the Marine Life Programme, USA. His work on the English Sole populations of Saratoga Passage, Holmes Harbour and Penn Cove gained him a PhD from the University of Washington in 1959. He joined the staff of the Oceanography Department at College Station, Texas A & M University in 1963, and remained there until his retirement in 1997, on which he was awarded Emeritus status.

Early on in his time at Scripps, Sayed became interested in the ecology of marine phytoplankton and Antarctic marine ecosystems. From 1962 to 1967 Sayed participated in nine Argentinean cruises in the Atlantic sector of the Southern Ocean, and nine American cruises in the Pacific sector. He presented a synopsis of this work at the Second SCAR Biology Symposium held in Cambridge UK in July 1968.

A significant outcome of this SCAR meeting was the recognition of our lack of knowledge of the fundamental ecology and dynamics of the entire Antarctic marine ecosystem. Coupled with the rapidly developing Antarctic

fisheries for fin-fish and krill, this gave rise to great concern. Following a series of international meetings, in 1976 the BIOMASS (Biological Investigation Of Marine Antarctic Systems and Stocks) Programme was formulated under the aegis of the newly formed SCAR Group of Specialists on Southern Ocean Ecosystems and their Living Resources, with support from other international bodies including SCOR, IABO and ACMRR. The main object of the BIOMASS Programme was to *gain a deeper understanding of the structure and dynamic functioning of the Antarctic marine ecosystem as a basis for the future management of potential living resources*. It was a highly ambitious program requiring the co-operation of 11 nations, standardization of methodology and techniques, and pooling of results. To be successful it would require strong and dynamic leadership. That task was given to Sayed El-Sayed, aided by the BIOMASS Executive.

Over a ten-year period there were two multiship, multinational cruises (1981 and 1984-85) leading to 32 international workshops. The research produced an impressive number of publications in scientific journals. In addition there were 68 reports in the BIOMASS Report Series, 23 BIOMASS Handbooks, 10 volumes in the BIOMASS Scientific Series and 25 BIOMASS Newsletters. This represents an enormous scientific legacy, but arguably an even more important outcome from the BIOMASS program was the establishment of the Commission on the Conservation of Antarctic Marine Living Resources that now controls the developing fisheries in the Southern Ocean.

That BIOMASS was so very successful owes much to the unremitting hard work of Sayed El-Sayed. His leadership was exemplary. His enthusiasm never wavered and he was ever generous with his time and support, especially to the many young scientists who were just starting their careers in oceanography. His charm and cheerfulness ensured that co-operation between scientists and nations was always total. In spite of this heavy workload Sayed maintained his own research output.

Sayed was awarded the National Science Foundation Antarctic Service Medal, and the 1985 Distinguished Service Award by the American Institute of Biological Sciences. The U.S. Board on Geographic Names named El-Sayed Glacier in recognition of his work in Antarctica. He will be remembered with great warmth and affection by all who knew and worked with him.

**SOME PERSONAL REMINISCENCES OF EL-SAYED**  
(Andrew Clarke) The start of my own research career in

Antarctica, working on krill from both shore stations and the RRS *John Biscoe*, coincided with the BIOMASS programme. Whilst the scientific shape of the programme was set by Dick Laws in the UK and Gotthilf Hempel in Germany, it was Sayed who drove the programme forward with his dynamic running of the BIOMASS Secretariat at Texas A&M University. Infectious in his enthusiasm, it was impossible to refuse him when approached for an article in the BIOMASS Newsletter, or a talk at a meeting. The enormous success of the BIOMASS programme was due in no small way to Sayed's charismatic and charming leadership. It was testament to the enormous affection in which Sayed was held that when he presented his final talk at a SCAR Antarctic Biology Symposium, the lecture hall was filled to capacity. And Sayed did not disappoint; pacing up and down energetically, waving his arms, and with a characteristic disregard for the passage of time, he described his most recent work on the effect of UV radiation on Antarctic phytoplankton and received a huge ovation at the end.

In the more personal surroundings of a smaller meeting in the mountain village of Ravello on the Amalfi coast of Italy, I learned more of Sayed's background and history (between his disappearances for games of tennis, a passion for all of his active life). With a typical Arab sense of hospitality and generosity, Sayed arrived with a small present for all the partners at the meeting, and presented these with style. Sayed was immensely proud of the work he had done in Antarctica, and also in the success of the BIOMASS Programme. However he also spent considerable time working in the Middle East, and he took enormous personal satisfaction in having received medals from both Egypt and Israel for his work furthering scientific cooperation across the religious divide in that troubled part of the world. I shall remember Sayed as a warm, generous character, who always had time for the younger generation of scientists, and who was one of the founder figures of Antarctic oceanography.

**THERE'S A CRUISE SHIP FOR EVERYONE.** We are into an era now when over twenty thousand tourists per year enter Antarctic waters. I often wonder what it would be like to go on one of the behemoths of the cruise ships, and that curiosity was recently fulfilled when I went on one of the largest, one of the most luxurious, one of the most glorious of all, Holland America's ROTTERDAM. Previously I had been on one at the opposite end of the scale, the DISKO. But I had also been on the well known WORLD DISCOVER, the excellent Russian ship, the IOFFE, and the ALLES TARASOVA. All I can say is that there is a ship out there, which will please everyone, that it is just a matter of finding the one, which fits your own personal profile.

There was a time, early on, when certain ships with a more or less permanent lecture staff, attracted the same tourists, time after time after time. I immediately think of the old EXPLORER, and our Whale Spotteress, Dotte Larsen, who made repetitive trips on the EXPLORER, as she was in love with the lecture staff, especially Keith Shackleton. But I don't think there is any one ship today, which has that kind of drawing power.

I always thought that there was one Pied Piper out there lecturing, Peter Harrison, the British born, Americanized ornithologist, who has a legion of supporters who follow him all over the world. Peter is the author-illustrator of that great book, SEA BIRDS, and he paints some bird, each and every day at sea which are auctioned off for some charity. Peter is also part actor, part raconteur, and he has the capacity to answer the same question time after time after time without blowing his top. And he goes the extra mile, and once upon a time never left the bar until the last questioner had called it quit. Maybe he still does, I do not know.

One of the very nicest persons lecturing in Antarctic waters is Yuriko Lindblad, widow of the gentleman who started all of this Antarctic cruise business many, many tears ago. I had the privilege of being with Yuriko several times, and once I asked her which was her favorite ship. Naturally I thought she would answer the EXPLORER, as her husband had had the ship built for something like three or four million. Her answer was the ALLES TARASOVA, now the CLIPPER ADVENTURER. So we all have our favorites.

I think the biggest problem with tourists is that they do not do their homework, do not know what their options are in ships, in itineraries, in lecturers. They have no idea at all when penguin chicks will be hatching, when they will be fledging, when the channels may be blocked by ice, when the weather may be stormy. They find a hole in their home schedule, and then book what is available.

If you really want to get completely immersed in Antarctica, go on one of the smaller ships, as smaller can very often be better, you get to know both the staff and fellow passengers on a more intimate basis. Plus the bridge is open to you. And if Antarctica is your only interest, you get to find that it is the only game on the smaller ships, there are no other distractions. On the debit side, smaller ships, especially the older ones, may not offer the stability of larger ships. But the Drake Passage is not interminable. There is a beginning and an end, and once in Antarctic waters, chances are that you will survive.

Now for ships like the ROTTERDAM. Dollar wise they may be cheaper per hour at sea than the smaller ships, but the big drawback for the pure Antarcticans is that you never get any closer to the Antarctic penguins (emperor, Adelie, gentoo, and chinstrap). than the end of your binoculars.. There are opportunities to see up close some of the sub-Antarctic penguins when you are in the Falklands and places like Punta Arenas..

If you are an Antarctic purist, maybe you should think twice before your booking, weighing your priorities. But if you are a bon vivant, who lives a life style befitting Las Vegas, but without nudity, by all means sign up with a ship like the ROTTERDAM. If you are handicapped, by all means sign up with a large ship which offers more of the amenities for the handicapped. . A ship like the ROTTERDAM has the works for all ages, all sizes and shapes, and is a grand hotel on water. There's shuffleboard, there's a complete fitness center, there's a very modern skin care center, there's a basketball court, two swimming pools (one fresh water, one salt water), there's a casino as well as a library, and, oh yes, a very large computer facility for those who need dot.com to exist. Then you have stores galore, even an art gallery. I don't know of anything missing, as they have lounges for those who just want to sit. There's lectures followed by bingo, and evenings come alive with music of all kinds, many dance halls, then stage shows, movies every night, a string trio, a piano soloist. It's hard, if not impossible, to find something you like which isn't part of the daily routine. But most Antarcticans that we know are more naturalists than Off-Broadway, and they may find the frequent formal dinings a bit too dressy. It is hard for me to believe that there are people who actually like to get dressed up, wear gowns, wear tuxedos. The ship even has formal dress rentals!! LL Bean clothes are strictly atypical, but they do have an excellent informal cafeteria dining room, with the same elegant food, overlooking the sea near the stern which is duly a great place to eat. So there is something for everyone, even if you want to see and hear a little bit about the Seventh Continent

### **SOUTH POLE TRAVERSE ARRIVES DECEMBER 23.** *(Peter Rejcek, The Antarctic Sun, 01/01/06)*

The mission is nearly over, but the journey is only half done. On Dec. 23 at 2:56 p.m., John Wright parked the last tractor of the South Pole Traverse on a hard-packed snow area near the South Pole Station. He wearily climbed out of his Caterpillar 95 Challenger, exchanged a few hugs and kisses with a Polie greeting party, and told his crew to form camp and ensure all the vehicles were plugged into electric outlets to keep them warm in the freezing temperatures. "Let's plug 'em in and shut 'em down," he said. After 43 days and some 1,600 kilometers,

the South Pole Traverse had done its job — proving that an overland snow route between McMurdo Station and South Pole Station is feasible. The arrival of Wright and his seven-member crew is the culmination of a four-year field project.

After taking a couple of days rest at the Pole (though still using the two berthing modules they towed there), the team left South Pole on Dec. 28 shortly after 8 a.m. for the return trip to McMurdo. It followed its flagged route all the way back to Ross Island with three tractors, a PistenBully, its support modules and fuel tanks.

Over the three previous seasons, the traverse field team has crossed the Ross Ice Shelf, climbed the Leverett Glacier through the Transantarctic Mountains, and made it to the polar plateau just past 86 degrees south. Each excursion from McMurdo Station went farther than the previous year, with the traverse returning to Ross Island at the end of each foray. The first field season for the traverse was the 2002-03 austral summer. It covered the least amount of real estate over the four seasons, about 200 kilometers, but successfully crossed a 5.5-kilometer area called the shear zone. This stretch of the route, not far from McMurdo Station on the Ross Ice Shelf, was Swiss-cheesed with 32 crevasses, Wright said. Much of that season was spent identifying crevasses in the shear zone and plugging them up with snow — a job much harder than it sounds.

"Finding snow in Antarctica is not a difficult proposition," Wright noted, "but finding snow in a crevasse field that you can maneuver to the brink of the crevasse you want to fill, is." The next season, soft snow and flaws in sled design slowed the traverse, though it blazed an additional 475 kilometers despite less-than-ideal conditions. Last season, the traverse did a blitzkrieg past its farthest south point and then up the Leverett Glacier, even while encountering another major crevasse field. After gaining a foothold on the polar plateau, about 1,180 kilometers from McMurdo, and farther than its original goal for that field season, the team safely returned to McMurdo. Wright said the route is now safe and repeatable, a criteria of proving the route. Only a few months ago, that was still in doubt. "It was a question back in October," he said. "It is a question no more. We are here."

**"IPY ON LINE"** (Katy Jensen) On January 17<sup>th</sup>, the National Science Foundation launched an Internet "portal" Web site (<http://www.us-ipv.org>) to support U.S. participation in the International Polar Year (IPY) 2007-2008. The White House's Office of Science and Technology chose NSF as the lead U.S. agency for the event, which was

co-founded by the International Council for Science (ICSU) and the World Meteorological Organization (WMO).

Primary goals of the IPY 2007-2008 are to quantify the earth's "environmental status," improve our understanding of global climate systems and circumpolar societies, and ignite a renewed passion for science, math, and global issues. Researchers from more than 100 countries are preparing for this largest-ever, multi-disciplinary data collection campaign, which will actually take place between March 1, 2007, and March 1, 2009.

The first IPY (1882-1883) was the brainchild of Bavarian Georg von Neumayer and Austro-Hungarian Karl Weyprecht. During their stellar careers as polar explorers, these two men recognized a need for international scientific collaboration, and they co-chaired the International Polar Commission in 1879. Primary interests at the time were weather patterns, magnetism, and other polar phenomena. Twelve countries participated in the first IPY, with twelve expeditions to the Arctic and three to the Antarctic.

The second IPY (1932-1933) occurred 50 years later, with 44 nations participating. The primary goal was to improve weather forecasts and radio communications for ships and aircraft, but scientists also began to recognize the advantages of interdisciplinary cooperation. For perhaps the first time, the Polar Regions weren't regarded as separate, remote entities, but as essential components in a complex network of earth processes. By studying the atmosphere, ice, and sediments of the higher latitudes, researchers discovered evidence of our planet's history and clues about our future.

So when American physicist Lloyd Berkner proposed a third EPY in the 1950's, the International Council of Scientific Unions decided to expand the research goals to include additional terrestrial and solar research, resulting in the International Geophysical Year of 1957-1958. Sixty-seven nations and countless individuals collected data all over the world—from the bottom of the ocean to the middle of Antarctica.

The IGY also launched science off the face of the planet. The U.S. announced its development of an impressive satellite program, but it was the Soviet Union who stunned the world by launching Sputnik I in October 1957 and Sputnik n (and its canine cosmonaut, Laika) a month later. After a few successes of its own, the U.S. passed the Space Act in July, and NASA was created before the end of the IGY. In 1992, an "International Space Year" commemorated the 35<sup>th</sup> anniversary

of the IGY and the 500<sup>m</sup> anniversary of Columbus' arrival in the New World.

The success of previous International Years and continuing support for forums such as the Arctic Council and the Antarctic Treaty have proven that international cooperation can exist among seemingly incompatible cultures. Today, signatory nations for the Antarctic Treaty represent 80% of the world's population. Let's use the upcoming IPY to reach the other 1,299,221,800 people!

**LIFE ON THE ICE - No One Goes There Alone**  
(by Raff Smith 2005. *National Geographic*) Reviewed by G. Machemer. Perhaps only a trained journalist, who writes sparingly and with clarity, can pack into 208 pages an overall physical description of the Antarctic continent, complete with its historic past of those who discovered, explored, and settled scientific bases there. So it was for Roff Smith, born in New Hampshire, and emigrated to Australia when he was 23. Under the Australian Artists and Writers Program, he first sampled the awe of the Antarctic at Davis and Mawson bases. Enthralled with that experience, he then covered the white continent for Time Magazine, and followed as a writer for the NSF Program. He was accorded every opportunity to explore all aspects of scientific research at the various stations. NOAA and the National Geographic found him a ride on a Russian icebreaker from Punta Arenas, south to King George Island where the Golden Fleece, a 70 foot steel-hulled yacht gave him a fantastic five-week tour of the Antarctic Peninsula all the way south to Marguerite Bay. His journal was filled with anecdotes of the famous explorers such a Charcot and Nordenskjold. RofPs reflections are forthright yet beautifully written, great for a review by experienced Antarcticans and just the best homework for those anticipating a trip to the Ice.

### **CARGO, FUEL SAFELY UNLOADED AT ANTARCTIC RESEARCH STATION**

(February 10, 2006) Overcoming challenging ice conditions, a ship has safely delivered cargo needed to supply National Science Foundation research stations in Antarctica through the coming austral winter and into the next research season. Fuel required to heat the stations and power aircraft and other vehicles is currently being transferred from a tanker into storage tanks on land.

The cargo vessel American Tern arrived at McMurdo Station's ice pier on Feb.2. With its cargo safely offloaded, and with recyclable materials and other goods stowed aboard, the Tern was escorted out of McMurdo Sound by the Russian icebreaker Krasin. The cargo ship has steamed

safely beyond the ice-clogged region and is now headed north.

NSF chartered the Krasin to cut and maintain a channel through the thick, multiyear ice covering the Ross Sea and the sound into McMurdo Station. Meanwhile, the tanker Lawrence H. Gianella offloaded fuel and completed its operations on Feb. 11.

**THINGS THAT YOU ALL SHOULD KNOW..** There are over 140 lakes buried beneath varying thickness of Antarctic ice, but most of them are small and shallow. The largest of them all is Lake Vostok, about the size of Connecticut, which holds 5,400 cubic kilometers of water, enough to fill Lake Michigan. There are two other subglacial lakes near Lake Vostok, one is called 90 Degrees East (as it stretches along that longitude) is the second largest subglacial lake in Antarctica, holds about 1,800 cubic kilometers of water, enough to fill Lake Ontario. The other major sub glacial lake is Sovetskaya, and that covers 1,600 square kilometers..... The ozone hole may not recover until the year 2065. At its yearly peak in early October, the ozone hole covered about 24.3 million square kilometers, an area about the size of North America. That's down from the hole's largest extent of 26.2 million square kilometers in 1998. The atmospheric data gathered over the United States and Canada now suggest a 15-year delay in recovery..... Using data gathered by a satellite (ICESat) launched almost 3 years ago, scientists have assembled the most comprehensive high-resolution map of Antarctica that's ever been made. ICESat collects elevation data down to latitude 86° S, a mere 450 kilometers from the South Pole. Previous maps of Antarctica covered areas only down to 81.5° S The new map of Antarctica will soon be made available to the public at <http://www.nside.org>, the Web site of the National Snow and Ice Data Center in Boulder, CO.

**THINGS THAT YOU SHOULD BE AWARE OF.** There is a new book out by Mariiana Gosnell entitled ICE, The Nature, the History, and the Uses of an Astonishing Substance. It's published by Knopf, and it sells for thirty dollars. You will find the names of many of our Society's members who have made a well-worthwhile living studying something which is more brittle than glass, at times stronger than steel, other times flows like molasses, covers 10 percent of the earth's land and 7 percent of the ocean. Buy it, you can't help but like it.

**THINGS YOU POSSIBLY MIGHT WISH TO KNOW.** The largest snowplough ever sent to the Antarctic departed Hobart, Tasmania on a Russian freighter in January, bound for Casey Station. It is hoped that ideal conditions will allow the plough to be put into position before winter sets in so that it can be used to construct a 4000-meter blue-ice runway. The strip will be placed on giant slides and dragged 60 kilometers

by tractor to an m land site where the ice is crevasse- free, at least 500 meters thick, and less exposed to the fierce winds and snow storms that lash the perimeter of the continent. It will take until the summer of 2007 to have the strip ready. The runway is going to be named the Wilkins Blue Ice Runway and scientists will transfer directly to small ski-equipped turbo propped aircraft to be taken direct to field camps, or to helicopters or passenger carrying tractors to reach Casey. The strip will be capable of taking Boeing 747 freighter and even the larger Airbus A380 freighter due in service from 2008. If Sir Hubert's ashes were not at the bottom of a sea, I am sure he would appreciate a ride to or from his runway. Remember how at McMurdo in 1957, he would hang around Willy Field just hoping to catch a flight to anywhere!!!.....An ailing crewman on a fishing vessel, presumably an Uruguay boat, was picked up by a New Zealand helicopter stationed at Hallett, then flown by an Italian twin otter at Terra Nova to McMurdo, where an American plane took him to Christchurch and hence to a hospital. He evidently wasn't too badly off, as while at McMurdo he was reportedly in stable condition, conscious, and watching a movie ..... Thousands of everyday articles left in explorer Ernest Shackleton's hut at Cape Royds will be preserved over the next three years. A conservation laboratory, in two containers, was shipped from Lyttleton in mid-January to Antarctica. This will allow conservators to work in relays, winter and summer on 3500 artifacts. Three conservators, trained in Australia and Europe, would stay at Scott Base this winter and work in the laboratory..... A lot of the real good stuff which you find in these Newsletters is here only because of the kindness and generosity of a person deeply respected and loved by many American Antarcticans, Margaret Lanyon.

**MOUNT TERROR RUGBY CLUB SETTLES FOR SILVER, LOSES 5-0.** In the almost annual World's Southernmost Rugby Championship, the elite Scott Base Rugby Club defended their World Cup gold, by edging the highly conditioned young American club from McMurdo, winning 5-0. The game played on natural turf, a 300 metre ice shelf, was made more exciting as winds registered 80 kilometers per hour. In a way, it was somewhat of a moral victory for the layered Mount Terror team who played with great gusto, as two years ago they had lost to the veteran Scott Base team by a score of 27-0.. The Americans were lead by Keith DePew, who once upon a distant past played rugby in college. However, we thinketh it is quite evident that Raytheon must recruit some offensive power, as if you can't score, you sure can't win.

**BRASH ICE.** We are becoming more of a team effort, with most welcomed contributions from many of you. John Spletstoesser has been our right hand man for many years, and Margaret Lanyon has blessed us with innumerable contributions from Christchurch over the past decade.. We have also been ably supported by Polly Penhale and Jerry Marty of NSF in keeping us aware of many activities on the ice. We have been using three avid Antarctic bibliophiles for book reviewers; Charles Lagerbom, Steve Dibbem, and Gracie Machemer. It's a toss up between Charles and Steve as to who has the largest not-for-sale personal Antarctic library. We are trying to make Grade into our modern-day Ruth Siple, an almost impossible task as Ruth did everything. And an ex-husband-wife Polie team of Drew and Diana Logan have introduced us to so many of the younger crowd, particularly Polies, that they are invaluable to us in trying to keep us up with the times. The most wonderful thing about these connections is that we are finding out that not only do they love Antarctica as much as us old has-beens, they are equally, if not more so, nicer than we are! Hard to believe, isn't it?

Another most important team member of our team is Jo Lindsay, a spritely lass who shines at adult tennis and has been known to be a flash on the local ice hockey arenas. She puts these words into a computer, and makes enough sense out of them so that they can be printed. She is probably the most fun member of our team, although John Spletts has a great sense of humor. We liked the way that Katy Jensen, an occasional contributor to these pages, writes, and we approached her as to her interests in putting out these Newsletters, as twenty-eight odd years is more than enough. But Katy gave us a polite, "Thanks, but no thanks." We want young blood to fill this chair, as they are our future. But there is one person who shares with us the deepest interest in Antarcticans, and that is Lynn Arnold, currently a school teacher in the international school in Singapore. She has appeared in our pages before, and she is a contributor to this issue. We are hopeful that perhaps Lynn might want to assume a larger role in our Society. Right now she has two votes, those of Charles Swithinbank and myself, representing a total of some 160 years of living, hopefully some of those with sound minds and good judgments about Antarcticans.

The headline story since the past issue has been global wanning, although we find that most of the articles are about as exciting as eating last night's warmed over remains of a macaroni and cheese dinner. Once upon a time I was even involved in climate change, as for three years in the mid-seventies I was a member of an interdepartmental government team at the National Defense University at Ft. McNair in Washington where we were trying to ascertain what things were going to be like by the year 2000, particularly food crops around the world. After three years we actually did publish a report, CLIMATE CHANGE TO THE YEAR 2000. It

had a beautiful cover and many nice wood cuts, which were sneaked by the approval Board when they all were on Christmas holiday! One of the experts helping us make valid assumptions and decisions is one of our Society's current members, the motorcycling Will Kellogg, then of the National Center for Atmospheric Research in Boulder. Will happens to be the father of an Antarctic scientist. Why Will is a member of our Society is beyond us, but he claims that he truly does like to read our Newsletters. It just goes to show that there isn't much interesting reading material in his home.

Another expert involved in that study was the late J. Murray Mitchell Jr., who presented our then-annual Memorial Lecture in 1978. It was probably our Society's first ever Memorial Lecture on climate change in the Antarctic. But if you go back to the first Byrd Antarctic expedition in the late 1920s, you will find that one of the stated reasons for the expedition was to find out if Antarctica was shrinking or expanding. Going back to Murray, he was one of the nicest guys who ever walked on this earth. He was taken to the South Pole as a distinguished VIP by NSF, and he thoroughly enjoyed every minute on the ice. It was my honor and privilege to have known Murray since his undergraduate days at MIT. Although an avid outdoor enthusiast, this strong environmentalist just could not lick the Big C.

Another climatologist who visited the South Pole was Bill Spriggs, then of the National Climate Program Office. Many of you folks will remember Ron LaCount, formerly in the head shed at NSF. He once gave an extensive interview to the press where he disclaimed that there was anything such as global warming. Another Pat Michaels!

There have been several publications of late devoted to global warming, and we asked John Splettstoesser to summarize what appeared in *SCIENCE* for March 24, 2006. This appears as a separate input to this Newsletter. Many of you have probably seen the issue of *TIME* magazine (April 3, 2006) which had a special report on global warming. Its cover had in big, bold print, **BE WORRIED, BE VERY WORRIED**. It was directed towards guys like me who are shoreline property owners. Right now it is rather exciting in winter when a good northeaster brings surf right up to my front doorsteps.

Herein you will find an article by one of Antarctica's best known husband and wife teams, the Frasers of the Antarctic Peninsula. Bill has been studying seabirds in the Palmer station area for more than two decades. Originally he worked under the late Dr. David Parmalee. His research on both Adelie and chinstrap penguins is classic in determining that natural causes such as sea-ice extent and

orographic features play a major role in population dynamics of the species. His wife Donna has been studying the foraging habits of giant petrels in the last few decades by using instrumented birds to track their ranges. (JFS).

The elevated station at the South Pole is completed, with all eight wings occupied, and the transition of all related functions from the Dome to the elevated station. Application of the exterior metal siding has begun and is scheduled to be completed by the station dedication. The station is now preparing for formal dedication sometime in the coming austral summer, month and date to be determined, supposedly coinciding with the 50th anniversary of the completed construction of the original Amundsen-Scott South Pole station in 1957.

There are some interesting books coming out in the near future, some over the horizon, and even more are in their embryonic stage. Historian Dian Olson Belanger reports that her book, **DEEP FREEZE, THE UNITED STATES, THE INTERNATIONAL GEOPHYSICAL YEAR, AND THE ORIGINS OF THE ANTARCTIC AGE OF SCIENCE**, written under a NSF grant, is being published by the University Press of Colorado in mid-September of this year. Her book is based on oral history interviews, diaries, memoirs, and official records. Dian offers a U.S. viewpoint and emphasis, but within the context of contemporary international politics and the aims and activities of the other eleven IGY stations on the ice. She explores why this story mattered then, and matters still. (DOB)

Another book which has been completed and is awaiting childbirth as soon as a contract can be drawn up with a publisher is **EAGLE ON THE ICE** by Pat Wilson and Roger Leslie. Pat has been nurturing within her bosom for at least two decades a child's book on Paul Siple, as she felt that he was the ultimate role model for youngsters. She never knew Paul, but was a very good friend of Ruth, who suggested the name for the book. We have been privy to an advanced copy of the book, and it is very interesting, dealing almost exclusively with Paul as an Eagle Scout of the Byrd Antarctic Expedition, 1928-30.

Mildred Crary tells us that she is going to make every effort to get Bert's book on his exploits in the Arctic and Antarctic into print for the 4th International Polar Year. Mildred, herself a very active author, has completed her editing of Bert's book, which has long been awaited by his multitude of friends. With much justification, we feel that Bert was the premier polar field scientist for the whole 20th Century. Now we can't wait for this to hit the book stalls.

Tim (BEFORE THE HEROES CAME) Baughman is currently researching material for a book which will be in many ways a continuation of Ken Bertrand's excellent AMERICANS IN ANTARCTICA. Ken's book ended with Operation High Jump, and Tim's book will take off from there and go forward through the IGY and into the early years of the Antarctic Treaty – maybe beyond.

**MEMBERSHIP.** On the whole, most of you have done a good job of renewing, but there are close to fifty who are still delinquents. Unlike another polar society in our country, we are not very lenient with delinquents. We don't mind if you want to drop out, as the fewer members, the less work for us. So those who are delinquent will get a last notice with this Newsletter. If you renew, please renew for several years as it helps us a lot. Membership cards are enclosed for those with paid up memberships. Over two-thirds of the people who renewed this year did so for multiple years. We thank you.

#### **ANOTHER FORMER ANTARCTIC**

**ADVENTURER DIES.** TOM ABERCROMBIE, a swashbuckling adventurer, whose life got jump started at the South Pole, died April 3, 2006 at Johns Hopkins Hospital of complications from open- heart surgery at the age of 75. While at McMurdo in the summer of 1957, he won a lottery to be the first photographer at the Pole. He arrived at the Pole on October 22nd, 1957, along with a photographer from the OREGON JOURNAL and a Navy photographer. When their P2V Neptune developed an oil leak while starting up to depart, the plane and crew were destined to stay at the Pole until a gasket could be obtained and flown in. The Men who Came to Dinner, eh what?

Upon arriving at the South Pole, he begged Paul Siple to let him stay at the station, promising to work in the snow mine twelve hours a day. It was too good an offer for Paul to turn down, but a most reliable source told us that Tom never came through on his promise! In fact, in Tom's first pilgrimage into the snow mine, according to Siple's 90 SOUTH, Tom had to check out from exhaustion after twenty minutes. So much for his promised twelve hours!

Tom took a multiple exposure of the Sun over a three-hour interval showing its horizontal motion above the South Pole Station. It appeared in Paul Siple's article in the April 1958 issue of The National Geographic Magazine There was one frosted picture of Abercrombie's face which was often published without a photo credit. It was also used in Tom's obituary in the 7

April 2006 issue of The Washington Post – Bob Benson took the picture. It seems Bob and Tom were down in the snow mine for some time, and when they came up, Bob took that great picture of Tom.

Before the IGY, Tom loaned George Toney, the station leader, a camera and twenty odd rolls of film, instructing him to take as many pictures as he could during the winter. George was a polar veteran before he went to the Antarctic, having served in the Arctic once upon a time. George diligently took pictures for Tom, and sent them off at the end of winter to the National Geographic, probably with visions of himself becoming famous for the pictures. But he got a short thank you letter back from the National Geographic informing him that none of his pictures came up to their standards!

It was said that Tom picked up languages as easily as most people pick up souvenirs. He was fluent in German, English, French, Spanish, and Arabic, and could fake it in Italian. With hands like catcher mitts, a photographer friend said that he could destroy the inside of a rental car before he got it out of the parking lot.. Over the years he became the magazine's expert on the Arab world, and he was so impressed by Islam that he read the Koran in Arabic, and became a Muslim. He made four pilgrimages to Mecca, where he took the first photographs of the city for the Western world.

He was like a cat, escaping death many, many times. He slipped off his yak in Afghanistan, and nearly plunged into a 1,000 ft chasm. He nearly died from typhoid in the Himalayas. An angry mob in a napalmed Cambodian village nearly killed him, stopping only when he managed to convince them that he was a Frenchman. He got knocked off the top of a mountain cable car in Venezuela and was saved by a stout Swiss guide who yanked him back into the car by his belt. One obituary read he was like Indiana Jones with a camera and pen. His great photography may have been exceeded by his wrings which also became legendary, writing articles on all seven continents. And it all started with a snow shovel in his hands at the South Pole. Well, not quite right, as he received the 1954 Newspaper Photographer of the Year award.

**“ICECUBE TURNS UP THE HEAT”** Condensed from the Antarctic Sun, January 29, 2006 (By Steven Profaizer Sun staff) (edited by Katy Jensen) Sixty billion neutrinos fly through your thumb every second. The weirdest part is that no one is sure where some of them are coming from.

Neutrinos are subatomic particles that fit into the same

general category as protons and electrons. Neutrinos, however, have special characteristics: they have no electrical charge and are almost without mass. This means they are not affected by magnetic fields and are rarely absorbed by matter. With nothing to interfere with them, neutrinos are born, and just keep going in whatever direction their source pushes them. For the most part, they slip straight through anything that gets in their way, shooting across the universe in a straight line from their origin. But every once in a while, they crash straight into an atom, destroying themselves in the process. These collisions give scientists a rare opportunity to learn about these abundant yet mysterious particles, which are notoriously difficult to detect because of their benign nature.

Enter IceCube — the monstrous, cubic-kilometer neutrino telescope currently under construction one-and-a-half to two-and-a-half kilometers below the surface of the South Pole. It is designed to observe the result of neutrinos careening across the galaxy, traveling through the earth, and slamming into an atom of ice. The rarity of these occurrences is the reason for IceCube’s immensity — the bigger the area of the detector, the better the chance of observing the interaction.

The collision destroys the neutrino but creates a negatively charged particle called a muon, which gives off a blue cone of light as it continues along the path of the neutrino.

This blue luminescence is called Cherenkov radiation. It occurs when a charged particle, like a muon, travels through matter faster than light would through that same substance. And the very large, dark and transparent ice region under the South Pole’s surface provides a perfect place for scientists to observe the effect.

IceCube is a sensor array made of digital optical modules, or DOMs. Eighty strands, each with sixty basketball-sized DOMs, will be placed into shafts drilled in the ice. The science team hangs the strands straight down into the holes, and within a month, the ice closes up completely around them.

The ice’s grip on the DOMs is hardly a gentle embrace, so their electronic innards are encased in a ball made from glass designed for deep water diving. Inside the glass is a minicomputer attached to several instruments, including a photomultiplier. This device works like an inverse light bulb, said Mark Krasberg, an IceCube scientist from the University of Wisconsin.

Instead of producing light, it traps light and logs the exact time it registers it — down to five billionths of a second.

The precision is needed so the scientists can tell the neutrinos apart. Software deduces the exact moment each DOM gets hit and uses that to judge the neutrino’s direction and speed. “It’s like putting a bunch of microphones in the street to figure out the direction of a car,” Krasberg said. “If you looked at when each microphone recorded the car passing, you could tell its direction.” There is an inherent oddity to the IceCube project: the blue-light-producing muons it studies are so rare that the array has to cover a cubic kilometer to produce useful data, yet IceCube will detect far more of these interactions than it wants. What makes this possible? The muons’ origin. Muons can come from many sources, only one of which is the collision of a neutrino with an atom of ice. So just because IceCube registers a muon’s blue cone of light shooting across the array, does not necessarily mean it is providing the scientists data on what they are trying to study.

Scientists have come up with a way, however, to use all that extra information — IceTop. IceTop is considered part of IceCube, but it uses a separate set of the same digital optical modules. These sensors are frozen into 2,300-liter tanks of water and placed in pairs above each string of the IceCube array. IceTop serves two major functions. The first is to help calibrate and enhance IceCube. The second is to make use of the valuable data that is not directly related to IceCube’s goals.

By studying the particles IceCube is not interested in, scientists can get better at eliminating the excess information the particles create in the IceCube array, said Tom Gaisser, principal investigator for IceTop. If scientists didn’t eliminate that interference, it would be like trying to decipher one voice in a stadium filled with screaming fans.

“For every muon generated by a neutrino, there are about a million generated by cosmic rays,” Gaisser said.

Scientists can tell muons’ sources apart by their trajectory. There are two general directions for muons to move through the array: up and down. The majority of downward-moving neutrinos are from cosmic rays creating showers of subatomic particles as they meet the Earth’s atmosphere. But IceCube is designed to look at the muons created by particles moving up through the Earth. Neutrinos are the only muon source that can travel through the entire planet.

“We’re looking down through the Earth and using it as a shield,” said Mark Krasberg, an IceCube scientist from the University of Wisconsin. While IceCube is looking through the Earth at the northern sky, IceTop will be looking straight up at the sky over the South Pole. “We’re

taking advantage of extra physics that can be done with the background that would otherwise be discarded,” Gassier said.

The IceTop team installed eight tanks last summer and completed 24 more this season. Those tanks are still in the process of freezing, but they will be operational in February.

**IS THERE REALLY GLOBAL WARMING?** (John Splettstoesser, with excerpts from *Science* and input by T.J. Hughes) Yes, according to many authorities who study the issue, and by authors of numerous articles in the 24 March 2006 issue of *Science*. The cover photo, of icebergs in a fjord in Greenland, is a hint of what is in the issue, which includes four articles, perspectives, and an editorial. Is there cause for alarm? Is the re-building of levees in New Orleans a waste of time? Are Holland, Miami, and Venice, Italy, doomed to be places that tourists used to visit, but won't be able to anymore? Model simulations are basic in this kind of study, as well as measurements taken over long periods of time. Satellite imagery is the newcomer in the analysis. Model predictions of warming during the next 130 years imply that surface temperatures will be as high by the end of this century as they were 130,000 years ago, thus melting enough of the Greenland ice sheet to raise sea level by several meters. Losses of the Antarctic ice sheet, as shown by satellites designed for the purpose, indicate a decrease in the ice sheet by  $152 \pm 80$  cubic km per year from 2002 to 2005, mostly from losses in the West Antarctic ice sheet. Ice loss around the margins is proceeding faster than the center of the ice sheet is growing. Glacial earthquakes, triggered by the sudden sliding of glaciers, have been more common in Greenland in summer, producing an acceleration of ice to the sea. Destruction of features like the Larsen Ice Shelf in the Antarctic Peninsula produces no increase in global sea level because the shelf is already afloat, but when the shelf barrier is removed, the land-based glaciers that nourished the ice shelf accelerate and their melted ice does raise sea level.

Bindschadler's article raises the issue of Pine Island Glacier that drains into the Amundsen Sea off West Antarctica, and its acceleration, thinning and retreat in the mid-1990s. The coastal geometry is such that warm, salty water overrides the moraine, or sill, in front of the glacier and reaches the base of the ice sheet, increasing melting. Compounding the problem of retreat is that of grounding lines of Pine Island Glacier and Jakobshavn Isbrae in Greenland. Each has the earliest recorded acceleration, making them more vulnerable to grounding line retreat because of the deep basins they have

developed at more than 1000 m below sea level. Concurrently, sea ice growth and thickness in the Arctic Ocean has diminished, pointing to a potential open-water ocean in the future. If you recall significant articles in the 1970s by the late Dr. John Mercer on the two topics discussed above – disintegration of the West Antarctic Ice Sheet, and an open Arctic Ocean – you will see appropriate background information as a bellwether of what the planet is experiencing. An ice-free Arctic Ocean was the subject of technical articles going back to the 1950's by Ewing and Donn. More recently (2004), Dr. Terry Hughes authored a paper showing how surface melt water reaching the bed in the Greenland ablation zone caused ice-stream 'surges' that released enough ice into the sea to raise sea level by 3 meters and cool the North Atlantic Current sufficiently to create another Little Ice Age, all in only 300 years.

Journalists are having a circus as these potential doomsdays are developing, with sensational headlines designed to sell newspapers. Stay tuned, however, to the results of researchers the likes of which contribute to articles in the 24 March issue of *Science*. It is worth some useful reading at your leisure, and creates thinking about disposal of your coastal property.

#### **SATELLITE TRACKING SOUTHERN GIANT PETRELS AT PALMER STATION, ANTARCTICA**

(Donna L. Patterson-Fraser & William R. Fraser, Polar Oceans Research Group, Sheridan, Montana, USA) Southern giant petrels (*Macronectes giganteus*) are large, surface feeding predator-scavengers with a circumpolar distribution in the Southern Ocean. Like many other Procellariids, Southern giant petrel breeding populations are decreasing throughout much of their range. Giant petrels are highly susceptible to some types of human disturbance near their breeding sites; however, some studies suggest that the observed population decreases are due primarily to entanglement mortality induced by commercial long line fishing operations. These fishing operations are rapidly expanding in the Southern Ocean, thus posing an increasing hazard to giant petrels because they are attracted to baited hooks. Indeed, current estimates are that as many as 100,000 seabirds are being killed annually by these fishing operations in the Southern Ocean, the southern giant petrel is now listed as vulnerable by the International Union for the Conservation of Nature (IUCN).

A notable exception to this decreasing population trend, however, occurs in the vicinity of Palmer Station, Antarctica (64° 46' S, 64° 04' W), where the breeding population has more than doubled to nearly 500 pairs over the past 30 years. Despite an increase in

entanglement events in the vicinity of Palmer Station, we have long-hypothesized that the area's increasing population may be due in part to minimal overlap between foraging ranges and commercial fishing operations.

To examine foraging patterns and potential fisheries interactions, small satellite transmitters were deployed on adult Southern giant petrels during their breeding season. Because the study population was habituated, we have deployed all transmitters without restraining or stressing the giant petrels. Over the past 8 austral summers, we have logged over 3500 "transmitter days" on 161 giant petrels, with most of the tracking coming during both incubation and the critical chick-rearing phase.

Preliminary analyses of our data suggest two broad patterns in giant petrel foraging strategies. The first is that during all seasons, individuals made repeated trips to the same areas, some of which are more than 1200 km away. This finding is important because most legal commercial fishing activities take place to the north of this population, suggesting a limited overlap between local breeding giant petrel foraging ranges and fishing activities. The second pattern relates to foraging changes within the breeding season. Foraging trips tended to decrease substantially in distance and duration during the brood/guard phases. The guard phase in giant petrels is coincident with fledging in Adélie penguins (*Pygoscelis adeliae*), which are highly vulnerable to giant petrel predation both on land and at sea. This geographically limited foraging strategy, while providing relatively easy access to prey, also serves to minimize giant petrels' potential exposure to fishing vessels.

Our results to date highlight the need to continue monitoring and telemetry studies on the Southern giant petrels near Palmer Station. We know very little about young giant petrels, who spend nearly all of their pre-breeding existence at sea, and are thus exposed to fisheries activities north of Palmer Station. We hope to gain a better understanding of these non-breeding Southern giant petrels, as they truly are the future of the Palmer Station breeding population. [Project funded by NSF/OPP.]

**EXTREME PLANNING** (Lynn Arnold) Today's world is into extremes more than ever. Extreme sports are the rage. Extreme sizes are available at convenient stores. Extreme adventure vacations are growing in participants. And, as I would shockingly learn after returning from a year in the Antarctic, extreme reality TV shows receive hordes of viewers. But let's face it. None of this holds a candle to the extremes you find in the Antarctic. Just

think of the science alone. How more extreme can one get? Do many people know there are eighty story balloons carrying 3,000 pounds of telescopes above the Antarctic in the summer season? How many people today have ever pondered a career as a cryogenics technician? Who is really aware of the prehistoric looking Antarctic cod whose blood contains antifreeze properties? Who has considered that scientists do absurd things like attach video cameras to unsuspecting *seals* and *penguins*? Who would guess that resourceful individuals would create a plexiglass tube that allowed us to go underneath the ice without donning a wetsuit? Does the general population realize that those ice divers cannot even dress themselves in their spacesuit-like gear? Who would imagine finding astronauts or meteorites near the South Pole? WOW!! Now that's EXTREME SCIENCE!

*"If I have seen further it is by standing on the shoulders of Giants."* –Isaac Newton

The cutting edge science currently going on at the poles has only been possible due to those who went early on, back in the days long before there were such luxuries as telephones and computers, snowmobiles, and saunas. Many of our friends and colleagues in the Antarctic Society for example, were there during THE incredibly exciting times: before and during the International Geophysical Year (IGY) and subsequent years. Ice veterans still glow with lingering enthusiasm when recounting experiences, some who were going where *no one else had ever been*. The International Geophysical Year was a time of change in the scientific world. The third of its kind, the idea to have a 3<sup>rd</sup> polar year became the geophysical year due to the heightened sunspot activity and it involved scientists all over the planet (30,000 people from 66 nations). The Antarctic portion of the endeavor involved 12 countries that sent 5,000 people to the ice, constructed 50 stations, and changed the face of science forever. IGY led to such exciting developments as the launch of Sputnik, the discovery of the Van Allen belts and the initiation of the term "tons of information" because that is literally what was generated. *17 tons* of data were collected in the US Antarctic Program alone. In order to house this explosion of new knowledge, three World Data Centers were created. The US National Committee announced IGY as, "*the single most significant peaceful activity of mankind since the Renaissance and Copernican Revolution.*"

As a result of IGY, the Antarctic Treaty was created, in which new standards of international cooperation were reached. These became a continued part of the legacy that continues today, along with the generations of

students who were inspired to pursue careers in science due to the role models they were exposed to during that time from July 1, 1957 to December 31, 1958. The spirit of the individual was to be replaced with the international cooperative effort, a remarkable feat for the world, especially considering it happened during the Cold War. It's tough to follow an act like that, even fifty years later.

The upcoming International Polar Year (IPY) will take place March 2007 to 2009, a half a century after what many consider to be the most successful collaborative scientific effort ever. While the novelty of a first time undertaking such as IGY will not be present in IPY, there are some definite other advantages of the foundation that was built during that time. During IGY, the scientists were young and inexperienced and the Navy ran things. The heart and soul of our society, Paul Dalrymple, was considered OLD at the age of 33 years. (Ouchy, that hurts!) Now many of the researchers are experienced leaders in their fields and the National Science Foundation is really the governing body for the US stations. Thankfully, the demographics have certainly changed, as now *both men and women* work there, ranging from 18-60+ years. More convenient methods of communication and transportation have made polar life much easier. And, due to advances in technology that change our everyday world, the thrill of the poles may be viewed immediately.

All over the world, people are in a frenzy of meetings gearing up for the IPY, collaborating on new ways in which to conduct science and work together more extensively. In March, there was a meeting in Brussels, while the USA sponsored a virtual planning workshop online. In April, scientists and teachers convened in Vienna. In May, the talks will leap across the ocean and take place in Ushuaia. And in July, Hobart will host thousands while we hold our own special Antarctic Society shindig in Port Clyde, Maine! To coordinate the plethora of activity to take place, there is now an official International Polar Year Program Office ([www.ipy.org](http://www.ipy.org)), which has been instrumental in matchmaking scientists with similar projects in similar institutions all over the world, thus further enhancing international collaboration.

In addition, there is a strong education and outreach component that is being emphasized in how to communicate these scientific feats to schools and the general public alike. But as this portion of IGY was developed largely *after* the actual time in the field, we now have the luxury to access much of that information right *during* IPY thanks to the computer age. A golden opportunity exists to both educate and motivate new generations of potential researchers and citizens through

digital data tools, media programs, web cams, video clips, podcasts, blogs, and a host of other ways in our progressive technological state. IPY hopes to be a focused "burst of activity" that will be more public. Quite frankly, this could not come at a more opportune time. Scientists the world over are concerned with the data being confirmed in a variety of different fields. The news from the poles lately is not good. Accelerated rates of temperature change and ice trends in the polar regions are alarming. Older and older ice cores consistently indicate rises in greenhouse gases that contribute to global warming and yet emissions are only growing. The ice holds keys to our future and we must pay attention.

And yet, we must remember (as some of us may have heard once or twice☺) *science never sleeps*. Antarctica still draws those who donate a portion of their lives to the cause. By the time this newsletter reaches you, the last hint of sun will have disappeared and the Antarctic winterovers have no doubt settled into the rhythm of the polar night, isolated from the rest of the world. The stars should now be out in full glory, the moon will make its monthly appearance to wake up those who venture outside, and, hopefully, the auroras will visit often.

While the various crews trudge through the dark, many will be quite unaware that a substantial population spread throughout "the north" is fixated on the poles in anticipation. The ice holds many keys to our future of working together to make our world better. The good news is that for those of us who are passionate about the pole(s), we will soon have a once in a lifetime opportunity to celebrate with the rest of the globe. Fellow Antarcticans, 2007 could be our year!

**ICE The Nature, The History, And The Uses Of An Astonishing Substance** BY MARIANA GOSNELL Knopf 501 pp. 2005 (Book Review By Grace Machemer) In 501 pages, the author thoroughly discusses every aspect imaginable of the frozen (solid), state of that compound we call water, so absolutely necessary for life everywhere in this universe.

If you thought you knew something about ice, think again. This encyclopedic book should convince you that there is more, much more all the way up from the chemical and physical attributes of ice to the various locations of it on earth: that is, in lakes, in rivers, in the Great Lakes, in glaciers in the Alps, the Arctic, the North and South American continents, to the Antarctic. All of it contributes its bergs and melt water to the oceans and the atmosphere of the world. And then there is extra-terrestrial ice to consider.

But what is the history of ice? We know by reading newspapers and journals something about ice ages. Ms. Gosnell details the facts of ice sheets and ice caps through research by way of drilling and coring and the examination of these cores of ice to tell us what happened in the past and how to predict the future climate.

Hardly a chapter (there are thirty-six), misses some facts supporting the hypothesis of global warming, the common buzz words of today's media, politics, and economics. She writes with ease, and interjects bits of wit and humor and poetry now and then. She copiously quotes experts in the field from CRREL and elsewhere such as Tony Gow, also Lonnie Thompson, and George Denton, so that we feel at home reading it. This is one COOL book for everyone to read, learn and enjoy.

**PERSONALS.** The Ray Arnaudos have packed up and moved to Moscow, at least for the next two years. It won't seem the same around Foggy Bottom where Ray has been connected to the Antarctic desk at the State Department for many years. His calling was to the Energy Department office in Moscow where he will be their senior advisor for non-proliferation and S and T (?) matters. Rose, his wife, evidently is proficient in the Russian language, and she has taken a position in the Carnegie Moscow Center. When Ray retires, he is interested in writing a children's book about the stuffed husky which Norman Vaughan carried to the top of Mt. Vaughan.

The SCAR (Scientific Committee on Antarctic Research) Medal for Outstanding Achievement in Antarctic Science will be awarded to Dr. Paul Mayewski of the University of Maine at the opening ceremony of the SCAR's Open Science Conference in Hobart, Tasmania on July 12, 2006. The presentation will be by the President of SCAR, Professor Jörn Thiede.

Another celebration in the long and distinguished career

of Dr. Susan Solomon. She was one of ten members inducted into the Colorado Women's Hall of Fame in March. This could not have been as big a surprise as much as a bewilderment as to why it took so long. After all she is the youngest woman elected to the very prestigious National Academy of Sciences, is a Foreign Associate of the French Academy of Sciences and the European Academy of Sciences. She was also awarded the Presidential Medal of Science in this country. And she mothered a glacier, no small feat.

Three of Stuart Klipper's Antarctic photographs from the permanent collection of the Museum of Modern Art (N.Y.C.) will be on display in photography gallery of the museum from March until November. Stuart Klipper has worked as a photographer in Antarctica in 1987, 1989, 1992, 1994, 1999, and 2000; five of those times he was a participant in the Antarctic Artists and Writers Program.

Sam Feola has been named as the new Raytheon Polar Services Company's Program Manager for the U.S. Antarctic Program. Feola replaces Tom Yelvington who retired from the program. Sam Feola came from SNC-Lavalin PAE, Inc., where he was the president and general manager of an American-Canadian joint venture company that supported Canadian forces employed overseas. From 1990 to 2000, he was director of logistics of Antarctic Support Associates, the previous Antarctic contractor where he directed contractor planning, management and operational support requirement of the U.S. Antarctic Program.

Jim Mastro is working on an Antarctic novel. Jim says he is sick and tired of reading novels by fiction writers who go to Antarctica for a couple of weeks and then fill their work with all kinds of inaccuracies. He promises "there will be no inaccuracies in my novel." Go for it, Jim.

# THE ANTARCTIC AN SOCIETY

## NEWSLETTER

*"BY AND FOR ALL ANTARCTICANS"*

Vol. 06-07

September

No. 1

### **PRESIDENT**

Robert B. Flint, Jr.  
185 Bear Gulch Road  
Woodside, CA 94062  
Phone: (650) 851-1532  
robflint@aya.yale.edu

### **VICE PRESIDENT**

John Spletstoesser  
P.O. Box 515, Waconia, MN 55387  
Tel/fax: (952) 442-2604  
[spletts@usfamilv.net](mailto:spletts@usfamilv.net)

### **TREASURER**

Paul C. Dalrymple  
Box 325, Port Clyde, ME 04855  
Phone: (207) 372-6523  
[pcdal@adelphia.net](mailto:pcdal@adelphia.net)

### **SECRETARY**

J. Stephen Dibbern 5996 Via  
Lane, Crozet, VA 22932 Phone:  
(434) 823-8484  
[victoriadibbern@aol.com](mailto:victoriadibbern@aol.com)

### **Past Presidents**

Dr. Carl R. Eklund 1959-61  
Dr. Paul A. Siple 1961-62  
Mr. Gordon D. Cartwright 1962-63  
RADM David M. Tyree (Ret.) 1963-64  
Mr. George R. Toney 1964-65  
Mr. Morton J. Rubin 1965-66  
Dr. Albert P. Crary 1966-68  
Dr. Henry M. Dater 1968-70  
Dr. George A. Doumani 1970-71  
Dr. William J. L. Sladen 1971-73  
Mr. Peter F. Bermel 1973-75  
Dr. Kenneth J. Bertrand 1975-77  
Mrs. Paul A. Siple 1977-78  
Dr. Paul C. Dalrymple 1978-80  
Dr. Meredith F. Burrill 1980-82  
Dr. Mort D. Turner 1982-84  
Dr. Edward P. Todd 1984-86  
Mr. Robert H. T. Dodson 1986-88  
Dr. Robert H. Rutford 1988-90  
Mr. Guy G. Guthridge 1990-92  
Dr. Polly A. Penhale 1992-94  
Mr. TonyK. Meunier 1994-96  
Mr. Ron Naveen 1996-98  
Dr. Paul C. Dalrymple 1998-00  
Ms. Kristin Larson 2000-02  
Mr. John Spletstoesser 2002-04

**BRASH ICE.** At long last, this is the Newsletter that I have been awaiting for over several years, one in which we would have multiple contributions from the younger, active people on the ice about what is actually transpiring there. However, one of the great things about their contributions - which all must read — is that they fulfill the Antarctic Society motto, BY AND FOR ALL ANTARCTICANS.

We have been involved in putting these Newsletters together for some twenty-eight years, and, of course, there are no financial rewards, strictly a matter of love. However, there is one silver lining; we are not committed to anyone. We are not bound to the National Science Foundation, to the Byrd Polar Research Center, to the Scott Polar Research Institute, to the International Association of Antarctica Tour Operators, to Raytheon or any of the contractors. And the writers in this Newsletter have followed in our footsteps. But one premise which we live by in the back of our heads is that we should not allow the truth to get in the way of a good story. We assume that our Antarctic audience is smart enough to separate penguin feathers from their guano.

This is an exceptional time in the history of the Antarctic, as the first half of the 20<sup>th</sup> Century was one of heroic exploration in the Antarctic, then the last half of the Century saw the advent of Scientific Discovery brought on by the International Geophysical Year, the IGY. Now we are on the Threshold of another International Polar Year. In recent months I have been in contact several times with one of the very few Antarctic scientists who was on the ice when they rang the gong for the IGY to begin. Dr. Robert Benson, seismologist at the South Pole in 1957, now a space scientist at the NAS/Goddard Space Flight Center in Greenbelt, Maryland, is very much interested in preserving the Legacy of the IGY, and towards that end most of the upcoming Newsletters of our Society for the coming year will delve into that theme. Bob recently submitted a proposal to NASA entitled "Preserving video records from the IGY Amundsen-Scott South-Pole Station". It was in response to a research opportunity in the International Heliophysical Year (IHY) Program (also timed to correspond with the 50<sup>th</sup> Anniversary of the IGY) where one of the goals was "preserving the history and legacy of the IGY on its 50\* anniversary." One of the main goals of Bob's proposal was to preserve his 8-mm movie of the first year, and the 16-mm movie of the second year at the Pole by DeWitt Baulch, to a digital format suitable for archiving. If his proposal is accepted, Bob will likely be contacting other members of the two IGY South-Pole years for their inputs.

This issue will include a couple of stories by yours truly on the selection and deployment of personnel going to the ice under the auspices of the IGY. As John Behrendt referred to us, we were Innocents On The Ice, but now we are part of history, some, a few, perhaps somewhat maligned, but others achieving scientific rank of note. Of those on the ice in 1957, besides Bob Benson, we have Mario Giovinetto, Arlo Landolt, Charlie Bentley, Nolan Aughenbaugh and Dick Chappell still going to a scientific office of some kind every morning. It is amazing that after

the IGY how many returned to seek higher education and fledged to professorial ranks. The IGY truly became an educational bank from which our country can now cash in dividends for the upcoming International Polar Year.

**ELECTION OF OFFICERS.** We had a Board of Directors Meeting this past summer, one in which we invited many of our past presidents (George Doumani, Pete Bermel, Bob Dodson, Tony Meunier, Kristin Larson, John Splettstoesser, and myself, Paul Dalrymple) to brainstorm the current status of our Society. Mainly we talked about our needs for an up-to-date set of Bylaws (in the works), the need for a Society web site (on a back burner), production of a CD with all the Society's Newsletters (a work in progress), the Ruth J. Siple Memorial Fund (on hold pending naming of the library at the South Pole), and the election of the next set of officers.

Rather than just have an approved list of candidates for election, we decided to open the nominations up to the whole Society. So if you want to run, or want to propose someone, here is your opportunity. But our Group came up with a list of suggested candidates. When Art Ford left the room to visit the refrigerator on behalf of fulfilling the thirst of his Thiel Mountains buddy, Pete Bermel, he was unanimously chosen as our candidate for Vice-President. His was the sole protest deemed out of order by the presiding president. It was suggested that our current president, Rob Flint, would stay on as Vice-President, as it appears a lot of our current business will carry on into the next term. Even though Lynn Arnold is currently teaching in Singapore, it was felt that her endearing interest in the Antarctic merited her being our secretarial candidate. Whereas we keep the Society records on mid-coastal Maine, I re-nominated myself without objection as Membership Chairman, and nominated my cohort, Grace Machemer, as treasurer. No nominations were heard from the Group for the Board of Directors.

**CALENDARS:** We already have a small supply of the New Zealand Hedgehog Antarctic calendars for the year 2007. So order now (\$14.00 each, check made out to the Antarctic Society), and you will have them by mid-October, all ready for holiday giving. On the whole, I would say that this calendar is one of their very best, ever, and our price is right (individually from New Zealand, they would be eight dollars higher).

**HOLD THE DATE!** December 2, 2006, Washington, DC. The Explorers Club, Washington Group, will again host an annual dinner program at the Cosmos Club,

Washington, DC. Members of the Antarctic Society are invited to join the gathering, along with members of the Society of Woman Geographers for the traditional December event. Details on the program will follow in the next Newsletter.

**SUMMER PLANS IN ANTARCTICA.** (Katy Jensen) Crews all over Antarctica are preparing for the start of the IPY in March, but their immediate concern is the beginning of austral summer and all the excitement and activity it brings to the Ice. As is usual this time of year, things are hopping at McMurdo Station. Winfly brought four C-17s with 330 passengers; 120,015 pounds of cargo, and 12,611 pounds of mail. Summer airlift operations will be as aggressive as ever, with various aircraft providing 75 sorties between Christchurch and McMurdo. Inland flight will include 411 LC-130 sorties, 200 days of Twin Otter flights, 79 days with the BT-67 Easier, and 560 days of helicopter time.

The USCGC *Polar Sea* will provide icebreaking services again, with the Swedish icebreaker *Oden* assisting with channel maintenance, and the annual fuel tanker and cargo vessel are scheduled to arrive in late January and early February, respectively. (The recent drop in fuel prices is probably a welcome sight for many, since the June 1<sup>st</sup> Defense Energy Support Center [DESC] cost projections had tagged an extra \$ 10M onto the annual fuel budget request.)

The *Nathaniel B. Palmer* will work on the Ross Sea side of the continent, while the *Laurence M. Gould* will continue to support science and operations on the peninsula side. Both ships are scheduled for dry dock maintenance later in the season.

Highlights include continuation of the ANDRILL project, use of the new Long Duration Balloon (LDB) facilities, and a film project led by award-winning director Werner Herzog (most recently of *Grizzly Man* fame).

Palmer Station hosts some of the longest-running science projects on the continent. These OAE grantees have returned, year after year, for decades, quietly collecting data and shaping the personality of the Palmer community. Dive into their Long Term Ecological Research (LTER) web site (<http://pal.ltemet.edu>) for an excellent introduction to some of the science that helps make Palmer Station the USAP's "best-kept secret."

Recent improvements at Palmer include a replacement engine in the power plant and a satellite bandwidth upgrade yielding 768 kbs (via Intelsat). The Palmer crew is currently battling high winds and heavy snow, and they are looking forward to the start of another busy summer season, beginning with the *Gould's* arrival in late September.

At the South Pole, plans for the IceCube neutrino detector array include drilling 12-14 new holes and moving the data collection system into the IceCube Lab (ICL). Conditional occupancy is also in the works for the 10-meter telescope (SPT) control room and walkway, and the telescope itself is scheduled for deployment and construction late in the austral summer. If all goes as planned, the 2007 winter crew will begin using SPT to search for dark energy in the universe. Check out Bill Spindler's excellent web site ([www.southpolestation.com](http://www.southpolestation.com)) for more information.

In order to support such an aggressive science schedule at the South Pole, work on the new station has been deferred except for critical activities such as upgrading the station power, adding a new water well, and correcting settlement and "envelope integrity" (heat leakage) issues.

There will be no field activity for the South Pole Traverse this year, but there *will* be a summer airdrop mission: 90,000 pounds of food and essential materials will be dropped from a low-flying C-17 *Globemaster III*. A fitting introduction to the IPY, perhaps, since the South Pole IGY Station was airdropped via *Globemaster I* fifty years ago.

**UNDERBELLY OF PINE ISLAND GLACIER TO BE STUDIED.** Back in 1930, Sir Hubert Wilkins, the very last of the Old Antarctic Explorers (died in 1958), bought from the US Naval Shipping Board for a grand sum of one dollar an old derelict of a submarine, the 0-12, which he later took under the ice in the Arctic in 1931. It turned out that Sir Hubert overpaid for what turned out to be near junk. Now, some seventy-five years later the US has built at a cost of more than \$1.5 million an autonomous underwater vehicle stuffed to the gills with scientific instruments to go on a voyage of discovery under the Pine Island Glacier, scheduled for early 2007. This isn't the first time that an ocean-going rover has gone under Antarctic shelf ice - in 2005, AUTOSUB made a 25-km probe under the Fimbul Ice Shelf, bordering Queen Maud Land at 0° longitude. Discoveries included kilometer-wide sections of ice that were unexpectedly riven with fissures as deep as 30 meters. However, for the most part, the shelf

undersurface was smooth, which wasn't surprising as an ice surface in contact with water is naturally self-leveling. The water under the Fimbul Ice Shelf was warmer and saltier than water that ship-based oceanographers sampled just off the same ice shelf.

**AUTOSUB** never returned from its second mission under the Fimbul, and scientists are still trying to determine what went wrong. If you are seriously looking for it, it was 6.8 meters long, less than half the length of the distance from home plate to the pitching mound (this is American baseball language), and a photo of it can be seen on the cover of *Science News*, 29 July 2006, where it is resting on the surface at the foot of a glacier in Greenland. If you see it, inform the British Antarctic Survey, who would be pleased to have it back. An underwater vehicle like AUTOSUB might also have been mistaken by a leopard seal as food, or something to mate with.

What might researchers find under the Pine Island Ice Shelf? When the Larsen-B Ice Shelf broke up in March 2005, scientists found thick mats of bacteria that were probably nourished by nutrient-rich water seeping from the seafloor. Perhaps the same can be found under the Pine Island shelf. Organisms might eke out their living on the organic material brought by ocean currents or by scavenging the occasional carcass washed from the open ocean. Stay tuned for exciting times that lie ahead. It is not true that all science in Antarctica has already been discovered. There is always a better mousetrap.

Looking back 75 years, if you are looking for some thrilling reading, Sir Hubert's adventures on this subject, with his *Nautilus*, appeared in *THE LAST EXPLORER, HUBERT WELKINS*, by Simon Nasht, published in the U.S. by Arcade, NYC, 2006. The content includes 40 pages about this great submarine adventure, which tips the scale for exciting and suspenseful narrative as much as Shackleton's account of the *Endurance*.

Of all the famous explorers, Wilkins alone might have been the one with the most scientific curiosity. Nasht wrote "Sir Hubert's insistence on science before glory was both his most admirable quality and his greatest failing as an explorer." He had a list of 20 detailed areas of scientific investigations that he wished to have conducted on the *Nautilus*, and he also had the very best Chief Scientist that he could have possibly engaged, Professor Harald Sverdrup of Norway. Sverdrup was acknowledged as the finest oceanographer of his day, and arguably the

most influential of all time. When it came to science, Sverdrup was everything that Wilkins was not.

August 22 was a real holiday for Sverdrup, as his echo-sounding equipment indicated that the *Nautilus* had left the continental shelf and was now in the deep Arctic Basin, in 2,200 meters of water. He was thrilled because for six years he had drifted with Amundsen on the *Maud* without ever reaching the deepest ocean in the North.

Wilkins gave Sverdrup every opportunity to do his work. Together they spent many hours taking deep-sea oceanographic observations from the former torpedo room, converted into a pressurized diving chamber and laboratory. They carefully lowered a meter-long steel-encased glass tube to the bottom to sample the undersea surface. Even in these ice-covered seas, they could watch its progress for hundreds of meters before it disappeared into the velvet black depth. These were the first records ever made of the deep polar waters and they would be just part of the rich mine of information collected on the voyage. Mud samples from the Arctic seabed and samples of strange sea creatures were of little interest to the general public, although Sverdrup had every reason to be pleased with the results. Sverdrup's reports from the expedition, which one renowned oceanographer had called a landmark in science, would later fill volumes of data, the first publications of the Woods Hole Oceanographic Institution.

The expedition was a total failure insofar as Sir Hubert's investors were concerned, and the *Nautilus* was beset with both mechanical and personnel problems from the very beginning, to say nothing of having extremely bad luck weatherwise. The navigator on the submarine was Ike Schlossbach, who later went to the Antarctic on the Second Byrd Antarctic Expedition, 1933-35, was on the U.S. Antarctic Service Expedition, 1939-41, and the Ronne Antarctic Research Expedition, 1947-48. Ike was a character of the largest magnitude, as can be read in his biography published by the Historical Society in his home town in New Jersey. The Commander of the *Nautilus*, Sloan Danenhower, was the son of the Master of the *Jeannette*, an American vessel crushed in the ice in the Arctic in 1891. All the above is history, however, and now we await great things from the new oceangoing rover. [Excerpted from *Science News*, v. 170, no. 8, July 29, 2006; and *THE LAST EXPLORER, HUBERT WILKINS*, by Simon Nasht, Arcade, 2006.]

**SOME SLIGHTLY SHADY FIFTY YEARS' MEMORIES.** (Paul Dalrymple.) Ah yes, indeed fifty

years ago a bunch of us were being processed to go to 'The Ice', nearly all on our baptism trip. I don't know when I first showed an Antarctic interest, but it certainly was nurtured when I heard old Bud (BAE II) Waite give a lecture in Thomaston, Maine, back in 1936. And my files contain a letter from Admiral Richard E. Byrd, written on March 14, 1952, stating that "I will put your name on file/ And, he certainly did, as when the IGY came along, so did another letter from the Admiral. But I was only one of many in the 1950s who saw an Antarctic opportunity on the horizon with the IGY.

In the spring of 1956, the National Academy of Sciences held some sort of an evening Antarctic meeting with many distinguished guests. It was the first time that I ever heard Larry Gould speak, and, oh, was I ever impressed by his rhetoric, fantastic words flowing from his lips about Antarctica. I thought God was speaking to us. But several months later, after I had finished reading Cherry-Garrard, I realized that those words of Larry had come straight out of the pages of *THE WORST JOURNEY IN THE WORLD*. Later, as I learned more about Cherry-Garrard, I found out that his neighbor was a fellow by the name of George Bernard Shaw, who had a heavy hand in editing that book by his beloved neighbor. So, in reality, that night I was really listening to GBS, not Larry!

That same evening was the first showing of the new American Geographical Society's !: 6,000,000-scale map of Antarctica by their well known Chief Cartographer, William Briesemeister. The map was covered with heavy stiff brown wrapping paper as Admiral Byrd spoke. The next speaker was Admiral George Dufek, and he had a junior officer rip the brown paper off the map, with loud crackling noises. At the same time Dufek boomed out, "That is to wake you all up." And I said to myself, "You sure aren't a very nice person", and you know what, it turned out that my first impression never had to be altered as I got to know him.

I don't exactly know how I was selected to go to the Antarctic, or exactly when it all happened in the spring of 1956. Back in those days, there was never an Office of Polar Programs, per se, let alone an overlord like the National Science Foundation. There were several small offices on the 3<sup>rd</sup> and 5<sup>th</sup> floors of a building at 1145 19<sup>th</sup> St., NW where a mere handful of people like Bert Crary, George Toney, Harry Francis, Dick Hubley and secretaries like Yum Yum, Alison Wilson, Mildred and Suzanne Rodgers, and others made it all work. Nowadays it takes a full battalion in Arlington, plus a regiment in Colorado to

do the same. Some things that happened then are almost impossible to believe in today's world, such as the chief honcho in the US for the IGY, telling this stunning secretary, a former highly trained Washington debutante, how she should dress!

Fifty years ago there seemed to be an awful lot of shuffling of would-be Antarcticans to and from Washington. How these people were uncovered are unbelievable. The largest number of people going to the ice were meteorologists, and this was the only group of scientists where they had anything resembling a cadre of people from whom to select, as the U.S. Weather Bureau had a strong polar group working in the Canadian Arctic and Alaska. The discipline where there was a dearth of people was glaciology, and on-the-job-training for aspiring candidates was conducted in Greenland that summer. And you never knew until candidates passed successfully through a full day with Navy psychiatrists whether you had a real live one, as I understand from a most reliable source that the best qualified glaciologist in this country was black-balled by the head shrinks.

Many of the geophysicists were recommended to one of the many national committees by one of their professors at schools such as Columbia or Wisconsin, and these men worked out just fine. But others came from many walks in life, such as a miner in Montana who was enraptured by all the stuff in newspapers about the IGY. One name which kept appearing was William O. Field of the American Geographical Society. The miner felt that he had to go east and seek him out, so he bought a plane ticket to NYC and ran down old Bill. This man had no qualifications at all, but his enthusiasm convinced Bill that there should be a place for him on one of the traverse teams. So he was chosen as Assistant Glaciologist. Later this person became a ghost writer for some of the early-on astronauts, then he became Secretary of the Scientific Writers of America, and today he is a science writer for some of the publications of Harvard University. Bill Cromie made it BIG, and there is now a Mount Cromie in Antarctica.

Then there were those people of great self-confidence who thought that they could do anything. One such person was Peter Schoeck of Germany, a former cross country skier on the German Olympic team who came out of World War II totally frustrated because Herr Fuehrer never awarded him the Iron Cross. He wrote a personal letter to Larry Gould telling him that he wanted the most difficult job in the Antarctic. He was given a two-pronged assignment, head of the aurora program and chief glaciologist at Little

America V. It was with some camp jubilation that Peter had to be evacuated back to New Zealand when he fell into a crevasse, cracked some ribs, while near Roosevelt Island. As this was the International Geophysical Year, all personnel were supposedly from one of the geophysical sciences. However, at Little America V there was a physiologist, Fred Milan from the Arctic Aeromed Laboratory in Fairbanks. Just how he crept in was sort of a miracle, although probably Kaare Rodahl, a well known polar scientist from Norway, who emigrated to Alaska, had an awful lot to do with it. But Fred (alias "Muckluck") was just a great guy, one whom we often described as the world's foremost expert on rectal temperatures of Eskimos. Later he went on to become the U.S. Head of the Health of Circumpolar People. He was one of the few of us who were overqualified. On the other hand, in the same camp, we had a middle-aged retired Marine Corps Colonel who still thought he was on active duty, even though his job sheet showed him as assistant to the ionospheric physicist.

My own story ended with a strange twist. Once upon a time I took a course in summer school at MIT in micrometeorological instrumentation, a course which I tried unsuccessfully to drop that afternoon. Insofar as I know, this was the only time that MIT ever offered this course, and it made me eligible for the position as micrometeorologist at Little America V, as NO ONE else applied for the position! It was supposed to be a two-pronged program, with a sister program being on the Chamberlin Glacier in the Brooks Range of Alaska. Micrometeorology had been conducted once before on the ice, by Dr. Gosta Liljequist of Uppsala at Maudheim on the Norwegian-British-Swedish Expedition, 1949-52, so we had some guidelines to go by. Liljequist leaned over backward being most cooperative to both of us, giving us advanced copies of his preliminary findings. I wish I could say that everything ended up peaches and cream, but, unfortunately, my counterpart in the Arctic committed suicide early on in the program, and he was never replaced. However, things took a rum for me for the better when I was invited by Paul Siple to bring the program to the South Pole for the following year, 1958.

The physical examinations for the Antarctic were all conducted by the Navy, and I took mine at the Oakland Naval Air Station, and it ran for three long days. At the very end of the exam, a doctor stuck one of those wooden paddles into my throat, choked me, and I coughed in his face. It made this Naval Captain so mad, he wrote all across the top sheet of my medical record, DISQUALIFIED. Here I was with one foot on the

gangway, all ready to go, and I was washed out. He had written below the "disqualification" that I had an ear infection. I went to see an eye-ear-nose specialist in the area, and she wrote an affidavit that I had no infections at all. I went back to the Naval Air Station and asked to see the Naval Captain who had disqualified me. They would not let me see him, but they did pass me. Phew!!!

In mid-October 1956 they assembled most of us going to the ice at Davisville, Rhode Island, for a mini-orientation and issuance of clothing. The Army, the Navy, and the Air Force all brought their clothing, and we were to pick out what we wanted to wear. People going to the South Pole were all given bright red down parkas made by Eddie Bauer, as well as down vests made by the same people. As I recall, the biggest choices were the warmer, long-legged woolen underwear or the more comfortable long-legged waffle weaves. I opted for wool. Then there was a boot selection to be made, one being the white felt bunny-type boots, the other being the large white rubber insulated boots good for extreme temperatures. I took one of each.

.Each evening we were free to leave the military barracks, and most of us found our way to a watering hole at the Kingston Inn. One evening Carl Eklund left his badge back in the room, but where Sir Hubert Wilkins wasn't going out that night, he loaned Carl his badge, which brought forth a loud exclamation from Carl "I will surely make out tonight."

As I had gone down to Davisville with several clothing experts from my home office, the Quartermaster Research and Engineering Laboratory, I went home with them after a tiring three days. Sir Hubert was in the car, and someone turned on the radio to help pass the time. All of a sudden the music was interrupted with an announcement that a Navy P2V had crashed on the runway at McMurdo. and that three were dead (a fourth was to die later). No one said much beyond a few cuss words, but I immediately thought of my small baby in a crib at home, and whether it would all be worth it. A sobering way to end our first gathering.

As many of the U.S. contingent was from abroad, they came in, one by one, to New York City. One of my colleagues was to be Dr. Herfried Hoinkes, chairman of the Meteorology and Geophysics Department at the University of Innsbruck, Austria. All he knew was that his dost in New York was to be someone by the name of William O. Field. He stopped to buy a handful of flowers to take to his hostess, then stopped, not being sure whether

it would be appropriate in this country as it was back in Austria. And as he told me later, "Was I ever glad, as when I got to the Fields, there was a tremendously large bouquet at each end of the living room, plus another at the fireplace." He was completely unaware that Bill was related to the Marshall Fields in Chicago and that his wife was a Vanderbilt!

There were other interesting arrivals. One foreign-speaking arrival was able to converse hi his native tongue with the pilot, who advised this young man that he should seek out the Sloan House in NYC for his hotel, as it was run by the YMCA and would not be too costly. So he did. and when he got to the room, it not only came as recommended by the pilot, but there was a young girl who spoke the same language who had just finished cleaning the room. Following a short introduction, they found that they could very well have something of interest to each other. Fifteen minutes later, the newly arrived "Innocent on the Ice" said to himself, "Say, the USA is a most wonderful place."

And that is how it was, fifty years ago. Hope you enjoyed some long gone memories of one of the IGY people who experienced it.

**MOST INTERESTING E-MAIL FROM WINTER- OVER SCIENTIST AT THE SOUTH POLE.** Yes, it's dawn at South Pole. Sure, it'll be another three weeks before we have even a chance at seeing any highly-refracted sunlight, and then another week or so before we get "direct" sun, but the horizon is lit up as if it were only an hour or so before sunrise in most latitudes. The moon set for us on 11 August, and even before that it was possible to see a smear of light on the opposite horizon, hi the subsequent two weeks, the smear has brightened, broadened, and changed colors: at first it was just grey, but now there's orange at the bottom and blue above, which then merges into the still-mostly-blackness of the sky overhead. In just the last couple of days we've lost sight of the Milky Way, and, alas, the auroras are increasingly washed-out.

In July we had several periods below -100F, one of which lasted for a number of days. At South Pole this means 300-Club weather. Long-time readers will already know the drill, but for new folks, the idea is that when it hits -100F outside, you crank the sauna up (way up), to +200F or higher (higher is better), you sit in the sauna for as long as you can handle it, and then you run outside naked. Ok, yes, shoes are encouraged, and in recent years it has

become common to wear balaclavas or neck gaiters and gloves as well. To complete the experience, you run out to and around the Pole marker itself, a goal that's become much easier as the years of moving ice have carried the station closer to the Pole, and now even easier since it's about half the distance from the new station to the Pole than it was from the Dome. I've done the 300 Club each year I've been here, often multiple times, and this was no exception. On my first run I did it in purist fashion, but then I decided that if wearing a balaclava and gloves would allow me to extend my stay outside (in the same way that neoprene gloves help me last longer in the water at Palmer), that was worth a try. And indeed, it worked all too well: on my second run with the accessories I was out for about nine minutes, and I got a little bit of frost-nip on my arm as my badge of honor/stupidity. I think it was the 15 knots of wind on the way back that did me in. After that I was a little more circumspect, but I still was able to stay out long enough to become pretty fully dark-adapted, and there's nothing quite like standing outside naked at -100F while visually soaking up the stars, the Magellanic Clouds and Milky Way, and the dancing auroras.

Our extended run in triple digits was broken by a nice storm, and since then, even with the occasional blow going through (including one that gave us a 41-knot wind gust, which is at least shouting distance to Pole's all-time record of 48 knots), we've spent more time cold than not, though we've not really threatened -1 OOF again. It generally takes three things to have a decent chance: clear, calm (although, interestingly, the winds never REALLY calmed down back in July...), and low pressure, and the pressure of late has been at the upper end of "normal", from 680-700mb.

There's still time for another shot at it, as despite the growing light it really doesn't start to warm up much until the last week in September.

Now for a few words about the old and new stations, now that I've actually lived in the new one for a while, and with the buildings inside the dome being gutted, it seems that now might be the time. Most of you probably know that the old station was made up of a number of smallish buildings parked under a geodesic dome and a number of metal archways (think paper-towel tubes cut lengthwise and placed on the ground, kind of like extended Quonset huts). Think also that the new station has departed from this concept and is on big stilts, elevated above the snow surface.

So, in the spirit of optimism, let's start with what's good about the new place. Well, the bedrooms are a bit bigger, and a bit more "updated"; the old bedrooms had been remodeled to the tastes of transient inhabitants so many times that you never knew what you'd get: you might have a wonderful layout or you might find yourself sleeping on a bunk so high that you were afraid that you'd bump your nose on the ceiling-mounted smoke detector. The new rooms, while no one's idea of stylish, are at least functional — for now. The new facility has a huge (relatively speaking) gym, and while cognoscente bitterly lament the demise of volleybag, the majority of folks are thrilled to be able to shoot hoops to a basket at legal height or to play volleyball on a court of ALMOST legal dimensions. In addition to the gym, the aerobic and weight area is at least twice the size of the one in the dome. The galley is also twice as big, and includes lovely large windows that offer a fine view of the plateau in the summer time. The computer room is expansive, with enough workstations so that even in the crowded summer there's almost always one available. The new greenhouse produces significantly more green stuff than the old one ever did.

And now, in the spirit of reality, what's bad about it? I guess the simplest way of putting it would be that it's the kind of station that you'd get if you: a) gave the design contract to a firm in Honolulu, b) pretty much limited input to those who have never wintered at South Pole (and of course limited the design team to red-carpet summer visits), c) cut comers in design and materials, and d) put the magic of the USAP planning process in charge of procurement and delivery of materials, all of which is exactly what happened. It's really not a bad station for the summer, when the population is high, the VIPs are thick, and the weather is warm, but in the winter, look out. The shell of the building leaks like the proverbial sieve, leading to extreme temperature shifts inside, and just flat-out COLD temperatures on the first floor (how cold? Cold enough to freeze bathroom drains; cold enough for mops to freeze to floors and glasses of water placed on windowsills to freeze solid). The wasted space is staggering: the TWO conference rooms rarely see any action, and although I have not measured it, I wouldn't be surprised if there were more (empty) hall space in the new place than floor space in the entirety of any one of the three main buildings under the dome. The thermal regulation in the gym wing (the electronic controls of which don't really work, requiring manual intervention as outside conditions vary) is poor, and with the aerobic area placed in an elevated mezzanine over the gym, you get a cold gym and a hot aerobic area, or a warm gym and a boiling aerobic area, or a comfy aerobic

area and a frigid gym. The lovely windows in the galley must be covered up in winter to avoid stray-light impacting the sky-watching experiments, and they're covered up with big squares of cardboard cut from boxes because the "blinds" with which the windows are equipped are like cheesecloth and do nothing more than fuzz the light that passes through them. Many computer workstations were purchased to fill in the fine new computer room, but no provisions were made for spare parts or life-cycle replacement of those machines. The color scheme on the walls on the main corridors is straight out of an elementary school, with oddly-colored grids that look like the floor has leapt up to the wall (the designer actually invoked chakras in his explanation of its origin), and where the walls are white> they're a funny corrugated texture that's hard to clean and gives one a headache if one looks at them too long. The corridor floors themselves are already as bumpy and uneven as a 20-year-old sidewalk (something about the underflooring not really being appropriate to the loads to which it's subjected). The showers in the dome bathrooms were tiny and cramped, and the showers in the new bathrooms are tiny and cramped. C'mon, it's not like a bigger shower uses more water, nor takes up that much more floor space, and is it too much to ask to be able to turn around without banging ones elbows? (Major props to Palmer Station for the showers in the GWR remodel of 2000!) And remember the 300 Club? Well, the old sauna had a single thermostat that could be easily placed in water, allowing for continuous heating; the new sauna has both an exposed thermostat AND a secondary thermal breaker that cannot be overridden, so heating the place up to 200F is an exercise in patience: press reset, get 10-15 minutes of heating, hear breaker trip, wait 5-10 minutes, press reset, etc, etc. Of course, no one NEEDS a sauna to be 200F unless, well, unless they're trying to take part in an iconic WINTER South Pole tradition.

Oh, and that whole elevated bit? Seems that it doesn't work quite so well at preventing drifting as was planned. While it's true that there is no snow build-up UNDER the station, there's an absolutely immense windward drift that builds up in front of the station, extending many hundreds of feet out. It gets bulldozed down every summer, but because it extends so far out, the bulldozed hole fills in that much more readily the next winter. And as if that weren't bad enough, the whole station is settling, and it's doing so differentially. I gather that the compressed pad wasn't quite compressed enough, and maybe not quite evenly and, well, the place is BIG, and weighs A LOT, and gravity is stronger down here (ok, that last part, while technically true, isn't particularly relevant in this context....).

Finally, although it's not strictly something specific to the station design, a word on power. As I expect you know, electricity here comes from generators that burn the same fuel that the LC-130 cargo planes burn to get that fuel here (the heat from those generators also partially heats the station and melts ice to produce water). The very first step in the "SPSM" (South Pole Station Modernization) was the construction of a new power plant. Well, the SPSM ain't even over yet, and already we're in an energy crunch. While the new generators are indeed large enough to power the new station and the science that existed at the time they were built, there was no foresight allotted to the possibility of additional science, and now the NSF has funded the construction of a huge (ten meter) telescope, which is planned to be erected this coming summer and operational next winter. And it needs LOTS of power to move. So there are discussions now about where to find that power, and among the options being given serious consideration are shutting down the gym, the greenhouse, and the sauna. I'll let you imagine my caustic comment at this juncture.

I think it's fair to say that (except for the thermal problems) the new place is more "comfortable" than the old, but it's disappointing that a brand new facility that will now endure for 30-40 years was designed and built with such shortcomings. And there's no doubt that the new station lacks the character of the old one. Even the name is bland: "the elevated station". Wheel Finally, although perhaps this has more to do with technology and numbers than the facility itself, there's less sense of community in the new station. In the dome there were only a few places for people to actually spend time, a couple of which were sort of "gathering spots"; now there are more places, including the now more comfortable bedrooms, and it seems like there are fewer opportunities for spontaneous interactions, which I think is a loss.

There are a number of people here who devote more time to mass communication than I do, and in this age of the "tubes of the Internet", it's the blog that's the medium of choice. For those interested in more "behind the scenes" looks at South Pole, different perspectives, and a fair number of photographs, I recommend visiting: <http://jeffderosa.blogspot.com/> <http://www.antarctic-adventures.de/> ....<http://www.nowhere-to-go-but-up.blogspot.com/> <http://www.brienbarnett.com/>

Enjoy your waning heat, as I lament my passing darkness.

**WILL SILVA WRITES AGAIN.** Well and good to know in my head that time is short, but the feel of things gives the lie to any promises of spring. The darkness has grown long. Weekly routines are unchanging: same tasks, same reports, same meetings.... The content varies a bit, we've all worked our way through a variety of projects and will continue doing so, but it's growing monotonous. Polar toast. Cracks are starting to show in some but most are staying on a fairly even keel. Thankfully we've had neither the pitched battles between factions nor the needy and dysfunctional individual behaviors that marked last winter. Neither have we had any serious illnesses nor any injuries to amount to anything amongst our crew this winter. Easy job for me, but a boring one. Most of my work this year has involved counting things, cataloging things, organizing information, and cleaning up the fallout of the move from the old to new medical facility. Yes, it's necessary and important to do this. No, I do not find this sort of work gratifying.

A great deal has changed since my last tour here. Some of it sits well with me, but much does not. My old home in BioMed was torn down last winter, and looking into the vacant arch it used to occupy brought a hollow catch to my chest the first I saw it. Most of the other buildings under the Dome have been torn down this winter. The vacant Dome would make a good cargo yard, but they're planning to tear it down too. We have nice gear in the new medical shop, much of it acquired while we were still in the old one. Like so many areas of this grandiose and highly touted new elevated station, my shop was designed by architects and engineers who have no familiarity with life on the Ice or with the tasks the space must support. The medical shop is an awkward place to deliver primary care, and it is poorly suited to dealing with seriously ill or injured patients. Having a nice janitor closet with a mop sink, and a fairly level linoleum floor I can mop is a real plus. I'd sooner have cabinets in which to store stuff, counters on which to put the gear I need for a procedure, enough room to run a code or trauma resuscitation, and a ventilation system that didn't have the shop reeking with odors from the galley. After knocking my head a few times, I've learned to duck below the marvelous surgical lamp with its twin swing arms bearing triple-lamp heads. It seems a fitting irony that we should have a lamp designed for a large OR with a ceiling 2 feet higher than the one in our narrow space, particularly given that the prospect of actually carrying out an urgently needed surgical procedure is the elephant in the room that none save those of us on the Ice wants to talk about.

Anyway, these weeks before sunrise are among my favorite times. A night owl, I rarely see the dawn at home. Here I've many days to enjoy the growing light, fading stars, the night's deep blue merging to dim blue and to the dawn's early light as Earth tilts towards the sun. On clear days beautiful pinks and oranges line the horizon. We take Saturdays off on the first weekend of each winter month, and after last Friday's All-Hands meeting most of us dressed up for the -100F cold and lined up out by the Pole marker for a crew picture, the dawn behind us. Ahh, the life of a PoleCat! The last stars have gone from our sky. I look forward to returning to a land where skies permitting, I'll see the stars and the sun every day.

Summer was frenetic as usual, occasionally exciting and often exasperating. We had 3 shifts working around the clock on construction projects, drilling projects, and snow removal. A consequence of living in the new station: as I'm winding down and washing up before bedtime at 23:30, a bunch of duty, cold, loud construction workers are using the same bathroom to clean up before their lunch or dinner. Ugh! Medically life was easy. We had no epidemics, only a couple of brief hospitalizations, and all our medevacs walked or hobbled onto the LC-130. That's not to say we weren't served a healthy share of BS from the NSF and the Air National Guard. Checkered lot, these: we had a couple of visiting Flight Surgeons who were grossly inappropriate, whereas I thought it a privilege to entertain several others who fit my notion of officers and gentlemen. No casualties resulted from a visit by 3 Senators, 10 Representatives, and a dozen aides though a couple of Congress folk spent the afternoon horizontal, breathing oxygen in my shop. My mid-January R&R to McMurdo unexpectedly landed me in Christchurch for a couple of days after flying a critical medevac. What a time warp! Going from flat Polar whiteness to high summer in New Zealand and then back to 90 South within a few days pitched me into a wrinkle in time. Reality seemed a tad slippery briefly, but what a lark!

None too soon, the last flight left and 64 of us began to settle in for the winter. The crew includes several friends from previous tours, and our winter manager is a woman who's worked for the USAP for years and whom I've long held in high regard. I credit a relatively calm and healthy season to our key managers being on the same page about the important stuff. Certainly we've had our interpersonal conflicts and occasionally several folks get spun up about something, but compared with the crap that's gone on down here, after some years we've had it easy. A few folks tell me we've less community-mindedness this year

than last. I woman t know not having been here, but I've enjoyed a variety of group activities. A few times I've played music alone or with friends for wine-tasting parties, Scottish dances, and Mid-Winter's Feast. Oh, the banquets we've had! Our galley staff is the best I've ever seen (do I say that every tour?) and our Thanksgiving, Christmas, Sunset, and MidWinter banquets have been spectacularly good. A half-dozen of us are Friday Night Radio Darts regulars, throwing a few games of 301 talking via HF radio to a couple teams apiece from McMurdo and the Kiwis' Scott Base. We got hosed the first few weeks but then did very well for awhile. We still win now and then. We have our movie traditions: the original version of The Thing (bring out the Thermite bombs!) and the remake of it are always shown the evening after the last plane has left. The Shining makes an appearance, and it's fun heckling Icebound. No, there were no damned tennis balls!

Once again I've had fun and learned a bit teaching my MedSurg 101 course. I had two veterans of previous teams and two new folks aboard this winter. Together we worked out how to rearrange the furniture in our bowling alley of a treatment room to manage cardiac arrests and seriously ill or injured folk. We figured where best to put litter stands so as to manage two critical cases in the room, and where to put the "reds", "yellows", "greens", and "blacks" in a mass casualty scenario. At the end of the course I taught sterile technique and OR protocol (ach, the blind leading the blind you say!), and built models on which we could practice procedures for ruptured tubal pregnancy and for appendicitis. I had a couple of friends stand in as "patients" up to the point of incision so our team would have the experience of dealing with a real person as we applied monitoring equipment, pretended to place IV's and catheters, and sorted out how to keep our patient warm. It was a good experience all around. We've not had to put the team to work, fortunately, but I rest easier for knowing PA Heidi and I will have some skilled help if we need it.

I'm looking forward to coming home sometime between mid December and early January. I'll likely return to Palmer Station next September for the austral summer. Between those times I hope to visit many of you, to ski and climb with several of you, and to fly with a few of you! And I hope to have a private pilot's ticket in my pocket and a lot of good memories to take South for one last tour.

**NSF awards nine grants for INTERNATIONAL POLAR YEAR education activities September 20, 2006**

**INFORMAL SCIENCE EDUCATION** (relayed to the Newsletter by Polly Penhale, NSF/OPP)

**IPY: Engaging Antarctica**

*Principal investigator: J. Michael Farrell, University of Nebraska-Lincoln*

Happy 80<sup>th</sup> Birthday to Dr. Charles Swithinbank on  
November 17<sup>th</sup>

**BRASH ICE.** Well, here we go again, with more trivia from 50 years ago plus some current activities which hopefully will be of interest to some of you. The bad news is that Alan Shapley has died. He was the Vice Chairman of the Executive Committee of the United States National Committee for the International Geophysical Year. He really wasn't old enough to die, being only 87, but the Grim Reaper does not take that kind of thing into effect. That leaves only one living member of that illustrious group, A Lincoln "Link" Washburn, who is 95 (as is his bride, Tahoe). We called up Link to see if he would/could write an obit for us on Alan, but according to a daughter, it seems that Link himself is not able to fulfill our request. If the IGY is not past history, it is damn close to being so. But wasn't it a great run while it lasted????!!

There is a new book out called THE LAST EXPLORER, which we referred to in our last Newsletter when we wrote about Hubert Wilkins going under the ice in the Arctic back in 1930. A group of us have banded together under the false nomenclature of being Old Antarctic Explorers (OAE's). This is not exactly so when you look up the definition of "explorer" in your Webster's dictionary. Probably the closest live Antarctic to being an explorer is Charles Swithinbank, but he doesn't qualify as being old, as he won't even be 80 until this month, in spite of having been in the Antarctic over parts of seven decades. And he is going back again this austral summer to help celebrate part of his legacy, blue ice runways. Finding countless ice runways was real exploration. Can a bird man be an explorer? I guess so, and if that is the case, there is a second legitimate Old Antarctic Explorer, Bill Sladen. He really does qualify as being old, as he is pushing 90, another seven decader. But the rest of us so-called OAE's are pure imposters, whether we want to believe it or not.

This is all sort of a prelude to the book by Simon Nasht on Sir Hubert Wilkins. It is quite a book about quite a man, whose career was unbelievable. Being a combat aerial photographer in World War I was a follow up to being lost with Stef's party for three years in the Arctic. Being the first to fly in the Antarctic, being the first to take a submarine, a real derelict, under the ice in the Arctic was just a continuation of one man's wildest dreams The whole book is one of true fascination, one that is worthy of all reading. Talk about explorers, here was a true explorer, whose limits knew no bounds.

I am writing about Sir Hubert in this Newsletter, as modesty does not prevent me from saying that I probably knew Sir Hubert better than any of you people. The two of us worked for the same organization for the last five years of his life, the Quartermaster Corps Research and Development Command in Natick,

Massachusetts. When he was in the office, when I was in the office, our desks were separated only by a big sheet of Plexiglas. He went to the Antarctic in the austral summer of 57-58, in part to help me move my instrumentation from Little America V to the South Pole. It may have been during our time together at Little America V and at McMurdo that I got to know him best, as I was with him in his true habitat, a polar region.

But he fell into disfavor with my least favorite admiral, George Dufek, when Sir Hubert gave out interviews to the press at McMurdo, which were published in the States, eventually finding their way back to McMurdo, where Sir Hubert talked about the deplorable conditions at McMurdo. He went on to compare the station with the bases of Scott and Shackleton, saying that the morale at McMurdo was much worse than anything experienced at Scott's two bases and at Shackleton's. And with that, Dufek kicked Sir Hubert out of his flag quarters and pilots were told not to take Sir Hubert to the South Pole. So he never went to the South Pole with me, although previously he had flown over the Pole. But within this Newsletter, you will find some interesting stuff about Sir Hubert, which is not always synonymous with what Mr. Nasht wrote. Sir Hubert was actually a very nice man, one who was described by one polar so-called expert as the only polar explorer without an ego. Could very well be.

Illegal fishing techniques in the waters off Antarctica threaten the stable food for seals, whales, and penguins, according to researchers attending a gathering of the Convention on the Conservation of Antarctic Marine Living Resources (CCAMLR) in Hobart, Australia. Ships are vacuuming up krill, and catches are used to feed salmon farms. Pirate fishing vessels are invading the rarely patrolled southern waters to catch Chilean sea bass, known technically by their proper name, Patagonian toothfish. Mark Stevens of the National Environmental Trust said "It is a deep-living, slow-growing, long-lived predator fish found in the Southern Ocean around Antarctica... important for the survival of Weddell seals, killer whales, and sperm whales."

Professor Chris Thomas of the University of York has been studying the migrations of birds for many years, finding that in the UK 80 percent of the 300 species his team monitor have abandoned habitats they occupied for thousands of years to move 40 to 60 miles farther north. Global warming has many side effects, does it not?

Reunions seem to be in vogue. Bill Spindler attended one recently of people from Palmer Station where 100% of the still living showed up! Can't beat that.

**JOINT ANNUAL BLACK TIE DINNER MEETING** with the Explorers Club, Washington Group, plus Society of Woman Geographers. **SPEAKER:** Dr Martin Nweeia was recently featured on the front page of the New York Times, Science Times, NPR's Morning Edition and Pulse of the Planet and two National Geographic Television stories on recent discoveries made about the narwhal tusk. Dr. Nweeia is expedition leader and principal research investigator for Narwhal Tusk Research, an international, multidisciplinary investigation focused on unlocking the mysteries of this elusive, legendary, arctic whale and the function of its extraordinary spiraled tusk. Dr. Nweeia will present "The Ice Whale: Discoveries and Tales" on December 2<sup>nd</sup> at the Cosmos Club, 2121 Massachusetts Ave., NW. **TIME:** 6 PM. **CONTACT:** Donald Gerson, (240)-293-6570, Castleleigh Rd, Silver Spring, MD 20904-1713. Dinner reservations: \$65.00 per person. Checks made out to ECWG. No cancellations or additions after Nov 27<sup>th</sup>.

**CALENDARS.** We have ordered a supplemental supply of the New Zealand Hedgehog Antarctic calendars to accommodate late orders. Again, this excellent 2007 calendar can be yours for the holidays if you send the Antarctic Society a check for \$14.00 (P.O. Box 325, Port Clyde, ME 04855).

**AMERICAN POLAR SOCIETY AND BYRD POLAR RESEARCH CENTER** will hold a joint Symposium on 25-27 April, 2007, at BPRC, The Ohio State University, Columbus, Ohio, with a theme on "U.S. Science Policy: Celebrating IGY (1957-1958) and Planning IPY (2007-2009)." Mark your calendars for what appears to be a very interesting agenda, to be announced soon in detail by BPRC and APS. Lynn Everett at everett.2@osu.edu is the point of contact at BPRC, and look for further details as they are known at the BPRC website: <http://www-bprc.mps.ohio-state.edu/>.

**ROBERT E. FEENEY DIES.** UC Davis scientist Bob Feeney, a world-renowned biochemist and Antarctic explorer who discovered an antifreeze-protein that allows fish to survive in polar seas, died Sept. 21, 2006, at the age of 93. Bob Feeney was known at UC Davis as "professor on the ice" for six expeditions he took to Antarctica during the 1960s to study peptides that prevent ice formation in fish blood, a discovery he made while researching penguin

eggs. He pioneered work in the biology of low-temperature organisms that led to many benefits in food and medicine, from preserving frozen tissue to improving the texture of ice cream. He led a team of researchers who fished through holes in 12-foot-thick ice near McMurdo Sound in Antarctica. He also led research trips to the Arctic. He wrote two books, "Professor on the Ice," and "Polar Journeys", about exploration and life in Antarctica. Feeney Peak is named for him in the Queen Maud Mountains.

**ANTARCTIC OZONE HOLE REACHES RECORD PROPORTIONS.** (Andrew Darby, Christchurch Press, 21 Oct. 2006, forwarded by **Margaret Lanyon**) This spring's Antarctic ozone hole has been declared the largest on record, an emphatic reminder that humanity's atmospheric harm is set to continue for decades. The hole peaked at 29.5 million sq km, exceeding the previous largest in 2000 by 100,000 sq km, the World Meteorological Organisation said yesterday.

It was also the deepest recorded over eastern Antarctica, at one point leaving a layer of sky above Australia's Davis station with no ozone at all to guard against ultraviolet radiation. The roughly oval-shaped hole, four times the size of Australia, swung over South American towns and the Falkland Islands, and reached its greatest extent on September 25. Its effects on people were limited by the sun's low angle at that time of the year, as well as cloud.

Scientists point to greater potential problems in the polar seas, where there is evidence that excess UV radiation may be affecting the phytoplankton that underpins life there. Recent studies of satellite images show that the amount of chlorophyll in the water, a measurement of phytoplankton, could be reduced by up to 65%. Growth in microscopic marine plant life could be inhibited by 6-12% in waters covered by sea ice and lead to changes in some krill species' abundance. An area of the far South Atlantic, which is known as the breadbasket of Antarctica, was this month exposed to three to six times the normal amount of UV radiation. This is a region with large bioproduction compared to other regions of the globe and is hence particularly vulnerable to elevated UV radiation.

Around this time, the hole's depth reached a low of 85 Dobson units over the East Antarctic Ice Sheet. Before the annual hole developed in July, there were about 300 of the Dobson units, an ozone prevalence measurement. Extremely low temperatures over winter, down to minus

93° in the upper atmosphere, were behind the expansion of this year's hole. An Australian Antarctic Division atmospheric scientist said the cold could be linked to climate change. Some global warming scenarios point to a balancing cooling effect in the upper atmosphere. Bans on chlorofluorocarbons have stemmed the ozone damage, but NASA scientists have said recently that the ozone layer may not recover until about 2068.

**HUMAN ACTIONS LINKED TO ANTARCTIC WARMING.** (John Henzell, Christchurch Press, 25 Oct. 2006, forwarded by **Margaret Lanyon**.) Antarctica is being warmed by its version of Canterbury's nor'wester in what is being touted as the first proof of human-induced climate change. The Antarctic Peninsula is the fastest-warming place on earth, with average temperatures increasing by nearly 3° in the past 50 years and prompting the sudden collapse of an ice shelf the size of Luxembourg. The collapse of the 3250-sq-km Larson B ice shelf four years ago is being called by a team of British and German scientists the first major world event shown to be linked to global warming.

The research, published in the *Journal of Climate*, found that westerly winds circling the outskirts of Antarctica have increased in strength in the past 50 years. When the winds cross the mountain range of the Antarctic Peninsula - at up to 2800 m, a similar height to the Southern Alps - the eastern side of the range is subject to warm, dry winds, just as the Canterbury Plains are warmed by north-westerlies. For the Larsen B ice shelf, temperatures were up to 5° warmer when westerly winds blew, leading to the collapse of the shelf which had been stable for 10,000 years.

The British researchers found links between Antarctic warming and a combination of increased greenhouse gas emissions in the troposphere and ozone loss in the stratosphere, which were thought to increase the strength of the circumpolar winds. Professor Peter Barrett, director of the Antarctic Research Centre at Victoria University, said there was concern that what happened to the Larsen B shelf could happen to the 500,000-sq-km Ross Ice Shelf.

Assessing evidence of previous changes to the Ross Ice Shelf is the focus of Andrill, a New Zealand-organised international drilling project that has begun work near Scott Base. However, Barrett said conditions on the Ross Ice Shelf were not similar to those on the Antarctic Peninsula and temperatures there had not risen substantially in recent decades.

The lead scientist of the National Snow and Ice Data Center at the University of Colorado, Ted Scambos, stated in *Nature* this month that the new research was "definitive". The study authors said the collapse of the Larsen B ice shelf could now be pinned down to a specific change in climate, and that in turn was linked to human-induced global warming. It was contended that this was the first event proved to be caused by human-generated climate change.

**THE CAT MAN MAKES HISTORY.** It was Halloween 1956, and Navy Lt. Cmdr. Conrad "Gus" Shinn was flying to one of the eeriest, most desolate places on Earth — the South Pole. He was headed to a barren, icy desert where no person had landed a plane. That's until Shinn, now 84, landed his ski-equipped, propeller-driven DC-3, *Que Sera Sera*, in the heart of the vast, largely unexplored continent of Antarctica, Earth's "Last Frontier." He was carrying a crew of five and two observers.

On the 50th anniversary of Shinn's pioneering flight, the former Navy aviator was celebrated at a ceremony at the National Museum of Naval Aviation, Pensacola, Florida, where 250 friends, colleagues, scientists and current South Pole explorers and researchers paid tribute.

"He didn't know the hazards," said retired Navy Capt. Bob Rasmussen, the museum's director. "He couldn't even guess at them. When he landed on the packed ice, he had no idea if he would even be able to take off again." Shinn, a Pensacola resident since 1964, shrugged off the accolades. "It wasn't scary at all," Shinn said. "We never thought about the danger. I was in the military and they said 'Go,' so we went."

The historic flight took off from McMurdo Station. Eight-hundred miles later, Shinn guided the *Que Sera Sera* to its icy landing, and Shinn and the crew members ventured outside the plane. They encountered temperatures in the 60-below range but became the first humans to stand at the South Pole since Amundsen and Scott made the trip overland, Amundsen by dog sled and Scott by manhauling, in 1911-12. They stayed only 45 minutes or so before venturing back into the plane to return. "There wasn't much to see," he said. "It was like a desert."

Many scientists and Navy officials worried about the return flight, fretting that the cruel cold would freeze the engines. Officials even ordered a U.S. Air Force C-124 transport plane to circle overhead. If Shinn's plane wasn't able to

Take off, the transport plane would crash-land and serve as a shelter until help arrived. The takeoff was difficult. Shinn needed to fire all 16 of his outboard rockets to lumber the plane slowly into the freezing air.

A few hours later, Shinn and his crew were back at McMurdo Station. The historic flight had ushered in a new era in scientific exploration, opening up the South Pole for future research. The first South Pole Station opened in March 1957, just a few months later.

At Shinn's ceremony, organized by the Gulf Coast Old Antarctic Explorers Association, researchers at the South Pole made a live satellite call to the ceremony to pay tribute to Shinn. "You proved it was possible to land on the South Pole," Brian Stone of the National Science Foundation, said during the call from the South Pole. "And you proved that science was possible on the other side of the world."

After the ceremony, Shinn and other attendees visited the aging *Que Sera Sera*, which is located outside the museum's maintenance facility. But Shinn isn't the only Pensacolian who has served his country in Antarctica. The Gulf Coast Old Antarctic Explorers Association was formed locally in 1999 because of the vast number of retired Navy personnel who were stationed there and now reside in the Pensacola Bay Area. There are 200 members of the association on the Gulf Coast, and about 1,200 nationwide, said retired Navy Lt. Cmdr. Billy Blackwelder who made five deployments to the continent. Blackwelder said there is a close bond that remains for everyone who served there. "It's kind of like the Grand Canyon," he said. "You can't explain it until you see it. And once you see it, you don't forget it."

**ANTARCTICAN MAKES IT BIG ON HIS OWN.** The largest circulation publication in the USA is the bulletin of the American Association of Retired People, and in its October 2006 issue they devoted a whole page to our own Bob Dale, but nary a word about his Antarctic involvement of some 12 years where he flew R4Ds, Otters, and C-130s for the U.S. Navy. His Antarctic time also included nine years working in the polar office at NSF. Bob now lives nearby in Maine (11 Chamberlain Avenue in Brunswick 04011), but until the past year he had lived a life in another part of Maine that you could not believe, and many would not sympathize with.

While Bob was at NSF, the HERO was bring built in a shipyard in Bristol, Maine, I believe, and Bob was the

contract officer for NSF who made periodic inspection of its construction. In the process, he fell in love with the area, and sought a realtor, told the agent just what he wanted, and lo and behold he found this island connected by a causeway to the mainland. He moved there permanently in 1975, and lived a life in keeping with that of Henry David Thoreau. Then a miracle happened, he found an educated, successful, and very good-looking business woman who was willing to chuck it all and move into this primeval estate. Well, it wasn't exactly an estate, as it had no modern toilet with plumbing, but it did have a one-holer near the house with a spectacular view down the coastline, a stretch of more than five miles without a house in sight. There was no refrigerator, but a deep well kept things cool enough to serve the purpose. There was no bath tub, but there was a sort of shower at the end of the living room, where a bucket arrangement would release water on call. Naturally there were no telephone lines, no lights, no modern day heating system. Bob lived there for 29 years and never once had a utility bill. He had solar panels on the roof and an indoor vegetable garden on the south side of his living room. Access to the house could be achieved via a sort of 'road' over the causeway. But within the house, over a sink, was a Bill Thon painting which his wife had bought in New York City prior to meeting Bob. Now Bill Thon may not mean much to many of you folks, even though LIFE magazine gave him a five-page spread once upon a time. But Bill Thon was a legend up here in Maine, and was famous in his late years as a blind artist who painted from pure memory. That was Bob's and Jean's one concession to high culture. I have one of Thon's art works in my house, and I treasure it.

This article in AARP shows a bearded Bob Dale, in fact it's a half-page picture of him. Too bad they did not show Jean, as she is much better looking than Bob (who is approaching 83, but has retained his youthful physique and general appearance). Bob has been very active in the State of Maine with the Green Party, and can be found at state fairs in their booths. He also crusaded for bicycles for downtown Brunswick in an effort to keep cars off the streets. He is deeply into politics, and the annual equinox party at his island retreat in past years brought people from all over the state, including some Antarcticans.

The story above is the real Bob Dale, but the article in AARP Bulletin did not have any of this good stuff, as they covered his transformation from his rural life to civilization at an address in Brunswick, where he and Jean are adapting themselves gradually. As we write this, we have just had a multiple day blackout from power outages (outrages!!)

resulting from high winds. Did that bother Bob and Jean? No, it just brought back memories of living on their beloved Hockomock Island. If you have the bucks, and want to live like Thoreau (or Bob and Jean), give Bob a call at 207 721-0981.

**THE LAST EXPLORER, HUBERT WILKINS**, Hero of The Great Age of Polar Exploration, by Simon Nasht. Arcade Publishing, NY, 2006, 346p. Review by Paul Dalrymple. Notwithstanding the above about Sir Hubert and his Australian actress wife, this is a book which I can highly recommend for those who want to read about a man who lived his whole life on the edge of danger and raw excitement. All other Antarctic explorers' lives pale into insignificance when compared to Sir Hubert's adventures in war and peace. He lived on the brink of defiance on many of his endeavors, but none more so than when he took a one-dollar (\$1) submarine derelict, the *Nautilus*, under the ice pack in the Arctic. The story of that adventure, as told by the author, will raise the hair on the back of your neck.

Sir Hubert was the only pure explorer who was in Antarctica during the past fifty years, being at Little America V and McMurdo in 1957. Even though he was going to be the naturalist on Ernest Shackleton's last expedition, he was not well known in the U.S., as he led a low-profile personal life. He was a veritable hero in Russia because of his extensive flying over the Arctic Basin in search of a famous lost Russian pilot, Sigismund Levanevsky. Sir Hubert flew more than 70,000 km in a futile search.

Not much has been written about Sir Hubert. His close friend, Lowell Thomas, wrote **SIR HUBERT WILKINS, His World of Adventure**, in 1961, but it did not cover the last half of his life. Elizabeth Chipman, a former member of our Society who lives Down Under attempted to write a book about Sir Hubert, but finally gave up. One came out recently (2004) on Sir Hubert, **THE MAKING OF AN EXPLORER and the Canadian Arctic Expedition, 1913-1915**, but I personally do not think much of the book - more or less another book on hunting with the Eskimos.

However, Sir Hubert is sort of having a Born-Again Renaissance. There is an Australian cruise ship named after him, and now the Aussies are building a state-of-the-art all-purpose aerodrome in Antarctica where giant wheeled aircraft can make landings. This will be named after Wilkins. If Sir Hubert is a No-Name to you, buy this book, and you will be thrilled by each and every chapter.

**SIR HUBERT AND LADY SUZANNE.** A lot of polar leaders had marriages that were not exactly created in Heaven, being often ones of convenience, and I guess you could put Sir Hubert's marriage into that category. They were certainly an odd couple, to say the least, but Simon Nasht's new book on Sir Hubert portrays their marriage as one of closeness. I will use the rest of this section to debunk that hypothesis.

The Sir Hubert that I knew was a very inward man, who kept to himself, who lived very humbly, who preferred to be in the field to being in the office, who often turned down his hearing aid so that he would not be disturbed by others. He lived in the worst possible hotel that you could imagine, the Park Central in Framingham, Massachusetts. In spite of being the second highest paid lecturer in the country — he got \$5000 for a gig, Lowell Thomas got 10 grand — Sir Hubert did not need luxury in his life. When the Quartermaster Corps consolidated their widespread facilities around the country into one central command in Natick, Sir Hubert went to a used car dealer and asked the guy, "What is the cheapest car in your lot?" The fellow answered, "\$25.00." Sir Hubert's next question was, "Will it run?" The answer came back "Yes," and Sir Hubert bought the car outright. This was the very same car he was working on the night before he died!

Sir Hubert spent a lot of time on military maneuvers, especially in the Arctic. On another assignment, he was in the Sahara on a camouflage study, and Lady Suzanne called him at the office. When she was told that he wasn't there, she asked where he was, and was told that he was in Africa on official business for the office. Her next question was "How long has he been there?" She was told six weeks, and then she hung up. This is the same guy who Nasht portrayed as always keeping in touch with his wife!

It just happened that I left for the Antarctic late in December 1956, and Christmas was on a Monday as I recall. Sir Hubert and I were the last two in the office that Friday afternoon, and I went into his office to bid my farewells. After exchanging pleasantries I said to him, "Well, I suppose you will be taking the train to New York tonight so that you can spend the holidays with Lady Suzanne", and he replied, "No, I will be staying here in the Park Central, as I got a card the other day from her telling me that she was very busy over the holiday and not to bother to come home." And Nasht thought they were close!

Ten months later, Sir Hubert joined me at Little America \ to help me dig up my cables and pack my equipment. On his way to the Antarctic, he had been on a VIP flight over the North Pole, so had not been home for well over a month, maybe two months. Where I had wintered over at the station, I knew all of the station radio operators quite well, so offered to set up a phone patch to Lady Suzanne in New York. Sir Hubert thanked me for my offer, but said "No, that will not be necessary, I do not have any real reason to talk to her."

Several weeks later, it's early December, McMurdo was full of VIPs, and I was berthed with them in a Quonset hut. Sir Hubert had a reindeer parka made for him by an Eskimo in the Arctic, and he offered it to me to take to the Pole. I graciously declined, saying that we all had excellent bright red parkas from Eddie Bauer, so I would not need it. But late that evening, I found said parka neatly folded on the end of my bunk. Sir Hubert came over and said, "Paul, I want you to take it to the Pole, as I can't get there (Admiral Defect had made sure that no pilot would take him there), there is a possibility that Lowell Thomas will come there, and I would like to have him wear this parka, as it is the same one that he wore in the Arctic. If you want to keep the parka, it's yours, if you want to leave it at the Pole, leave it there, as I have another one just like it at home." Incidentally, later that night, really very early in the morning, Paul Siple came out of the Pole. Defect had made certain there was no press there to publicize Paul's return, as he had taken them out of camp! Paul flew out of McMurdo that afternoon, and I flew into the Pole with Sir Hubert's parka.

About twelve months later, I had completed my year at the Pole, and was catching the Connie out of McMurdo for Harewood. Over my strong protests, I was told by the civilian representative at Christchurch, Eddie Goodale, that I had to go to a press conference. Reluctantly I went, and no one asked me a single question! I walked out on the street, picked up a local paper, and there on the bottom of the front page was this article that Sir Hubert had died the previous night in that old derelict of a hotel in Framingham. What a terrible blow to me, after two continuous years on the ice to come back and find out that this dear friend of mine had died that very day, that I could never tell him personally what life was like the second year at the Pole. I felt that I had to get out of town, so caught the first plane out the next morning for Dunedin where I visited with Murray Ellis and his wife. I had met Murray at the South Pole, as this close friend of Ed Hillary had

come into the station with Ed's party. Murray, now deceased, was a great guy, and I soon felt much better

Nasht's book quoted Lady Suzanne as saying Sir Hubert had died with a smile on his face. If he had a smile on his face, it probably was because he was going to join so many of his old friends, not from memories of her. A friend of mine who spent many months/years with Sir Hubert in the Arctic saw him only two days before he died, and he told me that Sir Hubert looked awful. He certainly lived a very full life, and just wore out. Oh yes, the parka. If you have been in the Antarctic wing of the Canterbury Museum in Christchurch, you probably saw it proudly displayed, and the kind people there were very generous in placing a card with it showing me as the donor. Sir Hubert was the Best of the Best

**DEEP FREEZE:** The United States, the International Geophysical Year, and the Origins of Antarctica's Age of Science, by Dian Olson Belanger. Boulder, University Press of Colorado, 508 pages, 2006. \$29.95. Review by John Splettstoesser. Whether you were an IGYer or not, this book is of interest because it provides a large amount of Antarctic history during the IGY period 1957-58 and preparations leading to its start. It is timely because of the 50<sup>th</sup> anniversary of IGY and the numerous projects planned for the International Polar Year, starting in 2007. If comparisons are to be made between the two events, 50 years apart, it can be said that IGY was the beginning of international cooperation in a continent claimed by 7 countries but owned by none, an international treaty was written that smoothed the wrinkles in controversies related to territorial claims, established a major land mass on Earth for the pursuit of science, and made significant discoveries that resulted in follow-up observations and research to benefit humankind. There was some posturing between the U.S. and Soviet Union with regard to a station at the geographic South Pole, if for no other reason than to illustrate to the claimant countries that their pie-shaped wedges that joined at the Pole could essentially be ignored with the presence of a station. The U.S. was there first and never left. A flight that touched down at the Pole on October 31, 1956, settled the issue, with construction of a station for IGY occupancy beginning soon after.

A station in the interior was something new, however, inasmuch as early explorers all had their bases at the coasts and trekked or sledged inland. No one had been to the South Pole since Amundsen (Dec. 1911) and Scott (Jan. 1912). The flight in 1956 included Admiral Dufek, in charge of Deep Freeze and IGY, and a handful of other

individuals. It is significant, as the author notes, that there were no civilians or scientists on that flight, and no meteorologist. Sparring for command and leadership is apparent with that statement, as there was to be no doubt who was in charge.

Snow conditions were basically unknown except for information from journals of the two expeditions in 1911 and 1912. Trigger Hawkes, co-pilot on the 1956 flight had calculated from the depth of Scott's footprints and his estimated weight in full gear in the famous 1912 photograph, that the snow at the Pole would support the ski-distributed weight of a fully loaded R4D aircraft. A more ominous unknown, however, was whether takeoff could be made in the rarified atmosphere at 9,200 feet (2745 m) and low temperature, even with the use of JATO (jet-assisted takeoff rockets).

To review briefly the content of the book in the 12 chapters, the planning aspects of IGY are detailed in full, with key individuals responsible for making decisions and authorizing the event. The U.S. gained its foothold by establishing the construction at McMurdo Sound, at the site used by Scott in his 1901 expedition at Hut Point. The ice conditions were favorable, it was nearly as far south as a ship could go, and gateway ports in New Zealand were reasonably close, to say nothing of flight distances that could be made nonstop. Logistics became everything at an early stage. Succeeding chapters cover the location and construction of Little America, then the surface trek to Marie Byrd Land to establish a station at 80°S, 120°W (Byrd Station), South Pole, which could not have been without numerous airdrops by C-124 Globemaster aircraft, which delivered construction material, and other chapters cover the remaining stations for the U.S. — Hallett, Wilkes, and Ellsworth, each of them having its own difficulties in getting started, and also (for some) problems in operations during IGY.

About half the book discusses what was done during IGY, and what resulted. Geology and mapping were not included as official IGY disciplines because of the prospect of finding mineral deposits of economic quantity, and with the continent under its 7-nation claimant situation, it was decided to sidestep that discipline. Mapping indicated that perhaps further claims might be forthcoming, and boundaries could be mapped. However, if you have geologists on traverses in the IGY, geology is carried out whenever mountains are accessible, so some very useful geology was indeed conducted.

The Epilogue chapter discusses in detail the Treaty process, which is in effect today and will hopefully continue. The human aspects of IGY personnel are also discussed, such as navy and civilian leadership issues, behavioral aspects (religious services, drinking, compatibility), and ham radio being a life-saver in contacts with the outside world. A major discovery was that of the origin of cosmic rays, unknown until IGY, when the relationship with solar flares was made, leading to the discovery of the Van Allen radiation belt.

How much did it cost? It is estimated that a total of \$ 1 billion was spent on IGY, but \$2 billion if logistic support is included. It is believed that the success of IGY was due to its organizers, and without government intervention. Lesson learned.

The author has done us a big favor by carrying forward where Ken Bertrand stopped with his book on "Americans in Antarctica, 1775-1948," and emphasizing how the IGY developed and was carried out, including the origins of Antarctica's Age of Science, as her subtitle indicates. She has done it with numerous interviews, researching archives and diaries, and blending it all together in a very readable account in some 500 pages. The interviews she carried out in order to research background for the book complement the interview program that Brian Shoemaker has done and archived, a very valuable effort to document personal accounts before the OAE's aren't around anymore, or can't recall much of what happened. How many of us of IGY era can recall all the details of what happened, and who did what to whom?

NSF provided the funds for Dian to carry out her work for this book. Many photographs are included, plus maps, and an index. Some might ask whether it is complete and comprehensive. Unless you actually participated in IGY, knew some of the scuttlebutt behind the scenes, and had your own opinions of individuals, personalities, and the like, the author probably did not include everything, but it is also difficult to define everything, in this case. If the details were not archived or in diaries or published accounts, or if interviews did not reveal all salient aspects of IGY, then the author was unaware of the gaps, and no, it is not complete. Given another 100 pages or so, she might have been able to fill some of those gaps. But I doubt if anyone can add to what is here and change the overall contribution made by the author. I recommend it for all readers of Antarctic literature, particularly those interested in IGY.

## **PLATEAU STATION - THE BEGINNING. 40th Reminiscence, by Rob Flint.**

Like many first time Antarcticans, when I boarded the C-130 for Christchurch on Valentines Day in 1965, I assumed that I had seen the last of the continent, and it was time to get on with "real" life. I had been at Byrd Station for fifteen months, maintaining equipment, collecting data, and building antennas for Stanford's VLF (Very Low Frequency) program. It was a good experience: it was my first job after grad school, a relatively harmonious winter, and the third winter group at comfortable and spacious New Byrd. I gained a lot of practical experience and new friends. After a "decompression" tour of New Zealand, Australia, Singapore, Thailand, and Japan, I returned to Stanford to debrief. Almost immediately, my boss, John Katsurakis of Helliwell's VLF group at Stanford put me to work on helping to design equipment for a proposed new Antarctic Station to be known as Polar Plateau Station.

This station, I learned, was to be air transportable so that it could be relocated after a few years. It was therefore necessarily very small - it would accommodate just four scientific personnel and four support from the US Navy. The first location of the station was to be on the high polar plateau of east Antarctica. Being slightly higher than Vostok, this location was expected to have the coldest temperatures in the world. Stanford would oversee the upper atmosphere geophysical programs. Other programs were to be meteorology - especially micrometeorology, aurora, and geomagnetism. John asked me to be a consultant for the design of this new station from the perspective of one who had wintered in Antarctica. So I was sent to ATCO (Alberta Trailer Company) in Calgary to discuss the design of the new station. I am not sure if I contributed much, but I did persuade them to make all the bunks extra-length - and I heard later that my shorter winter-over colleagues would have preferred to have more closet space instead! I still had not committed to wintering at this new station, and my diary does not reflect any specific decision date, but after a couple of months of working on equipment for the station and design of the station, I came to realize that I would like to see how this station would really work, and agreed to return to Antarctica as the first Station Scientific Leader of Polar Plateau Station.

So the summer and fall of 1965 were filled with all the preparations for another year on the ice: equipment design, construction, and testing, physicals, seeing lots of friends to make up for lost time, training on equipment at NBS Boulder, the Skyland orientation meeting, another trip to

Calgary to see a test assembly of the station modules, and a lot of dating to compensate for another celibate year to come.

The plan was that the station would be constructed during the warmest part of the austral summer. Therefore the initial fly-in was scheduled for mid December. There were conferences and planning sessions at McMurdo, and more at South Pole where those of us on the initial flight were sent to acclimate for six days. On December 13, 1965 we took off for... for where? . .for a somewhat indeterminate point on the high plateau of East Antarctica. The intention was to find the high point along longitude 40 degrees east. Since the winds on the high plateau are largely katabatic or downhill-flowing, this point should be a point of minimum wind. The C-130 seemed to take forever to get off the runway at Pole, even with eight JATO. But finally we were airborne for three hours over the completely featureless plateau. The initial party consisted of Lt. Jim (Doc) Gowan, who was to be the first winter-over Navy leader, Charlie Roberts - a meteorologist who had extensive Antarctic experience, Ed - a radioman, Art Weber - the Navy architect who had designed the station, a photographer/reporter, and myself as Station Scientific Leader. There was a mail bag for Plateau on the plane, and Jim and I decided to have a look. The loadmaster saw us and started to chew us out: he said that he had to deliver this mail bag TO THE STATION. We explained that if there was any station, it was probably embodied in the two of us! (Included in the mail was a box of slides for me, which I had mailed for processing from Byrd Station the previous year, had been lost in the mail, and somehow made its way back to the Ice for the Plateau flight!)

At about 79 degrees south, the radar altimeter indicated that the elevation was beginning to decrease; so we flew a grid pattern to try to find the local high point in the area. There was very little elevation change, but we finally agreed that we had done the best we could to find the local elevation maximum. We descended to a few feet above the snow, then made a "feel" of the snow, dragging the skis - ready to add power and take off again, and finally settled down for a landing in the soft snow. The doors were opened, and there we were, at the site of Plateau Station - 79°15'S, 40°30'E! The first impression was the soft snow - it was unlike any snow that I had seen at Byrd or Plateau Stations - it was almost powdery. A second and surprising impression was the warmth: it was -15 degrees Fahrenheit, making it warmer than Pole when we had left. We had timed the landing to be at the warmest part of the day - about 1 pm local time. It was windless and sunny, and

shortly we were stripping off parkas as we unloaded the plane. Another first impression was the utter lack of features: the only disturbance of the snow surface or horizon in any direction were our tracks where the plane had landed. The Navy quickly planted the flag and had the photographer take pictures of the plane and the Lieutenant and a representative of the admiral. Meanwhile the radioman was trying to set up the portable radio and make contact with South Pole. Charlie Roberts had his thermometers and barometer out to measure temperature and attempt to estimate elevation. The elevation was later established as 3625m (11,894 feet) above sea level (from an article by Michael Kuhn).

The plane crew were attaching fresh JATO rockets to the side of the plane. The rest of us were unloading fragile equipment so that the rest of the cargo could be dumped out the back of the plane. It took about two trips from my pile of belongings to the plane to remind myself that we were at high altitude, and I needed to move more slowly. We quickly erected a couple of Scott tents to serve as emergency bivouacs in case anyone came down with severe altitude problems. Then we went to work on our 16 x 16' Jamesway which would be our first home. While we were working on the Jamesway, the plane was attempting to take off. With the soft snow and no wind, they had to keep taxiing back and forth until they had burned off enough fuel to lighten the load. Finally, after an hour they were able to get off in a roar of JATO, and we were left in our new home.

We had all been warned about the typical problems of high altitude acclimatization - frequently people are afflicted with nausea and headaches after a few hours. The doctor himself was the first to succumb and retired to a tent with an oxygen bottle. The rest of us continued to work on the Jamesway. At this point, we discovered that the stove pipe for our heater had been forgotten; so even if we DID finish the hut right away, we could not heat it. With this news, progress became less enthusiastic. And we realized that we were quite hungry: on Pole Station time, it was seven AM, and we had been up and working throughout the night (on our body time). A small gasoline stove was located along with some cans of soup and chicken. We had gotten the ribs of the Jamesway up, but not all the blankets over them: so the first meal at Plateau was served under the bare ribs of an incomplete Jamesway. Revived by food, we finished the Jamesway, and at least we were able to get out of the slight wind that had sprung up for a cold, but welcome, sleep.

Breakfast consisted of more chicken and soup. I had entirely recovered from headache and exhaustion, brought on, I think, as much from hard work and long hours as from altitude. Someone forgot to tell Charlie that we were at high altitude, as he never slowed his pace. Art, the architect, likewise bounced back quickly. Ed the radioman just couldn't seem to get warm: I think he was simply exhausted. The doctor and photographer stayed mostly in their tent - they were slow to recover. I think that if they had gotten out and moved around a bit they would have been happier, but I could not tell them that. The little generator quite objected to the altitude and was very slow in starting. It finally ran just long enough to make a contact with Pole Station, and Ed repeated "stove pipe" several times before the generator died for good. Later we heard that this transmission had been garbled and was interpreted as "please help please" - this must have really upset the receivers at Pole Station. At this point, Charlie decided what the Plateau really needed was a decent outhouse. He went to work with a few packing crates and nails and soon the Plateau had its second and welcome building.

Believing that our requirement for stovepipe had been understood, when we heard a plane come on the second day, we assumed that we would soon be warm and snug. But alas! There was a brand new shiny stove for us, but no stovepipe! Our radio problem had, however, been correctly diagnosed, and there were several new generators in case any of them reacted better to the altitude than our original one. Later in the day, another plane arrived with stove pipe (hurrah!), but also, amusingly enough, crates and crates of movies - enough so that there would be one for every night of the winter-over. But at that point, of course, we had no electricity, no building, no projector, and no inclination to watch movies.

With the camp straightened up and organized, the outhouse built, there was suddenly not much for me to do. It was the last time for a year that life would be so leisurely. I read some Christmas present books, and did a local survey by walking two or three miles away from the Jamesway, then made a quarter circle around it to see if it would stay exactly on the horizon, which it did - indicating that the area was very flat. I also dug a thirteen foot glaciology pit to look at the layers and take a snow temperature reading as an estimate of the annual temperature average. I thought that this pit was well out of the way, but a few days later, the camp tractor backed into the hole, which was thereafter known as "Flint's tractor trap". Our estimates for

temperature averages turned out to be correct within five degrees.

On Christmas Eve, the flag had been flying at Plateau for ten full days. We had been short of cots; so had shared beds in the Jamesway, taking turns sleeping. There was always someone stirring about, running into your cot, or coveting it. I decided to move out for Christmas Eve, and slept in a tent which was cold, but peaceful. Art, the architect, had volunteered to be our camp cook, and did an excellent job. Wanting to reward him, I played S.Claus and sneaked a stocking full of goodies over his bunk. "What the hell is this?!" were Art's first words on Christmas morning - but I could tell that he was pleased. We hung Christmas cards from the ceiling and Art did an excellent job of Christmas dinner, including an eggnog made with frozen eggs, frozen milk, and medicinal brandy. We agreed that we may have had more pleasant Christmases, but none so memorable.

On December 30, the Seabee crew who were to build the station arrived with their larger Jamesway. I saw in New Years 1966 repairing my motor toboggan - I worked on it all night and turned in at 7:30 am. The Seabees were forbidden to drink on New Years Eve, but Art ran a speakeasy for the rest of us in the Jamesway. I don't think that all the Seabees were deprived, however, as a bottle of brandy that I had hidden away disappeared during the night! The camp became a hive of activity as the station was laid out, and starting January 2, the vans arrived one after another. The station was quickly assembled and by the 16<sup>th</sup> of January, I was moving electronic equipment into our laboratory. I enjoyed my first shower in weeks, when the bathroom van was activated. The rest of the month was taken up with stringing antennas, digging pits for various detectors, installing equipment, and generally moving in. As soon as the buildings were complete, fuel flights started to fill the fuel bladders for the winter. In all it took about 45 flights to establish the station and about half of these were fuel flights.

The Queen Maud Land traverse arrived on January 29. In the days before GPS, they had a little trouble in locating the station, but were able to find us due to "looming" - they could see us even when we were nominally below the horizon. Needless to say, they were very happy to be in the relative "civilization" of Plateau Station, and we enjoyed the infusion of eleven visitors. They went right to work in disassembling the three Sno-Cats for shipment back to McMurdo. The last plane left on February 10.

Mr. John Spletstoesser 2002-04

**BRASH ICE** Here we go again, and when you start out you are never certain just what you are going to write, although you aim to keep it timely. We recently had a letter from Norbert Wu, author of the fantastic UNDER THE ANTARCTIC ICE, one of my most favorite coffee-table books. Norbert finds that our Newsletters are a bit heavy on the past, although he did give us good marks on the last issue where we had columns from several Polies who were at the station at the time.

About four years ago we sort of saw the handwriting on the wall, as more of our members were dying than we were adding (new young members). So we made a concerted effort to arouse interest in the young crowd on the ice, and towards that end we were introduced by Drew and Diana Logan to quite a few of the current crowd. And in the past few years you have read, we hope, contributions from Katy Jensen, Will Silva, Lynn Arnold, and several others. We were so impressed by Katy that we offered to turn the whole store over to her, but she politely declined. She is still contributing stories to our Newsletters, though, including another great one<sup>in</sup> this issue, written after recently returning from the ice. But Norbert, believe you me, we are conscious of what we are doing and we know where we should be heading! Or at least we think we do. You must remember that about half of our members are plank members from the old days, and we should try to appease those who have gotten us where we are today.

However, there is not only good news but great news for our future. We have several real dedicated members, and all you need area few such persons to make a go of it. Some of you may remember Tom Henderson, who spent several summers out in the field on the ice, as well as wintering over at the South Pole in the early 1980s. He is no longer with the U.S. Geological Survey, but his heart is still in the Antarctic. We have long had an interest in archiving our Newsletters, as we have quite a collection from our beginning. He has taken it upon himself to put all of our Newsletters onto CDs, and he has an abiding interest in us having a web site. Towards that product, he wants you to express your interests to him on the future of our Society. Be sure to read the section from Tom, which appears in this Newsletter, and act accordingly.

In the meantime, please have some indulgence with me while I write about a couple of my friends who have died. I want you ALL to read what I am writing about Kirby Hanson, the head meteorologist at the South Pole in 1958 and later in charge of NOAA's network of Clean Air facilities, including the one at the Pole. His life story is truly fantastic, from a cab driver to the top echelon of meteorologists in our country. And yesterday we heard that Gordon Cartwright had also died. He was the very first US Exchange Scientist on the ice, going to Mirny in 1957. He opened the door for many to follow. And afterwards he had one of the plushest jobs that a meteorologist could hope for, working in Geneva, Switzerland at the headquarters of the World Meteorological Organization. That was his official address when he wasn't sailing on Lake Geneva or attending the opera. He lived to be 97!

At age 83, I wonder if I may not be the senior living man who worked in Antarctic meteorology for the US. Just took at those who have passed along; the Chief Scientist for Antarctica during the ICY was Harry Wexler of the US Weather Bureau; his right hand man was Mort Rubin; the micrometeorologist who helped me so much in planning our program was Gosta Liljequist of Norway, my colleague at Little America V was Herfried Hoinkes of Innsbruck; my after ego in the Arctic was Dick Hubley of the University of Washington; my roommate at Little America V was Ron Taylor of NSF The head Navy meteorologist at McMurdo in. early Deep Freeze was John Mirabito; The meteorologist on the Transantarctic Expedition who I met at the South Pole was Hannes La Grange from Pretoria, South Africa.

And if you go back, Henry Harrison of the Byrd Antarctic expedition, 1928-30 and I had a particularly good relationship, as we both came from Worcester, Massachusetts, we both were very avid baseball fans, we both played bridge (he was Byrd's partner at Little America), we both loved the Antarctic and loved corresponding about it and its people. He was the historian for the Byrd Antarctic Expedition and published BAE I NEWS, and I sort of envisioned myself as a weak underling of Henry's.

Last summer we hosted a gathering of some ancient and honorable Antarciticans, as well as a dozen or more young of recent vintage. I invited a friend of mine whose hobby was videographing to sit in and record the words of wisdom of some of the attendees. Some of the folks are quite well known in Antarctic circles, such as Charles Swithinbank. Tony Gow, Art Ford, George Doumani, Bob Dodson, Rob Flint, Bill Meserve, Jane Siple DeWitt, Lynn Arnold, Dick Chappell, and a few others. The DVD was produced by our friend, Dr Edwin L Witham of 4536 Greer Road, Roanoke, VA 24018, and it's yours if you send him a check for \$20.00. We think it is fantastic, but we are prejudiced. It runs for an hour and thirty-seven minutes, and there a some really great stuff in there by the speakers. We are using short excerpts from two of the speakers, Tony Gow and George Doumani, in this Newsletter. But members like Brooks Conrad and Tom Bayless should eat up this DVD, and people like Anne Benninghoff would also enjoy it.

**DUES NOTICES ARE IN THE MAIL.** Those of you who owe dues for the current year should have received your notices in the past few weeks. We deeply appreciate, it if members send in renewals for SEVERAL YEARS.

That helps materially when it comes to book keeping: Eighty per cent of renewals to date have been multi-years. We thank you. One other thing, which would help us out in the Head Shed is to let us know when you move. You can't

believe how many of you folks who have chosen to live on move into assisted-living havens each year. I think our Society is an unlisted adjunct of AARP.

### **US INTERNATIONAL YEAR POLAR STAMPS**

The U.S. Postal Service will issue a souvenir sheet of two 84-cent international letter rate stamps to commemorate the International Polar Year 2007-2008. The stamps depict the aurora borealis (image #1) and the aurora australis (image #2) (see p 10) and are truly very beautiful, although I think the borealis actually outshines the australis. The first day of issuance will be February 21st, and the place will be Fairbanks, Alaska.. The souvenir sheet will be available online at <http://www.usps.com/shop> or by calling 1-800-STAMP 24. The souvenir sheet can be purchased by itself or as part of a booklet jointly issued by the US, Canada, Denmark, Finland, Greenland, Iceland, Norway, and Sweden. Preorders were being accepted through the above phone number as of 1 February 2007. This souvenir sheet is the first US issuance to commemorate an International Polar Year. As we understand it, the same stamps will be issued later in the year, in panes of twenty stamps, 39-cent denominations. They will sure look great if you just happen to be one of the last of the surviving creatures who remember how to use snail mail

**CAMP TO PUT SIPLE ON A STAMP.** John Lenkey, a big-time business man and entrepreneur from the Commonwealth of Virginia is spearheading a letter drive to the U.S. Postal Service which, hopefully, will result in a Siple stamp. You can't discount John on anything, as it was he who in 1993 raised funds to rebuild the Admiral Byrd Memorial in Wellington, New Zealand and convinced the Kiwis to add a plaque describing Paul Siple's achievements.

John would like to have you write a letter to the Citizens Stamp Advisory Committee, Stamp Development, US Postal Service, 1735 North Lynn Street, Room 5013, Arlington, VA 22209-6432, and tell them in your own words why you think this Eagle Scout explorer, scientist, government bureaucrat merits a stamp. After all, he was the very first station lea ever at the South Pole, and the only Antarctic non who ever graced the cover of TAM magazine. And without Siple, we probably would not have betel wind chill, and would have never known how badly we feel on a miserable wintry night. So we encourage you to support John's campaign to put Paul in that upper right hand corner of your envelopes. Do it NOW.

## **WEAVING A WEB SITE** (Tom Henderson)

When I first raised my virtual hand in cyberspace to volunteer to build a web site for the Society, it was with both enthusiasm and trepidation. As a long-time member, helping the Society take the necessary step to move into the age of the World Wide Web is exciting. Web development has interested me for a long time, partly because I work alongside some very competent web developers in my day job. I had planned to really pursue it seriously as an avocation in a few years when I reach retirement. This just seemed to be an opportunity that is the right fit at the right time.

As I cautioned Paul, the trepidation I have is that I am still a web rookie. I have had some training and will be getting more in the near future, but this would be my first real development project. The good news is that I learn quickly and I can turn to my colleagues for advice when needed. I also have an obvious deep interest in the subject matter I will be pleased to voluntarily support the site for as long as the Society is pleased to have me do it.

Paul has addressed the first critical steps earlier in this newsletter. As the Cheshire Cat famously opined <sup>in</sup> Alice in Wonderland, if you don't know where you are going, it doesn't matter which direction you go to get there. The foundation of the web site, if it is to be successful, has to be the purpose and goals of the Society. I strongly encourage all members to give your opinions on the direction of the Society and what would be of most benefit in a web site to support that direction. The technical part falls into place once the needs are articulated.

I can offer a few ideas for consideration. Commonly used elements of web sites include, <sup>in</sup> order of simple to more complex:

- "About Us" page
- News and information (events, people, activities, etc.)
- Book and media reviews
- Links to related sites
- Public pages and password-protected member pages
- Member lists
- Member profiles
- Photo gallery
- Downloads (such as newsletters)

- Member message board (interactive)
- Interactive searching of archives (such as past newsletters)
- Ordering and payment (CD's, calendars, etc.)

Give me your thoughts. I also encourage members to forward links to what you consider to be good examples of well-designed and easy-to-use web sites. I find the best way to learn is to look at what already works well. I will also be searching for good sites with similar purpose to emulate. This is your web site, and your time to have a say in how it should serve you. You may contact me at [hendeidson@nycap.rr.com](mailto:hendeidson@nycap.rr.com).

I plan to begin work in late Spring, so there is ample time for you to provide input. I expect to have an initial site available in the second half of this calendar year. It will be basic to start. As time goes on, there will be growth and change as your feedback and my skills accumulate. I really want to make this not only something useful, but also something that we can be proud of I hope 2007 will be an energizing and gratifying year for all of us in the Society.

## **EVOLUTION OF AN ATTITUDE** (by Katy Jensen)

"Been down to the Dome yet?" That's how people start their conversations with me. It has been four years since my last trip to the Pole, and walking down that familiar hill now is, well, nippy. I know it's just a THING, barely even a building, but the Dome has been a big part of my life. This is where I met my best friends, and now it's just a rime-encrusted shell, half-filled with boxes of food and unwanted items. It feels like a garage sale on a Sunday afternoon.

Life under the Dome, well it seemed pretty simple, even just four years ago. That probably sounds funny to the OAEs who still mourn the loss of the IGY station, but it's true: even after we got e-mail and wheeled vehicles and (gasp!) incoming telephone service, the station was still straightforward and approachable. Midwinter conversations were about how to keep the generators running... just in case "something happened" to all of your crewmates. And even the Dome slugs who never ventured up the hill had to scamper between buildings-, a frigid reminder that life was fragile, fuel was your friend, and this was not "just a job" after all.

Gracious. Have I become one of those history-obsessed whiners, unwilling to change with the times? Will I follow that box of aluminum triangles to California and become a

tour guide at the SeaBee museum, pointing with my cane and hollering "I remember when...?"

Nah. Even though the new station intimidates the hell out of me, I have to admit it's pretty cool. I like the expansive gym, the luxurious computer lab, and the VW-sized clothes dryers that transform waste heat into fluffy sweaters. I especially appreciate the Food Growth Chamber: a lush oasis bursting with more food than a winter crew can eat. And yes, I even like being able to pad barefoot from my bedroom to the bathroom instead of having to get dressed or pee in a coffee can.

But whether I like it or not, this place has become a complex beast, as foreign and fascinating as an aircraft carrier, and I have to look outside just to get my bearings. Look outside! What a concept! As a weather observer under the Dome, I had dreamed of building a periscope. Now I can sip coffee and gaze out across the plateau, all from the comfort of a dining room chair!

And whether you live under the snow or above it, whether you converse via HAM radio or VoIP telephone, it's still Antarctica out there: beautiful when your basic needs are met, but unforgiving when the power goes out. (Life is still fragile. Fuel is still your friend. And this is not "just a job" after all!) This place still requires swiss-army-knife people with common sense and cool enough heads to figure out the problem and get it fixed. And these are the people who have made this place special from the very beginning. In the, (new, brightly lit, modular-shelf-lined) station store, I notice the design of the embroidered patch has changed. The U.S. flag and the barber shop pole are still prominent, but the 2006 patch features a mostly-buried Dome, struggling to stay afloat in the surrounding snow. The 2007 patch reveals an elevated station stretching across the horizon, so tall and proud you can see the sky between its stilts.

A little piece of history. "Two patches, please."

**NICE GUY KIRBY HANSON FINALLY SUCCUMBS** After fighting Parkinson for twenty-six years, meteorologist Kirby Hanson checked out on November 21, 2006, at a still relatively young 77. His name will indelibly be associated with the South Pole, where he headed up the U.S. Weather Bureau crew at the station in 1958. Then from 1975-1984, he was the senior meteorologist of NOAA's clean air facilities, including the South Pole station.

One might say that Kirby took a cab to the South Pole, as his original interest in meteorology came about from the days when he was driving taxis in Nevada. After bringing fares to the airport, or when there picking up fares, he would frequent the met office and talk to the observers and forecasters on duty. And it was only natural when he went into the U.S. Air Force in 1947 that he became a weather observer. When the IGY came along, Kirby left his beautiful bride Lisa back home in the Washington, DC area while he vacationed at the South Pole, the southernmost resort area on the planet.

Kirby did so well there that the Weather Bureau decided that they had a good deal for him which was also a good deal for them. They would send him off to college, the University of Wisconsin at Madison, where they had several research contracts with their highly respected meteorology department Kirby would monitor these contracts, while at the same time he would be taking courses towards a bachelor degree. He did so well at Madison that he was extended into graduate school. To make the long story somewhat shorter, he stayed at Madison until he had completed his doctoral studies. Pretty good deal, huh?

And then Kirby was put in charge of all the clean air facilities which NOAA operated/maintained. So in a way, Kirby came back on home to the South Pole, and he held this position for ten years. He had the world in the palm of his hand, still married to the beautiful Lisa, and now they had three kids joining them for meals. But, then stuff hit the fan tail, so to speak Kirby was detected to have had Parkinson for several years, and then Lisa came down with a form of cancer. He was given a job as a senior research meteorologist in Miami until it became time for him to retire because of health. Lisa was able to beat cancer, but Kirby lived on with Parkinson for 22 years after it had been detected.

There is a certain mystic about having wintered over at the South Pole that sorts of makes you feel more important than you are in real life, and you end up wanting to hang on to those who shared your time. So we have seen Kirby and Lisa at several gatherings of Pole Station IGYers. The last was about seven years ago, and we met in Georgia so that Kirby and Lisa could drive up from their home in Ocala, Florida. It was a melodramatic gathering, as Kirby was only the shell of the man who we all had known and

loved. Another man from the same year at the South Pole, Inn Burnham, was also there, and he, too, had been inflicted with Parkinson.

No one at the station in 1958 was more highly respected than Kirby. Our so-called station leader that year left much to be desired, but a handful of good young guys like Kirby made it a most memorable year. Kirby, we are sure going to miss you.

**A MAN WHO LEAD A FULL LIFE, GORDON DAVID CARTWRIGHT .** (From the Washington Post, of January 19, 2007, written by staff writer Patricia Sullivan), Gordon David Cartwright, 97, a meteorologist for the U.S. Weather Bureau for 46 years who worked in the Arctic, the Antarctic and Hawaii, died Jan. 1 of congestive heart failure at Renton Villa assisted living center in Renton, Wash.

Mr. Cartwright was the only American scientist to work with 180 Russians at the Soviet Antarctic station Mirny during the International Geophysical Year of 1957-1958. A mountain in Antarctica's Hughes Range was named for him. He worked several tours in the Weather Bureau's Washington offices and spent 1965 to 1975 in Geneva as the liaison to the World Meteorological Organization. After retiring, he continued to travel worldwide and speak on meteorological and geophysical matters. Mr. Cartwright, who was born in New Castle, Pa., began working after high school in 1929 as a meteorological observer for the Weather Bureau in Pittsburgh. He worked in Dallas, opened the forecast center at LaGuardia Airport in New York and also received one of the first bachelor's degrees in meteorology from New York University. He became head of aviation weather forecasts in Washington about 1940, and during World War II, he organized from Washington a series of weather reporting stations along the Alaska-Canada Highway. In 1946, he was appointed to the International Civil Aviation Organization in Montreal. Working with the Canadian Weather Service in Montreal, he helped launch the Joint Arctic Weather Stations in the far north. He oversaw the observation stations for four years, according to an oral history interview he did in 2000 with Ohio State University's Byrd Polar Research Center Archival Program. His superiors, looking for a scientist to join the Russians for a year, suggested him. He responded, "Well, first of all, I don't know anything about the Antarctic. Secondly, I don't speak Russian." That's no problem, his boss replied, saying he could learn.

In the Antarctic, Mr. Cartwright took time-lapse photographs of clouds to study the atmosphere in the far south and made daily weather observations. He learned the Russian way of doing things: using the more dangerous hydrogen instead of helium in balloons, rebuilding when a fire driven by 30- to 40-knot winds demolished their living quarters, fishing men and equipment out of crevasses and improving on the endless vodka with prunes, apricots and jams. He regularly visited a rookery of 25,000 penguins a half hour from the Mirny station. "But what was most impressive was the sunrise over the pole because there it appeared when we didn't see it down on the ice," he said in the oral history interview. "And you could see this glow that looked like a lighted city. And it was the sun shining on the ice over the pole."

After his year in Antarctica, he spent a short time as chief meteorologist in Hawaii before being sent to Washington to head the Weather Bureau's international affairs office. From there, he went to Geneva, retiring in 1975. A fan of opera, he never failed to catch a performance when traveling, his children said. He also enjoyed sailing. Mr. Cartwright settled in San Rafael, Calif. in retirement, and later moved to an assisted living center in Renton.

**LARRY MIYODA DIES AT ONLY 59.** Although we never had the pleasure of knowing this lad, he had quite an Antarctic career, which included wintering over at Siple Station in 1974 and being the station manager at Palmer in 1976. Larry was a mechanical engineer, a graduate of Cal State at Fullerton. As a Holmes and Narver employee, his first Antarctic winter was as a member of the second winter-over crew at Siple Station. He was part of a four-man team that included a doctor and two Stanford researchers. Larry was the facility engineer of Crary Lab, McMurdo, for several seasons in the early 1990s. He died peacefully of a subdural hematoma, and his ashes were scattered over the Rocky Mountains. Miyoda Cliff, a rock cliff along the Bowman Coast, south of Palmer Station and east of Marguerite Bay was named after Larry.

**HAPPY FEET' IS WHERE IT'S AT!** (By John Spletstoesser) The movie 'Happy Feet' about singing and dancing penguins is mindful of a lengthy Vaudeville act with singing, but there is more to the entertainment than simply watching lots of Emperor Penguins experiencing internal strife in the colony because of a newly hatched misfit (known as 'Mumble' in the movie). Some pretty spiffy tap-dancing by Mumble and other penguins sounds like Fred Astaire if you closed your eyes, there is also a bit of penguin-romance, and the addition of

five Adelie penguins with Spanish accents into the story makes it work.

I saw the movie shortly after its debut in the U.S., at my home theater in Waconia, Minnesota, where senior discounts attract me to a selected few movies, but the \$5 for this one was worth it. The movie has an acceptable socio-environmental message, but you have to wait until almost the end to find out what it is..... so I won't reveal it here. The scenes with a marauding leopard seal and killer whales are heart-pounding. Aside from a few inaccuracies that can be accepted, the most notable thing I saw was that of the colony habitats, where the snowy ground cover is absolutely white and pristine. If you have ever been to an Emperor Penguin colony, you will know that is not so, as penguins do what birds do everywhere, and have no bathroom manners whatsoever.

Also stay through the bitter end to watch the credits roll by (about 10 minutes worth), as you will try to see a familiar name or two, to no avail, as hundreds of names related to the animation and musical aspects of the film are shown. Finally, at the very end, the names of some people who actually know something about penguins appear.... Greg Mortimer, Jonathan Chester, Gary Miller, to name a few, who advised for the content. Background scenery of Antarctica was presumably borrowed from one or more of them, because the film was done in Sydney.

**TONY GOW ON YESTERDAY AND TODAY** (from The Cool Gathering) Now to speak about the IGY. I was there, it was a very memorable occasion. We were sort of scurrying around on small projects. But now the projects have gotten so large that they have become very impersonal in my opinion. The bases have become large and impersonal, and so the attitude has changed completely. And the attitude towards science, I guess, changed a bit too.

This has to happen, because of the technological changes, computers, and it's completely out of the complexion of affairs in Antarctica. And so you have lost the more personal familiarity that you had with people, and I find that today even at the lab where I worked, CRREL, it's undergoing dramatic changes.

And so now we are having to realign our priorities even in cold regions. So what's happening is that lab facility is not used properly - they are going through this transition now. Things have changed, but I still value greatly the comradeship that I developed over the years.

**THE PRICE YOU PAY FOR GOING TO THE ICE** (by George Doumani, from The Cool Gathering) Other problems were after coming home. And I have that in my book (THE FRIGID MISTRESS, Life and Exploration in Antarctica) because it was the price you pay that nobody asks about, and that is the family.

You swear to God, "I'll never see that place again," and that the first thing you want is to acclimate at home and get along with the family, However, very soon you are writing another proposal because I missed that other mountain, and I got to go, and so on and so forth. And the result was the loss of the family.

Most of my colleagues, in fact, everyone who was with me, whom I knew is on his second wife, an exorbitant price to pay for our accomplishments. People say, "Oh, yes, George Doumani, oh, I know him, he's got two mountains named after him. And he did this – he reunited Gondwana, he did this and that." But nobody ever says what happened to his family, while he was doing this. And that is why I dedicated my book to this tug of war between that mysterious continent that needed to be explored beckoning you, and your duty to your family and settling down. It is a very, very exorbitant price to pay.

**ROBOT HEADING FOR ANTARCTIC DIVE** (by Rebecca Morelle, Science reporter, BBC)  
The mysteries of the Antarctic deep will be probed by a new vessel capable of plunging 6.5km (four miles) down.

Isis, the UK's first deep-diving remotely operated vehicle (ROV), will be combing the sea-bed in the region in its inaugural science mission. Researchers hope to uncover more about the effects of glaciers on the ocean floor, and also find out about the animals that inhabit these waters. The mission began in mid-January and will last for about three weeks. While the scientists and engineers began their long journey to the Antarctic at the start of January, Isis left the UK shores in November and has arrived at its destination. Once unpacked from its containers, the ROV was placed aboard the British Antarctic Survey's ship - the RSS James Clark Ross - ready to explore the Marguerite Bay area on the west side of the Antarctic Peninsula.

With Isis, scientists hope to bring the UK to the forefront of deep-sea research. The submersive vessel, which is based at the National Oceanography Centre (NOC), Southampton, was built in the US in collaboration with the

Woods Hole Oceanographic Institution (WHOI). The project cost about £4.5m, and Isis is based on of WHOI's Jason II remotely operated vehicle.

UK marine scientists can book time on Isis to carry out their research into the deep. Isis was built to withstand enormous pressure, explained Peter Mason, the Isis project manager at NOC. It measures 2.7m (9ft) long, 2m (6.5ft) high and 1.5m (5ft) wide, and weighs about 3,000kg (6,600lb) in the air. Ten kilometres of cable connect it to its "mother ship", allowing scientists to control the vehicle and receive the data it collects in real-time. On the ROV, Mr Mason said, were lights, cameras to produce high-quality video and still pictures, sonars for acoustic navigation and imaging, and two remotely controlled manipulator arms to collect samples or place scientific instruments on the sea-bed. Isis, he added, also had extra capacity to carry a range of scientific tools, such as borers, nets etc, so that scientists could tailor the vehicle to their research needs.

Professor Julian Dowdeswell, director of the Scott Polar Research Institute at the University of Cambridge, is the principal investigator on this three-week-long inaugural research cruise. He will be using Isis to investigate in fine detail the sea-floor sediments, which have been delivered to Marguerite Bay by the massive ice-sheets that covered the bay about 20,000 years ago. The ROV will be traversing the relatively shallow waters of the bay to the continental shelf edge and then down the steeper continental slope beyond. The environmental history of the Antarctic is held in these sediments," he said. "Using the ROV, we can look at the sea-floor and its sub-surface structure on a very detailed scale." This will help the researchers better understand the record of past glacial activity in the Antarctic.

Another project will also be running alongside. Professor Paul Tyler, a deep-sea biologist at NOC, will use Isis to survey the sea creatures of Marguerite Bay. I'm interested in the effects of glaciers on the sea-bed and how this affects the fauna - the animals I'm also interested in how the animal life in Antarctica changes as one goes deeper and deeper into the water," Professor Tyler said. "Using the real-time imagery from the ROV, we will be able to look at what is happening as it happens, helping us to answer questions such as why some creatures exist at one depth and not another.

"We are hoping to see a whole bunch of large creatures such as star fish, sea cucumbers, sea fans, sea pens, etc, that

inhabit the deep shelf slope and abyssal depths." He added. "Essentially no-one has explored Antarctica using a ROV at these depths."

**RUSSIAN'S HILLARY RETURNS TO THE SOUTH POLE** (from Margaret Lanyon, out of Christchurch Press, January 11, 2007). Artur Chilingarov, a renowned polar explorer in his Homeland, is considered by some as the Russian equivalent to Ed Hillary. He caused a diplomatic stir back in January 2002 when his plane broke down at the South Pole and had to be abandoned there.. The US flew the Russian government members and their team to New Zealand for a reported NZ\$ 191,000. The seven tourists aboard had to pay US \$20,000 each on a chartered flight Artur came back two years ago with the Head of Aeroflot and a dozen aeronautical engineers, repaired their biplane and flew it home.

But guess who showed up at the South Pole this summer? You are right, good old Artur, Deputy Chairman of the Russian Parliament and official Hero of the Soviet Union. He and his team came in two helicopters from the Russian Federal Security Service (FSB), the successor of the KGB). Part of his team included FSB director Nikolai Patrushev, Russian Service Border head Vladimir Pronichev, and the World Meteorological Organization head, Alexander Bednitsky. After flying all the way to the South Pole, what did they want? The only thing they asked for was a phone so they could call someone by the name of Vladimir Putin. Is this the first call ever from the South Pole to a president of a super power?

**FALKLAND ISLANDS AN UNSETTLED ISSUE.** By Monte Reel Washington Post Monday, January 8, 2007  
BUENOS AIRES — As they organize separate 25th anniversary ceremonies to remember their war over the Falkland Islands, Argentine and British officials have found that remembering is the easy part. Resolving, however, is a much trickier proposition. The windblown archipelago is once again claiming headlines here, climbing back near the top of Argentina's international agenda a quarter-century after its military surrendered the territory to Britain.

Last week Argentina aimed yet another rhetorical dart at Britain, publicly reasserting its claim to islands it says were stolen by the English in 1833. The British should be getting the message by now: President Nestor Kirchner's government in the past year has issued official complaints

concerning rights to the islands at a rate of more than one per month. Meanwhile, Argentina's legislature has convened a committee dedicated to bolstering its claim over the islands which sit about 350 miles off its coast and where sheep outnumber people by about 220 to 1. The Argentine government has pushed for, and has received, attention from the United Nations, which drafted a committee resolution last year recommending negotiations. Some political leaders in the region, including Venezuelan President Hugo Chavez, have also publicly rallied around the cause.

No one believes the two countries are headed for another war: Even so, Britain maintains a defensive military presence of about 1,800 personnel on the island to protect a population that numbers only about 3,000. Residents of the barren islands have lived for years off agriculture and fishing. English is spoken, telephone booths are red and pubs have names such as the Globe Tavern. There are regular flights to London but none to Argentina, Kirchner banned charter flights shortly after taking office.

The Falklands also can boast natural resources, thanks mostly to the chilly South Atlantic waters that surround them. Since the war, squid fishing has boomed, and oil companies are hopeful that offshore drilling could prove lucrative. The islands' per capita income is higher than that of many South American nations.

The economic potential has played a big role in ratcheting up tensions. Argentina repeatedly has protested Britain's fishing and oil prospecting activities around the islands, and it sharply criticized the Falklands government when it extended local fishing permits to 25 years. With the anniversary approaching, Argentina is hoping that the rare spotlight on the islands will bolster support for its claim.

**EXPLORING POLAR FRONTIERS: A HISTORICAL ENCYCLOPEDIA. 2 VOLUMES;** William James Mills Santa Barbara, CA: ABC-CLIO, 2003. ISBN 1-57607-422-6 (Reviewed by Charles Lagerbom) This two-volume work is a thorough compilation of the historical side of Arctic and Antarctic explorations. As well as being a nice introduction to polar history for newcomers to the topic, it is also a great reference tool, written in an engaging style peppered with many illustrations. I found it to be quite comprehensive and really liked the different entry listings. Listed by category as well as by alphabetical and chronological orders, the entries were concise yet still informative and contained referrals to other entries in the

encyclopedia as well as to outside references for further reading. This structure worked well as I could decide to read topics chronologically or by region or by sponsoring country, etc.

Volume 1 stretches 388 pages from Abruzzi (Duke of) to Lyon, George, and Volume 2 opens with MacRobertson Land and continues 346 pages further to Zavodovski Island. A nine-page polar timeline follows a detailed glossary. Another feature I found helpful is the 26-page selected bibliography followed by almost thirty pages of Index. The encyclopedia comes to life with biographical entries, encompassing a "who's who" of polar personalities from ancient to modern times. More than just a list of "who went where and when", Mills also reveals why they went, who persuaded them, the political implications, the costs and so on. This other half of the story helps to put the information in proper context. Not only do the entries cover people, expeditions and places, but diverse topics such as Airships, Drifting Ice Stations, International Polar Years, Man-hauling, Medals, Ponies, and Submarines also get their fair share of attention. Mills, the late librarian at the Scott Polar Research Institute, had access to one of the world's leading polar libraries and made use of it for this great encyclopedia. Published in 2003, William James Mills' final work is an excellent addition to any polar library, a valuable reference tool and a fitting testament to his own polar passion.

**NEWS ABREAKING.** (Associated Press, January 29, 2007) As we go to press in late January, climate scientists meeting in Paris are about to issue a dire forecast for the planet that warns of slowly rising sea levels and higher temp. Their calculations don't include the recent and dramatic melt-off of big ice sheets. Lonnie Thompson says, "They don't take into account the gorillas- Greenland and Antarctica. I think there are unpleasant surprises as we move into the 21st century-"

A report by the Intergovernmental Panel on Climate Change, created by the United Nations in 1988, will issue their final report on February 2, 2007. The early version of the report predicts that by 2100, the sea level will rise anywhere between 5 and 23 inches. But some climate experts, including NASA's James Hansen, predict a sea level rise that can be measured by feet more than inches! Anyone want to buy a post and beam house on midcoastal Maine with a fantastic view of Penobscot Bay?

**2007 SOUTH POLE MARKER** (Clayton Correia, Electrician, South Pole Winter-over, 2006,2005 and 2004. Otherwise Salt Lake City, Utah). 2007 will mark the 50th anniversary of the International Geophysical Year and the 50th year of continual scientific research and support at the South Pole. I wanted to submit a design reflecting the historic significance of the year and also recognize the special people who have made the research possible. The research done on this continent has helped humanity achieve a better understanding of our planet and universe. Thousands of people have come from all over the globe to help support this effort over the last 50 years. Many of them give up a year or more of their lives to support the research done in this remote and inhospitable location I wanted to recognize all these people and their contributions but especially the people who have chosen to be here this winter.

The dimples on each side of the design represent the 64 winter-overs at South Pole in 2006; there are 16 on each side. The words "50 years of Science" surround a raised centerpiece in the design, signifying the elevated status of South Pole Station's peaceful purpose and all research outposts in Antarctica. These dimples will catch the light as the sun rotates around the sky and will hopefully create some nice reflections in the brass. The geographic South Pole is the only place where every direction is north, this uniqueness is represented by the points around the circle. The continent design will be deeply etched into the center circle so snow will accumulate there and provide a contrast for pictures.

I am honored that my fellow winter-overs have chosen my design to represent the Geographic South Pole marker for the year 2007 and look forward to seeing the design take shape.

**XAVIER CORTADA, 2006-2007 NSF ANTARCTIC ARTISTS AND WRITERS PROGRAM AWARD RECIPIENT** (pg. 10) Miami artist Xavier Gonads just returned from the South Pole where he worked with sound artist Juan Carlos Espinosa to complete a series of art installations addressing environmental concerns, see <http://www.cortada.com/antarctica/>. "Through this residency in Antarctica, stated Cortada, "I strive to create art that demonstrates how interconnected we as people are to each other and to our planet."

**HO HUM, THERE'S ANOTHER LEDGE** (Norwegian Coastal Voyage) A Norwegian cruise ship carrying nearly 300 passengers, including 119 Americans, ran aground near Deception Island and damaged its hull before getting free of rocks, officials said January 31. No one was injured. The 294 passengers were evacuated from the M/S Nordkapp to sister ship M/S Nordnorge as a precaution. "The transfer of all the passengers and eight of the crew was successfully completed. No one was harmed." The ship pulled off the rocks under its own power and anchored in the sheltered waters of Walker Bay for the passenger transfer. After the transfer, the ship carrying the passengers headed for Ushuaia, Argentina.

**WARMEST WELCOME IN COLDEST PLACE ON EARTH** (Bill McCormick, US. Ambassador to NZ – Forwarded by Margaret Lanyon) My recent trip to Antarctica in the company of Sir Edmund Hillary and Prime Minister Helen Clark brought home to me the tremendous level of support offered to the United States Antarctic Program by New Zealanders in general and the city of Christchurch in particular.

The whole experience of visiting Antarctica was magnificent. Dr Arden Bement, director of the US National Science Foundation, had been to the ice before, but, like me, the other members of the US delegation, Claudia McMurray, Assistant secretary of State for Oceans, Environment and Science and Glyn Davies, Deputy Assistant Secretary of State, were all nervous first-timers.

My trip to Antarctica was the sort of dream-come-true experience that you only have once in a lifetime. I am also aware of the continuing importance of the great southern continent to New Zealanders. That is why the US was so keen to join the people of NZ in celebrating a significant milestone and to demonstrate the importance that we, too, attach to the 50 years of NZ's presence and NZ-US scientific cooperation on the ice.

#1

#2

In "The Longitudinal Installation", Cortada placed shoes in a circle along the longitudes as they converge at the South Pole conceptually diminishing the distance between them.

### BRASH ICE

We are off to a most inauspicious start in a period of high-intensity-Antarctic-interest brought on by headline news about global warming and the interfacing with the new International Polar Year

*THE ECONOMIST* print edition of March 29, 2007, had an excellent five-page summary article about the status of research in Antarctica, one in which they covered the motives for doing science in Antarctica, but one sentence sort of kicked us right where it hurts, "Once, Antarctic science was strictly for eccentrics." I think the real problem is that the Mommy and Daddy involved picked out the wrong books for him/her to read when he/she was a kid. If they had been about Dr. Jean Baptiste Charcot, Dr. Otto Nordenskjold, Dr. Edward Wilson, Sir Raymond Priestley, or Sir Douglas Mawson, the kid would have realized that these persons were true scientists for any age, far from eccentrics. The writer must have confused Antarctic adventurers with bona fide scientists. Too bad, as the rest of the report is first class.

At seven thirty in the evening of the fifteenth of May, 2007, the USNS RICHARD E. BYRD (T-AKE-4) will be christened and launched by General Dynamics in San Diego. This ship is described as a new dry cargo/ammunition ship, and that is the only information we have on the ship at this time. One of Admiral Byrd's surviving daughters, Bolling Byrd Clarke, will be the ship's sponsor. Stand by for more information in the next Newsletter.

One thing bothered us about how one of our most highly respected Antarcticans was treated by a Republican member of a House committee on global warming. The Antarctic, Susan Solomon, appeared before this committee the week following the UN Conference in Paris. This all appeared on C-Span, and the Congressman was downright rude, and persistently so. Several days before the committee hearing, we had heard Susan read what amounted to the executive summary of the UN Conference on national television. So she was coming before this committee on a "high" and had to sit there and be humiliated by this political character (translate to "hack") that was trying to cut her up into small pieces.

The exploits of Father William J. Menster, a retired Dubuque archdiocesan priest and retired Navy chaplain who served as chaplain for a 1946-47 South Pole expedition, have been preserved on video. "South Pole Padre," features the priest's role in Operation Highjump, an expedition directed by Rear Adm. Richard Byrd, the most celebrated polar explorer in American history.

On the voyage, Father Menster oversaw religious services for 2,000 men of all faiths. He led what is believed to be one of the first worship services held in Antarctica, blessed the continent and dedicated it to peaceful purposes. He also helped to provide recreational opportunities for the crew.

"One of the reasons he did so well for the morale of his shipmates was because of his ability to sing and play the accordion and the guitar," said Msgr. Francis P. Fried], one of those interviewed in the 19-minute video.

**ABOUT MEMBERS.** We did pretty well on renewals, as 93% of you have already renewed. But the real good news for us is that over fifty percent of you answered our plea for multiple year memberships so that next year we will only have to go after about 45% of you. We received the biggest check we ever received when Jean Maurice Silagy of Israel sent in a check for \$400 for twenty years memberships. Wow! Wonder just who he is, do any of you know him? Another great surprise was a large check from Trim Baldwin, a former Naval officer in Antarctica, who was OIC of the 1990-1991 Wintering-Over Detachment McMurdo. Trina once told me at a gathering in Davisville, R.I., that she had aims of becoming an admiral before she retired, but, unfortunately, she had an accident, which for all purposes ended those dreams. Now she is retired, living in Central, S.C. Evidently she goes on the lecture circuit talking about Antarctica, and she was recently rewarded with a handsome honorarium for one talk in Illinois. And you know what, she cut the check in half and sent us half of it. All such donations help as we do send out quite a few Newsletters to widows of past members. If you are one of our eleven delinquents, you will be getting your final chance to renew with this issue, as we are running a tight ship and only will go forward with a full deck of paid-up members.

**CALENDARS.** It seems awfully early to be advertising calendars for next year, but in this economy driven society, you can introduce the holidays nine months ahead of time. We feel the New Zealand Antarctic calendars are the best Antarctic calendar on the market. Again we are offering Hedgehog House New Zealand Antarctic calendars at the same price as last year, \$14.00 each. If you want to order ten or more, the price is lowered to \$13.00 per (as we can get the supplier to mail directly to your home or business address). There seems to be several artistic photographs, but the one that captured our mind was a spectacular green aurora, no doubt shot by Robert Schwartz at the South Pole. But we regret to report that there is one shot of a skier. Our personal premise is that Antarctica speaks for itself, should be void of all personnel and machinery!

**INTERNATIONAL POLAR YEAR HAS ARRIVED.**  
We suppose most of you have already read what you

wanted to know about the IPY, but it behooves us as a so-called educational society to at least recognize its birth. We have chosen an announcement from the American Geophysical Union, forwarded to us by that illustrious Antarctic, Lou Lanzerotti of the National Science Board and mayor of Harding, New Jersey. So onward...

The International Polar Year (IPY) kick-off event was held at the National Academies on 26 February 2007. The International Polar "Year" officially extends for two years, from 1 March 2007 to 1 March 2009 to allow scientists time to conduct sufficient research in both the Arctic and the Antarctic despite nearly six-month periods of prohibitive weather and darkness. This IPY is occurring on the 125th anniversary of the first IPY that took place from 1882-1883 (with no one in Antarctica) and the 50th anniversary of the 1957-58 International Geophysical Year (when all The Innocents showed up). NSF has been designated as the lead agency to coordinate all US IPY activities.

There were many high-ranking officials from various government agencies and, of course, members of Congress who spoke at the event — too many to mention by names, really, and not really important in the overall picture. The Congressional members challenged the scientific community to draw public interest in the polar regions, which could be challenging since they noted that few Americans are familiar with the Arctic and Antarctic, and most will never visit those regions (but approximately 30,000 people do pay each year to visit Antarctica). Panelists also stressed that this is an opportunity to bring attention to the international nature of this endeavor. Several officials recalled that the 1957 International Geophysical Year was an event that captured their attention, and expressed their hopes that this IPY will have a similar effect on a new generation, especially on educators and students (and, hopefully, on some politicians).

The event also featured a panel of three scientists, Robin Bell of Columbia University, Robert Bindshadler of the NASA Goddard Space Flight Center, and Konrad Steffen of the University of Colorado at Boulder. The Science panel focused on the research that still needs to be done in the Polar Regions, and was very enthusiastic about the studies slated to occur in the next two years as part of the IPY. The panel also acknowledged widespread alarm about potentially dire effects of expected changes, such as thinning ice sheets, retreating glaciers, and sea-level rise. They explained that this IPY would focus on measuring the

rate of change occurring in the Polar Regions. However, Konrad Steffen emphasized that, to cope with such changes, it is important to increase our understanding of the Polar Regions and to reduce the amount of uncertainty associated with some of the research conducted so far (wonder what is bugging this guy about our ongoing research?)

**ST. MICHAELS II.** Katy Jensen (Acting South Pole Station Operations Support Supervisor) Fifteen years ago, a diverse team of planners met in St. Michaels, Maryland, to determine the South Pole station's future. Their task was to determine what types of science programs would come to the Pole in the following 10-20 years... then use unlimited imagination and fresh thinking to figure out how to make it all work with limited resources and a tight budget. The discussions were mostly about "living within the station's means," with the Dome at the center of attention.

In what will be a reunion for many and a new opportunity for others, NSF is again sponsoring a conference in St. Michaels to review the station's current status and set goals for the next several years. The safety issues cited in 1992 have been addressed and the Dome has been replaced, but advanced technology and subsequent science requirements have exceeded all expectations, resulting in a renewed urgency to review priorities and decide between 1) living within our means or 2) somehow changing our means to fit the new requirements.

A lot has changed in the last 15 years. Some examples of topics that will be discussed at this month's conference: **POPULATION** -The Dome was originally designed and built for a winter population of 18 (men) and a summer population of 33. In 1992, the summer population of 140 was hard to manage, and the winter crew of 22 (Drew Logan among them) was one of the largest ever. The new station was designed for 150 summer/ 50 winter. This year's peak summer population was 266, with 54 winterovers on site now. (The largest-ever South Pole winter crew was 86 people in 2005.) **SCIENCE** -1992: PICO drilled four 820-meter holes in the ice for a project that would eventually become AMANDA, and the structural steel for the first Dark Sector building (ASTRO) was erected. Plans were in development for a new Clean Air Facility (ARO) and "big" telescopes like SPIREX and COBRA. 2006-2007: The IceCube team drilled and filled thirteen holes, and the 10-meter South Pole Telescope (SPT) was constructed and brought on-line. IPY grantees

are packing their bags and heading poleward, and it seems the whole world is talking about global warming and climate change. **IT-COMMS**-1992: Back then, less than 10 MB/day of data were stored and sent over a serial modem, and most e-mail messages were sent to Rick Johnson, who would print them and send them via U.S. mail ("Polarmail") to family members who didn't have e-mail. There was a weekly sign-up sheet for phone calls via HAM patch or ATS-3 satellite, and the computer inventory consisted of two DEC VAX systems for data analysis, a Sun UNIX workstation, and a handful of personal computers. 2006-2007: Individual e-mail messages can be up to 5 MB in size, and approximately 60 GB of data are transmitted between the South Pole and the U.S. each day. Anyone can call the South Pole from their home phone, and most bedrooms at the Pole are wired for computer and telephone access. And the computer lab! Maybe we should just keep its grandeur secret lest the other stations get jealous. **LOGISTICS**-The 1992 team recommended up to 10 (C-141) airdrop missions per summer to supplement 140 LC-130 flights. Station inventories were stored outside on snow "berms" or tucked away in any available space. In 2006-2007, South Pole received 359 LC-130 flights and the first-ever airdrop from a C-17 Globemaster III. And station inventories are... well... still stored outside on snow berms or tucked away in any available space.

The upcoming conference in St. Michaels is sure to be an enlightening experience for all concerned. As with most things, hindsight is 20/20 and guessing the future is a tricky business. Do any of you have connections with a reliable prognosticator who can tell us what technological advances will be take place in the next several years?

**POLAR SCIENCE AND THE IPY.** Review by John Splettstoesser. In the event that you had not already heard and read enough about 'Global Warming' to convince you (one way or the other), the recent issue of Science, v. 315, 16 March 2007, will probably sway your impression toward the statement given in the caption for the cover photo — "In both the Arctic and Antarctica, melting ice and disrupted ecosystems have sounded the alarm on global warming." To ring in the International Polar Year (IPY), 2007-2008, a special section on Polar Science plus various scattered articles in the issue revolve around much the same scene in more than 40 pages — retreating glaciers in Greenland and Antarctica, the Arctic's shrinking sea-ice cover, ice sheet melting and contribution to global sea level, and many other related subjects by mainly U.S. and U.K. researchers are the harbingers of a worldwide phenomenon which has become a buzzword/term for

journalists and the general public – Global Warming. Contributions from human activity cannot be ignored in the process, although those discussions are not part of the theme in this issue. I expect that many of our Society members have seen some of these features in the field, such as retreating glaciers over historic time (yes, many of us are old enough to claim those events).

Alan I. Leshner, Chief Executive Officer of AAAS and executive publisher of *Science*, introduces the subject of the coming IPY and some of the challenges and research topics to be addressed in it in the Editorial column of the issue, "Celebrating Polar Science." Articles that follow illustrate the major advantage of the technological age we are in, whereby monitoring of ice sheets and discovery of a subglacial water system in West Antarctica can now be accomplished with satellite imagery. Ice discharge from the Greenland Ice Sheet shows rapid changes of two major outlet glaciers as determined in only two years from observations by satellites. Some authors pointed out that major changes of this kind can occur more rapidly than previously thought, and with respect to the West Antarctic Ice Sheet and coastal Greenland, meltwater at the base can be responsible for short time scales.

I recommend the issue for readers who follow the subject and await the thrust of the IPY – orders can be placed at \$15 for a single copy with AAAS, P.O. Box 96178, Washington, D.C. 20090-6178.

**CLIMATE EXPERT TAKES POSITIVE VIEW** (By John Henzell, *Christchurch Press*, 28 March 2007, forwarded by loyalist Margaret Lanyon.) Professor Paul Mayewski, Director of the Climate Change Institute at the University of Maine, told a lecture audience in Christchurch on 27 March that he was optimistic about the future. "I want to leave people with a very positive feeling that, yes, we're on our way to the cliff, but we know where the cliff is and we don't have to drive off the cliff. We need to reverse it, and it can be done."

Mayewski, a glaciologist, has been working in Antarctica since 1968 when the continent was thought to be unchanging and an isolated ice mass that was neither affected by nor an influence on world climate. Now, nearly forty years later, Paul is one of the world's foremost experts on analyzing data from ice cores in places as diverse as Antarctica, the Tasman Glacier near Mt. Cook, the Rongbuk Glacier near Mt. Everest, and the Greenland Ice Sheet. In that time, the ice cores have shown that instead of being a bit player in the global climate,

Antarctica is one of the driving forces and a place of abrupt changes. It is warming faster than almost anywhere else, with the Antarctic Peninsula, the Southern Ocean, and the mid-level of the atmosphere above the continent each getting hotter, and quicker than other similar bodies.

Paul said "Often climate change in Antarctica precipitates change in the southern hemisphere so, if that's true, once Antarctica starts going, we'll see things triggered through much of the world. We know enough now to know we're having a dramatic effect. We're realizing that, which is really critical because we now have the opportunity to do something about it. I have a very optimistic view of the future. We don't understand the whole system but we certainly understand the direction we're going in."

In the northern hemisphere particularly, the atmosphere had elevated levels of toxic heavy metals. Even in the southern hemisphere the lead levels in the atmosphere were high. Paul said the globe had shown a remarkable ability to bounce back. In the days after the September 11, 2001, attacks in the United States, when all civilian air traffic was grounded, the air quality improved quickly. Other factors such as greenhouse gases and the depleted ozone levels would take longer but would respond, he said.

**MAN OF THE YEAR, SORT OF.** This fellow Mayewski is a red-hot item, not only in the States but abroad. Ten days before he gave the above referenced lecture in Christchurch, he wowed some 1400 members and guests of the Explorers Club at their annual bash in the Ball Room of the Waldorf Astoria in New York City. His name is synonymous with Antarctica, and Antarctica is synonymous with global warming. They are talking about him in barbershops and in the foyers of post offices in Maine, and I assume so in other states. His facial growth makes him look like sort of an explorer, whatever explorers are supposed to look like. And he is old enough to make you think that he is old enough to know of what he speaketh. It looks to us from our vantage point (or disadvantaged point) location on shoreline property in Maine that, he has overhauled and supplanted Susan Solomon as Antarctica's Person of Nobility. But don't count Susan out, as she has an awful lot going for her, too.

**CLIMATE CRASH** *Abrupt Climate Change and What it Means for Our Future*, by John D. Cox (Joseph Henry Press, Washington, DC, 2005, ISBN 0-309-09312-0, 215 p., cloth, \$27.95). This excellent book honors one of the good old boys of the Polar Regions, Chester Langway, professor emeritus of geology. Chet is among the

principals involved in early deep ice core research, and his career is highlighted and discussed in this book. The book examines and analyzes, at a popular level, existing ice-core theories, as well as present knowledge of the global climate change controversy and the significant role that ice-core science plays in providing a detailed record of the Earth's paleoenvironmental history, especially regarding rapid change and variability in climate. Congratulations, Chet, on your contributions, and it is nice to see you remembered and honored while you are pretty much still alive. Much of Chet's academic and professional history is a bonus to reading a very interesting account of his life while with SIPRE and CRREL, and later as Professor of Geology at the State University of New York at Buffalo.

**PREMIO INTERNAZIONALE FELICE IPPOLITO AWARD RECIPIENT.** Probably no Antarctic has seen more people land and take-off from McMurdo than Art DeVries, professor of Animal Biology at the University of Illinois. He may also hold the world's record for spending the most months with more different wives at a single Antarctic station. These things did not bring him any awards, but his research did result in Art receiving an international prize awarded by the National Antarctic Programme and the Accademia in Italy. The award is the Premio Internazionale "Felice Ippolito," and is in memory of Professor Felice Ippolito, former deputy chairman of the Italian Committee for Antarctic Research. It is given to an Italian or foreign scientist who has significantly contributed to Antarctic research. It recognizes his more than forty years of research in Antarctica and his discovery of antifreeze protein in Antarctic fish.

Art DeVries spent his first year (1961-62) at McMurdo Station as a research technician for Dr. Donald Wohlschlag of Stanford University conducting respiratory experiments on McMurdo Sound Notothenioid fishes. He arrived early October on a C-124 Globe Master (12 hour flight from Christchurch). He spent 14 months on the ice, returned October 1963 for a summer and again in 1964 for a year conducting his PhD thesis research on freezing avoidance in McMurdo Sound fishes. During that time he discovered that the fishes living in ice-laden seawater avoided freezing because they had evolved a unique antifreeze glycoprotein. He returned again to Antarctica in 1969 and worked with Antarctic Peninsula fish freezing avoidance aboard the USARP RV/Hero and at Palmer Station.

After taking a research position at Scripps Institution of Oceanography in 1971 funded by OPP NSF, he returned to McMurdo Station as a Principal Investigator conducting further research into the role of the antifreeze glycoproteins in freezing avoidance of the McMurdo Sound fishes. He spent 5 (6 month field seasons) continuing his studies. In 1976 he accepted an assistant professorship in the Department of Physiology at the University of Illinois.

He returned again in 1977 and continued his studies up until the present, missing 2 Antarctic field seasons (two were with other countries—the Danish Galathea 3 Expedition and a 6 week season with the Italians at Terra Nova Station). In all he believes he has made about 41 trips to the "ICE" for research. Art wrote that, "A substantial part of my life has been spent at McMurdo. For the most part it has been enjoyable with the continual support of OPP/NSF. Discussions with people of all walks of life have been fascinating and those who are not biologists have broadened my knowledge of science. Those with glacial geologists have been very useful in interpreting the origin and evolution of the antifreeze proteins in the Antarctic fishes. On a personal level I have enjoyed interacting with everyone I have met in the Antarctic. Presently my wife and I alternate time on the ice while managing to raise two children (one a sophomore in college and the other beginning college this fall).

Research in Antarctica is not without its frustrations that include the uncertainties of weather, ice conditions, finding able-bodied technicians, the end of a long supply line and personalities. The bottom line is, one has to really love one's science and the "place" to do excellent research on the Ice. As an aside I enjoy training graduate students and technicians of which most of the latter have gone back to graduate school or medical school and excelled. Some of the graduate students have taken jobs and began their own Antarctic Programs, which is a very rewarding experience for me.

Finally the discovery of the antifreeze as a graduate student and the continuing studies have not only started an important sub field in insect and fish biology, but the story of their evolution is being written up in many of the modern evolutionary biology textbooks as an example of evolution in an extreme environment. Again it is gratifying to see that one's work is recognized not only in the polar science but also by the non-polar

How many of you have enjoyed a cold beer in the middle of the night with Art at one of his fishing holes in the sea ice off McMurdo Station -- one of the sheer delights of being at McMurdo? Congratulations, Art, on a well-deserved award.

### **AGELESS SLADEN IS A LONG-TERM**

**STUDENT.** Back in the early Pleistocene while a professor at the Johns Hopkins School of Public Health, Bill Sladen and his team from Johns Hopkins went to Cape Crozier in Antarctica in 1960 to study a colony of 300,000 Adelie penguins, which involved banding virtually every penguin they could capture. Supported by NSF, it was the start of what is now one of the most important avian studies. One of Bill's students, Dr. David Ainsley, has been continuing the long-termed study, and NSF recently has funded a grant to work with well-known filmmaker Lloyd Fales to redo the film, PENGUIN CITY, which Bill Bishot in the 1960s. Towards that end, Bill joined David this past austral summer at Cape Crozier. He had not been there since 1970, but Bill is only 87 and has many more active years in his life than an Arctic tern. The new film is going to be called PENGUIN SCIENCE and will be for the International Polar Year.

While filming at Cape Royds they celebrated the 100th anniversary of the first scientific study of the Adelie by John Murray, Shackleton's biologist. Bill met a fellow octogenarian while at McMurdo Sound, a former New Zealand apiarist turned Antarctic farm tractor driver, whose name has sort of slipped our memory, but is remembered as someone who could well qualify as Mayor of Scott Base, and liked to climb high mountains in his earlier days, one of them with a Sherpa named Tenzing.

Bill wrote that an Adelie penguin colony quite closely replicates a human city, with "generally good behavior," but also shows inexperienced juvenile "teenage" behavior, divorce about the same as in America, nest stone stealing, predation by leopard seals and South Polar skuas, as well as catastrophic weather with hurricane-like katabatic winds. Bill hopes that PENGUIN SCIENCE will compete favorably with the French documentary THE MARCH OF THE PENGUINS with accurate long-term science and (of course) much laughter." Incidentally Bill is very proud of being a 7th decade Antarctic, and will be an 8th if he can survive another four years. And just where were you in January 1948 when Bill was counting penguins at Hope Bay?

**PENGUINS**, by Brutus Ostling and Susanne Akesson. An Imprint of Harper Collins Publishers. 2007 (Review by Grace S. Machemer.) On the subject of coffee-table books on Penguins, there is now a new one by a pair of Swedes, Brutus Ostling, the photographer, and Susanne Akesson, an animal ecologist and ornithologist. This one joins seven others on our table, and, might be thought of as "ho-hum!" or "do we really need another?"

To be fair in assessing this beautiful book, we decided to compare all seven on the following terms: a) quality of photographs, b) accuracy and completeness of the text, c) publishing considerations such as size, kind of paper and type used, and d) organization of material.

As for quality of the photographs (images), as sure as the sun rises tomorrow, there will be some improvement almost daily in cameras for resolution and clarity that was not available yesterday. But, everyone can push buttons and voila, a good picture! However, not everyone has the eye of the artist for composition and light, which makes a picture a true work of art. All seven books are good, but, to be special, the Frans Lanting book, PENGUIN, and this new Swedish one are indeed hard to beat.

It is always helpful to the reader to establish place, as with maps, to show migration routes, and locations of the various tribes of penguins. They are all Southern Hemisphere species, all the way from the Galapagos Islands to the fringes of the Antarctic continent, depending on the availability of food and reproductive habitat. Ostling and Akesson's book is the most sensitive book to the threat of over-fishing, tourism, and global warming on penguins, all of which may lead to eventual extinction. The text is excellent and the images are fabulous. Maybe it is time to make room on your tabletop for this newest PENGUIN book.

### **USGS'S OPEN FILE REPORT 2006-1116, U.S. GEOLOGICAL SURVEY SCIENTIFIC**

#### **ACTIVITIES IN THE EXPLORATION OF ANTARCTICA: 1946-2006 RECORD OF PERSONNEL IN ANTARCTICA AND THEIR**

**POSTAL CACHETS.** Tony Meunier, who was in the last crew to occupy the original IGY station at South Pole in 1973-74, has gone into the files and tabulated the presence and activities of all USGS personnel in Antarctica from 1946 to 2006. It is sort of like a footnoted Manhattan Telephone Directory, telling what each and every soul did on the ice — at least what is fit to print!

During the past 60 years, the USGS, has sent 325 scientists to Antarctica to work on a wide range of projects. More than half were involved in aerial photography, surveying, and geodesy, primarily used for modern mapping of Antarctica. Slightly more than forty percent were involved in geophysical and geological studies, both onshore and offshore. A smaller number participated in projects in the Dry Valleys, and one came from the Director's Office.

Many of the USGS personnel became legendary. One was William R. MacDonald, who started in 1960-61 and supervised the acquisition of more than a million square miles of aerial photography of Antarctica. As a result, Bill probably flew more miles as a passenger on LC-130 flights in Antarctica than any other person. Both John Behrendt and Art Ford were piling up extensive careers on the ice for the USGS when the Survey pulled the rug out from under their Antarctic activities in the 1990s. However, both had established themselves by that time, and the result was just a blip in their careers, as they continued working in Antarctica.

There was a time in the 1970s and 1980s when USGS personnel were the backbone of our Society. They certainly were the halcyon days of our social life. Our Mid-Winter Day picnic at such places as Rippon Lodge and Stronghold were real celebrations when Charlie Morrison headed up a most able crew of USGS bartenders from Reston. Whenever any of the Antarcticans retired from the USGS, their retirement party was a don't-miss affair. At Mike Metzgar's retirement, all the waitresses came dressed as penguins, although they might have been real penguins that were trained as waitresses! A farmer from Pennsylvania named Jim Stoner went to the ice nearly every season and was a blessing for our Hedgehog calendar sales, as he would buy 40 each year! Boy, do we miss him! Every page of Tony's manuscript brings back many pleasant memories, even of the naked Bruce Molnia being, inducted into the Lake Vanda Swimming Club, as well

was Dr. Earl T. Apfel, of Operation Windmill, 1947-48, teaching me Geomorphology 101 in Graduate School at Syracuse. This is the best telephonic-type-directory that you will ever see. This open file report will soon be on-line.

#### **THE SIR ROBERT-ADMIRAL DUFEK FIASCO.**

Although you will not find this in Diane Belanger's book, DEEP FREEZE, what happened between the two of these persons was probably one of the biggest stories of the

summer season, 1957-58, I happen to know quite a bit of what went on as not only was I on the ice at the time, Sir Hubert and I were co-workers at the Army laboratories at Natick, Massachusetts. In reality Sir Hubert was a very quiet individual, not a rabble-rouser at all, and he was truthful.

It all started when Sir Hubert arrived at McMurdo and where he was a polar figure of some magnitude, he was besieged upon by the press as to his opinions on how he found McMurdo. He started out by talking about the conditions at McMurdo, which were pretty much of a mess where they were still in the process of establishing themselves. He should have stopped there, but he went on to say that the morale at the station was far worse than anything experienced by either Scott or Shackleton. And he said something to the effect that drinking was a real problem, starting with the admiral and going all the way down through the ranks! And you can imagine what happened when his interviews were published back in the States and eventually got back to McMurdo. Something in four letters started to hit the fantail, and Sir Hubert was kicked out of the Admiral's quarters, ostracized to a Quonset where scientists going and coming were quartered. No big deal for Sir Hubert as he was a most common person, but what hurt was the fact that Admiral Defect, as he was universally called by the civilian scientists, grounded him from all South Pole flights. However, Sir Hubert had a way of hanging out at the airstrip, and hopping on lesser flights hither and yon!

So Sir Hubert lived out his stay, and left McMurdo on an icebreaker that took him over to Wilkes Station, commanded by his friend Carl Eklund, and then onto Australia, his homeland. Upon returning to the States, he had to file the obligatory trip report, which included what he had said to the reporters at McMurdo. The Admiral then asked our General for the opportunity to come to Natick to answer Sir Hubert's charges. They fell upon deaf ears. I really had nothing to do with it, as I was then at the South Pole, but I took great personal delight in seeing Admiral Defect rebuked by our General, whose wife's maiden name was the very same as my last name! But we were not related at all. I left the Pole in early December 1958, and upon arriving in Christchurch, read in the newspaper that evening that Sir Hubert had died in Framingham, Massachusetts. So I never had the fun of talking to Sir Hubert about it all, although in his life, I am sure it had no significance at all. And he did tell -it as it was. What more could one have expected from him?

**BRASH ICE.** As we go into our 30<sup>th</sup> year of putting these Newsletters to bed, we have finally struck it rich thanks to a long-time member of our Society by the name of Tom Henderson. He has done the impossible, putting many of the records of our Society since its inception in 1961 onto a CD, including each and every Newsletter. And these are being made available to all members of the Society for a most reasonable price of only \$20.00, including handling and shipping charges. If you want to find yourself, all you have to do is spell your own name correctly, punch it into the Adobe Acrobat Reader search tool, and lo and behold it will list all references to you in the past forty-six years. Then you take it from there, and seek out those of your own interest.

Not only is this CD being made available to each of us at a most nominal price, Tom has taken on another Herculean task: establishing a Society web site, which hopefully will be up and running by the beginning of next calendar year. He welcomes any suggestions/ideas on what you folk may wish to see in/on our web site. You will find Tom's address on the cover sheet of this Newsletter. Tom is a quiet, unassuming, hard-working Antarctic who has a splendid track record on the ice. Plus, and this really impresses me, Tom is still active at age 59, playing baseball, yes, baseball, real baseball, in a senior league in the Albany, NY area.

We also have a new president, Art Ford, who has been around for quite a few years, and has accomplished great things. Among the most amazing may be producing two daughters while being an annual working penguin on the ice. And he is still married to his beloved. Wow! How come so many Antarcticans have daughters? He has a lot of ideas which we are going to initiate, one of them a column in each Newsletter on Antarctic firsts. You can contribute to this fun column by sending your firsts to Art at his address on the cover sheet. An abbreviated bio on Art appears later in this Newsletter. Incidentally, Art has a great resonant voice, is a wonderful speaker, as those of you who have been on cruise ships with Art can readily testify. Let's all skål to his presidency.

On the cover page you will see the names and addresses of key members of our Society. Our Society has continued to be blessed through the years in having excellent officers, and we certainly were blessed for the past three years in having the services of Rob Flint as our president. And, as you can see on our cover sheet, Rob has consented to stay on as our vice president for the next term. Thank you, Rob. Please note that John Spletstoesser and Paul Dalrymple have new e-mail addresses. Our by-line reads that our Society is BY AND FOR ANTARCTICANS, and that is true when you see all of the people involved in producing these Newsletters. Our Overlord is Charles Swithinbank, and whenever there is a question of doubt, we e-mail him and the answer awaits us the next morning.

We rely heavily on Lou Lanzerotti on what is going on relative to the current International Polar Year. Our close friend and neighbor, Charles Lagerbom, buried in one of the largest private polar libraries in existence, is always on call for help of any kind. His collection got so large, he is currently building a new house with a special annex just for his Antarctic books. He's a great guy, always willing to help. Another kingpin in our Society is Steve Dibbern, a man who we coveted unsuccessfully to take over the Newsletters. Our NSF contacts are more or less limited to Polly Penhale and Jerry Marty, and you frequently see input from them. Our New Zealand correspondent is the indefatigable Margaret Lanyon, loved by every Antarctic who ever went through Christchurch. In memory of her dear friend, Walt Seelig, she keeps up the tradition of supplying us with all the latest news from Kiwiland. Her latest is from the Aug. 15 *Christchurch Press*, which heralds a visit by American adventurer Will Steger to New Zealand as a guest speaker at a jubilee dinner to help celebrate NZ's 50 years in Antarctica. It's hard to establish contacts with the Newcomers (post-1990 to the ice), but we do have one loyalist, the very upfront Katy Jensen who has graced our pages for the past several years with great inputs. And let's not forget Dr.

Will Silva, the ever-present medical doctor who interrupts his skiing and mountaineering, plus flying, with over-winters on the ice, resulting in stories within our Newsletters. Our Antarctic music expert is Valmar Kurol of Montreal, who knows every piece of Antarctic music ever composed, and our Antarctic fiction consultant is Fauno Cordes of San Francisco. The person who smoothes rough waters is Gracie Macheimer, our Executive Coordinator, who keeps us all on the same page. Finally, but by no means least, Jo Lindsay, who not only serves as our Official Bartender at Informal Gatherings, but she is the one responsible for putting Newsletters in such a format that they look great. That is your team of doers that produces the Newsletters.

We are initiating with this issue a Table of Contents box on the cover sheet. This will show you up front a list of the articles within that issue. This is being initiated in hopes that when our web site comes on line, you can quickly find things of interest.

This year is two-pronged, one where we are celebrating the end of a very successful International Geophysical Year and the introduction of the most promising International Polar Year which is upon us. Within the past month, Dr. Rainer Goldsmith, medical officer with the advance party of the Commonwealth Transantarctic Expedition, hosted a 50<sup>th</sup> Anniversary Dinner for TAE members at his home in England. As each member arrived, the word we heard is that there was a certain similarity to troops on the Bataan Death March. Members of the Crossing Party who were there included Hal Lister, Jon Stephenson, Ken Blaiklock, George Lowe, David Pratt, and Roy Homard. Jon recently served as a lecturer on Antarctic cruise ships, and is apparently a better lecturer than writer, as the draft of his book on the Antarctic has been rejected by 22 publishing houses. Ken Blaiklock, who probably takes to his grave a record for most miles dog-sledged, has been active in the Antarctic as a surveyor until a few years ago, and was the only attendee who looked hale and hearty. Old age is pure hell.

Relative to reunions, we are going to host a gathering of Antarctic old-timers and neophytes in the 2008 summer at my retreat on the coast of Maine. This will be a two-day affair on a weekend in mid-July. No lectures, although maybe a few Show and Tells. This will be basically a good chance to talk about things from the past over a suitable beverage, with a barbecue providing adequate simple food. If interested, contact our treasurer at the address on the cover sheet.

We recently came back from a trip to the Lands of Nansen, Amundsen, Borchgrevink, and the Sverdrups. It has been a long-time dream of mine to go to that Citadel of Polar

Knowledge. But that dream was mellowed somewhat when I got an astronomical bill for my first dinner in Oslo. However, a trip to the FRAM on the following day made it all worthwhile. It was a sheer delight to walk on the decks trod by Nansen and Amundsen, and to go below to see how they actually lived. Wow! It does not get any better than that, the hair on the back of my neck actually curled! It was the very best museum that it has ever been my pleasure to grace. But remember, it is going to cost you an arm and a leg if you are going to drink wine in Norway, or anything else with alcohol in it.

We went all the way up the Norwegian coast on a mail boat, making thirty-five stops including Tromsø, headquarters for the Norsk Polarinstitut. It was a Friday, and after 3PM, all hands at the polar offices had gone home for the weekend. But all that meant was that I had some time to spend with Amundsen at his statue in the waterfront park named after him. Roald looked down at me, saw my Antarctic South Pole Station baseball cap and in his broken English asked me, "Son, have you actually been to the South Pole?" This resulted in a long conversation with Roald, which will be recreated/reproduced in our next Newsletter.

Rob Flint has been in touch with Alex Zaitsev, who was the Russian exchange scientist at the South Pole in 1977. Alex proposed to Rob that he was advocating a reunion of all Russian-US exchange scientists at St. Petersburg next June -- Rob thinks it could be a "real blast." Any of you exchange scientists out there who are interested should contact Rob (his address as our Vice-President is on the cover sheet).

Another old IGYer has retired. Wild Bill Cromie has hung it up at Harvard where he has worked in their News Office. He plans on sleeping until 4pm daily, and right now he is concentrating his efforts in Cambridge and Somerville to require establishments which sell food and liquor to be open 24 hours per day. A photographer at Bill's retirement said "I'll miss Bill... We were from the same era. We liked our photos like we liked our whiskey -- straight up, nothing fancy." Bill was and still is one of a kind!

We wonder how many IGYers are still gainfully employed, as fifty years is a long time to work. My old roommate at the South Pole in 1958, Mario Giovinetto, the Bull of the Pampas, is still at it at NASA in Greenbelt, Maryland. Ditto for Bob Benson, one of the original Pole sitters at the South Pole with Siple in 1957. Nolan Aughenbaugh is still with Louisiana State University, and Boy Scout Dick Chappell is still at it at both Hunter College and the biological lab at Woods Hole. Dick has a daughter who is getting (or has) her PhD from MIT in chemical

oceanography, and may soon be overtaking her old man. Don't look back, Dick.

For any new readers who might want to join our Society, a check for \$12 to the Antarctic Society, P.O. Box 325, Port Clyde, ME 04855, will put you in good standing. Membership dues notices will go out in January, which will show increased dues, but those of you who may want to take advantage of our current lower dues can sign up right now for multiple years. Go for it.

### **OUR INCOMING PRESIDENT, ART FORD**

After his PhD in geology from the University of Washington (Seattle), Art taught for two years at San Diego State College. Then, for nearly three decades, he led or participated in numerous USGS expeditions into many areas of Antarctica, and also did geological research in many areas of Alaska. His parties made first explorations of many south polar mountain regions in the 1960s to 1980s. In 1972 he was a member of the first Antarctic deep sea drilling program by the drill ship, *Glomar Challenger*, and in 1976 he was an exchange scientist on the 22nd Soviet Antarctic Expedition into the Shackleton Range. In 1986 he participated in a joint USGS and British Antarctic Survey expedition into Antarctica's last remaining, previously unvisited large area of mountains, the Black Coast of the central Antarctic Peninsula. His Antarctic research focused on the origin of one of the world's largest layered igneous complexes, known as the Dufek Intrusion, of the Pensacola Mountains, for which he is widely known. His Alaskan fieldwork was mostly in southeastern Alaska, but included fieldwork in the Brooks Range, Denali National Park, and the Talkeetna and Wrangell mountains, of south-central Alaska.

Art met Carole at Enumclaw High School (near Mount Rainier) and they married in 1955. Somehow, amidst the travels, two daughters, Judi and Jody were produced, in 1957 and 1959. Since retiring in 1995 after 35 years with USGS he became an Emeritus Research Geologist with the Survey and a geology lecturer on cruise ships to Antarctica, Alaska and the Arctic, including the North Pole. The chapter on Antarctica in *Encyclopædia Britannica* is among the more than 200 reports and maps published as a result of his research. In 1988 he served on NASA's International Space Station staffing advisory panel. He holds the U.S. Antarctica Service Medal and his name is on one of the mountains nearest the South Pole. Art joined the Antarctic Society in 1961 when he lived in Washington D.C., and is a Fellow of the Royal Geographical Society, the Explorers Club, and the Geological Society of America.

**CD-ROM AND ANTARCTIC CALENDARS FOR 2008 NOW FOR SALE.** Tom Henderson has just completed a CD-ROM on the Antarctic Society Newsletters, Bylaws, and the Society's incorporation. It is the highlight of our existence, a record of its history since 1961, up to 2007. It can all be yours for only \$20.00, including handling and shipping. Checks should be made out to the Antarctic Society, and mailed to P.O. Box 325, Port Clyde, ME 04855.

We are still selling the handsome Hedgehog Antarctic calendars published in New Zealand, at a cost of \$14.00 each. This is a real bargain, as we only clear pennies. Please make out checks to the Antarctic Society, and place orders at the above address.

**AN ENDORSEMENT BY GUY GUTHRIDGE (formerly NSF/OPP).**

Dear Tom Henderson,

Your commitment is wonderful to see. Paul has done so much for years, and your picking up the torch with the electronic methods of today will do a lot for the many people who have looked to the Society as a way of seeing the present through the invaluable perspective of the past.

It's almost a selfish statement to say that I am looking forward to seeing the newsletters online.

Much that was written there was nowhere else. I made sure a large collection of earlier newsletters got in the Library of Congress Antarctic Bibliography, which I funded from NSF. People today may not realize, for example, that two articles, by Mildred Cray and Paul Dalrymple ("It's About Time" and "The End of a (Great) Era" -- I still remember the titles), more than any other, set the tone for appreciating the change that took place when women joined the U.S. Antarctic Program.

Thanks again for taking up the challenge. Maybe I'm being tedious here, but just capturing online the accomplishments of the Society's past will be a huge contribution.

**TOM HENDERSON'S CD.** Many years ago old Bob Nichols, the man-hauling geologist of fame, wanted us to assemble all of our Newsletters and offered a stipend to initiate the campaign. Then several years later, John Twiss, the mammal man, proposed the same thing. Now fast forward another fifteen years, and Dr. John Middaugh sends forward a healthy personal check to get it underway.

But it wasn't until Tom Henderson stepped forward and volunteered "I can do it" that it actually got done.

I have been deeply involved in the Antarctic Society for the past thirty years, and for a long while wrote nearly everything. It was a lot of fun in the beginning. The Society then consisted of many male chauvinists, important people, like Ambassador Paul Daniels, geologist Larry Gould, geographer Pete Burrill, and many, many more. Even Ruth Siple was a male chauvinist in woman's clothing. You could write most anything and get away with it, as you had these people behind you. So those of you who buy this CD will find a fun-tone in those issues from the late 70s and 80's. But it all sort of changed with Michele Raney, who broke the mold.

There actually is a wealth of information in this collection which Tom has archived for one and all, especially on the Byrd expeditions. You will find long contributions within from the Poet Laureate of the Antarctic, Dick Black, plus a long treatise from the famed author, Charlie Murphy, and also great pages from the well-known Antarctic naturalist, Al Lindsay. They constitute an Antarctic historian's treasure.

One special issue was published, one about the serious burning accident of a program engineer in the polar office at NSF, Jerry Huffman. It was a heart-rending account of his survival, thanks entirely to his dear wife Gundel and a most dedicated surgeon who for endless hours wouldn't let Jerry die on the operating table. It was originally printed in the WASHINGTON STAR. Tears still come to my eyes when I read this story.

I was close to Amory "Bud" Waite, the radio-echo sounding scientist. I first met him back in 1936, yes, 1936, and he was at Little America V when I got there twenty years later! I saw him often in the intervening years as we both worked for the military, he in the Signal Corps, and I in the Quartermaster Corps. So you will find a lot about old Bud, a real character of the first magnitude. He really wanted to die on the ice, I am convinced of that. I used to tell Bud that he should not worry about dying as only the good die young. Then a ten-page letter came in his inimitable penguin scratching, headlined "Last Letter." I surmised that perhaps he was right this time, so I sat right down and wrote him a letter about what he had meant to my life. He died two days later, in the morning, my letter got there that afternoon. Bud, you were something else.

As nearly all of you know, Ruth Siple was very dear to me, very dear. This Society was our life for twenty years. Everything was done in her house, it was the Nerve Center for the Society. All of those Newsletters from the late 1970s to the late 1990s were edited and typed by her. Although not a typist, she could type a complete

Newsletter on her Selectric in ONE DAY without an error. Today with computers, it takes us with a team of experts over a week to get one out, and then we still can't produce a perfect one. The Newsletter of her passing was on one hand the hardest that I ever had to write, but it was also very rewarding to tell you all about the Ruth Siple that I knew and what she meant to the Society.

Buy Tom's CD, and then play it -- there is a lot of good stuff within.

### **LONNIE THOMPSON GOES TO 1600**

**PENNSYLVANIA AVENUE.** It is not often that news of this kind of event occurs for Antarcticans, or polar people in general. In July, Dr. Lonnie Thompson was invited to the White House in Wash. D.C. to be awarded the National Medal of Science by President Bush. Lonnie has a reputation as a hard-working, mountain-climbing, ice-coring enthusiast whose lifelong objective seems to be to use the world's glaciers as pincushions, poking holes into many of them to withdraw cores of glacier ice. Why he has been doing this goes back many years when he was a graduate student at The Ohio State University, and began his polar career as a field assistant on a project in Antarctica. That led to his career, along with his wife, Ellen-Mosley Thompson, of coring ice for analyses of past climates. His targets over 50 research expeditions have been Antarctica, Greenland, Peru, Bolivia, China, Tibetan plateau, Alaska, Franz Josef Land, and Mount Kilimanjaro. His work has resulted in many awards, including the Tyler Prize in 2005, Heineken Prize, Vega Medal, and the Common Wealth Award. A few years ago he gave a lecture at Banff to an audience of 160 high-altitude medical doctors, who told him that he had spent more time above 18,000 ft than any other human – they wanted to do a MRI on him to check for brain damage, or some such thing. Lonnie's latest award includes the Seligman Crystal in 2007, for his pioneering work in the reconstruction of past climate from high-altitude ice cores in tropical and subtropical ice caps and glaciers. An impressive career for a young lad from Gassaway, West Virginia, where he was born. Lonnie's biography, for the most part, is in the book by Mark Bowen, "*THIN ICE: Unlocking the Secrets of Climate in the World's Highest Mountains*," published in 2005. For a view of Lonnie at the moment of the award, see <http://www.nsf.gov/od/pms/medal.jsp>.

The Medal of Science was established in August 1959, with awards given to individuals in science and engineering who have made important contributions, in Lonnie's case in the category of Physical Sciences. A scan of medalists on the Medal of Science website totals 425 recipients as of Feb. 2006. The only other Antarcticans we

know of on the list is Susan Solomon, who received the Medal in 1999 in the category of Chemistry.

### **ADMIRAL BYRD HITS THE WAVES, AGAIN.**

And so it was on the evening of May 15, 2007, when the 6,700-metric-ton, 689-ft-long, 105.6-ft-beam, 29.8-ft-draft USNS RICHARD E BYRD (T-AKE-4) was launched in San Diego by a side-armed swing of the bubbly stuff by Bolling Byrd Clarke, the eldest daughter of the Admiral. It was my first launching ever, so I have nothing to compare it with, but it seemed quite official, with loads of sailors in their full dress whites, a military band playing the correct accompanying music, and here a Byrd, there a Byrd, everywhere a Byrd. It was a dull, overcast evening, near sunset. Even the Secretary of the Navy spoke, and no one seemed to mind when he pulled a guffaw in his talk on the late Admiral. Bolling, no longer the young, spirited, winsome daughter, finally made it up the ladder with the help of a convoy of young junior Naval officers, and at the correct moment the bottle was smashed, the ship slid gracefully down the ways into the dark as fireworks burst overhead. Have no idea at all what the ship really looks like, as all we saw was either a bow or a stern, a huge hunk of steel. The completion of the ship will be finished in the seas off San Diego, and then it will begin its mission "to deliver ammunition, provisions, stores, spare parts, potable water and petroleum products to strike groups and other naval forces, by serving as a shuttle ship or station ship."

Invited guests were then hosted by Bolling and the Byrd family to a giant reception in the ballroom of a palatial seaside hotel in San Diego. There were many tables with great mixtures of delicious goodies, and drinks of all mixes to help wash them down. But the main menu was the Byrd family members themselves, who circulated throughout the throng. Perhaps the one known to most of you was Robert Byrd Breyer, who was in the construction party for the domed South Pole Station. It was disconcerting to see that this once young, dashing, handsome, black-haired man now has touches of grey in his hair. But overall, it was a most gala evening.

**AMANDA,** A Scientific Legacy Stretches From The Core Of The Sun To Deep Beneath Antarctic Ice (abstracted from an article in the October 2007 issue of NATURAL HISTORY by Charles Liu, professor of astrophysics at the City University of New York and an associate with the American Museum of Natural History). The article is basically a tribute to the late John Norris Bahcall, a "giant in the field of astronomy and astrophysics." Bahcall, who died in 2005, was a Professor at the Institute for Advanced Study, Princeton University, and was particularly interested in the field of neutrinos and muons, which is the subject of project AMANDA, presently underway at the U.S.

Amundsen-Scott Station. The following narrative is taken from the article mentioned, as well as information gleaned from numerous websites (“*AMANDA neutrino project*” will get you many choices). **AMANDA** (**A**ntarctic **M**uon **A**nd **N**eutrino **D**etector **A**rray) is one of the biggest and most important ongoing research programs in Antarctica.

AMANDA is an array of light detectors buried in holes in the ice a meter or so wide and to a depth of 2,000 meters. (The ice thickness at the South Pole is some 2,800 meters.) Each hole is bored with high-powered drills that cut with superheated water instead of diamond bits. Before the water freezes, long chains of basketball-size glass globes are lowered into the lower half of the holes. Inside each globe is a sensitive light detector, which monitors the ice in all directions. Operational for about a decade now, the array has been continually upgraded and expanded. The current configuration, called AMANDA-II, includes nineteen detector chains strung with a total of 680 globular modules.

The most recent studies have included a search for neutrinos from gamma-ray bursts, among the most powerful sources of energy in the universe. Those distant cosmic events release more energy in a few seconds than our Sun will generate in its entire 10-billion-year lifetime. Neutrinos make ideal astronomical messengers. They have no electric charge, almost no mass, and are extremely difficult to catch – trillions of neutrinos stream through your body every second without a trace. If you thought you have captured neutrinos you are in error – you probably have arthritis!

Neutrinos produced in the centers of stars and galaxies could hold clues to the invisible dark matter comprising some 25% of the Universe. A neutrino traveling through the Earth from the northern sky will occasionally crash into a proton or neutron, creating another subatomic particle called a muon. The muon enters the South Polar ice from below, traveling extremely fast, emitting a shock wave of faint blue and ultraviolet light. Detectors embedded in the ice can track the muon as it travels through the telescope, allowing researchers to reconstruct the original neutrino’s energy and direction and determine its source in the cosmos.

The news so far is....no news. In a recent paper, AMANDA investigators reported no evidence of neutrinos from gamma-ray bursts, but the good news is, they didn’t expect any. According to the Waxman-Bahcall predictions, AMANDA-II is not likely to see anything from gamma-ray bursts until it can be made at least ten times more sensitive to neutrinos. And that’s precisely what the South Pole experimenters are working to do. AMANDA-II is being

incorporated into a vastly expanded array, known as **IceCube**, which will have more than 4,000 detector modules spread through more than a cubic kilometer of ice. If the enlarged array detects neutrinos emitted from gamma-ray bursts, the achievements will become yet another parcel of John Bahcall’s scientific legacy.

And for the American taxpayer it will be one of the truly great achievements in science by the U.S. Antarctic Program that will help maintain American leadership in the understanding of extraterrestrial events.

**PENGUIN DECLINE NEAR PALMER.** (excerpted by John Spletts from website <http://www.msnbc.msn.com/id/19918376/from/ET/>)

Population figures of Adélie penguins from the 2006-07 Antarctic season could well signal a harbinger of one of the common buzzword phrases of today, ‘global warming.’ Bill Fraser, biologist at the Polar Oceans Group, Montana State University, Bozeman, summarizes the status of many years research under NSF funding in the area of Palmer Station in the Antarctic Peninsula. Since he started working at Palmer in 1974, Bill’s time there on an annual basis gives him priority over all the Adélie penguins that he has counted, weighed, and burped, because the intervening 33 years is more than any of the penguins there have achieved in age since hatching. He probably knows many of the birds by their first name. Bill is talking about a small group of islands within the Palmer area, but on one of the nearby study sites, within sight of Palmer, Torgersen Island is one commonly visited by tour ships, with tourists going ashore to see the Adélie colony. Bill or one of his colleagues accompanies the group to explain the locality and provide information about the colony, which for many years has been divided into a control group that visitors don’t enter, plus a group for public viewing by tourists. If you visited Torgersen and you saw a tall, lean Montanan wearing a faded pink baseball cap (which he won in a poker game), you met Bill Fraser. Ironically, for some years the Adélie population at Torgersen was increasing, even though tourist visits were frequent, and on a nearby island never visited by tourists, the Adélie population was decreasing. Ask Bill about that the next time you visit Palmer. I think it’s called a factor of snowfall differences and orography.

To summarize Bill’s figures, in 1974 he counted 15,200 breeding pairs of Adélies on all his study islands. In 2003 the figure was reduced to 5,635 pairs, and in the recent season ending 2007 there were 3,393 pairs. So, Bill, what is going on? Rising temperatures in the Peninsula have produced not only breakup of ice shelves, but also caused more snowfall and less sea ice distribution, with the result

being that more snowfall on penguin colonies means a delay in returning to the breeding sites and nest-building, later hatches, and fewer birds. When Bill started his work, the weather was cold and dry, and it is now warmer and wet, making a major difference in the breeding cycle of penguins. He predicts that the colony will be extinct in only 8 years. This doesn't mean that Adélie penguins will be on the endangered species list, because there are numerous other colonies around Antarctica. A SCAR report published in 1993 lists a 'minimum' population of breeding pairs of Adélies at nearly 2.5 million, and it is possible that by that date not all existing colonies had been discovered. Bill, don't quit now, at least while there are penguins to count. You have 8 more years to retirement.

### **LAKE VOSTOK – NO FISHING JUST YET.**

(Information from Igor Zotikov to John Spletstoesser.) In the continuing saga of subglacial Lake Vostok, located some 4,000 meters below the IGY station Vostok, the issue that keeps recurring among the scientific community is that of sampling the lake water and bottom sediments without introducing contamination. Relatively recent discoveries of subglacial plumbing that might connect the water of numerous lakes have produced more concern among those who suspect that life forms such as microorganisms might exist in the water, and if Lake Vostok is penetrated and sampled but also unintentionally contaminated, numerous other lakes might be affected. Lake Vostok has been measured by every means available, including recent seismic and airborne gravity surveys, and estimates of the depth of a lake about the size of Lake Ontario approach 1,200 m at the deepest part. The ice cores collected as a result of drilling to date are valuable on their own, providing a climatic record of more than 400,000 years. Drilling reached a depth of 3,623 m in the 1997-98 season, which remained the situation as of 2004. Drilling continued by the Russians in 2005-06 into the remaining 120 m of ice above the ice-water contact, extending the depth to about 3,650 m as of Feb. 2006. Since then, Dr. Igor Zotikov, Institute of Geography in Moscow, provided information in August 2007 from Prof. N.I. Vasiliev, head of the drilling team at Vostok, indicating that drilling resumed in Dec. 2006, and a series of two drilling exercises extended the depth in 2007, the first to 3,658 m, where the drill got stuck in the hole, and after it was retrieved, drilling resumed in mid-February to reach 3,666 m, some 75 m or so above the ice-water contact. Bottommost ice cored appears to include ice formed from lake water, not glacial ice. Concerns remain, however, about the stability of the hole and surrounding ice at a depth where potential fractures might be encountered, with breakup of ice to an exit of less resistance --- the lake itself. So far, so good, as the Russians have proposed a means of penetrating the lake safely and sampling not only the water

but also bottom sediments. The book on Lake Vostok by Igor Zotikov (Springer, 2006) describes the method, and also other details of Igor's relationship with this project.

### **SOUTH AFRICA NATIONAL ANTARCTIC**

**PROGRAMS.** (By Rob Flint) On Friday, May 11, I visited the offices of the South African National Antarctic Program in Pretoria, South Africa. At the time I was on a tourist/educational trip to South Africa to learn of the history, geology, culture of the country and to enjoy the magnificent flora and fauna (not to mention the fabulous food and wine) that the country has to offer.

SANAP is a division of the Department of Environmental Affairs and Tourism. Their main offices are in Cape Town – the Pretoria office is a smaller operation in the administrative capital. I met with Richard Skinner, Deputy Director for Antarctica and Islands. Once past security (seems to be a world-wide part of government offices these days), I was in the familiar surroundings of impressive photos, maps, and posters of Antarctica on the walls and models of stations and technological equipment on display: somehow all government offices, contractor offices, and university labs that have anything to do with Antarctica have a similar ambiance around the world. I must say, I love these displays. It is interesting to see how others have adapted to and devised experiments upon the ice sheet and exposed areas that were home to so many of us in our Antarctic careers.

Mr. Skinner gave me a collection of literature and we had a very pleasant conversation about common acquaintances and interests. It was also most interesting to me to learn a little about the Antarctic background and present Antarctic efforts of the South Africans. South Africa's scientific efforts go back to 1959; so their program dates back to just after the IGY. There are three main bases in the program. There have been a series of bases on the ice shelf, but the present mainland base (SANAE IV) is located on a rocky nunatak. In addition there are bases on Marion and on Gough Islands. Gough and Marion began as meteorological stations, but now there are modest research efforts on both islands (Gough is a British protectorate which is operated by SANAP). SANAE IV can house 20 winter-overs and 60 summer personnel. It hosts a full range of scientific programs including upper atmosphere physics, geology, climatology, and biology. In size and scope, it reminds me of Dumont D'Urville -- it would not be a bad place to winter.

After our meeting, I rejoined my tour group for a lunch of springbok, crocodile, and kudu. Wonder if they serve them at their bases?

### **DAVE BRESNAHAN RETIRES – IS THERE ANYONE LEFT AT NSF?**

After 37 years with the U.S. Antarctic Program, Dave Bresnahan retired at the end of July 2007 to seek greener pastures and relax. Dave's first deployment to McMurdo was in June 1967 as an undergraduate student and research diver on a project funded by NSF. He returned in 1968 as the Field Center Manager for the contractor, moving supplies into the new Berg Field Center (BFC) in January 1969. He began working full-time at NSF's OPP in December 1970 and has paid his dues many times over by managing to keep lots of balls in the air and somehow making things come out the way they should. Interaction with contractor personnel, flight crews ('air ops'), and other support units of the program is not an easy job, but Dave made it work, and anyone who has passed through McMurdo knows what that means. When Dave welcomed newcomers in the Chalet and pointed out the tax-payer cost to position a person at McMurdo, he followed that with "and the meter's running." In other words, "get to work." Dave is the last of the old-timers at OPP, as most everyone else presently in the office dates from the 70's and later. We haven't seen the last of him, though, as his specialty in organization has earned him some consulting time with wannabe contractors preparing proposals for the next bidding procedure. Everyone gets a feature, of course, and in Dave's case, he earned 'Mount Bresnahan', in northern Victoria Land.

**KARL ERB AWARDS.** Karl Erb, head of NSF's Office of Polar Programs, has been named a *Chevalier* of the French National Order by the President of the Republic of France. The award was made for Karl's "contributions to the development and enrichment of French-American relations in science and technology." (See NSF Press Release 07-076 on NSF website for further details.) Karl Erb is a physicist who previously served as science adviser to the NSF director and in the White House Office of Science and Technology Policy. The award was only one of several for Karl this year, as he also received one from New Zealand for its "appreciation to the United States for long-standing support of the New Zealand Antarctic Programme and U.S. efforts to access Ross Island during a period of difficult ice conditions in 2003-2005." (Lou Sanson, Chief Executive, Antarctica New Zealand, Christchurch.) The award was presented by NZ Prime Minister Helen Clark, and was one of a batch in Queen Elizabeth's New Year's Honours List. Last but not least, he also received the President's Distinguished Service Award, the highest award for U.S. career civil servants. It would appear that the U.S. Antarctic Program is in good hands. Congratulations, Karl!

**COMING ATTRACTIONS.** The complete recovery of our faithful Antarctic, Polly Penhale, from a gall bladder operation at Johns Hopkins on September 20<sup>th</sup>....In anticipation of the holidays, please buy your Antarctic calendars now (see p.4).....Next issue will feature Top 27 Antarctic CDs by the musical Valmar Kurol....Also you will find an interesting recreated conversation between Roald Amundsen and Paul Dalrymple which took place at Roald's monument in Tromso on August 30<sup>th</sup>.....plus tributes to Cam Craddock at the August session of the International Symposium on Antarctic Earth Sciences.

**WE HAVE LIFTOFF !!!** In one sense, February 1, 2008 marks a major milestone in the history of the Antarctic Society. In another sense, it marks the point at which the Society simply caught up with the rest of the world. That was the day that our new website, "http://www.antarctican.org" went live. The web is a marvelous vehicle for communication and democratizing information and now we – the entire Society – can take full advantage of it. This is your website, your resource, your way to reach other Society members and Antarcticans young and old, in spirit or in fact. It is a work in progress that, with your help, will improve over time. The best way to learn about the site is simply to go there. Those of you comfortable with navigating the web will hopefully find it easy to explore. For those of you still intimidated by the web or without a computer entirely, what is described here will perhaps inspire you to become a “web surfer” at your local library. The site design is based on input from the membership collected last summer through a survey. A lot of suggestions, preferences and “must have’s” were recorded. The results were synthesized into a set of requirements and a “wish list” of future enhancements. Here is how the site design has addressed the central requirements:

Maintain the people-centered focus. The website continues the Paul Dalrymple tradition of focusing on people that has been the hallmark of his newsletters for over 30 years. To that end, all of the newsletters are archived on the site. There is also a Mail Bag section which will contain interesting past and current letters received, as well as selected emails from members, all published with the consent of the authors. Finally, articles about Antarcticans that are too long for the newsletter will appear on the website.

Serve existing members. While a great deal of the site is open to the public, there are members-only pages that are password protected. Included in this category are the newsletter archive, the members list, and newsletter indices to book/film/theater/music reviews, biographical sketches and obituaries.

A common thread throughout the survey responses was the desire to have a website that will facilitate communication and networking among members. In response, the Antarctic Society Forums area allows members to post and read messages, solicitations and opinions on any subject they desire. The posts will be archived on line so that threads of discussion over weeks, months and years will be preserved.

Attract new members. Voluntary societies such as ours either add new members or eventually die. Younger Antarcticans are sometimes not aware of the rich history of exploration and science in Antarctica. Our membership includes numerous prominent and lesser-known Antarcticans that actually carried out that exploration and science. Conversely, our members are keenly interested in what is going on in Antarctica now. The website is one way to connect the two. A freely accessible website literally allows the world to see who we are and what we do. The Time Trek feature (discussed below) is going to be a cutting-edge web tool to allow the younger web-savvy Antarcticans to explore the continent's history (and our members' contributions) in a new way.

In addition, the Society is taking another step to encourage current Antarcticans to take a look at us. We are offering free membership to winterovers at Pole and Palmer Stations for the duration of the winter. Common usernames and passwords will be provided through the station managers to all station personnel, allowing them full access to all parts of our website. At the end of the winter, the usernames will be retired and then the winterovers can decide whether or not to join as paid members. What better way to let current Antarcticans know who we are than through a captive audience with time on their hands!

Preserve and document history. The history of our Society is inextricably linked to the history of Antarctica. Our membership is extremely interested in researching and preserving that history, as reflected in the survey responses.

Time Trek is a feature of our website that will hopefully go a long way toward meeting this desire in an exciting new way. As the name implies, it is meant to be a vehicle to travel back through Antarctic time, but in a visual as well as a documentary way.

Many of you are aware of or have used an incredible geographic web application called Google Earth. Google now has more money than many developing countries and has been pouring a portion of it into buying and otherwise collecting detailed aerial imagery over the entire globe and making that data available through a powerful interactive web tool. If you haven't seen it, have a fairly new computer and are not on a dial-up internet connection, go to earth.google.com and download the plugin. You will be amazed! You can zoom from a view of the entire earth down to details of individual houses quickly and easily, for most of the world! In December, Google Earth published the Landsat Image Mosaic of Antarctica (LIMA) for almost the entire continent. This is 15-meter resolution data for an area the size of the continental U.S. and Mexico combined. They will keep adding to and improving the data in the future.

Time Trek takes full advantage of Google Earth. The really good news is that Google Earth is free and Google has opened it up for integrating other applications through an application programming interface. What we have done is develop a unique application that combines a slider bar-controlled time line with documentary information about events, geographic features, stations and images and links it all to Google Earth to display where those things are on the Google Earth imagery. All of the Google Earth tools for navigating the imagery are available to users.

The easy part (relatively speaking) is the development of the application; the harder part will be getting all of the historical information into it. But that is also the fun part and the part that could help rejuvenate the Society. Collectively, we have an enormous reservoir of resources that can be tapped into. We could, in a sense, use the wikipedia model where members contribute their pieces of knowledge, photos, letters and other recorded artifacts for inclusion into the timeline. The idea is to not only capture major events – as might be seen in textbooks – but also events and knowledge that might go undocumented otherwise. How many of

you kept lists of people that participated in particular field camp, or have a story about a discovery that may not have made it into a scientific journal? These are only two examples.

Time Trek is not only a multi-media historical tool; it also could be an attraction for younger Antarcticans and a feature that makes our website stand apart from others. That is the goal. So how do you get full access to the site? If you are a member and you wish to use the members-only areas of the site, simply contact Tom Henderson at [webmaster@antarctican.org](mailto:webmaster@antarctican.org) and provide what you want for a username and password. You will then be set up in our user database and notified by return email that you are registered. At that point, you simply login. Note that there is a separate login for the Forums area. However, that area allows you to register yourself. There is a user's manual available on the Members page that explains how to do this. There is no requirement that the website login and password be different from the Forums login and password.

Happy exploring, and use the Forums to let us know what you think!

**BRASH ICE.** When our November Newsletter went to print, we were all excited about drafting the next issue as we knew the Society's website existence would be ready to be announced, we knew the South Pole Station was going to be dedicated, and that there was an outside chance that its library might be named after our last Honorary President, Ruth J. Siple. But then things started to hit the fan tail, and it seems that some very important Antarcticans started to bite the dust, including a most popular cruise ship. And some strange things happened to human beings on the ice, who lost control of themselves over the holiday season. Some of these happenings we hope to cover within this Newsletter, but in some cases there will be supporting articles on our website.

We started this Newsletter with Tom Henderson walking us through the website which he has diligently prepared for our Society. Tom's address and contact numbers are on the breadboard on the cover page. And please check out the addresses of our officers, as many have new e-mail addresses.

As we were writing the last paragraph, we had an incoming call from Jerry Marty at the South Pole.

He reported that a plaque is going up on the library walls designating it as the Ruth J. Siple Library! (see cover) This has been a long, hard call, and as you faithful readers have noticed, we have cooled all comments on this possibility ever happening. Jerry has been an avid supporter all along of our proposal, and Polly Penhale has backed him up. Past Station Scientific Leaders have also supported our proposal. I can still hear Jerry's immortal words at the time we proposed this to him, "This will be a slam dunk" Well, it wasn't, but thanks to Jerry's perseverance, it all has come to fruition. I am so happy, so very happy, as Ruth was such a special person to all Antarcticans. Pictures of both Ruth and Paul Siple will be hung in the library. Jerry, could I buy you a drink tonight?

As you may have noticed in our last Newsletter, The Fund made its first contribution to the library at the South Pole, as musician Valmar Kurol of Montreal selected and collected twenty-seven CDs of Antarctic music. Bob Small, son-in-law of Gracie Machermer, known to many of you, is an expert woodsman, and he tooled a beautiful cherry box in which they are housed at the South Pole. We have spread our wings into the Antarctic Peninsula, and with the help of Valmar and Bob, a complimentary set is being sent to Palmer Station.

**MEMBERSHIP DUES CHANGED.** Our bills for the calendar year 2008 will soon be in the mail. Over half of our membership have already paid ahead, so naturally those folks will not be getting dues notices. We are dropping the family membership, as basically this was a gimmick to pick up extra dollars when we were in Washington, had local meetings where both husbands and wives attended. So all members are now individual memberships..

Dues are going up three dollars, so from now on our individual dues are \$15.00 per year. Foreign memberships will remain \$20.00 per year. If you are one of our members opting to receive your Newsletters electronically, your fee will be \$12.00 per year, whether national or international. If you should live in Canada, we recognize you folks as our American cousins, and you will be considered as such when it comes to billing. Thus you will be billed \$15.00 per year.

Bills going out will have an extra line for a write-in for the Ruth J. Siple Fund. We are recognizing the Ruth J. Siple Fund as our official charity, one

whereby we will buy books or CDs for the Ruth J. Siple Library at the South Pole . In addition to your individual donations, the Society each year will make a donation of a dollar for each member to the Fund.

### **BOLLING BYRD CLARKE, ICON OF THE BYRD FAMILY, SUCCUMBS AT AGE 85.**

Nearly twenty years ago I got a telephone call from Society Expeditions saying that they would like to have a nostalgic cruise to Antarctica, and wondered if I could get Bolling Clarke, Ruth Siple, and myself as speakers. I knew that Bolling and her male companion were camping out in Maine, and would be at my house later that week, and I talked daily to Ruth, so in a few days we were all committed for a fantastic 24 day cruise which took us to the Falklands, to South Georgia, to the Peninsula and the Chilean coast. Two days before leaving, Ruth called up and said she was canceling out, that she could never stand up and talk to a shipload of eager tourists. I was furious, and said “Ruth, you just keep quiet and show up, and I will give all your lectures for you.” And so it was to be! Bolling was in Seventh Heaven on the WORLD DISCOVER, loved every minute of her first and last cruise to Antarctica. She loved talking about her famous father, and was a delightful advocator of his many accomplishments.

Now let’s fast forward to last spring, and put ourselves in San Diego, where the U.S. Navy was going to launch still another ship named after Admiral Richard E. Byrd. And who was the Guest of Honor who was going to make sure that the ceremonies were done properly, yes, Bolling Byrd Clarke. There was a flock of Byrds there, but Bolling was the one chosen to smash the bottle of bubbling stuff as the ship slipped silently into the harbor as dusk settled over the city. When Bolling ascended the steps to the launching platform, I wondered to myself if she was going to make it, but a convoy of junior Navy officers in their dress whites saw to it that she got to the designated spot. Afterwards she hosted a large gathering of friends and family in the ballroom of an elegant seaside hotel where she seated herself at a large round table greeting everyone. It was the last time that I ever saw Bolling. She was still a very striking female, her most gracious and personable self, but I walked away from her with this inner feeling that perhaps I would never again see her. If this was to be her last formal fare-thee-well, what a way to go with Navy bands blaring, high ranking Navy officers

talking from prepared speeches, and your whole clan there listening to accolades about their forefathers. Scripted by Hollywood, played out in San Diego!

Bolling had a most distinguished career in her own rights, but during World War II it wasn’t all that great, as she tended livestock and milked cows in Maine. She attended Swathmore where she met her husband-to-be. She and he got together and produced four children, three being daughters, one a son.. She was an active Girl Scout leader for many years, but she will be remembered mostly as a medical counselor. For twenty years she worked as a family planning special-projects coordinator and medical counselor in obstetrics and gynecology at the University of Pennsylvania. During her late years, she made many appearances at polar meetings, so became well known to many of our membership. We will miss you, Bolling.

Pick up the torch, Robert Byrd Breyer,

**BOB THOMSON** (Al Fowler) In January two famous New Zealand explorers and expeditioners have passed on. One of them was Robert B. Thomson, known to all Kiwis as Mr. Antarctica. When I entered his name and hit search on our new Antartican Society CD there appeared a list of 16 entries. Then I found another entry about Bob’s performance as speaker at a meeting of the Society in 1969. He was the speaker again on November 7, 1995.

From 1965 to 1988 Bob Thomson served as Superintendent of the Antarctic Division of New Zealand’s Department of Scientific and Industrial Research. Most everyone in the U.S. Antarctic Program during those years was acquainted with Bob while passing through Christchurch or down on the ice. Bob has been my good friend since 1972 when I started as the Deep Freeze commander, and then was the Deputy at Polar Programs, NSF until 1988. Bob and I sat on the SCAR Working Group on Logistics, where he was the Chairman, and we both attended all the SCAR meetings from 1974 through 1988. Bob’s earlier career on the ice started in the IGY when he was the radio operator and electronics technician on Campbell Island. Then he was the scientific leader at the jointly run US/NZ Hallett Station in 1960. After that he went with the Australian program and wintered as scientific leader at Wilkes Station 1n 1962.

I remember many pleasant hours spent with Bob; none of them at total leisure, certainly not recreation -- he didn't do that; worked all the time. During our times together the closest Bob ever got to recreation was when he told me about his dream to trek the full length of the Wright Valley. He had it all planned and insisted that I participate. He was a good story-teller, and the stories I most enjoyed involved his memories as leader of the tractor traverse round trip between Wilkes and Vostok stations in 1962. That was 900 unknown miles getting up and on the high plateau. He told of navigating with sunshots and the rear view mirror, and of making repairs on the machines in the most awful conditions of thin air, relentless winds and very, very low temperatures. His performance as leader of that successful traverse was later recognized when the Queen awarded him the Order of the British Empire. Bob Thomson has also received foreign honors from the governments of USA, Japan and Australia. It seems especially appropriate that the main building of the new Scott Base is the Thomson Building. Bob was the responsible guy who dealt with shrinking budgets and conflicting visions to prevent the NZARP from becoming summer-only, and to make the redesign and new construction at Scott Base a reality. With his 78 trips to the ice Bob holds the all time world record. At least two geographic features in East Antarctica are named for Bob Thomson

I suspect that Bob Thomson's most challenging and difficult time as head of the New Zealand program started with the 1979 crash of the Air New Zealand sight-seeing DC-10 on the slope of Erebus. The aftermath included the recovery and identification of 218 of the 257 who died instantly. There followed a whirlwind of inquiry, investigation, sanctification of the site as a tomb, and various legalities; and Bob was at or near the center of it. In due course, Bob wrote his own personal comprehensive book-length account of the tragedy, but it apparently was never given government approval to be published.

Over the years there have been a number of instances where American Antarctic men going to and from the ice managed to capture New Zealand women to be their wives. Bob Thomson did it the other way. As the story goes, Bob first met, and apparently proposed, to his wonderful American wife, Betty, in a hotel elevator where their paths crossed in Hawaii. He even managed to

convince her to pull up stakes and move to New Zealand.

Bob and Betty designed and Bob built a beautiful house high on a steep hillside overlooking the ocean at Sumner, near Christchurch. They once told me about spotting the vacant lot on a picture post card, then finding and convincing the owner to let them buy it. After he retired, Bob and Betty moved to a place called Moneta in Bedford County, southern Virginia, where Bob's propensity for work and leadership was again apparent in his service as President of the Beechwood Shores Association.

My wife and I teamed up with Bob and Betty at SCAR meetings, including Chamonix in 1978, Queenstown in 1980, and San Diego in 1986. For Bob, however, those SCAR meetings were pretty much all hard work as leader of the Working Group on Logistics. Part of the pay-off for his efforts resulted in a well-planned Third SCAR Symposium on Antarctic Logistics that took place in Leningrad in 1982. It was there that his planning resulted in an outbreak of bonding and information-sharing among the assembled brethren of national operators and managers. While Bob was an accomplished logistician he had also established himself among the Antarctic scientists as one who walked the walk and talked the talk. I think of Bob Thomson as one of the very important people who contributed to the success of the Antarctic Treaty System as it flourished during the time of the Cold War.

#### **ED HILLARY ANTARCTIC ASSOCIATES.**

Your attention is directed to our website where there are three personal letters to me from two of Ed's Associates which you should find of great interest.

We aren't going to write an obit on Ed Hillary, as all of you have probably already read extensive obituaries on him in your favorite publications. The NEW YORK TIMES, as an example, devoted three-quarters of a page to Ed's passing. The CHRISTCHURCH PRESS published a 12-page supplement on Ed, "Tribute To A Hero", which we contemplated buying copies for our members. Our Faithful Kiwi POC, Margaret Lanyon, sent us two copies of it, but after reviewing it, we felt that it was not worth their asking price.

What qualifies me to write anything about Ed Hillary and his Antarctic comrades? I first met Ed at Scott Base in January 1957 when he was hammering nails, carried in his mouth, constructing their camp. Then I was at the South Pole when Ed and his party of Kiwis (Peter Mulgrew, Murray Ellis, Derek Wright, and Jim Bates) arrived at the South Pole Station on January 3<sup>rd</sup>, 1958. Peter stayed on with us, but the rest caught a flight back to McMurdo two days later. Ed returned on January 18<sup>th</sup> to await the arrival of Bunny Fuchs and his Weddell Sea contingent of the British Commonwealth Transantarctic Expedition (TAE), which arrived two days later. All of the TAE members took off on the 24<sup>th</sup>, ending a very exciting time. I tape-recorded nearly all members of the TAE, and they remain a treasure in my home.

But who were the associates of Ed? One was his childhood mountaineering buddy from New Zealand, George Lowe, who was traveling with Fuchs as his photographer. George was also with Ed on Mt. Everest, and his film, THE CONQUEST OF EVEREST, won the best documentary film of the year, 1953. George's film on the TAE never received any notoriety, but he was/is a real nice guy. He arrived at the South Pole wearing a broad-brimmed sombrero, driving a weasel with his code name, Wrack and Ruin, painted on its hood. Some forty years later when he and his second wife visited me at my redoubt on coastal Maine, I shocked him by playing back my interview with him from the South Pole.

Another man who was very close to Ed was Peter Mulgrew, another mountaineer, who served as Ed's radio man. Where he stayed with us at the South Pole for several weeks, we all got to know him very well, a most lovable chap. As many of you may remember, Ed was not supposed to go all the way to the Pole, as their mission was to set up depots of support for Fuchs on his way down from the Pole. But where Fuchs was late, where Ed was ahead of time, there was no stopping of Hillary and he sent a message to Fuchs saying something like Hell bent for the Pole. This was greatly overplayed by the press, and I think I know of what I speaketh, as I also became a very close friend of Fuchs's radio operator, Ralph Lenton. So close, I was his best man when he got married several years later!!

I think you know the rest of the Mulgrew story. Ed had a son who he named after Peter, and this son,

along with a couple of Australians, later had their own expedition to the South Pole. Peter was a double amputee, losing both of his legs on a mountain climbing expedition to Makalu. Then, as a last minute substitution as a lecturer for Ed on an Air New Zealand DC-10 tourist flight to Antarctica, Peter lost his life when the plane crashed onto Mt. Erebus on Ross Island. Ed had lost his wife and a daughter in another plane crash, this one off the airstrip at Katmandu. Quite a few years later Ed married Peter's widow, who became Lady June.

Ed and Bunny Fuchs teamed up as Antarctic lecturers on the Orient Line's MARCO POLO. They lectured on the ship for several years, along with another member of our Society, Jackie Ronne. But Ed and Bunny sorted of drifted apart, and most unfortunately Ed's last book, VISION FROM THE SUMMIT, came out when Bunny's health was deteriorating. The bad part was that Ed presented in the book his differences with Fuchs. This did not play very well in the UK, Bunny's second wife was quite furious, and shortly thereafter Fuchs died.

Another member of the Hillary's successful expedition to Everest was Griff Pugh, a high altitude physiologist, who somehow got a ticket to the South Pole to greet Fuchs's party. Most of us thought he was sort of a queer duck, but he blended in well with press from around the world so wasn't too conspicuous.

One of Ed's best friends was the engineer on his oversnow traverse to the South Pole, Murray Ellis. His parents owned and operated the Arthur Ellis Company in Dunedin, which at the time made the world's finest down sleeping bags. Murray built a lot of school houses with Ed in the Himalayas. When I came off the ice in early December 1958, after two consecutive years in Antarctica, after a one-night sleep in Christchurch, I caught a plane the next morning to Dunedin to visit the Ellises. Then thirty years later, I happened to spend the best New Year Day of my whole life with Murray and Shirley Ellis. They had a summer home in Arrowtown, and we all went on a hike towards majestic Mt. Aspiring, a favorite climb of several generations of Ellises. Shirley packed a great picnic lunch and Murray and I filled an ice cooler with cold beer. It does not seem possible that Ed has now gone to join Peter Mulgrew, Bunny Fuchs,

Ralph Lenton, Murray Ellis, and some others from the TAE.

Another one of Ed's Kiwi mountaineering buddies was Harry Ayres, who is often associated with being the guide who really taught Ed the mysteries of successful mountaineering. Ed wanted him as part of his crew at Scott Base in 1957, but he failed to pass his requirements for qualification. But Ed insisted that Harry should go, and he was finally accepted. Many years later, his son also went to the ice to participate on some oversnow traverse. I had the opportunity to meet Harry at Mt. Cook, when he was the ranger at that fantastic house looking straight up the valley.

Ed and Murray went back to the ice for five weeks in 1967 and climbed Mt. Herschell while trekking the Cape Adare area. Ed also went back to McMurdo and Scott base several years later with George Lowe. And he has been a frequent visitor to Scott Base in recent years. While there celebrating the 50th Anniversary of the construction of the station, after the official delegation had departed, he asked permission to stay an extra night so that he could sleep in New Zealand's "bach", an A-frame abandoned by the Americans more than 20 years ago which subsequently was towed by the Kiwis to Scott to create a holiday home. Ever the dreamer, he longed to relive old times, spend another night with a few mountain men in a small hut, cook over an old-fashioned Primus stove – just how he had spent his first night in the Antarctic some fifty years before.

During the past summer, one of the doctors on the TAE, Rainer Goldsmith, hosted a 50th Anniversary Celebration for the TAE in his home in England. Probably the most able bodied soul to show up was Ken Blaiklock, one of Fuchs' dog team drivers who has continued to go to the ice as a surveyor until recent years. Once he supposedly held the record for most miles dog sledged in Antarctica: 5000. One of Rainer's granddaughters, Anthea Arnold, has written a book, based on his diary, EIGHT MEN IN A CRATE. Charles Swithinbank says "It is a good read." It is reviewed in our website by Charles Lagerbom. Another book on the TAE which is coming out this year is one by the Australian geologist from Brisbane, Dr. Jon Stephenson.

In closing this story about Ed and his Associates, I would like to include one about the two of us. My

diary shows that on the morning on January 20th, 1958, Ed and I went up into the aurora tower at the South Pole at 8 AM to gaze out over the snowscape to see if we could see Fuchs's party on the horizon. A half hour later we spotted them, then we lost them as they went into a depression, only to reappear a few minutes later. It was the biggest moment of my life, to be alone at the bottom of the world with the world's humblest hero who had conquered the world's highest mountain, when who should appear on the horizon but a Bunny, later to be knighted, who was in the process of completing some unfinished business planned and not executed by another knight, Sir Ernest, the very first Crossing of Antarctica. What a Moment!!! And I took a bit of solace out of the day that even I could grow a better beard than Ed's.

One of our members who knew Ed, called him and told him that Ruth Siple was seriously ill, probably would not survive much longer. He asked Ed to call her, and lo and behold if she did not die a week later. Ed wrote me on August 8, 1979. "Like everyone I've had my good moments and my bad, but on the whole I have been very fortunate." I think the fortunate ones are those of us who had the opportunity to get to know him.

**TRIBUTE TO A HERO.** (Christchurch Press,) We have pulled several segments about Ed from this supplement which accompanied their issue of January 14, 2008. Mike Crean, Philip Temple, and John Henzell were three of the main contributors. It was said that Ed was "neither religious or political, that he believed in universal brotherhood and equality. Inclined to be blunt, he spoke out against corruption and greed, sometimes incurring the wrath of others. An outspoken call for honesty in government brought an angry response from then National Prime Minister Keith Holyoake. In 1975, he joined Citizen for Rowling, a group of notable New Zealanders opposed to the political style of National's Robert Muldoon. So it was a clever stroke when a Labour Government appointed Hillary New Zealand High Commissioner to India (with responsibility to Nepal) in the 1980s. He had no diplomatic training or experience but was a hugely popular figure there. He was proud to be a New Zealander, understood being a New Zealander meant being humble, willing and able to mix with people at all levels.

"He was president of the New Zealand Volunteer Service Abroad and interested himself in such

diverse causes as family planning and race relations. Hillary had little grace of manners, being gruff and casual with strangers, but he came into his own in the field. Here the ebullient, restless Hillary, as George Lowe described him, retained basically the same spirit of adventure and (and there is no other word for it) fun, long after he became famous,

He was appointed to the Order of New Zealand (ONZ), in 1987, the year in which the order was initiated by the Queen. He was appointed a Knight of the Garter (KG) in 1995. Hillary received the Royal Geographical Society's Founders Gold Medal in 1958 and in 1960 was back in the Everest region with an ambitious program largely financed by the American publishers of encyclopedias, Field Enterprises Foundation, of which he was to become a director. He also served as a consultant of sports equipment to Sears Roebuck.

It was said that Hillary's most famous words were probably "We knocked the bastard off" in reference to climbing Everest. Well, they are probably right, but I would like to have a lip reading expert look at the film *Conquest of Everest*, of which I have a copy. It appears to me that as Hillary and Tensing approached the camp where George Lowe was photographing, George zoomed in real close to their faces, and that Ed actually said "We made the son-of-a-bitch" To me it would seem more logical!

#### **MEMORIAL SERVICE HELD ON ICE**

(Anna Chalmers, Christchurch Press, 14 January 2008) In a small, wooden chapel overlooking the Antarctic sea ice, about 100 mourners shared a special memorial service for Sir Edmund Hillary. The stained glass windows of the Chapel of the Snows provided the perfect backdrop for yesterday's celebration to honour Hillary's 50 years of involvement in Antarctica.

Hillary's determination, humility and generosity were recurring themes. "It's the most common denominator to this man - and I think everybody knows it," Scott Base coordinator Yvonne Boesterling said after the service. Hillary set up Scott Base in Antarctica in 1957 and in January 1958 led the first party to reach the South Pole by land since 1912, driving a modified Ferguson tractor. He made repeated visits to the ice, the latest in January last year, when he stayed in a small A-frame hut to celebrate the base's 50th anniversary.

Every New Zealander at Scott Base who could be present attended the service, along with United States personnel, Boesterling said. Photographs of the great adventurer, including during his 1958 expedition, were included in the memorial service, led by Father Tom O'Connor, who heads the interdenominational chapel at McMurdo Station. It also included Pastor Todd Luce with eulogies from Antarctica New Zealand spokesman Dean Peterson and Scott Base science technician Peter de Joux. They prayed for Sir Edmund's family: that they might be comforted, while at the same time remembering with joy the great man that they have known and loved. Mourners sang *Amazing Grace* and gave thanks for Hillary's life. After the service, mourners headed to the rugby field for a New Zealand versus the United States rugby game.

**ANTARCTIC HERITAGE TRUST** (John Henzell) A heart-shaped aurora that formed in the midwinter night sky over the Hillary Field Center at Scott Base will help fulfil Sir Edmund Hillary's wish of saving the huts of the heroic age of Antarctic exploration.

Anthony Powell, a Kiwi who has spent seven winters on the ice, took a photograph of the aurora over Scott Base's newest building last winter. "I like to think of the heart shape in the photo being a symbol of love that Kiwis and the Antarctic community have for Sir Ed," he said. "One of the things I was considering even before I had heard he had passed was to make prints of the aurora available to the public to purchase, with all the profits going to the Antarctic Heritage Trust."

Powell, originally from Taranaki, went to Antarctica as a satellite communications technician at Scott Base but has since been working at the neighbouring McMurdo Station where his amateur photography earned him an artist's fellowship from the United States Antarctic Program.

Hillary was a passionate advocate of saving the huts used by Robert Scott and Ernest Shackleton in Antarctica and used his last visit to Scott Base a year ago to rail against the failure by the British Government to put money towards their preservation. The preservation plan is being run by the Christchurch-based Antarctic Heritage Trust. Soon after Hillary's comments, the British allocated money to the fund but still well short of the estimated \$9 million cost of saving the huts.

**Loss of the ship, “M.S. EXPLORER” By Keith Shackleton:** The graphic pictures of the M.S. ‘Explorer’ sinking through the ice of Antarctica provoked some varied thoughts – as indeed did the press accounts of the event. One was the display of consummate skill and professionalism by Explorer’s crew as well as that of ‘Nordnorge’ who came to her aid. If a definition of a ‘successful’ shipwreck is one with no loss of life, this was surely as successful as any shipwreck can be! But the thought uppermost for me was that this little ship deserved a short obituary. As she was undoubtedly, and from first hand experience, no ordinary ship. The description ‘cruise ship’, so often used in the press accounts, conjures up something she emphatically was not. She carried passengers it is true but it was her services in other fields, science, conservation, survey work and discovery that made her name – and at a time when there were no other ‘cruise ships’ venturing south to the Southern Ocean and Antarctica.

‘The little red ship’ as she became universally known, was launched in Finland in 1969 and embarked on her maiden voyage – to the Antarctic naturally – at the end of that year. She was the world’s first specialised, custom-built vessel to be commissioned by a travel company, for the purpose of carrying a small number of passengers into the furthest flung corners of the world. By the very nature of her purpose she undertook field work for every kind of international scientific organisation involving the oceans. She was equipped with winches for plankton dredging and research. She had a marine biology laboratory that doubled as a lecture room. Her staff were scientists as well as boatmen to share their enthusiasm and expertise with passengers, many of whom were their equal or more so in scientific terms. The company that commissioned her was Lindblad Travel of New York, headed by the legendary Lars-Eric Lindblad and for her first 15 years she sailed under the name ‘Lindblad Explorer’.

Because the Antarctic was Lars-Eric’s passion, he had chartered several previous ships and drew advantages from each. She was first and foremost an ice-working ship – Antarctica for the southern summers – then north to the Arctic – while exciting experiences lay between. In her first 15 years she became the furthest travelled ship on the high seas. She reached the furthest north for a passenger vessel and the furthest south and cruised over 1,300,000 nautical miles. By now, under her name

‘Explorer’ she must have more than doubled this figure. Some of her voyages involved spectacular rescues, logistical back-up to polar expeditions, delivery and collection of mail and equipment to polar stations, she attended medical emergencies and saved lives and in the process made a host of friends.

‘Lindblad Explorer’s’ final achievement was to be the first passenger ship to make it through the Northwest Passage in 1984 (Captain Hasse Nilsson, Master) – completing a valuable hydrographic survey on the way. As Dr. Layall Watson put it – “For fifteen years we lead charmed lives...” He was talking of crew and staff but I feel he was including everyone on board....

And now she lies at the bottom of the Bransfield Strait. Anyone for whom this little ship has been a second home for so many years will feel the poignancy of those final images. The one of her settling into the pack ice called up a somewhat prophetic quote from the book ‘Ship in the Wilderness’. ‘Lindblad Explorer’ was a true ‘ice ship’. Ice was her natural element and each year she seemed to be coming home to Antarctica for Christmas... One can not help thinking that the seas off the South Shetland Islands make a far more appropriate resting place for such a vessel, than any ship-breaker’s yard – anywhere.

*General Note. ‘Keith Shackleton was taken on as naturalist and Zodiac driver for the maiden voyage and worked in her constantly for many years to follow – including the North West Passage voyage 15 years on.*

**ADDENDUM.** The EXPLORER was a ship dear to many of our members, but probably to no one more so than John Spletstoesser, who sailed on her for many years. Dotte Larsen, our Society’s Official Whale Spotteress, made four cruises to the Antarctic with Keith Shackleton. She also went on the Northwest Passage cruise. Several members of our Society, including Jackie Ronne and Anne Parks Hawthorne, were on the EXPLORER when she was on the Weddell Sea side of Antarctica and caught a rogue wave which smashed port holes and hurled passenger around like ping pong balls. But, nevertheless, everyone seemed to love the Little Red Ship. John is even contemplating organizing a small deep-sea diving expedition to go on down and bring back his mattress. He is sure he can find it, as it was the only double bed on the whole ship.

There was something really ironic about the ship going down where she did, as it appears she picked her own final resting place, very close to Lindblad Cove which was officially named by the Board of Geographic Names after Lars-Eric Lindblad himself, Within a hundred miles!! She went down at 62 24'S 57 15'W. Lindblad Cove is located at 63 57'S, 59 27'W. She is between 1100 and 1500 meters deep.

I had heard that the Expedition Leader was Brad Rhees, a man who I had worked under on many, many cruises for Marine Expeditions. He was an ex-Marine, a perfect man to be on board a sinking ship. I once saw him pull a zodiac driver out of the water at Peterman Island by just grabbing his collar with one hand and lifting him back on board. No one seemed to know where Brad lived, but I felt lucky one night so tried Google. It seemed that there was only one Brad Rhees in the whole country, and he was out in Southwestern Colorado. I called him, and we had a good talk. He had been on the bridge all that evening. Sure enough he and the captain of the EXPLORER were the last to leave the ship. The ship was so far over on its side that they just stepped over the rail on the bridge into a zodiac and took off.

The amazing thing to me is that the berg that got the EXPLORER was evidently a real small one, much smaller, in fact, than the EXPLORER itself, maybe half its size. Apparently the bridge was aware of its existence, as the captain had made an announcement that there was a berg in sight, which they were going allow to drift out of their path before proceeding. There is a complete eye-witness account by one of the passengers, Pete D'Angelo, of what went on in our new website. You should read it, interesting, to say the least.

Another amazing thing about all this was the weather. First of all, they were darn lucky that the generators were still functioning when the passengers were being lifted in their life boats into the water, Then the seas were quiet, no brash ice or bergy bits around. And other ships were relatively nearby, so were able to pick them up under ideal conditions. Then, and only after everyone had been picked up, the winds came up and it got rough. If you saw the pictures taken by the Chilean Naval Air, you saw the EXPLORER within a solid ice-pack. This was a real Hollywood production, from beginning to end, with no lives lost, and the ship seeking its own cove as its final

resting place.

### **SOUTH POLE DEDICATION (FROM THE EYES OF AN ANONYMOUS POLIE)**

On Saturday, January 12th, a pretty historic event happened here at the South Pole. We all participated in dedicating the brand new elevated station. For us residents, this meant our workday was a little different than normal and it thankfully ended up being cut a little short.

The day started with the whole station going out in front of the old dome for a final group shot with the dome. After the picture taking, the flag was lowered on the dome and we all formed a chain to pass the flag up to the geographic south pole marker where it was folded properly. Then, the flags of the original 12 nations of the Antarctic treaty and the ceremonial pole were moved to their new resting place directly in front of the middle of the elevated station and we took another group photo. At this point, I was getting pretty cold from being outside for a long period of time and couldn't wait to join everyone else in the galley for coffee.

Later that day, the distinguished visitors flew in for a few hours and gave some speeches. We then raised the flag from the dome over the new station for the first time and cut a ribbon. There was some concern that the dv's weren't going to be able to make it in since there had been bad weather in McMurdo and no flights for a few days. However, everything worked out and the dedication happened as planned.

As far as dv's go, I didn't recognize anyone and actually felt kind of sorry for New Jersey residents as their congressman gave a speech in which he referenced polar bears in Antarctica and called McMurdo, McCurdo, even though he had just spent some time there.

After all the ceremony, we had an awesome dinner of filet mignon and lobster, and then, once the dv's left, we had our own party with some South Pole bands and some good dj'ing.

I would have to say overall it was a great day, and I'm happy that I got a chance to be part of Antarctic history.

**AMUNDSEN CONVERSATION WITH PCD  
PUT ON HOLD.**

Mr. John Spletstoesser 2002-04  
Mr. Robert B. Flint Jr. 2004-07

## ANNOUNCEMENTS

**YOU NOW HAVE A CHOICE, NEWSLETTER WILL BECOME AVAILABLE ELECTRONICALLY.** Starting with our next issue, anticipated in late January 2008, you can pick up your Newsletter on our new web site which will be up and running the first of the year. Members who choose to receive issues on the website will be given a password which will allow you access to the web site. And there will be a slight reduction (to be determined) in membership dues. Interested persons should contact our webmaster, Tom Henderson, whose address is shown on the masthead to the left. If you want to continue to get hard copies of the Newsletter, just keep quiet!

**JOINT DINNER MEETING WITH THE EXPLORERS CLUB, WASHINGTON GROUP, INC.,** on Saturday, December 1, 2007, at the Cosmos Club, 2121 Massachusetts Ave., NW. Dinner reservations, \$65.00 (check payable to ECWG) should be sent to Donald J. Gerson, 3148 Castleleigh Rd., Silver Spring, MD 20904-1713. Tel 240-293-6570. Speaker will be Dr. Anna Kerttula de Echave, the subject, The Human Face of Climate Change. See page 2 of this Newsletter for further information.

**SPSE/SM STATION DEDICATION,** January 12, 2008. The acronym is misleading unless you are a member of the Club. It stands for the 3<sup>rd</sup> United States Amundsen -Scott South Pole Station.

**ANTARCTICAN SOCIETY PREPARES TO MAKE FIRST DONATION FROM THE RUTH J. SIPLE FUND TO LIBRARY AT THE SOUTH POLE.** See page 1.

**CDs on Antarctic Society still on sale,** see page 2 of this Newsletter. Checks for same, \$20.00 each, should be made out to the Antarctic Society, and mailed to Box 325, Port Clyde, ME 04855.

**2008 HEDGEHOG ANTARCTIC CALENDARS** still available until 10 December. For US and Canada residents, \$14.00 each. Checks payable to the Antarctic Society should be mailed to Box 325, Port Clyde, ME 04855.

**BRASH ICE.** These have been very busy days in the Head Sheds of the Antarctic Society, as we are in the midst of some very radical changes which will hopefully guide our Society into a continuous growth period with new, young invigorating members. This organization was founded shortly after Plymouth and Jamestown, and more Ancients and Honorables are dying than Fresh, New Bloods are joining. Thanks to Tom Henderson, we have and are taking steps to change things. The first was his producing a historical document of who we have been, who we currently are. It was a labor of true love by Tom, one that Lou Lanzerotti of the most prestigious National Science Board has described "the CD is terrific. The history recorded is priceless." And Dr. Chester Pierce of Harvard Medical wrote "a marvelous legacy for generations to come."

Our next step forward, another Tom Henderson Production, is the creation of an Antarctic Society Website. It is being field tested by some of our cornerstones, and we expect that it will be up and running by early January 2008. Tom invites suggestions for improvement from all readers. Our Newsletters will go onto the website at the beginning of the year, but will be protected from non-members access. So from now on our Newsletters will also be distributed electronically to those who take that option. The new site will be found at [www.antarctican.org](http://www.antarctican.org).

And our third giant step forward is a plan now being worked out by a triumvirate of Tom, Jerry Marty, and Katy Jensen whereby members wintering over at the South Pole and Palmer will be given complimentary access to the website, including access to copies of our Newsletters. We are going all out to make our Newsletters something of interest to younger active members. The complimentary access will be discontinued at the end of winter, at which time we hope at least a few of the current Antarcticans will want to continue on as paying members – and hopefully contributors.

As we announced on the cover page, our Society is making its first contribution from the Ruth J. Siple Fund to the South Pole Library, a handsome box with a collection of Antarctic Music CDs selected and procured for us by a musical expert who just happens to be an Antarctic, Valmar Kurol of Montreal. The list of the pieces going to

the South Pole in a few weeks are shown in a resume by Valmar on page 3. A complimentary set is being collected by Valmar which the Society hopes to send to Palmer later in 2008. This is just the beginning of how our Society will enhance the libraries in the Antarctic through the Ruth J. Siple Fund, which will continue to be our Society's charity.

We feel that it is most important to have the first contribution from the Ruth J. Siple Fund to be in the musical field, as music was one of Ruth's true loves. She sang in the choral group at her college, although we are not exactly certain on what basis she was selected, as she was low-toned. Later on she took up the harp, and enjoyed playing that instrument for many years. She loved to listen to classical music, and daily listened to this FM station in Washington that featured classical music. She possessed a fine collection of classical CD's, which she often listened to in the confines of her home. It is most appropriate that this Antarctic musical donation from the Antarctic Society's Ruth J. Siple Fund be at this time, the dedication of the 3rd South Pole Station. Ruth, herself, was at the dedication of the 2nd South Pole Station, and her late husband was the Grand Marshall of the 1st South Pole Station.

Valmar Kurol, a native of Saint John, New Brunswick, came into the Antarctic scene through his love for the Arctic. His first trip to Antarctica was on the Northern Ranger, and he subsequently made four other trips to the 7th Continent. His most recent trip was in 2003 when he went with the Canadian Students on Ice Program headed up by Geoff Green. Valmar produces an Antarctic Newsletter out of Montreal, the Seventh Continent, although at this time it is in a state of rest. Valmar is a tried and true musician in his own right, and his ANTARCTIC ARRIVAL, produced in 1999, is a fine collection of twelve Antarctic pieces. Buy it, you are sure to enjoy it. He can be reached by e-mail: [mtl.ant.soc@sympatico.ca](mailto:mtl.ant.soc@sympatico.ca).

Now for the bad news. We are going up in our Membership dues, but only a modest amount, to \$15.00 per year. Still a bargain, less than half a tank full of gas. However, for all of you faithful, we have a bit of good news. If you want to extend before 31 December 2007, you can sign up for the present rate: \$12.00 per year.

**DR ANNA KERTTULA de ECHAVE SPEAKS.** Our speaker at the December 1<sup>st</sup> meeting with the Explorers Club Washington Group (see cover sheet) will be an anthropologist and native Alaskan who has been observing and researching the people of the Arctic for over 40 years. She will talk about the ways in which humans have been adapting, or in some cases not adapting, to unpredictable changes in climate for millennia. Based on the observations of indigenous people and recent scientific research findings, she will put a human face to the foreboding headlines of climate change and will give the audience a deeper insight into our own future vulnerability and resilience.

**ELEVATED SOUTH POLE STATION TO BE DEDICATED.** For a few short hours in mid-afternoon on January 12<sup>th</sup>, 40 invited visitors will be eyewitnesses to the dedication of the new megabucks, multiyear erection at the Geographical South Pole. It is our understanding that the station will remain the Amundsen-Scott South Pole Station. The lucky few who have been invited appear not to be the scientists who have made the station such an important scientific laboratory, but a potpourri of those who have been “involved with the project funding design, logistics, construction, and management.” In other words, a bunch of bureaucrats will show up, spend a few hours there, and go back to McMurdo later that day. Hopefully, there won’t be a chance for them to do any damage in the few hours that they will spend at the Pole!

I looked back into my journal to see what I wrote about the first dedication of the South Pole Station on January 22, 1957. It was held at McMurdo and I described “the ceremony was brief and simple.” But there were several distinguished guests, such as Harry Wexler, Bert Crary, Larry Gould, Paul-Emile Victor, Trevor Hatherton, and Kaare Rodahl. Speakers were Gould, Wexler, Rodahl, Hatherton, and two Navy men, George Dufek and Willie Dickey. Our ship, the USS CURTISS, was tied up to the bay ice about two miles from the station at McMurdo. The ice started to break up while we were at the station, so 25 of us were stranded overnight at the station. My journal showed my keen appreciation for the place, as I wrote “What a miserable place!”

**ANTARCTICAN SOCIETY NEWSLETTER CD-ROM STILL AVAILABLE! (Tom Henderson)** The CD-ROM containing the entire archive of Antarctic Society newsletters and other documents from 1959 – 2007 is still available to members for the reasonable cost of \$20. If you doubt that last assertion, consider:

- The archive contains 1,802 individual pages and 235 separate documents.
- The archive includes both individual document files and a single combined file of all of the documents. The latter is included for easier searching.
- The archive is in Adobe PDF format, the most common document format in the world. If you don’t have Adobe Reader already installed on your computer (most people do), you can download it free of charge from [www.adobe.com](http://www.adobe.com).
- Because it is in PDF format, you can use the tools built into Adobe Reader to search for words or phrases in any or all of the documents. For example, if you enter “Erebus,” it will zoom to the first instance of that word in the archive. Each click on the Find Next feature then takes you to each successive occurrence.
- There are hundreds of articles about Antarctic people, places and events over almost fifty years.
- There are dozens of reviews of Antarctic books, films and other media contained in the archive.
- There are an equal number of obituaries describing in detail the lives and careers of Society members and prominent Antarcticans.
- The archive includes the full-color commemorative booklet of Dr. Laurence Gould’s illustrious career produced in limited quantity by Carleton College.
- Finally – and certainly not least – the archive contains all of Paul Dalrymple’s writings and ramblings, those labors of love that Society members have enjoyed for the past thirty years. Paul’s wit and the facts, stories, and gossip acquired from his huge network of Antarctic contacts have made these communiqués thoroughly unique.

So isn’t all of that worth \$20? Buy one and enjoy hours of reading and reminiscing. And they make

excellent Christmas gifts for fellow Antarcticans or those who would like to be. Just send a check made out to the Antarctic Society to: Paul C. Dalrymple, Box 325, Port Clyde, ME 04855.

#### **ABOUT ANTARCTIC MUSIC.(Valmar Kurol)**

What is the music of Antarctica? What kinds of tunes does the Antarctic inspire? Is there an Antarctic sound? Based on my fifteen years of collecting recorded music about Antarctica, the answer is, it's everything and anything people bring from their own varied backgrounds. The classical repertoire appears to be relatively minimal and it is the pop artists who have been making more Antarctic musical noises, in some cases literally. While earlier songs may have focused on urging listeners to keep the continent pristine, much of the current crop seems to hold Antarctica as a mirror/metaphor for the coldness and isolation people feel in their day to day lives. The music collected for the Ruth J. Siple Collection at the South Pole includes the beautiful, inspirational, comical and the harsh & discordant, varying in style from classical to jazz and rock. It starts with the mother of all Antarctic music, Vaughan Williams (7<sup>th</sup>) Sinfonia Antartica and includes the soundtracks for the latest penguin flockumentaries. For those who may be interested, a chronological discography of my collected discs is at <http://antarcticcircle.org/valmar.htm>. Now let's roll with the Ruth J. Siple Pole Collection. **CDs for the South Pole or any hot deserted island...**

**1) SINFONIA ANTARTICA (Seventh Symphony)** by Ralph Vaughan Williams (1998)  
Conducted by Kees Bakels, Bournemouth Symphony Orchestra, recorded September 1996; The background music for the vintage 1949 film *Scott of the Antarctic*, by one of Britain's greatest 20<sup>th</sup> century composers, was later arranged into his Seventh Symphony, which premiered in 1953 and is considered to be the mother of all Antarctic music.

**2) ANTARCTIC SYMPHONY (8<sup>th</sup> SYMPHONY) & HIGH ON THE SLOPES OF TERROR** by Sir Peter Maxwell Davies  
The British Antarctic Survey and the London Philharmonia Orchestra commissioned prolific British composer Sir Peter Maxwell Davies to compose an **Antarctic Symphony**, his **8<sup>th</sup> Symphony**, for its première in May 2001. A companion piece, the 21-minute **High on the**

**Slopes of Terror**, was composed in 1999 and was the first musical work resulting from Sir Peter's Antarctic trip.

**3) MARCH OF THE PENGUINS** Original Score by Alex Wurman (2005)

The North American version of this French-made documentary won the Oscar for best documentary feature film of 2005.

**4) MARCH OF THE EMPRESS** by Emilie Simon (2005)

This is the soundtrack for the French version of *March of the Penguins*. The original music, by Simon, a French singer and instrumentalist, is in an electropop New Age style with English vocals. The North American version of the film developed an entirely different soundtrack of serious orchestral music.

**5) MUSIC FROM SEVEN CONTINENTS Vol. 2** by The Cincinnati Boychoir (2004)

The CD includes four lively song tracks about the seventh continent. Texts were by Bill Manhire (a New Zealand university professor and poet), from the Book of Job and from the writings of Antarctic explorers Apsley Cherry-Garrard and Ernest Shackleton, with music composed by Carlton Young, an American professor, editor and composer of sacred music.

**6) ANTARCTICA – NHK Television 50<sup>th</sup> Anniversary Nankyoku Project** (2003)

NHK (Japan Broadcasting Corporation), Japan's sole public broadcaster, commemorated the 50<sup>th</sup> anniversary of TV broadcasting in Japan in 2003 by establishing an HDTV broadcasting station in Antarctica in 2003. This is the commemorative music CD (Japan Version).

**7) MUSIC FOR THE SCOTIA CENTENARY (2002)**

Music to celebrate the centenary of the 1902 Scottish National Antarctic Expedition under William Bruce. The first half of the disc consists of seven traditional Scottish country dance tunes with Antarctic titles. The main event, however, is a 24-minute orchestral suite, *South*, by Dundee composer Gordon McPherson.

**8) THE SONGS of the 'MORNING': a Musical Sketch** by G. S. Doorly (2002)

The *Morning* was the relief ship sent to resupply Robert Scott's *Discovery* Expedition of 1901-04.

During the *Morning's* 1902 voyage to Antarctica, the third officer, Lieut. Gerald Doorly and the chief engineer, J.D. Morrison, collaborated on a collection of songs that were performed during musical evenings on the ship. The present recording was undertaken as a *Discovery* centennial project and the Chorus contains all the adult male descendants of Gerald Doorly, along with professional colleagues and interested friends. All royalties from the sale are to be divided between the Dundee Heritage Trust and the New Zealand Antarctic Heritage Trust for their work on the original Expedition's historic artefacts.

**9) SHACKLETON'S ANTARCTIC ADVENTURE** – Original Giant Motion Picture Soundtrack Composed by Sam Cardon (2001)

The film score of the superb IMAX film about the Endurance Expedition.

**10) SHACKLETON** – Original Score by Adrian Johnston (2001)

This score for the two-part four-hour TV dramatization of Shackleton's Endurance Expedition, featuring the prominent British actor Kenneth Branagh in the title role.

**11) FROM AUSTRALIA** – John Williams, guitar (1994)

Includes **Antarctica - Suite for Guitar and Orchestra** by Australian Nigel Westlake. Westlake wrote the score for the IMAX film *Antarctica* and later reworked it into this longer 1992 guitar concerto in four movements.

**12) ANTARCTICA - The Film Music**, composed by Nigel Westlake (1992)

The CD of the score of the IMAX film *Antarctica* has thirteen mostly short orchestral tracks of various themes portrayed in the movie, four of which were developed into the previously mentioned guitar concerto.

**13) TO THE ENDS OF THE EARTH - Original Soundtrack Recording** - music composed and conducted by John Scott (1988)

This is the soundtrack for the William Kronick documentary film about The Transglobe Expedition, led by Ranulph Fiennes. Over a three-year period ending in 1982, the team circumnavigated the globe along its polar axis from North to South Poles, being the first to do so.

**14) DARK ADVENTURE RADIO THEATRE PRESENTS H. P. LOVECRAFT'S "AT THE MOUNTAINS OF MADNESS"** (2006)

The H. P. Lovecraft Historical Society (California) has adapted one of Lovecraft's best regarded stories, written in 1931, in the form of a spooky 75 minute radio play about a Byrd-era Antarctic expedition gone wrong, in the way it might have been produced in the 1930s.

**15) ANTARCTIC SUITE** by Wendy Mae Chambers (1999)

Wendy Mae Chambers is a New Jersey-based musician who visited the Antarctic Peninsula in 1999 as a tourist and subsequently recorded a CD of piano solo compositions inspired by her trip.

**16) ANTARCTIC ARRIVAL - a Tribute to a Frozen Land** by Valmar Kurol and Marc-André Bourbonnais (1999)

This Montreal-produced CD contains ten thematic instrumental pieces and two vocal tracks in New Age/light rock/classical styles, based on Kurol's three visits to Antarctica in the 1990s.

**17) ANTARCTICA** by Ian Tamblyn (1994)

Tamblyn is an Ottawa-area Canadian pop-folk artist and expedition tour lecturer. This recording is associated with the CBC radio documentary, *Notes from the Bottom of the World*, based on his trip to McMurdo Sound. The music is a combination of New Age/folk-rock/jazz influences.

**18) ANTARCTICA** by Richie Beirach (recorded 1985, issued 1994)

Beirach is an American jazz artist who improvises on elements of eclectic modern music in his piano solo *Antarctica Suite*.

**19) POLAR SHIFT - A Benefit for Antarctica**, various artists (1991)

A compilation of New Age instrumental and vocal music dedicated to the conservation of Antarctica.

**20) ANTARCTICA** by Vangelis (1983)

Synthesizer music from Koreyoshi Kurahara's film of the same name. Best song is the title track, *Theme from Antarctica*, which, arguably, still remains the definitive Antarctic mood music.

**21) PROGRESS • REFORM** by iLiKETRAiNS (2006)

Only a British group could open their debut rock disc with a track called *Terra Nova*, named after Robert Scott's 1910-1912 South Pole expedition and ship. A special treat is the accompanying video of the *Terra Nova* soundtrack, portraying the fated South Pole march. It is complete with a miniature ship, expeditioners and styrofoam ice.

**22) RECONSTRUCTION SITE** by The Weakerthans (2003)

The Weakerthans are a Canadian alt-rock band and this CD contains the track *Our Retired Explorer (Dines With Michel Foucault in Paris, 1961)*, about an imaginary Historic-era explorer who has seen better days. The enhanced CD also includes a video of the soundtrack, complete with ice, dogs hauling a sled, an underground den, penguins, and sailing ship.

**23) CARNIVAL OF CHAOS** by GWAR (1997)

This American theatrical shock-rock heavy-metal group slashes and burns from their opening number, *Penguin Attack* and then does further damage to the ears with *Antarctican Drinking Song*.

**24) ANGEL ABOVE MY PIANO** by Fiona Joy Hawkins (2006)

Fiona Joy is an Australian painter and pianist whose CD of romantic New Age piano presents a suite of *Antarctic Interludes*, based on her trip to the Ross Sea side of Antarctica in 2005.

**25) ANTARTICA** by Gale Revilla (1999)

Gale Revilla is a Nevada-based New Age synthesizer artist. This CD is based on the idea of Ancient Civilizations and Antarctica as Atlantis.

**26) PENGUINS ON THE MOON** by Sack Trick (2000)

The British Sack Trick is a revolving group of comedic musicians and the CD is an entertaining heavy metal/music hall/rock musical about a group of penguins in Antarctica who take a spaceship to the moon.

**27) SEA OF GLORY America's Voyage of Discovery – The U.S. Exploring Expedition 1838-1842** - book by Nathaniel Philbrick, read by Dennis Boutsikaris (2003)

This 5-CD, 6-hour package is a superb invitation/teaser for reading the book about the controversial and little-known U.S. Exploring Expedition of 1838-1842 (the U.S. Ex. Ex.), led by Charles

Wilkes. CDs 2 & 3 cover the voyages to the South Shetland Islands and along the Adélie Coast, respectively.

**THE SOUTH GEORGIA ASSOCIATION** was formed in 2001 to give voice to those who care about South Georgia. South Georgia is a sub-Antarctic island of exceptional natural beauty and rich wildlife both on land and at sea. Its snow-covered peaks, glaciers and emerald-green bays are a breathtaking sight. It has an interesting history, is environmentally vulnerable and is home to two scientific research stations -- one in Cumberland Bay and one on Bird Island. The association ([www.southgeorgiaassociation.org](http://www.southgeorgiaassociation.org)) aims to hold two meetings a year in Britain and publishes a newsletter. Members are alerted to important sources of information such as the official South Georgia website [www.sgisland.org](http://www.sgisland.org) which publishes a monthly newsletter, and the South Georgia Heritage Trust [www.sght.org](http://www.sght.org)

Membership of the association is open to all. The subscription is £15 annually or £50 for a five-year subscription. There are 360 individual members and four corporate members. We have members (in descending order of numbers) from UK, USA, South Georgia, Falkland Islands, Norway, Australia, France, Canada, Ireland, Sweden, New Zealand, Switzerland, Germany, Spain, Argentina, Uruguay, Zimbabwe, Netherlands and Austria.

For added interest, the museum at Grytviken has a new Curator, Elsa Davidson, with Tim and Pauline Carr having moved on in life, to New Zealand. The museum email address is [museum@sght.org](mailto:museum@sght.org). Current president of the South Georgia Association is our own Charles Swithinbank.

**BRITAIN TO STAKE CLAIM FOR ANTARCTIC SEABED.** (Excerpted from the Malaysia Sun, The Guardian, 17 Oct. 2007, Margaret Lanyon/Christchurch Press, various websites, and editorial prerogative.)

The news that the UK intends to file a claim for sovereignty over the seabed adjacent to its Antarctic territorial claim will significantly change the way we think about Antarctica.

When the original 12 signatories signed the Antarctic Treaty nearly 50 years ago, they agreed to put their territorial claims over the remote

continent into abeyance, a major geopolitical milestone. The international agreement stated that the interests of individual nations should come second to preserving Antarctica as a common heritage for all countries. So, even at the height of the cold war, the idea of Antarctica as a demilitarised continent dedicated to science in a spirit of international cooperation was born. So much for the idealistic aspects of the Treaty, because the high seas surrounding Antarctica, technically speaking, lie outside the bounded land of the Antarctic continent and are therefore subject to the UN convention on the law of the sea treaty (UNCLOS), which was signed in 1982. Whether the seabed will be considered as an extension of the land and therefore subject to the Antarctic Treaty, which covers territory south of 60 degrees, or whether it will be treated as part of the high seas and governed by the law of the sea remains to be seen. That said, Britain and Australia appear to believe that the law of the sea will take precedence in seabed disputes.

Somehow, it doesn't seem right to tamper with what is, and has been, a unique Treaty that covers the only part of our planet above sea level that belongs to no one. Adjacent seafloors should be treated with the same respect.

The International Seabed Authority (1994) enables states to register territorial claims to sovereignty over their continental shelves. Shelves come in all shapes and sizes. Some go well beyond the recognised 200-mile exclusive economic zones, and can therefore be critical for accessing greater resource rights.

Why is this happening now? The answer, in a word, is energy. The world's largest economies, including the UK, are seeking new supplies of energy away from the instability of the Middle East, without wanting to depend on the whim of Russia or any other nation. The ocean seabed is a resource frontier with the potential for immense mineral wealth. Critics (Greenpeace and World Wildlife Fund) have already voiced their displeasure at this move by a major Treaty Party, and Chile has stated that its territorial claim in Antarctica remains as originally outlined, not to be affected by the U.K. proposal. Further details can be found with a Google search for 'U.K. claim', including one link to a fancy map of the proposed U.K. areal claim.

**JERRY KOOYMAN, “MAYOR OF CAPE WASHINGTON,” COLLECTS WELL-DESERVED AWARDS.** Dr. Gerald Kooyman, of Scripps Institution of Oceanography at UC San Diego, received New York City’s Explorers Club highest award in 2007, the Finn Ronne Memorial Award for Polar Field Science and Exploration “for his innovative and groundbreaking research on the diving behavior and physiology of Weddell seals and emperor penguins and for scientific achievement during a lifetime of Antarctic field research.” Kooyman was the first scientist to design and implement studies using a time-depth recorder to measure diving in free-diving seals. In recent years, he has focused his research on diving and population studies in emperor penguins. If you have visited Cape Washington in the Ross Sea on a Russian icebreaker in about November, you have probably seen Jerry and his colleagues studying the colony of 20,000 – 25,000 breeding pairs of emperor penguins, probably the largest in all of Antarctica. Total population of the species in a 1993 SCAR report listed 195,000 breeding pairs in more than 40 individual colonies. Part of his studies in instrumenting emperors is to determine where newly hatched chicks go after fledging, as well as their diving limits while foraging. During recent expeditions to Antarctica, Kooyman has documented climate-induced changes and their impacts on emperor penguin habitats. In addition to the award from The Explorers Club, he was the first recipient in 2005 of the Kenneth Norris Lifetime Achievement Award from the Society for Marine Mammalogy.

**PHYLACTERIES AT THE SOUTH POLE** (from the Jewish Telegraphic Agency Bulletin of January 11, 1974). Roy Millenson, a staff member of the National Science Foundation’s subcommittee of the Senate Labor and Public Welfare Committee and an aide to Sen Jacob K. Javits (R, NY) found himself at the South Pole with a Congressional delegation inspecting the station in January 1974. Roy brought with him the phylacteries that his parents had given him for his Bar Mitzvah at the Adas Israel Synagogue some forty years before. This Synagogue became a national monument and subsequently a museum and library for our country’s centennial.

Roy had worn the phylacteries over the years, and his rabbi said that the proper way to dispose of them was by burial. So the Antarctic trip came

along and he took them with him. He put them in a paper bag bearing the date, January 3, 1974, and placed them in a hole three feet deep. Then Roy said two prayers—the “shechayuno” and the “shma” and covered them with snow, forever preserved in a permanent deep freeze. The temperature at the time was a balmy -14F.

I (Paul Dalrymple) remembered Roy telling me back in the 1970s about what he did, and he thought that perhaps this was the first ever such burial of Jewish effects at the South Pole. Naturally he was very proud to be at the South Pole and was even happier that he could leave his own phylacteries, given to him by his parents. Then I recently read in the Antarctic Sun about how the station manager at the South Pole was assembling historical memorabilia gathered at the stations in the past fifty years for permanent display. I thought back to what Roy had told me, and I went onto the internet and finally tracked down his son, also a Roy. We had a great talk, he was as communicative as his late father, and was most happy to cooperate with me, supplying me with the above details. I trust the station manager can find room for this touching and most unique piece of South Pole history.

**CAM CRADDOCK – A SPECIAL TRIBUTE.** (Bob Rutford) Cam Craddock (John Campbell Craddock) died July 23, 2006. Cam was one of the first geologists to venture into Antarctica following the International Geophysical Year, and following his first trip to Antarctica in 1959, he spent 6 additional field seasons and one DSDP cruise south of the Antarctic Circle. He served on many committees dealing with maps of the Antarctic, was active in SCAR, served on the Polar Research Board, was the organizer and host of the Third Symposium on Antarctic Geology and Geophysics, and was active in a number of international committees and organizations.

Following Cam’s field seasons in Antarctica he became interested and involved in Arctic research in both Alaska and Svalbard. He spent parts of 12 summers with students in the Alaska Range and 9 summers in Svalbard. His work was supported by grants from The National Science Foundation and in Svalbard with logistic support from the Norwegian Polar Institute. In addition he continued his interest in the geology of the Upper Midwest and the western part of the U.S., supervising students in their work in New

Mexico, Wyoming, Minnesota, and Wisconsin. Cam was a teacher (over 8000 students were taught in his classes at The University of Minnesota and University of Wisconsin). He was the advisor or co-advisor for 21 PhD students and 69 Masters students. He was a researcher who published. He was senior author on some 138 papers and was a joint author on an additional 100-plus papers. (I would note here that he was generous with his students on authorship of papers.) He was active in University affairs, serving on committees and as chair of the department at Wisconsin. He served a number of organizations well, and was recognized by the Geological Society of America when he was awarded their Distinguished Service Award in 1988. Most recently the Board of Geographic names revised the names applied in the southern Sentinel Range of the Ellsworth Mountains and recognized Cam’s contributions to the understanding of the geology of that area by naming the large block of mountains Craddock Massif, where also is found Mount Craddock, just south of Vinson Massif, the highest mountain in Antarctica.

At the recently completed International Symposium on Antarctic Earth Sciences (ISAES), the late Cam Craddock was honored in a number of ways. A continuing session of lectures under the general heading of “Antarctica in Rodinia, Gondwana and Pangea” were presented on three consecutive afternoons “in honor of the contributions of Campbell Craddock.” A total of 31 papers were presented in the formal sessions.

One session dealt specifically with Cam, and the papers were authored by his son, John, and his students, John Spletstoesser, Jerry Webers, and Bob Rutford. John Craddock made a presentation about his father’s life and his interests in things other than geology. He also gave a most interesting paper describing work on the carbonate breccia bodies found in the Heritage Range of the Ellsworth Mountains. Bob Rutford summarized Cam’s contributions to Antarctic geology and presented a paper on the Jones Mountains, a feature discovered by Cam, Ed Thiel, and Ed Robinson in January of 1960. Some anecdotes about Cam and those who shared a tent with him in Antarctic field projects spiced the presentation. The papers by Webers and by Spletstoesser were delivered by John Craddock, as the authors were unable to attend. A highlight

of the opening session was Ian Dalziel's paper entitled "The Ellsworth Mountains: Critical and enduringly enigmatic." The Proceedings of all sessions, plus abstracts of papers, are online at <http://pubs.usgs.gov/of/2007/1047/>.

**I KNEW YOUR FATHER.** About a year ago, I found myself being wheeled into the Operating Room for minor surgery at Mercy Hospital in Portland, Maine. The pushers stopped the gurney to talk to this doctor, and I heard one address this person as "Hedblom". I opened my eyes, looked the guy over, and said "I knew your father." He was somewhat surprised, as his father had been dead for several years, and here I was a completely unknown person, telling him that I knew his old man. And he said, "Where did you know my father?" I replied, "I met him fifty years ago at Little America V." He was aghast, and said "I want to talk to you after you come out of surgery."

Dr. Hedblom was the senior Naval Officer in Deep Freeze II, He was a giant of a man, at least six feet, five. He wore this tent-size white canopy with a great big red cross on his back. Couldn't miss him. And when I opened my eyes and saw this doctor who was also a giant of a man, whose name was Hedblom, I knew that he had to be a son of Captain Hedblom. I remembered that his Dad was a strong Mason, and here his son was working in a Roman Catholic hospital. So I sort of needled him by saying, "Wasn't your Dad a strong Mason?" Fifty years can be a short time, occasionally.

**CONVERSATION WITH AMUNDSEN. (The following does not constitute the official view of the Antarctic Society)**

In late August of this year, I found myself at the feet of a man who I had long admired. I was in Tromsø, a coastal town in northern Norway. I was in a park near the waterfront, a park called Amundsen, and the name "Roald Amundsen" appeared in a granitic base. It was late in the afternoon, and the skies were darkening, but I could still see my hero quite easily. I was transfixed, frozen, wondering a thousand different thoughts about the man in polar garb standing directly in front of me.

Suddenly I started to hear strange noises. and he appeared to be trying to move. All of a sudden he looked down on me and spoke in broken English,

"I see you are wearing a South Pole Station cap, have you by chance been there?" I replied, "Yes, your Honor, I was privileged to go there in 1957, and spent a whole year there. You, your Honor, changed my whole life, I want to thank you so much." And he answered. "Son, please just call me Roald, and if you don't mind, will you answer some questions for me? You see most people come by, see my statue, really do not see me, but they take pictures and go on their merry way.

I sort of dropped off the surface of the earth back in 1928 when I went looking for a downed polar explorer who wasn't even a close friend of mine. How does the world now look upon me?" I wasn't expecting such a tough question, but I finally gathered some thoughts and said, "Roald, I think most people in this world would put you in the top three as a polar explorer. To be utterly truthful, I think you would come in a close second to your fellow countryman, Fridtjof Nansen. However, Sir Ernest has benefited by a groundswell of popularity in recent years. You know there is a popular saying going around, if you want to obtain a goal, go with Amundsen; if you want to go for science, go with Scott; if you want to come back, go with Shackleton." Roald sort of chuckled over that, but then cleared his throat as he hadn't been talking for many years, and bristling said "Well, that really isn't totally fair to me, as I brought back all of my men alive, and Ernest did not bring back all of his party from the other side." I answered, "You are truthful, but the Boss got a lot out of South Georgia and Elephant Island, and people never get tired of hearing those stories about him. The trouble with you, Roald, was that you planned so well, executed your plans to perfection, that you left nothing for the public to criticize. You were just too perfect, too drab, and that is not how you win popularity contests."

Roald continued with, "When I vanished in the summer of 1928, several of my men were preparing to leave for Antarctica with an American who had come to me to seek information, a man by the name of Richard E. Byrd. Would you be so kind as to tell me what kind of an expedition they had, as their destination was the same as mine, the Bay of Whales." I answered, "Well. Roald, one of the main purposes of their expedition was to fly, particularly to the South Pole. They had hoped to be the very first to ever fly in Antarctica, but

George Wilkins, an Australian who you no doubt knew, won that distinction with a flight from the beach at Deception Island. However, your dear friend and fellow Norwegian, Bernt Balchen, piloted the first plane, a Ford Tri-Motor, over the South Pole in late November 1929. In support of that flight, a geologist by the name of Larry Gould led a dog sledging support party out into the Queen Maud Mountains. On Christmas Day, atop of Mt. Betty, they saw a cairn which you had erected on your return trip from the Pole, and inside was a page from your notebook that read that you all had reached the Pole. A Norwegian with Gould by the name of Carl Petersen translated your writings. Larry carefully folded your page, committing himself to some day personally delivering it to your king. It came sooner than he anticipated as your government invited him to Oslo to accept the Cross of St. Olaf from King Haakon.

Byrd came back to the Antarctic for a second time with another expedition. That was in 1933-35, and he decided that he would live alone out on the Ross Ice Shelf, about a hundred miles from Little America II. That turned out to be nearly a disastrous mistake, as Byrd was not really an expeditioner, and had to be rescued in mid-winter. However, the seed had been planted in an Eagle Scout by the name of Paul Siple on the 1928-39 expedition, and one might say that the torch lighted by Byrd was carried to the South Pole for the International Geophysical Year, 1957-58. The South Pole station was dedicated in your name and Scott's name in a ceremony at McMurdo in the shadow of Scott's Discovery hut. I just happened to be there that day, not in any official capacity mind you, but more or less in just passing through. I think Kaare Rodahl, a cold weather physiologist, may have been the official representative of your country at the ceremonies. Do you have any more questions, Roald?"

Roald then asked about his companion on the *Belgica Expedition*, Dr. Frederick Cook, saying that the last time he saw him was when he was in Leavenworth. I told him that I had never met him, really did not know much about him, but that he apparently died an inglorious death about 1940, with very few authorities believing any of his accomplishments. However a small corps of family and friends of the family remained steadfast to his memory. This led me to comment that the other pretender to the North Pole, Robert

Peary, was also being looked at with jaundiced eyes. I told Roald that his least favorite geographic society had hired an explorer/adventurer from the U.K., one Wally Herbert, to prove that Peary actually did reach the Pole. However, after an exhaustive study, Wally wasn't able with a clear conscience to tell that society that Peary had actually gotten there!

You might be interested to know that ten years ago when I was in Ushuaia, I walked down on the pier late one afternoon and got into a conversation with this man who had just come down the gangway from a ship. He was on his way to the Antarctic, a 100<sup>th</sup> Anniversary trip of your old ship, the BELGICA, the travelers being relatives of Adrien de Gerlache. How about that! Incidentally tourism in Antarctica is a flourishing business. This year they are expecting 30,000 tourists to visit the continent. About half of them will be on giant behemoths of ships, carrying over a thousand passengers who will just cruise with their binoculars with no landings.

That led me to follow up on Byrd and his flights to the North Pole. It seems since Roald's vanishing that some second thoughts have arisen as to whether Byrd's plane actually got to the North Pole, turning around short of the destination. One of Byrd's disclaimers was Bernt Balchen, who was not a great admirer of Byrd. Then a Swedish meteorologist did an after-the-fact weather analysis saying that Byrd's plane could not have possibly done it. So then I told Roald that by default of Peary, Cook, and Byrd, that he, himself, Roald Amundsen, could actually lay claim to not only being first at the South Pole, but also to the North Pole. He did not seem to be particularly impressed that something else could be added to his vitae, but accepted it as a possibility. I had to spoil his moment of instant glory by telling him that it was all much ado about nothing, as the world is in the midst of global warming, which is most pronounced in the polar regions, and that within a few decades all the North Pole will be part of an expanded ice-free ocean. Then I added that the Russians recently felt that they had a legitimate claim to the North Pole, and had put a territorial claiming stake on the bedrock surface below the North Pole. This really brought a deep-throated laugh out of Amundsen.

(To be concluded in January's Newsletter)

**BRASH ICE.** What's new in Antarctica? Well, for one thing a US Air Force C17 Globemaster made history on September 11th when they made the first landing by a pilot using night-vision goggles in the darkness of a McMurdo night. The Globemaster was making an 11-hour round trip overnight from Christchurch. A snowstorm nearly prevented the landing, but the Globemaster was able to touch down and then complete several other landings on the ice to ensure all the pilots on board gained experience. The successful mission means scientists and support personnel will be able to come and go from McMurdo during winter. How about that!!!

We are fast approaching some very historic dates. In a few short weeks, we will be celebrating the 100th anniversary on October 29th of Ernest Shackleton leaving Cape Royds for, supposedly, the South Pole. Later on during the austral summer, we will be celebrating the 100th anniversary on 9 January 2009 of his 'Furthest South'. And if you want to extend this still further, in approximately 1200 days we will be celebrating the most glorious date in the history of the Antarctic, Amundsen's arrival at the South Pole on December 14th, 1911. Wonder what great celebrations are in order, especially from the Norwegian side.

Our ever faithful friend in Christchurch, Margaret Lanyon, sent us a press clip from the CHRISTCHURCH PRESS of 12 July 2008 in which they wrote about an upcoming 800 K race to the South Pole, officially known as the Amundsen Omega 3 South Pole Race. At press time they had ten teams of three-persons each who were crazy enough to enter the race. Seven are from Britain, two from Norway, while the tenth is a combined Kiwi-Brit team. It is expected that teams will ski for 18 hours, on a good day, and that the fastest teams will get there in 30 days with the slowest teams taking up to 45 days. There is a mandatory 24-hour stop at the mid-way point. The contestants are expected to burn 8000 calories per day while consuming only 6500 calories per day.

But let's take a look at what a group of us aging walking Antarctic curiosities did this past summer. We gathered in mid-coastal Maine to celebrate first that we were still somewhat alive, second, to reminisce about what, if anything, we had accomplished in Antarctica in the past fifty odd years, and third, to see if we can use the past to help guide the Antarctic Society towards a fruitful growth. Quite a few of our past presidents ( Bob Rutford, Bob Dodson, Polly Penhale, Tony Meunier, Rob Flint, Guy Guthridge, Art Ford, Paul Dalrymple ) showed up, and many other prominent scientists, including Charles Swinbank, George Denton, Warren Zapol, Tony Gow, Mary Albert, Lou Lanzerotti, Charlie Bentley, John Behrendt, David Marchant, Hal Borns, Chet Langway, Ed Robinson, Jamie Robertson,

Hugh Bennett, Dick Chappell. John Clough, Dick Cameron. Steve Den Hartog, and others joined in.

The IGY was well represented with Bentley, Behrendt, Cameron. Glasgal, Bennett, Dalrymple, Den Hartog, Gow, Rutford, Denton, Robinson, Ken Moulton, Bill Meserve, Art Jorgensen, Johnny Dawson, Jim Burnham, and Charlie Bevilacqua. And Mildred Crary, Bess Balchen Urbahn, and Barbara Honkala represented their deceased husbands. Felise Llano, daughter of George, came with her brand new husband. And there were two pre-IGYers, as Swithinbank was on the ice at Maudheim in 1949-52, and Dodson was on the Ronne Antarctic Research Expedition to Stonington Island in 1947-49.

How many stations were represented? Well, there was Little America V, Byrd, Amundsen-Scott South Pole, Ellsworth, Wilkes, McMurdo, Eights, Siple, Plateau, Vostok, and Novolazarevskaya. Hallett Station was not represented from the stations with a US connection during the IGY, as we only had one person there, Jim Shear, and he has been long deceased. One of us, Rob Flint, holds a distinction that will probably never be equaled, that of wintering over at three interiors stations (Byrd, Plateau, and Vostok) . There should be an asterisk on Vostok as he worked there another summer, as well as another summer at Dumont d'Urville.

Our Gathering was also graced/blessed by some of the younger generations. Drew and Diana Logan have many multiple years at the South Pole in recent years: he wintered over thrice, she twice. Dr. Will Silva is one of our favorite Antarcticans of all-time, and he had just returned from another sojourn to Palmer Station. With Dr. Dalton being there – he being the Irish doctor at Byrd in 1957 – we had one of the very first doctors and certainly the most recent . Jerry Marty is certainly not a youngster, but his ever-going trips to the South Pole leads one to erroneously suspect that he is still a kid.

Was there a purpose for the Gathering beyond a desire to see old friends from bygone years? Some of us are on borrowed time, and records show that Antarcticans celebrate their fiftieth anniversary, then just fade away. Three of my colleagues from the South Pole, Class of 58, made the supreme efforts under most trying conditions. Jim Burnham came all the way from Costa Rica,

even tho he could hardly stand, even with a cane, as he is in a very advanced stage of Parkinson. Johnny Dawson came, even tho he had just completed a series of chemo treatments for lung cancer. Art Jorgensen was given two years to live last year, but he opted to come. Then Chet Langway came, thanks to daughter Nancy driving him here.

There was a very legitimate reason for having so many important Antarcticans together, and that was the preservation of the Antarctic Society for future generations. And that reason was Tom Henderson and our website which he has built in the past year . It was his first dry run through the website before a critical knowledgeable Antarctic crowd. Tom is especially proud of Time Trek, which has become his baby, and he walked two different groups through his showing. It was most favorably received, and we invite, in fact, encourage you all to familiarize yourself with the website. It is going to be, hopefully, the salvation of the Antarctic Society, something which will bring into the fold the new generation of young Antarcticans.

There was actually quite a wide-spread of attendees. Including wives and families, there was over a hundred in attendance. Public Radio found out about our Gathering, and asked if they could come and interview some of our people from the IGY, and we said “Sure”. So Barbara Boyaev came along with an engineer and interviewed some of the more prominent, who you may have already heard on Public Radio. We ourselves have a close personal Antarctic friend who just happens to be a videographer, and he recorded at least a dozen histories which will be made into a private DVD.

It might be said that the Gathering was held on hallowed grounds, as the property was once owned by Russell Porter (see Herman Friis's THE ARCTIC DIARY OF RUSSELL WILLIAM PORTER) who once went north with both Peary and Cook. And the live music was polarized by Steve Lindsay, who had an arcticite uncle, Harry Whitney (who authored HUNTING WITH THE ESKIMOS) , who was ably assisted on the bass by Renny Stackpole, a distant relative of the real Roald Amundsen. And as an add-on, our very own Ed Robinson, a retired Hokie professor, donned his kilts, pumped up his bags, and played his pipes as the beverages were consumed into the

twilight. Even the hard-shelled Dave Bresnahan found fun and enjoyment in meeting socially with scientists who hitherto he had to be hard nosed. The last evening ended with spectacular fireworks over neighboring Tenants Harbor, which just happened to be celebrating Saint George Days that weekend.

Well, that was all Show and Tell, but at the same time democracy was at work in Ballston, with a reorganization taking effect in the Office of Polar Programs. From the outside, it has looked to us as though this office has gone through several major changes. First it was Era of Tom Jones and Bert Crary, Ken Moulton and Al Fowler, Joe Fletcher and the real boss, Helen Gerasimou. Then there was the follow-up generation with Ed Todd, Peter Wilkniss, Cornelius Sullivan, Polly Penhale, Julie Palais, David Bresnahan, Erick Chiang, and Jerry Marty. But in the last year or so Guy Guthridge, Al Southerland, Bresnahan and Chiang have all retired, so I guess it was reshuffling time. Section Heads became Division Heads. Scott Borg is one of the few dinosaurs left who actually earned his stripes on the ice, and he is head of the Division of Antarctic Sciences. Brian Stone is Acting Head of Antarctic Infrastructure and Logistics. Michael Montopoli heads Polar Environment, Health and Safety, Simon Stepherson heads the Division of Arctic Sciences. Carrying it a step further, in the Division of Antarctic Sciences, Kelly Falkner is Program Director for Integrated System Science; Roberta Marinelli is Program Director for Organisms and Ecosystems; Peter Milne is Program Director for Ocean and Atmospheric Sciences; Vladimir Papatashvili is program director of Aeronomy and Atmospheric Sciences. Just take a second look at that listing, Bernie Lettau is actually gone, retired, can you believe it? It's true!!

**ANTARCTIC CALENDARS.** We are begging you to buy the 2009 Hedgehog/Caxton Antarctic calendar for 2009. To be utterly truthful, this is not their best calendar by any means, but even a poor Hedgehog calendar is far better than any of its competitors. We have a pile in stock right now, so we can supply you immediately. We are asking you \$15.00 for each calendar. Even buying in bulk, we are still only making pennies on each calendar. Checks should be made payable to the Antarctic Society, mailed to P.O. Box 325, Port Clyde, ME 04855 .

**THE RUTH J. SIPLE FUND.** The most positive action during the past few months has been the procurement of twenty-seven CDs/ DVDs of Antarctic Music, hand selected by our musical expert in Montreal, one Valmar Kurol, for Palmer Station. These were housed in another beautifully engineered cherry-wood box by Bob Small of Quarter Point Woodworking, LCC. Bob is a friend of our Society through osmosis, being married to a daughter of Gracie, a woman behind the scene in our Head Shed. Valmar's selection is very similar (four exceptions) to his South Pole Collection previously sent to the Ruth J. Siple Memorial Library at the South Pole.

The selection of books for the Ruth J. Siple Memorial Library is well underway. Basically we have 1) solicited personally inscribed copies of books by Antarctic authors, 2) duplicate prime copies of surplus Antarctic books in the hands of Society members who are noted book collectors, and 3) selected Antarctic books from Longitude Books. Darrel Schoeling, an Antarctic through the travel industry, chief honcho of Longitude ([www.longitudebooks.com](http://www.longitudebooks.com)) is offering us a 25% discount on books selected from his listing. We fully expect to have several shipments of books at the South Pole by the end of the calendar year.

**WE HAVE ACHIEVED ORBIT!** (by Tom Henderson) I reported in the last newsletter on the launch of the Society's new website, "<http://www.antarctican.org>". I can now report that the website has successfully achieved orbit. From February 1 through August 31, 2008, there have been 4,435 visits to the site resulting in 29,731 pages viewed. 71% of the visits have been made using Microsoft's Internet Explorer browsers, 17% using Mozilla Firefox, 6% using Apple Safari, 5% using Netscape Navigator, and 1% using Opera or other browsers.

The biggest change on the website since its launch has been the completion of the Time Trek application. Now, both the Static Map and Google Earth versions of Time Trek are available. Time Trek is an interactive timeline of Antarctic history that is combined with mapping of the continent and information on stations and geographic features as well as photos taken by Antarcticans. There are two things that make it stand apart from any other timelines on the internet: (1) there are two separate map interfaces to the timeline, one to a fixed satellite image map and the other to

Google Earth's dynamic mapping, and (2) the content is contributed by users – in other words, you and me!

Time Trek's map interfaces have different purposes. The Static Map version is intended for users who either want simple retrieval of the information in Time Trek or do not have a computer of the type or power to use the Time Trek Google Earth version. The Google Earth (GE) version directly embeds Google Earth within Time Trek, giving a whole new dimension to Antarctic history. GE is a free browser plug-in that connects to an enormous repository of aerial images of the entire earth, including Antarctica, and provides the tools to navigate through this imagery in both two and three dimensions! Within the past eight months, Google has added huge amounts of high-resolution satellite images and terrain data to their repository, with more expected in the remainder of this year. Since Time Trek embeds all of GE's capability, whenever Google updates GE, Time Trek users automatically have access to it!

One drawback – at least temporarily - is that the Time Trek is guaranteed to work properly with only Microsoft Internet Explorer (IE) browsers, versions 6 and 7. Soon, the Static Map version will work with any of the major browsers (Mac Safari, Firefox, or Opera). Google released a beta version of their first Application Programming Interface (API) for GE in April. The full production version of the API, expected in the fall of 2008, will include support for all major browsers. When the production API is available, it will be incorporated into Time Trek so that all users with high-speed internet connection and a computer with enough power will have access.

I mentioned previously that content will be contributed by the users. The Time Trek model is much like Wikipedia in this regard -- only users do not add their content directly to the website. Information on timeline events is contributed to the webmaster, who will then organize it into linked pages within Time Trek and upload it to the site. I should note that "event" simply means anything that can be related to a time and place. Events do not have to have major historical significance; Time Trek is intended to record experiences that might go unrecorded otherwise. Every Antarctic has some story, photo, letter or recording that could be shared. Time Trek is one

place where it can be shared with the entire world! The good news is that members are beginning to respond. At a recent gathering in Maine, I received electronic diaries, photos and PowerPoint presentations that will soon be posted in Time Trek. To learn how to contribute, please read the document by that name linked on the Time Trek main page, or just contact the webmaster, Tom Henderson, by email at [webmaster@antarctican.org](mailto:webmaster@antarctican.org).

You may have noticed if you Google "antarctican society" that you don't see the link to our website at the top of the search results. The reason for this is that, even though our name is an exact match, the search algorithms that Google (as well as other search engines) use are based on many factors. These factors include key words in the website's descriptive information, the number of links to our website from other sites, the number of times the website is reached through web searches, and other factors. One way each of you can help elevate our site's ranking is to do a Google search on "antarctican society," find the link to our site in the search results, (it begins "*The Antarctic Society is a social and educational organization founded in 1960 .....*") and then click on that link to get to our site. The more hits on the search results link from different computers, the higher our ranking will be.

By the way, if you haven't been to the website for a while you can get a quick idea of what has changed since your last visit by clicking the "What's New" link on the Home Page. There you will find a chronological listing of the significant changes made to your website. Also, there is something similar on the Time Trek page specifically for the Time Trek application, titled "Time Trek Content Changes."

I really want to emphasize that this is your website. Use it, contribute to it, criticize it, but don't ignore it! Comments and suggestions are always welcomed.

#### **IGY ANTARCTIC SIGNATORY CACHETS.**

The following paragraphs provide some background for what is now on the Society website. Prior to going to the Antarctic at the end of 1956, I, Paul C. Dalrymple, met with a family friend, one Mrs. Maxwell Hall Elliott of New York City, a philatelist, and we worked out a plan whereby, hopefully, we could collect cachets from

all of the stations in Antarctica during the IGY, requesting their leaders at the stations to sign the envelopes. Mrs. Elliott was to send two envelopes to each station, and have them returned by the various postal services to her. With the exception of one envelope, both collections were the same. The sole exception was that President Eisenhower would only sign one envelope, which remained in Mrs. Hall's personal collection. After the IGY, her Collection received second prize in a national philatelic show held in New York City. Shortly thereafter Mrs. Elliott passed away, and where she had no children, I assume the estate sold her Collection at auction, although I have no proof of same. I might add that Mrs. Elliott was one of the very first females to join the Antarctic Society.

The Van Allen Dinner Party. Back in the early 1950s, when the famed space scientist, James Van Allen, was living in Washington, DC (actually Silver Spring, MD), he hosted a dinner party where several prominent scientists were hosted. One was Lloyd Berkner, who was one of Admiral Byrd's radio operators on board a ship participating in the Second Byrd Antarctic Expedition. Berkner had been active in the Second Polar Year when he was Head of the Section on Exploratory Geophysics of the Atmosphere in the Department of Terrestrial Magnetism of the Carnegie Institution of Washington. During the course of the evening, Berkner suggested that the time might be right for holding another International Polar Year. Also in attendance that evening was Sydney Chapman, who was the Sullivan Professor of Natural Philosophy of Queens College, Oxford, and was soon to be elected president of the supreme nongovernmental academic body, the International Council of Scientific Unions. Also in the Van Allen's living room that evening were three other geophysicists, S. Fred Singer, J. Wallace Joyce, and Ernest Vestine. It was decided that evening that Berkner and Chapman would present Berkner's proposal for another polar year to the Mixed Commission on the Ionosphere to be held three months later in Brussels. So the seed for what later turned out to be the International Geophysical Year had been planted by Berkner in Van Allen's home.

Signatories Cachets/ Covers. It is my feeling that this exhibit of IGY Antarctic Cachets/Covers should lead off with the envelope signed by James

Van Allen, followed by the one signed by the flowing signature of Lloyd Berkner, and then the one signed by Sydney Chapman. The USA soon formed a National Committee for the IGY, and there is an envelope signed by Joseph Kaplan, chairman of the US IGY Committee. Larry Gould signed one as Director of the US Antarctic Programs, Harry Wexler as Chief Scientist for the Antarctic IGY, Bert Crary as the Deputy Chief Scientist for the Antarctic IGY, and Hugh Odishaw as head of the IGY offices in Washington, D.C -- A Who's Who of Antarctic bigwigs during the IGY.

Then there are many cachets signed by personnel at all of the American scientific stations (Little America V, Amundsen-Scott South Pole, Byrd, Ellsworth, Wilkes, and Hallett. McMurdo was strictly a logistical support base during the IGY. Some of the cachets have multiple signatures, such as participants on the first Ross Ice Shelf Traverse, the first Weather Central, the foreign scientists at Little America V, and the first Congressional Delegation to visit Antarctica. The last group featured Congressman Torby McDonald, former All American at Harvard, who was JFK's best man when he married Jackie, and who initiated legislation for local viewing of all NFL games sold out by the preceding Thursday. Then there were special individual signatory envelopes, showing the autographs of explorer Sir Hubert Wilkins, Father Dan Linehan, a seismologist and Jesuit priest, who took the first seismic shot at the South Pole, Gentleman Jim Zumberge, budding glaciologist-college president, and many, many others.

British Commonwealth Trans-Antarctic Expedition. Having a connection in Wellington, New Zealand, I purchased perhaps forty TAE cachets, and I got both Crossing Parties (Hillary's from New Zealand and Fuchs' from the UK) to sign the cachets. I gave them to relatives and close friends, although I dare say now that there are probably only a couple of dozen in existence. I also was a close friend of Ralph Lenton of Fuchs's party -- even stood up for him when he got married. So I ended up with some very special signed cachets that were carried from Shackleton Station to the South Pole to Scott Base.

**GEORGE R. TONEY**, 89, died at his home in Chevy Chase, Maryland, on January 17, 2008.

George was born in West Barrington, Rhode Island, but grew up in Newton and Needham Heights, Massachusetts. He graduated from Bowdoin College in Brunswick, Maine, just prior to the beginning of World War II. He served with the U.S. Army as an interpreter in France and Belgium during the war.

Following his return from Europe, George taught English and French in the Gloucester, Massachusetts, school system before he was lured away by the Arctic Operations Project of the U.S. Weather Bureau. In 1950-51, he served as Executive Officer at Isachsen Station, a joint Canadian/U.S. weather station on Ellef Ringnes Island in the Canadian Arctic (now part of Nunavut). Following the year at Isachsen, he was employed full time at the Arctic Operations Project office in Washington.

In 1954, George served as a Weather Bureau observer aboard the icebreaker USS ATKA during the ship's voyage to Antarctica to survey coastal sites for the International Geophysical Year (IGY) stations. As preparations for the IGY Antarctic program were ongoing George was reassigned from the Weather Bureau to assist the U.S. National Committee for the IGY in the planning and screening of scientific personnel to man the Antarctic stations. He subsequently served as scientific leader at Byrd Station during the IGY.

After he returned from the Antarctic, George joined the newly formed Office of Antarctic Programs at the National Science Foundation where he served until the mid- 1960's. He worked at NSF for several more years before retiring at the end of 1971, after 25 years of service to the U.S. Government. In recognition of his dedicated service to the Antarctic Program, Toney Mountain in Marie Byrd Land, Antarctica, was named in his honor. Following his government career, at the age of 52, George attended Antioch School of Law and subsequently embarked upon a second career. He spent over 20 years in solo practice defending juvenile and neglect cases in the District of Columbia.

Prior to his death, George summed up his life as follows: "I have lived through a series of unique and exciting events. Most of my life's endeavors have challenged my spirit and abilities and generated satisfaction of a very personal kind while also contributing to worthwhile endeavors."

George is survived by his wife of over 66 years, Sallie and son Stephen. He was predeceased by a daughter Sara.

On a personal note, I had the privilege of knowing and working with George Toney during the infancy of the U.S. Antarctic Program. He was instrumental in my being employed at the National Science Foundation. He was a mentor and teacher for me and many others in the Antarctic Program. How can I forget those long work days when we were in the field together! Most of all he was a friend during those years and I feel privileged to have known him. ....

**Kendall Moulton**

**TILL DEATH US DO PART.** This is a deadly Newsletter in many respects. We are in the process of identifying obituaries published in our Newsletters of the past, said information going into our new website. Why are we doing this? Because our obituaries are in many cases outstanding, as they have been prepared by their fellow colleagues who knew the individuals up front and personal. We are including in this section on deaths a lot of some of the more prominent, but by no means all-inclusive, Antarcticans who have died natural deaths since our Society was formed. Chances are that their obituaries will be on our website several months after the death date is shown.

How long can Antarcticans expect to live? Whenever I shave, and look in the mirror, I wonder how many more days that face will be in that mirror. The average age of Antarctic deaths shown is about 80, so we have beaten the odds by quite a few years. Ages on our list run the gamut from Harry Wexler, Chief Scientist of Antarctic programs during the IGY, who checked out at the very early age of 51, to Norman Vaughan, Harvard drop-out and dog team driver on the first Byrd Antarctic Expedition, who survived (by a few days) over the century mark. How come Norman lived so long? Was it because he never drank and never smoked, yet was still alive? Was it because he never swore and had a relationship with the Almighty God? Was it because he had five marriages (although one did not officially count as it was a remarriage) and had to keep moving? Was it because he met and married a real young thing, 40 years his junior, in late life and then had no desire to die? We vote for Carolyn!

Where do Antarcticans end up? Well one, Ralph Lenton, radio operator on Fuchs' British Commonwealth Trans-Antarctic Expedition ended up at the South Pole. His ashes were actually taken there by one of his sons, Anthony, who once worked for an American contractor. At the other end of the globe, Sir Hubert Wilkins, the first man to fly in Antarctica and who led several expeditions to the Antarctic, actually ended up at the North Pole, courtesy of SKATE, an American nuclear submarine.

One of the most unusual depositions was that of George Llano, who at the age of 93, died on a cruise ship to Antarctica, dying off the Falklands. I had talked to George the night before he left for the cruise, and he had promised to bring me back a polar bear, which I was eagerly looking forward to receiving! When George died, while his accompanying son was at breakfast, a three-ring circus followed. The family wish was for George to be cremated and left on the geographic feature named after him on King George Island. No way, it seemed that a body must be delivered to the crematorium in Punta Arenas within 24 hours of death. Next family choice was the cemetery at Grytviken. No way, that cemetery is reserved for whalers and The Boss. Meanwhile, George is taking a farewell cruise around Antarctica except he saw none of it. It was beginning to be like that hilarious Shirley McLain movie about burying Harry. The family wanted George to be left somewhere near his beloved home-away-from-home, so the Falklands became the only viable option. But wait a minute, was it really viable? No, it wasn't, it seems that the Falklands would not accept George until the family flew out a medical doctor from the U.K. to perform an autopsy to see if old George was truly dead. It seems that he was, and at a considerable cost to his family, George now overlooks the harbor at Stanley. George is now trying to rest in peace.

The Founding Father of our Society, Carl Eklund, met a real untimely early-on death. Coming back from a year on the ice, expecting his bank account would have profited by his absence from malls, found to the contrary that he was broke! In an effort to recoup and get back on his feet, he signed up for a lecture tour. His first port-of-call was Philadelphia, the City of Brotherly Love. The lecture went fine, he went back to his hotel

room, and died that night. So much for that lecture tour.

On the other side of the coin, Finn Ronne, in late life, finished his final book on the Antarctic, and then visited his homeland, Norway. While there he was graciously welcomed by their King, who treated him like a member of the Royal Family. Finn returned home to Maryland, went to bed with a smile on his face and never woke up. He was 80, and what a way to go.

One Antarctic, Paul-Émile Victor, who directed the French Antarctic programs, died at age 87 on an island in French Polynesia, close to Bora Bora. He did not want to take any chances that his friends would not be informed of his passing, so Paul-Émile, an artist of some small merit, made up this cartoon entitled "Feed Me To The Sharks" and left it in his Paris office to be sent out to special friends announcing his demise. The cartoon that he did was priceless, an albatross view from above showing a flying winged Paul-Émile, waving goodbye to his beloved wife Colette and their daughter on the beach, who in turn were waving goodbye to Paul-Émile as he floated upward and onward.

I have been to a lot of Antarctic services. Did you know that there is a special Antarctic hymn, one which is played at many services? Yes, there is. Some of us have gone out with full military dress performances at Arlington Cemetery, with cannons blasting off, taps being played over a neighboring hill. Some of us have departed without the help of the clergy, as classical music wafted through a chapel. Our former Honorary President, Ruth Siple, was laid to rest in real wind-chilling conditions, ground covered with snow, and wind buffeting so strongly that young strong men had to be on each corner of the canopy to prevent it from being blown into the next county.

And strange things can happen when you are laid to rest. Perhaps the strangest of all is that Admiral Richard E. Byrd and Colonel Bernt Balchen, arch enemies in real life, find themselves next to one another at Arlington National Cemetery. Byrd has a simple white cross, like the tens of thousands at Arlington, with only his name, Richard E. Byrd. Balchen, who died much later than Byrd, has a massive tombstone, at least five feet high, with all of his credentials.

Now for the roll call:

Age 50s

Harry Wexler, 51.....Carl Eklund, 53.....Mary Alice McWhinnie, 57.. Malcolm Mellor, 58  
Paul Siple, 59.

Age 60s

Hugh DeWitt, 61.....J. Murray Mitchell, Jr., 62 Ralph Lenton, 63..... Emanuel Rudolph, 64  
Harry Dater, 65.....Lois Jones, 65  
Dave Canham, 65.....Ned Ostenso, 65  
Mike Benkert, 66.....Hugh Odishaw, 66  
Jim Zumberge, 68.....Richard E. Byrd, 69  
John Katsufakis, 69.

Age 70s

John Mirabito, 70.....Sir Hubert Wilkins, 70  
Fred Milan, 70.....Ed Zeller, 70  
Peter Wilkniss, 70.....Bill Cooke, 71  
Vernon Anderson, 72.....Art Owens, 73  
Gordon Ebbe, 73.....Kirby Hanson, 74  
Admiral George Dufek, 74  
Bill Benninghoff, 74.....Al Wade, 75  
Duwayne Anderson, 75.  
Tom Abercrombie, 75..Jerry Webers, 75  
Cam Craddock, 76,..... Bert Crary, 76  
Charlie Morrison, 77,  
Aleksei Treshnikov, 77.....Walter  
Sullivan, 78 ..Harry Darlington, 78.....Murray Wiener,  
79.....Price Lewis, 79.

Age 80s

Admiral David Tyree, 80.....Finn Ronne, 80  
Ed MacDonald, 80.....Bob Thomson, 80  
Dwight Schmidt, 80.....Dick Goldthwait, 81  
Tom Poulter, 81.....Bud Waite, 82.....Dick Conger,  
82.....Richard Moulton, 82  
Ambassador Paul Clement Daniels, 82.....Mort Turner,  
83.....Ed Todd, 83.....Charlie J.V. Murphy, 83.....Palle  
Mogensen, 83.....Father Dan Linehan, 83.....Rudi  
Honkala, 83.....  
Bolling Byrd Clarke, 85  
Arnold Court, 85 ..John Dyer, 85  
Walt Seelig, 85.....David Lewis, 85  
Joe Hill, 85.....Tom Jones, 85  
Mort Rubin, 86.....Henry Harrison, 87.....Paul-Émile  
Victor, 87.....John Roscoe, 87  
Sir Edmund Hillary, 88  
Admiral James Reedy, 88.....Whirley Bird  
McCormick, 88  
Don “Curly” Wohlschlag, 88...George Toney, 89.

Age 90s

Bob Nichols, 90.....Dick Black, 90  
Bill Field, 90.....Sir Vivian Fuchs, 91.....Alton  
Lindsey, 92  
Ruth Johannsmeyer Siple, 92

Ike Schlossbach, 93.....George Llano, 93 ..Robert  
Feeney, 93.....Pete Burrill, 94  
Howard Mason, 95  
Gordon Cartwright, 97.....Larry Gould, 97.

Age 100

Norman Vaughan, 100.

**NSF/OPP BUDGET TIME AND SUPPORT CONTRACTOR TIME.** If you live in the U.S. and have not yet gotten used to gasoline prices around \$4.00 a gallon, you might feel better if you tune into the website that describes the current predicament of the U.S. Antarctic Program, as administered by the NSF Office of Polar Programs. The FY 2009 (Oct. 1 – Sept. 30) budget represents a fixed amount from the prior year, which was essentially the same as for FY 2007. Fuel costs up \$8 million for 2007-08 would normally require contingency planning of an amount up to \$19 million for 2008-09, thus deferring many logistical plans and science projects, such as pier renovation at Palmer Station, reducing lengths of science cruises, and many more. That’s just a spin-off because of fuel costs, whereas additional increases in labor costs and inflationary issues make the picture more pessimistic. About 30 specific deferred items affected by the problem can be found at [http://nsf.gov/od/opp/ant/usap\\_pi\\_alert.pdf](http://nsf.gov/od/opp/ant/usap_pi_alert.pdf), with some details included in an article in *Science* (29 August 2008, p. 1142-43), with the title (and pun) “NSF Budget Ills Send Big Chill Through Antarctic Program.”

The timing for re-bidding the contract for support for the USAP has occurred, with a pre-solicitation conference at NSF on Aug. 26-28, 2008, already past, with 41 companies represented. A final Request For Proposals is scheduled for October 2008, and an award for October 1, 2009. See the website at [http://www.nsf.gov/about/contracting/rfq/support\\_ant/conference/index.jsp](http://www.nsf.gov/about/contracting/rfq/support_ant/conference/index.jsp) for details on the proceedings, the time lines, and a list of companies.

The contractor selection is a critical exercise for USAP, with a budget expenditure at the ratio of 10:1 for support of science. In other words, it takes a lot of money to achieve what has been, and is, a successful U.S. science program in Antarctica for many years. (Many thanks to Polly Penhale, Environmental Officer at NSF/OPP, for the information that led to this news item.)

### **ANTARCTIC CLIMATE, SHORT-TERM SPIKES, AND LONG-TERM WARMING.**

According to a story in Science Daily (Aug. 15, 2008), dramatic annual temperature swings and a century-long warming trend in West Antarctica are linked to conditions in the tropical Pacific Ocean, according to a recent analysis of ice cores at the National Center for Atmospheric Research (NCAR) and the University of Washington (UW).

David Schneider (NCAR) and Eric Steig (UW) are the scientists behind the results, alerting us to watch the tropics -- as the tropics warm, so too will West Antarctica, thousands of miles to the south, an interesting correlation with El Nino events. Destabilization of the West Antarctic Ice Sheet is the subject of concern, as to whether it will survive over a period of decades or centuries. If the ice sheet (covering an area the size of Mexico) were to melt, global sea level would rise to as much as 16 feet.

El Nino influence can be shown by changes of a major El Nino event from 1939 to 1942, temperatures in West Antarctica rose by about 6 to 10 degrees F, and then dropped by an estimated 9 to 13 degrees F over the next two years. While West Antarctica is the subject of considerable study for the above reasons, the ice sheet in East Antarctica is close to stable due to different atmospheric and oceanic patterns. Disintegration of the West Antarctic Ice Sheet has been proposed to have happened in the geologic past by Dr. John Mercer, forerunner in this subject.

**EXPLORER; The Life of Richard E. Byrd**, by Lisle A. Rose. University of Missouri Press, Columbia, 2008, 544 p. Reviewed by Steve Dibbern.

“Explorer” is an attempt to put the enigmatic “Admiral of Antarctica” into perspective after the passing on of both the subject and all of his companions on his most heralded expeditions. It relies on material not previously available to the general public and significantly on several recently published diaries of expedition participants. It also goes deeply into the origins of Byrd’s activities with a family history and his earlier less well known exploits.

Early in the book Rose makes a spirited defense of Byrd’s claim to have flown over the North Pole which has been the subject of much controversy and would later make the grist of personal

animosities between Byrd and some of his associates, notably Bernt Balchen. Indeed Rose’s defense of Byrd’s claim leads into the major theme of the book which is that Byrd was an extremely complex man. A gentrified Virginia gentleman from a very achievement-oriented family, he was egotistical and very protective of what he regarded as his “turf”. He chose aviation as his mode of exploration but was neither an accomplished pilot nor it appears was he comfortable in the air. He held grudges, and had powerful political allies, but appears to have been painfully naive about the politics of the day. He was a drinker but sometimes chose non-drinkers for lieutenants. Drinking was to cause major problems on both of his major Antarctic endeavors. The book is a vibrant and enlightening trip through an under-analyzed period of Antarctic and American history as well as an analysis of one the most flamboyant personalities of the time.

I like the book very much but it would be dishonest to ignore some faults. The author needed an editor. This is the first book on Antarctic history for which I kept a pencil next to my chair to mark mistakes. Chapter 7, The Secret Land stands out. It appears to have been an add-on, as it does not flow with the narrative. This historical set piece is riddled with misspellings and wrong facts. Examples include on page 183, Scott did not use ponies on his first expedition, he had (and misused) dogs. Shackleton was the first to use ponies in 1907. Scott had two, not three companions on his first trip to the South. Rose repeats the pony mistake several times on the next few pages. He later credits Mawson with reaching the South Magnetic Pole “which Professor T. Edgeworth David had earlier plotted” when David led the trip to the magnetic pole with Mawson in support. He further claims that Mawson wintered over again twenty years later when he did not. The “B.A.N.Z.A.R.E.” expeditions were summer only. The same chapter calls Shackleton’s ship the *Endeavour* a number of times. Both the crews of the *Endurance* and Capt. Cook’s *Endeavour* would have been slighted.

Another “fact check” should have been about the Fokker airplane that Byrd took on BAE I. Rose claims that Byrd wanted to use the larger Fokker Tri-Motor for his South Pole flight rather than the Ford Tri-Motor suggests that the loss of the

Fokker early on during a geological trip put the Polar flight in jeopardy. In fact the Fokker taken on BAE I was not a Tri-Motor at all but a smaller single engine airplane that was never meant to be anything but a support aircraft.

The maps in the front of the book are superfluous. They are too small to be of much use and are unexplained. Several of the illustrations are a bit strained as well. For example World's Fair photo and the last which shows Byrd shaking hands with an unknown person and is captioned "Marie greets her husband"; she is only in the background.

This book was a fascinating read but it also annoyed me. It is a real first rate attempt to understand one of the most controversial men in Antarctic history. By in large it admirably succeeds. Byrd was a larger than life figure with a larger than life ego who could be a formidable enemy or a life long friend. He put Antarctica into the forefront of American consciousness, but damaged his legacy in the end for his narrow-mindedness. We have Lisle Rose to thank for unraveling all of this but the book is seriously flawed by the lack of a good editor.

**Addendum (PCD).** Several months ago I received the book from the University of Missouri Press that Steve Dibbern reviewed in the above paragraph. As I had known the author when we both worked and lived in the Washington, DC area, and where I was not particularly enamored by his first book on Admiral Byrd published by the Naval Institute Press, I looked for a reviewer who did not have my inborn prejudices. It did not take me long to find that person, as within five minutes I was on the phone with Steve Dibbern, who never knew any of the Byrds or Lisle. I

Then several weeks later I received a telephone call from one of our close friends and neighbor, Bess Balchen Urbahn, one of Bernt's former wives. She had received a copy of the book, and upon reading it her temperature exceeded her boiling point. She took deep exceptions to quite a few, in fact, many references (over forty) to her former husband. A sixteen-page letter followed to the Editor of the University of Missouri Press, with copies to four so-called polar experts and six societies/museums/libraries, signed by both Bernt Balchen Jr., and his brother Lauritz Balchen, The letter to the editor of the Missouri Press said "Mr.

Rose's book contains so many lies and innuendoes about our father, Bernt Balchen, that we respectfully suggest that you stop the sale of his book." If you care to read the material sent to the Editor, it is included in its entirety on our website.

#### **A GEOGRAPHIC NAME LONG OVERDUE.**

A geographic feature in Antarctica has recently received its proper name, after many years of being referred to by many of us who were unaware of the complete story. The UK Antarctic Place-Names Committee recently made the feature 'Una Peaks' official, whereas it had been known as 'Una's Tits' as early as 1956, according to a British chart of the area. The complete citation for the naming can be found on a website, which reads as follows:

'On 20 May 2008 the Antarctic Place-Names Committee of Great Britain (UKAPN) approved the name Una Peaks for "Twin ice and snow-capped peaks on Renard Island, south of Cape Renard, at the entrance to Lemaire Channel. Named after Una Spivey, a member of staff in the SecFIDS Office in Stanley, Falkland Islands in the 1950's. Known colloquially as Una's Tits since circa 1955, also as Cape Renard Towers (APC, 2008)." Renard Island was also approved as a new name at the time.'

The words within quote marks above are excerpted from the SCAR document "Composite Gazetteer of Antarctica" (CGA), whose database can be downloaded from the web site [www3.pnra.it/SCAR\\_GAZE](http://www3.pnra.it/SCAR_GAZE). The location of Una Peaks is perhaps best known by those who approach Lemaire Channel on tour vessels for its striking topography prior to entering the channel from the north. After researching for further information, it turns out that the UK Committee printed the wrong information, as Una was Secretary to the Governor in Stanley, not the FIDS Office. This, however, is being corrected in the next announcement by the CGA, following communication between the Place-Names Committee and Una. The complete story is in a draft manuscript which I prepared for submittal to a journal, and which awaits approval by Una herself. Watch this space for an update. *John Spletstoesser*

**HEADS UP:** Be sure to look up the IGY signatory cachets on the website. They are beautiful!

**BRASH ICE.** These are extremely hard times, although your Society is prevailing. We are running a bit late, as I have been victimized/slowed down by carpal tunnel syndrome. I like to look upon our Society as a Friendly Users Society. As you know from our cover page, we are “By and For Antarcticans”, and I think that is very true. Rather than just being a Society of subscribers, I like to think of us as a bunch of Commonly-Linked Participants. A lot of things have changed in the past three years, nearly all brought about by the active participation of one of our long term members, Tom Henderson. First, he brought us up-to-date historically by putting all of our Newsletters and documents from our beginning in 1959 to 2007 onto one CD. Almost a hundred of our members have bought these CDs which we sell for \$20.00 each. At about the same time, Tom initiated a reduced-fare membership for those who opted to receive their newsletter electronically, and to date thirty-five members get theirs this way for \$12.00 annually. Then he took on the role as our webmaster and established a very active website, featuring his own baby, Time Trek, whereby each and every one of us can, if we so wish, present our own bit of Antarctic history for posterity. His website never goes on holiday as Tom is continually updating it as events transpire. It is NOT a static website by any means, so use it and enjoy. In this same time period the Society initiated action to see if NSF would name the library at the new elevated South Pole Station after our late Honorary President, Ruth J. Siple. This was finally approved, and thanks to contributions of over \$5000 from you members, we made our first substantial shipment of books to the library during the past austral summer.

Recently our Society has produced through the clever expertise of our own videographer, Dr. Edwin Williams of Roanoke, an album of three lengthy DVDS of presentations by some thirty of our more illustrious members. And in recent months, Chips Lagerbom has started scanning pictures, film, and documents of historical interests of some of our members, many of which will soon find a home on Tom’s web-site. So we are getting more Up Front and Personal in recent years, and we want you all to take advantages of the many pluses which are available to you members through the efforts of a few of your dedicated co-members.

The above is all very positive and most forward looking, but our membership is in a dead-fall. Just in the past couple of years we have lost Bolling Clarke, Brooks Conrad, Bob DeViolini, Bulldog Drummond, Len Dykes, Bob Feeney, Orland French, Kirby Hanson, Janice Harvis, Rudi Honkala, Will Kellogg, Jim O'Neal, Mike Pavlak, Marty Pomerantz, Al Raithel, John Roscoe, Walter Smith, George Toney. Link Washburn, Gerry Webers, and Aileen Lotz plus some other lesser knowns. Obituaries of some of the above have already been published: Bolling Clarke, Kirby Hanson, Marty Pomerantz, and George Toney. We started this year with 314 members, and as we go to press close to ten per cent have not renewed, so we anticipate we will drop below 300 for the first time in fifty years. The hardest job in the Society is recruiting young members. Word of mouth is by far the best way. Contract personnel do not seem to buy into our Society the same way as Navy personnel used to, who considered Antarctica their fraternity. Is Antarctica becoming just another job, no longer the love of their life?

The DVDs which we are offering for sale are our Golden Anniversary present to ourselves. Thirty of some of our more prominent members agreed to come on camera to tell their own life stories of Antarctica. There are no stupid questions being asked, each presenter tells the camera what he or she wants to divulge. Like George Doumani, one of our past presidents, stops talking about his involvement with Gondwanaland long enough to tell all the price of being away from family. There are three DVDs, each of over two hours duration, but you can pick out the speaker you want to hear from the menu, so you don't have to get swamped unless you want to be inundated. Most presentations are about fifteen or twenty minutes. All of the IGY personnel are put onto one DVD.

Although basically it is a celebration of what has happened in the past fifty years, one DVD presents such modern stalwarts as Paul Mayewski, Mary Albert, Warren Zapol, George Denton, Lou Lanzerotti, and a few

others. If you like history, there's Bob Dodson of the Ronne Antarctic Research Expedition and there is Charles Swithinbank of the Norwegian-British-Swedish Expedition of 1949-52. These DVDS have a wealth of archival information on the past fifty odd years, and they are all blended together with the artistry of Lucia deLeiris and the magical photography of Ann Hawthorne.

Most of the taping was done on my property in mid-coastal Maine which I bought back in 1949 from the widow of arctic explorer-scientist Russell Porter, who had gone north with both Peary and Cook. And the background live music was also polarized, as Steve Lindsay on the electric piano had a relative who lived with the Eskimos in the arctic and Renny Stackpole on bass is a distant relative of Roald Amundsen! So we had the proper setting, the right people, and one of our most honored guests was Bess Balchen Urbahn, widow of the very first pilot to ever fly over the Geographical South Pole.

Our own Dr. Ed Williams, a most talented videographer in his own right, a veteran Antarctic traveler, produced ANTARCTICA CALLING as a labor of love for us to sell to you at a most nominal price of \$50.00 each. BUT we, your Society, is subsidizing the cost to you of \$15.00 each, so you only have to pay \$35.00 for all three DVDs. We have already sold close to a hundred albums, so they are selling fast. You can get on the bandwagon, and have yourself a nice memento of the past fifty years of Antarctica by sending a check of \$35.00 to Dr. Edwin L. Williams, 4536 Greenlee Road, SW, Roanoke, VA 24018 and one will soon be on its way to you.

This is a big year for decision making in Antarctica for the USA, as it is getting close to the time when the National Science Foundation will select their next contractor for the ice. Requests for proposals were issued on October 10, 2008 and site visits to Antarctica were conducted from October to December 2008. Receipt of proposals were

welcomed in February of 2009, and currently evaluations and negotiations are going on. Someone in authority will make an announcement on October 1<sup>st</sup> of this year as to the winner. Some people are going to be real happy, others are going to be real sad, but that's life, is it not?

The Antarctic Treaty Consultative Meeting will be held in Baltimore from April 6<sup>th</sup> thru April 17<sup>th</sup>. The sessions for club members are closed, although there are some sideline events open to the public (see this Newsletter or visit our website). Never having been privy to attend any of their meetings, one wonders just what goes on for those eleven days. Certainly there are no weapons of mass destruction on the ice, supposedly no rock hounds have ever been able to find mineral deposits of strategic importance. After an hour briefing on where to find the best crab cakes in Baltimore, what will they do the rest of the time during this period of global economic tightening?

**WEBSITE UPDATES** (by Tom Henderson)  
If you haven't been to our website since the last newsletter, take another look. There have been some important changes. We are now truly multi-media with the addition of video and audio files on the site. Ralph Glasgal's excellent documentary, "The International Geophysical Year 1957" and a couple of historical audio segments are posted under Pack Ice and soon will be linked to Time Trek. Speaking of Time Trek, we have upgraded the application, the first since June 2008. The changes may appear modest, such as the addition of a browse button for events but our programmer, Amos Alubala, has made some important structural improvements in the background to prepare for the next upgrade. I will discuss that in a moment.

Another news item is not a website change, but it definitely will have a very positive impact on the website. I am speaking of the Society's new slide scanning service. Charles Lagerbom covers this exciting topic in another article in this newsletter. The service

is off to a flying start and there is now a good backlog of excellent digital images, many of which will appear as part of Time Trek. Look for the beginnings of that ongoing effort soon.

On the hardware front, the Society recently purchased a very portable, high-quality digital audio recorder that will be used for interviews with members and for narration of images and video that will be posted on the website.

More changes are on the way. The next upgrade of Time Trek is significant because it will make it possible for Macintosh computer users to access the Google Earth version of Time Trek for the first time. It will also include support for a photo gallery. The gallery will be an easy way for visitors to explore what will be a host of historical images in a more thorough way. You will be able to leverage the detailed catalogue that Charles Lagerbom is assembling as part of the slide scanning service to search for images by photographer, category (people, ships, scenic, etc.), date, or key word in the description. The photo gallery will have the same "look and feel" as Time Trek; in fact, the plan is to make it almost seamless with Time Trek so it will be easy switch back and forth between them.

You will also see a dramatic improvement in the content of Time Trek in the coming months. In addition to new imagery, the sparse number of events currently in the timeline will be gradually and steadily expanded. With the publication of Robert Headland's Second Edition of "A Chronology of Antarctic Exploration" (see review on page 6), we will have a wealth of updated material to reference. Dr. Headland has already granted us permission for the Society to excerpt from the book for use in Time Trek. As always, of course, we encourage all members to submit material on their own experiences in Antarctica to add to the timeline.

I mentioned a revised, more interactive members list in the last newsletter. I fully intended to have that on line by now, but some pesky database issues have set back the release date. It should be up before the next newsletter for sure. As I stated in December, my intent is to allow members' addresses to be shown unless they tell me otherwise. Again, this list is only viewable by members who have a username and password, not by the general public. **IF YOU DO NOT WISH TO HAVE YOUR ADDRESS SHOWN IN THE MEMBERS LIST, CONTACT ME (TOM HENDERSON) AT THE EMAIL OR ADDRESS ON THE COVER OF THE NEWSLETTER.** The new list will have a feature that allows logged in members to change their own settings to reveal only the information they choose to reveal. Members will also be able to update or correct their information directly on the web page. The latter will save Paul some time and effort in keeping his membership information current.

Finally, since we passed the first anniversary of the Society's website in February, I think it is time to get feedback from those who use the site. I have set up a short on line survey about the website, which you can access through a link on the website. Look under What's New to find the link. Your opinions and suggestions will be very valuable in guiding development going forward. Please take a few minutes to go on line and answer the ten questions that make up the survey. I will leave it available until we have a reasonable number of responses. By the way, non-members can take the survey as well. I will publish the results, probably in the next newsletter.

If you haven't yet been to the website, [www.antarctican.org](http://www.antarctican.org), I encourage you to do so. After all, it is your website, supported by your membership dues. If you haven't yet established a username and password to get to the members' area of the website, simply contact me at [webmaster@antarctican.org](mailto:webmaster@antarctican.org) and let me know what you want for both. Most of the website can be viewed without logging in, but there is a lot of interesting

material that is reserved only for our members. Enjoy it all!

### **NEW SLIDE SCANNING SERVICE FOR MEMBERS** (by Charles Lagerbom)

In January 2009, the Antarctic Society initiated a very valuable service for its members. For the cost of certified shipping, members may now submit their film slides taken in Antarctica to the Society for conversion to digital images, free of charge! The scanning is done on a Nikon Super Coolscan 5000 ED, which is a high-quality, high-end scanner used by photographic professionals and serious digital photo enthusiasts. It has special software that removes the artifacts of most scratches and dust particles from the scanned image. The slides are scanned at a resolution of 4000 dpi, more than enough for producing sizeable photo print enlargements. Members retain their copyrights; the Society only asks that the contributor grant the Society non-exclusive use of the images for the Society website. To date, I have scanned and catalogued over 2,600 slides from our members.

As the actual scanner of the Antarctic Society's slide scanning service, I consider it a privilege and honor to work with these images of so many people who have visited, worked, researched and otherwise experienced the polar regions. These are their personal impressions of the place, most of them shot for their own use. They are important in that the photographer thought enough of the moment, place and subject to preserve the image of it. As far as I am concerned, every single image is important to preserve. It is not that we want or need every scanned image to go up on the website's Time Trek feature; rather, we want every image scanned for preservation sake and for getting these historically important visual images on a more modern medium. While it is the goal of the process to reproduce the image as near to real as possible, the more important consideration is that the image is digitized in a high quality format and therefore made available for further

processing with Photoshop or some other program at the owner's leisure.

The process is somewhat labor intensive, but well worth the preservation of these images, since many of these slides face deterioration in quality and color from poor storage, age or other elements. The best part of the scanning process is the creation of a database (in an Excel spreadsheet) of the images with a catalog number that corresponds to the scanned image's jpeg name. For instance, the first slide of Charles H. Lagerbom's slides is cataloged as CHL1 which is the name given the jpeg image on the CD. Other categories of the catalog include the slide's date (as specific as can be), the Time Trek date (only for the purpose of tying in the images chronologically that fits with the website feature), three columns of locations (each getting more specific: Antarctica, Ross Island, Hut Point), and finally a category for notes or other information providing more data about the place, people or image subject. These categories can be sorted using the electronic version of the catalog which is included on the final CD of images so that, for example, all slides from 1958 can be listed or identified, or all slides of the ship HERO, etc. A hard copy of the catalog is also sent back with the CDs and original slides so that one can sift through the images with the catalog as their guide. The aim is to make it user friendly and image accessible.

So if you have slides and have not converted them, please consider using the new service. Even if you have a set of photos digitized, I will be happy to catalog them and include them in our inventory for supporting Time Trek. See details of the service on the Society website at [www.antarctican.org](http://www.antarctican.org), or you may contact me at: 16 Peacedale Dr. Northport, ME 04849 [clagerbom@sad34.net](mailto:clagerbom@sad34.net)

**32ND ANTARCTIC TREATY CONSULTATIVE MEETING.** The United States will host the 32<sup>nd</sup> Antarctic Treaty Consultative Meeting (ATCM) in Baltimore, Maryland, April 6-17, 2009. The ATCM is

the major annual diplomatic event related to Antarctica, and will include the participation of nearly 400 diplomats, Antarctic program managers and logistics experts, and polar scientists from 47 countries, including 28 Consultative Parties with a scientific presence in Antarctica. Also attending will be representatives from other entities comprising the Antarctic Treaty system and observers from several non-governmental organizations. The Parties will discuss issues including environmental protection, the advancement of science, and the management of tourism.

The Baltimore ATCM occurs as the Antarctic Treaty marks its 50<sup>th</sup> anniversary. The Treaty, which was signed in Washington, promotes international and scientific cooperation. The 2009 Meeting coincides also with the conclusion of International Polar Year, the most ambitious multinational, interdisciplinary polar research effort ever undertaken. The Meeting thus offers a unique opportunity for Parties—and the public—to reflect on the theme of "Fifty Years of Peace and Science" in Antarctica. In addition to celebrating achievements under the Treaty, the 32<sup>nd</sup> ATCM will provide a forum for Parties to look ahead and discuss a future agenda for Antarctic collaboration.

**MARYLAND SCIENCE CENTER.** The Maryland Science Center in Baltimore will be the focal point of a range of public events April 4 and 5 that highlight federally funded Arctic and Antarctic research programs. The public events are being held in conjunction with the two-week-long Antarctic Treaty Consultative Meeting (ATCM), attended by delegates from more than 40 countries. The Science Center events will include an unprecedented exhibit of collected art, film, poetry and prose created by world-class artists to interpret the nation's Antarctic heritage, the public unveiling of a unique NASA film that shows the global importance of the world's Polar Regions to multimedia and hands-on demonstrations of polar science and cultures.

The exhibit of work by participants in the National Science Foundation's Antarctic Artists & Writers program and many of the related events are funded jointly by NSF's Office of Polar Programs (OPP) and its Education and Human Resources Directorate's Informal Science Education (ISE) program. Past participants whose work will be represented in Baltimore include internationally acclaimed director **Werner Herzog**, whose Antarctic documentary "Encounters at the End of the World," was nominated for a 2009 Academy Award; **Kim Stanley Robinson**, author of the science fiction work "Antarctica" and the Mars trilogy; installation artist **Lita Albuquerque**; and the late nature photographer **Galen Rowell**. The art exhibit is scheduled to run through Labor Day. For more information, [http://www.nsf.gov/news/news\\_summ.jsp?cntn\\_id=114340](http://www.nsf.gov/news/news_summ.jsp?cntn_id=114340)

#### **A CHRONOLOGY OF ANTARCTIC EXPLORATION**, by R.K. Headland.

Review by John Spletstoesser. While I was on a ship in Antarctica in February, I received an email message from my colleague, Bob Headland, who alerted me to expect a 2.2- kilogram package in my mail after I returned. I knew exactly what he meant, because the publisher of his Chronology of Antarctic Exploration, Bernard Quaritch, London, had earlier announced its publication. In fact, a formal reception was held in London at the New Zealand High Commission on 20 February to announce its publication.

I also was aware of the bulk of the hard-cover volume because I performed a voluntary editing adventure for Bob in 2008, when I read every word of it during several weeks. A few gremlins were encountered in the text, nothing unusual for a work of this nature, and the final touches on it were worked on by the author and the publication of 722 pages is now in print and available from Quaritch at a cost of £110 (about \$146, April conversion rates). The 722 pages include 40 plates, 27 maps, 21 histograms, a very thorough Index (p. 635 – 719), and an Introduction and other advance text from p. 9

to 72. Bob relied on some assistance to produce such a classic, and the pages of Acknowledgements include a list of 31 archives and libraries and 167 individuals. It is apparent, therefore, that much research has gone into this excellent piece of work, an updating of his earlier chronology on the subject in 1989, reprinted in 1993.

Having known Bob Headland for about two decades is enough to know that he is one of a few who would be capable of putting together this kind of information into a usable form, beginning with earliest historical records that postulated a land mass to the south. This edition has 4,865 entries, and the final one, dated 2009, is the citation for this book. The subtitle for the book is 'A Synopsis of Events and Activities From the Earliest Times Until the International Polar Years, 2007-09.' The basic forms of entry in the list are expeditions and events. Expeditions are followed by their years, country of origin, and purpose, followed by the name of the leader, captain, or other officers of the vessel involved. Brief annotations provide further information as to locations, operations, events, and some other details. Introductory pages include bonuses such as membership of SCAR and Antarctic Treaty signatories and lists of winter stations. All polar libraries will have this volume in its reference collections as a means for scholars and authors to look up anything related to its purpose. The price might dissuade some from purchasing it, but the long-term value is forever. It leaves a question, however, as to whether Bob or someone else with his enthusiasm and tenacity will continue the Chronology on a regular basis, perhaps issuing Supplements via the internet. Bob is still a young man, however, 10 years my junior, and I think his energy will persist. Purchase his book to keep him on cloud-nine.

For order information, contact Catherine Scheybeler at Quaritch, 8 Lower John Street, Golden Square, London W1F 9AU; tel +44 (0) 20 7734 2983; email [c.scheybeler@quaritch.com](mailto:c.scheybeler@quaritch.com). As I understand it, Catherine was the glue that kept Bob in

line while it was in process, including copy-editing and all the rest of the details required for its production.

**“INNOCENTS IN THE DRY VALLEYS – AN ACCOUNT OF THE VICTORIA UNIVERSITY OF WELLINGTON ANTARCTIC EXPEDITION, 1958-59”**, by Colin Bull, Victoria University Press, Wellington, 2009, 90 figures, 4 maps, \$30 plus postage from Colin Bull Polar Books, 12818 Sunrise Drive, Bainbridge Island, WA 98110. Reviewed by Steve Dibbern.

The reviewer must first confess to an unrequited love affair with the Dry Valleys those unique geological/climatological oddities across McMurdo Sound from our main base and the sight of so much Antarctic history. I once saw into them from a helicopter but never got to go into them... a tease but no consummation!

With that admission out of the way I will begin by saying that Colin Bull's narrative is a fascinating look at how science was sometimes done 50 years ago particularly in the countries without big budgets for Antarctic research. Taylor and Debenham's accounts of their reconnaissance of the Taylor Valley during Scott's last expedition are, to me, classics of exploration and polar literature. Bull's book starts with a description of science on a shoestring. He and three others; Dick Barwick, Barrie McKelvey and Peter Webb got support in principle from the NZ science establishment but little financial aid. They caged transport from the Americans and equipment from their University and private suppliers.

Once in Antarctica they were landed in the previously unsurveyed Wright Valley north of Taylor and Debenham's work area and set about to **walk** the area. Split into two teams they did their science the old fashioned way... in detail and on foot. They hiked the length and breadth of the Wright Valley and walked north through Bull Pass into the

Victoria Valley as well as across the Wilson Piedmont Glacier to the Ross Sea.

Their accomplishments are too many to list here but suffice to say that the ratio of science to cost was extraordinary. Science to shoe leather was quite another thing as one of the photos and the narrative make clear! Bull drew from his own memory and heavily from diaries of his companions. The narrative is well written and frequently irreverent (in a Kiwi sort of way) and very funny. The color illustrations are both very nicely done and numerous. The maps are well done but the larger fold-out could have benefited by showing its relationship to the other (southern) dry valley.

This book is an exceptional addition to the narratives of the modern IGY inspired research in Antarctica. What sets it apart is how very exhaustive the process of gaining the knowledge was! After the helicopter left them you could imagine that they were simply the Taylor/Debenham "Northern Party" working in the next valleys up. This was "earned" science, modern in its data but "Heroic" in its winning. "**Innocents**" will sit comfortably along side Taylor, Debenham and Craig Potton's "**Improbable Eden**" in my library and anyone else's who love the Dry Valleys.

**REFLECTIONS "IN ICE"**. (By Jerry Marty's Ghostwriter) Retirement is a word we've all talked about with comments like, "If I won the lottery, I'd call in to have my check mailed to me," or, "I wonder what it would be like to get up on a weekday morning and not have to go into the office." Usually it's something we all eagerly anticipate, not really knowing what to expect...and then, the day arrives. I have to be honest – it's not like that at all. I've had the privilege of being a member of a very elite and unique team over the years – from 1969 forward, working with scientists, Department of Defense, USARP, USAP, and all the support personnel who have the passion for Antarctica flowing in their bloodstream just as it does in mine. The

people I've had the honor to have worked with have exemplified excellence in work ethic, esprit de corps, passion, and dedication to a continent and project that has no equal. My "retirement" has a bittersweet tone. I have a sense of personal loss, a void in my life, and a sense that something has been taken away from me. I am having a difficult time with leaving – and there is an overwhelming awareness that I'm no longer a part of the magic that built the impossible.

Growing up on a farm in rural Wisconsin, I attended a one-room school which served grades one through eight. As one of thirteen students, I saw beyond the fertile farmland. The old-fashioned pull-down maps of the world sparked an interest and I realized I wanted to travel where few had gone before. I read the books of Admiral Byrd and began to focus on Antarctica and the South Pole. In high school I wrote letters to possible future employers asking what qualifications and experience would allow me to attain my goal. I thought, why not see the world and get paid to do it at the same time...plus there was a world of "women" out there just waiting for me. I attended the University of Wisconsin, Platteville and graduated with a degree in Construction Technology and Management, School of Industry. Two decades later I was honored by UWP as one of their distinguished alumnus, an honor I share with Jerry Huffman who also was part of the Antarctic program.

Forty years ago I interviewed with the first support contractor, Holmes & Narver, Inc. based out of Los Angeles, California. It was the summer of '69 and I was ecstatic to have been selected and assigned to Byrd Station as a General Field Assistant (all-around gofer). It was at Byrd Station that I became part of Antarctica, and it became part of me. From that point onward, I knew that this was where I wanted to devote myself; to be assigned to engineering & construction projects building scientific research facilities. I had become one of those "with ice in my veins". Looking back, it's coincidental that I finish my tenure almost to the month with the completion and

dedication of the new Amundsen-Scott South Pole Station (fourth station following the initial IGY station).

The adventure hasn't been without a few bumps in the road. Along the way, I won a different kind of lottery. In 1969, the government instituted the draft lottery and in 1970 I "won" a free trip with a very low number. As it were, I volunteered for the Army...

And so began the next chapter of my life. With only two days to go before basic training, I celebrated my impending departure at a Santa Monica watering hole called the Oar House. Three or four sheets to the wind, I saw with my own eyes, the loveliest creature on the planet earth emerge from the madding crowd. Yes, we met in a bar! My pick-up line was reduced to stutters, stammers, and slurs, but somehow she bought it. We went on our first date the day before I was to travel by bus to Fort Ord.

Elena and I wrote to each other during my tenures at Fort Ord, Fort Polk, Fort Benning, and just before I got orders to go to Southeast Asia, I took the plunge and asked her to marry me. Not knowing what "Uncle Sam" had in store for me, we decided that we would proceed with the ceremony if I got orders to someplace other than 'Nam. As it were, Korea was on the agenda. We married in September and after a one week honeymoon trip to Fort Ord to apply for my bride's military dependency card, I was unceremoniously shipped out.

For the first six months of our marriage, Elena and I wrote to each other...me huddled shivering and cold on the DMZ in Korea as an Imjin Scout (2<sup>nd</sup> Infantry Division). Having served time in a hostile fire zone, I returned to California, not only to my bride, but also to Holmes & Narver who had kept my position open for me while I served our country.

Once again, the circle came round. In 1974, H&N made an unprecedented decision to

send “women” to the ice. Elena jumped at the opportunity and was one of the first two women to be sent to Antarctica as part of the support effort. While on the ice, we spent time at McMurdo Station and at South Pole Station. Among her many diverse duties, Elena served as a logistics coordinator for construction materials. Even so, she didn’t flinch while at South Pole, when offered an opportunity to help move the Hercules aircraft 917 from the crash location to the end of the ice runway. She gamely drove a forklift through the side of the fuselage and paced the rest of the crew in its half-mile traverse.

That was then, and since that time, Antarctica has always had a fond place in our hearts. Following a few years wherein work took us to Micronesia (Palau, Truk, Guam, and Saipan), me to Saudi Arabia, Alaska, and other exciting locales, I was invited to return to my roots – working at the Office of Polar Programs at the National Science Foundation to be part of the South Pole Station Modernization Project. Over the past fifteen years, I’ve watched a dedicated team of Ph.D. scientists, support contractors, Navy, and Air Force (ANG) men and women give with their hearts and souls the life blood that grew the new elevated station. Without them, there would be no South Pole Station. My greatest experience in life has been the opportunity to work with people who worked around the clock, against deadlines, and in the harshest environment in the world to build a mega structure that is like no other.

Last November I knew I’d be faced with one of the best...and worst times of my life. There was great satisfaction in seeing a great monument built to further science and research at the South Pole, and at the same time, I dreaded saying goodbye to my “Polie” family. The praise and accolades have been hard for me to accept. I’m uncomfortable, finding I don’t do well on the receiving end of compliments and tributes. I’m overwhelmed with gratitude to the people who made this all happen, for they, in reality, deserve the respect, admiration, and

credit for making the impossible -- possible. Most recently I was honored by the ANG 109<sup>th</sup>, Schenectady, New York during a visit and presentation. Again, in the presence of those who made the project success possible, I felt humbled.

Contemplating the future, I flirt with following in the footsteps of Paul Siple by writing a story of the people, the real heroes who made this all a reality; a sequel to **90 South** that tells the human story of the challenges of building a testimonial to 21<sup>st</sup> century science.

I leave with mixed emotions. I’m proud to have known such classy people as the “Polies” who allowed me into their lives while we worked together to accomplish the impossible. Along the way, I salute my son, Jamie and his wife Tara, and my two adorable grandchildren, Troy and Reese; and my beautiful daughter Joanna who lived without her dad for fifteen annual four-month sojourns to “the ice.” I am indebted to them for their support for they, and my bride (and best friend) of 38 years, allowed me to live the dream.

I have now joined the Paul Dalrymple Club. In spirit and soul, I have never left 90 degrees south latitude (although cash donations for my \$300 per hour psychotherapy sessions to get through all this would be most appreciated).

Can you pick out Jerry?

Elena and Jerry, South Pole 1975

One of two reasons to retire.

**BRASH ICE.** We had looked forward to this Newsletter as an end to my 30-year era of putting these Newsletters together and out on the street. I am really ready to call it quits, as something which was once a great pleasure and delight to do has now become a frustrating ordeal. When I was physically located in the Washington, DC area, when NSF was on 18<sup>th</sup> Street, when the Polar Research Board was in Foggy Bottom, when Ed Todd and Peter Wilkniss were in charge of the Office of Polar Programs, when Louie deGoes and Tim Hushen were heading up PRB, and when we had use of rooms at NSF and at the National Academy of Sciences for meetings, it was all so easy. And it all was a cakewalk with Ruth Siple not only providing a home for our Society, but she made it all work so smoothly and harmoniously. It was a two-person operation, and Newsletters were written, edited, and mailed within a few days, unencumbered by numbers of people and computers. It is no longer fun, believe you me.

It all happened for Ruth Siple and me back in the fall of 1978 when we more or less took over the Antarctic Society, lock, stock and barrel. We took over its treasury, its membership, its secretarial responsibilities, and we started publishing Newsletters on a regular basis. And it all worked, even though I governed with a hard hand, as Ruth Siple fully supported me and calmed the waters whenever I created waves. Nobody wanted to cross Ruth, she was truly the Sweetheart of the Antarctic Society. We lasted as a team for approximately twenty years, but then I sought refuge in the peacefulness and quietude of mid-coastal Maine where an aging mother needed caring. At the same time, NSF moved to Ballston, and it all became another ball game.

As I sit here in front of this silly computer, I have seen 169 Newsletters produced, a total of 1664 pages. The Society is doing quite well, thank you, mainly because when Ruth Siple was active, we banked a lot of monies because she did all the work gratis. Now we try and break even annually. We are the longest continuous Antarctic society in the states. The American Polar Society under the guise of the very dedicated August Howard had a continuous stretch of some fifty years, but soon afterwards it went underground for seven years after August died.

It's a good time for me to think about phasing out of the Society. I wanted to stay active for thirty years. That I have done. I had hoped to see all the Newsletters assembled as one. I never really expected to see this happen, but Tom Henderson brought my fondest dream to a reality. I had hoped to see the library at the new elevated station at the South Pole named after Ruth Siple, but when I was told to "cool it", I thought my wheels were spinning in granular snow. However, Jerry Marty never lost faith in our mission, and it finally became a reality this year. Now I can truly retire proudly. But one thing remains, I wanted to see the Society regain its rightful tax-exemption status originally granted in the early 1960s. Thanks to the efforts of our Vice President, Rob Flint, this all may become a reality in the next year.

I feel that our Society is on the threshold of a new era, one where my old cronies are fast fading out, where new, young blood will open the gates to a more exciting future. This has already started under the direction of Tom Henderson, who is doing new and wonderful things each month on the website, where we hope to see more active participation by members. Check out the website to see what it offers --

[www.antarctican.org](http://www.antarctican.org).

**CALENDARS.** As we go to press we still have a FEW Antarctic Hedgehog (New Zealand) calendars. We will mail them out toute suite, so if you want one, get your order in now. Send a check for \$15 each to Antarctic Society, Box 325, Port Clyde, ME 04855.

**WEBSITE UPDATE** (by Tom Henderson)  
Most of my time since the last newsletter has been directed toward improving the mechanics and structure of our website, and that will be the case for the remainder of this year. Some improvements are subtle, such as the centering of the website pages in the browser window, the addition of a background image behind the pages and the highlighting of all links in the website when

you move your cursor over them. A major improvement is the removal of a separate log-in for the Society Forums. That annoying requirement was a result of using an open source bulletin board application as the basis for our Forums. That application was intended to be stand-alone and public-facing, hence the complicated log-in. The log-in and authorization code was deeply imbedded so it took some time and careful programming surgery to make sure that removing it did not cause unintended consequences. Now, anyone who logs into the main website is automatically authorized to access the Forums for posting and responding to messages. My intention is to encourage more of you to make use of it. This is a quick and easy way to post your observations, opinions and questions for other members to see and respond to. Take advantage of it!

We will have an updated version of Time Trek on the website within the next two months. Google still has not released the stable production version of its new Google Earth plug-in (Version 4.3), so we have not integrated it into Time Trek as yet. That new version will support multiple browsers including IE, Firefox, Safari, Opera and others, so it is definitely worth waiting for. We will, however, upgrade Time Trek to provide users with a better console interface and a more logical display of the event descriptions and user-provided information about events.

Another major improvement that will be finished by the end of this year is better access to information about our members. Currently, only a list of member names is available in the password-protected Members area. The new page will feature not only the list of names but will also allow members to click on any name and see information about that member in a form displayed on the same page. The plan at this point is to show only the member address unless the owner of that information chooses not to show it. Therefore, **if you do not want your address available to other members, send me an email at [webmaster@antarctican.org](mailto:webmaster@antarctican.org) or a**

**letter to my address shown on the front page.** Remember, this information will only be available to persons who have logged into the website and will not be shown to the public. Other information on each member, such as telephone number, email address, professional affiliation and biographical information will only be available by the owner's choice. That can be done directly by the owner because if you click on your own name, the form that displays all of your information will change to give you editing options. The current design will have radio buttons next to each information item that the owner can click 'on' to reveal or 'off' to hide. The owner will also be able to change any of the information on the form. This way, if a member moves or changes email address or telephone number, they can update their information themselves online! This will save Paul a lot of work keeping track of everyone, which is no small task. I hope that members will be open with their contact information because this is a great way to facilitate communication among all members. That is, after all, one of the reasons the Society exists. I have in mind adding another "goody" to this page that I am sure members will like, but that is going to be a surprise!

Beginning early next year, the focus of website development will shift from structural improvements to the addition of content, particularly Time Trek content. We will go into "full court press" mode (consistent with the sports season) to really make Time Trek a valuable resource. Expect to see extensive additions to the descriptions of events in the timeline and perhaps a number of contributions from members as well. As some of you know, a new edition of Robert Headland's well-respected reference, [A Chronology of Antarctic Exploration](#) is scheduled for release in February 2009. This massive and extensive tome is widely regarded as the definitive general work on activity in Antarctica from the earliest days forward. We have contacted Bob Headland and he has generously agreed to allow us to excerpt from his book to help populate our

Time Trek event descriptions, with credit given in each case. This will be a great help in making Time Trek a useful reference. Eventually, descriptions of historic stations will be added as well. Finally, we expect to have video files of historic information available on the website early next year.

So visit often to see the changes in your website as they occur. Our goal – with your help – is to make the website better and better .... and better!

**ARCHIVING.** Dr Edwin Williams, retired surgeon, lover of Antarctica and all things natural, is in the process of producing a couple of DVDs for us of Favorite Antarcticans. Basically the DVDs will feature field scientists from the past fifty years, with each talking on camera about his or her Antarctic careers. Charles Swithinbank talks about his seven decades on the ice. Bob Dodson was with the Ronne Expedition back in the 1940s when women were introduced as wintering- over companions. Charlie Bentley, John Behrendt, Hugo Neuburg, Dick Cameron, Ralph Glasgal, Johnny Dawson, Steve DenHartog, and Ed Robinson all talk about their experiences during the IGY. Then there are the ice corers, with Tony Gow and Paul Mayewski documenting their own drilling programs, as George Denton talks about his research in climate change. It is not just a bunch of good old boys, as Mary Albert was chief scientist on the Norwegian traverse to the South Pole, via Plateau and the Pole of Inaccessibility. And to add still further prestige to what has happened on the ice, Dr. Ed has captured Lou Lanzerotti of the National Science Board and Warren Zapol of the Polar Research Board (and recent presidential appointment to the Arctic Commission). Even Dave Bresnahan tells about his experiences trying to keep one and all happy in the field. Guy Guthridge talks at some length about his child, the Writers and Artists Program at NSF.

### **ANOTHER ICE SHELF IS LEAVING.**

Wilkins Ice Shelf, located on the west side of the southernmost part of the Antarctic Peninsula, appears to be in a state of disintegration, similar to others in West Antarctica. According to Science Daily, Dec. 1, 2008, Wilkins Ice Shelf is one of seven along the Antarctic Peninsula that have retreated or disintegrated in the past 20 years, including the Larsen B Ice Shelf in 2002. The Wilkins Ice Shelf had been stable for most of the last century before it began retreating in the 1990s. An ice bridge that connects the Wilkins Ice Shelf to two islands, Charcot and Latady, showed new rifts detected by satellite on November 28, 2008, that threaten to break up a critical portion of ice and cause the bridge to collapse, thus adding to the probability that the ice shelf would separate from the Peninsula. Because an ice shelf is floating, there would be no rise in sea level, but its demise would be an indicator of on-going climate change in this part of Antarctica.

The Antarctic Peninsula has been experiencing extraordinary warming in the past 50 years of 2.5°C. For effects on the wildlife in the Peninsula, see the journal American Scientist, July-August 2008, which provides details of research by James McClintock, Hugh Ducklow, and William Fraser who have conducted research for many years in the area of the U.S. Palmer Station, located on Anvers Island on the western side of the Antarctic Peninsula. The three biologists, well known in the U.S. Antarctic Program, have put together a study from the 'bottom up' to show that climate is changing in that area, as shown by major changes in sea-ice reduction and effects on the marine fauna. For example, average mid-winter temperature has risen 6°C since 1950 in the peninsula, the highest rate of warming anywhere on the planet, and 5 times the global average. If the rising trend continues, sea ice will not form by mid-century in most years, leading to a major regime change in the ecosystem.

**WIND POWER AT McMURDO.** Naomi Arnold, CHRISTCHURCH PRESS (Margaret Lanyon) On a ridge overlooking Scott Base, a wind farm is rising from the frozen landscape. Three wind turbines on Crater Hill will supply renewable energy to power New Zealand's Scott Base and its neighbour, the American base at McMurdo Station. The project, a collaboration between Antarctica New Zealand, Meridian Energy and the United States Antarctic Program's Raytheon Polar Services, brings unique challenges as the ice dwellers act to reduce their carbon footprint. Project manager Iain Miller said designing foundations to keep the 40m high turbines working in high winds was a testament to Kiwi ingenuity.

The 12-tonne concrete blocks were fabricated in Christchurch then buried in the Antarctic ground. "We're going to bolt on this big steel spider to these concrete blocks, then grout some bars 10m into the permafrost. The concrete plus the steel is designed to be enough to hold these turbines up in the severest of conditions."

The turbines required smart engineering. The blades of the three 330kw German turbines were able to tilt their pitch as wind direction and intensity changed, and were able to withstand hurricane force 122km/h winds. "The other quite fascinating challenge is that we haven't got a national grid to plug into," Miller said. "Instead, we're feeding the energy into a diesel generation system. A lot of wind farms plug into the national grid, which is so enormous that the energy that comes from the wind turbine doesn't destabilise the flow of electricity to your house or business. These generators don't like sharp increases or decreases, so we have to put in some very smart engineering between the wind farm and the generators to keep the flow even. Everything is about trying to figure out the most efficient way to provide energy to Scott Base and McMurdo."

**DEALING WITH SOME FAMILY BUSINESS** - Naomi Arnold, Christchurch Press (Margaret Lanyon)

One hundred years after Sir Ernest Shackleton abandoned his attempt to reach the South Pole, descendants of his Nimrod Expedition hope to finish some unfinished family business. The Matrix Shackleton Expedition, which started on November 13, 2008 from Shackleton's hut at Cape Royds, plans to traverse 1400km to finally reach the original destination. In 1908, the Nimrod team - Shackleton, Frank Wild, Jameson Boyd Adams and Eric Marshall - made it to latitude 88°23', within 160km of the pole. The modern-day expedition plans to go all the way. Sitting on their heavily loaded sledges in the searing Antarctic light on the first day of their journey, Henry Worsley, Will Gow and Henry Adams estimated it would take 70 days to complete their family destiny.

**BLACK MEN IN EARLY**

**ANTARCTICA.** By Steve Dibbern. While reading Ian B. Hart's excellent book *Whaling in the Falkland Islands Dependencies 1904 – 1931* I found a reference to Cape Verde Islanders working on Norwegian whale factory ships in the South Shetlands circa 1905. The writer proposed that they might have been the first Africans to visit Antarctica. It was not clear if he was referring to black men or Africans specifically. But it made me wonder as I had known that the American New England sperm whale fishery was integrated and indeed was a focus of free blacks in New England. Wouldn't it be fair to assume that the New England fur seal trade was similarly integrated?

I did a number of index searches in my own library and found very little. In the meantime I queried the New Bedford Whaling Museum and the Mystic Seaport museums libraries and got helpful replies to look at such works as *Black Hands, White Sails* by P. and F. McKissack, *Black Jacks* by J. Bolster and *Black Sailors* by M. Putney.

They also gave me references to on line data bases of crew lists and ship registers.

This pointed me to a book on my own shelf. *The Voyage of the Huron and the Huntress* by Edouard Stackpole, Mystic, 1955. The book was subtitled "The American Sealers and the Discovery of the Antarctic Continent". The *Huntress* and the *Huron* were in the Stonington fleet that contained Nathaniel B. Palmer and the *Hero* in the Austral summer of 1820-21. One may argue until the cows come home over exactly who first saw Antarctica and when, but almost certainly they were among the very first.

Buried in an appendix on page 78 was this quote from the crew list of the *Huron*: "The cook and the steward were mulattoes, named William White and Cyrus Treadwell, respectively. Two others in the crew were colored men." Certainly black men were in Antarctica in the very earliest voyages to Antarctica. That laid to rest I turned to the semantics of "African" versus "Black" and the statement in the Hart book. A conversation with a librarian at New Bedford also solved much of that as she reminded me that a large number of blacks in the New England trade were Cape Verdean in origin as they had a long history of cooperation and crewing in the sperm whale trade.

So the outcome is that black crewmen of the ships in the New England fur seal trade were among the first people to visit the Antarctic. It is also of interest to me to note that the New England black sailors and even ship captains were an important influence on the abolition movement in America.

**ICE IS WHERE YOU FIND IT** – in Salem.

We borrowed this title from an old friend of ours from many years ago, a former Coast Guard Captain of an icebreaker who wrote a book entitled "Ice Is Where You Find It." He actually should have written a book about automobiles, as they are what did him in, being run over in Ushuaia.

But going on right now through March 1, 2009, is an art show at the magnificent Peabody Essex Museum in Salem, Massachusetts. The exhibition, TO THE ENDS OF THE EARTH, Painting the Polar Landscape, got a big write-up in the Art Section of the Sunday NEW YORK TIMES for November 9<sup>th</sup>, and this drew us to the city 15 miles north of Boston which is better known for its witches than icebergs. Boston is infamous for its crazy roads and lunatic drivers, and it took us over an hour after we reached the city of Salem to find the museum. But it was well worth the nightmare of finding it, a fantastic museum. You can see most of the paintings in the exhibit by going to <http://www.pem.org>, or if you want to buy the booklet on the exhibit, its ISBN (paper) number is 978-087577-216-1. The name is the same as the exhibit, TO THE ENDS OF THE EARTH, Painting the Polar Landscape.

Who are the big players here? The entrance to the exhibition hall features a king-sized painting done in Greenland by Rockwell Kent. Some of his words about the glories of Greenland are on the floor as you enter, ending with "Greenland! Oh God, how beautiful the world can be." Well, I guess that shows that old Rockwell had never been to South Georgia. In 1772, the British painter William Hodges did something no Western artist had ever accomplished, painting an eye-witness view of Antarctic ice. Hodge's pioneering achievement came as a result of his position as landscape artist on Captain James Cook's second epic trip around the world from 1772 to 1775. George Marston, artist with Shackleton's Endurance Expedition, is also in the exhibit. Other famous artists featured are Frederic Edwin Church, William H. Smyth, William Bradford, and others unknown to me. The artist with the most exhibits are those of David Ashley Paige, an artist with Byrd on BAE II. The Ohio State University loaned PEM fifteen of his paintings.

Besides what you might call the Masters of Icebergs, there is another contemporary

exhibit of polar paintings in another section of the first floor of the museum. I found this contemporary exhibit to be of equal interest to me, as there were a lot of great hands-on things to see. Pulling out one drawer, I found Lucia deLeiris within. Not exactly her bodily, but there was an open page to her field notes to accompany her painting. She has been one of Guy Guthridge's more successful winners in his Artists and Writers Program, and lives in the outskirts of Salem. Lucia will be having her own exhibit next month in Newport, Rhode Island. On February 7, 2009, Lucia will give a lecture at the museum on AN ARTIST'S JOURNEY TO THE ENDS OF THE EARTH.

#### **GODFATHER OF TRACY AUSTIN DIED LAST JUNE.**

Joe Fletcher was one of the most famous polar scientists to come out of World War II. He was most famous for probably being the first man to set foot on the Geographic North Pole, although his illustrious Air Force career took him all over the globe, including a three-year stint as head of the Division of Polar Programs at the National Science Foundation. His career was most fantastic, and he led a sort of charmed life. One should read Brian Shoemaker's Oral History on Colonel Joseph O. Fletcher, done on January 5, 2006, which is archived at The Ohio State University. I have to confess to not having read many of the oral histories of polar people, but I can't imagine reading any that are more exciting and as varied as Joe's. It is full of misspellings of famous names, but it is still great reading. He got into the ROTC in college only after finding out that some of the students rode horses. And later on in his military career he chose UCLA, as he felt the roof of the campus physics building would be an ideal place to pick up a sun tan.

How Joe became the first man ever to set foot on the North Pole is truly epic. While on T-3, later to be known as Fletcher's Ice Island, Joe tried unsuccessfully, repeatedly, to get the Command in Alaska to let him

have a plane so that he could make some flights around the Arctic Basin. Finally General Olds said that he could have a C-47 under one condition, that its first flight was to be to the North Pole, ninety miles away. But there really was one other gimmick, an Ace pilot in World War II had gotten himself into heap big trouble, had been court marshaled twice, had recently been slugged by his co-pilot, but he still had a believer in General Olds. He felt if he, Bill Benedict, made the first landing at the North Pole that perhaps he would gain enough notoriety to clear his name. So with Bill at the controls, Joe sitting in as the co-pilot, off they went. The landing was sort of a three-ring circus, and on the last scheduled low pass to inspect a frozen lead as a possible landing strip, Benedict touched down on the ice floe! Joe was standing at the open door with a smoke bomb in his hand, and as the smoke reentered the plane, Joe decided that he had nothing better to do than jump out onto the ice. So, you might say by default, Joe became the first man ever to set foot on the North Pole.

In the early 1970s, Joe was in the Director's Chair of the Division of Polar Programs at NSF. It wasn't something on his Wish List, with several things contrary to his desires. He found a Division which was "all biology. There was no program manager for the atmosphere, there was no program manager for the oceans, there was no program manager for glaciology. Can you imagine that? What I considered the most important subjects for Antarctica, there weren't even program managers. It was a very "weak staff." Then there was a budget cut, roughly half the DPP budget. He did not think much of the Antarctic office at the Navy Yard, so he wiped them out completely, the admiral and thirty-five to forty people on his staff. But he kept the support forces. Joe's next crisis was finding that the National Science Board was considering abolishing the Division of Polar Programs so that its funding could be distributed elsewhere within NSF. Joe gave a series of briefings to the Board, but they still were not convinced. Finally a Committee of Five was chosen to

go to the ice to see for themselves if anything worthwhile was being done. Joe escorted them to the ice and selected eight to ten programs for them to examine, and when they came back, they all had become firm supporters of DPP. But after three years, Joe moved on again. This seemed to have been his life style, outward and onward and upward.

He retired officially from NOAA in 1992, but that was only a paper retirement. He was destined to be active in the scientific arena. The polar regions were blessed to have Joe in their ball park for a large portion of his life. Through a goodly part of his polar life, he and Bert Crary were very close colleagues. Each had not only a great amount of respect for one another as scientists, but they were comrades-at-arms as well. I bet wherever the two of them are at this moment, they are having one hell of a good time over an appropriate drink, with Ambassador Paul Clement Daniels at their elbows.

In closing, back in Joe's days in DPP, I found myself driving Joe to an Earth Day Celebration at Ray Heer's home, Ray being the Program Manager for Atmospheric Physics. It was a delightful ride, and Joe asked me if I had read Bert Crary's chapter on T-3 which was to be part of his memoirs. I said that I hadn't, and Joe said, "Borrow it from Bert, it is the greatest chapter that I have ever read." At that time in my life, I was playing a lot of tennis, and Joe told me all of a sudden "I am Tracy Austin's Godfather." I replied, "You are pulling my leg, Joe, how could you be her Godfather." And he told me that when he was stationed at UCLA, one of his colleagues was George Austin, and they went out dancing one night. Joe introduced one of his lady friends to George, and you know the rest of the story. George married this lady, and when little Tracy came long, they asked Joe to be her Godfather. You only find good stuff like this in the Antarctic Society Newsletter.

This was a most difficult obituary to write as when I circulated it for comments (my big

mistake) I found that some did not care for Brian Shoemaker's oral history. However, I think I captured the gist of what Joe told Brian. I think Joe ran the shop (DPP) according to his own wishes, which wasn't bad at all. Even after he left DPP, when the ozone program came into being, he still tried to have an impact on what should or should not be done.

**MARTIN POMERANTZ, WORLD FAMOUS ASTROPHYSICIST, PASSES AWAY AT 91.** (Excerpted from the *San Francisco Chronicle*.) Dr. Marty Pomerantz (1916-2008), an expert in cosmic rays, passed away at his home in San Rafael, California, on October 25, 2008. He was the first to recognize that the key to understanding the inner workings of our Sun lay at the South Pole. The bone-dry atmosphere there and the stable position of objects in the sky seen from that vantage point made it possible to study, for the first time, the seismology of the Sun, and how its interior rumblings create solar oscillations that reverberate across the cosmos. Marty, as he was commonly known in the USARP system, spent much of his career at Bartol Research Institute, starting in 1938, serving as Director and then President until 1987, retiring in 1990. His role in astrophysics at the South Pole resulted in NSF dedicating the Martin A. Pomerantz Observatory (MAPO) at the Pole in 1995. Marty spent 26 summers at the Pole, the last visit at age 79. He earned four honorary doctorates and numerous awards. Pomerantz Tableland (USARP Mountains) is named for him. More of his legacy can be found in his book **ASTRONOMY ON ICE: OBSERVING THE UNIVERSE FROM THE SOUTH POLE**, 2004. A review of the book can be found in the Society Newsletter, v. 04-05, Feb., no. 4. Last but not least, Marty knew how to live, and very successfully as a result of his achievements, and he also knew how to die. A week before his death, Marty was barely able to walk, but told his grandson he wanted to get out of bed. Together, they shared a final vodka. Marty, you were our kind of guy! A more complete obituary is

being put onto our website on Marty by John Lynch, retired Program Manager for Upper Atmospheric Physics in DPP.

**EAGLE ON ICE**, by Patricia Potter Wilson and Roger Leslie. Review by Paul Dalrymple. This is a book which we have been waiting for a long time, and now it is on our doorstep. It is all about Paul Siple's first trip to the Antarctic with Commander Richard E. Byrd, 1928-30. Pat Wilson, a comely effervescent blonde, professor emeritus who has authored seven books and numerous articles in professional journals, has long nourished thoughts that Paul Siple was a role model for youngsters, particularly boy scouts, and that someone should take it upon themselves to write such a book. When she met Ruth Siple in person, and as she got to know her, she realized that she herself was the person who should really write the book. While talking to Ruth one day, Paul's widow said, "I think I have a title for your book, how about 'Eagle On Ice?'" So then all Pat had to do was write the book. In the end she solicited the help of a fellow author, Roger Leslie, to put the finishing touches on the book.

And now it is out, published by Vantage Press, ISBN 978-0-533-15955-0. As we go to press, Amazon does not have the book, but if you contact Vantage Press Inc., 419 Park Avenue South, NY, NY 10016 or call their Order Department, (800) 882-3273, you can get the book as a holiday gift for your errant grandson or the overachieving boy scout in your family. Actually there are no age limits for readers, as it is an ageless book on how one young man captured the world before the depression and went on to find his portrait on the cover of TIME Magazine as the International Geophysical Year came forth in 1957, which included man's wintering-over at the South Pole. Paul Siple lives on today with the selection of other Eagle Scouts who go to Antarctica every other austral summer.

The story goes that Commander Byrd was not overly enthusiastic about having to take an eighteen-year-old kid to the ice for a

whole year, to be his surrogate father, responsible for bringing him back alive. But he found Eagle Scout Paul Siple was a very mature young man, six feet tall, muscular, and full-grown. On the ship enroute, Paul was a most able seaman, pulling his full share of the load. But it was when he got to the ice that he showed his versatility and capability, and directed much of his attention to learning all about seals, penguins, and dogsled driving, and so much more. This book will walk you through the early Antarctic experience of a most engaging young man who was to use his first year there as a springboard to his becoming one of our country's foremost polar scientists. BUY.

**STUART KLIPPER HAS DONE US A FAVOR.** (Review by John Spletstoesser) The Antarctic Society prides itself in having a variety of significant members that are known for their diplomacy, writer skills, science backgrounds, and one more, photography. Stuart Klipper, a professional photographer, just produced a stunning album of 110 color photographs from his six visits to Antarctica, in a hard-cover book called THE ANTARCTIC FROM THE CIRCLE TO THE POLE. Stuart is one of those rare people who traveled to Antarctica as a result of awards from Guy Guthridge's Artists and Writers Program from the NSF/OPP, not just once but FIVE times with awards from the AWP. Guy Guthridge was impressed to the point of writing the Introduction to the book, in which he says that 4 out of 5 applications for the AWP are turned away. The book was published by Chronicle Books in 2008, contains 175 p. and sells for \$40 (Longitude Books already has it in stock). Additional introductory material is presented by William L. Fox and Stephen J. Pyne (the latter of his book *The Ice*).

The photographs are striking because of the camera equipment that Stuart uses, a Technorama model that produces wider photos than normal because of a 110 degree range of the scene. Klipper states that the subject material in the photographs

encompasses three major all-inclusive topics – ethereal (atmosphere, light, blues of ice, etc.); actual (glaciers, mountains, wildlife); and human evidence (stations, field camps, icebreakers, aircraft, snow vehicles, etc.). The photos are thus arranged according to 11 topics, and progressively from the ocean and the coast to the South Pole, an understandable choice for a broad display of Antarctic scenery and all that goes with it. To get some idea of how Klipper was ferried around during his 5 AWP visits, plus his first visit aboard the 61-foot aluminum-hulled yacht *Warbaby*, the final page lists the locations where he photographed in the months of November through April in the years 1987 to 2000, within a range of 60°S to 90°S and about 50°W to 135°E. That will give readers some idea of what to expect when viewing the photos. Captions to all photos are included in the end pages, which include a few challenges for readers to tie the photos and captions together, but not serious.

I recommend the book for anyone interested in Antarctica, whether they have been there or not, as the photos will provide the incentive to go there.

**ANTARCTIC TOURISM -- PRESENT AND FUTURE** The International Association of Antarctica Tour Operators (IAATO) has existed since 1991, when 7 tour operators active in Antarctica united to form an organization that would act as one voice for what has grown into a large industry. Its function is to advocate, promote and practice safe and environmentally responsible private-sector travel to the Antarctic, with activities causing no more than a minor or transitory impact to the continent. IAATO held its 19<sup>th</sup> annual meeting in Punta del Este, Uruguay, 28 April – 1 May, 2008, and as a result of its proceedings now has 106 members, consisting of not only tour operators, but also travel companies, government organizations, port agents, and others. Its company office was in Basalt, Colorado, until June 30, 2008, when Executive Director **Ms. Denise Landau** stepped out of the position after 9 years of service, and was replaced on July 1

by **Mr. Steve Wellmeier**, who has been active in Antarctic tours for many years and is a specialist in marketing. Steve is assisted by **Dr. Kim Crosbie**, Environmental Officer, in policy-making and management of the organization, with major assistance provided by an Executive Committee plus several committees to deal with maritime safety, site guidelines, membership criteria, and others.

That's the administrative part of the story, but figures on the climbing rate of tourism, both in passenger numbers and ships, is worth some elaboration. IAATO achieved the respect, slowly but convincingly, of Antarctic Treaty Parties at annual Consultative Meetings, where Denise Landau headed the IAATO delegation in illustrating the management strategies that IAATO developed over the years in maintaining order among the numerous tour companies and ships. This was primarily achieved by members following a standard series of procedures in their operations, mostly directed toward the preservation and protection of the environment. This has worked remarkably well, with Treaty Parties feeling comfortable with the way in which the organization is being managed, rather than having it under direct control of the Parties. Some figures in the recent season will illustrate what the figures mean in the recent past.

In the 2007-2008 season, some 60 vessels were engaged in Antarctic tourism, carrying some 45,000 passengers in the period October – March. About 32,000 were on ships that made shore landings, and another 13,000 on cruise-only vessels that made no landings. Another 600 were on overflights for scenic views only, and about 260 were flown to the interior for adventure tourism. About 49,000 tourists are expected in the 2008-09 austral summer. Tourism statistics and other information can be found at the IAATO website – [www.iaato.org](http://www.iaato.org). Denise and Steve Wellmeier attended the XXXI Antarctic Treaty Consultative Meeting in Kiev, Ukraine, in June, where tourism continued as an active topic for discussion.

Although the tour industry has made great strides in managing tourism successfully with respect to the environment, critics say that without formal and enforceable legislation coming from the Treaty Parties, the industry will grow to unmanageable proportions. “Environmental groups fear that tourism is becoming entrenched as the main Antarctic activity in terms of scale and influence, resulting in the erosion of the ..... primary roles of science and environmental protection in the Antarctic Treaty System” (from press release by the environmental group ASOC). Recent incidents have tarnished the success of the industry somewhat, a result of ship groundings in the 2007-08 austral summer, and in one case, sinking (*M/S Explorer*, in November 2007). On December 4, 2008, the tour vessel *M/V Ushuaia* grounded at the entrance to Wilhelmina Bay, on the east side of Gerlache Strait, with all passengers and crew evacuated safely and returned to South America. The fate of the ship, which showed minor oil spillage around it, is unknown as of this writing, but this incident on top of recent others is surely to draw attention to the industry as a whole. Whether formal regulations might be enacted by Treaty Parties in the future as a reaction to these incidents is unknown. It is expected that the 2008-2009 tour season will resume without interruption, and further seasons will continue as previously, with perhaps approximately the same numbers of passengers and ships. (By John Spletstoesser, Advisor to IAATO since 1991.)

**GRACIE MACHEMER'S** Favorite-Book-of-the-Month is BLUE ICE by Don Pinnock. This book has outstanding photographs and is a very interesting read. Pinnock is a South African travel journalist.

Another of her recommendations is the new DVD, ICE PEOPLE, by award-winning documentary filmmaker, Anne Aghion. This film features geologists Allan Ashworth, and Adam Lewis.

**BRASH ICE.** This is a transition period Newsletter, written as people on the ice are getting ready to celebrate another Mid-Winter Day. Back here in the States, a lot of people are waiting with baited breath to see who will win the upcoming contract award this fall for supporting research in Antarctica. The recent International Polar Year closed out this past spring, the 50th anniversary celebration of the Antarctic Treaty is now history, and we await the most recent satellite imagery of calving ice shelves.

We try to put something of interest to all of you people in each Newsletter. The hardest part is to find things of interest to the current generation of Antarcticans. It has been speculated of late that there is a generational gap in the type of people going to the ice, that to many of the current generation, Antarctica is a basically a job. Is the excitement and glamor of going to the ice fading away? We hope not.

Our own Society has changed a lot. In many ways, the Newsletter is only a fill-in for our flourishing web site under the web mastermind, Tom Henderson. You should look at our web-site regularly, as it is a very active web-site, with Tom continually adding and upgrading its content. Be sure to read in this Newsletter Tom's passages about what is new on the web-site. And Chips Lagerbom is performing an unbelievable service to you Antarcticans who may have an interest in seeing your own photography preserved. Read what Chips is offering to you people.

Dr Ed Williams, a retired surgeon in Roanoke, Virginia, caught a severe case of Antarctic fever on a cruise ship to Antarctica, and hasn't been the same man since. His wife is a soft-spoken, charming Southern belle who lets Ed play with his toys. Since his initial trip to Antarctica, Dr. Ed has made repetitive trips back to the Ice, and produced for his family and friends a special DVD on Antarctic penguins. So, we prevailed upon Dr. Ed to make our Golden Anniversary Antarctic album, **ANTARCTICA CALLING**, which features the historical remembrances of thirty of the most prominent Antarcticans in the past sixty years. Over a hundred of you members have already bought copies of these archival DVDs. John Spletstoesser writes herein why they are so important to our history and why you all should have copies of them.

Have a nice summer, enjoy the Newsletter, keep abreast of ongoing additions to our web-site, and order your calendars NOW.

**HAPPY MID-WINTER DAY!**

## ANTARCTIC CALENDARS

(HEDGEHOG), 2010. We have received an advanced copy of the photographs which will adorn the Antarctic calendars published in New Zealand by Hedgehog. It is my candid opinion, for whatever it is worth, that this is one of their better ones, free of kayakers, free of vehicles, free of planes. It's pristine Antarctica at its best. In spite of increased mailing costs, we are offering the new calendar at the same price as last year's, \$15.00. It would help us a lot if you ordered now, as it is no fun getting orders from you people in mid-December when we may or may not have any left. We will mail them as soon as we get a shipment from down under, probably in late summer. But please order now, please.

**WEBSITE UPDATE** (by Tom Henderson, Webmaster) There never seems to be enough time to get done everything that I want to do with the website! My "day job" is increasingly interfering with what I really enjoy doing. Nevertheless, there has been some progress to report.

First, the long-awaited Google Earth API version of Time Trek is almost ready for prime time. Amos Alubala has completed the coding, but there remains some testing to do before going "live." It will be worth the wait because this enhancement will accomplish two major things: (1) It will allow Mac users to use the Google Earth version of Time Trek and (2) It will eliminate the need to load two separate software modules to run GE Time Trek (Google Earth and the Googleearthairlines plugin). The former is a big deal according to the results of the website survey (discussed further below). As to the latter, users will download a single plugin for their browser and that's it. Google Earth is already built-in so when an update to Google Earth comes out, it will automatically be updated in the plugin. Look for the new API version on the website within the next month. It will be prominently announced when it finally arrives.

As of late May, there is a significant enhancement to the way images are searched for and displayed in Time Trek. The old method was admittedly a bit clunky, so we have now moved to a "lightbox" type of image handling. This is commonly used in many online photo galleries to provide an easy and aesthetically pleasing interaction with images. We think it is a big improvement – try it yourself. By the way, even Mac users can try it in the Static Map version of Time Trek [right now](#). It has the same search and browse functions for stations, features, images and events that the Google Earth version does.

We also have changed the way that members' information is displayed and used in the Members area. A new page called "Members Info" lists the member names in the left-hand column. When any name is clicked, more information about the member is shown in the right-hand side of the page. By default, only the member's address is displayed, unless they have contacted me and requested that it not be displayed. Members have full control over how much of their information – other than their names - they show or don't show. When you initially enter the page, a form appears on the right side that shows all of the information we have on you in our database, such as address, phone number, email, etc. [No one else sees this form except you](#). The form allows you to correct mistakes or update information that has changed. It also allows you to pick what parts of your information you want other members to see or don't see. It will be very helpful if members will check this page from time to time to update any incorrect information that might be there. Remember, since this page is in the members-only area, the general public never sees it.

We have a survey on the website posted online that so far has had 26 responses. [The survey will remain available until the end of June, so if you have not taken the time to offer your opinions on the website, please do](#)

so. It only takes a few minutes. The results are of great value to me in pointing out what you like and don't like so I can improve the website going forward. I will post the detailed summary of the survey results in July on the website, but here are a few general results: (1) Users go to the website primarily to learn what is happening in Antarctica and to explore historical information, (2) Those who use Time Trek (about half of the respondents) find it very useful and (3) Most people visit the website on a monthly basis.

Finally, I know that I am way behind on adding content to the website and especially to Time Trek. I am as frustrated as probably some of you are. The backlog of good material is growing fast, so I have every incentive to get it uploaded. You will definitely like what is coming. If you will bear with me, you will not be disappointed!

**SAVE THE SLIDES CAMPAIGN** (by Charles H. Lagerbom) The Antarctic Society has embarked on an ambitious project to locate, catalog and digitize the slide collections of its members. This project is geared towards getting these historic and important images onto a more modern digital format. The members then receive their original slides back (if they want them) as well as a cd of their images newly digitized. The Society bought a top of the line scanner, the NIKON Super Coolscan 5000 and began the project over the winter. It has special software that can remove scratches and dust particles from the images. What emerges is a digital scanned image of the slide, preserved and burned onto a cd. First up was Bob Dale's almost two thousand polar slide collection spanning more than a decade from his career as pilot and aboard the research ship HERO. Since then we have digitized Paul Dalrymple's almost 500 slides of his two years with the IGY, Calvin Larsen's almost 300 slides from the same period, as well as my own slides from my two field seasons in the Dry Valleys in the early 1990s. All slides were scanned at a resolution of 4000 dpi which

makes for producing sizable photo print enlargements. We have also begun cataloging the images collected by Charles Swithinbank from his multi-decade polar career.

Q. Do you really want all of my slides from my time in Antarctica?

A. Our policy is that all images contain historic relevance to your polar experience and should be included for a total picture.

Q. I only have a few slides, is it worth your time?

A. From our point of view, the size of the collection is irrelevant; the preservation of the images is what is important.

Q. What if my slides are in pretty bad condition?

A. We will do what we can to preserve what we can.

Q. What if many of my images have yellowed with age?

A. Our first step is to digitize the image. Then software such as Photoshop can be used to clean up the saved image.

The process so far has yielded several thousand images that have been historically preserved. More importantly, a catalog system has been developed to aid in the maintenance and accessibility of so many images. A catalog number is assigned to each slide and corresponds with the slide owner's name. For instance, Paul Dalrymple's slides were designated PCD1 - PCD488. Then they were categorized with date (as specific as possible) and three different location designations (each getting more specific). One heading was for what type of image it was such as Science, Animal, Aviation, Structure, People, Scenic etc. Along with the original slides and the cd of images, the slide owner also receives a hard copy printout of the catalog as well as an electronic form of it burned onto the cd with the images. It is understood that members retain all copyrights to the original image and that the Antarctic Society be

granted non-exclusive use of the scanned images for its website and publications. The images will not be used by the Society for any commercial purpose. Comparable scanning services can charge up to or over \$1 per slide. This service is offered FREE for members of the Antarctic Society. It would be helpful if slides were already labeled with date, location, names, etc but we can work around that if necessary. The important thing is for these fragile (and deteriorating) slides be transferred to a more reliable and better preserved digital format. See the Society's website for more information about the service or contact me at [clagerbom@sad34.net](mailto:clagerbom@sad34.net) if you have any questions. So whether you have a few slides from your Antarctic days or several thousand, the slide scanning service of the Antarctic Society stands ready to help you save these great memories.

#### **ANTARCTICA IS STILL CALLING.**

You have read in this Newsletter previously about this remarkable DVD set that Dr. Ed Williams filmed and produced recently, most of the content resulting from the Antarctic Gathering held at Port Clyde, Maine, in 2008. It is called **ANTARCTICA CALLING, Antarctic Society Golden Anniversary Album**, and with sales continuing to be active, there eventually will be a close-out for sales in the future. Nevertheless, **Antarctica is still calling.** This is the time and in your interest to revive the subject before you miss out on something as equally historic as your collection of polar books (assuming you collect some, as most of us do). Just to review what is included, it is possible that some are turned off because they don't know all the names, but once begun, as John Splettstoesser mentioned, "I found it difficult to stop looking at the faces and hearing more of the interviews until I had downloaded all of the content in the three discs, although I took parts of several days to do it." Sure, it's long (each DVD is just a bit longer than 2 hours), but it's an archive that will never be repeated, and some of the members might not see it that way because it

appeals to mostly an audience of the same era (IGY, a bit before, and a bit after), but these names are familiar in one way or another to all of us. John has a tape recording of speeches by Peary and Shackleton, and playing it brings them to life as though they were still with us.

Disc one includes interviews of 10 IGY veterans, Disc two has eight more spanning some years following IGY, and Disc three has 12 more. Pre-IGY veterans interviewed were Charles Swwithinbank (began Antarctic work in 1949), and Bob Dodson (Ronne Expedition, 1947-48). A bit of frosting that Dr. Ed included on the DVDs is the admixture of oils and watercolors by Lucia deLeiris, and photographs by Ann Hawthorne. The DVD set of three is dedicated to Bert Crary, whose name is known to all of us, a respected scientist and pioneer of Antarctic research.

I would encourage members to buy the DVD set, enjoy, see history that many never knew and never will otherwise, and from those who were there. Be an Antarctic historian, like we all are and should be. After viewing and hearing an individual once, you might never return to the same DVD, but when you have a reference book on your polar bookshelf you don't discard it.... you refer to it from time to time when you recall something you missed earlier, and the DVDs will forever be the primary and unique source. When you read news that someone interviewed on these DVDs might no longer be with us, you can return to the DVD and review once again that documentary. You will regret not knowing that part of important history, as told first-hand by those who experienced it. Antarciticans are not immortal (although some might appear ancient), and as the years pass, a refresher will be welcome as we have another look at a DVD that brings back memories. Because of the way that Dr. Ed set up the interviews on the DVDs (most interviews were done in Paul Dalrymple's back yard), access to individual presenters can be made by selecting their chapters on

the DVD menu.

There is a cost involved, but the Antarctic Society has blessed the product with a subsidy. An actual cost of \$50 for the set of three DVDs has been made more comfortable at \$35, with a check for that amount mailed to Dr. Ed Williams, MD, 4536 Greenlee Road SW, Roanoke, VA 24018.

**ATCM AND IPY EVENTS** (by Ray Arnaudo) The State Department marked the 50<sup>th</sup> anniversary of the Antarctic Treaty last month by hosting a special high-level diplomatic session in the Dean Acheson Auditorium on April 6<sup>th</sup>. The meeting was a Joint Meeting with the Arctic Council, a first-time ever event, which highlighted the conclusion of the 2007-09 International Polar Year (IPY) as well, demonstrating the continued potential for science in Antarctica to improve our practical understanding of the global environment while contributing to international understanding in general. Secretary Clinton opened the meeting (<http://www.state.gov/secretary/rm/2009a/04/121314.htm>), followed by a speech from the current Arctic Council Chair, Norwegian Foreign Minister Store, and finally, an address by the President's new Science Advisor, John Holdren. The event drew a pretty good response: over a dozen Foreign Ministers and the Prince of Monaco attended. Sec. Clinton then hosted a high-level lunch for all in the State Department's 8<sup>th</sup> floor Ben Franklin Room.

In the afternoon, the National Science Foundation and the National Academy of Sciences held a celebration of IPY at the National Academy building across the street. Academy President Ralph Cicerone and Polar Research Board Chair James White spoke, followed by several panels discussing the significance of IPY research.

The location was particularly important because, as we Antarctic Society regulars know, the Treaty negotiations took place in

the NAS building at the conclusion of the IGY, in 1959. It was also announced at the meeting that a commemorative plaque will be installed in the Academy building, once the imminent two-year renovation is completed, to highlight the building's role in the creation of the Treaty. Later that evening, a reception for all was held at the Smithsonian's Ocean Hall in the Natural History Museum.

These events kicked off the regular annual session of the Antarctic Treaty Consultative Meeting, held in Baltimore, April 6-17. There are now 47 countries in the Treaty, including 28 Consultative Parties which both maintain a scientific presence on the Continent and oversee the governance of the Treaty. The ATCM adopted a mandatory 500 passenger limit on tour ships. Additionally, the Parties supported a U.S. initiative to engage the International Maritime Organization (IMO) in promoting vessel safety in the Treaty area, including work toward adopting a mandatory polar shipping code and stronger lifeboat protections. Finally, the Meeting began work on a U.S. proposal to extend the IMO limitations on vessel discharges in the Special Area of the Southern Ocean up to the Antarctic Convergence, instead of stopping at 60 degrees south. The meeting brought back a couple of old ATCM hands: Tucker Scully was asked to chair the meeting, and Ray Arnaudo served as the head of the US Secretariat. Evan Bloom of the State Department led the US delegation.

### **ANTARCTIC ICE SHELVES ARE IN THE NEWS!** (by Jane Ferrigno)

Justifiably so! Whether an Antarctic ice shelf is calving a gigantic iceberg, or partially or completely breaking up, large areas of real estate are involved, areas the size of some U.S. states or small European countries.

The Wilkins Ice Shelf is the most recent area where dramatic events are happening. The ice shelf is centered about 70°15'S., 73°00'W., on the western side at the base of

the Antarctic Peninsula. In recent years it filled Wilkins Sound in the area between the western side of Alexander Island and Charcot and Latady Islands and was about 13,680 km<sup>2</sup> in area. Although Wilkins Ice Shelf has been in place for several hundred years, if not longer, its extent was only recognized in 1960 from aerial photographs acquired in 1947-48 by the Ronne Antarctic Research Expedition (RARE) and the shelf was named in 1971.

On April 2, 2009, the ice bridge collapsed that connected the ice shelf to Charcot Island on the northwest and to Latady Island on the southwest, and that stabilized the western side of the ice shelf. As a result about 330 km<sup>2</sup> of ice was lost. Following that event, large pieces of the ice shelf fractured from the north and west sides of the shelf with an additional area of almost 700 km<sup>2</sup>, possibly leading to a comprehensive breakup of the ice shelf. This dramatic event followed several large break-offs in 2008 that totaled about 2,000 km<sup>2</sup>. Although the recent changes are dramatic, they are not unexpected. In 1993, David Vaughan, a glaciologist with the British Antarctic Survey (BAS), predicted the northern part of the ice shelf would be lost within 30 years, considering the climate warming that was taking place – temperatures in this part of Antarctica have risen by 2.5 degrees Celsius since the 1950s. His predictions have turned out to be too conservative. In 1998, a US Geological Survey (USGS) geologist Baerbel Lucchitta measured a retreat of up to 20 km of the northern margins of Wilkins Ice Shelf using time-lapse Landsat imagery.

Wilkins is the most southerly of the nine Antarctic Peninsula Ice Shelves that have either disappeared or been substantially reduced in the last 30 years. The ice shelves of Prince Gustav Channel, Larsen Inlet, Wordie Bay, and Jones Channel have disappeared, and Larsen A, Larsen B, Müller, and George VI Ice Shelves have lost considerable amounts of ice. Larsen B lost 3,250 km<sup>2</sup> of its ice in thirty-five days in

2002 and a total of more than 7,850 km<sup>2</sup> between 1986 and 2005.

The changes in the ice fronts of the Antarctic coastline have been mapped and analyzed in a USGS Project “Coastal-Change and Glaciological Maps of Antarctica”. USGS scientists, realizing measurement of change in area and mass balance of the Antarctic ice sheet is critically important during this interval of global warming, because of implications to rise in global sea level, utilized their extensive archive of satellite images to document changes in the coastline of Antarctica. Although changes in the areal extent of the Antarctic Ice Sheet are not directly related to changes in mass balance, the two are related, and the analysis of the changing coastline can yield important data. The data used for the coastal-change project were Landsat 1, 2, and 3 Multispectral Scanner (MSS), Landsat 4 and 5 MSS and Thematic Mapper (TM) and RADARSAT images and available maps. In some areas, aerial photography, NOAA AVHRR, MODIS, Landsat 7 Enhanced Thematic Mapper Plus (ETM+) data were used to compare changes that occurred during a 20- to 25- or 30-year time interval or longer. A combination of manual and digital annotation of glaciological features was used, and interpretation and analysis was done by those familiar with Antarctic ice features, such as Charles Swithinbank. A noteworthy result of the project is the determination that a large percentage of the smaller, less obvious ice fronts are also showing signs of retreat, in addition to the noticeable, dramatic changes of the ice shelves.

The results of the analysis are being used to produce a digital database and a series of Geologic Investigations Maps (I-2600). The maps already completed are available online at <http://www.glaciers.er.usgs.gov>. As of June 2009, seven maps have been printed (I-2600 A and B that cover the northern two thirds of the Antarctic Peninsula and show changes in the Larsen, Wordie, Müller, and

northern George VI and Wilkins Ice Shelves prior to 2005, and I-2600 D-H, that portray changes in the coast from Ronne Ice Shelf westward to the Ross Ice Shelf). The map that covers the Wilkins Ice Shelf is in production and should be available later in 2009.

### **JERRY MARTY (MR. SOUTH POLE) RETIRES.**

This August will mark 40 years ago that I made my first trip to Antarctica. I'm also celebrating my retirement from the National Science Foundation – Office of Polar Programs on June 30, 2009. I have spent over five years of my life actually living “on the ice” with most of that time at the actual geographic South Pole. The rewards have been beyond my expectations, among which are having an Antarctic geographic feature named after myself – Marty Nunataks, being featured in a National Geographic documentary "Man Made Structures , " seeing the completion of the new South Pole elevated station, and the never ending support of my wife Elena who has allowed me to live the South Pole dream. My life's journey has not only allowed for the Antarctic career but also project management assignments to other remote locations in Saudi Arabia and the Trust Territories of the Pacific Islands (Palau and Truk). Now it's time for Elena and I to enjoy more time together, with the kids & grandkids – telling them the stories, experiences, and about the very special people we met along the way, especially those within the USARP/USAP. I am of a Swiss heritage therefore we never say good-bye, only Auf Wiedersehen (until we meet again). Keep in touch and stop in at the Jerry & Elena “90 South” B&B.

### **AN E-MAIL FROM DALE ANDERSON.**

Dale Anderson, whose work on limnology in the Dry Valleys starting in the 1970s and continuing thereafter, sent an e-mail message to Paul Dalrymple and Charles Swithinbank in May, which is modified and edited slightly below. He worked at Lake Untersee (U.S. Board on Antarctic Names

uses Unter-See), last Antarctic season (71° 20'S, 13°27'E, Gruber Mountains, Queen Maud Land), followed by work in Axel Heiberg Island in the Canadian Arctic.

Dale is located at the Carl Sagan Center for the Study of Life in the Universe, Mountain View, California. In Dale's words,

*"I am now getting ready to head back to McMurdo for work in the Dry Valleys at Lakes Joyce and Vanda. It will be nice to get back to my old stomping grounds, its been 12 years since I was there last. This time I go as the PI, which will be a nice change of pace. The work will center on the benthic ecology of lakes, primarily some carbonate structures (microbialites) I discovered in Lake Joyce in 1986 while diving beneath the 6m ice-cover there. Neat place and I am looking forward to seeing it again.*

*I have posted a few images from my trip to Lake Unter-See online at my website. I will get some video up soon too, including some underwater video of this absolutely stunning lake ecosystem. Lake Unter-See likely has the most transparent water of any lake in the world, with Vanda a close second. But the microbial mats form large pillars in Unter-See, something we have never seen before in any other lake. Pretty cool!*

*Charles, I re-visited your old home at Novo[lazarevskaya]. You may recognize some of the shots looking down the boardwalks between your old hut, and the others that were down below (which are now refurbished and are used by ALCI for housing folks like us).*

*The images can be found if you go to my website and hit the link to Lake Unter-See in the column on the left side of the screen: <http://daleanderson.seti.org>."*

**CHINOOK MAY BE HONORED.** The first Byrd Antarctic Expedition (1928-30) had a husky from a kennel in the state of New Hampshire, and the dog was named

Chinook. Supposedly the dog was the strongest, the bravest, and best sled dog that they had. But evidently he wasn't cut out for the city life of Little America and he wandered off on an expedition of his own, never to be seen again. Now there is a campaign in the state of New Hampshire to make Chinook the State Dog. And the New Hampshire Historical Society now has a bobble-head version of Chinook to publicize the campaign to immortalize said husky. Antarctic Paul Adams graciously sent us one to guard our boudoir.

**THE FABULOUS JULES MADEY, K2KGJ** The unsung hero to all Antarcticans during the IGY was a young high school boy from Clark, New Jersey, who somehow stayed up all night running phone patches as a ham radio operator for Antarcticans, while going to school in the daytime. His younger brother, John, K2KGH, also ably assisted him at times, but it seems that Jules was always up on frequency with a strong signal waiting to serve us so elegantly. According to Jules, he and his brother ran something on the order of 10,000 phone patches. WOW! His service continued into the 1960s, when he was invited to attend the Antarctic orientation session at Skyland, Virginia, as a means of promoting what he volunteered to do for those on the Ice.

Jules was one of the first amateur radio men to pick up the signal from Sputnik. If you have a copy of LIFE magazine at the time of Sputnik, you probably read about Jules and saw a picture of his antenna in his back yard. He has been recognized by the feature known as Madey Ridge (83°28'S, 55°50'W) in the Neptune Range of the Pensacola Mountains. He also can wear a medal presented to him by the Department of the Army for his services supporting science in Antarctica. But probably what meant the most for him was a free ride to the Antarctic, McMurdo. Boy, did he ever deserve that trip.

What ever happened to him, the boy wonder?. Well it seems his chosen field turned out to be electronic engineering. Jules got married in 1967 just before moving to San Francisco where he worked for ten years at a research institute for vision and visual neurophysiology. Then the Madeys, now with three kids, moved back east and for the last 24 years he has worked for the New York State Thruway Authority. He is still in electronics, transportation related, and was involved in the deployment of the EZPass electronic toll tag system. He lives in Hillsdale, NY, between Hudson, NY and Great Barrington, MA. Another kid appeared on the scene, so he and Gertrude now lay claim to four (boy, girl, girl, boy). Meanwhile, brother John is a professor at the University of Hawaii, parents of one.

**PIECE OF ANTARCTIC HISTORY GOES UP IN FLAMES** (Margaret Lanyon). Part of the original U.S. base at McMurdo, ceded over to the Kiwis at Scott Base, an A-frame hut dear to Ed Hillary, was destroyed by fire on May 24th. The fire started during a routine changeover of diesel fuel tanks used to heat the timber and bitumen hut. When the heater was reignited, priming fuel flashed over and set fire to the hut.. Three Scott Base staff were outside the hut, while one staff member poured priming fuel into the heater. Staff tried to fight the blaze but the hut burnt quickly in minus 35 C temperatures.

It was known as the Scott Base bach (as in 'bachelor' hut) for its seclusion and basic comforts. It was a favorite of Ed Hillary and he asked to spend his last night in Antarctica there after the official Scott Base 50th birthday celebration in 2007.

**A. FORD ON THE ROCKS! ANOTHER ANTARCTIC CRUISE SHIP AGROUND** (by Art Ford, in his own words.) It was some dimly recalled time around 1:30 early the morning of last February 17. At 68°08'S by 67°06'W in historic and scenic Marguerite Bay, we were far south of points normally reached by

cruise ships to the Antarctic Peninsula. We were at anchor, we thought. My head was being battered, working that bashing against my bed's headboard into some really weird and vivid beer-inspired dreams. I was Geologist lecturer on board Quark Expeditions' ship M/V *Ocean Nova* and rooming with an Irishman, Jonathan Shackleton, our Historian and relative (second cousin twice removed, he said) of Sir Ernest. It had been one of those rare, clear and windless days that made our afternoon visit to the decaying 1939 East Base (R.E. Byrd, U.S.) and 1946 FIDS (British) buildings on Stonington Island a stunningly euphoric experience, followed by a short evening visit with hospitable Argentines at nearby San Martin Base. Back on board our Danish Captain, Per Gravesen, announced we were anchored and undergoing engine maintenance to prepare for our trip back north early next morning. Our EL (expedition leader), South African Conrad Henning, told us of plans for raising anchor before dawn and a landing at Horseshoe Island before breakfast.

An idyllic day, the beautiful calm seas under a setting sun, and 5 Irish on board made a memorable celebration mandatory for Crossing the Circle and reaching our Farthest South. Most participants headed for bed about midnight as an early morning EL's rooster call was expected. Little notice was taken of rising gusts of wind across the sea. We were ill-prepared for the jolt over the intercom an hour or so later when Capt. Per announced that the anchor had dragged and our ship was blown aground on rocks. "But we are safe, and no need to become alarmed," he assured us several times. Jonathan ("Shack") was out of his bunk and announced "We are at a strange angle," as he lurched from the head. Walking was strange at an angle of 15 or more degrees. Gale force winds were howling outside at more than 50 knots. The sea was a frenzy of white foam and froth.

A rocky islet loomed closely beyond our window and a submerged ledge of gneiss

and granite could be seen vaguely just beneath our window. Sobering up was prompt. Most passengers followed Capt. Per's advice and stayed in bed, as there was really no need to assemble for an emergency. By the time most arose, images on laptops vividly portrayed our situation as seen from the nearby Argentine base. Digital camera-equipped Argentines had watched the entire episode under light of the midnight sky. Images bearing the label "San Martin Base" spread with the speed of light through the internet worldwide. The world knew of our plight within moments, before even most passengers did, and long before word reached Quark Expeditions' Toronto headquarters or London insurance companies.

Our sturdy little 230-foot ship with a 12-ft draft was carrying 64 passengers plus 41 crew and staff. Registered in the Bahamas, it was built in 1992 in Denmark for coastal Greenland ferry traffic. She and M/V *Polar Star* have the best observation lounges of any polar cruise ship I've sailed. Her 2000 HP diesel engine gives a speed of 12 knots in good conditions but not enough strength to take us off those rocks. Later, in mid-day, with higher tide and engine at full power and stern thruster at full blast, we pushed off and the ship was afloat. Applause roared from passengers, immediately silenced at the jolt we felt as the ship was blown back onto new rocks close by.

The winds that arose so suddenly, reaching full gale force or stronger and catching the ship crew off guard, were undoubtedly katabatic in origin - a gravitationally unstable, dense and heavy cold-air mass draining off a large glacier front near the ship. Even with a watch on duty, there was little time to restart a cold engine, warm it up and develop power to stop an anchor dragging under such force. Years before, in our tent camps in the Thiel and Pensacola Mountains, such unpredictable blizzard winds off the polar plateau were not uncommon and could last several days or more. They are much less frequent on the

Antarctic Peninsula, of course, where ice masses are far smaller.

A distress signal was issued and by late afternoon the Spanish naval ship *Hesperides* was coming into view through the mist. Eventually the wind lessened so that a small boat could be launched to inspect our hull, but I did not hear of any damage found. That ship was ready to assist if needed, but two other Quark ships with passenger space were standing by. The *Clipper Adventurer*, the nearer, about a day away near Deception Island headed south for the rescue. Several aircraft flew over for aerial views and imagery that also spread around the internet. That evening, our bartender Sam's ingenuity produced his daily house-special, this time a \$4 one called "Ocean Nova on the Rocks": a marvelous concoction of tequila, contreau, and lime juice, rimmed with rock salt.

The winds raged on, then dropped quite rapidly by late morning for arrival of the *Adventurer*. By afternoon seas were again calm and passengers and luggage were transferred by Zodiac without incident, along with three Quark staff, the geologist, historian, and EL. This *Nova* group was somehow squeezed into the *Adventurer* where new friendships were soon made. Luckily, neither ship had been at full capacity.

A direct sea route was taken back to the Argentine port of Ushuaia, during which the *Nova* followed closely in event of problems. At the time, no penetration of the hull was known and there had been no evidence of fluid leakage. Back at dock, however, a detailed inspection by divers found that at least the outer of the two hulls had indeed been penetrated. A steel patch was welded onto the hull for *Nova*'s return to Europe for drydock repairs.

Her return to Antarctica for 2009-2010 is expected.

Incidents like this, the sinkings of the Argentine *Bahia Paraiso* (1989) and *Lindblad Explorer* (2007), and the advent of

huge new tour ships carrying thousands raise concerns at Antarctic Treaty meetings about potential impacts on the environment and research programs at bases. Such matters are addressed at meetings of the International Association of Antarctica Tour Operators to attempt management of this growing industry that by 2007-2008 reached approximately 45,000 passengers carried by about 60 vessels. Antarctic Tourism is even available for university degrees (e.g., Canterbury University, Christchurch, New Zealand).

In summary, there was no evidence of environmental impact, as no leakage from the hull was seen; and there was no impact on research activities at the nearby San Martin Base, as all personnel were transferred directly to a rescue vessel. This was a very successful rescue operation that shows the value of IAATO's recommendation for pairing of cruise ships operating in these waters. In the present situation, a multi-engine ship would have had much better chance to hold that anchor. Without doubt this incident would have been far more severe had *Nova* not had a full double hull. The ship also has an unusual, special steel plate along its keel, which protected the hull during the incredible pounding it took on those rocks.

Passengers on both ships felt well treated by the tour company, Quark Expeditions, in its prompt response to the incident, the EL's keeping them well informed, and especially a generous refund offer of 50 percent of ticket price. Those on the *Adventurer* crossed the Antarctic Circle, which hadn't been scheduled, and those on both ships had visited more than half their planned sites -- and all had great tales of adventure on a polar sea to take back home.
